more advantaged and the rest of society tends to erode (Nehring).
Nehring (2007) encouraged school leaders to combat the resistance against school reform efforts and urged these leaders to think differently about school reform. His article provides background knowledge about the obstacles against thoughtful school reform efforts and to teach school leaders to apply the accompanying practical lessons.

Questions were asked to invoke thoughts about how to combat the 7 conspirators described in the article including:  
(a) Where in my practice do the language and thinking of product assembly appear?, (b) Where in my practice am I allowing myself to respond reactively to fear?, (c) Do the policy decisions under my jurisdiction take into account their full effect at the point of impact?, (d) Are there places in my practice where I am allowing fit to trump effectiveness? , (e) When aiding something new, how will it affect existing activities and influence the school’s central mission?, and (f) who gains from this decision and who loses? Nehring argued that understanding the tendencies in our culture that work against thoughtful schooling will aid the ability to ask helpful questions and develop useful strategies to build and promote inquiry and reflection, all elements of effective thoughtful schooling. The results were not geared toward anyone’s self-interest but rather to enhance the quality of learning for our students. According to Hoyle and Slater (2002), the purpose of school reform was to produce high performers who become our future leaders of a troubled world but cautioned against allowing this goal to take the place of happiness, love, and service.

*Embracing Confusion*

Jentz and Murphy (2005) argued that most leaders are often confused because of growing daily challenges, but they choose to hide their perplexity and fail to take the
necessary actions to problem solve for fear that their lack of knowledge may be revealed. In other words, they make decisions not to act instead of acting with potential failure. If they do address an issue and merely pretend to know what they're doing, the results are bad decision-making and prevention of a potential growth experience. Jentz and Murphy described this cycle of hidden confusion as the lost leader syndrome.

Jentz and Murphy (2005) explored a method managers can use to transform their confusion from a liability into a resource. This method is called *reflective inquiry and action* (RIA) and can be used to promote learning and new ideas along with the ability to take effective action through a five-step process. Through these means, managers can use their need to make sense and involve people in the process without sacrificing goals, values, or judgment. Designed for small groups in private sessions, the guiding principles behind RIA are embracing one’s confusion, structuring a process for moving forward, and listening reflectively.

Jentz and Murphy (2005) highlighted many moments that leaders have faced and have in common in which they are presented with an obstacle or a serious problematic situation and yet pretend to function without being altered or having a level of concern. The authors illustrated various circumstances that might alarm administrators such as unexpected personnel issues, failed initiatives, or even tragedy. Jentz and Murphy demonstrated a position for revealing high levels of concern or confusion to constituents even though the technique goes against conventional thinking.

In order to be successful in sustaining reform efforts, Jentz and Murphy (2005) stood against hiding confusion. The high cost of deciding to keep the information or pain
of a situation private was demonstrated as a high cost for all constituents. In order to bring about substantive and sustainable progress, all team members must have high levels of trust and truthful communication. The RIA model is held up as a path to success for managers when they deal with unexpected problems or sensitive emergencies (Jentz & Murphy). The goal of the model is to turn confusion into a resource. The steps consist of multiple cycles in multiple venues that are flexible and opportunistic (Jentz & Murphy). They are as follows: (a) embrace your confusion, (b) assert your need to make sense, (c) structure the interaction, (d) listen reflectively and learn, and (e) openly process your effort to make sense.

Embracing confusion is to acknowledge that one is confused. Admitting confusion helps with the process of problem solving (Jentz & Murphy, 2005). Recognition is given that leadership is about being out front, about not having the choice but to encounter situations that will be confusing, and about accepting that confusion is not a weakness (Jentz & Murphy). Asserting the need to make sense is clarifying one’s understanding of the situation by speaking the circumstances out loud as one understands them to be (Jentz & Murphy). This allows for the opportunity to structure a process that can turn confusion into a productive, shared search for innovative solutions (Jentz & Murphy). Along with innovative solutions, Smith (1997), argued rights, public policy, attitudes, values, pedagogy, and the use of innovative strategies are interrelated and must be aligned.

Jentz and Murphy (2005) explained that structuring the interaction is designing a means of involving others in the process of joint inquiry. At this time, there is a need to
develop a plan of specific steps and procedures to accomplish a goal within a given timetable, and an agreement about how decisions and actions are made. Listening reflectively and learning is different than typical listening. Usually people listen in order to be prepared to make a decision or judgment. Reflective thinking is done in order to put oneself in the position of the speaker without judgment and then clarifying the person’s position or understanding by repeating some of the concepts back to them. This can be a challenge, especially to those who do not reciprocate listening. Jentz and Murphy described this kind of reflection as an area that requires much practice.

It is important for leaders to develop specific people skills if large groups of people are going to be able to work cohesively toward a common goal and to meet the needs of school reform efforts while being able to sustain them. Jentz and Murphy (2005) argued that leaders need specific skills in the RIA process that give them the ability to take constructive action, even in the wake of confusion. What is significant is that there are tools available such as the RIA for educational leaders to use it as a platform to hear the ideas of stakeholders, and to use them in their own confusion (Jentz & Murphy). The goal is to obtain new information and to learn from mistakes, which sometimes means revealing the lack of knowledge (Jentz & Murphy). Environments that engage in models such as this one, also inadvertently address school climate. Researchers have highlighted school climate as integral to leadership effectiveness and school reform efforts (Kelley, Thornton, & Daugherty, 2005).
**Flaws of Macro School Reform Efforts**

Large school reform efforts have been instituted in attempts for making mass improvements through policy reform. Booher-Jennings (2006) illustrated unintended consequences of accountability systems and compared them to emergency healthcare situations, describing this action as educational triage. Specifically, NCLB is highlighted as an example of the flaws in such a plan. The intention of the policy was to improve the outcome for all students, especially those who have been neglected in some way and have historically failed. Nevertheless, because of the punishment for failure that many individual teachers, schools, and districts may face, they began to strategize ways of meeting goals for adequate yearly progress and in the process forgot specific student needs. Neuharth-Pritchett (2005) highlighted current accountability trends in schools and strategies for documenting student progress and using it to intervene with low performing students.

In many cases, data are used to group students according to how they are predicted to perform on a test, and then instructional decisions, including resources, are made to ensure that the right number of students will pass it (Hess & Finn, 2004). Those students that are believed to not be ready to pass the test do not receive instruction in the same way as those who are borderline students (Hess & Finn). Also, the different groups are not given the same resources. Booher-Jennings (2006) emphasized the ethical and moral dilemma that most educators face when placed in this position because of macro accountability systems. Booher-Jennings encouraged educators to make better choices, even when faced with the possibility of losing their jobs. Regardless of whether or not a
student can contribute to a school’s bottom line, teachers should choose to teach all of the
students. Emphasis is placed on the fact that if enough teachers stand up against these
mandates and stand up for all students, then the chance of being asked to go against their
beliefs will be minimized or eliminated. Murray and Harlin (2006) argued that teachers of
children of poverty need more of a good grasp of content knowledge about the different
subject areas along with the ability to view themselves as agents of change.

According to Kohn (2004), educational accountability is viewed as a dark period
in American education for a significant segment of the minority population. Sheppard
(2006) argued it more disturbing for inner-city schools because of callous repercussions
that include publicly identifying low-performing schools in the media. Steele (2004)
asserted that this mindset restricts opportunities and contributes to dropout rates among
African Americans.

Hess and Finn (2004) argued that NCLB has become political, has caused
confusion, and is not working as intended. The purpose of the reform was to impose
sanctions on schools that fail to meet their obligations and to take action against those
ineffective schools in which students have been trapped. Most stakeholders are working
hard to put this law into practice with good intentions, but critical assessment is needed
about how the law is or is not working to raise the achievement of students (Hess &
Finn). Among the key lessons from the focus of this study were that low performing
students may not be welcomed in all schools regardless of the school choice focus due to
the measure of accountability and responsibility within the law (Hess & Finn).
Measuring School Reform Efforts

Among school reform efforts is the school choice movement. All but 10 states in the United States have adopted a charter school law of some kind, allowing for the creation of new public schools based upon the laws of each particular state (U.S. Department of Education, 2007). Various views at all levels of the spectrum have been explored on this initiative. Duncan (2006) explored Chicago's Renaissance 2010 school reform efforts and posed arguments against it. As in many states across the nation, the school choice movement in Chicago has been attacked by constituents (Duncan). However, Duncan emphasized that some who have previously stood against the movement are now attempting to participate by opening their own schools. Duncan emphasized that school reform is not about creating winners and losers but making new efforts to help children become successful.

Researchers have tried to identify ways to create almost a foolproof method of predicting whether or not a school reform effort or a new school option would be successful. Coulson (2005) argued for the need to be able to measure market education and to rank school choice reforms. To aid this process, he suggested providing a metric for rating school reform plans based on the size and quality of the educational marketplace. The specific metric addressed by Coulson is called the market reform metric. Its purpose is to rate existing educational systems by attempting to predict the outcomes that specific proposals would produce. With this tool, the characteristics within the proposals would be measured comprehensively to avoid potentially bad proposals and to predict successful ones. Stollar, Poth, Curtis, & Cohen (2006) argued for the need to
use a tool of some kind also to identify whether or not innovations are sustained by themselves, or if they are sustained, because of the organizational principles and design.

*A Systems Approach to School Improvement*

Thornton, Shepperson, and Canavero (2007) examined how program evaluations can be utilized for ongoing learning, learning that affects organizational change and overall school improvement. They explored an organization's capacity to learn and emphasized the ability to learn if they can (a) disseminate information, (b) solve problems, (c) experiment, and (d) analyze experiences they have or were had by others. These elements are much like those of Jentz and Murphy (2005), that there is an argument for hitting a process of obtaining information, analyzing, and reflecting. Thornton et al. emphasized the need to have an effective system for receiving feedback. Data must be used continuously along with program evaluations that result in shared perspectives. Thornton et al. expressed similar concerns for the ability to sustain progress in the same way as Collins (2005) and Fullan (2005) did. Short-term strategic planning is not useful for sustaining what has been learned in an organization over time. Meaningful improvement of schools requires holistic organizational transitions and substantive leadership. Thornton et al. highlighted 5 core disciplines or aptitudes establishing pricing as a means of emphasizing whether or not organizational personnel have the capacity to adapt and learn. These 5 core aptitudes are (a) personal mastery, (b) mental models, (c) shared vision, (d) team learning, and (e) systems thinking. All 5 are needed if the people from the organizations have hopes of learning. Many of these are shared ideas among the current researchers explored in this paper.
Thornton et al. (2007) argued that organizational staff learns through individuals and that the organizations must contain people who are committed to ongoing growth and development. Staff development is integral to the process of personal mastery and can be used to develop systematic procedures to improve personal capacity of personnel. Ediger (2006) argued that school administrators are responsible for the growth and development of all staff and therefore must stay abreast of the latest trends that develop leadership characteristics in vital areas. Organizational change takes time and quick fix approaches that show mediocre improvement should be avoided. Evaluations can be used in the process of program improvement as specific strategies to raise student academic achievement are created and revised. Thornton et al. emphasized a common vision. Without one, schools do not have the capacity to meet goals or take action in an agreed-upon direction. There must be a shared vision, and everyone must be involved in the process of reflection, evaluation, and decision-making.

Thornton et al. (2007) also highlighted team learning as a means to guide improvement. Organizations are described as a composition of interdependent components that function together towards predetermined goals with guidelines and strategies. Ongoing review and evaluation are necessary in systems thinking. These elements drive continuous improvement and discourage the possibility of repeating mistakes. Thornton et al. wrote that in complex organizations, nothing is ever influenced in one direction, which means that NCLB must not be able to construct educators if systematic systemic school improvement is expected. School leaders have to accept general directives of federal legislation but must also use program evaluations and new
accountability data to make decisions that assist in school improvement and help the schools to be engaged in ongoing learning and internal growth.

The relationship of systems thinking, program evaluation, and organizational learning all intersect in organizations that are engaged in deep learning and new ways of thinking. Each of these ideas can be utilized as means of sustaining school improvement. As stated by Fullan (2005), all stakeholders must be involved in the process of school improvement, including students but little has been done to act on this idea.

Middle School and High School Reform

Interviews, surveys, and observations have been conducted in a variety of population groups in order to identify the effects of school reform efforts; however, the voice of the students has been missing from the process. In one specific research project, by Bushaw (2007) middle school students were involved in a study that measured the success of school reform by seeking out their opinions on current school activities in their preparation for success in high school and college. Bushaw highlighted some high school reforms that were taking everyone in the right direction. The areas addressed were testing, the helpfulness of teachers, student relationships, homework, and how students were engaged in decision-making. Bushaw discovered that students want to graduate high school and go on to college. Still, according to the poll, what occurs in high school with the dropout rate and the lack of preparation for college demonstrated that something must be happening to prevent the students from reaching their goals. Bushaw highlighted this outdated view of the U.S. high school as the root cause for the disparity between student
goals and their actual achievement. This view is identified as the sort of select mission in which some students are purposely prepared for college and others are not.

Bushaw (2007) explored the feasibility of offering a challenging course of study for all students without intentionally or systematically failing some of them. The argument made for replacing the idea of preparing some students for college and others for work was to prepare everyone for meaningful post-secondary career opportunities according to their personal interests. The suggestion was to identify for the students particular interests such as working with their hands, working with people, or working in specific career interests. Bushaw challenged educators to discontinue the sorting of successful and unsuccessful high school students and to redirect their efforts toward preparing students for this new definition of college.

Bushaw (2007) said that in changing the focus to preparing all students for post-secondary careers, it is important to figure out how college is involved in this process. For educational institutions to identify their mission as preparing students for college is to ignore current outcomes. However, to rethink this mission in terms of career opportunity will heighten student success, which in turn will build successful educational programming. Exploring the ninth-grade high school program status, Bushaw described it as the time students begin to disengage and become at risk for dropping out. This grade was highlighted as having high failure rates, so school programming that helped students with the difficult transition from middle school to high school was emphasized. An issue in the 21st century is the financial burdens that prevent low income students from attending or finishing college. Bushaw emphasized that policymakers should consider
increased need-based funding like Pell grants, help students access low interest loans, and find ways to allow students to take college credits in high school to reduce the amount of time being in college and thus reducing costs.

*The Role of Technology in School Reform*

Henson and Steele (2007) demonstrated effective decision-making in a school system in South Dakota. There was a need for a choice to be made between building a new school and selecting much-needed resources for academic success. The previous school building in the school district had been condemned and there was no money to build a new building. A collaborative effort with all stakeholders was formed to obtain a laptop for every student by tying together resources between the state of South Dakota and the school districts.

This process was initiated by the governor of the state. A clear timeline with all the steps of the establishment of a systemic reform plan was indicated in addition to a plan to sustain the progress. The initiative was divided into three areas: starting strong, finishing strong, and staying strong. The goal by 2010 was for South Dakota to be the first in the nation in the percentage of students going to college, technical school, or dance training. This goal highlighted the desire to go beyond standardized testing goals and to build a deeper desire to impact the lives of the students into daily practices (Henson & Steele, 2007).

The achievement of these goals included ongoing professional development involving preparation for goal achievement (Henson & Steele, 2007). Many strategies were developed and executed in order to communicate best practices and adequately
prepare all stakeholders to implement them. Among the most highlighted effective methods was one in which certain staff were trained to train others in specific best practice methods. Another key element of this training was for teachers to attend technology academies in the summer months in order to have the skills sets and the knowledge base to use the laptop computers effectively. Many of the ideas expressed by Fullan (2005) in Henson and Steele’s article were put into practice in the school system and South Dakota. The process of planning, coordination, and teamwork along with a one year timeline provided a model for applying effective school reform models. Also provided was a model for how school systems can take problematic situations and turn them in to effective initiatives for school reform.

This particular school system can be used as an example for educational leaders in many ways. First, it took one person to initiate action, which happened to be the governor, but the action of any person of influence can be instrumental in school reform and student academic achievement. Collins (2005) pointed out that technology should be used in a way that accelerates the mission. This school used technology for that reason, and thus was effective in its accomplishment. The focus was on student academic achievement, rather than the building in which the students were being educated. Not only was their process for student academic achievement effective for that particular year, but it was also effective for subsequent years of lifelong learning.

*Technology and Low Socioeconomic Areas*

Thomas (2007) demonstrated the need for all students to be well educated in technology to be productive citizens one day. Students from low socioeconomic levels
often have limited access to technology, not only contributing to the overall achievement gap but also to the lack of opportunity gap in the workforce. Thomas also mentioned various industries that require owners and employees to have working knowledge in many types of technology including agriculture, newspapers, communication, trucking, and other industries. Thus, schools are challenged with obtaining technology education by providing hands-on practice to close the achievement gap for all students.

Thomas (2007) also emphasized the need to teach technology effectively and use it is an important life skill. A key component of staff development is using technology to integrate all curricula and to do so by exercising the whole learning process and regular teaching pedagogy. Technology must be used as a means in school reform efforts to close the achievement gap and ensure students are prepared for the future job market. This issue paints a new perspective on the need to involve technology in school reform efforts. Some schools have done this by focusing on specific areas of specialization for particular age groups. Others have been designed specifically with technology specialization in mind.

School Specialization

Merrifield (2005) explored the areas and impacts of specialization in a competitive education industry. The purpose of the school choice movement is to create competition and to allow the opportunity for areas of specialization to flourish. The thinking behind this was that students with specific areas of interest and giftedness would be attracted to programs with those specializations. In this case, they would not have to go to the neighborhood school but would be able to choose which school best fit their
needs, one advantage of which would be the raising of their achievement levels (Merrifield). Another advantage of the movement would be the opportunity to create more learners with a specific knowledge base and a given area of their interest and thus impact positively the market place for that area (Merrifield). An example of this concentration would be schools that are specialized in arts training that produce actors, dancers, or specialists in other forms of art (Merrifield). Another would be specialized science programming in which students become experts in different fields of science and become chemists or scientists in various areas of need. In some situations, specialized schooling is strictly geared for certain populations with specific needs who need a targeted curriculum to meet those needs in order to help them achieve the same opportunities that students of higher social economic levels usually have (Merrifield).

Merrifield claimed that the main purpose of the school choice movement has been lost due to the federal mandates of NCLB and that there is a need to get back to the original concept.

Merrifield (2005) predicted that competition will continue to produce specialization if federal mandates allow competition to proceed in the right way. He believed that it should be recognized that school programming and specializations in K-12 programs should be designed to meet diverse student needs. University settings provide options, and according to Merrifield, there should be more specialization options in K-12 programs as well. Failure to develop and allow more specialization within K-12 programs is failure to institute the true purpose of the parental choice school options in the school reform effort. Merrifield argued that what schools do and how they do it could
vary in an infinite number of ways just as fast as children and technology change. Specialization would occur by focusing on specific subject areas like math or business but would also mean embracing different ways of teaching and learning.

The Role of Child and Adolescent Development in School Reform

Researchers advocated a shift to a focus on child and adolescent development in our schools. Concerns have been addressed by a number of them about the failure of educators to more readily implement the knowledge that the expression of intelligence is interactive and developmental (Comer, 2005). A claim has been made that the underlying reason for not focusing on child and adolescent development is that many still believe that performance in school and in life is determined by one's genetics and a fixed intelligence. Comer blamed these inflexible ideas on economic, political, and social forces that impede the results regarding the expression and development of intelligence.

Comer (2005) expressed discontent for the educational system of the last two decades and claimed that educators have focused wrongly on the areas of curriculum, instruction, assessment, and modes of delivery when the focus should have been on child and adolescent development. He declared that when child development has been addressed, it has been done incorrectly, because the focus has been on the problem behavior of the student instead of the real issues that contribute to the cause of the problems. Comer stated that the capacity to learn is developmental and the focus should be on how to create a culture that promotes positive development. He identified six critical developmental pathways that children develop as they interact and learn in their school environment. These developmental pathways are physical development,
social/interactive, psycho-emotional, ethical, and cognitive-intellectual development. All of these pathways can be widened by creating a positive school culture. Kunkel (2007) demonstrated a strong belief in school culture in the early 1980’s by leaving a teaching position in the public school system and creating a new school aligned that represented her belief system.

**Emotional and Social Intelligence and School Leadership**

The changing society has caused the need for school leaders in the 21st century to develop an array of competencies and to understand emotional and social intelligence and the development of a positive school climate and culture. The ability to exhibit skillfulness in these areas has been known to separate the good leaders from the great ones (Goleman, 2005). These discoveries have caused many organizations to incorporate the ideas into preparation programs for current and aspiring school leaders.

**Leadership and School Climate**

Kelley et al. (2005) explored the relationships between the measures of both leadership and school climate. The background of various studies relating to leadership styles and school climate issues were highlighted. Specific variables researched were student academic achievement, leadership, school climate, teacher effectiveness and perceptions of teachers and leaders. Various assessments for each area were utilized to assess different components of schools and leadership styles that impact school climate. Perceptions of the teachers were compared to the answers given by the principals for self-evaluation on leadership style. The relationships among the variables were examined.

Communication, decision-making, innovation, advocacy, evaluation, and staff
development were critically assessed by teachers and principals.

Kelly et al. (2005) emphasized power, authority, and the position of the principal to impact the climate of the school. The authors stated that many principals lacked the feedback to improve the school because of the climate that has been created or because of the immaturity or other situational characteristics of the followers. There is a need for principals to be highly skilled in building a strong cohesive team whose members trust one another and communicates openly. Principals must be able to receive critical information to avoid making bad decisions and to have a handle on the perceptions of all of those within the organization. Kelley et al. argued that leaders should be aware of the needs of their constituents in creating a climate in which all stakeholders have embraced the vision and are empowered to act in ways that create and sustain an effective school climate. The ability to develop such a climate has become an integral leadership skill in the 21st century. However, much more has been learned over the past two centuries from school reform efforts that can be utilized to prepare future leaders.

Chaltain (2007) emphasized the need to understand the balance among freedom, security, and order and specified that educators can accomplish this through the understanding of creating shared cultures that unify diverse groups. The key to accomplishing this is leadership. He developed a five-part framework for school leadership to assist educators in the process of creating conditions that balance both freedom and order in schools. The framework emphasized the principles and process of (a) reflection, (b) connection, (c) creativity (d) people development, and (e) developing a shared vision. The process of developing an inspirational school climate should have the
involvement of all stakeholders within each of these elements.

Cautioning against the tendency to view it as a distraction from educational goals, Beghetto (2007) also defended the idea of utilizing creativity in schools in order to cultivate new and unique ideas. He acknowledged educator dilemmas when making decisions about the use of instructional time, but claimed the solution was an effective implementation of ideational code-switching, the ability to move interchangeably between personally meaningful ideas and to exercise creativity constraints toward a specific outcome on a given task. This is also highlighted in the ability to exercise both intrapersonal and interpersonal creative expression. Beghetto emphasized Sternberg’s (2004) argument that successful creators are able to balance their ability to generate ideas with their ability to select, test, and consider the implications of ideas, and then communicate the value of the idea to others. Beghetto stated that in order to implement ideation code-switching successfully, key components of successful teaching and learning must be implemented, which are to encourage student ideas, and listen and give ongoing formal feedback.

**Leadership and School Culture**

Comer (2005) stated that children walk on six critical developmental pathways as they interact and learn in their school environment and as they observe and participate in the culture of the environment. He said that students begin to internalize their surroundings through relationships and a sense of belonging, so a good school culture provides children with confidence and motivation to learn. Comer reminded educators that many children do not naturally value academic learning. It must be developed within
the learning environment. Many school leaders do not realize that school culture must be created and must be their primary responsibility, thus Comer developed a framework to assist school leaders with building a positive school culture. An important part of this structure is a focus on planned strategies and nurtured relationships. When implemented in a given educational setting, the results of Comer’s framework were both academic and behavioral successes. Among one of the key issues addressed is the issue of teacher preparation.

**Social-Emotional Component of Leadership in Developing School Culture**

Goleman (2004) advocated for the need to teach emotional intelligence and social intelligence. Elksnin and Elksnin (2004) added to this claim with a rationale for teaching social emotional skills. Social-emotional problems for children and adolescents with learning disabilities have increased over the last three decades and are a point of contention for school leaders. These educators have to be mindful of these issues and to have a plan to meet the needs of the students. Elksnin and Elksnin contended that there are a multitude of academic interventions that have impacted academic achievement positively for students with learning disabilities, but too few validated social emotional interventions. To address the needed interventions adequately, a more complete understanding of the causes of social-emotional problems must exist. The authors expressed concern about the way policy informs practice to ensure that children and adolescents with learning disabilities receive the social-emotional skills intervention as they require. School leaders must be able to take appropriate action to meet student needs
across all spectrums regardless of the policy constraints; they must find a way to inform policy of the best practices.

Elias (2004) stated that social-emotional learning has a great deal to contribute to theory and practice in the area of learning disabilities. Emphasizing that most students with learning disabilities also have difficulty with relationships and with social situations, he identified three key skill areas that are needed and called attention to the fact that social-emotional learning is the main source of these difficulties. These three key skill areas are (a) recognizing emotions in self and others, (b) regulating and managing strong emotions (both positive and negative) and, (c) recognizing strengths and areas of need. Elias also provided examples of comprehensive intervention that are linked to academic and social-emotional learning.

Elias (2004) wrote about the argument of not pulling children out of class for intervention because it reduces opportunities for natural peer interaction, develops a social stigma, and may cause educators to lower their expectations and lose confidence in the student’s abilities. Elias also expressed concern about subliminal messages students receive when they are in remedial settings, among which are that may never find their way out of the settings, maintaining that the more effective way to address intervention is through successful inclusion, described as relying on the ability to implement positive peer modeling, which occurs when there is a cycle of instruction, rehearsal in practice, and immediate and specific feedback. Elias defended a total of 15 skills involved in social-emotional learning and connections with disabilities, listing essential principles that complement the list of skills to guide the intervention. These principles state that (a)
caring relationships are the foundation of all learning, (b) emotions affect how and what we learn, and (c) goal setting and problem solving provide focused direction and energy for learning. Elias stated that in education we must direct our attention to skill development as well as the creation of a classroom climate that will allow for this development and reflect individual student strengths.

The Role of Poverty in Schools in the 21st Century

The Children's Defense Fund (Reid, 2006) released statistics indicating that since 2000, 1.3 million more children have become victims of poverty. Edelman (2007) stated that the organization illustrated an urgent crisis in the nation at the intersection of race and poverty that puts black boys at a one in three lifetime risk of going to jail. The report estimated that tens of thousands of children and teens are pulled into this pipeline, and so it called for hard work and persistence to build a transforming movement that completes the work of the civil rights movement to end the poor conditions of children and families living in poverty. The report emphasized that the U.S. does not have a level playing field for all children. Moreover, contributing factors to the pipeline in the education system are the lack of early childhood education and early detection for circumstances that impede learning, zero tolerance discipline policies, and failing schools. Zero tolerance policies expose children too early to criminal institutions and street behaviors such as drugs and violence when the school does not address issues within the school and community.

Edelman (2007) also revealed that the nation is spending three times more per prisoner than per public-school student. Edelman argued that after Brown v. Board of Education and the integration of schools, many were not prepared to walk through the
doors of opportunity and were separated by poverty level. She further contended that some people were distracted by materialism and forgot the purpose of the civil rights movement in which the basic teaching for the purpose of education which is to give back and make the world better. Edelman’s report also stated that 86% of black fourth grade children cannot read. Being able to read was described as a catalyst for reversing racial progress and social death. Edelman argued that the United States has the wrong priorities and that dollars should be spent educating students to eradicate poverty in our own country and around the globe as opposed to addressing issues of war.

Payne (2005) emphasized that poverty is a critical element of diversity and argued for the need for educators to operate with the tool box of strategies. Payne defined poverty as the extent to which an individual does without resources. Educators usually assume that poverty is about financial hardship, so Payne highlighted eight resources that influence poverty including the following: (a) financial, (b) emotional, (c) mental, (d) spiritual, (e) physical, (f) support systems, (g) relationships/role models, and (h) knowledge of hidden social class rules. The presence or absence of these resources determines the impact of poverty.

Pellino (2006) stated that teachers have the power to make a difference in the lives of children regardless of the level of poverty. Children living in poverty are more likely to attend schools with fewer resources, but if the child is strong in other areas the impact of financial poverty may be decreased. If a child is stronger emotionally, spiritually, and physically, there may be a teacher that is able to motivate the student and minimize the effects of poverty on his or her education. Cooter (2006), Payne (2005), and
Tableman (2004) each developed strategies that educators can use when working with poor students and their families, focusing on raising self-esteem and practical skill development.

Ayers & Klonsky (2006) emphasized the need for a caring school culture that meets holistic needs of students and the need for teachers with an aspiration to use their hearts and minds in the service of student learning. Ayers & Klonsky identified a rationale of students for a high drop out rate was best expressed by one student when he stated “no adult cared if I stayed.”

**Common Challenges of Inner-City Schools**

An investigation of the challenges in inner-city schools targeted academic achievement, behavior problems, low teacher satisfaction, financial problems, parent involvement, and the lack of student and family motivation (Szente, 2006). Kozol (2006) emphasized the low expectations of educators, rundown facilities, and inequality in school programming and learning opportunities. Payne (2005) illustrated the specialized needs of children and families living in poverty that make up a large portion of inner-city schools and in some cases more than 90% of the school population. Szente reported recent statistics from the National Center of Education Statistics that urban students are twice as likely to live in poverty as students in the suburbs and are more likely to receive free or reduced lunch prices. In addition, urban students are more likely to be subject to health problems and physical danger as well as to engage in risk-taking behavior. Drug and alcohol abuse, high crime rates, incessant violence, and extreme poverty are just a few of the negative environmental factors that create even more challenging educational
circumstances for inner-city schools and their surrounding communities (Dandridge, Edwards, & Pleasants 2000). Even though it is clear that inner-city schools have desperate needs, evidence indicates states and districts are frequently slow to aggressively improve or overhaul failing schools (American Federation of Teachers, 1999; Brady, 2003).

According to the Education Commission of the States (2003), urban schools tend to perform below national testing averages and are more likely to end up in the category of failing schools. Szente argued that the realities of poverty and lack of resources prevent most urban children from reaching their full potential. More investigation is needed in the area of poverty and its impact on education and what role education can play to combat poverty in the 21st century.

Murray and Harlin (2007) conducted a study to identify the strategies that brought about the success of an urban magnet laboratory school. In this school, 50% of the students enrolled were eligible for free and reduced lunch programs. This school was balanced racially and had a variety of achievement levels. Its success was questioned because it did not contain real inner-city poor children but in fact the school shared comparable demographics to that of other public schools. Murray and Harlin argued that the difference was not in whom the students were but how they were treated. Students were able to select academic topics to study and assignments to complete. They were responsible for their own behaviors. Obtaining experienced effective teachers and their participation in ongoing development were a key strategy to the success of the program. Among some of the major differences identified in the teaching staff compared to others
was how they saw themselves as agents of change and people who can make a difference in the lives of students. Among some of the other characteristics deemed integral to the school’s success were key partnerships in the community and a quality tutoring program. Hollister (2006) highlighted the importance of community and its ability to bring profound and powerful changes if it is united and willing to implement inspired ideas that others may consider outrageous. Carter and Friesen (2005) emphasized partnerships as a way to provide services and education that build capacity among inner city youth. The partnerships identified combine skills sets that produce research to serve the community in the development of needed policies and programs.

School Reform Efforts Designed to Combat Urban Issues

Booher-Jennings (2006) contended that many education reform efforts have been characterized as faddish and presented as silver bullet approaches. Too often, as in NCLB they have brought about unintended consequences for all stakeholders. Among these are actions that include going after percentage goals for adequate yearly progress by ignoring the needs of the lowest achieving students in focusing only on students that are on the border of passing the achievement testing. Booher-Jennings encouraged teachers to teach all students regardless of the school’s bottom line. Kozol (2006) argued that regardless of what many believe to be miraculous attempts to integrate students to provide equal education opportunities, black parents still flock to suburban schools because they realize an extreme disparity exists in inner-city schools regardless of the nation's attempt to mask it. Attempts to integrate students have failed due to our ravaged national history,
extremes of inequality, and over a century of severe segregation, demonstrated by high
dropout rates and achievement gaps.

National Concern for Leaders Serving High Need Areas

Ambach (2006) noted that 200 of the largest districts enroll about 40 percent of
the nation’s students and nearly 75% of those students live in poverty. From this statistic,
a deduction was made that if the leaders in these areas are given what they need in terms
of training and resources, then efforts for reform would be more successful. Ambach’s
argument targeted resources towards an area that has the greatest potential to affect
schools. The most impoverished areas were characterized as a group of high-value. This
area is described as the Fortune 300 in efforts to compare this significant group of leaders
to Fortune 500 companies, including superintendents of the 200 largest school districts,
50 chief state school officers, and 50 other national education leaders. This comparison is
drawn to illustrate the direction in which leadership preparation needs to go if we plan to
make significant strides for the future. Highlighted examples of what must be done in
education to provide advanced leadership training to top school executives in these areas
are the investment that Fortune 500 companies make in executive learning as well as the
military commitment to ongoing career development for its leaders.

Ambach (2006) emphasized several components that should be a part of the
educational program for the Fortune 300 leaders. To prepare these leaders, there is a need
to study the best practices from various industries in and outside of education, as
emphasized by Covey (2004). There is also a need to involve leaders in opportunities to
reflect on lessons learned and to have the opportunity to connect with others who have
served in similar capacities. There could even possibly be a formal mentoring program in which the new leaders are mentored by those who have gone before. Another key component that could be viewed as unrelated is the emphasis on encouraging leaders to pursue intellectual interests in the sciences, arts, or humanities in order to engage them in the process of ongoing learning opportunities, and to avoid the potential of becoming narrow-minded. The main goal of the leadership development program is on the need to find a way to learn what works, have the ability to implement it, and then most importantly be able to sustain it. Ambach cautioned against becoming frustrated with the demands of addressing widespread needs and allowing those to shift the focus from those serving in areas that have the most needs and are most crucial to making effective progress in school reform efforts. This can be avoided by strategically designing a program, offered in university settings or other national forums, that meets the needs of these leaders and can be sustained for the successors of these leaders (Ambach).

The 21st century leaders face many challenges. Fortunately, much has been studied and revealed about what is effective and what is not. The key to lack of success in a leadership role is in having knowledge about challenging areas, having access to them, and having experience in making decisions related to them. Although much knowledge has been gained, there is still much to know. Some researchers question whether or not one is effective if they seem to know everything, or if they're more effective if they reveal that they do not (Ambach, 2006).
Charter Schools

Manno, Finn, and Vanourek (2002) described charter schools as the liveliest reform in American education and a part of a big idea of public education. They are defined as an independent public school of choice, freed from rules but accountable for results. Charter schools possess some similarities to district public schools with some of the prized attributes of private schools and crucial differences (Manno, Finn, and Vanourek.) A charter school is open to all who wish to attend it (i.e., without regard to race, religion, or academic ability), is paid for with tax dollars (no tuition charges), and is accountable for its results to an authoritative public body (such as a school board, state agency, or public university) as well as to those who enroll and teach in it. Palmer and Gau (2005) argue that the success of the charter school movement depends on the effectiveness of authorizers.

The differences according to Manno, Finn, and Vanourek.(2002) are they can be created by almost anyone; they are exempt from most state and local regulations and are essentially autonomous in their operations; they are attended by youngsters whose families choose them and staffed by educators who choose to work in them; and they are liable to be closed by the public authority that authorizes them if they fail to produce satisfactory results. According to Williams (2007) some charter schools are founded and led by teachers. In New York City Williams highlighted two schools operated by the United Federation of Teachers governed by a board of trustees made up of teachers, community members, and parents. According to Nathan (1998), even Rosa Parks, a founder and the civil rights movement applied to start a charter school.
A study Fox (2002) conducted described the origination of the charter school movement in the state of Ohio. In the fall 1997, Ohio adopted a plan for the implementation of charter schools in its eight largest urban school districts in fall 1998. Subsequent legislation allowed the establishment of charter schools in any of Ohio's 21 large urban districts or in any school district declared by the state board of education to be in a situation of academic emergency.

Charter schools resemble private schools in two important particulars. First, they are independent. Although answerable to outside authorities for their results, they are free to produce those results as they think best. They are self-governing institutions with wide-ranging control over their own curriculum, instruction, staffing, budget, internal organization, and much more. The second similarity is that nearly all of them are schools of choice. Nobody is assigned against his or her will to attend (or teach in) a charter school. Charters are, quite simply, redefining and reinventing what is meant by public education. Traditionally, Americans have defined a public school as any school run by the government, managed by a superintendent and school board, staffed by public employees, and operated within a public-sector bureaucracy. In this familiar sense, a public school is not very different from a public library, a public park, or a public housing project (Manno, Finn, and Vanourek, 2002.)

The U.S. Department of Education (2008) reported that 4,000 charter schools educate more than a million students in 40 states and Washington, D.C. The department reported that long waiting lists and admission lotteries are testaments to their growing needs and that President George W. Bush and Secretary Spellings were committed to
seeing charter schools opened in every state. Since taking office, President Bush invested more than $1.4 billion in the Charter Schools Program and more than $262 million on charter school facilities to reduce waiting lists. The president's 2008 budget provides $214.8 million to continue the Charter School Program, including $200 million to help create new charter schools and an additional $14.8 million in matching funds to states that offer per-pupil financial assistance so that charter schools can obtain facilities (U.S. Department of Education, 2008). Current president, Barack Obama has also made known his support and plans to support the ongoing mission of charter schools (U.S. Department of Education, 2009). According to Stuart Wells (2002), charter school reform has been embraced by policy makers on both sides of the political aisle and by diverse groups of activists as one of the most promising solutions to the problems of public education.

Christensen, Aaron, and Clark (2005) argued that problems of public schools are identified by most people, but that they are not able to change, and that charter schools seem like a good start due to new educational models that will allow more people to consume effective educational services in increasingly convenient settings and at a much lower cost to the taxpayer. Manno, Finn, Bierlein, and Vanourek (2002) argue that much is to be learned from charter schools and policy makers, professionals, taxpayers, parents, and others committed to revitalizing public education should welcome charter schools as a giant step toward the reinvention of public education in America.

Morley (2006) also argued that charter schools are becoming an increasingly important part of America's primary and secondary education system. Stewart (2002) argued that charter schools have created more opportunities and that charter school’s are...
designed to allow freedom from the constraints imposed by local school districts, charter schools have greater flexibility to select specific models of operation. Steward emphasized that flexibility provides an opportunity to design, implement, demonstrate, evaluate, disseminate, and extend specific educational models. According to Heaggans (2006), charter schools have the potential of reinventing education through curricular initiatives. Premack (2002) argued that charter schools in California have provided a diverse collection of educational programming. Raywid (2002) highlighted that public interests are being addressed more readily through charter schools. Coulson (2005) highlighted the number and variety of school choice proposals that continue to grow and that education markets have been argued more efficient, academically effective, and responsive to the demands of families than state-run school monopolies because of this growth in school choice. Arne Duncan (2006) identified this school reform effort as an effort to make every child in every school a winner.

Legislators have authorized grant programs to assist with start up costs for charter schools and facilities as a way to allow public schools to restructure themselves as charter schools under NCLB. There is much debate about whether or not schools should be nonprofit or for-profit entities, but at the present time both types exist. Charter school laws differ from state to state. The key characteristic of a charter school is that it obtains public funding yet has private management and thus contains elements of both public and private schools. Charter schools do not charge tuition and receive all funding from state and local governments. Defining potential operators as any members of the local community, state laws place little restriction on who can start a charter school.
Enrollment in a charter school is optional but the schools rarely have geographic boundaries in which students can attend (Morley, 2006). If a charter school has more students who desire to attend than open seats, then it admits students by lottery due to the public-school open enrollment policies. Prior to opening, there must be approval from an authorized agency. The level of scrutiny applied to charter school applications varies from state to state. Among the types of charter schools within the states are new startup schools or conversion charter schools. New startup charter schools can be initiated by individual founders, partnering groups, or organizations. Conversion charter schools are schools that were once public schools. Both types of schools can be for profit or nonprofit organizations. Nonprofits have dominated the industry but for-profits do maintain a presence. Charter schools are non-sectarian and must comply with antidiscrimination, auditing, safety and health, and other applicable state and federal laws (Morley).

Many charter schools utilize such nontraditional facilities as nonschool buildings. According to Wohlstetter & Smith (2006), partnerships expose students to opportunities that school cannot. They gave an example of a charter school housed in one church that educates students in grades 9-12 in which students learn about art, philosophy, literature, and cultural studies as part of integrated thematic units with an approach that stresses hands-on application of computer technology, Internet research, work study, and community service. Another charter school housed in a church in New York is highlighted by Massey, Szente, and Stewart (2005) as one that meets the needs of parents, teachers and community by educating 105 inner-city children.
Morley (2006) noted that charter schools determine their own educational objectives and basic curricula but those are approved by chartering agencies. Some charters are designed to target specific population needs and others are specialized educational innovations. Charter schools are regulated by the monitoring of student academic achievement outcomes. Government agencies do not interfere with operational decisions of charter schools as long as they can demonstrate success. When charter schools fail, chartering agencies respond by closing the schools.

Saiger (2005) argued that waves of school reform have ushered in because the most troubled school districts within the last few decades have lacked accountability and incentives for improvement. Manna, and Witte (2006) analyzed flexibility and accountability in the nation's education reform debates and how these values were considered in addition to developing state charter school laws. The outcome of the analysis suggested that elected officials who write charter school laws be mindful that some of the issues centered on accountability and flexibility may present challenging conditions for charter school operators in the attempts to support good public policy. A suggestion was made to allow for the revision of charter school laws incrementally based upon the experience or non-experience of some states and the ability to pass public scrutiny. Also, it was found that the number of charter schools within the state were due to the political context within a given state. Furthermore, lawmakers are cautioned against low profile interest groups and reminded to remain non-partisan.

Heaggans (2006) conducted a study to determine the impact charter schools have on urban youth. The argument was made that charter schools have the potential to
reinvent education through curricular initiatives and stronger educational outcome because of the lack of bureaucracy. A critical element highlighted in the study was the promotion of inequality in the wake of the 50th anniversary of Brown v. Board of Education, a Supreme Court case that ruled segregation was unconstitutional and was prohibited in public schools by the United States Constitution (Hirsch et al., 2002). The Heaggans study emphasized that the separate-but-equal doctrine that has manifested itself in charter schools but explored the argument of Finn, Manno, and Vanourek (2004) that indicated half of charter schools are in urban districts having 40 percent of students at risk for dropping out of school.

The Heaggans (2006) study also explored the U.S. Department of Education's fourth year National Study of Charter Schools (Nelson, 2000) which released outcomes that a higher percent of students enrolled in charter schools than in public schools were eligible for free or reduced lunch and were from minority groups. Segregation and inequalities have been revisited because of recent arguments that the charter school movement is allowing segregated schools and is out of compliance with Brown v. Board of Education. The results indicate that the largest population in most urban communities is African-American and that 40% of charter schools have been developed and established in urban communities. Segregation is not a goal of the charter school movement but rather has been a result of meeting the needs of underserved populations. At this point, the charter schools have the support of the same people and legislation that were supportive of the establishment of separate but equal and the Brown v. Board of
Education case because of the ability to address the achievement gap in urban areas of poverty in which previous efforts have made little headway.

Harrison (2005) criticized the government's job in providing education, stating that the reason for the failure was a political focus benefiting teachers’ unions and public interest groups rather than a true public interest which is to provide children with a quality education. Among some of the flaws emphasized were the lack of information, ability to satisfy customers, control costs, innovate, and the ability to ensure quality teaching. These governmental behaviors have caused the reduction of efficiency and have harmed those living in poverty. In efforts to resolve these problems, choice and competition in schools have been introduced to the education market to increase productivity and customer satisfaction while having more control over quality teaching and innovation as the needs of children living in poverty are met. Because decisions are made politically and true educational issues are ignored, Harrison argued that government run schools are poorly managed internally. He defended the market system because of the decision-making methods used in the accountability structure. In this system, success is evaluated on the basis of student academic achievement results and the ability to satisfy customers. Harrison contended that no adjustments in the public system will provide a solution except that of school choice options. According to Finn and Kanstoroom (2002), charter schools present innovation minded principles and utilize professional staffs in ways that traditional schools can not.
Giftedness and Leadership

Sternberg (2005) argued that people obtain leadership roles, not by demonstrating high scores on tests of knowledge, but by leading with their ideas. He showed that leadership involves both skills and attitudes. Gifted leaders are currently skillful in making and implementing decisions that represent creative, intelligent, and wise judgments, and they excel in (a) creative skills and attitudes to generate fresh and good ideas for leadership, (b) analytical intellectual skills and attitudes to decide whether they are good ideas, (c) practical intellectual skills and attitudes to implement the ideas, (d) persuasive skills to convince others to value the ideas, and (e) wisdom related skills and attitudes to assess the long and short term impact of these ideas on the individuals and institutions as well as themselves. Sternberg contended that the United States is too individualistic and risks developing successive generations of self-interested young and that will continue to work against the self-interest of the nation. Sternberg claimed that the nation’s interest should be in developing leaders that embody three characteristics: intelligence, creativity, and wisdom.

WICS Model of Giftedness and Leadership

To address the need of developing leaders who embody characteristics of intelligence, creativity, and wisdom, Sternberg (2005) developed a model that is referred to as WICS. The acronym represents wisdom, intelligence, and creativity synthesized, and is so ordered to make it pronounceable. Sternberg argued that these elements are a form of developing competency and expertise that can be utilized in making leadership decisions but depend largely on the environment and its influences. This model can be
used in the development of wisdom for leaders in which they can exercise a higher form of intelligence by making a difference in the world.

*Thinking Styles and Scientific Giftedness*

Park, Park, and Choe (2005) examined thinking styles and scientific giftedness to determine the relationship between the two. The study consisted of a thinking style inventory and a scientific giftedness inventory, resulting in an argument for development and implementation of school gifted programs to be based on their participants’ psychological characteristics and intellectual abilities. The study highlighted Sternberg's 13 thinking styles that fall within 5 dimensions and the researchers proposed that thinking styles and learning approaches are related. According to the research, the more creativity generating and complex thinking styles are related to holistic modes of thinking. The more simplistic thinking styles are related to analytical modes of thinking, which has implications for science instruction and for gifted curriculum. Among some of the issues explored for gifted learners are the implications involving thinking styles. An example is one in which teachers tend to give better grades to those who have thinking styles that match their own. This finding may also impact the interactions school leaders have with stakeholders.

*Leaders as Critical, Successfully Intelligent, and Wise Thinkers*

Sternberg (2004) demonstrated the need for critical, intelligent, and wise thinkers. Sternberg attempted to predict the future of the United States based upon the ability to accomplish this task. In exploring this idea, Sternberg found four possible futures for America that can be determined by the educational system and argued for the need to be
successful wise critical thinkers. Sternberg argued that critical thinking requires skillful
analysis and evaluation, emphasizing the importance of being able to distinguish between
true and false, credible and incredible, rational and irrational, and the ability to determine
the correct argument for a relevant conclusion. All of these thinking skills are necessary
in order to be able to function beyond merely surviving in society. Without these skills,
we are ill-equipped for leadership and lack problem-solving skills. Without these
abilities, the school environment will likely be dysfunctional and cycle through confusion
and disarray.

Sternberg (2004) described the higher capacity of deep thinkers with creative
skills as those with the ability to (a) generate new ideas, (b) analyze the ideas
(determining the good ideas from bad), (c) exhibit practical knowledge in knowing how
to implement the ideas, and (d) persuade others to value the ideas. This ability has been
described as thinking outside of the box. Sternberg also emphasized the need to have the
ability to create and sell ideas. He cautioned against the assumption that ideas will sell
themselves and explained that new or different ideas are usually viewed with suspicion
and distrust, emphasizing that people are comfortable with current views of thinking and
become uncomfortable with change. Sternberg cautioned educators against the narrow-
mindedness that can be found in those who have achieved an expert level of intelligence.
Without a commitment to learning as a lifelong process, knowledge can both facilitate
and impede creativity. If the latter occurs, there is a loss of achieving the highest potential
that knowledge can offer.
Resilience was also emphasized by Sternberg (2004). We must be able to identify and surmount obstacles and be able to encounter resistance, looking and listening beyond the opposition that attempts to prevent moving forward. Sternberg advised the development of awareness of well-known figures in society who have faced and overcome opposition, and creative people whose ideas were not welcomed but held to their beliefs. The key is to be prepared to confront similar obstacles and participate in brainstorming strategies that will develop this intelligence. To build upon this thought, Sternberg encouraged another way to develop successful thinkers by sensible risk taking, reiterating that creative people take sensible risks and produce ideas that others ultimately admire and respect. However, Sternberg stated that successful intelligence may not be enough given the many examples of society in which smart and educated people have lacked something fundamental from their intelligence.

Sternberg (2004) emphasized that we must teach that it is important and not just what one knows, but how one uses what one knows, and whether one uses it for good ends or bad. Sternberg argued against the tendency to only look out for one’s own interests but also but for the interests of others. Sternberg argued that knowledge only is insufficient in producing the future we hope to create. Knowledge does not guarantee satisfaction, happiness, or the behavior that looks beyond one's self interests. Wisdom is better attainment of goals, can be taught to others in all subjects, and provides a way to develop a more harmonious world. Sternberg provided examples of previous world dictators that were good critical thinkers, but lacked wisdom and ultimately caused insurmountable harm and death. Sternberg emphasized that students benefit from
learning to judge rightly, soundly, and justly on the behalf of their communities.

Sternberg believed that the greatest thinkers in history, and the truly great people were not necessarily those who distinguished themselves on tests but those who distinguished themselves for their creative and practical accomplishments that make a difference and shape the environments in which they lived.

*School Turnarounds*

Another strategy used by school reform experts is to study schools that have turned around from low performing to high-performing and to identify factors within the schools that caused the decline in the first place that might have hindered the transformation. Duke (2006) emphasized that the only stories that are told in school reform are the successful ones. He added that there is much to learn from the unsuccessful ones but, of course, those stories are never told. Duke highlighted the reliance upon the experience of veteran educators, and key components of the school improvement process. Among the most integral components discovered are 11 characteristics of successful school turnarounds that are important in training specialists. These characteristics are (a) prompt assistance for students having difficulties, (b) teacher collaboration, (c) the use of data in decision-making, (d) actions of leaders that set the tone for others, (e) organizational structure to support student academic achievement, (f) ongoing professional development to sustained results, (g) alignment among curriculum, instruction, and testing, (h) regular assessments that measure progress, (i) high expectations of students, (j) positive communication with parents
throughout the process of improvement, and (k) adjustments in the schedule to create more academic time.

Duke (2006) argued that more research is needed in six areas including the process of school decline, the nature of teamwork, the effectiveness of specific interventions, midcourse corrections, unanticipated consequences, and specific personnel issues. Many questions were posed around each of these general topics and it was suggested that further exploration is needed. Still, within the investigation, many successful strategies were discovered. One school was highlighted for the process of academic review and it was noted that there is a right and wrong way to conduct this process. The most highly productive way of implementing the academic review process was in roundtable meetings in which participants received student background information prior to the meeting. During the meeting, time was devoted to discussing how to make immediate instructional adjustments to support individual students and to assign responsibility for the interventions that involve reporting back on progress at the next roundtable. This is an example of effective teaming that has been instrumental in many school environments in the school improvement process. It is also been mentioned that in the road to recovery from low performance that there will be pitfalls in implementing change. Duke (2006) highlighted the research of Fullan (2005) in an effort to caution those involved in the school improvement process to expect that things will get worse before they get better. The key is to learn from those who have gone before us and to expect that there will be challenges at different stages of the improved day-to-day process. Schanin and Reiter (2007) highlighted a process of change in four stages: entry
into the process, implementation of the process, assimilation of the process, and assessment of the results of the change. It was argues that using this process empowered parents and teachers.

Description of Level 5 Leaders

Collins (2001) argued that level 5 leaders can be developed over time and could be discovered all around us; he illustrated the progression of a level 5 hierarchy of leadership. This hierarchy is based on different characteristics, competencies, and accomplishments at each level. Leaders at level 1 produce results and have good work habits. Level 2 leaders have a say in group projects as contributing team members. Level 3 leaders have demonstrated the ability to organize people and resources toward the accomplishment of a goal. Level 4 leaders have performed at higher levels than others and partnered in the accomplishment of overall visions and commitments. After successfully proceeding through all four levels, level 5 leaders build lasting greatness by obtaining both humility and the intense professional will to accomplish the mission of their organization. Collins emphasized that a leader does not necessarily need to master all 5 levels in sequence, but all level 5 leaders do successfully accomplish all that is demanded on the preceding levels.

Distinguishing Factors of Highly Successful School Principals

Gray and Streshly (2008) studied highly successful principals in order to identify certain characteristics and behaviors that cause schools to be very successful. This study built upon the research of Collins (2001) that sought to establish whether or not the qualities of CEOs in good-to-great companies were related to behaviors in highly
successful public school principals. The results of the study indicated leadership qualities exhibited by principals who have been very successful in increasing student academic achievement regardless of the obstacles they may have faced. The study also explored the similarities and differences between school principals and business leaders and identified universal leadership attributes applicable to the business and social sectors, both private and public. The outcomes of the study were designed for those who aspire to be successful school leaders while taking into consideration the needs of the 21st century.

Gray and Streshly (2008) discovered that successful school leaders exhibit a wide range of personalities that contain specific solid core leadership qualities and characteristics that attribute to the accomplishments of their schools. This qualitative study identified elements necessary to produce great schools and explored characteristics of the principals that can be correlated with long-term educational success. It also identified the absence of leadership characteristics that cause failure in the accomplishment of goals in low-performing schools of comparable demographics. The outcomes in the Gray and Streshly study revealed a close alignment of the results in the Collins (2001) study with one key distinction between CEOs and the highly successful school principal, which was that the highly successful school principal had the ability to build relationships among faculty. Chapter 5 will include recommendations for future research. One recommendation is to survey students to determine if the ability of school leaders to build relationships with students is a quality of a good leader. The other actions that were aligned with the outcomes of the Collins (2001) study of executives of Good-to-great Companies are as follows: (a) exhibited hedgehog concept, (b) confronted the
brutal facts, (c) had ambition for success of the school, (d) understood how to select people and put them in the right positions, (e) exuded a culture of discipline, (f) exhibited duality of professional will and personal humility, (g) had compelling modesty, and (h) had unwavering resolve.

The highly successful school principals exhibited the hedgehog concept in the Gray and Streshly (2008) study by being passionate about student academic achievement, being clear about the strengths and the purpose of the school, and by lining up behaviors to address this specific focus. These administrators exhibited the ability to confront the brutal facts by obtaining real data including the analysis of student academic achievement and demographics with a commitment to work through challenges regardless of the obstacles. Beatty (2007) described this process as the uneasy partnership of school improvement in school effectiveness. Petrides (2006) emphasized the need to build trust among others by taking the focus off of who is not performing and target the improvement process. Chaltain (2007) cautioned against the use of snapshots data and isolated parts of the system because deeper problems do not get resolved.

The principals demonstrated ambition for school success by encouraging professionalism and leadership among staff, developing school leadership successors, and putting the school before personal ambitions. They also exhibited the ability to understand how to select people and put them in the right positions because they had the latitude to hire and fire staff. These principals remained persistent in getting the right people even if they had to maintain less successful staff for a short period of time. The highly successful school principals exuded a culture of discipline without
micromanagement tactics by promoting teacher responsibility in focusing on student academic achievement. These administrators exhibited duality of professional will and personal humility because they were humble while being fearless and acted as buffers during times of conflict between the school and outside forces. The highly successful school principals had compelling modesty in giving others the credit for successes while taking the blame for failures. Finally, these principals had unwavering resolve by exhibiting relentlessness, aggressiveness, persuasion, and continuous involvement in the primary operations of the school.

The distinguishing factor in highly successful school principals in the Gray and Streshly (2008) study was the ability to build relationships with staff members. This trait is deemed necessary because a collaborative school environment requires teamwork and the development of professional learning communities. Effective communication is also a requirement of the school principal. Without effective communication and the ability to build and maintain positive relationships with stakeholders, the results indicate that there is a likelihood of failure in accomplishing school goals.

*Ongoing Exposure to Teaching*

For an administrator, Culross (2004) argued for the necessity of continuing the practice of teaching as a priority regardless of the demands that other roles in administration may bring over a school year. Culross emphasized that teaching helps measure knowledge and skills, and allows for better decision making due to ongoing hands-on experience.
Responsibilities of School Leadership

Marzano, Waters, and McNulty (2005) identified 21 responsibilities of school leaders based upon the correlations they have with student academic achievement. The 21 categories of behaviors highlighted were referred to as responsibilities based upon the examination of 69 studies in a meta-analysis. The outcome of the study indicated that the behaviors had a significant relationship with student academic achievement and were described as behaviors of school leadership that work. These 21 behaviors are identified as (a) affirmation, (b) change agent, (c) contingent awards, (d) communication, (e) culture, (f) discipline, (g) flexibility, (h) focus, (i) ideals/beliefs, (j) input, (k) intellectual stimulation, (l) involvement in curriculum, instruction, and assessment, (m) knowledge of curriculum, instruction, and assessment, (n) monitoring/evaluating, (o) optimizer, (p) order, (q) outreach, (r) relationships, (s) resources, (t) situational awareness, and (u) visibility.

All of the 21 responsibilities were found to have a significant relationship with student academic achievement. The outcomes for Marzano et al. (2005) were also aligned with the description of the characteristics of successful CEOs of good-to-great companies in the Collins (2001) study and highly successful principals of good-to-great schools in the Gray and Streshly (2008) study, but are explained in different terms or categorized as a single behavior, whereas in the good-to-great studies they would be deemed as sub behaviors within a larger characteristic. For example, Marzano et al. identified affirmation as a responsibility in which the school principal recognizes and celebrates accomplishments while acknowledging failures. This characteristic is also present in both
good-to-great studies but is described in different terms. In the good-to-great studies, affirmation is described as compelling modesty which is the ability to assign credit for successes to others and take personal blame for failures. The element of the compelling modesty of the level 5 leader description in the good-to-great studies is that leaders affirm others by giving them credit for successes while taking the blame for failure.

Among some of the differences in the Marzano et al. (2005) results from Collins (2001) and Gray and Streshly (2008) is the responsibility to (a) recognize and reward individual accomplishments through the responsibility of contingent rewards, (b) establish a set of operating procedures and routines known as the order responsibility, and (c) to provide teachers with materials and professional development necessary for the successful execution of their jobs known as the resource responsibility. The outcomes of the studies highlighted have been critically assessed to determine the variety of research perspectives and outcomes in the areas of school leadership, charter schools, inner-city issues, school reform efforts, and needs for quality education in the 21st century. Each component of the literature review is essential to understanding the many different facets of the background of this study and the critical aspects that affect the outcome of the results.

Summary and Conclusion

The need to identify characteristics for urban charter school leaders in the 21st century is well documented. The literature explores the (a) needs of the 21st century, (b) progress and history of school reform efforts that impact the current state of education, (c) unique issues of urban schools, (d) charter schools, and (d) leadership characteristics
that cause success in both the business and education sectors. The gap in the research is in identifying leadership characteristics in urban charter schools specifically that can be attributed to leaders’ success regardless of the obstacles they face. Understanding the characteristics that cause the success of inner-city charter school leaders could raise student academic achievement and decrease the achievement gap, provide leaders with new knowledge to help them become successful, and transform inner-city charter schools in the 21st century. Many of the barriers that may prohibit educators from becoming successful inner-city charter school leaders may never be eliminated totally, but the results in this study may increase the knowledge of what is needed to be successful and how to access tools and utilize strategies that lead to success. Chapter 3 describes the application of the qualitative methodology, its overall approach, and its rationale. In this chapter, there is a presentation of the design of the study, research approach, interview questions, data gathering, and data analysis procedures. Chapter 4 provides the demographic results in the semistructured interviews and a discussion of the relationship between the research questions and the findings. Chapter 5 presents a conclusion, implications, and recommendations drawn from the literature review, the study methodology, and the data.
CHAPTER 3:
RESEARCH METHOD

This study addressed the problem regarding the lack of successful inner-city charter school leaders. In order to enhance the selection and development process of strong leaders, it is important to identify characteristics that can be attributed to a leader’s success in guiding inner-city charter schools. The problem can be resolved through the contributions of this study to improving the selection and development of successful inner-city charter school leaders. Ultimately, student achievement will rise and the transformation of schools will occur.

Research Design

This research project was a qualitative exploratory multiple case study with a theoretical framework and an inductive approach. Five different leaders were the subjects of this multiple case study that was explored inductively in an attempt to identify characteristics and behaviors that are attributed to the success of leaders of inner-city charter schools. Although all 5 leaders to be utilized for this study serve in the state of Ohio, the findings of the study can be applied to all states. The participant selection process involved using demographic data from the Ohio Department of Education that match the criteria needed for the study. Three successful leaders and two comparison leaders of inner-city charter schools in the state of Ohio were selected based upon the demographics that closely match the criteria of the inner-city reflected nationally in areas of high need. The selected demographic also reflects the areas that include both elementary and middle school students, allowing the opportunity to study leaders serving
areas that include middle school populations. Much of the literature reviewed in chapter 2 underscores the challenges in areas of high need (Ambach, 2006), and this involves serving middle school students through strategizing dropout prevention, emphasizing higher learning, and preparing these children to compete in the global economy (Freidman, 2007). All of these issues are stated to be contentions for schools beginning at the middle school level, and therefore, that age group was utilized for the study (Bushaw, 2007).

The successful leaders selected for this study were those working in schools with an enrollment of more than 200 students, including grades 4-8, with a 60% or higher poverty rate, and who have sustained an effective school rating or better in the state of Ohio for more than 3 years. If there were more than three leaders that meet the criteria for successful inner-city charter school leaders, they were chosen randomly. Comparison leaders selected for the study were also those also working in schools with an enrollment of more than 200 students, including grades 4-8, with a 60% or higher poverty rate, but who have not obtained an effective school rating or better in the state of Ohio for any of the last 3 years, or could not sustain an effective rating or better for a period of 3 years consecutively. The public data provided by the Ohio Department of Education relating to the number of students enrolled in inner-city charter schools, the percent of the poverty rate, and the school rating were used as criteria for selecting the participants.

Charter schools have existed in Ohio since 1998. In this state, all public schools, including charter schools, participate in state achievement testing and are rated in one of the following categories: academic emergency, academic watch, continuous
improvement, effective, and excellent. The ratings are dependent on whether or not 75% of the student population or better pass state achievement tests in each subject at each grade level. Schools are also measured based upon attendance percentages and graduation rates. For this study, leaders were selected based upon whether or not each school leader serving in the urban has achieved an *effective* rating or better and sustained it for a period of three years or more. The 3-year period was used for this study because charter schools in Ohio have only existed since 1998. In the first 3 years of each school’s existence, the school is not given achievement ratings even though it does participate in state achievement testing. The state gives each school a grace period of 3 years before releasing achievement test results to the public and rating them according to state standards. For this study, the leaders selected have been serving in schools that have existed for more than 5 years in the urban with a high percentage of students living in poverty, including those from middle school.

The process of this study involved reviewing public demographic data, creating a demographic questionnaire, and having two researchers do observations and interviews. The focus was on identifying characteristics and behaviors that are attributed to the success of leaders of inner-city charter schools, determined inductively by exploring multiple cases involving 5 leaders: three successful and two comparison leaders. Participant selection was based upon specific school demographics. The criteria for leadership selection were based on those leaders working in schools with an enrollment of more than 200 students, including grades 4-8, with a 60% or higher poverty rate, and who have sustained an *effective* school rating or better in the state of Ohio for more than
3 years. If there were more than three leaders that met the criteria, they would have been chosen randomly. This researcher used the public data provided by the Ohio Department of Education to identify leaders that met the criteria. The method of establishing a relationship with the research participants was through an introductory electronic mailer and a follow up introductory phone call to establish commitment to the process. Participants who made the commitment were given a gift registration to the state National Charter School Conference in the 2008 or 2009 school year.

Before beginning the interview process, school leaders were asked to complete the demographic information questionnaire. Based upon the information in this document, three successful inner-city charter school leaders and two comparison charter school leaders with the same demographics were selected as study participants. The interview was recorded and notes were taken on a laptop computer as a backup for the recording. When clarification or additional information was needed, the school leaders were contacted via phone or video conferencing in order to obtain the necessary facts.

Qualitative Research

Corbin and Straus (2008) described qualitative research as the ability to step into the world of participants to see their points of view in order to make new discoveries to create empirical knowledge. They described a qualitative researcher as one who is curious, creative, and not afraid to trust his or her instincts. Qualitative research can be contrasted with quantitative research in that qualitative research allows the researcher to get an inner experience of the participants to discover variables rather than to test existing variables. This study did engage in the process of qualitative research in that it
allowed the researcher to explore the inner workings of the successful inner-city charter school leaders and comparison leaders through the process of induction, causing concepts and themes to emerge.

Miles and Huberman (1994) emphasized the strengths of qualitative data, which focus on naturally occurring events and on the lived experience of people in order to interpret real-life circumstances. Thus, these data are well suited for interpreting the meaning of events, processes, and structures and connecting them to the social world around them. Qualitative data have been advocated by Miles and Huberman (1994) as the best strategy for discovering information, exploring a new area, and developing hypotheses. This study focused on the experience of leaders, the interpretation of their characteristics and behaviors, and the relationship that these factors have to their success, or lack thereof.

Corbin and Straus (2008) emphasized the many different properties of qualitative research. The authors contended that good qualitative research exhibits the following characteristics: (a) a humanistic bent, (b) curiosity, (c) creativity and imagination, (d) a sense of logic, (e) the ability to recognize diversity as well as regularity, (f) a willingness to take risks, (g) the ability to live with ambiguity, (h) the ability to work through problems in the field, (i) acceptance of the self as a research instrument, and (j) trust in the self in the ability to see value in the work that is produced. This study has incorporated all of these components as elements within the study.
Reliability and Validity

Miles and Huberman (1994) noted that issues of instrument validity and reliability are dependent upon the skills of the researcher. Meanings emerging from data have to be tested for strength and confirmation, and the authors defined this process for obtaining validity. According to Miles and Huberman, the researcher is responsible for removing potential biases to ensure validity. All important observations in a study should be included rather than selecting those based on the researcher’s personal views and preferences. Two surveys were utilized for this study. The first survey (Appendix B) was sent to participants with consent forms. This survey requested basic demographic information such as highest education level and number of years employed in education. The second survey (Appendix C) was used to guide the interview process. This series of questions was modified from the Gray and Streshly (2008) study.

During the process of data collection and analysis, for validity purposes, this researcher engaged a fellow doctoral student familiar with inner-city charter schools to allow for two sets of data comparison. There were two stages of data collection: observations and interviews. During the observation stage, each researcher recorded a separate set of data and compared each other’s data at the completion of the observation. The observation data were open coded by each researcher based upon concepts that emerged and then compared again. The same process occurred during the interview process with the participant. At the completion of each stage of data collection and open coding of both researchers, this researcher engaged in axial coding separately from the second researcher and then compared the grouped concepts or themes.
Research Questions

The following research questions guided the study: What characteristics and behaviors are exhibited in successful inner-city charter school leaders that relate specifically to student academic achievement? What characteristics and behaviors identified in the outcomes in this study were not mentioned in the previous Gray and Streshly (2008) study? The specific questions that were used to guide the observations can be found in Appendix A, and the interview questions can be found in Appendix C.

Informed Consent

The permission of the Institutional Review Board was obtained to solicit information for this study from inner-city charter school leaders. Establishing a relationship with the research participants was done through an introductory electronic mailer and a follow up introductory phone call to ascertain commitment to the process. Participants that did commit were given a gift registration to the state Charter School Conference for 2008. Participants involved in the study were sent two different surveys. The first survey (Appendix B) was a demographic questionnaire accompanied by a consent form (Appendix D), and those were sent to each of the 5 leaders. The first 3 leaders were classified as successful and the other two were utilized for the comparison study. The second survey (Appendix C) was a series of questions modified from the Gray and Streshly (2008) study to guide the interviews for the qualitative study. Participation in the study was completely voluntary.

A deadline was given for the return of consent forms. If the consent forms were not returned within 10 days, the researcher planned to send out additional e-mails and
make further phone calls to encourage participation. When the researcher received completed consent forms from a participant, an e-mail was sent or a phone call was made to set up the interview process. The second survey (Appendix C) was made available to the interviewee via e-mail.

**Ethical Protection of Respondents**

First, the researcher explained to all participants that they would maintain their anonymity in the study. Next, they also were made aware that no negative statements or derogatory statements would be made about their school system or their leadership. Interviewees were informed of their right to refuse to participate in that all risk of reprisal cannot be guaranteed. Finally, the researcher followed all the requirements established by Walden University regarding the use of human beings in research, and she secured letters of consent from the participants involved in this study.

**Confidentiality**

Participants in the study will remain anonymous. They were observed in a variety of activities and situations and participated in a recorded face-to-face interview. Although they were quoted when needed, they were not identified. To hide their identities, pseudonyms were used for the participants and the schools in which they work. All data will be securely maintained and locked in a safe by the researcher for a period of 5 years.

**Criteria for Respondent Selection**

The first group of participants for this qualitative study was selected based on their positions as inner-city charter school leaders who have sustained success over a
period of 3 years or more with state testing results from the Department of Education for the particular state in which each one resides. The second group of participants in the study was identified as the comparison group based upon their positions as inner-city charter school leaders who have matching demographics to that of successful inner-city charter school leaders.

Data Collection

There are many sources of data in qualitative research. Corbin and Straus (2008) identified a variety of ways in which the researcher can collect data alone or in combination such as: (a) interviews, (b) observations, (c) videos, (d) documents, (e) diaries, (f) memoirs, (g) newspapers, (h) biographies, (i) historical documents, and (j) autobiographies as well as other sources. The primary sources for this study were documents, observations, and interviews. The documents that were analyzed are the demographic questionnaire in Appendix B, the Department of Education demographics report, the data results of the observations included in Table 1, and the interview questions in Appendix C. Both the observations and interviews were flexible and open ended in order to allow ample opportunity for inductive exploration.

There were two stages of data collection: observations and interviews. An open coding process was used by both researchers at each stage of data collection and compared. In order to connect related concepts or themes, the two researchers used an axial coding process. The first stage included observations of the school leaders engaged in various contexts and activities. During different time segments, each researcher observed inner-city school leaders in action and recorded their observations. Examples of
activities that were observed are included in Appendix A. The second stage of data collection was the interview stage. Prior to the interview stage, the primary researcher asked the participant to complete the questionnaire included in Appendix B. This questionnaire provided insight on the background and perceptions of the leader. After the demographic questionnaire was completed, the interview began.

During the interview stage, this researcher asked a series of 12 questions. These 12 questions sought to identify characteristics and behaviors attributed to the success or lack of success of the leaders. The interviews were semi-structured and flexible with an open framework, allowing for two-way communication for extensive exploration and an opportunity to place emphasis on the perspectives of the interviewees. Each interview was recorded and notes were taken on a laptop computer as a backup for the recording. If clarification or additional information was needed, the school leaders were questioned again in order to obtain important information. In this portion of the study, like Collins’s (2001) research, during the interview process, there was an emphasis on the perspectives of the interviewee. The same process was used to find patterns in the stories of the highly successful principals interviewed in the Gray and Streshly (2008) research. Interview questions selected for the study have been modified from the Gray and Streshly study on good-to-great schools, and have been tested for reliability and validity in this study.

The researcher interviewed, recorded the interview, collected data, analyzed the data, and summarized the results. Data collection was conducted in person. The interview was recorded and a laptop was used for taking notes to back up information. Various concepts were explored through a series of 12 questions related to experiences of the
inner-city charter school leaders. The focus of the interviews and the data collected was upon the perceptions of the interviewees. There were a total of 5 interviews conducted. Three of the interviews were with successful inner-city charter school leaders that have sustained success for 3 or more years. Two of the interviews were with comparison leaders to serve as demographics. Note cards were used to record each new variable that revealed itself from each interview.

Each related variable was grouped within a concept and coded according to that concept. Variables or concepts that existed in individual interviews were eliminated from the study. Variables or concepts that existed in all three successful inner-city charter school leaders that did not exist in comparison leaders were noted as variables attributing to the success of the inner-city charter school leaders. If two of the successful inner-city charter school leaders identified a common variable not represented in comparison schools that was not identified for the third successful leader, a follow-up interview was conducted with this third leader for clarification. If the variable or concept was still not identified in the third successful school leader, the variable was identified as a variable in two of the three successful leaders.

The variables and concepts that emerged from the study were compared with the variables of highly successful principals in the Gray and Streshly (2008) study. Results were categorized as confirmed, not confirmed, not revealed, or as a new variable. Results that were confirmed were those that were noted in the Gray and Steshly study as variables attributing to the highly successful principals. Results that were not confirmed were those noted in the Gray and Steshly study that this researcher’s findings contradict
in some way. Results that were not revealed were those in the Gray and Steshly study that were closely related to the findings in this researcher’s study but were not categorized or were indicators of success according to participants. Results indicated as new variables were those concepts that emerged from this researcher’s findings that were not indicated in the Gray and Steshly study. Specific emphasis of new variables was placed upon issues relating to inner-city charter schools that do not exist in the schools participating in the Gray and Steshly study. This research was conducted with prior permission of the school district and was in compliance with the requirements established by Walden University regarding the use of human beings in research. In addition, letters of consent were secured from the participants involved in this research.

**Instrumentation**

This researcher and a fellow doctoral student who has worked within inner city charter schools for more than a decade served as the primary instruments for observing, interviewing, carrying out document analysis, and collecting and analyzing data. Miles and Huberman (1994) emphasized the markers of a good qualitative researcher-as-instrument as: (a) familiarity with the content in this setting under the study, (b) strong conceptual interests, (c) a multidisciplinary approach, and (d) good investigative skills. This researcher and her fellow researcher each have experience in the development and leadership of an inner-city charter school, as well as all content, concepts, and various approaches of the study.

Both researchers had experience using the Janesick (2004) observation methods and exercises, as well as identifying characteristics and behaviors of leaders that were
presented as concepts or themes. The interview protocol was developed and had been used in a similar way first by Collins (2001) and later by Gray and Streshly (2008) with modifications. The interview questions used can be found in Appendix C. These questions were modified from previous studies to reflect issues related to inner-city charter schools. The questions had been tested in the previous study for reliability and validity.

Observations

The first stage of data collection included observations of the school leaders engaged in various contexts and activities. During certain time segments, observations of inner-city school leaders in action were recorded. Examples of the activities that were observed are included in Appendix A. The observations were conducted by this researcher and a fellow doctoral student knowledgeable about inner-city charter schools, as indicated in the explanation of instrumentation and methodology.

During the observation stage, each researcher recorded a separate set of data and compared one another’s set at the completion of the observation. An open coding process was used by both researchers at each stage of data collection and then compared. The observation data was open coded by each researcher based upon concepts that emerged and then compared again. In order to connect related concepts or themes, the two researchers used an axial coding process.

A laptop computer was used for taking notes in all observations. Some observations were videotaped based upon the comfort level of the participants and if permission was granted from the necessary parties. Examples in which videotaping may
be included were situations that involved simultaneous activities or engagement from any interaction and reactions involving participants. One specific example may be a meeting that was being held by the leader in which there was a need to observe the reactions and interactions of everyone in the room.

Interviews

Merriam (2002) emphasized that interviews are conducive to allowing researchers to communicate with participants in order to understand their point of view or a particular phenomenon. There are a variety of interview types ranging from highly structured to very unstructured. In this study, this researcher utilized a semi-structured interview approach modified from the Gray and Streshly (2008) study. Merriam described a semi-structured interview as exploratory and open ended in order to obtain better information about perceptions and meaning. There was also a semi-structured survey developed to guide the interview process. This survey was sent to each participant in advance with a note indicating that additional information provided during the interview would be appreciated. At the conclusion of the interview process, transcripts were emailed to the participants to allow for the opportunity to add, clarify, or expand their thoughts.

Interview Questions

The following 12 research questions are modified from the questions in the Gray and Streshly (2008) study and guided the interview:

1. What kind of leadership style do you think you have? What kind of leadership style would your staff say that you have?
2. Take a minute to write down the top 5 factors that you think have contributed to school success in improving student academic achievement performance. When you think you have the top 5, number them in order of importance with one being the most important factor. Let me know what you have written beginning with number one.

3. Give some examples that illustrate the factors that you chose as the top 5 factors contributing to the school’s success.

4. What decision did the school make to initiate an increase in student academic achievement during the years prior to achieving success? What sparked that decision?

5. What process did you and the school staff use to make key decisions and develop key strategies that led to the increase in student academic achievement performance at the school? (This is not what decisions the school made, but how you went about making them.)

6. How did the school gain commitment from everyone to agreeing with its decisions? Teachers, parents, students? Give me a specific example of how this took place.

7. What did you do to ensure that teachers continue to focus on improving student test performance?

8. What did you try that didn't work during the years before attaining a positive school ranking? Why didn't it work?
9. Many schools undertake change programs and initiatives, yet their efforts do not produce much in the way of results. One of the remarkable aspects of your school’s transition is that it moved forward over several years, and was not just a short-term upswing. We find this extraordinary. What makes your school different? What were the primary factors in maintaining the rankings of similar schools over the years? What efforts did you make to ensure that the school continued to sustain its success?

10. When you think about your work here, where you most proud of? When you leave your position as school leader, what do you want to be remembered for?

11. What unique challenges of inner-city schools have you overcome that you think have attributed to your success as a school leader? What unique challenges of the 21st century have you had to overcome that have attributed to your success?

12. What else would you like to tell me about the reasons for the success of your school in raising student academic achievement?

Data Analysis

Corbin and Straus (2008) described analysis as the act of giving meaning to data or the process of examining something in order to find out what it is and how it works. Corbin and Straus illustrated the performance of analysis as breaking a substance into various components to examine them closely and to categorize them according to their properties and dimensions. Inferences made about the data during analysis rely upon the experience and training of the researcher.
This was a qualitative exploratory multiple case study with an inductive approach. This researcher, along with a fellow researcher, used both open coding and axial coding for validity purposes. Corbin and Straus (2008) argued that open coding and axial coding go hand in hand and serve different purposes, which is also true for this study. The open coding process was used first to break the data apart and identify concepts that stand for the data or determine what themes emerge from the data based upon their properties. Raw data were collected on note cards. Each piece of data was labeled with a concept and given a code name based upon the concept for analysis. Concept labels were based upon the researcher’s interpretation of what is observed and stated in the interviews. This process continued throughout each of the observations and interviews.

At the completion of the analysis of each of the observations and interviews, emerging themes that could be identified were noted and coded. Axial coding was used in the second step to put the data back together by relating the concepts and codes. Any concepts and themes that emerged were rated according to levels of importance as contributing factors to leadership success. These identified concepts and themes were compared with findings in previous studies of good-to-great schools as a means for checking the outcomes of those studies with the findings of this study. New concepts and themes that emerged in this study were noted as new variables identified in successful leaders of inner-city charter schools.

Summary

This qualitative exploratory multiple case study used an inductive approach through observations and semi-structured interviews to analyze common characteristics
and behaviors of successful inner-city charter school leaders in the 21st century. The researcher was responsible for each element of the study including its reliability and validity, as well as protecting the rights of participants. In this study, three successful leaders and two comparison leaders from inner-city charter schools were interviewed and observed in a variety of activities and situations. The data were collected, categorized, and analyzed to identify common characteristics and behaviors of successful inner-city charter school leaders in the 21st century. Chapter 4 provides the demographic results in the semi structured interviews and a discussion of the relationship between the research questions and the findings. Chapter 5 presents a conclusion, implications, and recommendations drawn from the literature review, the study methodology, and the data.
CHAPTER 4:
DATA ANALYSIS FINDINGS

Introduction

As educational systems advance into the 21st century, successful leadership is a concern for inner-city charter schools. This study was conducted to identify characteristics of successful inner-city charter school leaders. The researcher conducted a qualitative exploratory multiple case study with an inductive approach to identify which characteristics and behaviors successful leaders of inner-city charter schools have that unsuccessful leaders do not possess. According to school rating data, some leaders have been able to minimize the effects that various challenges have on their success. Therefore, the purpose of this qualitative exploratory multiple case study was to explore characteristics and behaviors that can be attributed to raising student achievement in successful inner-city charter school leaders by comparing the findings of leaders who have sustained success with others who have not. The demographics and identifying concepts and themes that emerged were analyzed and identified as new variables needed for successful urban charter school leaders. The following research questions guided the study: What characteristics and behaviors are exhibited in successful inner-city charter school leaders that relate specifically to student academic achievement? What characteristics and behaviors identified in the outcomes in this study were not mentioned in the previous Gray and Streshly (2008) study?

The criteria for selecting leaders for the study were based upon specific demographics from the Ohio Department of Education. Participants were leaders in
schools with an enrollment of more than 200 students, including grades 4-8, with a 60% or higher poverty rate who sustained an *effective* school rating or better in the state of Ohio for more than 3 years. To identify the characteristics and behaviors of successful inner-city charter school leaders, the researcher interviewed and observed three different successful people who fit this demographic and two comparison leaders with matching demographics who have not obtained success according to the criteria.

**Data Collection and Analysis**

Using a theoretical framework and an inductive approach, this qualitative exploratory multiple case study took place in the state of Ohio. Five leaders of inner-city charter schools were selected for this study. Three of the leaders were selected based upon the criteria for successful inner-city charter school leaders. Two of the leaders were selected based upon the criteria for comparison inner-city charter school leaders.

There were two stages of data collection: observations and interviews. The researcher observed these leaders in action during their daily activities and events. Examples of observations are included in Appendix A. These leaders also completed a demographic questionnaire that is included in Appendix B, which provided insight into their background and perceptions. The second stage of data collection was the interview stage. During this stage, this researcher asked a series of 12 questions, listed in Appendix C, in order to identify characteristics and behaviors attributed to the success or lack of success of the leaders. The interviews were semi-structured and flexible with an open framework, thus allowing for two-way communication for extensive exploration and an opportunity to place emphasis on the perspectives of the interviewees. The interviews
were videotaped and reviewed later so notes could be taken on a laptop computer as a backup for the recordings.

Data collected on all 5 subjects incorporated observations included in Appendix A, the demographic questionnaire included in Appendix B, and answers to questions and discussion that transpired from interview questions included in Appendix C. Notes were taken on a laptop computer by two researchers at each stage of data collection. Each researcher recorded data for each observation and interview individually. At the completion of the data collection process on all 5 subjects, both researchers examined their notes on the responses of observations and interviews with three successful inner-city charter school leaders and two comparison leaders. After the notes were compared, at each stage of collection, both researchers used an open coding process and compared the data again. At the completion of data recording, both researchers again compared notes to ensure the reliability and validity of the outcomes. The researchers then condensed the notations into chunks of information and coded them as comprehensible names or abbreviations. For example, during the interviews, participants were asked a question about what 5 factors contributed most to their school success. A common answer involved some form of staff development, yet the answer was stated differently by each participant. Some participants in the study used the words “teacher training,” others “professional development,” and still others “training sessions.” The content gathered for this category was coded as “S D,” which stood for staff development.

After each researcher agreed upon the outcomes of the field notes and codes for each concept, the process of axial coding began. During this process, the researchers
together were able to connect certain concepts from the codes. For example, during the interview process, it was discovered for all three successful leaders in the study that development content was nearly interconnected with selecting the right people, but the same was not true for comparison leaders. The successful leaders shared stories during the interviews of the importance of selecting the right people because of the turmoil they experienced when they had not employed qualified staff members. Many stories were told about the strategies taken to improve the hiring process and how in many cases even extensive training would not help some people become even minimally adequate for the role they needed to play. Importance was placed upon the need to first select the right person and then to have a strong development plan in place for them. Again, it was clear for these school leaders that the concepts of selection and development were highly interrelated. This revelation within the outcomes caused the researchers to decide to connect the two concepts and to characterize them as a theme called “the selection and development of people,” which is further illustrated in the findings. The tabulations resulting in such findings are illustrated in Table 1.

</table>
After various stages of data analysis were completed, certain characteristics and behaviors were found to be exhibited within the study at high levels for the three successful leaders that were absent or only minimally present for the two comparison leaders. These characteristics and behaviors identified for the successful leaders were then identified as the 7 emerging themes of successful inner-city charter school leaders in the 21st century. These 7 themes were examined at the conclusion of the study for comparison with the background theoretical framework that served as the foundation for this study. The previous studies used were based upon results of Collins (2001) in the study of good-to-great companies and builds upon this with the Gray and Streshly (2008) study of characteristics of highly successful principals in good-to-great schools. The comparisons of the outcomes of this study are illustrated in chapter 5 in the theoretical framework section.

At stage two of the data collection process, interview questions were used to guide a discussion in the attempts to discover characteristics and behaviors within the three successful leaders that caused their success that were not exhibited in the comparison leaders. At times, the questions did not produce exact answers but the open discussion format allowed each participant the opportunity to reflect more deeply and to provide information that offered a picture of distinction between the two types of leaders in the study. The observations served the purpose of allowing researchers to see if the data collected during the interviews were accurate. For example, if a participant claimed to focus seriously on a safe and orderly environment, the school observation visit revealed whether or not this was true and at what level orderliness was present. Students
in all cases appeared to be at least minimally in order, but observations during transitions at lunch and dismissal clearly distinguished which leaders effectively implemented the need to have a safe and orderly environment and which leaders did not.

**Interview Questions**

The findings were organized by the results of salient data from interview questions of characteristics and behaviors that were exhibited during the observations and communicated at high levels in the interviews for the three successful leaders within the study but were absent or only minimally present in the results for the two comparison leaders. Certain interview questions were eliminated from the reporting within the findings that did not produce useful results. Some of the questions did not render results specifically to the question but were successful in providing related information to the study due to the flexibility of the interview format. In each of the interviews, participants provided information useful for identifying characteristics and behaviors within successful leaders that were absent or minimally present within comparison leaders.

The data collected during the observations were used to inform the researcher prior to interviews of further needed questioning, and to confirm or disprove the information gathered during the interviews. Out of the 12 questions used during the interviews, 5 questions rendered results that demonstrated common characteristics and behaviors present at high levels within successful leaders that were absent or minimally present within comparison leaders. Other results were obtained from dialogue that occurred during the interviews or during the observations. The interviews were open ended and semi-structured to allow participants to contribute additional or connected
thoughts to the questions. When participants contributed information that was not a direct response to the question, it was recorded and categorized according to related content within the questioning.

Five areas that rendered common findings from questions are explained and differences between characteristics and behaviors of successful leaders and comparison leaders are highlighted. After illustrating the outcomes of the data, there is an explanation in the findings of the 7 themes that emerged, indicating characteristics and behaviors present at high levels within successful leaders that were absent or minimally present within comparison leaders. These characteristics and behaviors also presented distinguishable actions or conditions present at high levels in successful leaders that were absent of minimally present in comparison leaders. Identifying these actions and conditions led to the development of the 7 themes. The tabulations resulting in findings of characteristics and behaviors present at high levels in successful leaders and absent or minimally present in comparison leaders are illustrated in Table 1. These 7 themes were examined at the conclusion of the study for comparison with the background theoretical framework that served as the foundation for this study.

The previous studies used were based upon results of Collins (2001) in the study of good-to-great companies and builds upon this with the Gray and Streshly (2008) study of characteristics of highly successful principals in good-to-great schools. The comparison of the outcomes of this study is illustrated in chapter 5 in the theoretical framework section. These actions and conditions are explored at length after first having been explored in chapter 4.
Five Factors that Contributed to School Success

School leaders in the study were asked the top 5 factors that they think have contributed to school success in improving student academic achievement performance and were asked to rank them in order of importance, with one being the most important factor. Most leaders in the study were not able to rank the factors in order of importance but they were able to list at least 5 factors that have contributed to their success. There were 27 areas that were present at high levels within successful leaders that were absent or minimally present within comparison leaders. The first of these areas were ongoing evaluations and goal setting.

Ongoing evaluations and goal setting. Evaluations and goal setting occurred at some level for all 5 of the school leaders in the study. The differences among leaders occurred within the number of data used, the type of data, the rate of data collection, and implementation of the findings. Everyone participated in data collection and used data in goal setting, but the three successful leaders engaged in this process continually. The three successful leaders varied in the way data were collected and what types of data were selected. However, all three successful leaders conducted ongoing evaluations and assessments and collected different types of data to establish goals and make decisions. All three of them were consistent in using the evaluation process as a regular part of the operations involving all stakeholders.

The three successful leaders used data from self-created assessments in which they measured targeted areas they or other key stakeholders had selected for a particular purpose. The outcomes of these data were shared regularly in some form although the
methods of communicating outcomes varied among leaders. For the comparison leaders, the main data used for goal setting and evaluation was the annual state achievement test, school rating data, and the state school report card. The successful leaders used this data but emphasized the need to collect ongoing incremental data along the way. For example, in specific areas of need, successful leaders measured the ability of the students to perform that skill or exhibit mastery every quarter or even sooner.

*Decision Making.* All school leaders in the study were asked what decision the school made to increase student academic achievement during the years prior to achieving success, what sparked that decision, and what latitude and restrictions they had in making those decisions. They were also asked what process they used with the staff when making decisions and planning strategies to increase student academic achievement. (This is was not what decisions the school made, but how the leader went about making them.) From this dialogue, characteristics and behaviors emerged that were present at high levels in successful leaders and absent or minimally present in comparison leaders. The three successful leaders emphasized the process of decision-making and indicated a series of ongoing decisions that were instrumental to their success. Rarely did these leaders take credit for any decisions or actions personally. They talked about the need to be aware of everything possible and to be involved at high levels in order to be positioned to make decisions quickly and then guide others in the process of implementing the decisions. During the observations conducted by researchers, there was a sense of thoroughness in the three successful leaders as evidenced by their ability to be visible and aware of their environment and the way they took time to address each issue,
big and small. When a leader became aware of a problem or area of concern throughout the school day, an immediate decision to address that problem was made. In some situations, problem solving was delegated. In other situations, the leaders recorded the need to address the issue and indicated a timeline for resolving it.

During the interview, each leader described different decisions when specifically discussing school programming. These differences were due to the diverse types of schools. The common characteristics and behaviors of the successful school leaders were in the amount of time it took them to make a decision and implement it as opposed to the comparison leaders. All leaders engaged in regular decision-making, but the difference was within the action taken and how quickly the decision was implemented. There was a sense of urgency for all three successful leaders to become aware of problems and to address the problems quickly. For comparison leaders, awareness of the need to make a change or a decision was present, but the implementation was not immediate or within a reasonable amount of time. Comparison leaders allowed some problems to perpetuate, which caused bigger problems, so they were not able to focus on the significant elements of student achievement that would cause success as it did for the successful leaders.

Vision for Their Schools. School leaders were asked what they want most and hope for in the future for their schools. During this line of discussion, school leaders began to share their dreams, dreams for their students and their futures. They shared dreams for the teachers, other staff, and extended community. For example, they spoke at length about their desire to see their students go to college, backed up by extensive college preparation programs. They even had pictures of alumni on the wall who were
attending or had graduated from college. Current high-achieving students had their grade point average posted alongside their picture. They also shared dreams for the school as an organizational whole and where it could be in the future in order to impact the lives of hundreds and even thousands of students. This discussion led to an awareness of what leaders do to develop a school culture that reflects the values of the leader and the organization.

All 5 leaders had hopes and dreams for their schools. The differences between the successful leaders and comparison leaders were related to the level of activity leaders spent in communicating and acting out a clear direction and vision. The successful leaders created an ongoing platform in which the leader could cast a vision and navigate a clear direction, something these leaders seemed to do naturally. They were able to pull people together and communicate a direction effectively. They engaged in this process regularly. They communicated whether or not each stakeholder was headed in the right direction regularly for all levels of the organization. If a member of the organization was off track, the leader created a plan for getting them back on track. If this plan failed, a number of attempts would be made, but ultimately if the member did not engage in activities aligned with the mission and vision and would not maintain the right direction, the member would likely lose his or her position. All stakeholders engaged in ongoing activities that involved casting visions and providing direction.

These characteristics and behaviors were present within comparison leaders as well, but there were a few distinguishable missing elements. Comparison leaders did not spend much time talking about the future or planning for it. All of the leaders in the study
were able to engage in daily activity with the students and cast a vision for their futures. All of the leaders envisioned effectively preparing their students for college and career and overall life. The difference of successful leaders and comparison leaders were related to be ability to cast an organizational vision. Successful leaders regularly cast vision for the organization and all the stakeholders within it. They navigated the steps along the way to achieving that vision. This was not observed or identified for comparison leaders. Additional questions were targeted for the comparison leaders related to this concept, but little information was yielded.

*Sustained Success.* School leaders were asked about their efforts to ensure that the school continued to sustain success. All participants in the study communicated the need to have team members within the organization who had a shared mindset. One difference between the successful leaders and comparison leaders was the level of expectation held among the leaders to succeed. The three successful leaders were relentless individuals who attacked challenges no matter how large and who expected success. They did not back down from the challenges of the inner-city or of being a school leader. The comparison leaders definitely gave what appeared to be their best efforts, but it was clear that they lacked the determination to persevere. In situations where the circumstances seem to present challenges that were too much to bear, the leaders decided to refrain from applying energy in that direction. In some situations, there was an apathetic attitude compared to that of the successful leaders. During the interview process, all leaders communicated thoughts about problem solving in a bold manner but during the observations, the level of energy directed at addressing challenges was clearly
distinguishable between successful and comparison leaders. During the interview, one comparison leader even stated that regardless of what he/she did, this particular problem would not change and so he/she had to take care of what was within his/her control. Successful leaders seem to persevere regardless of the challenge.

Holistic Needs Programming

Another difference that related to problem solving and educational programming in general was the ability of the successful leader to address holistic needs more effectively than that of the comparison leader. All 5 leaders had strategies for addressing holistic needs of students. Some had school nurses and counselors and some had particular extended day programming designed to meet various student needs. The characteristics and behaviors that were present at high levels within successful leaders and absent or minimally present within comparison leaders were that they continued to work to find the resources to address holistic needs. The needs of the inner-city students are vast largely due to the issues of living in poverty. The successful leaders were able to create an environment in which students living in poverty were not limited in their opportunities for learning, enrichment, or resources in the school setting. These students of successful school leaders were able to have opportunities just like many students living in higher socioeconomic conditions, even though the leaders have limited budgets and received more than 30% less funding than traditional public schools. Still, the leaders were able to succeed and meet the needs of students holistically. These leaders were successful by being resourceful with community partnerships and by targeting specific staff with particular talents to meet needs. Staff selection was done carefully by hiring
teachers that were also committed to extended day programming to address holistic needs. The staff was utilized as a resource for more than teaching a class. The leader was aware of their talents and used them in order to meet the needs of students and spur their interests to pursue new educational and life learning opportunities. Comparison leaders allowed their staff members to focus strictly on classroom teaching and had limited programming to address holistic needs due to what they deemed to be limited resources. Other results from data are further illustrated in the findings.

Findings

The data collection and analysis research process of the inner-city charter school leaders caused 7 specific identifiable concepts and themes to emerge. Specific characteristics and behaviors were present within successful leaders at high levels and absent or minimally present in comparison leaders. These characteristics and behaviors presented distinguishable actions or conditions existing at high levels in successful leaders that were absent or minimally present in comparison leaders. Identifying these actions and conditions led to the development of the 7 themes. The concepts and themes that emerged were identified as variables needed for successful urban charter school leaders. Salient categories of information were supported by data collected in the interviews and observations of the school leaders. The researcher looked for identifiable themes to emerge related to the success of the school leaders, which were as follows: Theme 1: Consistent Navigation, Theme 2: Holistic Focus, Theme 3: Shared Mindset, Theme 4: Mission Alignment, Theme 5: Resourcefulness, Theme 6: Shaping and Sustaining Culture, and Theme 7: Selection and Development of People. The 7 themes
that emerged from the study represent the results of common characteristics and behaviors of each of the successful leaders that were minimized or completely absent in comparison leaders. The tabulations resulting in these 7 themes are illustrated in Table 1.

*Theme 1: Consistent Navigation*

Successful inner-city charter school leaders have the ability to be highly engaged in daily operations while navigating the direction and big picture of the organization. The researcher’s data show that leaders who employ consistent navigation have clear direction and are faithful to their missions. Within the structure of their days and their involvement with stakeholders, these leaders cast vision in ways that include the big picture, daily actions needed to accomplish their missions, and communication strategies to achieve success. Part of the navigational process for these leaders is about modeling a strong work ethic themselves by working as long and as hard as anyone else. They arrive early to work and stay late. These leaders are visible and are aware of what is happening in all aspects of the organization.

The navigational process is no different for casting visions to students. Successful leaders create opportunities for students to envision their futures and make incremental progress towards accomplishing their goals according to the results of the study. College and university partnerships and visits occur regularly for upper-level students. Students are counseled individually and made aware of their strengths and weaknesses, their academic status, higher education opportunities, and future goals. For those students in need of improvement, plans are set in place to help them progress, which involve hard work for both students and educators.
Successful leaders constantly measure each element of the school to determine whether or not expectations are being met. They engage naturally in the process of quality improvement and use the results to improve current systems and to develop new systems where needed. They are not afraid to initiate change or to deal with difficult issues. Communicating the needs of the organization effectively, they provide direction on how to meet those needs. These leaders do not point out the direction from afar, but rather, they guide the process up close with high levels of involvement. Once a system for improvement is set in place and is deemed effective, and it is working as it was designed to do, these leaders delegate responsibility to trusted team members and then partner with these team members for ongoing monitoring for success. This process is continuous, cyclical in nature, and integral for the successful leader’s consistent navigational process.

Theme 2: Holistic Focus

Leaders who use holistic focus concentrate on the needs of the whole child or whole person from different vantage points within the organization. They are able to meet the needs of stakeholders by coupling the focus to achieve excellence with understanding and reaching out to meet individual needs. They approach each stakeholder as a vital family member who is to be treated with special care and concern, yet the leaders also couple this mentality with high expectations of the stakeholder. A common phrase that could be used to express this thought process is —to whom much is given, much is required." The essence of this expression came up so much that it was repeated almost verbatim or in the actions of the successful leaders, e.g., the leader who dealt with a
missed paycheck of an employee by addressing the problem personally with the accounting personnel without delay. In this study, this theme was best described successful Leader 1 who said that leaders must “eat the small stuff.” They strive to cover every detail and address problems as they arise, leaving themselves little room for surprise or lack of preparedness for a particular incident.

All 5 leaders in the study made regular attempts to address students’ holistic needs. Nevertheless, the three successful leaders in the study were constantly developing strategies for becoming aware of individual student needs and then utilizing staff members, creating programs, and even working one-on-one with the students. Successful leaders had more readily instituted ongoing programs to address needs of poverty, health concerns, and dysfunctional home conditions than that of comparison leaders. In some situations, successful leaders had partnerships with community organizations to extend a hand to the family of the student in need. The successful leaders expressed the desire to address these issues first if the student is going to perform academically. These leaders had an acute awareness of these student needs and how to meet them without broadcasting the actions to others, which, in turn, created a level of respect and appreciation from the students for the school leaders. As a result, these students tended to display more academic effort than in the past when their needs went unmet. Comparison leaders were heartfelt about the living conditions of their students but were not successful with implementing strong action plans to resolve the problems. Further explanation of these processes is included in the resourcefulness theme.
Along with addressing the holistic needs of students, successful leaders had strong accountability plans in place for all stakeholders, including the parents of the students in need. The school leaders communicated expectations to parents according to the ability of the parents to have control over a given circumstance. In some situations, the expectation was to have a parent ensure the student’s attendance at school every day all day in a case where extended day tutoring was necessary. A particular student may be struggling academically, but the school leaders felt this was largely attributed to absenteeism. The school leaders agreed to provide extended day tutoring in order to meet the student’s needs but expected the parent to ensure daily attendance in order to make the tutoring after school a viable option. If the parents did not comply with this plan, it was understood that continued truancy problems would be communicated to the court system so the student would likely be retained in school.

*Theme 3: Shared Mindset*

The process of sustaining a cohesive team with shared values is ongoing. Such team leaders focus primarily on the need to surround themselves with those of like minds, shared values, and vision, while balancing the team with diversity of backgrounds, skills, and knowledge. New ideas and challenges related to ways of improving programming are welcomed, while interpersonal struggles and loss of focus from the desired goal are not. Large amounts of energy are placed upon developing a strong cohesive team with members who share core values and purpose that dictate specific actions to be taken by each person. This cohesiveness is transferred to the students in that they are made to
understand the purpose of their education and how they are to spend their time and energy.

The successful leaders in this study are individuals who have a mindset to attack challenges no matter how large. They have big dreams for their schools and expect the institutions to succeed. They are strong believers in building people and programs through motivation, knowledge, and skill. All of the leaders in this study have opted, career wise, to work under urban conditions or circumstances deemed as challenging, and have removed themselves from comfortable work situations or what they describe as easy schools in which students have home support and few economic challenges. All leaders are aware of the challenges of the urban, but the mindset of the successful leaders can be best described as an acute awareness of the plight of inner-city youth and a passion to change their circumstances by elevating the students through education. Comparison leaders in the study have passion too but seem to accept defeat more readily than successful leaders. For example, Comparison Leader 1 said, “There is only so much time in the day” and Comparison Leader 2 said, “Well, we do what we can, but without the support of the parents it makes it difficult to make big changes.” Successful Leader said, “We do whatever it takes.” Successful Leader 3 said, “We want people who make things happen.”

In contrast, successful leaders are offended by those who accept defeat. They have the tendency to look beyond obstacles for solutions to insurmountable problems. They seem to be drawn to those individuals who are willing to roll up their sleeves and share in the challenges. They are not interested in those who are looking for comfortable positions
in which they can sit back and put in the time of their workday just to receive a paycheck. In fact, successful leaders work diligently to build a team of people that exhibit a mindset of getting down to business and are willing to do whatever it takes to get the job done. Their teammates are also willing to assume various roles depending upon the needs of the organization and partner with the leader to determine that role and know that it will change according to different circumstances.

*Theme 4: Mission Alignment*

Successful inner-city charter school leaders align everything they say and do with an overlying mission, a clear and direct one. All objectives, goals, and actions are set in place for the sole purpose of mission accomplishment. Curriculum selected for the educational program is research-based and proven to raise achievement and is specifically aligned with the mission of the school. Instructional strategies are also research-based and improved based upon achievement outcomes that result from having used the strategies. Courses, instructors, daily programming, staff development, parent communication, and community partnerships are all carefully calculated according to what will best help the school accomplish the main mission.

*Theme 5: Resourcefulness*

All leaders involved in the study have something in common: limited resources. It was discovered that charter schools receive one third less funding than their public-school counterparts in the state of Ohio, the state in which this survey was conducted. The reason for limited resources is unknown but is believed to be due to the lack of legislation in the state allowing property tax monies allocated for public schools to be used for
charter public schools, even though charter schools are also public. In cases where student enrollment is higher, resources are more plentiful, but all leaders experience limitations due to lack of funding. Facilities used for the schools represented in the study are not traditional school buildings but ones that had been converted to academic use from a previous use such as for church or business. None of the school buildings is similar to each other. Not only were the conditions and the facilities of these successful inner-city charter school leaders challenging, but the leaders’ access to resources is also challenging. Regardless of these financial challenges and limited resources, these leaders are able to provide a high quality education for students through resourcefulness and strategic partnerships with outside community organizations and, in some cases, colleges and universities. These leaders know how to make the most of the resources available to them for school success even when the resources are severely limited. Successful leaders engage in ongoing planning, for how they will utilize community resources to meet students’ holistic needs. For a further example on differences between successful in comparison leaders and how they utilize resources to meet holistic needs of students, see the holistic focus theme.

Theme 6: Shaping and Sustaining School Culture

Much emphasis was given by the successful school leaders upon the shaping and sustaining of school culture. This theme rated at a high level of importance as one of the top three factors in the success of inner-city charter school leaders. Among the top elements existing within the cultures of these successful leaders are a culture of achievement, discipline, collaboration, accountability, family-oriented relationships
among colleagues and stakeholders, and recognition and celebration of successes. Each
of these elements is different within each of the organizations but is present and highly
visible in every one.

A culture of achievement was established among all stakeholders within all
schools of the successful leaders. Successful leaders make a habit of collecting ongoing
data and using these data to make decisions, a strategy known as data-driven decision-
making. Individual needs are addressed, but ultimately the focus is achievement. Not
only is achievement communicated verbally, but it is also displayed in some form of
reporting. In some cases, achievement results of individuals are posted on bulletin boards
and results are charted over time. Recognition of individuals achieving at high levels is
an ongoing practice and a climate is established within the schools that this recognition is
something to which everyone should aspire.

All successful leaders are adamant about the need to create and sustain a safe and
orderly school environment for all stakeholders, an environment that appeared different
in each of the schools observed in the study but nevertheless present and highly visible in
each. Students are expected to take pride in their appearance, yet they are given room for
individuality. Most students wear uniforms and are expected to tuck in their shirts and to
wear belts, and in some cases, ties and blazers. However, this is not a consistent variable
in any of the schools of successful leaders. The consistency amounted to the self-
discipline of the educators and students who take pride in what they are doing and have a
commitment to do their best and persevere until success is achieved.
Collaboration among educators is vital for school leaders. They recognize that everyone is instrumental in the education process and that the leaders could not stand alone. They speak of their educator colleagues as fellow soldiers in a battle and give great honor to them. Still, the leaders are also quick to recognize their need to be highly involved in the process daily as a means for sustaining this element of a culture. This theme is highly related to the shared mindset theme because the first step to building a collaborative team is to recruit staff members strategically and engage them in a process that eliminates those that do not share the vision and philosophy of the school. Among some of the common practices of the hiring practices of effective leaders are to explore the track record of the potential employee’s ability to exhibit problem solving skills and their track record of self discipline. In many cases, a new teacher entering the profession right out of college may not be able to handle the responsibilities of the role. They have to be able to be trusted with responsibility. This concept is explored further in the selection and development of people theme.

Successful leaders have developed ways to measure achievement and expected outcomes of all parties by creatively developing a variety of internal accountability systems. Measurement of just about everything deemed important exists and is communicated to all stakeholders, thus keeping accountability at high levels at all times. In some cases, educators who have a pattern of failing to be accountable are removed from the culture entirely. Leaders expressed that this removal is a rare occurrence but sometimes a necessary one in order to sustain the culture of achievement, discipline, collaboration, and accountability.
The family oriented relationships developed by the successful leaders within the organization are common in the schools of the study. This family atmosphere is surely present in the collaboration and overall climate of the school but becomes even more apparent with the leaders’ desire to see others succeed and achieve. The students are treated as if they were the actual children of the educators, which is present in the way that educators deeply care about successful outcomes for time and energy spent preparing and developing students. The educators also seem to treat each other like siblings in that even though there are occasional levels of strong disagreement in the collaboration process, in the end, a common direction is agreed upon so that everyone can move forward with little dissention.

The final common element of shaping and sustaining a culture is recognizing and intentionally celebrating success. Successful leaders have systems of recognition throughout the school year for all stakeholders. Areas of accomplishment are recognized and celebrated differently, yet they are visible in each environment. Student recognition ceremonies are common and a variety of celebration techniques are used to honor high achievers and others who have met goals in a variety of areas. In each of the environments, educators are also honored. In some situations, events are held specifically for the purpose of acknowledging fellow educators’ progress and accomplishments.

*Theme 7: Selection and Development of People*

Successful inner-city charter school leaders have extensive practices of selecting people to become staff members and a high level of commitment to developing them once these people become part of the team. Each leader implements a variety of hiring
practices, but commonalities exist in the hiring preconditions. Before being selected to
join the staff, or even to interview for a position on the staff, candidates are asked to
become informed about the mission and overall vision of the school, and then to observe
staff members in action to prepare potential candidate’s for daily realities of
responsibilities. The importance of this process is to provide an opportunity for the
candidate to observe the strong work ethic, high energy level, skill sets, and dedication
required of educators. Once the candidates are believed to have a clear understanding of
what is required, then they are asked to make a decision about whether or not they would
like to complete application requirements and get interviewed. The application
requirements in the interview process vary according to each leader, but the common
traits that exist are extensive questioning, finding out previous experience, and having a
trial run of some kind before receiving an employment contract. In some instances, after
an interview, candidates are required to teach a lesson that administrators observe and for
which the leaders provide feedback. Candidates are carefully monitored by administrators
for knowledge of instruction, interactions with the students, the ability to reflect on
practices, and ability to give and receive feedback.

In cases where new teachers were selected who had little to no previous teaching
experience outside of their teacher preparation programs, there are close examinations of
the young candidates’ ability to handle themselves and responsibilities independently.
For example, in cases in which young people are just out of college, had no employment
during that time, had no responsibilities to pay for school, or had low levels of
accountability, they would be considered high risk for failure and are not likely to be
selected. However, for new, young teachers just out of college who had work experience and exhibited strength to be able to handle large amounts of responsibility and had a track record of doing so, they are more likely to be hired but placed in a stringent new teacher induction program. This program is important because in the state of Ohio and other states that have only recently authorized charter schools as a public school option, most inner-city charter schools do not employ many veteran teachers. Most veteran teachers that become employed in charter schools can keep their retirement benefits as usual but lose their sick leave pay or other employment incentives related to accumulated leave days that translate to pay upon retirement. There are some veteran teachers with more than 10 years of teaching experience employed in each of the schools in the study, but in most cases had either already retired from other school districts and went back to work for a charter school or had obtained all their teaching experience in charter schools.

Once candidates are selected for staff positions, they participate in extensive professional development growth programs. All school leaders engage educators and pre-service training in which staff development is provided for at least one week prior to the beginning of the school year. In addition, throughout the year, regular training opportunities that are carefully selected are conducted, and then the outcome of this training is monitored for effective implementation. The types of professional development opportunities vary with each school leader but the processes are similar. Very little time is spent holding meetings in which large parts of the meeting are taken up with announcements or trivial tasks. Time to meet with fellow educators is used for
improving on what is called best practices and research-based methods to raise achievement.

Distinguished Actions or Conditions Leading to Themes

Specific characteristics and behaviors were present within successful leaders at high levels and absent or minimally present in comparison leaders. These characteristics and behaviors presented distinguishable actions or conditions existing at high levels in successful leaders that were absent or minimally present in comparison leaders. Identifying these actions and conditions led to the development of the 7 themes. These actions and conditions required the effective use of the characteristics and behaviors identified as having attributed to the leaders’ success.

*Action and Condition 1: Purposeful Platforms*

These successful school leaders used all platforms within the school to cast vision, set clear direction, and navigate the steps along the way to accomplishing goals. In some cases new platforms were created in order to enable the leader to have the ability to communicate to targeted groups. Successful school leaders conducted informal assessments to determine the needs of specific groups within the school and then create a platform to address those needs. Each time the leader met with the groups, a clear direction was set, goals were communicated, and specific data related to progress within those goals were present in some form. At times, the leader delegated meetings for training tasks within specific groups but expected the same process to happen whether or not the leader was the communicator.
Action and Condition 2: Proven Methods

All school leaders within the study were strong believers in professional development. The distinguishing factor between the leaders was the use of research-based methods related to instructional practices in curriculum implementation. The comparison leaders used these methods but at a minimal level. Successful school leaders had a system in place for monitoring the implementation of proven methods within all possible areas of the school.

Action and Condition 3: Maximum Use of Academic Time

All school leaders were careful about using their time within the school day but the successful leaders were exemplary in minimizing school transitions. Strong priority was placed upon the need to begin the teaching process immediately during the school day. Structured academic activities were present at times throughout the day when students are not receiving direct instruction such as lunch, riding the bus, switching classrooms, and waiting for the restroom. Students were expected to use time productively for learning and were encouraged to be engaged with fellow students in the process. These elements were part of the ability to create a culture of achievement and self-discipline in which the focus of the academic institution was to keep oneself focused on academic progress and to put forth one’s best efforts at all times.

In some situations, students and schools with comparison leaders had more than six classroom rotations and used up to 10 minutes at a time before beginning the next class, meaning there were potentially 30 minutes of lost instructional time per day for the students. Successful school leaders were able to minimize this loss. They each had
different strategies for doing so, but the results of the transitional time of students for successful leaders was significantly better than for comparison leaders, although all leaders recognized the need to continue to improve loss of academic time.

*Action and Condition 4: Relationship Capacity*

All school leaders within the study were relational in some form with all stakeholders but the successful leaders seemed to have a deeper capacity to develop relationships than those for comparison leaders. Successful leaders were aware to some degree of the personal interests and the backgrounds of staff members and their families. The leaders took time to listen to people along the way even though their time always seemed to be limited. Successful leaders seem to utilize this knowledge to motivate staff members to improved performance, to stretch themselves to experience new things, and to seize opportunities to contribute to the overall vision of the school. Comparison leaders did exhibit this knowledge and ability but at minimal levels.

*Action and Condition 5: Level of Expertise and Team Development*

The 5 leaders within the study all varied within the many facets of the organization in levels of expertise such as instructional leadership, communication skills, and overall school operations. There are so many different components to the demands of an inner-city charter school leader in which the expertise is difficult to measure. However, the significant difference between successful leaders and comparison leaders was the ability to have strengths present in all areas regardless of whether or not the strength resided within the leader. The successful leaders tended to operate from their strengths and delegate responsibilities according to their weaknesses to other team
members who exhibited strengths the leaders lacked. Successful leaders made a conscious effort to have diverse people with different abilities around them. These leaders were not afraid to admit weaknesses or to reveal a lack of ability in certain areas. Comparison leaders seem to be less aware of their strengths and weaknesses. In some cases, certain tasks or responsibilities should have been delegated, but for some reason inhibited the comparison leader’s ability to delegate a task. In some cases, the comparison leader was not aware of other team members who exhibited a needed capacity. In other cases, the comparison leader did not have a team member to delegate to who was believed to be able to handle the responsibility. When cases like this were present for successful leaders, they tended to research how they might obtain a partnership with someone who could handle the responsibility, or if appropriate, they sought to recruit a new staff member with this ability.

Discrepant or Nonconfirming Data

Any discrepant or non-confirming data in the study was not utilized in the development of the 7 themes. This decision was made by the researchers because of the limited number of subjects in the study. In order to qualify it as a variable attributing to the success of the leaders, the characteristic or behavior needed to be present at high levels in the successful leaders and absent or only minimally present in comparison leaders. Any data that did not meet this qualifier were not utilized in the study. The tabulations resulting in these 7 themes are illustrated in Table 1.
Nonsalient Data

There were many comments and points of discussion during the interview stage that did not render results or provide salient data and therefore are not commented on or utilized in the findings of this study. Still, it is important to note that both successful and comparison leaders in the study experienced common challenges that are ongoing points of needed resolution. One example was how a school manages funding issues. Another was the pressures of the district, state, and federal accountability laws especially related to funding and the lack of monies allocated to public schools for facilities not accessible to charter schools. These questions invoked much discussion but were not used in the study because they were not elements or variables leading to the leaders’ success.

Summary

This qualitative exploratory multiple case study searched for characteristics and behaviors of successful inner-city charter school leaders and comparison leaders. The criteria for selecting leaders for the study were based upon specific demographics from the Ohio Department of Education. Participants were leaders in schools with an enrollment of more than 200 students, including grades 4-8, with a 60% or higher poverty rate who sustained an effective school rating or better in the state of Ohio for more than 3 years.

The observations produced 27 identifiable actions and conditions present at high levels in successful leaders that were minimally present or absent in comparison leaders. The interviews produced 5 actions and conditions that were also present at high levels in successful leaders that were minimally present or absent in comparison leaders. The
findings of both sets of data were compared and the process of axial coding was used to identify 7 emerging themes. Although many themes existed among all leaders, there were 7 distinguishable characteristics and behaviors among successful leaders in the study that were absent or existed at minimal levels in comparison leaders. This researcher determined these characteristics and behaviors as themes from the results of data collection and analysis from interviews and observations of three successful inner-city charter school leaders and two comparison leaders. The 7 themes that emerged were salient concepts present at high levels from the results within the study of the three successful leaders, but minimally existed or were absent from those of the comparison leaders. Although the study was conducted in the state of Ohio, the results can be applied to any inner-city charter school leaders throughout the nation.

The 7 themes that emerged from the study were as follows: Theme 1: Consistent Navigation, Theme 2: Holistic Focus, Theme 3: Shared Mindset, Theme 4: Mission Alignment, Theme 5: Resourcefulness, Theme 6: Shaping and Sustaining Culture, and Theme 7: Selection and Development of People. The 7 themes represent the results of common characteristics and behaviors of each of the successful leaders that were minimal or completely absent in comparison leaders. Specific characteristics and behaviors were present within successful leaders at high levels and absent or minimally present in comparison leaders. These characteristics and behaviors presented distinguishable actions or conditions present at high levels in successful leaders that were absent or minimally present in comparison leaders. The identification of these actions and conditions led to the development of the 7 themes. The tabulations or characteristics and behaviors leading
to the 7 themes are illustrated in Table 1. These 7 themes were examined at the conclusion of the study for comparison with the background theoretical framework that served as the foundation for this study. The previous studies used were based upon results of Collins (2001) in the study of good-to-great companies and builds upon this with the Gray and Streshly (2008) study of characteristics of highly successful principals in good-to-great schools. The comparison of the outcomes of this study is illustrated in chapter 5 in the theoretical framework section.
CHAPTER 5:
SUMMARY, CONCLUSION, AND RECOMMENDATIONS

Overview

The purpose of this study was to identify characteristics and behaviors of successful inner-city charter school leaders that are causes of their success with academic achievement by comparing them to leaders with like demographics that have not achieved the level of success based upon the criteria for success in the study. The criteria for selection in the study were based upon specific demographics from the Ohio Department of Education. Participants were leaders in schools in the state of Ohio with an enrollment of more than 200 students, including grades 4-8, with a 60% or higher poverty rate who sustained an effective school rating or better in the state of Ohio for more than 3 years. This study was conducted as a qualitative exploratory multiple case study with an inductive approach in which the researcher explored two research questions. These questions were targeted at identifying what characteristics and behaviors are exhibited in successful inner-city charter school leaders that relate specifically to student academic achievement and identifying what new characteristics and behaviors are exhibited that were not mentioned in the previous Gray and Streshly (2008) study on characteristics of highly successful school principals.

The outcome of the study produced 7 emerging themes, each of which was present at high levels in the three successful leaders of inner-city charter schools within the study. For the two comparison leaders in the study, these themes were absent or present at minimal levels. The themes that emerged related to the success of the school
leaders were as follows: Theme 1: Consistent Navigation; Theme 2: Holistic Focus; Theme 3: Shared Mindset; Theme 4: Mission Alignment; Theme 5: Resourcefulness; Theme 6: Shaping and Sustaining Culture; and Theme 7: Selection and Development of People.

The 7 themes that emerged from the study represent the results of common characteristics and behaviors of each of the successful leaders that were minimized or completely absent in comparison leaders. Specific characteristics and behaviors were present within successful leaders at high levels and absent of minimally present in comparison leaders. These characteristics and behaviors presented distinguishable actions or conditions existing at high levels in successful leaders that were absent or minimally present in comparison leaders. The identification of these actions and conditions led to the development of the 7 themes. The 7 themes are also compared in this chapter to previous studies used as a theoretical framework.

Interpretation of Findings

The effects of the leadership crisis existing in inner-city charter schools and the attitudes and perceptions of what has resulted in failed leadership were the guiding principles that led to conducting this study. Seven significant themes emerged from analyzing the data obtained from the 5 leaders of inner-city charter schools and are explained at length in chapter 4. Within the findings it was discovered that the characteristics and behaviors themselves in the individuals did not result in their success, but rather, the cause for success was in the way the leaders used their own characteristics and behaviors to achieve excellence. Within the findings, specific actions and conditions
present were identified that demonstrated significant differences between successful leaders and comparison leaders. There were 5 distinguishable actions and conditions present at high levels within successful leaders and absent or minimally present in comparison leaders. These actions and conditions were purposeful platforms, proven methods, maximum use of academic time, relationship capacity, level of expertise, and team development.

It was noted that many characteristics and behaviors were present within all leaders in the study but that the differences resided within the levels of activity in which the characteristics and behaviors were displayed. These actions were aligned with the noted characteristics and behaviors that caused the 7 themes to emerge. The tabulations resulting in the characteristics and behaviors that led to the 7 themes are illustrated in Table 1. These characteristics and behaviors presented distinguishable actions or conditions present at high levels in successful leaders that were absent or minimally present in comparison leaders. Identifying these actions and conditions led to the development of the 7 themes. The 7 themes and conclusions are summarized as follow.

Theme 1: Consistent Navigation

The theme of consistent navigation seemed to stand alone in some instances and to be integrated in the other themes in others. Navigation was at the forefront of each successful inner-city charter school leader’s mind at all times as he or she engaged in various activities throughout the day. Priorities were given to activities that would better serve the leader’s navigational goals. Navigating consistently and effectively depended upon the leader’s clear vision and understanding of current reality within the
organization. Successful leaders maintained the ability to know the facts of current conditions coupled with a vision of what needed to be accomplished and the steps to be taken to arrive at that destination. The characteristic of consistency, also categorized as perseverance, was integrated in other themes. In order to apply consistency properly, leaders needed the skills to develop genuine relationships in order to accomplish the outcomes related to these other themes.

*Theme 2: Holistic Focus*

The holistic focus theme required the integration of other themes. In order to become aware of the needs of students and fellow stakeholders, leaders needed to possess “people” skills to build genuine relationships. There was also a need to develop a variety of programs based upon the unique needs of the individuals in the organization. Programs within the schools in the study were different because the needs of the people varied. The common trait in all successful leaders related to holistic focus was the ability to meet individual needs by creating and maintaining programs that addressed those needs. In some instances, the programs revolved around health needs within the community; therefore, leaders initiated and sustained a community health program with nurses and health agency partners. In other instances, the programs consisted of a variety of academic plans added for the sole purpose of meeting specific needs of an individual or group. These programs were absent or present at minimal levels for comparison leaders. In many cases, these leaders were aware of the problems they faced but failed to address them and cited lack of resources as a reason. Successful leaders have a strategy for discovering needs within the organization and a plan for addressing each need. This
theme had a stark difference in the findings. Successful leaders prioritized knowing their school’s needs and addressing them, and comparison leaders seemed to lack awareness and problem solving skills when presented with situations they deemed outside of the realm of general education.

*Theme 3: Shared Mindset*

The shared mindset seemed to be difficult in many ways for successful leaders to detect until they had spent time with team members or fellow educators. They recruited who they believe to have a "shared mindset" (those exact words were used often), but in some cases they discovered later that they were wrong. This theme is a difficult tightrope for successful leaders to walk. On one hand, successful leaders needed to build strong relationships in which trust is integral. In the interviews, every one of the successful leaders talked about the challenges in selecting quality people, but the differences resided in their ability to take action when someone was not right for the environment. Successful leaders needed to be able to make the tough calls to remove people that have become what was described as "cancers to the organization." In these situations, successful leaders had a strategy of heightening communication to the remaining team members when one fellow team member or more had to be removed from the organization. All of the successful leaders were honest and open about the reasons for removal and involved committed team members in the decision and in the process for addressing issues along the way. Successful leaders described a period of healing in situations like these but stated that over time trust was built, and most people were found
in the study to be confident that their leaders would take the right action to benefit the entire organization.

Successful leaders also acknowledged that sometimes people who have a shared mindset experience something in their lives that changes them, and therefore, those changes within the individual can end up impacting the organization negatively. Cases like this are the most difficult for these accomplished leaders, who expressed that in order to be faithful to the mission and maintain a healthy climate where the shared mindset is truly representative of the overall school vision, action must be taken to try to correct a faulty mindset. If the action is not effective, then ultimately the individual must be removed from the organization.

Theme 4: Mission Alignment

The mission alignment theme was most effectively accomplished by leaders who had the most experience. In order to be effective in aligning all objectives and activities with school goals and ultimately the school mission, leaders needed to have years of experience and many opportunities with trial and error. Successful leaders did not experiment with anything that they were not sure would work or had worked in a previous instance. They believed in research based methods for just about every part of the school, utilizing instructional strategies, classroom and overall school management tactics, school design, and just about everything else based in research. The leaders’ creativity came within the holistic components of the organization. They carefully calculated types of programs that would accomplish their mission and yet meet the holistic needs of the students.
Successful inner-city charter school leaders acknowledged that in their early years of leadership, they would not have known the skills sets and knowledge base required to be truly effective in aligning with their mission. This element is unique to each environment and in order to be successful, leaders must be in the same environment for several years in order to understand how to align everything to accomplish the one big goal or mission. In each case of the successful leaders, they had been with the organization previously as teachers or as original founders of the school. The comparison leaders and the schools were hired to their position from outside and seem to have a larger learning curve for how to align objectives and activities to their mission.

Theme 5: Resourcefulness

The resourceful theme was the most disappointing one for this researcher. Somehow the successful leaders were able to do a lot with very little. They were happy with their facilities, with anything they were given, and complained little or not at all. These schools had an excellent curriculum, technology applications, and necessary supplies to provide quality education but in many cases, these leaders had to go outside of the bounds of their per-pupil allocations in order to be able to obtain these necessary resources. They saw themselves and their staffs as the most important resources in a child's education. They made themselves accountable and made no excuses in areas in which they were lacking. The leaders’ relationships with outside stakeholders were vital for providing ongoing resources. In order to maintain relationships with stakeholders, the leaders allowed access to students in order to build the necessary emotional hook.
Theme 6: Shaping and Sustaining School Culture

Being able to shape and sustain school culture was one of the first two factors mentioned by school leaders during each interview. The importance placed upon this theme was tremendous for growth of both successful and comparison leaders. The difference between the two was obviously that successful leaders had a strong ability to shape a strong positive school culture and comparison leaders did not. One of the factors that came to light was that in each of the situations of the successful leaders in the study, these leaders had grown up within the organization in some way. The successful leaders were either part of the original founding team, had a different position within the school and were later promoted to a leadership position, or had a certain connection to the school for some time prior to obtaining a leadership role. The comparison leaders in the study did not have a history with the school in which they were working prior to becoming a school leader. This situation seemed to cause a blind spot for these leaders and make them less effective in their positions even though they had been leaders of their school for the same amount of time the successful leaders had been.

Theme 7: Selection and Development of People

Selection and development of people was a constant theme of all leaders in the study. There was a stark difference also with this theme between the successful leaders and comparison leaders. Successful leaders seem to be choosier about who was selected to be part of the staff and comparison leaders were more willing to take a chance on people who at a first impression seemed to fit the teacher demographic. Another stark difference between successful and comparison leaders was in the development process.
Successful inner-city charter school leaders spent large amounts of time prior to the first day of school building culture and making sure all team members started with a specific knowledge base. Throughout the year, skill sets to accompany the knowledge base was developed within all staff members. Recognition was given that everyone would be at different levels, but emphasis for successful leaders was on the process of development. Comparison leaders also said they focused on development and spent time in meetings that they called staff development meetings, but the activities paled in comparison to those of successful leaders. Part of the reason for the lack of quality development for comparison leaders is that they seem to be less involved in staff development and delegated such a task to team members. Successful leaders were highly involved in executing development programs and more involved at high levels. Successful school leaders described the development of people as one of their top priorities and emphasized that nearly half of their time is spent developing others in some way.

Previous Studies Used as Theoretical Framework

The theoretical framework for this study began with a foundation based upon results of Collins (2001) in the study of good-to-great companies and builds upon this with the Gray and Streshly (2008) study of characteristics of highly successful principals in good-to-great schools. Gray and Streshly (2008) studied highly successful principals in order to identify certain characteristics and behaviors that cause schools to be very successful. This study built upon the research of Collins (2001) that sought to establish whether or not the qualities of CEOs in good-to-great companies were related to behaviors in highly successful public school principals. The results of the study indicated
leadership qualities exhibited by principals who have been very successful in increasing student academic achievement regardless of the obstacles they may have faced. The study also explored the similarities and differences between school principals and business leaders and identified universal leadership attributes applicable to the business and social sectors, both private and public. The outcomes of the study were designed for those who aspire to be successful school leaders while taking into consideration the needs of the 21st century.

Gray and Streshly (2008) discovered that successful school leaders exhibit a wide range of personalities that contain specific solid core leadership qualities and characteristics that attribute to the accomplishments of their schools. This qualitative study identified elements necessary to produce great schools and explored characteristics of the principals that can be correlated with long-term educational success. It also identified the absence of leadership characteristics that cause failure in accomplishing goals in low-performing schools of comparable demographics. The outcomes in the Gray and Streshly study revealed a close alignment of the results in the Collins (2001) study with one key distinction between CEOs and the highly successful school principal, which was that the highly successful school principal had the ability to build relationships among faculty.

Findings Compared to the Theoretical Framework

After illustrating the characteristics and behaviors of successful leaders that led to the findings of the 7 themes and identifying distinguishable actions or conditions present at high levels in successful leaders that were absent of minimally present in comparison
leaders, the second research question was able to be resolved: “What new characteristics and behaviors are exhibited that were not mentioned in the previous Gray and Streshly (2008) study?” In order to answer this research question, the data related to be successful school leaders needed to be analyzed. The findings of the characteristics and behaviors of successful school leaders and the themes that emerged along with the actions and conditions that led to the development of the themes needed closer examination for comparison with the findings in previous studies. The foundation of this study is based upon the results of Collins (2001) and the outcomes of Gray and Streshly (2008). Both of these studies identified leadership characteristics that can be attributed to sustained success. There are specific leadership characteristics for leaders of good-to-great companies that Collins described as level 5 qualities. The leaders who possess those characteristics can guide a business to sustained success. Specific leadership characteristics aligned with the outcomes of good-to-great companies are what Gray and Streshly discovered in good-to-great schools.

The outcomes in the Gray and Streshly (2008) study revealed a close alignment of the results in the Collins (2001) study with one key distinction between CEOs and the highly successful school principal, which was that the highly successful school principal had the ability to build relationships among faculty. The outcomes of this study also reveal alignment of the results in the Collins study and the Gray and Streshly study. The outcomes of the Collins (2001) study of executives of good-to-great companies are as follows: (a) exhibited hedgehog concept, (b) confronted the brutal facts, (c) had ambition for success of the school, (d) understood how to select people and put them in the right
positions, (e) exuded a culture of discipline, (f) exhibited duality of professional will and personal humility, (g) had compelling modesty, and (h) had unwavering resolve.

The findings in this study also exhibited the hedgehog concept. In a similar manner, the successful school leaders were passionate about student academic achievement, were clear about the strengths and the purpose of the school, and aligned behaviors to address a specific focus. The successful leaders in this study exhibited the ability to confront the brutal facts by obtaining real data including analyzing student academic achievement and demographics with a commitment to work through challenges regardless of the obstacles. As in the Collins (2001) and Gray and Streshly (2008) studies, the successful leaders in this study demonstrated their ambitions for school success by encouraging professionalism and leadership among staff, developing school leadership successors, and putting the school before personal ambitions. They also exhibited the ability to understand how to select people and put them in the right positions because they had the latitude to hire and fire staff. The successful leaders remained persistent in getting the right people even if they had to maintain less successful staff for a short period of time.

The results of the culture of discipline were also aligned with the findings in the previous studies even to the point of the lack of micromanagement tactics in which teacher responsibility was promoted in focusing on student academic achievement. The school leaders did exhibit the same duality of professional will and personal humility as in the previous studies as well. Also, as in previous studies, the successful leaders in this study demonstrated unwavering resolve by exhibiting relentlessness, aggressiveness,
persuasion, and continuous involvement in the primary operations. The distinguishing factor in highly successful school principals in the Gray and Streshly (2008) study was the ability to build relationships with staff members, and this ability was also a trait present in successful school leaders in this study.

The differences among the outcomes in this study and the previous studies were related to the nature of the work environment and the expertise required of successful leaders because of the unique characteristics of inner-city charter schools. The responsibilities of the leaders of inner-city charter schools are much more extensive than those of traditional school leaders and require strength in many diverse areas in order to be successful. However, the leadership process, mindset, and overall characteristics and behaviors of the leaders are very much aligned in the outcomes of this study to those of previous studies.

Diverse Expertise with Team Leadership

The essential difference between the findings of this study and those in the previous studies was the need for successful leaders of urban charter schools to have diverse expertise and a strong cohesive team of leaders around them. To address the vast areas of need in these settings effectively, a team of leaders is needed. Previous studies explored the themes related to developing others but not in this context. Urban charter school leaders are limited in the amount of success they can have without a team of leaders. Thus, much time and effort is spent on developing successors for areas of responsibility. Once a person is ready to assume responsibility and can be trusted to be a strong team player, the leader then concentrates on another area of need.
Implications for Social Change

According to Reed (2004), moments of sharp social change can condense abruptly, when least expected. This study has the potential to offer sharp social change. It is significant for scholarly research and literature in the education field because of the requirement for successful leadership in areas of high need. Many of the charter schools that exist are serving students living at high levels of poverty who had traditionally been low achieving. The results of this study can provide leaders of inner-city charter schools across the nation with the awareness of 7 needed areas of development within themselves and their leadership teams. The leaders involved in this study recognized the fact that this process is ongoing and their level of success was not reached until three or more years within a program. This point is stated to offer hope to those new school leaders of programs that have existed only for a few short years and to encourage them to go back and revisit the 7 themes to ensure them that the themes are embodied within all leaders as they build a school culture.

Recommendations for Action

The findings of this study should be communicated to all inner-city charter school leaders because these findings can be applied throughout the nation. Davis (2007) emphasized most credible research is subject to different interpretations and should be used as a road map. This researcher advises that the outcomes of this study be used as a road map but also as practical application. This researcher plans to simplify the findings of this study in the form of a publishable booklet and media presentation, which will
include key bullet points with the findings from this study and video segments illustrating the explanations of the results. The media presentation will be useful in allowing a visual representation for the characteristics and behaviors of successful leaders along with the actions and conditions created by the leaders. Media representation will minimize some elements of the study that a typical reader may miss. This researcher plans to request if she can present this study at the National Charter School Conference in June of 2009 in Washington, D.C. All stakeholders at charter schools will benefit from awareness of this study, especially those located in urban areas with similar demographics.

Recommendations for Future Research

Future studies relevant to inner-city charter schools are needed. Charter schools are still relatively new and still do not exist in 10 different states in the nation. Studies that have been done relating to urban issues and schools in general are limited. Whitsett (2007) argued that much has been written about leadership in business but very little research has been conducted on leadership and academic areas. Duke (2006) argued for the need of more research on both successful and unsuccessful efforts to turn around low-performing schools and emphasized the need to know why some turnaround efforts succeed and others do not. Stollar, Curtis, & Cohen (2006) highlighted a major disconnection between large bodies of research on effective educational practices and what is actually occurring in many schools.
There are even fewer studies involving charter schools. Future studies related to how urban charter schools address the issues of the urban including poverty, involvement of dysfunctional families, and how these schools break cycles of low academic achievement for these students would have many potential benefits. Studies addressing the achievement gap have been conducted, but more are needed about how charter schools are addressing this gap.

The internal workings of urban charter schools vary from school to school due to the diverse programming related to each school’s focus. Further study is needed about whether or not the different programming is meeting the needs of the students enrolled and whether or not the open enrollment mandate is conducive to specially designed charter schools targeted to students with particular needs, abilities, or interests. The question to be answered in a study such as this is whether or not it would be beneficial to have students demonstrate sincere interest and ability before being enrolled in a particular type of charter school. For example, if a school is a college preparatory school, then how different would the school’s success be if the student and the family had a sincere intent for their child to go to college? If a parent has no interest in the programming and no interest in the child going to college, what would happen to the rate of school success if this student was not permitted to enroll in this public program?

Further in-depth study is also needed within each of the 7 themes that emerged in the study individually in order to explore the content in depth for the full benefit of future school leaders. A study such as this would render detailed strategies in place for different successful school leaders that would allow other leaders to learn of a variety of methods
used within each theme. It would be interesting to discover the different ways other leaders across the nation who use the 7 themes effectively implement the themes and how they take their populations into consideration when making decisions. Further research is also needed on the actions and conditions leading up to the 7 themes. It would be of interest to other school leaders to determine how to create these conditions themselves within their organizations. This particular study identified the presence of the themes and the conditions under which they exist but did not identify how the leader specifically created them.

Additional research is also needed on the factors that can be attributed to increased challenges for inner-city charter school leaders such as the amount of funding or per pupil allocations for charter schools that is one-third less than their public-school counterparts. The successful leaders in this study were able to be resourceful in were able to meet the needs of the student populations but admitted that limited funding was an ongoing concern in that dependence upon community partners was something they wish they did not have to rely upon. Additional research is also needed on how to increase school facility purchases or new building opportunities. Many of the challenges faced by school leaders in this study were due to school facility issues and lack of funding. The successful leaders in this study were able to minimize the effects these obstacles had on the outcomes of student achievement, yet they were ever present challenges, which cause one to consider what the schools may be able to accomplish if these challenges were indeed minimized.
Reflection

During the entire study, this researcher's experience was life-changing. It was a great opportunity to be able to visit all of the schools and observe these leaders in their daily operations and in variety of activities. It was very difficult throughout the process to remove myself professionally when observing the leaders in their natural environment and listening to the answers to the interview questions in the dialog that transpired as a result. As a fellow charter school leader, I found myself comparing my own school environment to those that I observed, and thus had to discipline myself to keep that thinking completely separate.

I appreciated the extensive time all of the leaders involved in the study allowed me to take from them. It was difficult for me to leave my own work responsibilities and travel across the state for periods of time to conduct the observations, but it was well worth it and the best part of the entire research process for my research partner and me. Just as it seemed that this study was going to take a lot more time than I had allocated in the plan, I received an announcement that there would be a state charter school conference in the middle of the time that I was conducting the study. This opportunity allowed me to encourage all participants in the study to attend this conference so that I could schedule all of the interviews within a three-day time span. Although the process was exhausting, it was also very productive and beneficial. There was some value in the fact that I was able to conduct interviews with all participants within a short time frame. I think this variable a cause for improved questioning and better dialogue with each interviewee. In some circumstances, I could tell that the leaders were rushed for time and
had given me minimal pieces of information, but I realized they were doing the best that they could given the limited time that they had within their day to spend communicating with me and my research partner. If I had additional questions, I was able to locate the participant quickly at the conference, strike up a new dialogue, and obtain the needed information. The contributions of all these leaders demonstrated the sincere interest that school leaders have to improve the profession of education as a whole. Every one of the participants in the study looked forward to my sharing the results. In the future, if I am able to develop this study into a booklet or presentation, I believe that these leaders in particular would take this information and implement the findings immediately.

**Findings Compared to Previous Studies**

The main difference between the findings of this study and those in the previous studies was the need to have more varied expertise and the need to develop a strong cohesive team of leaders around the top leader in order to effectively address the vast areas of need in an urban setting. Expertise in many more areas is needed for charter school leaders’ success than for any traditional school leader, including the need to be effective with school business operations, organizational design and leadership, facilities, federal programs, transportation, human resources, and common school principal duties including instructional leaders.

The Gray and Steshly (2008) study was conducted in the state of California and utilized highly successful principals who had a much different demographic than the school leaders used in this study. All of the school leaders in this study are working within a demographic of high poverty conditions and low achievement and were given
the expectation to obtain an *effective* rating or better while combating the challenges of the inner-city and poverty with one third less funding than that of traditional public schools. While conducting the research, it became apparent that the amount of the effort and expertise to achieve success for inner-city charter schools would look much different than that of traditional leaders because of the very unique challenges these charter school leaders face. Still, the measurement of the leaders is the same: strictly by state achievement test data and overall school rating data mostly determined by testing outcomes.

**Conclusion**

This study explored the characteristics and behaviors of successful inner-city charter school leaders. The results produced 7 emerging themes that were present at high levels within the successful leaders and absent or minimally present within the comparison leaders. The sample size and the study were small and cannot be generalized throughout the whole population of inner-city charter school leaders; however, the researchers were successful in exploring each of the leaders and their roles in depth, and discovered from this study clear and distinct emerging themes that have resulted in the 7 themes of successful inner-city charter school leaders. There is much to gain from the findings of this study for inner-city charter school leaders and their stakeholders. This study demonstrates that effective implementation of the characteristics and behaviors identified in the findings along with the actions and conditions that led to the themes of these successful leaders will create success for inner-city charter school leaders in the 21st century.

South Dakota 2.0: You may still find the occasional barn raising in one room school house, but a plan for technologically advanced schools that first took root more than a decade ago has ushered the state into the digital age. *THE Journal (Technological Horizons In Education), 34* (7), 14+.

APPENDIX A:

OBSERVATION EXERCISES

The observation exercises will not be limited to the items listed in this appendix. The items included are examples of the types of observations that were conducted by two researchers simultaneously as described at length in the methodology located in chapter 3 within the instrumentation section. Types of observations will include the following:

1. Interactions with people throughout the day within the school organization including students, parents, teachers, and other stakeholders.

2. Reactions of people during interactions with the leader.

3. Roles the leader assumes and action the leader takes in different situations.

4. The amount of time the leader takes throughout the day engaging in various activities.

5. Decision-making processes.

6. Staff meetings

7. Small group meetings

8. Problem solving opportunities

9. Communication strategies

10. Leadership style and how others are impacted
APPENDIX B:

DEMOGRAPHIC QUESTIONNAIRE

1. Give me an overview of your work history.

2. Give me a brief description of the demographics of the school. Students?
   Teachers? Parents? Socio-economic levels? Percent of students living in poverty level? Enrollment?

3. What are the common issues you face as an urban charter school in your city and state?

4. How did you become the leader of the school?

5. What kind of leadership style do you think you have?

6. What kind of leadership style would your staff say that you have?

7. List certifications and administrative preparation courses you have taken. On a scale of one to 5 how would you rate them? (1: of value; 5: of great value.) If 3 or more: give me a few examples of elements of your coursework that you believe to be of value to the work you do as a school leader.

8. Whom do you consider to be your mentors? Talk to me about that person(s) and why he or she is your mentor.

9. Talk to me about some experiences related to work or your personal life or experience that you have had in the past you believe helped to shape your leadership.

10. When you leave your position is school leader, what do you want to be remembered for?
APPENDIX C:
INTERVIEW QUESTIONS

The following research questions are modified from the questions in the Gray and Streshly (2008) study and will guide the interview:

1. Take a minute to write down the top 5 factors that you think have contributed to school success in improving student academic achievement performance. When you think you have the top 5, number them in order of importance with one being the most important factor. Let me know what you have written beginning with number one.

2. Give some examples that illustrate the factors that you chose as the top 5 factors contributing to the school success.

3. What decision did the school make to initiate an increase in student academic achievement during the years prior to achieving success? What sparked that decision? What latitude did you have as the leader of the school to make the decisions you had to make? In what ways were you restricted?

4. What process did you and the school staff use to make key decisions and develop key strategies that led to the increase in student academic achievement performance at the school? (This is not what decisions the school made, but how you went about making them.)

5. On a scale of one to 10, what confidence did you have in the decisions at the time they were made before you knew their outcome? (10: you had great confidence that they were good decisions with a high probability of success; 1: you had little
confidence in the decisions; they seemed risky or chancy.) If the interviewee has confidence of 6 or greater, ask: What gave you such confidence in the decisions?

6. How did the school gain commitment in agreement with its decisions from everyone? Teachers, parents, students? Give me a specific example of how this took place.

7. How does your school manage the pressures of the district, state, and federal accountability law making these long-term changes for the future?

8. One of the remarkable aspects of your school’s transition is that it moved forward over several years, and was not just a short-term upswing. What makes your school different? What were the primary factors in maintaining the similar schools’ ranking over the years?

9. Tell me about one particularly powerful example or vignette from your experience or observation that, to you exemplifies the essence of the success at your school.

10. What did you do to ensure that teachers continue to focus on improving student test performance?

11. What do or did you want most for your school?

12. When you think about your work here, where you most proud of?

13. What efforts did you make to ensure that the school continued to sustain success?

14. What else would you like to tell me about the reasons for the success of your school and raising student academic achievement?
APPENDIX D:

CONSENT FORM

You are invited to take part in a research study of characteristics and behaviors of successful urban charter school leaders. You were chosen for the study because you are the leader of an urban charter school. Please read this form and ask any questions you have before agreeing to be part of the study. This study is being conducted by a researcher named Lisa Hamm, who is a doctoral student at Walden University.

Background Information:
The purpose of this study is to identify characteristics and behaviors of urban charter school leaders that cause the increase of student academic achievement, and school success.

Procedures:
If you agree to be in this study, you will be asked to:

- Review a series of questions sent via email
- Share your point of view on the questions by participating in an informal interview via video conferencing, or other preferred method
- Be available for a follow up phone call if clarification or further explanation is needed

Voluntary Nature of the Study:
Your participation in this study is voluntary. This means that everyone will respect your decision of whether or not you want to be in the study. No one at Walden University will treat you differently if you decide not to be in the study. If you decide to join the study now, you can still change your mind later. If you feel stressed during the study you may stop at any time. You may skip any questions that you feel are too personal.

Risks and Benefits of Being in the Study:
Your participation in this study presents little risk of problems. However, your participation may yield findings for this study that can be used to make select and develop inner-city charter school leaders to be successful, and to transform schools in need.

Compensation:
There is no compensation for participating in this study but as a gift for your participation, registration will be provided for the next National Charter School or State Charter School Conference of your choice. You may email the researcher the listing of the conference of your choosing and registration information completed according to the
expectation of the organization selected and the registration will be paid and a confirmation will be forwarded to you immediately.

Confidentiality:
Any information you provide will be anonymous. The researcher will not use your information for any purposes outside of this research project. Also, the researcher will not include your name or anything else that could identify you in any reports of the study. If you consent to this study, please sign the consent form as “anonymous participant.”

Contacts and Questions:
The researcher’s name is Lisa Hamm. The researcher’s faculty advisor is Dr. Charles McElroy. You may ask any questions you have now. Or if you have questions later, you may email the researcher at lisahamm@zoomtown.com or the advisor at charles.mcelroy@waldenu.edu. If you want to talk privately about your rights as a participant, you can call Dr. Leilani Endicott. She is the Director of the Research Center at Walden University. Her phone number is 1-800-925-3368, extension 1210.

The researcher will give you a copy of this form to keep.

Statement of Consent:

☐ I have read the above information. I have received answers to any questions I have at this time. I am 18 years of age or older, and I consent to participate in the study.

Printed Name of Participant

Participant’s Written or Electronic* Signature

Researcher’s Written or Electronic* Signature

Electronic signatures are regulated by the Uniform Electronic Transactions Act. Legally, an "electronic signature" can be the person’s typed name, their email address, or any other identifying marker. An electronic signature is just as valid as a written signature as long as both parties have agreed to conduct the transaction electronically.
### Table E.1
Primary Researcher: Observation of Successful Leader 1

Field notes of observation:

<table>
<thead>
<tr>
<th>Time</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>8:00 a.m.</td>
<td>This school is in a building that appears to have been a former warehouse or a small factory that has been converted into a school. As we enter the first floor, we come to an office that houses at least three organizations, one of which is the school. The principal greets us and walks us down a long hallway. He tells us that there are a lot of steps and because we have so much to carry, i.e., our laptops and bags, we will take the elevator to the fourth floor. We start to tour the school and conduct our observations immediately.</td>
</tr>
<tr>
<td>9:00 a.m.</td>
<td>I stand in the hallway of the school, and within minutes of a fairly quiet bell, students file out of their classrooms facing forward in straight quiet lines. The first student in the line stops at the end of the hallway and awaits instruction to move forward from the teacher. The students are wearing uniforms, neatly buttoned up with their shirts tucked in. The name of the school is embroidered on the jackets. Upon direction from the teacher, students file into the next classroom and sit down quietly the moment the bell rings for the beginning of class instruction.</td>
</tr>
<tr>
<td>9:03 a.m.</td>
<td>The teacher starts the class promptly by greeting the students and informing them of the day’s objectives.</td>
</tr>
</tbody>
</table>

Facility challenges
- Resourceful
- Thoughtful

Order
- Organized
- Disciplined
- Routines are established
- Students move quickly from one place to another
- Transition time is less than three minutes
- Noise level is low
- Everyone is acting according to expectations
- Academic time is maximized
- School culture of discipline and order

Culture of achievement
- Culture of high expectations
- Procedures and routines established
Field notes of observation:

| As I walk through the hallways, the bulletin boards are filled with charts and graphs displaying achievement progress of the students. The charts measure various school or teacher made exam outcomes. Some of them display school progress over the years on the state test. This particular board is located in an area where teachers work and hold meetings. Other boards indicating particular grade level progress are located outside of the classrooms and the hallways that the students frequent. On the walls there are also pictures of students with their names and the reason they are being honored listed under their names. In many cases, their grade point averages are listed along with the college they plan to attend. | Culture of achievement displayed  
Celebration of learning displayed  
Effective and ongoing use of data  
Celebration for Learning  
Vision for Students |
|---|---|
| I am sitting in a meeting right now, listening to a small group of staff members talking about curriculum and instruction. The principal is in the meeting, but one of the teachers is leading the meeting. The teacher not leading the meaning is talking about, lesson plans for writing instruction over the next two weeks. They are discussing the strengths and weaknesses of the students’ writing skills and strategies to improve. The teacher is running through examples of her lessons, and the other members in the room are per riding feedback and asking questions. | Collaborative culture  
Expertise on curriculum and instruction  
Focus on teacher growth  
Involvement in regular feedback on instructional practices  
Effective use of work samples and data |

(continued)
Field notes of observation:

| The principal is walking around the building and visiting every classroom for about three to five minutes at a time. The students appear to be used to his presence because, although some of them are greeting him, some do not draw their attention to him. So far, all of the teachers except for two have been providing direct instruction to the students in the front of the classroom. These two teachers are seated next to students, working with them independently, and the other students are working quietly. The principal spends 20 minutes in one particular classroom. Later, he tells me that this teacher is new, and that he is in the process of coaching her to keep student engagement high. When asked how he was doing that, he said that he has given examples of ways that could happen to her, given her articles to read, allowed her to visit other teachers’ classrooms, and provided development sessions on the issue. | Visibility  
Accessibility  
Principal and his staff developer  
Principal is mentor  
Awareness of overall school environment  
Able to prioritize  
Knowledgeable about curriculum and instruction throughout the school levels |
|---|---|
| The tone in the building is positive. There has not been anyone in the classroom raising his/her voice and no anger has been displayed. There have been several students that the principal has had to speak with regarding certain issues. Among the issues have been school absenteeism, discipline issues, and encouragement for homework and grades. | Positive attitude  
Good relationships with staff and students  
Has respectful students  
Addresses issues and problems with a sense of urgency, but balances according to priorities |

<thead>
<tr>
<th>Right now the principal is meeting with a parent in his office. The mood is somber. As the parent leaves the meeting, both parties are pleasant to each other and smiling. The parent is holding a datasheet of some kind that the principal gave her in the meaning. When the principal is asked about the parent meeting, he informs me that this child is struggling in class, and that they talked about tutoring in school and what changes need to happen in the home. He says that this particular child is staying up way too late by himself because the mother is working and there is no one to help him with homework. He tells us that the mother agreed to allow the student to stay late for tutoring and that she would try to make sure the child's grandmother make sure he gets in bed at a reasonable hour and checks his homework. The student has also seen the nurse frequently this year and has a high number of absences that need to be addressed. ——The approach with this student needs to be holistic, but incremental, so as not to overwhelm the parent,” the principal states.</th>

<tbody>
<tr>
<td>I would say there is <em>academics</em> first...academics first, <em>parent connections</em> second, community outreach third...when it is <em>community outreach</em> it involves colleges as well because we are a college prep school... all of these are to educate students..it is definitely... <em>one-on-one guidance student and parent teacher interaction</em> that could be the fourth one, and the fifth one I would say <em>discipline</em>. But all of these are once you have a good environment and the students have the mindset that they are there to learn to secure their future career then it starts to make a big big difference... you do not start to discipline students until you have disciplined their minds. If they are there to learn every day that students show up and they come to school it is important how you meet them. There are certain expectations that are developed, nothing happens overnight; they need to get to know you and understand you as a school leader. And as a member of a team. You are not an individual but a member of the team... every single person... I do have regular assemblies and meetings, everyone gathers around, and we talk... I share my vision, and I say this is us; you are the ones who make the difference, not me... So believe in yourself...</td>

A description of characteristics and behaviors present at high levels in successful leaders and absent or moderately to minimally present in comparison leaders are noted in written form in Table 1: Tabulation of Findings in chapter 4.

After axial coding of the observation stage of data collection, the findings indicated 5 distinguishable actions and conditions that were present at high levels in successful leaders and absent or present at low to moderate levels in comparison leaders. After the process of axial coding, some items were grouped together to form one overarching category. A sampling of the process is included in the table below.

</table>

These successful school leaders used all platforms within the school to cast vision, set clear direction, and navigate the steps along the way to accomplishing goals. In some cases new platforms were created in order to enable the leader to have the ability to communicate to targeted groups. Successful school leaders conducted informal assessments to determine the needs of specific groups within the school and then create a platform to address those needs. Each time the leader met with the groups, a clear direction was set, goals were communicated, and specific data related to progress within those goals were present in some form. At times, the leader delegated meetings for training tasks within specific groups but expected the same process to happen whether or not the leader was the communicator.

### Action and Condition 1: Purposeful Platforms

These successful school leaders used all platforms within the school to cast vision, set clear direction, and navigate the steps along the way to accomplishing goals. In some cases new platforms were created in order to enable the leader to have the ability to communicate to targeted groups. Successful school leaders conducted informal assessments to determine the needs of specific groups within the school and then create a platform to address those needs. Each time the leader met with the groups, a clear direction was set, goals were communicated, and specific data related to progress within those goals were present in some form. At times, the leader delegated meetings for training tasks within specific groups but expected the same process to happen whether or not the leader was the communicator.

Theme 4: Mission Alignment

Successful inner-city charter school leaders align everything they say and do with an underlying mission, a clear and direct one. All objectives, goals, and actions are set in place for the sole purpose of mission accomplishment. Curriculum selected for the educational program is research-based and proven to raise achievement and is specifically aligned with the mission of the school. Instructional strategies are also research-based and improved based upon achievement outcomes that result from having used the strategies. Courses, instructors, daily programming, staff development, parent communication, and community partnerships are all carefully calculated according to what will best help the school accomplish the main mission.

Theme 6: Shaping and Sustaining School Culture

Much emphasis was given by the successful school leaders upon the shaping and sustaining of school culture... the top elements existing within the cultures of these successful leaders are a culture of achievement, discipline, collaboration, accountability, family-oriented relationships among colleagues and stakeholders, and recognition and celebration of successes...

A culture of achievement was established among all stakeholders within all schools of the successful leaders. Successful leaders make a habit of collecting ongoing data and using these data to make decisions, a strategy known as data-driven decision-making. Individual needs are addressed, but ultimately the focus is achievement. Not only is achievement communicated verbally, but it is also displayed in some form of reporting. In some cases, achievement results of individuals are posted on bulletin boards and results are charted over time. Recognition of individuals achieving at high levels is an ongoing practice and a climate is established within the schools that this recognition is something to which everyone should aspire.

CURRICULUM VITAE

Education:

Post Graduate Principal and Superintendent Certification: 1996, Xavier University
Masters of Arts in Educational Administration: 1994, Xavier University
Bachelor of Science in Elementary Education: 1991, Northern Kentucky University

Employment History:

2003-Present, ROAR Education
President and Founder
• Developed a professional development organization to service school needs
• Consulted with an underperforming school in Ohio to raise school rating two levels

1999-Present, Cincinnati College Preparatory Academy
Superintendent and Founder
• Founded and developed an urban charter school serving 700 students K-12 with a 90% poverty rate
• Led school to effective rating status
• Led school to 0% drop out rate since 1999

1998, Cincinnati Public Schools
Hearing Officer
• Led expulsion hearings for the district

1995-1998, Cincinnati Public Schools
Assistant Principal
• Served in two different schools
• Partnered with community organizations to raise student academic achievement
• Served as discipline coordinator, instructional leader, and multiple assignments designated by the principal

1996-1998, Children’s Hospital
Mental Health Specialist
• Worked with children and adolescents in need of behavioral, emotional, and mental health intervention
1993-1995, Cincinnati Public Schools
Taft High School Head Volleyball Coach
  • Served as head coach
  • Advised more than 25 young women through the volleyball program in community building, goal setting, and perseverance

1991-1996 Cincinnati Public Schools
Classroom Teacher
  • Earned National Board Professional Teaching Standard Certification
  • Honored with the Governor’s Educational Leadership Award
  • Achieved 75% or more passing rates of state testing measurements each year for all classes
1. Title of Submission:
School improvement using Inquiry based planning - A framework for schools districts

2. Name:
Dr. Sharon Sola

3. Affiliation:
University of Calgary and School District 67 (Okanagan Skaha)

4. Address:
Carmi Elementary School 400 Carmi Avenue, Penticton BC V2A 3G5

5. Email Address:
ssola@summer.com

6. Abstract:
This session focuses on school improvement. Inquiry based planning is a shift from the traditional approach used where schools set goals for improvement. Inquiry-based planning is framed in a spirit of inquiry rather than through the adoption of specific programs or strategies. Inquiry-based planning begins with a powerful question. The question creates curiosity and builds commitment by those involved. We know that active, focused inquiry drives improved learning gains for all learners. This approach relies heavily on collaboration and will provide participants with a framework that school and district leaders could use with staffs who are considering an inquiry-based planning approach to school/district improvement. Participants will further their understanding of inquiry-based planning for school improvement, become familiar with a process that they could use with staff, consider the implications for the role of facilitator in an inquiry-based school improvement process, practice generating meaningful questions, reflect on and consider next steps in their own contexts.
SUBMISSION FOR 9TH ANNUAL
HAWAII INTERNATIONAL CONFERENCE ON EDUCATION

(a) Title of Submission - Using Collaborative Web-Based Documents to Instantly Collect and Analyze Whole-Class Data

(b) Topic area of Submission – Educational Technology

(c) Presentation Format - Workshop (90 minutes)

Abstract: New collaborative web-based document technology provides the opportunity to instantly collect and analyze large sets of data from multiple lab groups and class sections with speed and accuracy. Curricular resources can be developed that employ this emerging technology to create a classroom environment that mirrors the collaborative environment of a professional scientific community. Students gain a better understanding of various aspects of the nature of science when they view their findings in the context of a larger set of data collected by their peers. By engaging in laboratory activities in which they analyze whole-class data using wikis and collaborative web-based documents, students gain an understanding that the scientific enterprise requires collaboration, independent verification, and peer review. In this workshop, participants are introduced to a range of collaborative web-based activities in which they collect and analyze data submitted by their colleagues.

Introduction

American science educators agree that that the purpose of the laboratory experience is to enhance mastery of science content, develop scientific reasoning, build practical skills, cultivate interest in science, develop teamwork abilities, and introduce students to the complexity and ambiguity of empirical research and the “nature of science.” Although there is strong consensus regarding these goals, it is clear that some goals are rarely realized. In particular, research shows that few laboratory activities provide attention to collaboration and the analysis and interpretation of data collected by others (National Research Council, 2006). Students generally work only with their own data and do not analyze it in context with data collected by their peers. Thus the opportunity to reach conclusions based on evidence is hampered by the quantity and quality of evidence at hand. Students will better develop teamwork abilities and am enhanced understand the complexity and ambiguity of empirical research by engaging in investigations that require collaboration, replication, and peer review. Laboratory activities that employ new collaborative web-based document technology to readily collect and analyze entire sets of data from multiple investigators can be used to provide students with a more accurate understanding of the collaborative nature of scientific investigation.

Rivas (2009), Lederman (2005), McComas (1998, 2005), McComas et al. (1998), Peters (2006), Bybee (2004), and others have described the nature of science and have encouraged its inclusion as a topic in the science curriculum. The following aspects of the nature of science are frequently mentioned in literature related to teaching the sciences. (1) Science involves the activity of explaining and predicting natural phenomenon. (2) Scientific knowledge is derived from evidence, and as a result our current understandings are durable but tentative. (3) Empirical evidence, accurate record keeping, and replication of experiments help validate scientific ideas. (4) The scientific enterprise requires collaboration, independent verification, and peer review. (5) Science is a creative endeavor, and there is no such thing as a single scientific method. (6) Science and technology are not the same, but they impact each other. (7) Because of social, historical, and cultural influences, science can be subjective and have bias. (8) There are realms of understanding, knowing, and belief that fall outside the scientific domain and thus science and its
methods cannot answer all questions.

Although much has been written on the need for laboratory experiences that give students an understanding and appreciation of the nature of science and scientific research, few practical solutions have been proposed. Laboratory activities are generally selected because they match the curriculum and are feasible given the constraints of time and resources, not because they help students understand the nature of science. Fortunately, recent advances in collaborative web-based document technologies now provide educators the opportunity to develop laboratory experiences that require contributions from all members of the class. Students publish their data to collaborative spreadsheets where it is visible to their peers, and thus are able to analyze their own findings in light of entire class data. Students thereby learn the collaborative nature of science and realize that researchers must view their findings in context with those published by their peers. In addition, they see how collaboration between many researchers provides the opportunity to see relationships and trends in data that would otherwise go unnoticed.

The science teacher education program at California State University, Northridge, has developed a curriculum that uses collaborative web-based documents (e.g. Google® documents, spreadsheets, forms, presentations, drawings, wikis, and websites available at docs.google.com and sites.google.com) to create a classroom-based research community that addresses the consensus goals specified in America’s Lab Report (National Research Council, 2006). In particular, the use of collaborative web-based documents to collect and analyze data, and to record and present findings, imitates the collaborative environment of a professional scientific community in which researchers develop hypotheses and explanations in light of their own findings and those of their colleagues.

Collaborative Web-Based Documents

Various science educators have advocated the use of spreadsheets and word processors in the writing of science lab reports to make comparisons, create graphs, sort data, draw conclusions and interpret data (Guglielmino, 1989; Kademan, 2005; Scribner-MacLean et al., 1989), and many teachers require their students to submit lab reports as word-processed documents with embedded tables and charts generated by spreadsheet programs such as Microsoft Excel®. Some instructors require each student to submit an individual lab report, while others require lab groups to collaborate and submit one report that represents the contributions of all on the team. In collaborative situations, students exchange data and versions of the lab report by exchanging files on flash drives or by email. If there are three people on a lab team, there can be three copies of each section of the lab report. Each time a student edits one of these copies, a new version is introduced. The simplest way to avoid confusion is for a lab team to designate one student to compile everyone’s work, but this works against the goal of developing teamwork through a cooperative, collaborative learning situation (Slavin, 1980). Fortunately, the introduction of interactive web-based document processing has created a new environment where all students in a lab group can work together simultaneously on the same version of the report.

In 2006 the information management giant Google acquired Upstartle, the software company which introduced the first web-based word processor, as well as the rights to the first web-based spreadsheet from 2Web Technologies (Google Press Center, 2006). In 2007, Google developed the first web-based presentation program (Bodis, 2007) and introduced all three as a free development suite known as Google Docs®. Any individual who opens a free Google account has an automatic link to Google Docs®. Users can develop documents, spreadsheets and presentations online using any modern browser, or can import them from OpenDocument files (.odt, .ods), common text file formats (.html, .txt, .csv, .rtf, .pdf), or proprietary formats such as Microsoft’s .doc, .xls, and .ppt. Google docs are automatically saved to Google servers, but can also be downloaded in all of the same formats from which they can be uploaded. As with related wiki technologies, a revision history is associated with each document so users can review, revise and/or reverse editorial changes.

Web-based documents like Google Docs (docs.google.com) offer teachers and students an environment in which they can work on the same file as they co-author lab reports and other projects. As students collaborate, each can see which revisions have been made by their colleagues, and can reverse or restore changes by selecting options in the revision history. Rather than working on original files and sending copies for peers to work on, all students work directly on the original so there is no confusion about the current status of the document. Such web-based development resources preclude the need for
Collecting and Analyzing Large Group Data with Collaborative Web-Based Documents

Web-based documents provide the opportunity for instructors to design lessons that meet many of the commonly held goals of science educators. Teachers agree that the science laboratory experience should help develop scientific reasoning and an understanding of the complexity and ambiguity of empirical work (National Research Council, 2006). In traditional laboratory experiments, students work individually or in lab teams, and write lab reports based solely upon their own data. Although such reports may be valuable educational activities, they do not give students an understanding of the collaborative nature of scientific research. Scientists recognize the complexity of the natural world and realize that experiments must be performed many times and by many researchers before assigning confidence to observations or hypotheses. Scientists examine large data sets using descriptive and inferential statistics to document relationships and propose explanations, and recognize the inherent tentativeness and ambiguity of empirical work. Researchers view their findings in light of those presented by their colleagues, and reserve judgment until a preponderance of studies confirm their findings.

Fortunately, web-based documents provide an opportunity for students to understand the complex and collaborative nature of empirical research as they collect and analyze data from multiple lab groups, classes, or schools. Data collection can be simplified by survey tools, such as Google Forms®, that link directly to online Google Spreadsheets®. Teachers or students can develop forms in an online work center and then invite students to input their findings. Spreadsheets are created from the data, with records (rows) representing the lab groups, and fields (columns) representing answers to specific questions. Links to survey forms and their associated spreadsheets can be provided by copying document addresses to email messages, blogs, newsgroups or websites. Students reply to the online forms, and together build a single spreadsheet file that is shared by all. Within a few moments, an entire class can input their data, generating a table with as many records as there are laboratory groups, and as many fields as there are questions on the form. These data sets can be analyzed with built-in online tools and “mashup gadgets” (web application hybrids), or downloaded to each group for analysis with traditional tools such as Microsoft Excel®.

As students analyze their own data in the context of a larger data set, they are better positioned to understand the collaborative nature of the scientific endeavor, and the need for independent verification and repeatability of findings. Numeric data can be graphed and charted directly in the web-based spreadsheet, or downloaded by each lab group for individualized analysis. Students can then upload class data sets into their private accounts where only their partners have editing privileges. Thus, each lab group can perform a collaborative analysis of the entire class data independently from the other groups. The resulting charts and tables can be linked to the lab report that is developed in the document editor, and the entire project shared with the class by posting a link on a class blog or newsgroup. Lab groups can thereby share their findings with other groups and compare their analyses and conclusions with those of their peers.

Many classroom experiments call for the measurement or calculation of specific values, such as the density of water, the molar volume of a gas, the wavelength of a laser’s light, or the percentage of root tip cells in mitosis. Students may notice that their values differ from those of other lab teams and thereby gain an understanding of the value of descriptive statistical measures, such as mean and standard deviation, when analyzing experimental data. As students graph class data using web-based spreadsheet tools, they may note bell-shaped distributions and gain a more intuitive understanding of the normal curve and basic descriptive statistics. Bimodal distributions may indicate the use of two different techniques while random distributions may indicate flaws in experimental design or implementation. By analyzing class data sets, students learn the complexity of the natural world and see the need for standardizing procedures and controlling for confounding variables.

Web-based documents can be employed to help students learn aspects of the nature of science and gain experience working in large teams. Scientists work in research laboratories that are part of larger networks and associations, and share their findings with their peers through journals and conferences. In the traditional college or school science classroom, only the instructor reviews student work. Web-based document technology provides students the opportunity to work cooperatively in the collection of data, and...
to electronically share their findings with their peers.

Teachers agree that a major function of the science laboratory experience is to help students develop teamwork abilities, but note that teamwork skills are rarely taught in schools and colleges (National Research Council, 2006). Dickinson and McIntyre developed a 7-factor model to define and teach effective teamwork. In their model, leadership and orientation (acceptance of team members, norms, and goals) are considered input components in team building. Monitoring, feedback, and back-up (assisting the performance of other members) are considered intermediate processes for ensuring effective teamwork behavior, while coordination is considered the output component because it defines the performance of the team. Communication is considered a transversal component because it links all of the other components (Dickinson et al., 1997). For many years, computer-supported collaborative learning studies have investigated the use of computer network systems to build collaborative teamwork environments, with most of the work focusing on distance learning efforts using tools such as email, video conferencing and electronic chat (Ellis et al., 1991, Silverman, 1995). More recently, researchers have found that wireless interconnected hand-held computing devices can be used to create environments that support face-to-face collaboration and the development of teamwork in traditional classrooms as defined by Dickinson (Cortez et al., 2009), but little has been written of the use of “Web 2.0” applications in the process of teambuilding.

Web 2.0 applications that are dynamic web-based resources designed to facilitate communication, interoperability, and collaboration on the World Wide Web. Interactive web-based document processors are Web 2.0 applications that provide an environment for collaboration, and educators can employ them to build teamwork skills that reflect the nature of science research.

Web-based document technologies (e.g. Google Documents, Spreadsheets, Forms, and Presentations®) provide an environment for collaboration, but teachers must develop appropriate activities and lessons if they plan to capitalize on the opportunities the technology affords. Virtually any inquiry-based inductive laboratory activity can be improved by the use of these tools. However, it is incumbent upon the instructor to develop effective lessons. For example, an investigation may ask students to find the relationship between mass, length, and the period of a pendulum. Relationships that are invisible with the few data points collected by a single lab group become clear with the addition of whole class data. If each group measures the period of a pendulum using different weights and lengths, then students will have large data sets to analyze. Using spreadsheet curve-fitting technology, students can find the equations that best fit the class data. By analyzing whole class data, students can determine that the period of pendulum is independent of mass, but directly dependent upon the square root of the length of the pendulum. Such conclusions can be made quickly when working with whole class data, but may take very long if each lab group must independently generate all of the necessary data.

Although web-based document technology is best suited for use with inductive laboratory investigations, it can also be employed in traditional deductive laboratory activities to collect whole class data and quickly acquire class means, medians, and standard deviations. Students will note that class average values are generally closer to accepted values than are their own. For example, when determining the molar volume of a gas, the lab group with the best data in the class might get 22.9 L/mole (2% error), while the class average of 22.5 L/mole (0.5% error) is closer to the accepted value of 22.4 L/mole. Teachers can capitalize on this phenomenon to show the value of collaboration in scientific research, and can illustrate the fact that “accepted values” (e.g., growth rates, germination percentages, melting points, mathematical constants, etc.) are “average values” representing the collective observations of many researchers.

The recent introduction of “mashup” technology introduces a host of new opportunities for science educators. A mashup is a Web application that combines data from one or more sources into a single integrated tool. For example, the mapping mashup gadget Map by Google® that is accessible in Google Docs®, integrates Google Spreadsheet® data with Google Map® data. Students can input their addresses into a form that creates a spreadsheet of street numbers, cities, and zip codes. The mashup then integrates this data with mapping applications to show on a map where everyone lives. Such data can be used not only to visualize distributions, but also calculate distances and other significant data. Mapping mashups are very useful for plotting fieldwork data, and one can expect an increasing number of mashup technologies to appear, making interactive web-based documents even more functional for use in the teaching of science.

Conclusion
Collaborative web-based document technologies provide educators an environment in which to foster the development of a community of researchers. Google Documents® (docs.google.com) is currently the best suite of development tools, and one can be confident that these tools will continue to improve even as new tools are introduced by Google and other parties. The list of tools and capabilities continues to grow, and the introduction of third-party “gadgets” will further increase options for lesson development. Students who collaborate using web-based documents have many opportunities to learn about the value and techniques of teamwork and collaboration in scientific research. As they work together with online data and analyses generated by their peers, they are more likely to understand the complexity and ambiguity of empirical work, as well as the need for accurate record keeping, replication, independent verification and peer review. Working in an online research community affords students the opportunity to better understand the nature of science and scientific research.

Abstract: New collaborative web-based document technology provides the opportunity to instantly collect and analyze large sets of data from multiple lab groups and class sections with speed and accuracy. Curricular resources can be developed that employ this technology to create a classroom environment that mirrors the collaborative environment of a professional scientific community. Students gain a better understanding of various aspects of the nature of science when they view their findings in the context of a larger set of data collected by their peers. By engaging in laboratory activities in which they analyze whole-class data using wikis and collaborative web-based documents, students gain an understanding that the scientific enterprise requires collaboration, independent verification, and peer review. In this best-practices session, participants are introduced to a range of collaborative web-based activities in which they collect and analyze data submitted by their colleagues.

Introduction

American science educators agree that that the purpose of the laboratory experience is to enhance mastery of science content, develop scientific reasoning, build practical skills, cultivate interest in science, develop teamwork abilities, and introduce students to the complexity and ambiguity of empirical research and the "nature of science." Although there is strong consensus regarding these goals, it is clear that some goals are rarely realized. In particular, research shows that few laboratory activities provide attention to collaboration and the analysis and interpretation of data collected by others (National Research Council, 2006). Students generally work only with their own data and do not analyze it in context with data collected by their peers. Thus the opportunity to reach conclusions based on evidence is hampered by the quantity and quality of evidence at hand. Students will better develop teamwork abilities and enhanced understand the complexity and ambiguity of empirical research by engaging in investigations that require collaboration, replication, and peer review. Laboratory activities that employ new collaborative web-based document technology to readily collect and analyze entire sets of data from multiple investigationalists can be used to provide students with a more accurate understanding of the collaborative nature of scientific investigation.

Rivas (2009), Lederman (2005), McComas (1998, 2005), McComas et al. (1998), Peters (2006), Bybee (2004), and others have described the nature of science and have encouraged its inclusion as a topic in the science curriculum. The following aspects of the nature of science are frequently mentioned in literature related to teaching the sciences. (1) Science involves the activity of explaining and predicting natural phenomenon. (2) Scientific knowledge is derived from evidence, and as a result our current understandings are durable but tentative. (3) Empirical evidence, accurate record keeping, and replication of experiments help validate scientific ideas. (4) The scientific enterprise requires collaboration, independent verification, and peer review. (5) Science is a creative endeavor, and there is no such thing as a single scientific method. (6) Science and technology are not the same, but they impact each other. (7) Because of social, historical, and cultural influences, science can be subjective and have bias. (8) There are realms of understanding, knowing, and belief that fall outside the scientific domain and thus science and its methods cannot answer all questions.

Although much has been written on the need for laboratory experiences that give students an understanding and appreciation of the nature of science and scientific research, few practical solutions have been proposed. Laboratory activities are generally selected because they match the curriculum and are feasible given the constraints of time and resources, not because they help students understand the nature of science. Fortunately, recent advances in collaborative web-based document technologies now provide educators the opportunity to develop laboratory experiences that require contributions from all members of the class. Students publish their data to collaborative spreadsheets where it is visible to their peers, and thus are able to analyze their own findings in light of entire class data. Students thereby learn the collaborative nature of science and realize that researchers must view their findings in context with those published by their peers. In addition, they see how collaboration between many providers makes the opportunity to see relationships and trends in data that would otherwise go unnoticed.

The science teacher education program at California State University, Northridge, has developed a curriculum that uses collaborative web-based documents (e.g. Google® documents, spreadsheets, forms, presentations, drawings, wikis, and websites available at docs.google.com and sites.google.com) to create a classroom-based research community that addresses the consensus goals specified in America’s Lab Report (National Research Council, 2006). In particular, the use of collaborative web-based documents to collect and analyze data, and to record and present findings, imitates the collaborative environment of a professional scientific community in which researchers develop hypotheses and explanations in light of their own findings and those of their colleagues.

Collaborative Web-Based Documents

Various science educators have advocated the use of spreadsheets and word processors in the writing of science lab reports to make comparisons, create graphs, sort data, draw conclusions and interpret data (Guglielminio, 1989; Kaderman, 2005; Scribner-MacLean et al., 1989), and many teachers require their students to submit lab reports as word-processed documents with embedded tables and charts generated by spreadsheet programs such as Microsoft Excel®. Some instructors require each student to submit an individual lab report, whereas others require lab groups to collaborate and submit one report that represents the contributions of all on the team. In collaborative situations, students exchange data and versions of the lab report by exchanging files on flash drives or by email. If there are three people on a lab team, there can be three copies of each section of the lab report. Each time a student edits one of these copies, a new version is introduced. The simplest way to avoid confusion is for a lab team to designate one student to compile everyone’s work, but this works against the goal of developing teamwork through a cooperative, collaborative learning situation (Slavin, 1980). Fortunately, the introduction of interactive web-based document processing has created a new environment where all students in a lab group can work together simultaneously on the same version of the report.

In 2006 the information management giant Google acquired Upstartle, the software company which introduced the first web-based word processor, as well as the rights to the first web-based spreadsheet from 2Web Technologies (Google Press Center, 2006). In 2007, Google developed the first web-based presentation program (Bodis, 2007) and introduced all three as a free development suite known as Google Docs®. Any individual who opens a free Google account has an automatic link to Google Docs®. Users can develop documents, spreadsheets and presentations online using any modern browser,
or can import them from OpenDocument files (.odt, .ods), common text file formats (.html, .txt, .csv, .rtf, .pdf), or proprietary formats such as Microsoft’s .doc, .xls, and .ppt. Google docs are automatically saved to Google servers, but can also be downloaded in all of the same formats from which they can be uploaded. As related wiki technologies, a revision history is associated with each document so users can review, revise and/or reverse editorial changes.

Web-based documents like Google Docs (docs.google.com) offer teachers and students an environment in which they can work on the same file as they co-author lab reports and other projects. As students collaborate, each can see which lab reports and other project by their colleagues, and can reverse or restore changes by selecting options in the revision history. Rather than working on original files and sending copies for peers to work on, all students work directly on the original so there is no confusion about the current status of the document. Such web-based development resources preclude the need for expensive software, since all one needs is a free downloadable browser such as Firefox®, Safari®, or Internet Explorer®.

Collecting and Analyzing Large Group Data with Collaborative Web-Based Documents

Web-based documents provide the opportunity for instructors to design lessons that meet many of the commonly held goals of science educators. Teachers agree that the science laboratory experience should help develop scientific reasoning and an understanding of the complexity and ambiguity of empirical work (National Research Council, 2006). In traditional laboratory experiments, students work individually or in lab teams, and write lab reports based solely upon their own data. Although such reports may be valuable educational activities, they do not give students an understanding of the collaborative nature of scientific research. Scientists recognize the complexity of the natural world and realize that experiments must be performed many times and by many researchers, assigning confidence to observations or hypotheses. Scientists examine large data sets using descriptive and inferential statistics to document relationships and propose explanations, and recognize the inherent tentativeness and ambiguity of empirical work.

Researchers view their findings in light of those presented by their colleagues, and reserve judgment until a preponderance of studies confirm their findings. Fortunately, web-based documents provide an opportunity for students to understand the complex and collaborative nature of empirical research as they collect and analyze data from multiple lab groups, classes, or schools. Data collection can be simplified by survey tools, such as Google Forms®, that link directly to online Google Spreadsheets®. Teachers or students can develop forms in an online work center and then invite students to input their findings. Spreadsheets are created from the data, with records (rows) representing the lab groups, and fields (columns) representing answers to specific questions. Links to survey forms and their associated spreadsheets can be provided by copying document addresses, blogs, newsgroups or websites. Students reply to the online forms, and together build a single spreadsheet file that is shared by all. Within a few moments, an entire class can input their data, generating a table with as many records as there are laboratory groups, and as many fields as there are questions on the form. These data sets can be analyzed with built-in online tools and “mashup gadgets” (web application hybrids), or downloaded to each group for analysis with traditional tools such as Microsoft Excel®.

As students analyze their own data in the context of a larger data set, they are better positioned to understand the collaborative nature of the scientific endeavor, and the need for independent verification and repeatability of findings. Numeric data can be graphed and charted directly in the web-based spreadsheet, or downloaded by each lab group for individualized analysis. Students can then upload class data sets into their private accounts where only their lab group has editing privileges. Thus, each lab group can perform a collaborative analysis of the entire class data independent of other groups. The resulting charts and tables can be linked to the lab report that is developed in the document editor, and the entire project shared with the class by posting a link on a class blog or newsgroup. Lab groups can thereby share their findings with other groups and compare their analyses and conclusions with those of their peers.

Many classroom experiments call for the measurement or calculation of specific values, such as the density of water, the molar volume of a gas, the wavelength of a laser’s light, or the percentage of root tip cells in mitosis. Students may notice that their values differ from those of other lab teams and thereby gain an understanding of the value of descriptive statistical measures, such as mean and standard deviation, when analyzing experimental data. As students graph class data using web-based spreadsheet tools, they may note bell-shaped distributions and gain a more intuitive understanding of the normal curve and basic descriptive statistics. Bimodal distributions may indicate the use of two different techniques while random distributions may indicate flaws in experiment design or implementation. By analyzing class data sets, students learn the complexity of the natural world and see the need for standardizing procedures and controlling for confounding variables.

Web-based documents can be employed to help students learn aspects of the nature of science and gain experience working in large teams. Scientists work in research laboratories that are part of larger networks and associations, and share their findings with their peers through journals and conferences. In the traditional college or school science classroom, only the instructor reviews student work. Web-based document technology provides students the opportunity to work cooperatively in the collection of data, and to electronically share their findings with their peers.

Teachers agree that a major function of the science laboratory experience is to help students develop teamwork abilities, but note that teamwork skills are rarely taught in schools and colleges (National Research Council, 2006). Dickinson and McIntyre developed a 7-factor model to define and teach teamwork in traditional classrooms as defined by Dickinson (Cortez et al., 2009), but little has been written of the use of “Web 2.0” technologies in the process of teambuilding.

Web 2.0 applications that are dynamic web-based resources designed to facilitate communication, interoperability, and collaboration on the World Wide Web. Interactive web-based document processors are Web 2.0 applications that provide an environment for collaboration, and educators can employ them to build teamwork skills that reflect the nature of science research. Web-based document technologies (e.g. Google Documents, Spreadsheets, Forms, and Presentations®) provide an environment for collaboration, but teachers must develop appropriate activities and lessons if they plan to capitalize on the opportunities the technology affords. Virtually any inquiry-based inductive laboratory activity can be improved by the use of these tools. However, it is incumbent upon the instructor to develop effective lessons. For example, an investigation may ask students to find the relationship between mass, length, and the period of a pendulum. Relationships that are invisible with the few data points collected by a single lab group become clear with the addition of whole class data. If each group measures the period of a pendulum using different weights and lengths, then students will have large data sets to analyze. Abstract: In the summer of 2010, twenty secondary school science teachers participated
in an intensive eight-day institute to learn new teaching strategies developed by teacher
educators at California State University Northridge (CSUN). These techniques, known
collectively as Computer Supported Collaborative Science (CSCS), make use of new free
collaborative web-based document technologies to engage all learners in interactive
lecture and discussion. Electronic quick-writes provide instructors with richer
information than is afforded by audience response systems, and make possible detailed
formative assessments. In addition, CSCS techniques allow students to participate
synchronously in whole-class research projects by contributing their findings to
collaborative web-based documents that serve as databases for classroom research. All
teachers participated in classroom activities with middle school students who were
engaged in a CSCS-based inquiry science class taught in CSUN’s Summer Academic
Enrichment Program (SAEP). One hundred percent of institute participants
recommended CSCS “very enthusiastically”, and post-institute surveys showed
significant gains with respect to teachers’ intentions to incorporate activities that are
facilitated by CSCS, such as the analysis of whole-class data and the evaluation of large
data sets.

The objective of our current research is to study the effectiveness of CSCS as a technique
for engaging learners in secondary school science classrooms. CSCS-trained teachers
participate in periodic follow-up workshops to provide tools for implementing CSCS in
their classrooms. Although results from pre- and post-institute surveys indicate
significant transformations in teacher intentions, it is necessary to document actual trends
by collecting data regarding pedagogies actually employed by CSCS-trained teachers,
and their perceived influence on student engagement in learning. Researchers will
conduct additional surveys and interviews with CSCS-trained teachers to determine the
extent of CSCS implementation and its impact on student engagement and learning.
Although it is anticipated that teachers will encounter numerous technical constraints in
their implementation of CSCS, it is also anticipated that those who are successful in
implementation will see significant increases in student engagement in classroom lessons,
laboratories, and related activities.
INVESTIGATING THE TEACHING AND LEARNING CHALLENGES FOR MATHEMATICS EDUCATION IN RWANDA

Dr. Diana S. Perdue
2009 – 2010 Fulbright Scholar, CIES
831 Liverpool Circle, #304, Chester, VA 23836
Diana.Perdue@gmail.com

Abstract:
In this interactive workshop, I will share with participants and answer questions about my 6-month tenure as a Fulbright Scholar in Rwanda teaching and learning at some of the country’s leading universities. My Fulbright project focused on the needs of two particular universities: the Kigali Institute of Education (KIE) and the Kigali Institute of Science and Technology (KIST). At KIE, I was to help Rwanda reform their mathematics curriculum to make it more student-centered. At KIST, I was Director of E-Learning and was tasked with the development of their distance education program. I will explain the goals that I was able to accomplish and what challenges I encountered along the way. I will also share with you ideas and strategies that helped me adapt to challenges in the classroom (and that I think you can use as well). Finally, you will hear about the challenges and successes that this country is experiencing in terms of distance education.

Overview
In this proceedings file, I will describe my projects in particular and the Fulbright Program in general, discuss educational reform in Rwanda, especially in terms of teaching methodology and incorporating technology, describe teacher preparation in Rwanda, especially focusing on the effect of language, and discuss my international educational experience including the comparisons of the US and Rwandan educational systems and my experiences with Rwandan students.

Fulbright Program – General Information
What is the Fulbright Scholar program? "The traditional Fulbright Scholar Program sends 800 U.S. faculty and professionals abroad each year. Grantees lecture and conduct research in a wide variety of academic and professional fields. The Fulbright Program is sponsored by the United States Department of State, Bureau of Educational and Cultural Affairs. Under a cooperative agreement with the Bureau, the Council for International Exchange of Scholars (CIES) assists in the administration of the Fulbright Scholar Program for faculty and professionals." (quoted from http://www.cies.org/us_scholars/us_awards/).

Fulbright Projects - General Description
I was chosen as one of four 2009-2010 Fulbright Scholars to Rwanda, a small, landlocked country located in the southern half of the continent of Africa known as the sub-Saharan region. I was one of approximately 150 other Fulbright Scholars selected to serve various countries in sub-Saharan Africa. I lived and worked in Kigali (the capital city of Rwanda) for six months (January through June). I worked at two universities: the Kigali Institute of Education (KIE), which is the premier university for teacher training country-wide, and the Kigali Institute of Science and Technology (KIST), “the first public technological institute of higher learning in Rwanda” (quoted from http://www.kist.ac.rw/about/about.html). My project was to assist KIE in achieving three goals: design an appropriate mathematics curriculum for pre-service teachers, create student-centered methodology in teaching mathematics, and enhance teacher training using effective pedagogy. I taught courses that conveyed mathematics content while illustrating inquiry-based, hands-on learning using appropriate manipulatives and technology. In addition, I assisted in curriculum development, materials selection, and staff development necessary to achieve long-
term success. In my project at KIST, I served as their Director of E-Learning, conducted hands-on workshops, and helped the faculty develop their course material for online-delivery.

**Educational Reform & Teacher Preparation in Rwanda**

In order for the reader to understand some of the educational challenges that I faced, it would be prudent for me to give a little background information about the educational system in Rwanda and describe some of the recent changes and reform efforts that are ongoing. First, the system consists of primary and lower and upper secondary schools. Until recently, mandatory education stopped at grade 6 (primary); it now continues until grade 9 (lower secondary). The secondary teachers, like my students from KIE, are also the ‘teacher trainers’ and the ones responsible for training the primary teachers in their school systems. Also, just this year the primary and secondary schools made the switch from education being conducted in French (as it has been since colonization) to English. The previous year, the University system made the language switch (and I can tell you that, even now, when you walk by a classroom at a university, you will hear French, English, and Kinyarwanda being spoken, often all in the same sentence). It was so abrupt and so challenging that school, which normally starts in January, had to be delayed until February to allow the teachers to be somewhat ready for it. Large numbers of Peace Corps volunteers arrived en masse to the country to assist in this huge undertaking. Now, a Rwandan child begins his / her education in primary school and, until grade 4, is taught exclusively in Kinyarwanda. Then, in 4th grade, they begin learning exclusively in English and that continues throughout their educational experience. Keep in mind that most of these students come from homes where either Kinyarwanda or French is the primary language spoken (and is the primary language of their parents).

To address the his / her usage in the previous paragraph, I would like to mention that education for girls rarely continues past the mandatory limit. This seems to be due to a variety of factors; however, chief among them is, I believe, is that the girls / women do everything in the country. They are responsible for the plowing, planting, harvesting, cooking, cleaning, water-gathering (a full-time job all by itself), and in general “taking care of” the rest of the household. Also, girls have traditionally been viewed as “less than” boys. This is particularly fascinating from a gender and women’s issues viewpoint when you realize that Rwanda has the highest percentage of women in government (Parliament) than any other country (over 50%). Contrast this with any other group and the numbers differ greatly. In my class of 16 at KIE, for example, there were three women. In the meeting regarding the Rwanda Open Learning project (which I will describe in greater detail later in this paper), there were 5 women (including myself and another American) in the group of 33 in attendance. However, the emphasis on girls’ education is an important part of President Kagame’s plan for the country so these numbers are better than they were and expected to continue to improve.

Additionally, the entire country has been very enthusiastic about transitioning from traditional lecture to a more student-centered methodology. Though Rwandans want this change and welcome it, they really have no resources, examples, or training on how to make it a reality. When one considers the existing physical and material challenges in the schools, the task of this transition seems almost overwhelming. As my KIE students are constantly asking me, “How do you teach when you have nothing?” (“Nothing”, by the way, can include no chalkboards, books, paper, chairs, desks, a building, electricity, chalk, computers, internet, water, etc.) At the University level I saw that no one (not even faculty) had books. Couple that with the fact that I couldn’t even get two copies of a handout made nor could I expect to make it through an entire class period with fully functional electricity, I realized that it would be even more challenging to institute the required changes throughout the rest of the nation.

The statistics regarding level of education here in Rwanda are disturbing yet fascinating. The country has a population of about 10 million people (of which close to 1 million live in Kigali) and the number of students that finish secondary school is around 30,000. The total number of students that are enrolled in all tertiary institutions is about 40,000. That works out to 0.004 of the population or less than one-half of one percent. This tremendous need to provide education to their people is one of the main reasons that Rwanda is so interested in distance education – it is the most viable solution to their problem. Lack of education is not the only problem, of course. Life expectancy is in the mid-forties (for both men and women), the GDP per capita is less than $250, and the unemployment rate is about 33% in the city, higher in the country.

The incredible shortage of books or other written material was amazing to me as a woman who, at any given time, is reading 3-7 books. On the other hand, when one realizes that a written language was not even introduced to Rwanda until the late 19th century, it sort of makes sense. There is a wonderful oral tradition and the country is filled with
fabulous storytellers; however, there is not a culture of reading. There are no libraries and there is a complete lack of awareness of how a book can be appealing in its ability to take you away. Given all that, I suppose it’s not shocking that when I met my KIE class on the first day and gave them each their very own copy of an NCTM (National Council of Teachers of Mathematics) educational journal they looked at me with adoration and gratefulness. Like the issues with gender equality, though, this one is also being addressed and showing improvement. For example, despite the country’s late start with a written language, the literacy rate in Rwanda is about 70% nationwide (higher for men than for women) and there are many projects that focus on reading, literature, and other written forms of communication.

The appropriate use of technology in teaching is a major focus of the National Council of Teachers of Mathematics (NCTM) (see Masalski & Elliot 2005 and NCTM 2000). In our country, the technology used in our classrooms takes three primary forms: web-based platforms and LMS (Learning Management Systems) like Blackboard and My Math Lab, graphing calculators (in the case of my classes at home, the TI83+, TI73, or NSpire), and computer software like Microsoft Excel and Minitab. In Rwanda, however, those types of technology are generally not available, and, when they are, unable to be used effectively due to the limitations presented by unreliable electricity and slow (or non-existent) Internet access. Instead, the technology in Rwanda that is established, reliable, and used in everyday life consists of mobile phones and radio. Interestingly, although the cell phone and the radio are integral parts of a Rwandan’s life, they have not really been put to educational use. Instead, the efforts (all coming from outside sources and other countries like the US and UK) focus on trying to establish web-based footholds for the country to begin using. In the next few paragraphs, I will describe three particular efforts that I was involved with as Director of E-Learning at KIST.

I was invited to a meeting with Dr. Stephen Swithenby from the Open University in the UK and, because of that initial contact, became involved in the nationwide “Rwanda Open Learning” (ROL) project being developed to utilize distance education as a means by which to increase those percentages that I mentioned earlier. One major goal of the ROL project is to “double engagement in higher education (i.e. to 6%) in the next 8 years”. Stephen and his colleague, Jerry, were invited by the government of Rwanda to analyze the current status of E-Learning in the country and present a proposal for how to move forward from here in order to achieve the nation’s very ambitious educational goals. I was asked to join them in this endeavor and assisted in creating the one-page executive summary and description of the task force that was presented to the Ministry of Education. The Ministry accepted this proposal and the project is in the initial stages (creation of the task force, etc.) at the time of this writing.

I hosted a meeting with the members of the KIST ICT Strategy Group (of which I was chosen as Vice-Chair) and we had a good discussion about what has been done on campus regarding E-Learning and what remained to be accomplished to start seeing results. They already had a head start in this effort: a group from Tulane University (which has a campus in Rwanda as well) came and did a few weeks’ training on using Moodle and various Web 2.0 tools for delivery of online educational materials. There is a core group of interested and dedicated faculty who had begun putting their syllabi online for student access. The short-term goal is for each department to have their course syllabi available for online access by the end of the year.

I gave a Public Seminar in the boardroom (“penthouse” floor of KIST 3, the math building) on the topic of LMS (Learning Management Systems) and E-Learning. It was well attended (over 75 people including faculty, administration, and students) and everyone participated and asked very thoughtful questions. During the seminar, I showed a few of my BB (Blackboard) courses that I taught last semester at my home university and discussed how “blended” or “hybrid” classes (those that meet both F2F – ‘face to face’ – and have online components) work and how I balanced the blend. At KIST, they will likely use Moodle as their LMS rather than BB since they have already received training on that platform, plus it is open source and has roughly the same capabilities as BB.

To close this discussion on E-Learning and technology in education, I will share two of my personal stories and try to paint a picture of some of the challenges that I saw and experienced.

As I mentioned before, several of the faculty at KIST had completed training on distance education, specifically on using Moodle, and the campus had a Moodle site set up. However, there are two major problems that had not been adequately addressed and are the primary reason why, when I asked the six HODs (Head of Department) present at my meeting how many of them had faculty who at least had their course syllabi available online, their response was one out of the six. Those two problems are bandwidth / speed / reliability of the Internet connection on campus and...
access to the computer labs (both by faculty and by students). The “ethernet connection” on campus is basically like what I have at home (high speed DSL) except that the one line is shared between everyone on campus – imagine your home line being shared among 1600 people. As a result, when I did speedtest.com the results said, “Ouch, are you on dialup or something? You’re connection ranks 0.5 stars out of 5.” A small Javascript applet that took 15 seconds to download from an Internet connection at the US Embassy in Rwanda was going to take 3 hours to download from my office at KIST. The multiple computer labs are only open and staffed when a class is being held in them. Otherwise they are closed and locked. In other words, if a student or faculty member wants to use a computer / have Internet access, they cannot because the labs aren’t open.

When I went to the boardroom (at 1pm) to get ready for my public seminar (at 3pm), I especially wanted to set up the projector with my laptop (since I have a Mac, I anticipated some additional problems) and to test the Internet connection to make sure I could login to BB and access my course materials. Of course, things did not go smoothly. First, there are lots of windows and that day the torrential downpours continued throughout the morning so, by the time I walked into the room in early afternoon, there was about 3 inches of standing water on the floor the cleaning staff was busily trying to mop up. Ignoring the pool, I hooked up the projector to my MacBook Pro only to discover that the projector did not recognize any signal coming from the computer. Then, I plugged in the Ethernet cable and saw that, unlike every other time with my Mac, it did not automatically connect to the Internet and kept telling me a cable was unplugged. In the beginning I tried getting the people (department head, technician, lab manager, etc.) to help me. In the end (when they’d all left, ostensibly to find help / get other equipment), I fixed it all myself (thank goodness for previous experience as a tech!). What was funny, though, was when my department head introduced me, he included my amazing abilities with technology (as demonstrated by the fact that I got it all to work in time for my seminar). ;-)

**Conclusion**

In conclusion, I would like to share some of my personal stories, especially from the classroom as illustration of both what I gained and what I learned. What follows are a few such examples from my experiences teaching students at KIE.

I had been assisting Faustin, a Physics educator, with developing their Mathematics Education program, conducting seminars with his class of 250 students on “micro-lessons” (writing and teaching mini lessons), and teaching my own wonderful group of 16 senior-level “teacher trainers” various mathematics and mathematics education topics (including history of mathematics, problem solving, technology, lesson planning, assessment, and number theory). It has been fantastic! The campus, like the city (and, perhaps, the country) in general, has a crazy mix of modern and broken. For example, the huge room where Faustin’s class meets has a collection of desks, some of which are broken, and a pitiful excuse of a chalkboard (where it’s not even real slate but some type of adhesive material that’s all warped from humidity) but it is equipped with a “sound system” and microphone for lecturing.

I was able to do lessons for the entirety of one week with my class using my laptop and their projector, but the week before I had to end class early because the electricity went out (my classes are in the evenings) and the generator (though it exists) is not hooked up to my building (because it’s too new).

There are so many interesting stories to share but there is a special one that comes to mind. My students had just finished the “Chipton” activity. For those of you who aren’t my students, in this activity I explained that, when they entered the classroom, they went through a portal and are now in a different world. In this new place, called “Chipton”, they have been brought to interview for a job as an accountant. You see, the Queen of Chipton is making so much money she has to hire new people all the time just to keep up with it all. I asked the students to get into pairs then have one come up and get a bag of “stuff” consisting of white, blue, red, and yellow poker chips and a die. They each have a trading mat where they can put their chips in the appropriate column. I explained that in Chipton the white poker chip is the unit of currency and that the magic number is 3. Whenever you get three of something, you can trade them for one of the next biggest something. In this case, three white chips can be traded for one red chip; three red chips can be traded for one blue chip; and, finally, three blue chips can be traded for one yellow chip. The activity involves each pair taking turns rolling the die and earning a set number of white chips, which they then put on their recording mat. Whenever they can make a trade, they must because, as I explained it, the Queen hates the sound of chips jangling together and has made a law that, in Chipton, one is not allowed to have more coins than necessary for the value. In other words, if you have four white chips you are ‘illegal’ because, for
that value, you could just have one white and one red chip (less noise). I informed the whole class that they are honorary “coin cops” (as am I) and that, if they catch someone in violation, then they may confiscate that person’s money and add it to their own mat. We practice the “official” statement: “I hereby confiscate your coins in the name of the Queen!” (Preferably stated very loudly and formally and with some type of accent.) Anyway, the pairs all compete, trying to be the first to get to a yellow chip (where you “win” the interview and earn the job) and everyone has a blast. Then, the “math” comes in when we discuss trading and connections to numeration systems and, specifically, place value and base. We compare Chipton, a base 3 world, with ours, a base 10 world, and convert numbers from one base to another by answering questions like “how many white chips are in one blue chip?” and “how many red chips are in one yellow chip?”

Right about here in the lesson my students are just getting the idea that this whole game / activity / thing was all a sneaky way to teach conversion of bases without lecturing and we’re recording all of our patterns / connections to exponents / etc. on a table on the board and then, just like that, the power goes out all over campus. Several of us were in mid-sentence and one of my students was in mid-writing (recording our data on the board) when the electricity went off and we were all plunged into total darkness. I finished my sentence and waited a second for the power to return (as the electricity goes off regularly in Kigali) because most public places (schools, hotels, restaurants, etc.) have generators that come on automatically when the power goes off. Then I realized that the building next to ours was illuminated while we all sat in darkness (later I discovered that our building, because it is so new, is not yet connected to the generator). Before I could decide what to do next, almost as one, each of my students got out their cell phone and turned on the flashlight (all cell phones in Rwanda have a flashlight feature) and aimed them at the board so the student could finish recording the data and we could finish our discussion! Isn’t that simply amazing! It was such a we-are-the-world moment!

There was not even a suggestion of simply stopping and going home. They are just so eager for knowledge and they will go through extraordinary lengths to achieve it. It’s a very pleasant change from some of the attitudes I’ve seen in students in the US (no offense students in the US, you know I love you guys!) – it’s just so obvious that education is valued here in a way we do not at home. For students to even get into KIE they must earn a almost impossibly high score on the country’s mandatory examination, then they have the added challenge of trying to finding funds. There are no opportunities like we have in America for things like scholarships, loans, or even part-time work (the unemployment rate in Kigali is about 33%, higher outside of the city). So when a student gets in and has the funds to go to school, you better believe s/he wants to get the most out of it.

My class at KIE was literally a dream class: they are excited, motivated, interested, fun, I mean, you can’t ask for more than that! My second story involves another memorable lesson involving a lesson that I call “handshake problem” with this class. It’s just a fun way to teach problem solving by having students act out the situation, look for a pattern, and figure out the formula to answer the question “There are 25 people at a party. Everyone shakes hands with everyone else. How many total handshakes happen at the party?” Of course the excitement was palpable when I whipped out my iPod and mini-speaker, turned on my “party” playlist, and had them get up and “party around the room” shaking hands in groups of 3, 4, 5, etc. people. So, here is the scenario in my class: my students are “partying” around the room, shaking hands, laughing, and recording their data; the iPod is blaring music; and, here’s the best part, it attracted a crowd! The windows in my classroom are filled with students watching from the outside – I had 75 people outside watching my lessons every day after the handshake lesson! It was so fun to teach in a place where not only your students are insanely interested but also the rest of students on campus are too!

I hope that hearing and reading about my experience as a Fulbright Scholar will awaken you to the potentials in your own students, motivate you to expand your own horizons, and inspire you to go beyond your initial limitations. I can honestly say that applying to become a Fulbright Scholar was one of the best decisions I’ve ever made and my experiences in Rwanda changed me and made me a better teacher and a better person.

Abstract
In this study, we explored the educational opportunities available to secondary students in the Toronto District School Board using both Board and Ministry of Education data. The student demographic variables of special education, family income and parent education were correlated with services and programs provided (Gifted, French Immersion, full-course offerings, OSSLT opportunity, OYAP, and SHSMP). Overall, each of the demographic variables showed significance for multiple programs. Using binary logistic regression, we were able to show students attending special/vocational/basic education schools were almost five times as likely to come from the lowest income quartile as compared to students that offer elite programming. Work place programs were more likely to be situated in the lowest income neighbourhoods.

- This article is an abridged draft version of a revision for journal resubmission.
For some time now, Canadian researchers (see Curtis, Livingstone, & Smaller, 1992; Martell, 2009) have been arguing that public school systems are structured to replicate the social stratification experienced by students who are poor, who are from minority groups, or who have disabilities. Not only does the evidence support that these students are being systematically streamed away from academic opportunities, but the bar for ‘academic success’ is continually on the rise. Research in Canada on equity issues related to secondary school opportunities and social economic status, disability, parent education and disproportionate representation is limited. Education at the elementary, secondary and post-secondary level is governed provincially/territorially. Consequently, available research is generally locally focused. The Toronto District School Board (TDSB), the largest in Canada and the fourth largest in North America (www.tdsb.on.ca/aboutus), is an excellent source of data. The student sample is large (~250,000) and it has, in the past (and again just recently) had data on student demographics, programs and achievement levels available for analysis.

In the following study, we examine educational opportunities available in public secondary schools and their relationship with student demographics such as students coming from low-income households, students who are using special education services and students whose parents have had the opportunity to acquire some university education. Poverty, disability and lack of parental education have long been viewed as traits that diminish a student’s perceived academic potential (Wright, 1970). Our study investigates whether there is a relationship between the number of students who fall into these demographic categories and the available programming at their secondary school. We also explore which demographics are more strongly represented in schools offering selected programming such as French Immersion, Advanced Placement and certain vocational programs.
**History of Inequity within Ontario Schools**

Inequitable education opportunities for certain social groups have been woven into the fabric of Ontario’s education systems since their inception in the 1850’s (Curtis et al., 1992). There is significant evidence that demonstrates how students from particular social groups continued to be denied access to academic opportunities. Research shows that poor, minority, and special education students were among those most likely to be streamed out of academic education and into lower performing-lower paying and precarious jobs (Curtis et al., 1992).

Wright (1970) conducted a study based on demographic information from eight schools in Toronto, collected through the *Every Student Survey*. He looked specifically at immigration status, first-language, and parental occupation effects on representation of students within various educational programs. Wright’s study (1970) determined that children whose parents were professionals were most likely to be found enrolled within the academic 5-year programs and least likely to be representative of over-age students or students within special or vocational classes. Wright (1970) also demonstrated a strong relationship between students whose parents were unemployed, receiving welfare or were single mothers as having the greater likelihood of being enrolled within “opportunity or special vocational” classes. Parental occupation and enrolment within vocational classes had a strong correlation. In vocational programs, there was a higher representation of children of labourers and a lower representation of children of professionals (Wright, 1970).

A further study, conducted by Deosaran and Wright based upon the 1975 *Every Student Survey* for the Toronto School System, showed the same stratification of class and parental occupation and their relation to program designation (Deosaran & Wright, 1976). The results of
the 1975 Survey also revealed a sharp increase in the percentage of students enrolled within special education and vocational classes (Deosaran & Wright, 1976). According to a search conducted within the Ontario Institute for Studies in Education library, it appears the final *Every Student Survey* was conducted in 1997 – the year before the amalgamation of the Toronto School Boards into one Toronto District School Board. There had been a long gap in the administration of these types of surveys but in 2006 the TDSB completed a student census (grades 7 through 12). A parent census (kindergarten through grade 6) was conducted in 2008. The grade 9-10 achievement results, based on student demographic characteristics from 2006-7, were released in April 2008. The data shows a large discrepancy by family socioeconomic status of students who were successful at the Ontario Secondary School Literacy Test (OSSLT) on their first try (i.e. 89% of professional/senior management; 84% of semi-professional; 74% of skilled/semi-skilled clerical and trades; 66% for unskilled clerical and 54% of non-remunerative) (TDSB, 2008). Without passing this test, or an equivalent course, students are unable to graduate from high school.

In terms of academic preparedness for post-secondary education for poor students in particular, “...[I]t is reported that of the 17-20 year olds (from the lowest 10% of income areas) who were in the TDSB in March 2004 only 13.4% registered at university and only 6.5% registered at community college” (Martell, 2009, para. 25). Figures for 2003 demonstrate an overall registration rate for TDSB graduates of 26% in university and 5% in community college (TDSB, Student Success: Pathways, 2004-2005). A recent report shows that 54% of students go on to postsecondary school in Ontario (King et al., 2009). Close to 80% of students from Toronto’s poorest neighbourhoods are not pursuing post-secondary education (Martell, 2009). Martell (2009) explains this outcome as a result of the lack of preparation these students have
received due to the effects of bottom streaming (the act of placing students into groups that are
directed to specific programming opportunities based on perceived ability), compounded by the
high costs associated with post-secondary education. According to the TDSB report released in
2008, there is an extreme disparity between levels of achievement and students considered at-risk
in the three academic streams (academic, applied and essential) (TDSB, 2008). The report states
that while only 6% of grade 9 students in the academic stream are considered ‘at-risk’, 31% of
students in applied and 48% of students in the essential stream are considered to be ‘at-risk’
(TDSB, 2008, p. 50). In terms of achievement for first time eligible students taking the OSSLT,
the results are even starker. While 87% of students from the academic stream pass on their first
attempt, that number drops considerably to 38% of students in the applied stream to a staggering
8% of students in the essential or workplace stream successfully (TDSB, 2008, p. 51). In
conclusion to these dramatic findings, the TDSB research report (2008) acknowledges the
presence of a continued if not widened gap in achievement between academic and non-academic
streams by stating “the gap in achievement of university courses and non-university courses was
observed a generation ago; it is still a key characteristic in the TDSB secondary panel” (Brown &
Sinay, 2008, p. 50). The TDSB report also maintains that despite these findings, according to the
Ministry of Education, streaming does not officially exist (TDSB, 2008, p.50). When post-
secondary options are limited, graduating students are largely employed in dead-end, mindless
jobs, precarious employment or filling up the lines at the unemployment office (Martell, 2009).

Methods

This study was designed to explore the current educational opportunities available within
the TDSB secondary panel for students with disabilities, students from lower income families,
and students whose parents have some university education. We examined the stratification of
students from various backgrounds in secondary school programs and services within the Toronto District School Board. Specifically, we looked at a) the relationship between student demographic variables as well as their relationship with available programs and services offered within the selected TDSB secondary schools; b) trends of overrepresentation of student demographics within specific school types as determined through binary logistic regression; and c) location trends in schools offering the Specialist High Skills Major Program (SHSMP), the Ontario Youth Apprenticeship Program (OYAP), complete course loads, and French Immersion opportunities.

School Selection

Schools for this study were selected based on the following criteria. Each school was a secondary school within the TDSB. Adult education centres, alternative schools, junior high schools, or language focused schools (ESL) were excluded from this study. A total of 85 schools met the criteria and were included.

Program and Service Selection

All information regarding programs and services was drawn from the Toronto District School Board’s website (www.tdsb.on.ca) for the school year 2008-2009. Information on OSSLT, Academic course offerings, gifted programming, Advanced Placement and OYAP was pulled from individual school profile available through the TDSB website listed above. The information for the SHSMP programs was retrieved from the Ministry of Education’s website http://www.edu.gov.on.ca/morestudentsuccess/SHSMresult.asp.

Programs and services selected for the study included the following:
1. **Opportunity to participate in the Ontario Secondary School Literacy Test (OSSLT):** The OSSLT is a test that is administered across the province targeting grade 10 students. A passing grade on this test or equivalent course (if test has already been failed) is required in order to achieve an Ontario Secondary School Diploma (OSSD).

2. **Full Academic Course Offering:** Schools that were deemed to offer a full academic course load had to meet the requirement of offering university level courses in grades 11 and 12 for English, Math and Science. It is important to note that all courses listed on Secondary School profiles were included, however, if student demand falls beneath the quota, not all courses will be offered.

3. **Gifted Program:** The gifted program is a specialized program to meet the needs of students who have been formally identified as gifted through an Identification, Placement, and Review Committee (IPRC).

4. **French Immersion:** Completion of requirements for French Immersion curricula at the secondary school level provides the opportunity for students to graduate, along with their OSSD, with a certificate of Bilingual Studies in French Immersion from the TDSB as well as the opportunity to achieve an Honours Certificate in Bilingual Studies in French Immersion from the TDSB (TDSB, French Immersion, current website).

5. **The Advanced Placement Program:** The Advanced Placement program offers students the opportunity to achieve university level accreditation while in high school. Exams are marked externally and participating universities are able to grant first year level credits in specified subject areas (Advanced Placements, current website).

6. **Ontario Youth Apprenticeship Program (OYAP):** OYAP is a school-to-work (vocational focused) program offered to students interested in pursuing employment in the following
trade sectors: motive power, construction, industrial and services. The OYAP courses and program provide students with apprenticeship opportunities while they are working towards their OSSD (OYAP, 2009). For this study, schools reported to host the OYAP program were schools that identified OYAP within their list of programs and services offered at their school on each individual 2008-2009 TDSB profile.

7. Specialist High Skills Major Program (SHSMP) - The SHSMP is a career path focused program intended to aid students in pursuing interests in various fields such as agriculture, business, construction, environment, forestry, and transportation (Ministry of Education, 2010 current website).

Student demographic variables: All demographic information was taken from the Ontario Ministry of Education School Information Finder Website - http://www.edu.gov.on.ca/eng/sift/ Demographic information from October 2009 was used.

The selected demographic variables were the following:

- Percentage of students who live in lower-income households. This is defined by the Ministry of Education as “[t]he estimated percentage of children who attend the school and whose families devote a larger share of income to the necessities of food, shelter and clothing than the average family”. The Ministry of Education states that the percentage is tabulated by students’ postal code and then cross-referenced with relevant data from the 2006 Census. Low income measures determined through the LICO (low income cut off measure).
- Percentage of students who receive special education services: This percentage relates to the number of students in the school “who are in special education programs or receive special education services. This includes students with identified
and non-identified exceptionalities, but excludes students identified as gifted” (Ministry of Education, 2009b definitions).

- Percentage of students whose parents have some university education: This percentage relates to the number of students who have at least one parent who has achieved a university degree, certificate or diploma. The Ministry states that this percentage is tabulated using student postal code information and cross-referenced with relevant data from the 2006 Census. It is isn’t clear by this definition if the Ministry is actually referring to any post-secondary education since universities don’t typically give diplomas and certificates but we will use the wording as given by the Ministry and assume it means University.

Student demographic variables were also tested for correlation against themselves using a t-distribution analysis to determine statistical significance (p<0.05). For example, percentage of students living in lower-income households was tested for correlation with percentage of students whose parents have some university education and percentage of students who use special education services. Following the above analysis, a multifactorial ANOVA was run for each program/service using the student demographic variables as dependent variables and each program as a factor (e.g. student demographic variables grouped to run against French Immersion).

Binary Logistic Regression was performed to explore the impact of student demographic variables (low income, parental education levels, and special education) on education opportunities available at students’ schools. To prepare data for the regression analysis, the student demographic variables were divided into equivalent quartiles. To calculate quartiles, student demographic percentage values from each secondary school were grouped together and
the total was divided into four equal quarters. Dividing demographics into equivalent quartiles allowed for assessment as to which school categories fell within the top 25% of student demographic variables (e.g. schools falling into the top low income quartile would indicate that they had the highest percentage of students coming from low income households). In order to facilitate interpretation, schools were categorized by which programs/services they offered. Initially, a criterion was created to ensure that each school could only fit within one specific category with no overlapping characteristics. A chart of criterion selection and school placement can be found below. Vocational programming includes the SHSMP and OYAP programs, Elite programming includes French Immersion, Gifted and Advanced Placement programming, and Uniprep includes schools that state they offer a full course load that allows students to become eligible for university admission.

<td>No</td>
</tr>
</tbody>
</table>
However, due to the high number of categories, n values became extremely small limiting any possibility for determining significance through a regression analysis. The previous seven school categories were then collapsed into four groups based upon intuitive sense. The four new categories were determined as follows:

*Table 2: New School Category Breakdown*

<table>

</tr>
</tbody>
</table>

*Note: Uniprep schools have indicated that there are enough available courses possibly offered throughout the year to ensure that a student has the eligibility to apply for Post-Secondary Education. However, our data could not substantiate if all the listed were actually offered.*

Using the four school categories, a binary logistic regression was performed to determine the impact of the percentage of students who came from low income households, had parents who had gone to university, and students using special education services and supports on overall programs offered within schools. The binary logistic regression categories greatly
reduced the \( n \), therefore a crosstabs analysis was run to further explore how many schools had the highest percentages of highest low income, parent education and special education quartiles across the board.

Lastly, schools hosting vocational-focused programs such as the SHSMP or OYAP programs were plotted on separate 2001 Low Income Neighbourhoods maps of Toronto (Social Policy Analysis & Research, 2003) to determine which neighbourhoods and income demographics vocational programs were targeting. Secondary schools that did not offer full academic course selections were also plotted, as were schools that offered French Immersion.

**Results**

Results for this study demonstrated significant disparity of education opportunities for students from low-income households, for students using special education services, and for students whose parents have not acquired some university education. There is a demonstrated variance in demographics at schools offering programs such as French Immersion and Advanced Placement as well as schools hosting vocational programs such as the OYAP and who do not offer a Full Academic Course Offering or the opportunity to take the OSSLT. Location trends reveal that both lower and higher income areas around the Greater Toronto Area offer significantly different programming opportunities. Most notably, vocational focused programs operate primarily in Toronto’s lowest income neighborhoods whereas French Immersion programming is more likely to be offered in more affluent areas.

*The Intersection of Low Income, Special Education and Parental Education*

Each student demographic variable was tested for correlation to determine whether there was an inherent relationship between students from low income households and their use of
special education services as well as their relationship with parental education levels. The correlation between students using special education services and parental education levels was also explored. When correlated, each variable of low income, special education and parental education demonstrated a significant relationship with the variable to which it was correlated. The percentage of students who live in lower-income households and the percentage of students whose parents had some university education had a significant negative correlation $r=-0.498, (t=-5.96, p=<.0001)$. The percentage of students who live in lower-income households also had a significant positive correlation with the percentage of students using special education services $r=0.214 (t=2.844, p<0.01)$. The percentage of students using special education services and percentage of students whose parents had some university education had a significant negative correlation $r=-0.298 (t=-4.044, p<0.0001)$. Based on these findings, a significant relationship between the three selected student demographic (low-income, special education and parental education) has been determined.

**Means and ANOVA**

The mean for each student demographic variable was tabulated by program and service offered. Mean values are listed in the table below. A Multivariate ANOVA was used to explore significance of the relationships between the student demographic variables and their representation within each program and service. Each student demographic variable was selected as a dependent variable and each program and service was individually calculated as the independent factor. Significance was determined and is indicated according to asterisk within the means table below.
Using the four school categories, a binary logistic regression was performed to determine the impact of the percentage of students who came from low income households on overall programs and services offered within schools. The model contained four covariates (school categories) and one dependent factor: low income. The model demonstrated to be statistically significant, $x^2 (3, N=85)=8.871$, $p<0.05$. The model explained between 9.9% (Cox and Snell R Square) and 14.2% (Nagelkerke R Square) of the variance. As shown in table 4, for the case of low income, only one independent variable demonstrated significance (Special, Vocational and Basic Education only). The strongest predictor of low income was the school category Special, Vocational and Basic Education only schools which had an Odds Ratio of 4.6. This indicates that Special, Vocational and Basic Education only Schools were almost 5 times more likely to fall within the income quartile representing the highest percentages of students from low income households as compared to Elite schools. Schools offering both University Prep + Vocational programming had an Odds Ratio of 2.654 indicating that these schools were almost 3 times as likely to fall within the income quartile representing the highest percentage of students from low income households as compared to Elite schools. However, this was not shown to be statistically significant.

A second binary logistic regression was performed to determine the impact of the percentage of students whose parents had some university education on overall programs and services offered within schools. The model demonstrated to be statistically significant, $x^2 (3, N=85)=20.34, p .001$ and explained between 21.3% (Cox and Snell R Square) and 31.6% (Nagelkerke R Square) of the variance. As shown in Table 5 for the case of parent education, only one independent variable demonstrated significance (University Prep + Vocational programming). Schools offering both University Prep + Vocational programming had an Odds Ratio of 0.051 indicating that these schools had a .05 chance of falling into the highest parent education quartile compared to Elite schools.

</table>
A third binary logistic regression was performed to determine the impact of the percentage of students using special education services on overall programs and services offered within schools. Again, the model demonstrated to be statistically significant, $x^2 (3, N=85)=34.59, p \leq 0.001$ and explained between 33.4% (Cox and Snell R Square) and 48.5 % (Nagelkerke R Square) of the variance. As shown in table 6 for the case of special education, none of the independent variables demonstrated significance. However, students who attended schools that offered special, vocational and basic education programming had an Odds Ratio of 1.010E10 indicating that these schools were most likely to be found within the highest special education quartile as compared to Elite schools. Similarly, schools offering University Prep and Vocational programming were almost 2 times as likely to fall within the highest special education quartile as compared to Elite schools. However, due to the miniscule numbers within each independent category, statistical significance was not achieved.

Due to the small n limiting the ability of reaching significance, a crosstabs analysis was run to further explore how many schools fell within the highest low income quartile across the board (how many schools had the highest incidence of low income). The results demonstrated that 54.5% of special, vocational and basic education only schools fell within the highest low income quartile as compared to 40.9% of Uniprep and vocational schools, 13% of Uniprep only schools and 20.7% of schools offering Elite programming.

Table 7: Low Income – Cross-tabulations

</table>
Crosstabs was repeated for the percentage of students whose parents had some university education. Looking at how many schools from each school category fell within the highest quartile of parent education (highest incidence of parents having been to university), none of the Special, Vocational and Basic education schools could be included. Only 4.5% of schools offering Uniprep and vocational programming fell within the highest parent education quartile as compared to 26.1% of Uniprep only schools and 48.3% of schools offering Elite programming.

Table 8: Parental Education – Cross-tabulations

A third crosstabs was performed to determine how many of the schools within the selected school categories fell within the highest quartile of students who used special education services. The highest quartile for special education indicated the highest incidence of students within the school using special education programming or services. 100% of Special, Vocational and Basic only schools fell within the highest quartile for special education. 22.7% of schools offering Uniprep and vocational programming fell within the highest quartile for special education as compared to 13% of schools offering only Uniprep and 13.7% of schools offering Elite programming.

### Location Trends of Programs

To further explore the established disparity in academic/vocational programming and demographics, schools hosting the OYAP, SHSMP, and French Immersion programs as well as schools that do not offer full academic course loads were plotted on Poverty Maps (Social Policy Analysis and Research, 2003). The poverty maps demonstrate areas of affluence and low income in the Greater Toronto Area. The current study was able to determine that the majority of schools offering vocational programs, such as the SHSMP or the OYAP, were located within or bordering neighbourhoods with higher incidences of poverty. For example, of the 22 schools offering the OYAP program all but 7 (68%) were located in neighborhoods identified as having the highest or second highest incidence of low income in Toronto. This trend was also observed for schools offering the SHSMP and schools that did not offer full academic course loads. Schools offering French Immersion programs were plotted and revealed a distinctly different pattern. Conversely, half of schools offering the French Immersion program are found within
Toronto’s neighborhoods with the highest and second highest degree of affluence. Only 30% were found to be located in the two lowest income areas.

Discussion

Low Income

This study found a significant positive correlation between the percentage of students who are from lower income households and the percentage of students using special education services. This suggests that there is an overrepresentation of poor students being identified as requiring specialized education services. Wright (1970), Curtis, et al. (1992), and Martell (2009) claim that the trend of separating and streaming poor students has long been embedded within Ontario school systems. There was also a significant negative correlation between the percentage of students from lower income households and percentage of students whose parents had some university education, which suggests a strong relationship between the acquisition of higher education with the successful navigation of the market (e.g. monetary remuneration). Denying access to select social groups (students from lower income households and students using special education services) as found within this study, is evidence of a marketized system that is reproducing the embedded inequities present in Ontario’s society as a whole; a system that apportions resources to students who already mirror the identity of those with economic power.

Curtis et al., (1992) also discuss similar findings for the French Immersion programs. French Immersion was introduced to Toronto Boards in the mid 1970’s, and has always been representative of the middle and upper class ‘with rare exception’ (Curtis et. al, 1992, p. 68). In the current study, trends show that schools hosting French Immersion programs have a statistically significant lower incidence of students from lower-income when compared to
schools hosting the OYAP and those not offering full academic course loads. A binary logistic regression demonstrated with statistical significance that students attending SPCL, VOC, Basic Schools have almost 5 times as likely be from the lowest income quartile as compared to students attending Elite Schools which often include French Immersion. A crosstabs revealed that over half of students from SPCL, VOC, Basic Schools are from the lowest income quartiles as compared to 13% of students attending Uniprep Schools only and 20.7% of students attending Elite Schools.

These findings are particularly concerning as it appears that a divide has been drawn between programs geared towards students coming from higher and lower income households. There is a significant overrepresentation of poorer students within programs that offer little option for post-secondary education and a significant underrepresentation of poor students within schools offering French Immersion. These trends have been clearly recognized (see for example Curtis et al., 1992; Martell, 2009) and have been supported through the current study. These findings suggest that there are structural conditions within the school system that maintain these economic divides. Opportunities to develop more marketable skills as a student and as a future economic contributor appear to be reserved for those students who already come from a certain level of financial advantage or socio-economic status.

Parental Education

Percentages of students whose parents have some university education was statistically significantly higher for schools hosting the French Immersion and Advanced Placement programs when compared to schools hosting the OYAP. The binary logistic regression demonstrated with statistical significance that students attending Uniprep and Voc Schools had
only a 0.05 chance of having parents as educated as students attending the Elite schools. A crosstabs revealed that 0% of students attending SPCL, VOC, Basic Only had parents coming from the highest education quartile as compared to 48.3% of students from the Elite schools. As previously suspected, education levels and class status maintained by students’ parents had an enormous impact on education programming options. The current study has demonstrated that the students whose parents have higher levels of education are more often found within programs that increase their future eligibility for university such as the French Immersion and Advanced Placement programs. This study has also reinforced that children of people who have not gone to university are more likely to be found within vocational programs or schools that limit their opportunity to advance to post-secondary education if they so desire. For example, students who participate in the OYAP program are less likely to have met the minimum college entrance requirements (King, et al., 2009). These findings reinforce the notion that the education system is structured to socially reproduce the stratification of previous generations and that greater academic opportunity is afforded to those students whose parents have already successfully acquired post-secondary education.

Special Education

Percentages of students using special education services was significantly higher within schools who did not offer full academic course loads or the OSSLT as compared to the rest of the programs in the study. Due to such small \( n \), a binary logistic regression did not reveal a statistically significant result when investigated across the various school groupings. However, a crosstabs revealed an overrepresentation of students using special education programs within SPCL, VOC, Basic Only Schools (100%) and an underrepresentation for both Uniprep only and Elite Schools.
**Location trends of Schools Offering the SHSMP and OYAP (Vocational) Programs**

In Ontario during the 1970’s, vocational programs consisted

almost entirely of students from working-class, ethnic/racial-minority and single-parent families. The survey found that a working-class child ran a ten times greater chance of ending up in a vocational programme than did a child of the professional or managerial class. Similarly, over one-third of all children from unemployed families, and over half of those from families on welfare, ended up in these schools.” (Curtis, et.al, 1992, p. 89)

As demonstrated by the plotting of programs offered on the Low Income Neighbourhoods map, most of the school-to-work programs are located in the lowest income neighbourhoods. If, as many argue, these are “opportunities”, one must question why they are not distributed more evenly throughout all income brackets. The statistics clearly show that it is not by chance that these programs are offered where they are.

**Conclusion**

This study has demonstrated that after 40 years not much has changed. There continues to be significant inequity in programs offered by the Toronto District School Board. These inequities, which have been shown to be highly relevant to student demographics (special education, parent education, socioeconomic status), lead to which ‘types’ of students are granted access to future and more marketable education opportunities and which ‘types’ of students are denied access. The results of this study suggest that the structure of the TDSB continues to require further reform to ensure that all students have equitable program opportunities. Currently, students deemed as less able to meet academic expectations are met with a reduction in access to
resources and services that will provide them with greater career options. The Toronto District
School Board has the opportunity to serve as an organization that reduces social inequities but
only if it chooses to prioritize equitable education opportunities for students experiencing
poverty, disability and academic disadvantage.

An integrated approach towards establishing Industry Institutes that models Techno-education & Training in order to shape Zimbabwean youths who are the future of a high technology economy

1Ngoni Chirinda

2Elangovan Gowdhaman

Abstract

Exciting technological education programs, also termed techno-education in this paper, are being developed and implemented across the globe. The paper advocates state-wide establishment of Industry Institutes that models techno-education for shaping our Zimbabwean youths who are the future of a high technology economy from an integrated approach. Techno-education has enthused extensive interest in the study of technology and has contributed to the rapid growth of contemporary or modern-day curriculum materials worldwide. The process of harnessing techno-education curricula is a complex undertaking that requires an adaptation of philosophy, curriculum, and instructional practices. However,
this study reviews and suggests a fine tune integrated approach towards Techno-education in active participation of Industry Institutes with efforts to achieve a high technology economy. It will also address the need for social relevance in building Technical Literacy for the betterment of a prospective society. The youths are the future of the likely Zimbabwean economy. Thus they are today’s concern as beneficiaries of this research conception.

**Key Words:** Techno-education, Industry-Institute, Social Reconstruction, high technology economy

1.0 **Introduction**

An Industry Institute harmonizes industry needs through Institute involvement, operationally and technically. Industry Institutes are the nucleus of expert human capital sharpening, advanced research & development practices and high technology generation & transfer. The concept of Industry Institute is a cooperative model between industry and institutes. It has globally taken different models at different times over years. Historically, it started with simple interaction as in industrial visits/walk-through by students in industry and gradually evolved to very close strategic interactions overtime. There has been a wide variety of interactions practiced among industries and institutes which includes problem solving, curriculum development, study visits, scholarships, apprenticeship training and incubation center.

Professor Shyamal Majumdar, Ph.D. *et al.*, (2010), however articulated that, ‘until the time that the concept of public private partnership has evolved, industry, has, by far, not been involved in taking sustainable financial, technical and operational risks in the design, financing and
building and operation of educational projects’. Therefore, public-private partnerships has been regarded as a natural progression of relationship from interaction elevated to structural partnership where the private sector assumes substantial operational risks in the design and implementation of educational projects.

The same has been so in Zimbabwe to date where Industry-Institute Interactions are not strong. From a mini survey, it has shown that some local companies are now even rejecting tertiary students applying for internship because they are not value adding to the organizations. However, in recent years technical trainers/educators across the globe are setting out to reform education by calling for a social reconstruction, advocating a restructuring of training/education.

2.0 The technical curriculum

The ever changing perception of the roll of technology in our society provides educators with a myriad of challenges and problems for the technical curriculum. Technology is alternately seen as a major source of society's problems, or as the salvation of society. People become slaves of technology. This confused role, compounded with the current trend of life-long learning, and the need for future citizens who can function effectively in a modern technological society, provides educators with innumerable opportunities for integrating realistic problem solving techniques into the teaching environment. This leads us to the purpose of this article which is to provide practical suggestions on how a technological problem solving environment can be created and used by educators in any area of study to help prepare youthful students for living in our modern society through Industry-institute Interaction as our future for a high technology economy.
3.0 The current Zimbabwean Industry Institute Interaction

All the Institutes in the country are practicing problem solving, curriculum development, study visits, scholarships, and apprenticeship training as a form of Industry Institute Interaction. There are merely two Institutes that went an extra mile and envisaged the Incubation Center and Science Park approaches namely National University of Science of Technology and Harare Institute of Technology. That said the tertiary institutions are categorized into Universities, Polytechnic colleges, Teachers’ colleges, Vocational Training colleges, and Specialist schools/colleges under the hospices of the Ministry of Higher and Tertiary Education. Their endeavor to fulfill their mandate for manpower development has been a success story before our recent ten year economic downfall. This is the opportune time when survival strategies have to be exploited in order to revive our economy when resources have become extremely scarce for nonproductive centers that used to depend wholly on Government support such as Institutions.

Close analysis by the researcher\(^1\) has drawn the following model, Figure 3.1, to address the short falling link from a football pitch standpoint. The model is a real eleven member team determined for attack and winning. There is no football team that determines to win in the second half round match when players are fully aware that player, position number six, has weakened. Chinese Military Strategist, Sun Tzu c. 490 BC, declared that, “Do not repeat the tactics which have gained you one victory, but let your methods be regulated by the infinite variety of circumstances”.

The 4-1-5 formation in this model of Figure 3.1 appreciates well the value chain of the Zimbabwean education system. It stretches from the Pre-school level up until tertiary
education then links to industry. The challenge is in the midfielder’s position six highlighted in red. The player seems to be becoming unfashionable or tiring with age. How can you make sure that team nine will be well supplied and given several opportunities to score goals? Football coaches have the answer to this question. The least suggestion you can ever find is to leave the struggling player in the game. Substitution is not a threat but a survival strategy.

![Diagram](image)

**Figure 3.1** Football pitch approach (4-1-5 formation) - Substitute critical position 6

The Zimbabwean technical education curriculum is due for review and substitution. There is a very big gap between Institutes and Industry. Moreover, the global economy has since shifted from being Labor-intensive or Industry-based to knowledge-based. The Zimbabwean technical education curriculum is to pursue the virtue of Institute Industry Interactions. The researcher calls this ‘the midfielder position substitute strategy’. Developed nations have
structured their curriculum so well that students have become the backbone of Industrial
development. Microsoft and Nokia international companies are achieving their global
competitiveness by virtue of a Science Park vis-à-vis Industry Institute Interaction. High
technology economy has become possible in their locality, regionally.

4.0 Objectives of Industry-Institute Interaction

Close interaction between the Institute and the Industry is seen as the platform for showcasing
best practices, latest technological advancements and their implementation and impact on the
Industry. Industry will certainly yield positive results proceeding discussions from section 3.0.
It surely scores goals of success when backed by the Industry Institute Interaction. It is
basically considered to improve the quality of techno-education adequately to meet the needs
of the industry and the technology economy. Having a close interaction in place, industries
are able to vividly participate in techno-education programs, with the goal of cross-fertilizing
ideas for systems improvement. To integrate industrial training and other inputs from the
industry with the teaching-learning processes, interaction is necessary as it develops students’
awareness on job functions in the industry, attitudes to adapt to industrial environment, proper
practical and relevant knowledge, skills and competencies in preparation to becoming self
employed. Industry expectations are also echoed through sound interaction, particularly the
requirements from new recruits who are expected to be orientated to industrial disciplines, job
descriptions within the workplace with industrial practices.

Mutual benefit is derived from the shared expertise and experiences between the industry and
the institute. In addition, operating within the framework of a specific cooperative program is
an essential outcome of having both industries and institute agree on specific skills training for some specific jobs vis-à-vis customized programs.

5.0 The nature of Interaction

As the social and economic structures of various countries in the globe move from labor-intensive and industrial-based to knowledge-based and globalized economy, the role of academic institutes has been intensified more than ever. Institutes possess the optimum resource base to supply new ideas, innovations and analysis of the trends in the labor market in a holistic and pedagogic approach. This is the new concept of techno-education.

There are different forms of Industry-Institute linkages that have been started in various countries globally. These have likewise provided value-added approaches for Institutions to offer technical education and facilitate smooth decision making and reconciliation of different interests from the various sectors. These are enumerated below:

5.1 Problem Solving Interaction

The need for assimilating the latest technologies and technical capabilities to employ in the industrial work systems necessitates a strong and continuing process of reviewing the landscape of greater productivity through research and development (R&D) approaches. Industries are heavily oriented towards raising competitiveness. By saying this, there is a felt need to continuously study how best technologies can be optimized to achieve productivity. The role of the industries here becomes collaborative and oriented to provide avenues for undertaking collaborative industrial projects, contract research or technology transfer
initiatives and to solve intricate problems through R&D. Institutes, which possess vast intellectual resources base, particularly those with strong research and development cells, are in the best position to provide the intellectual augmentation and innovations that serves industry purpose. The identification of industrial problems and discovery of the ways to solve them are also good motivations for industries.

For mutual benefits to be achieved, institutes draw their motivations in industry interaction from the potential of getting relevant exposures to real industry problems, engaging into intellectually challenging research for professional achievements, augmenting professional income sources and obtaining support from research and development infrastructures/equipment. All these may be extended by industries in aid of the benefits derived, i.e. design tests, process optimization tests etc. in the case of telecommunication industries.

5.2 Curriculum development and teaching and learning system

Mechanisms to involve industry representatives in formulating the curriculum and teaching and learning systems do open productive platforms for industry-institute interaction. Collaboration, discussion and decision-making processes produce mutual agreements and understanding of the real conditions in the work place, the systemic functioning of industries and industry expectations. To some extent, such kind of interaction provides a highly effective mechanism to generate feedback based on employer demands to meet half-way in the design of academically-sound and industry-oriented curricula. This kind of interaction has resulted in the creation of such opportunities like offering of sandwich courses, development of courses jointly developed and certified under Institute - Industry tie up, joint continuing courses and periodic curricula update in relation to industrial trends and projections.
Suffice it to say, there is a need to review and modify curricula and teaching and learning styles of various disciplines to accommodate technological changes, management practices and needs of the labor market that is the Industry.

5.3 Scholarship and Internship

The introduction of development funds in the form of scholarships, stipends, insurance and even sponsorships by the industry encourages students to continue embarking on study and training programs. This also proved to be effective in drawing the best talent for the industry. In countries where effective industry support mechanisms are in place, companies sponsoring graduate scholarships have the privilege for the right-of-first-refusal in employing new graduates. For example, major telecommunication companies with business in the Philippines provide scholarships to graduate and undergraduate students under specific arrangements with universities/institutes.

Through a well-established industry-institute interaction, job fairs, placement activities and similar career orientation programs can lead to systematic recruitment of the right people for the right job, thereby aiding skills-matching that is highly required in some high technology sectors.

5.4 Industrial Tour and Study Visits

Exposing the future workforce to the actual field work, industrial environment, state-of-the-art science and technology adapted in machineries and equipment operations and industrial
practices provide ways to relate classroom theories with actual industrial experiences at the
cognitive level of the students. The visits to the industry broadens the mental orientation of
the students and also give the true picture of the on-going work.

One of the strengths and attractions of academic and vocational institutions to prospective
students is their ability to link with important industries, derive mutual support and later
access employment opportunities for school pass outs. Familiarity to industrial process, close
coordination and linkages form solid grounds for the industry to rely heavily on educational
institutes with which they have ongoing linkages with to supply the manpower needed under
any given circumstances. Employment prospects amongst students, in turn, are heightened by
deeper familiarity with existing industrial systems.

5.5 Faculty and Staff exchange

One of the known motivations of industries to step up efforts to linkage with academic
institutions is the access to well-trained students and faculty. Staff exchange between the
industry and the institutes is one of the keys to make Industry-Institute interaction successful.
The acquisition of actual field experiences by technical teachers aids in skills formation and
facilitation of the learning process. These are gained through available forms of interaction
such as industrial attachments, industry secondment to universities/institutes. Industry-
institute interaction also paves the way for co-planning of the training needs of teachers and
meeting them in close coordination with industries.

One of the best practices derived from South Korean Industry - Institute interaction system is
the recruitment by vocational training institutes and polytechnics of professional staff with
significant industry experiences and actual industry training throughout their career. This is one way effectively translating technical skills and knowledge to students enrolled in technical education and vocational programs.

On the other hand, people from the industry also benefit from the exchange through their increased access and exposure in applied research, academic and management approach by teachers and institutes which provide new ideas for product innovations.

5.6 Industrial apprenticeship

The importance of education as a strategy in skilling the future workforce for industries is vital, as industry training is inextricably linked to industry practices, Fien, et al, (2008). Historically, the private sector has played pro-actively in the training for productive employment. Individuals learned new skills through training provisions such as the apprenticeship or on-the-job training, with systematic financing schemes. Industrial revolution in the 19th century changed the employment structure and demanded high level industrial discipline with specialized skills sets. At the turn of the 20th century, vocational schools were introduced, a practice that spread in Europe, and has set the agenda of governments to increase investments in vocational skills training.

Zimbabwe has an apprenticeship model adopted from Europe. The Asian Pacific region adopted the distinct apprenticeship models from different countries and has utilized industry-institute interaction and linkages in various forms and commitment. The German model, for example, one of the most widely adopted models across regions, provides dual apprenticeship training which combines institute-based training and enterprise-based training; and are
strongly oriented to the demand of the labor market. Theoretical training is provided about one day per week by vocational training centers, while practical training is provided in-enterprise in longer period during the week. An apprenticeship model that emanated from Japan focuses on enterprise-based training among employees in needed skills. The hallmark of the Japanese skills formation system is training by large corporations which make provision for in-service training throughout the life of the workers. Unregulated apprenticeship training, as another form of apprenticeship training, on the other hand, consists of observing and imitating the master and caters to individuals who lack the educational requirements for formal training, serves important target groups and is generally cost-effective.

Apprenticeship training has become an effective industry-institute interaction scheme and is governed by certain government policies that mandate industries in cooperation with government agencies, to share the cost on trainings. Sandwich diploma programs in some countries like India has facilitated the integration of industrial training into educational program.

5.7 Incubation center

Countries all over the world have started establishing incubation centers which allows for the shared access to infrastructures, practices, venture capitals and market information. In the context of technical and vocational education, business development or Information Technology-oriented ventures, incubation centers allows for the development of a product of the academia for practical application. Incubation, as in technical development, facilitates concepts, research or laboratory process, practical application towards introduction for
commercial purposes or release. Industry-institute cooperation at this level increases opportunities for hatching new innovations for the creation of new products.

The same concept is also applied in cultivating technology-entrepreneurial skills, now termed Technopreneurship. In some countries, government-sponsored sector-specific incubators are set up to take 15 to 20 small and medium enterprises, which provide opportunities for credit, access to technology, vocational and management training, and extensive consulting facilities. The incubator effectively chaperones SMEs during their initial growth stage. Industry interaction and support in these kinds of initiatives are of paramount importance to guide potential entrepreneurial activities with the trends in the labor market, skill development, other types of support such as access to credits, technology, and market information on a shared scheme between government institutions and training providers to encourage Technopreneurship.

5.8 Science Park

A Science Park is a concept from academic institutes in their effort to fulfill industrial development. A Science Park or Science & Technology Park is an area with a collection of buildings dedicated to scientific research on a business footing – Electronic Wikipedia (2010). There are many approximate synonyms for "Science Park", including Research Park, Techno Park, Techno Polis and Biomedical Park. The appropriate term typically depends on the type of science and research in which the park's entities engage, but many of these developments are named according to which term gives the park the best profitability and naming advantages. Often, science parks are associated with or operated by institutions of higher education such as colleges and universities.
Science Parks are more organized, planned, and managed. They are concerned with future developments in Science and Technology. Typically businesses and organizations in the parks focus on product advancement and innovation as opposed to industrial parks that focus on manufacturing and business parks that focus on administration. Besides building area, these parks offer a number of shared resources, such as uninterruptible power supply, telecommunications hubs, reception and security, management offices, restaurants, bank offices, convention center, parking, internal transportation, entertainment and sports facilities, etc. In this way, the park offers considerable advantages to hosted companies, by reducing overhead costs with these facilities.

Science and technology parks are encouraged by local governments, in order to attract new companies to towns, and to expand their tax base and employment opportunities to citizens. Land and other taxes are usually waived off or reduced along a number of years, in order to attract new companies for the science and technological parks. The world's first science park started in the early 1950s and foreshadowed the community known today as Silicon Valley. The companies in a typical science park are primarily private sector, but the science park is also home to university and government facilities.

5.8 Evaluation system

Industry-institute interaction in student evaluation has been regarded to give progressive benefit to the institutes as a way of providing technical guidance on the skills and competency levels of students. For example, practicing technical professionals in the field may be engaged in the assessment process to identify possible technical skills gaps, inadequacies in training
focus, and competency matching with the kinds of work available in the industries. These are facilitated through industry involvement in the various stages of evaluation of students through interviews, seminar and projects.

6.0 The criticality of Industry Institute Interaction

The global economy has shifted to a new paradigm called the knowledge era. It is the complexities at the work place that brought about rapid technological changes, paradigm shifts in education and training and the growing demand for skills training, call for harmonized efforts to reverse the acute skills shortage in many developing countries. Industry-institute interaction allows exploring endless possibilities in working in synergy and derives a new focus to address socio-economic and technology-driven challenges.

One of the challenges in the present times is the rapid pace of technology which makes skills obsolete at greater pace before everyone else could learn from them. The excessive pace of technological changes has emphasized the need to integrate technological knowledge and skills in education and training to expand lifelong capabilities of a knowledge-based worker. It has been observed that the economic pace of technological change makes 50 percent (50%) of computer knowledge irrelevant within one year, technological knowledge in three years, specialized vocational knowledge in five years and higher education knowledge in 10 years. Another serious challenge is the increasing complexities at work, which lead to the growing need to adapt to new innovations in the market and adopt the technologies that provide utmost efficiency in machine operations. As a result, complex procedures are borne. An example of this is the transformation of automobile repair and operations manual from simple to complex piece of multiple-paged document that require skills cluster and know-how to perform them.
Considering that people and institutions are not always interested in getting involved, partnerships through industry-institute interaction can only be achieved by finding out strategies to draw relevant stakeholders into systematic and reciprocal interaction to address such workplace trends and technology emancipation.

7.0 Curriculum development

The systematic design of technical instruction based on competencies has a rich tradition in the academic circles. Charles Allen's influential work 'The Instructor, the Man and the Job', published in 1919, demonstrated the usefulness of organizing instruction into logical units which could be standardized among different training locations. The effectiveness of instruction was no longer based solely on the ability of the individual instructor, but was also due to the quality of the design itself, which served to guide the instructor and provided the basis for planning, conducting and evaluating instruction.

Subsequent work by W. W. Charters (1923), Robert Selvidge (1923; 1926), Selvidge and Fryklund (1930) and others helped to develop a framework for the systematic analysis of instructional content and the design of instructional materials. These early efforts were applied during World War II to the training of military personnel and production workers. The effectiveness of deliberately planned and systematically organized training was clearly demonstrated. Following the war, government groups and private industry convinced that quality and productivity could be improved through systematic training, invested in research and development. This work established the foundation for contemporary instructional design practice. Theoretical designs were formulated along with practical procedures which helped to guide instructional development and implementation.
In India, the Govt. introduced the Craftsmen Training Scheme by 1950 in order to ensure a steady flow of skilled workers. The scope of activity also expanded significantly. At least the following four lines of research, which impacted on instructional design, were pursued by different researchers.

- Attention was focused on the need to clearly specify objectives in observable and measurable terms;
- Measurement and evaluation concepts were advanced, making it possible not only to directly measure learning outcomes but also to assess the efficiency of the various instructional components;
- Learning theory was merged with instructional design theory;
- Advances were made in the use of instructional materials and educational technology; and by the 1970s sufficient theory and practice existed to build well-conceived, efficient, integrated systems of instruction.

Instructional development evolved into a large enterprise serving government and military groups, private industry, public education and related professions. The 1990s have seen additional instructional system refinement, particularly in the application of learning theory and the use of educational technology. Computer technology especially is a current focus. Present models for the design of technical instruction build from a rich body of knowledge, and draw concepts and practices from a diverse stream of influence, including industrial psychology, skills analysis, programmed learning, measurement and evaluation, media design and learning theory.
The Zimbabwean needs the attention of Social Reconstructionism in order to afford successful Industry Institute Interaction. Observations have shown that academic students in Zimbabwe are becoming rich with textbook knowledge. They are limited in knowledge application and innovation. Since the 80’s, embracing technological advancement by Zimbabweans as well as being involved in modern innovative research & development has been constrained with resource unavailability. It is high time we break the ceiling or takeoff in order to explore the new free space of technology economy. No wonder why third world countries take time to develop. It is the lake of an appropriate strategy towards industry technological literacy. Social Reconstructionism is a pedagogic approach that adds value to the technical curriculum. It is a philosophy currently being used to design models for the technical education curriculum.

8.0 Social Reconstructionism

Social Reconstruction as a stream of thought or “official program” is often synonymous with Depression-era Progressivism. But, Social Reconstruction, unlike progressivism, enjoyed political prominence. The spirit of progressivism, at least in terms of education, found a home in those enthusiasts who supported a child-centered perspective of education. Others, such as the essentialists viewed their progressive role as one that advanced the view of essential or basic education as the most sound approach to curriculum and teaching. Still others, more radical in their outlook, believed that progress should be framed with questions about social justice and equity. Proponents of social reconstruction included Harold Rugg and George Counts, although the “movement” was rich with supporters. To date, social reconstruction is only a by word in most texts that deal with the Progressive Era or progressive education, perhaps, because Rugg and Counts, the two most visible proponents, sought and received the
political limelight, no matter how glaring. In any event, the depths of social reconstruction have yet to be plumbed. Hence, the first book in this series will offer a comprehensive treatment of Social Reconstruction, which includes chapters that examine its proponents, political nature, and social justice programs born of and within the tumultuous context of progressive politics.

8.1 Restructuring of Training/Education

Within the epistemological frame that focuses on the nature of knowledge and how we come to know, there are four major educational philosophies, each related to one or more of the general or world philosophies just discussed. These educational philosophical approaches are currently used in classrooms the world over. They are Perennialism, Essentialism, Progressivism, Reconstructionism and Critical theory. These educational philosophies focus heavily on WHAT we should teach on the curriculum aspect.

8.2 Educational Philosophies

The following sub-sections describe the five educational philosophies in question.

8.2.1 Perennialism

For Perennialists, the aim of education is to ensure that students acquire understandings about the great ideas of Western civilization. These ideas have the potential for solving problems in any era. The focus is to teach ideas that are everlasting, to seek enduring truths which are constant, not changing, as the natural and human worlds at their most essential level, do not
change. Teaching these unchanging principles is critical. Humans are rational beings, and their minds need to be developed. Thus, cultivation of the intellect is the highest priority in a worthwhile education. The demanding curriculum focuses on attaining cultural literacy, stressing students' growth in enduring disciplines. The loftiest accomplishments of humankind are emphasized – the great works of literature and art, the laws or principles of science. Advocates of this educational philosophy are Robert Maynard Hutchins who developed a Great Books program in 1963 and Mortimer Adler, who further developed this curriculum based on 100 great books of western civilization.

8.2.2 Essentialism

Essentialists believe that there is a common core of knowledge that needs to be transmitted to students in a systematic, disciplined way. The emphasis in this conservative perspective is on intellectual and moral standards that schools should teach. The core of the curriculum is essential knowledge and skills and academic rigor. Although this educational philosophy is similar in some ways to Perennialism, Essentialists accept the idea that this core curriculum may change. Schooling should be practical, preparing students to become valuable members of society. It should focus on facts, “the objective reality out there”, and "the basics," training students to read, write, speak, and compute clearly and logically. Schools should not try to set or influence policies. Students should be taught hard work, respect for authority, and discipline. Teachers are to help students keep their non-productive instincts in check, such as aggression or mindlessness. This approach was in reaction to progressivism approaches prevalent in the 1920s and 30s. William Bagley took progressivism approaches to task in the journal he formed in 1934. Other proponents of Essentialism are: James D. Koerner (1959), H. G. Rickover (1959), Paul Copperman (1978), and Theodore Sizer (1985).
8.2.3 Progressivism

Progressivists believe that education should focus on the whole child, rather than on the content or the teacher. This educational philosophy stresses that students should test ideas by active experimentation. Learning is rooted in the questions of learners that arise through experiencing the world. It is active, not passive. The learner is a problem solver and thinker who makes meaning through his or her individual experience in the physical and cultural context. Effective teachers provide experiences so that students can learn by doing. Curriculum content is derived from student interests and questions. The scientific method is used by progressivist educators so that students can study matter and events systematically and first hand. The emphasis is on the process, how one comes to know. The Progressive education philosophy was established in America from the mid 1920s through the mid 1950s. John Dewey was its foremost proponent. One of his tenets was that the school should improve the way of life of our citizens through experiencing freedom and democracy in schools. Shared decision making, planning of teachers with students, student-selected topics are all aspects. Books are tools, rather than authority.

8.2.4 Reconstructionism

Social reconstructionism is a philosophy that emphasizes the addressing of social questions and a quest to create a better society and worldwide democracy. Reconstructionist educators focus on a curriculum that highlights social reform as the aim of education. Theodore Brameld (1904-1987) was the founder of social reconstructionism, in reaction against the realities of World War II. He recognized the potential for either human annihilation through
technology and human cruelty or the capacity to create a beneficent society using technology and human compassion. George Counts (1889-1974) recognized that education was the means of preparing people for creating this new social order.

8.2.5 Critical theory

Critical theorists, like social reconstructionists, believe that systems must be changed to overcome oppression and improve human conditions. Paulo Freire (1921-1997) was a Brazilian whose experiences living in poverty led him to champion education and literacy as the vehicle for social change. In his view, humans must learn to resist oppression and not become its victims, nor oppress others. To do so requires dialog and critical consciousness, the development of awareness to overcome domination and oppression. Rather than "teaching as banking," in which the educator deposits information into students' heads, Freire saw teaching and learning as a process of inquiry in which the child must invent and reinvent the world.

For social reconstructionists and critical theorists, curriculum focuses on student experience and taking social action on real problems, such as violence, hunger, international terrorism, inflation, and inequality. Strategies for dealing with controversial issues (particularly in social studies and literature), inquiry, dialogue, and multiple perspectives are the focus. Community-based learning and bringing the world into the classroom are also strategies.
9.0 Towards Social Relevance in Techno-education

Photo 9.1

Slowly and painfully, Zimbabwe is becoming aware of newer challenges as a population such as, the environment, employment, health, psychological issues of individuals and meaningful education of youth, which are not being met by the mere accumulation of more data or expenditure of more years, energy, and money. There is need to shape the experiences of the youth so that instead of reproducing current habits, better habits shall be formed, and thus the future adult society can be an improvement on their own. The photo of Photo 9.1 depicts empowered youths towards Industrial development by Harare Institute of Technology through offering customized course curricula.

In recent years in India educators of Tool Room Trainers are setting to reform education by calling for a social reconstruction, advocating a restructuring of education and training. Artificial environment of the schools was not educative in the youth of the country. They were not prepared to see and understand the values and issues which would confront them as they become adults, said researchers Dewey and Childs. There should be a creation of a new social order that creates a new environment in the Technical colleges by ‘reconstructing’ the existing environment towards Industry-to-institute setup.
9.1 Creating a Social Relevance Curriculum for Technology Education

Many Educationalists have relied upon technical processes as a means of generating curriculum content. But Teaching about technical processes is essential in a technical program. A social reconstruction curriculum orientation would be ‘hands on’ or adequate hands on as well as allowing for progressivism. It is the way in which the technical processes are organized that distinguishes the curriculum orientation.

Several purposes of education are prominent in this country since the beginning of public education. Social reconstruction is one of the unique categories of purpose which has helped to shape educators’ thought about curriculum. Social relevance program tries to involve students in technical school and community life in order to help them to become adults who can reconstruct or shape and improve society. Globally, many technology educators have tried activities with students which were motivated by a social reconstruction perspective, but few have implemented a complete program.

10.0 Specialized Technology Education Programs – the case of India

One of the major targets of technological Training is to promote technological literacy of a broad and encompassing nature. To achieve this goal, the students are prepared to understand, control, and use technology. Students are learning how to adapt to technological change and how to deal with forces that influence their lives and potentially control their future. The paradigms for teaching technology education are changed in this direction in order to harness Industry Institute Interaction.
India has changed in the same direction through establishment of Tool Room Training centers across the country as well as Service Institutes. It is realizing a breakthrough increase in technology economy through these facilities which are strongly empowering youths as well as the SMEs. The Tool Rooms are specialized academic Institutes and Production Industries in one. Students will no longer go to Industry in order to get internship because they have a form of on-the-job training. They imparted the same approach to other nation through the support of the World Bank. Amongst beneficiaries, they saw the establishment of the Indo-Danish, Indo-Germany, Indo-Canada, and Indo-Zim projects of Tool Room Training centers, which are going a long way empowering the youths and the SMEs who are the future of a successful technology economy.

Technology education teachers and curriculum experts recommend a variety of differing instructional approaches such as self-paced modules, interdisciplinary methodology, and problem solving to inform students about technology and its effects on society. These instructional approaches all have their advantages and disadvantages. The instructional approaches typically used in technology education are defined as follows.

10.1 **Industrial Arts Approach**

A body of related subject matter, or related courses, organized for the development of understanding about all aspects of industry and technology, including learning experiences involving activities such as experimenting, designing, constructing, evaluating, and using tools, machines, materials, and processes, (America Council on Industrial Arts Teacher Education, 1979).
10.2 Integrated Approach

Instruction that incorporates other disciplines such as English, math, science, and social studies to show how technology is an integral part of other disciplines and vice versa. It also emphasizes the need for humans to apply knowledge from other disciplines to solve technological problems.

10.3 Modular Approach

It is an individualized, self-paced, and action-based units of instruction that allow students to use current technologies to learn independently. The modular approach provides students with problems and activities that encourage them to use critical, higher-level thinking skills to solve problems and make value decisions.

10.4 Problem Solving Approach

It is an instructional approach that emphasizes critical thinking and is centered on students using a problem solving process in order to find creative solutions to problems.

11.0 Industry Technological Literacy

In a study in United States, the following definition of technological literacy was used: ‘technological literacy is having the knowledge and ability to select, properly apply, then monitor and evaluate appropriate technology given in the given context’.
Several reports on education have addressed the technological literacy issue and have all called for an increase in the level of technological literacy exhibited. They voice of an opinion similar to Mr. Ley (1987), namely, “The level of technological literacy to which educators and others are able to bring the general population will determine the future world in which humankind will exist”. It is also true with the future of Zimbabwe.

Here the term “General Population” is keenly to be watched. Very rich technology Institute is not reached to the general public. It has been giving benefits to very selective group of students. Though this is important, for third world countries like Zimbabwe there should be more programs specifically designed for the very average students, which address “General Population” with given opportunity for active participation to Industry - Institute Sandwiched program. Figure 11.1 demonstrates the model for prospective society through technology education.

![To Achieve a Prospective society
A Model](image)

![Figure 11.1](image)

**Figure 11.1** Prospective Society through technology education ‘A’ model
12.0 Preparing Students for Living in a Technological Society

National Science Board Commission on Pre-College Education in Mathematics, Science and Technology (US 1983) noted the effects of technological changes in its report. We must return to basics, but the basics of the 21st century are not only reading, writing, and arithmetic says Prof James Braukmann (2001) of Eastern Washington University and Prof Melvin Padras (2001) of Industrial Technology Education Department, University of Idaho, Moscow. They include communication and higher problem solving skills, and scientific and technological literacy. In Technical Training, development of students’ capacities for problem solving and critical thinking in all areas of learning is presented as a fundamental goal.

Problem solving as a Teaching Method can cluster the skills into two general categories namely group dynamics and problem solving strategies. Group dynamics includes leadership, communication, presentation, and persuasion skills. These skills are vital in business or academia, in industry or politics, from committee work to designing. We should force students to use them. For example, if a group of students will be evaluated on a final cooperative product, and no one member can manage all the work, persuasion, communication, and cooperation will develop. The group must find ways to organize and communicate internally and externally to accomplish a common goal. The second category, problem solving strategies, includes the design process, information management, and learning skills.
13.0 Conclusion

It is now drawn that Industry-Institute Interaction can empower the Zimbabwean youth through techno-education for the betterment of a high technology economy. The following is the challenge for this duo interaction that builds a prospective society through social reconstruction of the technical curriculum.

All forms of public technical education design pattern and its application, however, is less sophisticated than is found in military and Industrial applications due to the large gap between Institutes and Industries. Industries should come forward to deliver the latest Technologies to the Technological Institutions. Most of the conferences in Institution are with very less participation of Industries or it might not be sufficient.

Many Industries keep technologies as a secret and do make great setbacks for the technical Institution. The industry and institute alumni must come forward to give seminars through their motivated industrial team to boost future technologist and or technical teachers. This creates a smooth relationship between Technical teachers-students-professionals-Industries.

Remember the ‘midfielder position substitute strategy’. If you are determined to attack and win, replace the failing player especially the one by the critical position. Industry and Institutes in Zimbabwe will certainly prosper, so is the high technology economy, when technical curriculum is reconstructed with social relevance for a prospective society. The youths will significantly benefit from the developed curriculum, econometrically, since they are the future drivers of a high technology economy.

Title: Don’t Waste Your Time Teaching in an Online Environment

Topic: This workshop will offer for review a set of ten instructional design templates, or models of instruction, each designed to build a sense of community among students and between students and teacher.

Workshop: A work in progress, this information is part of a manuscript that I intended to be published as a book.

Name: Dr. Bernie Potvin, Associate Professor and Chair, Education

Workshop Summary:

This workshop is designed for architects of learning experiences, educators whose courses are in whole or in part written for an online learning environment.

In this workshop I will present ten models for possible use regarding instructional design, specifically for designers of instruction who work with computer mediated courses. Universities and colleges, businesses and technical training institutions employ instructional designers specifically to design courses for delivery to students, directly to the student in some computer mediated way. In addition, professors at universities and colleges, and trainers and instructors in technical institutions and businesses are being asked more frequently to design their particular courses to fit into a template in an online environment. In other cases the design of instruction is blended and includes some face to face session, usually delivered at the beginning of a course or program, then followed by learning experiences designed in an online environment. Finally, more and more teachers in K-12 education regularly include some form of online learning experiences, from homework and other assignments nested into an online environment for students to access to full courses delivered entirely in an online environment.

In particular this workshop addresses one question asked by many online architects of learning experiences, “How can I build a sense of community among my learners in my class?” This workshop provides ten instructional design methodologies, theoretical based approaches to guide architects of learning in designing courses that develop a sense of community among learners in a course. A methodology is a theoretical construct. A theory is a plausible explanation based upon observable evidence. The evidence this book draws from includes learning theory and what is known today about how people learn, community and theories drawn from anthropology, psychology and sociology in particular, about how community is developed and nurtured and finally from the analyses of experience of professors and teachers who have been architects of learning for computer mediated courses.

Each methodology will ring true for the experienced educator. The instructional designer with limited teaching experience may need to suspend disbelief regarding a methodology until tried and tested in
the heat of instructional battle. Both the experienced educator and experienced designer of instruction will be able to give that “phenomenological nod” to what is presented in each methodology, and why each methodology as designed can develop community among learners.

In addition to ten methodologies this book provides ten instructional design templates. Once upon a time, a long time ago and far, far way, we called these templates “lesson plans.” Finally, this book provides a set of tried and true methods and strategies used by the author and other professors to build community in learners.

This workshop is a work in progress and my hope is that a community of scholars and educators would join in with me to evaluate my ideas and offer constructive feedback.
Title:
Effects of Japanese mothers’ various views and values on potentially bilingual children’s language

Abstract
In order to explore Japanese mothers’ views and values regarding their children’s bilingualism, questionnaires that inquired about mothers’ desires, methods, beliefs, and attitudes toward bilingualism as well as their cultural values were filled out by 33 participant mothers. This paper presents the mothers’ questionnaire responses and their analyses. Results indicate that Japanese mothers differ in their ideas toward
bilingualism for their children, at least in degree, and that these differences exert a certain amount of influence on their children’s language, particularly language exposure. Suggestions are proffered for mothers who wish to promote their children’s bilingualism as well as for mothers who, for whatever reason, do not seek such language learning for their children. The paper concludes with a call for further research, particularly studies comparing Japanese living in Japan with those living in foreign countries and comparing mothers from various nations and different ethnic backgrounds.
Effects of Japanese mothers’ various views and values on potentially bilingual children’s language

Kayoko Ishikawa, M.A.T.

In his book, Hakuta (1986) mentions that he is frequently asked if being bilingual is a good or bad thing for children. I have also quite unexpectedly been asked the same question by Japanese acquaintances. As was often the case, those friends who are mothers and who have kindergarten children would discover that I was involved in English education, and they considered me to be a reliable source on English language learning. They knew that I would not steer them toward a certain set of language courses or textbooks like some people with profit as their motive or as people with their own language schools are wont to do. According to those mothers, several English and early education companies had called them to try to sell them their expensive educational materials, and they had been wondering if they should invest a fortune in their children’s English education from such an early age. When asked, I was unable to answer their questions very well simply because at that time I lacked knowledge on bilingualism and bilingual education.

The present study, part of which was conducted for my Master’s thesis, was carried out in the hope that I would be able to answer Japanese mothers’ questions about this topic in the future by presenting them some suggestions and/or results deduced from this research. The other trigger for this study was meeting mothers from other countries in the U.S while studying for my Master’s degree and noticing that those
mothers have different values, views, and implementation methods for their children’s bilingualism. This caused me to wonder what the case is for Japanese mothers. A further impetus for this research was my raising my own children as bilinguals, as I constantly strive to seek the best language learning route for them.

The Literature

Studies on bilingualism from the 1920s to 1960s claimed that bilingualism was harmful to children. For instance, Thompson (1952, cited in Hakuta, 1986) stated that there is little doubt that children raised in bilingual environments are handicapped with regard to their language growth. Yet, later studies like the one by Peal and Lambert (1962, cited in Hakuta, 1986) showed the possibility of cognitive benefit for bilinguals. They asserted that young people with multiple language systems have superior mental flexibility and concept formation as well as more diversified mental abilities.

If being a bilingual is truly beneficial for children, then when is the best time to start exposing them to another language? The literature argues a variety of theoretical claims, but whether or not mothers should encourage bilingualism in their children and, for instance, purchase English educational materials ultimately depends on how mothers view bilingualism for their children. If they are serious about raising their children to be bilingual, they should start from an early age. Shichida (1995) asserts that language education should start from the fetal stage or by the age of six at the latest because of the indefinite capacity of their right-brain hemisphere. Yet, at the same time, once they start, they should continue their education, since it is easy to lose a language unless one keeps using it. Karachi (1980, cited in Nakajima, 1998) also states that it is well known that bilingual children in the environment of two languages easily lose one language
immediately after they are placed in an environment with the other language. Losing one language in this way is one of the characteristics of the child’s brain. Harley and Wang (1995, cited in Nakajima, 1998) also mention that even though children by age seven or eight acquire two languages and two cultures easily, it is extremely hard to maintain them. Harding and Riley (1986) conducted interviews with sixteen bilingual families and found that one of the families moved quite often from one country to the next while their two children were still very young. These children were exposed to different languages in various countries but only retained English, which was the language they used at home. They acquired but soon forgot the other languages.

The Research

In order to explore Japanese mothers’ views and values toward raising their children bilingual, a set of research questions were constructed. The research questions were:

1. Are Japanese mothers different in their desires, methods, beliefs, and attitudes toward bilingualism and their cultural values, and if so, how?
2. If there are differences, how do these differences (i.e., in their desires, methods, beliefs and attitudes toward bilingualism and their cultural values) affect their children’s language learning?

Procedure

A two-page questionnaire written in Japanese was constructed and distributed by mail to Japanese mothers. 33 questionnaires were ultimately returned. The questionnaire questions were open-ended, as unbiased, free opinions on bilingualism
and bi-culture were sought.

The questions in the questionnaire (which were translated from Japanese and revised from my previous study on international mothers) were as follows:

Topic 1: mothers’ desires
(1a) Would you like to raise your child(ren) to be bilingual? (Please note that bilingual in this questionnaire is defined as a person who controls the use of two languages freely. It does not necessarily mean that their pronunciation is the same as that of a native-speaker.)
(1b) Why or why not?
(1c) If your child(ren) is/are bilingual, is being Japanese-English bilingual desirable? If not, is Japanese and another foreign language desirable (and if so, what other language)?
(1d) Why do you think so?

Topic 2: mothers’ methods of dealing with a language(s)
(2a) Do you currently do anything for your child(ren) regarding English/foreign language education now (whether or not you wish your children to become bilingual)?
(2b) What do you think you should do as a mother for your child(ren)’s bilingual, English, Japanese, or foreign language education?

Topic 3: mothers’ beliefs about bilingualism
(3a) What method do you believe is the best in order to make your child(ren) bilingual? (When is it best to start? Do you think teaching two languages simultaneously from birth will confuse children?)
(3b) Do you think so according to your intuition, or did you receive that information from somewhere, for example, books or magazines?
Topic 4: mothers’ attitudes toward English

(4a) Do you have a positive attitude toward English? (Did you like English in school?)
(4b) Would you like to be able to speak English or improve your English?

Topic 5: mothers’ cultural values

(5a) Do you think learning the target culture should occur simultaneously alongside learning a foreign language?
(5b) What do you think would be the best possible way to learn the target culture?

The reason the bilingual definition was added to this questionnaire is that it seems that the Japanese people have a tendency to have a relatively strict definition of what it means to be bilingual. In general, Japanese regard bilingual as Bloomfield (1933) long ago defined it: a person who has native-like control of two languages. His definition is considered rather extreme and maximalist among the numerous definitions on bilinguals. With this narrow definition, there are probably an extremely small number of bilinguals in the world, and my participants would most likely think that raising their child(ren) bilingual would be impossible. Considering the other end of the spectrum (i.e., Diebold’s (1964) definition of a bilingual as a person with minimal competence of a few phrases and greetings in two or more languages), in this study, I set up the definition to lie near the middle of the continuum, with the definition of bilingual being “a person who controls the use of two languages freely.” More commonly, since Japanese also believe that a bilingual’s pronunciation should be the same as a native-speaker’s pronunciation when speaking a particular language, I added the extra comment regarding pronunciation: “It does not necessarily mean that their pronunciation is the same as that of a native-speaker.”
Subjects

The subjects in the present study were 33 Japanese mothers ranging in age from 31 to 42 years old. They had children ranging from 11 months to nine years of age. Except for three mothers who were living in the U.S., all of the other mothers were living in Japan at the time of questionnaire completion. Considering the mothers’ backgrounds, 4 categories were created to describe the mothers: U.S. Life Experience Mothers, International Mothers, Language Teacher Mothers, and Mothers with no Profound Relation with Languages. These categories, which were created to better understand who the participants were, were constructed by looking at the background information of only 22 mothers, as the background of the other 11 mothers was never provided to the researcher.

U.S. Life Experience Mothers

A mother lived in the U.S. with her American husband (his mother was Japanese, but he could not speak any Japanese), one stepdaughter, and one biological son.

B mother lived in the U.S. with her American husband and one son.

C mother lived in the U.S. because of her Japanese husband’s job. She had two daughters who went to the local school. They had lived in the U.S. for almost five years and had planned to return to Japan soon.

D mother lived in the U.S. for a total of five years because of her Japanese husband’s job but had since returned to Japan. She had two sons. One boy had experienced life in the U.S. from the age of 8 months to 4 years. The other boy was born and raised only in Japan.
International Mothers

E mother lived in China and the Philippines approximately six years in total because her husband was a member of the Japan Overseas Cooperation Volunteers. Even though the whole family was living in Japan at the time of the study, they planned to return to China. She had one son and one daughter.

F mother lived in Japan her whole life, but her husband grew and sold orchids internationally. Guests from all over the world visited their house frequently. She had two sons.

Language Teacher Mothers

English Teacher Mothers

G mother was a full-time English teacher in a private junior high school. At the time she was taking graduate-level linguistics courses. Presumably, her knowledge in linguistics was the deepest among the study’s 33 participants. She had one daughter and one son.

H mother was a part-time English teacher in a private junior high school. She had not studied in an English-speaking country for an extensive period of time, but she endeavored to improve her English in order to compensate. She had two sons.

I mother was an English home teacher employed by one of the major English conversation schools in Japan. She had two daughters and one son. She often accepted guests as part of a home stay program.

J mother was a former part-time English teacher at an English conversation school in Japan but had quit temporarily to take care of her baby girl.

K mother was a former school manager at the same conversation school and also taught English as a part of her school manager job. At the time of questionnaire completion, she was a full-time mother to her son and daughter.

Multilanguage Teacher Mother

L mother was head in her area of the multilingual teaching nationwide group. Essentially, she was a coordinator for teachers of different languages, and yet she taught
only a little. Since she majored in French as an undergraduate, she was supposedly teaching mainly French. She had one daughter and one son.

**Japanese Teacher Mother**

M mother was a former Japanese teacher for foreign students in the language division of one of the major cram schools in Japan. She quit her job to take care of her son and daughter.

**Mothers with no Profound Relation with Languages**

**Mothers Who Like English and Traveling**

N mother was a full-time mother who had one daughter. She had traveled abroad numerous times with her husband.

O mother was a full-time mother with three children. The countries she had traveled to were all English-speaking countries.

**Mothers Who Like English Now but Disliked it in School**

P mother was a full-time mother with two sons.

Q mother was a full-time mother with three children.

**Mothers Who Dislike English but Love Traveling**

R mother was a working mother with one son.

S mother was a part-time mother and a part-time swimming instructor. She had three daughters.

T mother was a full-time mother with one daughter and one son.

**Mothers Who Dislike English**

U mother was a full-time mother with one daughter and one son.

V mother was a full-time mother with one daughter and one son. Even though she did
not have any deep relation with English (which was a subject she hated at school), her mother-in-law had been teaching English to children in the neighborhood her whole life. This mother’s children went to her classes from time to time.

**Results and discussion**

First of all, Tables 1 through 4, along with Graph 1, present the results of the first four questions, Questions (1a), (1b), (1c), and (1d), which were asked in order to investigate the mothers’ desire toward bilingualism for their children.

<table>
<thead>
<tr>
<th>Responses</th>

</tr>
<tr>
<td>Yes, I thought so, but I feel that my children are already too old to acquire another language</td>
<td>1</td>
</tr>
<tr>
<td>No</td>
<td>5</td>
</tr>
</tbody>
</table>

As can be seen from Table 1, 18 mothers simply answered “yes” and five mothers simply answered “no.” The other 10 mothers put some additional statements on the “yes” answer, yet from their statements, their desire for their children to become bilingual can be observed. 28 mothers (85%) answered positively and indicated a desire to raise their children as bilinguals.

---

1 Please note that questionnaire responses were not translated word-for-word, and that some amount of response interpretation was necessary for categorization purposes.
The three mothers who wrote that “I do not want to force my child(ren), but it would be great if they could speak English well” appeared to not want to become like the so-called “education mothers,” or mothers who are overly concerned about their children’s education, yet the three mothers admitted their desire to raise their children as bilinguals even though they were a bit reserved with their answers. Two mothers indicated their feelings of limitations in raising children to be bilingual. One of these two mothers, M mother, who was a Japanese teacher, answered “it is extremely difficult and almost impossible if both parents are Japanese who are non-native speakers of English.” Since her husband was also Japanese and did not speak English, she was the one to speak English to her children, and she felt that this kind of method limits the raising of bilinguals. The other mother (G mother in the English Teacher Mother category) commented that she thought she wanted to but felt that her children were already too old to acquire another language. This is because she thought that the critical period hypothesis fits about eighty percent of the people and that at the age of six there is a boundary in acquiring another language. Since two of her children were already past the age of six, she had given up on raising them to be bilingual.

Interestingly, C mother and D mother, both of whom had experienced living in the U.S., answered “no,” even though their children were likely to be farther ahead in understanding and using English than typical children in Japan in regard to the English language due to their having lived in the U.S. D mother mentioned that her elder son’s English was good enough to correct her English and he was an English-dominant bilingual when living in the U.S. Nevertheless, immediately after they returned to Japan and he started going to the local kindergarten, he lost almost all the English he had acquired, even spontaneous expressions such as “Oops.” She likely gave up trying to
maintain his English by experiencing the reality of “children forget easily,” which was explained in detail in Harding and Riley’s (1986) research.

Table 2 deals with the reasons for the positive answers for the mothers’ desire to raise children bilingually. Table 3 deals with the reasons for the negative answers for their desire.

</tbody>
</table>

As Table 2 illustrates, the comments of the mothers who answered “because English will be indispensable in the future when their children become adults,” “to survive in an internationalized society in the future,” “because it will be useful for their future,” or “because it will help when job-hunting” are very future-oriented. They
foresee the global importance of the English language and expect the coming and/or expanding of an internationalized society. Some mothers mentioned that their children should prepare for an information-oriented society, which can be seen through the diffusion of the Internet that requires the ability to manipulate both English and computers.

Eight mothers answered the reason for their desire is that their children will be able to communicate with people from all over the world. Moreover, some of them added the comment that through English as a communication tool they can make more friends from many different countries. For instance, E mother in the International Mothers category indicated that, due to her own experience living in China and the Philippines, children can make friends with others who speak a different language through their “telepathy.” Notwithstanding, if children can speak other children’s native language, their attitude toward them changes for the better. Take V mother’s statement as another example: English helps children become more active in the world. H mother in the English Teacher Mothers category also commented that through communication with not only people in their own nation but also people in foreign countries, we become able to better absorb more in order to live in our current internationalized and information-oriented society. Her additional comment is that since nowadays we can associate with each other “border-freely,” we can make international friends more easily. In this current situation, the more languages their children can speak, the better. Hence, several mothers appeared to value the importance of communicating with people with different nationalities, ideas, and backgrounds.

Five mothers answered that their children’s view and their world will be broadened. According to N mother, who is in the Mothers with no Profound Relation
with Languages category and who loves traveling, being multilingual can widen children’s views, that is, by allowing them to read books in the original language and listen to a variety of people’s ideas. It can also let us better enjoy foreign countries since she felt very inconvenienced with her limited foreign language ability when traveling abroad. A mother and B mother, both of whom desired their children to become bilingual, answered with “to be able to communicate with relatives in her home country, Japan.” Because of their American husbands, they planned to live in the U.S. forever, but would likely return to Japan for occasional visits. Yet, their parents spoke no English, and also their nieces and nephews, who were around their children’s age, spoke no English, either. They hoped their children would keep a good relationship with them, and thus did not want linguistic problems to arise between them.

Now, let us examine the reasons for no desire in raising children as bilinguals, which are shown in Table 3. Three mothers answered that “it definitely depends on the children’s will. I do not want to force them.” Interestingly, even though the same reason of “it depends on the children’s will” was described in Table 1, some mothers took this to be positive while others took it to be negative. C mother and D mother, who had experienced American life and later returned to Japan, answered with this reason. Their children happened to be exposed to English and became bilingual in English and Japanese, but they were certain their families would return to Japan at some point in the future. After going back, the decision to maintain their English would ultimately lie with their children. Other mothers might envy those children who can be considered lucky enough to have lived in an English-speaking country, but in fact, later efforts would be necessary to maintain their English. At least at the time of questionnaire completion they had a choice as to whether they would like to maintain their English
ability or not, although they did not have the original choice of being exposed to English in the U.S.

Besides these mothers, the other mother who indicated no desire also thought that it all depends on her children’s will because that is their own life. If they wanted to study English, she would expect them to find a way to continue their English studies. Additionally, one mother answered that one’s native language is more important. One mother answered this way: “I am not interested in foreign languages at all.” This answer explains why she had no desire for her child to learn a foreign language.

Graph 1 shows the mothers’ language preferences for their children’s bilingualism or multilingualism, and Table 4 shows the reasons for their preferred languages.

As Graph 1 reveals, all 33 participants mentioned and admitted the significance of English. 21 mothers chose it as a definite single preferable language, and others chose it as the core preferable language or choice. Ten mothers reasoned that their language preference is English because it “is a lingua franca,” and nine mothers reasoned that “English can be a communication tool in the greatest number of countries.” Examining some mothers’ additional comments for these reasons, we can find their interesting thoughts, which are reflected from their own experiences. For example, O mother, who is also fond of traveling, commented that she felt closest to English, as she travels through several English-speaking countries. Yet, her inability to manipulate English made her think that her children should learn English in order not to feel inconvenience in the same way she did while traveling.

Suggesting English and any other language, N mother, who had no profound
relation with foreign languages but really enjoys traveling, mentioned that English was not useful at all in some European countries except in some first-class hotels. She felt that knowing another foreign language would have helped her more at such times.

All of the English teacher mothers added their comments to their reasons why they chose English. For instance, J mother mentioned as a second reason for choosing English that she can somehow get involved with her child’s language education because of her occupation as an English teacher. I mother indicated that English is accepted by and used in many countries but Esperanto is not. She thought that English must have a secret to attract so many people in the world. H mother also mentioned that English would probably facilitate learning other foreign languages. Thus, English is strongly supported by the mothers in this study.

There were other areas of interest from this table. Two of the mothers chose Chinese, as many expect increased economic development in China. Two mothers wrote “because we understand each other far better in each person’s native language”; one is L mother, the head of a multilingual education group, and the other is G mother, the English teacher with the deepest linguistics knowledge. The latter thought that children can accept various thoughts by thinking in different languages. She also thought that if more and more people can do this, we will move closer to world peace. Examining these two mothers’ comments together, we can surmise that they believed in children’s unlimited ability in language, which is, in fact, also mentioned by C mother and D mother, both of whom lived in the U.S. Although A mother and B mother chose English, they also pointed out the immense importance of Japanese in order to communicate with relatives in their home country of Japan.

Tables 5 and 6 present the results of Questions (2a) and (2b), which
investigated the mothers’ method of teaching a language(s). Table 5 shows what mothers actually implement for their children’s language(s) learning, and Table 6 displays what mothers should do for their language education.

</tbody>
</table>

As Table 5 shows, 17 mothers make use of videos, TV programs, books, and/or CDs (essentially, whatever materials are available to them). R mother, who had no relation with languages and disliked English, thought that she did not do anything to promote her 4-year old son’s English except let him watch such TV programs. Yet, he could say English words very well by mimicking the pronunciation, which made her think that English should be learned at an early age. T mother, who also had no relation with languages and who disliked English, pointed out the positive results from playing English recordings, and her children could sing along very well with them with perfect pronunciation. Some mothers mentioned that they received picture books and Disney videos from relatives in the U.S., even though such merchandise is available at many major bookstores in Japan. They had such goods sent to them because it was cheaper than buying such import products in Japan.
Seven mothers answered that they sent their children to English classes. Some of them mentioned that their teachers were native-speakers of English. Yet, U mother, who had no profound relation with languages, stated that even though her children took classes, she did not expect them to become fluent English speakers anytime soon. Instead, she hoped that they would learn that foreigners are not different from the Japanese. This mother confessed that in front of foreigners she herself would get very nervous, her whole body would tremble, and she could not even greet them in English, even after studying English in school for eight years. C mother also mentioned experiencing similar feelings, even though she had lived in the U.S. She remarked always feeling uncomfortable with the language and that she had no confidence in speaking it.

The number of mothers who answered they carried out nothing for their children with regard to foreign languages coincides with the number of mothers who answered they had no desire to do so. Yet, as a matter of fact, only three mothers had no desire to raise their children bilingual and do nothing. Two mothers (C mother and D mother) had no desire but did quite a few activities for their English, while two other mothers had the desire but carried out nothing. Hence, it can be seen that mothers’ desires contradict their implementation of their children’s foreign language education.

G mother (an English teacher mother) and M mother (the Japanese teacher mother) reported saying some formulaic expressions to their children in daily life. Yet, both of them felt the limit of their methods, as also described in Question (1a). M mother mentioned that trivial daily chores prevented her from being consistent in saying them, and she felt that it was very difficult and almost impossible to raise children as bilinguals in Japan with non-native speakers of English parents. Among those mothers
who wrote that mothers should send children to English classes, some mentioned that if possible they would prefer to teach them English, believing mothers should speak English to their children. Yet, in reality, they could not speak English, so as a second choice they would settle for sending their children to English classes, and that is what they actually implemented. H mother (an English teacher mother) added that they travel abroad for about a week once a year, since she felt constrained by the limit of experiencing “life with English” in Japan. It is certainly preferable to do so, but in reality this kind of investment is impossible for every household.

</table>

As Table 6 reveals, a wide variety of answers came up in this section. 12 mothers answered that to produce an environment where children can acquire English naturally and be exposed to it is what mothers should implement for their children. We can see mothers’ value of acquiring languages in a more natural setting rather than
learning or studying hard, which typically does little for most Japanese learners of English. Five mothers answered that mothers should pay attention to their own native language (i.e., Japanese) in order to teach children proper language usage. They value education in the Japanese language above education in foreign languages. Six mothers thought that mothers should speak English (or a foreign language) to their children, and three mothers thought that mothers should send children to English school. Two of these three mothers (H mother, the English teacher, and O mother, who likes English and traveling) mentioned that there is a limitation at home in cases where mothers cannot speak English, even though they believe that mothers should speak the target language to their children. Therefore, considering realistic options, the only possible way would be to send them to English lessons. Yet, H mother made a suggestion that mothers should learn English together with their children.

One of the most interesting comments was made by G mother (in the English Teaching Mother category). She was the mother with the most linguistic/language teaching knowledge. She wrote that she was disappointed when listening to speech contest speeches made by Japanese high school students who had returned to Japan after studying abroad. Such students ended up following the same predictable pattern: criticizing the areas in which Japanese society is lacking and insisting that Japan should change. G mother thought that instead of that, we Japanese should be able to express ourselves on an international stage without excessive modesty. We should convey to the world just how wonderful Japan really is. She thought that there are more things we should teach our children ahead of linguistic competence. In addition, she mentioned that Japanese mothers should definitely disagree with the “examination hell” system, which makes Japanese children struggle and takes away their free time from more
creative and physical activities. As a result of “changing ourselves” rather than “changing others,” we should become “the people who can change others.”

Answering that to demonstrate mothers’ positive and friendly attitude to foreigners in front of children is what mothers should implement for children, C mother confessed that even though she had lived in the U.S., she tended to look at foreigners differently. Although she knew the importance of showing children what she should do, she could not change herself easily. Therefore, she envied her children who naturally got along with the local people without prejudice or discomfort.

Examining the interrelation between their beliefs and what they actually do as mothers, 19 mothers implemented what they believed they should do. From six of the mothers’ comments, it was unclear what the relation was. The reality and the ideal of eight mothers conflicted with each other.

At this point, the results of Questions (3a) and (3b) will be shown in order to investigate mothers’ belief in bilingualism. Table 7 shows the result of the question regarding the best methods to promote bilingualism in children. The result of the question on the best time to start a second language for children is exhibited in Table 8. Graph 2 displays the results of the question about whether or not children will get confused by simultaneous languages exposure if they are spoken to in two languages immediately after their birth. All of the above-mentioned questions were included in Question (3a). Table 9 shows the results of Question (3b).

A great variety of answers can be seen in Table 7, which suggests that the mothers are quite different from one another in terms of their beliefs. 13 mothers answered that the best method would be to be in an environment where English is naturally spoken in daily life. 1 mother, who is a multilingual evangelist, remarked that children can acquire foreign languages in the same manner as their native language. Another mother added her comment that creating an environment that exposes children to other languages and then sending children abroad to study when they get older would be the best method. Five mothers considered the best method to be parents speaking in their native languages to child(ren), especially if they are native speakers of different languages.

According to two mothers, letting children live abroad for a couple of years before puberty is the best way. One of these two mothers suggested the importance of mothers’ involvement in foreign language learning and stated that in cases where
parents cannot teach a target language, they should at least learn together or play together in that language. G mother, who had the deepest linguistics knowledge of all the participating mothers, remarked that attending an immersion program is the only way to make children bilingual in Japan. She pointed out the great success of Kato Gakuen’s immersion program. One mother answered that allowing children to be interested in foreign languages is the best method. This mother proposed that small children are usually interested in everything and they can absorb things very quickly. For instance, when her children got together with her friends’ bilingual children, they became very interested in English and learned the language from them very quickly and steadily.

Earlier, the interrelation between mothers’ beliefs and actual implementations was examined. Now, the interrelation among the above-mentioned two categories and mothers’ considerations of the best method of raising bilingual children will be contemplated. Only seven mothers noted that they were at the time implementing what they believed mothers should do and which was also the best method that they believed worked. Unfortunately, it was not possible to judge the interrelation from 15 mothers’ comments. Eleven mothers’ reality and ideals differed from each other.

As Table 8 suggests, with the exception of one mother answering that anytime is fine, three mothers with no answer and two mothers with the answer that when children are motivated, 27 mothers thought a foreign language should be introduced before puberty at the latest. Five mothers answered that children should be exposed to a foreign language as soon as possible. One of the five mothers mentioned that a genuine English “r” sound, which does not exist in Japanese, would not be acquired after six years of age. Yet, one mother answered that it should be introduced after the age of six “when their mother tongue is stable enough not to get damaged by another language.” As such, the mothers’ opinions at times completely contradicted each other. Some mothers proposed that length of study is more important than when children start learning another language. Additionally, V mother added the suggestion that we should not be conscious regarding when to study English but should let our children sense that English is not something special or difficult. In this way, children can accept English
As can be seen from Graph 2, an overwhelming majority (18 mothers) answered that children will not get confused, even if they are exposed to two languages simultaneously immediately after birth. E mother, who had experience living in China and the Philippines, also answered that to produce the natural foreign language environment would be the best method, and she thinks immediately after birth or even during the fetal stage we can start offering our children a second language and they will not become confused. Her children were able to handle different languages very well according to the listener’s language, for instance, English with the maid (from about age two and a half), Tagalog with the local friends, Japanese with their mother, and Chinese at school (from age three). She could attest from her experience with her children that they did not get confused. A mother suggested that immediately after birth is fine, yet patience is necessary since children might be slow in their language development. Two out of six mothers who answered that they may be confused without resistance.
distinguished between the two different situations. Unless their parents are native speakers of different languages and speak their native language to children, the children may be confused. However, in reality, most parents are native speakers of the same language, yet if one of the parents speaks a different language, the children could get confused. M mother, in fact, illustrated her case. She believed that, as a mother, she should speak the target language, especially the formulaic expressions, and that even with bad pronunciation children can pick up some expressions from her. Subsequently, that is what she implemented. Even so, what she considered the best method was for parents with different native languages to speak their own language to their children. She felt frustrated, and her children, especially the younger one, were apparently confused by two languages, as they sometimes said entirely meaningless expressions in both languages.

</tbody>
</table>

As Table 9 shows, nine mothers answered that they came up with their opinions on confusion according to their intuition. V mother answered that she thought
children do not get confused, and this answer came through her actual experience with her own children and with her intuition. Her elder daughter at age five repeated English words exactly as she heard them. She therefore thought that children get used to English sounds before they feel the sounds are difficult or before they become too bashful to pronounce them. When she was at school, she felt it was so embarrassing to create something different from Japanese in front of her classmates that she always pronounced English words with Japanese accents on purpose, just so she would not stand out.

Japan has been inundated by information on bilingualism. Compared to mothers from other countries, which I discovered through my previous research on international mothers’ views on bilingualism, there are more Japanese mothers who learned information from books, magazines, TV, and so on. In fact, some mothers mentioned that there are more and more features on bilingualism on TV in Japan nowadays, and they gained their knowledge about bilingualism from those programs.

Continuing, in Tables 10 and 11, to determine mothers’ attitudes toward English, the results of Questions (4a) and (4b) will be shown. Table 10 displays the outcome of the mothers’ attitudes toward English, and Table 11 reveals the outcome of their desire to improve their English.

<td>3</td>
</tr>
</tbody>
</table>

Table 10 shows that at questionnaire completion time, a total of 21 mothers had a positive attitude toward English, which combines the 11 mothers who liked English in school and the 10 mothers who claimed that they did not like it at school. Several of the 10 mothers indicated that their dislike was attributed to their teachers, their boring lecture-type lessons, and/or their terrible pronunciation. Some of the mothers regretted that they did not study harder at school, so they hoped their children would be able to manipulate English better. Some mothers questioned the English education of their times in Japan. In other words they asked questions like “Why did they emphasize grammar, which most students have no interest in it?” “Why did we only do translations every day?” (asked by V mother). “Why did we study so hard for nothing?” (asked by U mother). U mother liked English until junior high school, but after high school English must be learned by rote for regular exams as well as entrance exams, which was a complete pain for her. Several mothers who loved traveling mentioned that they disliked English at school but learned how fun it is to use English by communicating with foreigners. They said that they could communicate with them even though they absolutely forgot about the details of the English they learned in school. They wished they had known that English could be great fun when they were at
school. They wondered why schools did not get students interested in English like that. The major reason was that learning English in school was almost solely to help students pass their entrance exams.

<tr>
<td>I already gave up improving my English</td>
<td>2</td>
</tr>
<tr>
<td>Unrelated answer</td>
<td>1</td>
</tr>
</tbody>
</table>

As Table 11 demonstrates, except for four mothers with negative answers, two mothers who gave up, and one mother who provided an unrelated answer, a total of 26 mothers answered they would like to improve their English, which includes all the English teacher mothers. Among the English teacher mothers, as far as could be determined, H mother endeavored greatly for her English, taking evening classes at an English conversation school and attending English workshops on weekends, subscribing to “National Geographic” both in English and in Japanese for her study in her spare time, and so on. Needless to say, G mother made efforts for her English as well, having completed the TESOL certificate program. She then went on to attend graduate linguistics classes at a graduate school. Two other mothers answered that they felt like improving their English when traveling abroad.

Lastly, Tables 12 and 13 deal with the results of Questions (5a) and (5b),
which were asked in order to determine mothers’ cultural values. Table 12 displays the results on whether mothers think learning target culture at the same time of learning the language is important or not. Table 13 shows what mothers thought the best way to learn the target cultures is.

Table 12. Importance of learning target culture(s)

<td>2</td>
</tr>
<tr>
<td>Yes, a little bit</td>
<td>2</td>
</tr>
<tr>
<td>No, it is not important</td>
<td>6</td>
</tr>
</tbody>
</table>

A total of 23 mothers answered simply “yes,” and six mothers answered “no.” Combining the numbers of mothers who answered “it does not have to be at the same time, and later would suffice” with those who answered “yes, a little bit” gives a total of 27 mothers who answered positively. They all admitted the importance of learning the target culture as well as the target language. It appears that not only the learning of the language itself but also learning culture is indispensable. Without knowing the target culture, it is almost impossible to survive in every possible situation. Although it is rather extreme to say, Heath (1992), for instance, views all language learning as cultural learning, which comes from data from interviews with spokespersons of language group communities in the U.S., comparing them, and investigating the effects of parents’ roles on children’s language development, based on their own cultural values.
Table 13. How to learn target culture(s) the best

<td>2</td>
</tr>
<tr>
<td>No answer</td>
<td>2</td>
</tr>
</tbody>
</table>

As Table 13 shows, both the 21 mothers who answered living in the target country and interacting with local people and the four mothers who answered meeting people from the target country and interacting with them point out the significance of interacting with people. Some of the mothers who answered positively warned that our own culture should be absorbed first before learning foreign cultures in cases of less appreciation toward our culture because of the overpowering influence from foreign ones. Some of the mothers who answered negatively put additional comments, saying that we simply should naturally absorb interesting or unique aspects of cultures rather than trying to learn them. We can just start from them to step forward for learning the whole target culture(s).

**General discussion and conclusions**

While it is recognized that this was a small scale investigation that did not have the resources to make it sufficiently large enough in scope to produce generalizable results, based on what has been described concerning the data collected for this research study, the conclusions (i.e., the answers to the research questions) that can be proffered are that (1) Japanese mothers do, in fact, differ from one another in
their ideas toward bilingualism for their children, at least in degree, as some of them have similar ideas in some aspects, and (2) the mothers’ differences exert a certain amount of influence on their children’s language (i.e., their language exposure, which ultimately influences aspects like language production), but it does not necessarily mean that the mother with a stronger desire, a more positive attitude, and a particular method can develop her child(ren)’s target languages. Even though mothers with positive attitudes toward the target language using certain methods may hope to raise their children as bilinguals, those elements do not affect children’s language positively.

In the case of M mother (in the Language Teacher Mothers category), who had positive desire and attitude and believed in the efficacy of a certain method, her younger child was completely confused by two languages, which was a consequence of her using both of these languages. On the contrary, for instance, R mother’s (in the Mothers with no Profound Relation with Languages and the Mothers Who Dislike English category) child could say words very well by only picking them up from TV programs, even though R mother did not strongly wish him to be bilingual and had a negative attitude toward English. In addition to her, T mother and V mother (in the Mothers with no Profound Relation with Languages category and Mothers Who Dislike English category) reported their children’s ability to pronounce English words and sing English songs well, even though they had no strong desire and negative attitudes toward English. What they did was simply create, to the best of their abilities, an English environment in Japan. Analyzing these examples, the environment surrounding children seems extremely important in developing a foreign language, even though mothers may create it differently and artificially. Certainly, it should be noted that several kinds of tests on their children’s language should be carried out to judge their actual ability in
English/Japanese because what they can say and how they sing in English is just a self-evaluation from mothers. This self-evaluated outcome might be too low compared to mothers’ high expectations, and vice versa. Further research in this area is obviously warranted.

The surroundings of the children, moreover, seem to influence their languages, judging from the instance of C mother’s and D mother’s children. They were well-balanced bilinguals who went to local schools in the U.S. and spoke Japanese at home. However, D mother’s child lost almost all English immediately after going back to Japan, and C mother realized that there was a strong possibility her children would lose English in the Japanese-language-only environment in Japan. She long ago gave up on her children’s English. A mother also indicated another case that all of her acquaintances of Japanese mothers and American fathers in her city in the U.S. gave up teaching Japanese to their children. This was because they replied only in English to mothers who spoke to them in Japanese, especially after they began to attend local schools.

Considering the feeling of “giving up” on teaching another language expressed by some of the mothers, it appears that, on the one hand, such feelings are understandable because there are so many other matters mothers have to concern themselves with (e.g., housework, other family members), yet on the other hand it seems to be such a waste because their children’s receptive skills are likely to remain intact. As studies by Yukawa (1999, cited in Hirai, 2003) and Tomiyama (1994, 1999, cited in Hirai, 2003) show, receptive skills are more easily maintained than are productive skills. If parents do not give up talking to their children in their heritage language, they may maintain at least their receptive skills, which may facilitate
language learning in the future when they decide to restart the learning.

Because of the environment’s strong influence on language learning, it is extremely difficult to raise a bilingual in monolingual countries. Nakajima (1998) suggests tips for those families who have difficulty in raising bilinguals, both in the case of teaching Japanese at home in foreign countries and teaching English at home in Japan. Nakajima’s tips, which include being forgiving with language mistakes and focus on forging relationships rather than concentrating on the language, may go a long way in encouraging mothers who have a strong desire but nevertheless give up raising bilinguals because of the solid influence from the surroundings of monolingualism. Saunders (1983), who succeeded in raising his two children as German-English bilinguals in a monolingual English-speaking environment, also suggests that “the important thing is not to give up at the first hint of difficulties. If parents are patient, determined and persistent, it is very likely that they will succeed in raising their children as bilinguals” (p. 245). Kishimoto (2008) also discloses the regrets and cries of Japanese mothers in the U.S. failing to raise bilinguals and presents suggestions to aid parents in similar positions.

To conclude, after examining the data from the participants, the most prudent approach for parents who value bilingualism and who are serious about raising their children bilingual would be for those parents to implement what they believe to be the best methods with consistency and patience. Providing children the environment – even artificial ones that may include showing the English movies – would be quite useful due to the influence that the environment has on language development. Finances are of course a point of concern, but if at all possible, children should be taken to countries where the target language is spoken, although the costs involved to ensure that children
become bilingual, even biliterate, are indeed high (Okita, 2002, cited in Caldes, 2006). Caldas (2006), who successfully raised his three children English–French bilingual-biliterate, shows the importance of societal immersion. According to him, children should be in a place cut off from their parents and where they can only speak the target language. Moreover, Caldas’ ideal immersion situation is where children are surrounded by native language-speaking peers who did not have the ability to speak the children’s native language. Mothers who do not value bilingualism or who care little for foreign language development should not be dismayed. “Giving up” or implementing no course of action are acceptable alternatives because, as could be seen from this study’s results, not all mothers are the same, for they place priority on various things.

The purpose of this research project was to primarily observe the existing views and values of mothers on bilingualism with the ultimate aim of assisting mothers who are concerned about their children and who seek the best for them (e.g., furthering their education) to find a way to successfully raise them to be bilingual if they so desired. It is sincerely hoped that in the future that suggestions (from myself as well as from others) regarding effective ways to foster bilingualism in children that are drawn from past research and studies such as this one will be made. Even so, further studies in this area are highly encouraged. Such studies could, for example, be carried out via personal interviews and evaluations of the participants’ children’s actual ability. Making comparisons (e.g., of Japanese mothers living abroad with those in Japan) is also an option, as are investigations of the effects of Japanese mothers’ differences with mothers from other nations and ethnic backgrounds and observations of children’s chronological language development.
Note: all translations from Japanese were done by the author.

**Biodata**

Kayoko Ishikawa received her Master of Arts in Teaching degree from Georgetown University and continued her studies at the University of Texas at Austin. Her research interests include English loanword usage by native Japanese speakers, bilingual education, and second language acquisition.

Abstract

This paper describes education and the educational system in Colombia. It begins with a review of the historical components, challenges, reforms and decrees that have affected where education began and where education currently is. This paper then takes a look at different perspectives of teacher education during the 19th century, its developments and achievements through the 20th century, as well as highlights of some of the the challenges and expectations for the 21st century. As a platform for understanding the social, religious, economical, political and cultural issues facing education, a statistical review is also presented. The paper will conclude with a description of the educational system, its birth and current status through the eyes and experiences of teachers who have been prepared by both the private and public sector of education. Some final thoughts present a forecast of where education could be in the future.
History of Education in Colombia

Trying to outline the history of education in Colombia is not an easy task, due to the fact that, according to Herrera (1994), “the history of education has not occupied a privileged place within the nation’s historical doing and only at very limited times has the historical re-enactment of educational happenings been approached with the tools pertaining to the discipline of history” (Londoño, 2001). This fact represents an unexplainable act of negligence if one considers the vital role of education in Colombian history as the driving force of economic modernization, territorial and cultural integration, and the constitution of a modern mentality through the diffusion of ideas and theories (Herrera, 1994). However, regardless of the difficulties previously mentioned, this article attempts to track the development of education and of the educational system in Colombia in the nineteenth century, give a general view of education in the twentieth century, as well as provide future perspectives of education into the current twenty-first century.

Following this order of ideas, it is then necessary to mention a Decree issued on January 26, 1822 by General Francisco de Paula Santander who ordered the creation of the first Normal Schools of the Republic, in Bogotá, Caracas, and Quito (Londoño, 2001). The term ‘Normal School’ refers to an institution that prepares future elementary school teachers. Its name comes from norm, that is, to homogenize, organize, standardize, and regulate the teachers who will then be in charge of educating the children (Herrera, 1990). These schools followed the Lancastrian method, and their mottos were “the shedding of one’s blood makes learning permanent” (an approximation of the Spanish ‘la letra con sangre entra’) and “no pain no gain” (an approximation of the Spanish ‘y la labor con dolor’) (Londoño, 2001).

In the beginning, future teachers in Colombia received their training while working with the children who became their pupils. There was only one teacher at each school who, being unable to have direct contact with every student, designated advanced students as class monitors who gave the teacher’s directions to their classmates. The teacher’s roles would then be limited to directing, receiving
information, and applying the necessary penalties and punishments depending on the case. Thus, future teachers lacked specific training with regards to the academic subjects they taught (Herrera & Low, 1990; and Londoño, 2001). This system of using one teacher for a thousand students was highly advantageous for the State that, as a result of its political instability, did not have the necessary resources to invest in education. Nevertheless, students suffered from the lack of pedagogical preparation of their classmates who had been newly converted into teachers (Londoño, 2001). According to Londoño (2001), schools with these characteristics only required very limited materials such as a blackboard, paper, and pencils, since all the teaching was based on memorization. Unfortunately, these teaching habits became deeply engrained in the system, and they can still be found in today’s schools (Londoño, 2001).

A New Educational Decree

On November 8, 1825, a new Decree established *Bentham’s Principle of Legislation* as a general text at the universities, arousing great controversy between the Church and the State. This same Decree also instituted free and sustained primary education provided by the State throughout the Gran Colombia’s territory (Londoño, 2001).

In 1826 the organizational and administrative guidelines of the General Division of Public Instruction were given. A Decree from October 3 of the same year dictated the principles and norms that regulated public primary education that could not be put into effect due to the country’s political instability (Herrera & Low, 1990; Londoño, 2001). Two years later, in 1828, a Decree dated March 12 prohibited teaching Bentham because of relentless pressure from the Church. Likewise, it abolished the Study Plan of 1826. This situation, according to Londoño (2001), left educational policy helplessly linked to the political sways of the time. Each successive party that held power would decide on different educational policies resulting in a lack of continuity in academic standards.
The Rebirth of the Normal School

During the decade of the 1840s, the Normal Schools received a considerable boost by changing their name to “Normal School of Primary Education” supported by the Division of Elementary Education of the Department of Education. Another important modification was the separation of the teacher from the school during the teacher education process. This led to the institutionalization of pedagogical learning that was based on teaching children general knowledge and moral standards. The axiom that represented this new movement stated that “the kind of man that desires a formal school and wants to model the teacher is a man defined by political and religious conviction” (Zuluaga, 1984, as cited in Herrera & Low, 1990). These convictions later defined the academic activities and the formal training of teachers (Londoño, 2001).

In 1842, a new series of reforms were implemented based on four pivotal perspectives: industrial development, political consolidation, moral and religious structures, and pedagogical innovations that combine humanities and vocations. Within the context of this judicial irregularity, the preparation and training of teachers could not be conducted in a clear and orderly matter. Londoño (2001) states that this politicized education slowly evolved in response to changes in the role of the State.

Moving Past 1840

A great example of the lack of continuity in educational reforms was the Law of 1850 that reduced the importance of all prior rulings related to education, established absolute academic freedom, and eliminated all academic titles. Londoño (2001) indicated that the main premise of this law, the implementation of a new civil and free education system, could not be implemented because of a lack of infrastructure.

Starting in 1870, the new role of the teacher was limited to being a transmitter of knowledge. The State still held all the power and was in charge of designing curriculum and education plans without consulting the teacher or ever taking into account the
classroom environment. The teacher’s only responsibility was to recite norms and moral principles, with some academic content scarcely embedded in the instruction. This led to teachers being named apostolic-teachers, a perception that is still held in the collective imagination of people in Colombia. Londoño (2001) and Herrera & Low (1990) describe the philosophy of this era that was to mold “men with healthy bodies and spirit, dignified, and capable of becoming citizens […] of a free and republican society”. This meant that education needed to be harmonious with the soul, the senses, and the forces of the body.

The year 1881 was witness to the arrival of the first pedagogical mission from Germany that was invited to help guide the Normal Schools under the educational principles of Pestalozzi. Londoño (2001) suggested that these principles were intertwined with a consciousness of the interconnectedness with the environment (or what they called Mother Nature), as well as with the acknowledgement of the existence of harmony between liberty and discipline and between the educator and the educated. It also paid close attention to free education, the creation of a moral conscience, the development of the self, the knowledge of personal values and flaws, and the idea of belonging to a social class. This particular movement further promoted the social differences of the time.

The weak point of this process was that the educational principles from Germany were imported into the national standards without considering the needs and demands of the Colombian people. Londoño (2001) suggested that the clash of these two different cultures made the implementation of these international academic standards virtually impossible. This missionary pedagogy also encountered great resistance from the ecclesiastic authorities. Combined with the political instability of the country, this turmoil gave rise to numerous civil riots that, in the end, prevented a better utilization of the German recommendations.

In 1887, the judiciary body of the government suffered another setback. The political Constitution enacted the previous year, along with the agreement with the Holy See, gave way to the abolishment of the attempt to create a free and civil education. It was
then determined that educational principles needed to be based on those of the Catholic Church. This marked the beginning of the dominance of Catholic pedagogy. Londoño (2001) and Herrera & Low (1990) stated that this movement was reinforced even further by the rise of several religious communities that monopolized the preparation of educators and, in turn, education.

At the end of the 19th Century, in 1983, Decree 429, known as the Zerda Plan, revised public instruction and declared a new standard for all normal schools. This plan required five years of higher education after elementary school in order to be certified as a teacher. This decree, along with the later one in 1904 (Decree 491), made these standards mandatory for future teachers and has not been altered since (Herrera & Low (1991).

The 20th Century: New Vision, New Opportunities

In order to study the evolution of education in Colombia during the 20th century, it is critical to acknowledge the support and involvement of Agustin Nieto Caballero, who studied in Europe, and upon his return to Colombia, founded what is known as the Gimnasio Modermo. The term gimnasio should not be confused with the word used for a sports building. Instead, it should be seen as a metaphor for educational activities. This institution became a pioneer in Latin America by putting into practice the premises of the New School. According to Herrera & Low (1991), this new mentality brought a much needed reform to the pedagogical belief systems of the previous century. In addition, the institution invited a group of German educators for a second missionary visit; these individuals brought with them the theories of John Dewey, María Montessori, and Ovide Décroly.

During the 1930s, with the assistance of the liberal government, considerable progress was made in modernizing and expanding education through the creation of more rural normal schools and the reacquisition of some urban ones. In regards to higher education, three new educational institutions were founded with the sole purpose of educating teachers who would teach and
become administrators in secondary education system (Calvache, 2004).

The year 1991 brought a change to the country’s political Constitution, or what was called the norm of norms. In this Constitution education was defined as “a person’s right and a public service that has a social function. With education, a man would be able to search for access to knowledge, science, technology, and the rest of goods and values of the culture” (Calvache, 2004; Colombian Constitution, 2009). Education was also made mandatory for children between five and fifteen years of age and included a year of preschool and nine years of basic educational instruction. At the same time, it was established that the State, the family, and society were responsible for its implementation. It was also stipulated that all public State schools needed to be free of cost, although some fees could be charged to those who could afford them (Colombian Constitution, 2009).

The General Law of Education, Decree 115 of 1994, defined the organizational structure of formal, non-formal, and informal education as, respectively: a. that education which is given in approved institutions, in series, and with curricular parameters; b. that education whose goal is to update knowledge outside the grading and evaluative system; and c. that education which is understood as the collection of concepts, as well as acquired information from people and means not regulated by the State (General Law of Education, 2009).

A New Boost to Education: The Ten-Year Educational Plan

A new plan, the Ten-Year Educational Plan, was introduced and implemented as an attempt to advance education. Its purpose was to include all public suggestions about improving the educational system. This decennial plan, the document governing the educational period of 2006-2016, was the product of information collected from several educational evaluations and reviews (Decennial Plan of Education, 2009).
The opposition, however, continues to compare this ten-year plan to those previously implemented. These critics persistently point out the failures and limitations of the plan itself. These shortcomings are reportedly related to equal access to education and to problems with student retention in schools. As part of the teacher preparation program, some questions are asked to assure that teacher candidates understand the various components of the plan. Examples of these core questions are: "What guarantees that this plan will be implemented, maintained and followed as it is proposed?" and "Who is in charge of securing the execution of the projects and collection of data proposed in the plan?"

Although it is understood that the educational system faces considerable challenges, there seems to be a willingness from the new teacher work force to improve this system. Some answers to the before mentioned questions and others, as provided by those teachers in preparation, are summarized in the following ideas:

1. Guarantee an educational system that can respond to the demands of the Colombian context, develop research skills, and promote access to communication technologies.
2. Educate in and for peace, civility, and citizenship.
3. Build pedagogical renovation that strengthens all aspects of schooling.
4. Integrate science and technology with education while developing human talent.
5. Provide an increased and improved investment in education
6. Improve educational statistics
7. Make elementary education and child development a priority at the national level.
8. Ensure access to equal education and student retention in a high quality environment.
9. Provide leadership, accountability, and transparency in the accreditation phase of the educational system.
10. Provide training, professional development, and appreciation of scholars.
11. Promote the active participation of the family, the labor sector, the general society, the mass media, and cultural institutions to ensure the relevance of education.

12. Improve teachers' working conditions.

**Characteristics of the Colombian Educational System**

Education in Colombia is a right as well as a requirement for that part of the population between five and fifteen years of age. In other words, a student at the age of fifteen can decide to leave the general educational system and not be penalized by the State. It is also important to mention that the system is divided into two levels: primary (elementary) and secondary (basic education). The elementary level goes from first to fifth grade, without including preschool or kindergarten. The secondary level goes from sixth to eleventh grades. In all, there are only eleven years of education, as compared to the twelve years in other countries such as the United States of America. What this means then is that a student in Colombia who turns fifteen years of age can choose to leave school and join the workforce. At fifteen, students are expected to be in the tenth grade.

This attrition problem has created a number of difficulties for the social, economic and cultural systems of the country (Flórez, 2005). The main problem created by what is called student desertion during or before the completion the last two years of basic education (tenth and eleventh grades) is the lack of preparation for the world of work. In 2004, only 47% of students who started school actually finished, which means that an estimated 53% of school-aged teenagers did not complete the cycle (Flórez, 2005). On an annual basis, it was estimated that approximately 7% of students left school. This problem is caused mainly by three specific factors. According to some experts such as Flórez (2005), the first factor is directly related to institutional structures in the educational service, in other words, failing to keep promises and responsibilities to students. Some issues in this area include lack of space in schools, rapid and unexpected increase in fees, unequal access to opportunities, and in other cases, lack of instructional quality. The second factor relates to the pedagogical preparation of the teachers. It is believed that teachers who are in charge of the integral development of the student fail to
motivate students and keep them interested in high school (taken from the *Ten-Year Education Plan*). Over-crowded rooms and inadequate teaching skills result in teachers who become uninterested in teaching, and even worse, caring for the students. Students' growing disinterest in school drop was studied by the *Departamento Administrativo Nacional de Estadisticas de Colombia* (National Administrative Department of Statistics), better known as the DANE, which reported that approximately 21% of students who leave school early expressed a major lack of interest for staying in school.

The DANE also reported that the third main factor for lack of student retention was, as one might guess, economic disadvantages. In 2003, approximately 40% of seventeen-year-olds who left school early claimed some level of financial need that forced them to leave school and look for a job. It is rather ironic and worth mentioning that the school system in Colombia is currently designed with the last two years of high school as the vocational years of basic education. It is expected that a student who completes the full eleven years of schooling, will have sufficient knowledge and skills to enter the workforce. The issue is that, unfortunately, more than half of the students who leave school early do so before they get prepared for a vocational job. In turn, it is harder for them to find employment because most employers won’t hire someone who has not completed high school (Flórez, 2005).

**Problems with the Current Education in Colombia**

Education in the twenty-first century should be concerned with solving several issues that will be discussed in this section. To begin with, teachers must have an active role in curricular planning. Since the 1970s education has been viewed as a static process that is centrally planned. This policy has resulted in making teachers the administrators of curriculum rather than leaders or guides. The resulting educational policies have few or no connection at all to the day-to-day realities of the classroom (Martínez & Alvarez, 1990).

Another legitimate question is that of educational quality because, with the exception of Cuba, the quality of basic education in Latin America does not meet minimum standards. The *Segundo*
Estudio Regional Comparativo y Explicativo de 2005 Y 2006 (Second Comparative and Explanatory Regional Study of 2005 and 2006) studied third grade elementary school students and first year secondary school students (i.e. grade 6) and found that education achievements in Colombia only reach the regional average, with no significant differences in students’ performance in mathematics and language (Hommes, 2008).

Likewise, nationwide educational coverage becomes a critical issue both at the basic educational level and at the advanced level because in many states there are no institutions in charge of advanced education. This fact is reflected in Law 1084 (2006) in which the State, as the institution responsible for education throughout the country, strengthened advanced education in remote areas by means of agreements with private and public institutions outside of these areas. These schools agreed to reserve 1% of their quota for students that come from less accessible areas (Law 1084, 2006). Even this proved to be insufficient support because student retention should be insured by programs that provide them with employment opportunities and/or university subsidies, without having to drop out.

A universal educational system with full coverage needs teachers who are qualified in their specific field of study and in appropriate pedagogical methods. At the same time, it is also vital to guarantee teachers' job stability, good working conditions, and necessary materials to shape Colombian citizens (Hommes, 2008).

In terms of educational quality, Decree 230 (2002) provoked a lot of controversy because it established that a maximum of 5% of an institution’s student population could fail a grade. It stated that having students repeat a grade was costly to the country, and the process of failing adversely affected students' self-esteem (Ministerio de Educacion Nacional). However, this Decree was revoked as part of the Ten-Year Educational Plan in response to pressure from teachers and the general population who perceived it as detrimental to the quality of education.
Some Helpful Statistics

Out of the 42.3 million Colombian citizens in 2000, 91.5% knew how to read and write, and the educational competition level was 90.7% for primary education and 61% for secondary education (World Bank, 2010). By 2007, based on figures provided by the National Ministry of Education, more than eleven million students attended basic primary education, secondary education, and middle school. The basic education level reached 100.87%. There were 1,444,544 students enrolled in advanced education. The creation of new openings had been achieved through three programs: credit, modernization of the management of public advanced education institutions; and the development of technological and technical education. This effort enabled enrollments to increase from 20.6% in 2002 to 33.3% in 2008. The most significant growth was related to the technical and technological levels.

Achieving these increases in educational enrollments was a slow process because at the beginning of the twentieth century Colombia had low educational levels compared to other Latin American countries. Ramirez and Téllez (2007) analyzed the evolution of both elementary and secondary education in Colombia during the twentieth century. Their study discovered that at the beginning of the century nearly 66% of children between the ages of seven and 17 years of age were illiterate (World Bank, 2010). This illiteracy rate decreased to 15.8% during the seventies and eighties, and reached 8% by 2006, which was the lowest figure in one hundred years. The efforts of the government, although limited at times, had also increased the net scholastic participation from 103.1% in the late 1980s, to 114% by 2000 (Ramirez & Téllez, 2007). Even though these numbers look promising, it must be considered that there are still 12% of children in Colombia that lack the means to attend school. These are troubling figures when compared to the 9% level in the rest of Latin America (World Bank, 2010).

A promising spike has been present since 2000, where an approximate 1.8% of elementary school enrollment has showed a steady annual increase. There is a current increase of about five million children enrolled in first to fifth grade. Secondary education
has also experienced a considerable growth of almost 5%, and retention has remained at the highest level it has been in years. Additionally, the number of schools and teachers has doubled. Based on a longitudinal study done by Ramírez and Téllez (2007), it can be seen that the number of children enrolled went from 4.5% in 1905 to more than 12% by 2000. Ramírez and Téllez (2007) also reported that there has been an increase of teacher preparation schools and that the teacher workforce has increased almost by 50%. Lastly, tuition in most cases grew proportionally in high school by going from 61% in the late 1980s to a little more than 70% by 2000.

Although the forecast is very promising, according to Ramírez and Téllez (2007), after the impressive advances of the past 30 years, the government still needs to improve educational access, quality, investment politics, and proper administration of the educational sector. Regarding teacher salaries, the new Decree enacted this year promises a pay increase of 14% for this year, and of 24% over the next three. This would benefit approximately 70,000 educators and administrators. This means that a high school graduate from a normal school or vocational educator would make $1,013,000 ($553), a lecturer or professional educator would make $1,983,948 ($1084), and a licensed, credential teacher from a university would make $2,367,092 ($1294). Lastly, a teacher with a Masters degree would make an estimated $2,934,879 ($1603) and with a doctorate, an approximate $3,904,519, or roughly $2133 dollars ("Salarios de 70," 2009).

**Teacher Preparation**

In Colombia, the responsibility for the training of teachers has been assumed by two types of institutions. The Normal Schools prepare students during the last two vocational years of high school and are responsible for teaching content knowledge (Calvache, 2004). The colleges of education prepare teachers, not in content, but in curriculum and pedagogical approaches at a higher educational level (Calvache, 2004). Both institutions have always been under the influence of diverse pedagogical models of instruction, as well as multiple political reforms throughout history. These inconsistencies, at times, have caused the educational system to project the idea that
only the elite could afford an education. According to Calvache (2004) education “is a privilege for some elite social classes, as well as a representation of a political purpose whose agenda reflects the dependency on external factors that contradict those internal factors that are inherent to the organization.”

When it comes to the Normal Schools, teaching is based on methodologies, and the predominant expectation for a teacher is *know-how*. On the other hand, the colleges of education at universities place great importance on training teachers in the administrative components of education (Calvache, 2004).

**A Brief Revisit to the Normal School**

It is important to note that the Escuela Normal, Normal School, is the most important step in teacher preparation. As described in the history of education in Colombia, the Normal School dates back to 1821, and throughout its historical turmoil, it has still proven to be an effective and productive institution for teacher preparation. Its most influential reform came in 1970 with the enactment of Decree 80, in which education was defined as an instrument that would equip the teacher with *practical knowledge* and with the use of technology as a foundation. From this point on, teachers would become supervisors of knowledge using a better developed curriculum and instructional guides that would assist them with time management and administration (Calvache, 2004).

**A Short Political Review**

As was previously mentioned, education in Colombia has been closely related to the political changes in the country. By observing politically motivated educational changes it has been easy to tell which political party was in charge. This was especially obvious during the twentieth century. A good example was during the 1949-1957 period during which the conservative party regarded the normal school as a vehicle for promoting its ideology. During this period, conservative politicians sought to replace high level liberals in the department of education. Once this was accomplished, the number of teacher in elementary schools doubled, and political beliefs of these
teachers became conservative. Unfortunately, this strategy backfired and the quality of education fell drastically, as did the value and appreciation for those in the field of education (Martínez & Alvarez, 1990).

**Teacher Certification**

When it comes to departments of education in universities, known as *Facultades de Educación*, their origins date back to 1920 when the influence of the *Escuela Nueva* (New School) indicated the need to train teachers with a different mentality from that of traditional educators. These new teachers would depart from the memorization methods used at the time in schools, as well as from pedagogical dictatorship styles (Martínez & Alvarez, 1990). During this time, it was imperative that teachers possessed the skills of a professional educational administrator, in other words, the new approach was that teachers should no longer be simple transmitters of content, but motivators, communicators, and thinkers. From this movement, the title *Licenciado en Educación*, or Certified Teacher, was born.

**One Last Historical Review**

The history of teaching practices in Colombia has been filled with contradictions both at the social and the state level. During the nineteenth century, at the time of the reconstruction process of the Republic, it was mandatory that all teachers be examples of virtue and good citizenship. It was believed that teachers who could demonstrate good behavior and judgment would be models of morality for students. The educator during this period needed to posses moral qualities, vocational skills, in addition to extensive knowledge of teaching methodologies (Martínez & Alvarez, 1990). This is why all aspiring teachers attended normal schools. Unfortunately, teaching came to be regarded as a missionary endeavor that received insufficient financial compensation.

Historically, there have been several functions assigned to teachers. These have been defined as being first and foremost an educational vocation, a State employee, and lastly, an administrator.
Teachers have been responsible for providing all social classes with high standards and a sense of responsibility, as well as taking the blame for social problems such as teenage pregnancy or the existence of criminal gangs. After several centuries of reforms, not much has changed in the public’s perceptions of educators' roles.

**What Current Teachers Think About Education in Colombia**

To get a slightly better idea about the current situation of education in Colombia, a short survey was conducted at the University of Antioquia, recognized as one of the best universities for teacher preparation in Colombia. When asked about their general opinions of the educational system, the most dominant feeling was that although there were substantial human resources, the State and the government have not supported the system (Anonymous, personal communication, April 24, 2009). Some respondents believed that still more changes were needed in the perception of teacher quality and that the government needed to re-evaluate the existing competitive approach among districts, which have reduced the willingness for teachers to participate.

Some of the other mixed responses dealt with too much money being spent on the current drug war and not leaving enough for education (A. Quiroz, personal communication, April 25, 2009). Also, it was felt that the quality of education for teacher training has been diminishing because there is too much attention paid to training teachers who can do, rather than preparing teachers who can think. Another point of agreement among teachers was that extensive pressure is being put on teachers by the State in regards to their discussions and teachings about the current socio-political, economic, and cultural realities (J. Marin, personal communication, April 23, 2009).

In reference to the challenges of education in Colombia, research indicates that there is a current lack of resources and investment and that there is little to no attention given to research and investigation. In addition, many believe that the teacher-student ratio is much too high, especially in cases there are over 40 students in elementary classes and close to 50 in high school classes. Most
teachers still agree that the biggest challenge is equal access for all (Ramírez & Téllez, 2007).

**Final Thoughts**

 Colombian people are hard working, honest, dependable, and resilient individuals. Teachers in Colombia want to teach; they understand that they must overcome the current situations to open up opportunities for the future. Teachers still have faith and hope for a better, more accessible educational system. They feel they are competent and believe that with the help of the local government and the State they can become even better role models for young people. They dream big and hope that in the near future the schools and the government will offer more opportunities for research and studies. They know that the support at this time is not ideal, but they also know that history will not repeat itself.

 All is not as bleak as it may sound. Vocational education in Colombia has begun to take root, and the private sector is taking notice. Current teachers are finally awakening from their sense of helplessness in the face of the political forces that have oppressed them for decades. Today's teachers have broader ideas, expanded interests, and stronger motivation for equipping themselves with better pedagogical tools. Finally, educators no longer think about themselves as individuals. They have become a community of minds and hearts that is ready to change the world.

Cyberbullying in schools, a recent phenomenon, affects students, parents, and staff, and often the community as a whole. Some parents, having lost their teens to suicide, are suing school districts claiming their children were bullied to death. There is an urgent need for clear guidelines on what schools can and cannot do to stop bullies. Expansion of current laws, board policies, and the Education Code are necessary to guide districts and administrators in these new arenas. The goal is to ensure a safe and positive learning environment for all students.

Cyberbullying involves minors using electronic technology to harass, embarrass, intimidate, torment, or in any way cause emotional suffering to another minor. California was one of the first states to pass cyberbullying laws and provide school administrators with the authority to suspend, expel, transfer to alternative programs, or deny participation in extracurricular activities to offending students (Education Code 48900).

The potential for harm from cyberbullying is immense. In the case of Megan Meier, the consequences were fatal. A woman posing as a sixteen-year-old boy on MySpace initiated an online relationship with Megan. After six weeks, the imposter ended the communications by telling Megan the world would be better without her. The next day Megan hung herself. The gravity of this situation prompted city officials to pass an ordinance making online harassment a criminal offense. Megan’s tragic response to cyberbullying has repeated itself with countless other teens who saw no other way out.

According to the July 2010 California School Boards Association report, one-third of teens aged 12-17 are affected by cyberbullying. Girls are more likely than boys to experience cyberbullying as well as victimize others. Twenty-six percent of teens said they have been harassed via cell phone and this occurs in all cultures, races, and ethnicities.

Another issue of national concern involves “sexting” or sending sexually explicit text messages or nude photos via cell phone or other electronic device. According to a report on Good Morning America in April 2009, twenty percent of the nation’s students say they have participated in “sexting.” One example of the problem arises when a girl sends a photo of herself to her boyfriend, the two break up and the boy sends the photo to others, thus becoming a form of cyberbullying.
Most teens communicate on social networks and blogs. Websites such as MySpace and Facebook allow multiple users to publish information about themselves on a profile that can be accessed by other users. These sites are often the place where teens post cruel comments, make threats, and intimidate others.

Recent cases highlight the problems that courts face when deciding cases involving cyberbullying. In the case of Doniger v. Neihoff (2008), a student council member sent a mass e-mail from a school computer, expressing frustrations regarding the scheduling of a school event. The student encouraged community members to voice dissent to the administrator. A blog entry was posted referring to the administrator in offensive terms. The Second Circuit court ruled in favor of the school because the student’s speech was offensive, disruptive, the blog entry was inaccurate, and the school’s discipline was not excessive.

J.C. v. Beverly Hills Unified School District (2009) defined boundaries for disciplining students’ conduct off campus. The student posted a video on YouTube with demeaning remarks about another student including profanity and sexual innuendo. The video received 90 hits on YouTube but there was no evidence that students viewed it on school grounds. Judge Wilson’s 57 page decision stated, “The good intentions of the school notwithstanding, it cannot discipline student speech simply because young people are unpredictable or immature or because teens are emotionally fragile and may often fight over hurtful comments.” The school district was ordered to pay $107,150.80 to JC for legal fees.

In the case of J.S. v. Blue Mountain School District (2010), the courts ruled in favor of the schools. A student created a MySpace profile of the middle school principal indicating that the principal was bisexual, a sex addict, and also made disparaging remarks about his wife and children. The internet activity was conducted off campus but courts upheld the student’s suspension based on foreseeable substantial disruption.

A similar case, Layshock v. Hermitage SD (2010), was found in favor of the student based on a claim of the violation of his first amendment rights. The student used his grandmother’s computer to set up a parody profile of the school principal, along with a photo copied from the school website, on MySpace. Under the Tinker standard, the actions did not constitute a sufficient nexus between the profile and substantial disruption.
to the educational environment. Both J.S. and Layshock have been appealed and heard en banc in June. The Supreme Court has not yet taken a stance on Internet bullying (off campus) and Tinker still reigns.

Evans v. Bayer School District (2010) involved a student who created a Facebook group to express displeasure with a teacher whose photo was posted on the website. The posting was done off campus and when other postings came in supporting the teacher, the student removed the profile after two days. The student was suspended for three days and moved from an AP class to an honors class. The court ruled that the school district did not document substantial disruption to the school environment and that this is a case where the student speech is protected as it was not lewd, vulgar, threatening, or promoting illegal activity.

Courts look at three areas when determining whether schools have the right to regulate student use of technology. Judges consider true threats to school safety, whether the incident was materially and substantially disruptive, and if there is sufficient nexus to school activity. A few key court cases govern the court’s discretion regarding cyberbullying. Tinker v. Des Moines, a 1969 case involving students who wore black armbands to school in protest of the Vietnam War, is often quoted in noting that students and teachers do not shed their constitutional rights at the schoolhouse gate. However, the case is also used to show that conduct that disrupts class work or involves substantial disorder or invades the rights of others is not protected by the First Amendment.

The constitution guarantees freedom of speech in the First Amendment. However, the expression of free speech does not allow one student to deprive another student of the right to a safe school environment, free from harassment or damage of reputation. Bethel v. Fraser, a 1988 case, involved a student who gave a vulgar, lewd, and offensive speech during a school assembly. The courts ruled that younger students were a captive audience and that schools have a right to prohibit this type of speech whether or not actual disruption occurs.

Violence on school campuses across our nation shifted the burden of proof to students to show violation of First Amendment rights when a true threat exists. In the 1996 case of Lovell v. Poway USD, the court of appeals defined a threat as a “true threat” if a reasonable person would interpret it as a serious expression of intent to harm or
assault. Schools also have a right to regulate speech that promotes illegal drug use or other illegal activities under the court’s decision in Morse v. Frederick, a 2007 case. Schools may prohibit this type of speech without establishing a true threat.

President Obama signed the Broadband Data Improvement Act on October 10, 2008, which requires districts to develop policy to ensure students are educated about appropriate online behavior, awareness, and response to cyber bullying. Forty-four states have bullying statutes but less than half offer guidance about whether schools may intervene in bullying involving electronic acts.

California was one of the first states to pass a cyberbullying law. Assembly Bill 86 came into effect January 1, 2009, and states that cyberbullying is disruptive and invades the rights of others by creating an intimidating or hostile educational environment. This bill adds cyberbullying to the list of activities schools officials and law enforcement agencies are encouraged to prevent. Assembly Bill 86 also amended California Education Code 48900 under section (r) to allow school administrators to discipline students who bully others by electronic acts such as messages, text, sound, or images transmitted via phone or other wireless device.

California Board Policy (BP) 5131 provides instruction to those who supervise students who may be involved in cyberbullying. Expectations are that staff will intervene immediately or call for assistance, if they witness behavior that disrupts the classroom or school environment, and this includes cyber bullying, as defined in Education Code 32261. This Board Policy gives broad, general direction but leaves the details up to the districts. The policy mentions that teachers must receive professional development related to cyberbullying. Reported activities should be documented and any threatening messages saved and printed, but there is much left to the discretion of the district.

Cyberbullying, sexting, and social networks may put minors at risk for sexual predators. Megan’s Law, named for the seven-year-old raped and killed by a molester who lived across the street, provides the public with information on the whereabouts of sexual offenders. All states now have a form of Megan’s Law. Many cities have Sexual Assault Felony Enforcement (SAFE) Task Forces. The sheriff’s department, District Attorney, and local and state law enforcement agencies work together to identify, monitor and force sex offenders to register. Riverside County California also includes a SPIDER
(Sexual Predator Internet Decoy Enforcement in Riverside) unit under the SAFE task force. This unit targets unidentified predators that use the internet to prey on unsuspecting victims.

Due to lack of specifics in BP 5131 regarding cyberbullying and the increased incidents in schools and districts throughout the county, the Riverside County Office of Education convened a work group to address the issue of “sexting.” The work group was composed of Child Welfare and Attendance representatives from the districts, representatives from the District Attorney’s office, the DA Investigator’s Office, and the Sheriff’s Department. Specific guidance was provided for dealing with incidents such as the confiscation of a cell phone by turning it off, and turning it over to the School Resource Officer or law enforcement agent. The importance of acting immediately was stressed in order to recover data that is lost after three days. Accurate report writing was stressed to assist prosecution and defend school personnel if necessary. The purpose of the group was to gain consistency among all districts in the county and find ways to effectively eliminate sexting from schools.

The county workgroup planned to create an eighth grade assembly on cyber bullying to be presented by representatives from the Sheriff’s Department and District Attorney’s Office. Another presentation on the subject would be incorporated into Freshmen Orientation, and all seniors would attend assemblies to notify them of prosecution as an adult after age 18. The county workgroup also planned to create a DVD, modeled after one created by an Assistant Principal in Jurupa Unified School District, to address the issue of cyber bullying and the gravity of consequences that follow the offense. Students convicted of sending nude photos of themselves may be charged with a felony and consequences may include probation or time in Juvenile Detention. Staff must be warned that possession of nude photos of children under age 18 may be considered child pornography under penal code 311.

Cyberbullying is an issue that can tear student and staff morale apart. Teachers forced to spend time policing students and defending others from this behavior lose precious instructional time. Students who are harassed are unable to concentrate and learn. This issue could potentially cause test scores to drop and schools to end up in Program Improvement.
Clearly defined policies and staff training are essential in dealing with the problem. One district has reduced the incidents of cyber bullying significantly by communicating candidly with students on the issues and consequences. School administrators have the responsibility for maintaining a safe and secure campus so all students can succeed. Dealing with issues such as cyber bullying, and minimizing or halting the occurrences on campus is critical. One instance of sexting ended in a sting operation that included the arrest of a sexual predator. In cases such as this, the lives of students and families could be at stake.

Board policy in some ways resembles the constitution in that it provides broad guidelines. It is important that Administrative Regulations and district policy follow up with more precise guidelines. The county resolved to offer information and assistance to districts but the need was so immediate that districts and individual schools developed their own approaches to dealing with the problem. Providing a forum for districts to share ideas is crucial. Networking with outside agencies such as the DA’s office and law enforcement ensures that all preventative organizations are on the same page, and sends a message to students that the offense will be dealt with at all levels. Written and oral communications are critical to combat the spread of potentially harmful behaviors such as cyberbullying and sexting. The use of a county-wide DVD to open up dialogue and warn students of the possible dangers and consequences is an excellent resource. Courageous conversations with students, parents, and staff, and age appropriate educational assemblies are valuable tools to combat cyber bullying.

Communities must become proactive in facing the challenges related to cyberbullying, sexting, and blogs. Adults who interact with teens must be on the lookout for signs of low self-esteem, anger, loneliness and threatening behavior. Educating students regarding digital citizenship, informing them of the dangers and consequences, and engaging peer mediation strategies are proactive measures that may end up saving lives. Schools need to develop a system for reporting incidents of cyberbullying, and outline steps to investigate and document negative activities. Considering the recent increase in teen suicide, Congress has been called on to pass the Safe Schools Improvement Act requiring schools receiving federal funds to implement bullying prevention programs, specifically addressing anti-gay harassment.
Schools should also coordinate educational sessions and meetings with parents, staff, and outside agencies to target prevention and intervention strategies. The technological advances in society necessitate new school policies. County, district, and school administrators must stay abreast of current issues and be pro-active in research, collaboration, and implementation of strategies. We must ask ourselves whether poor school climate increases incidents of cyberbullying or if cyber bullies affect school climate? The end goal is to provide positive learning environments that allow all students the opportunity to succeed in a safe and secure setting.

Universal Design for Learning and Gifted Students in a 21st Century Classroom

Abstract

This study examined in what ways and to what extent using Universal Design for Learning strategies impacted the learning of gifted students in a 21st century classroom. Various UDL practices were employed in a Humanities grade 8 classroom over the course of one term, focusing on the Renaissance unit in the social studies curriculum. I hypothesized that the implementation of UDL teaching strategies into my professional practice and the creation and completion of UDL projects by the students would allow the five gifted students involved in the study to demonstrate an increase in learning, as illustrated through an increase in grades, in-depth student reflections and self-assessment, and evidentiary support written by the students on their clear target tracking sheets.

Gifted students can be difficult to motivate to work to their true potential. I theorized that by using the three principles of Universal Design for Learning, engagement, representation, and expression, the gifted students in my classroom would be intrinsically motivated to produce authentic learning activities to demonstrate their knowledge of the curricular objectives, or clear targets. My hypothesis was confirmed. The completion of these projects enabled the students to come to an in-depth understanding of the curricular content, through integrating prior knowledge with new concepts, which consequently gave them the tools to perform better on written exams as an assessment of their learning.

In this study, I discovered that through using UDL strategies consistently and giving students the opportunity to practice (to complete more than one UDL activity), the students generally demonstrated growth in learning as demonstrated in an increase in
Introduction

I conducted my action research project to explore the following question: In what ways and to what extent do using Universal Design for Learning strategies increase the learning of gifted students in the 21st century classroom? The study took place at Mitford Middle School in Cochrane, Alberta. Through the school’s AISI project, teachers at Mitford Middle School are working collaboratively to improve learning in students in 21st century classrooms using UDL strategies. Mitford’s AISI goal relates to specific aspects and priorities in Mitford’s Three Year School Education Plan in that:

Goal #1 in the SEP states: “Learners have their basic and diverse needs met”. Implementing UDL strategies will allow teachers to meet the students’ basic and diverse needs by differentiating instruction and providing access to technologies that will enable all students easier access to the material and an avenue of expression of the learning outcomes.

Goal #2 in the SEP states: “Learners are competent, qualified, and dedicated”. UDL strategies will engage students and give the opportunity for those students to acquire 21st century skills.

Goal #4 in the SEP states: “Learning opportunities are distinct, continuous, and systematic”. Implementing UDL strategies into classroom practice will provide distinct, continuous and systematic learning opportunities for students through differentiation and the use of technology.
Goal #5 in the SEP states: “Instruction challenges and engages the learner”. UDL strategies are proven effective in increasing student engagement and providing challenge for “highly able” students in the classroom.

I connected my research to Mitford Middle School’s AISI project to increase fluidity between my required school-based professional development and my personal action research project. My hope was that UDL strategies would be effective in increasing the learning of all of my students, regardless of ability. However, due to the extent of this task, and the data collection required as evidentiary support for my action research project, I have concentrated my data collection on the impact of learning on the gifted students I teach in the split 7/8 Humanities class. I wanted to demonstrate that by using Universal Design for Learning strategies, the gifted students would not only meet curricular objectives, but would exceed my expectations in pursuing enrichment opportunities. I theorized that using these strategies would:

• Help my “highly able” students to become more engaged in classroom work
• Increase their learning in humanities, and
• Motivate them to become independent, inquiry-focused learners who will develop a passion for life-long learning.

Why Universal Design for Learning?

Universal Design for Learning (UDL) is an emerging pedagogy in the field of education, which has the potential to positively affect the learning of all students in the classroom if employed correctly. “Truly every student, from the gifted to the at-risk to the one with physical and cognitive disabilities, benefits from UDL” (Erlandson, 2002, p. 2).
UNIVERSAL DESIGN FOR LEARNING AND GIFTED STUDENTS

UDL focuses on developing curriculum that reacts proactively to various pedagogical contexts that arise in today’s diverse classrooms by “uploading flexibility into the curriculum rather than waiting for students to falter to put strategies in place to remediate,” (Edyburn, 2003, p. 2). This is very similar to the practice of differentiation. Universal Design for Learning and Differentiation are synonymous in many ways, however, Universal Design for Learning has taken differentiation a step further, according to DeCoste, (2004), by anticipating the needs of diverse learners. “UDL is primarily concerned with learning content, learning process, learning products and the learning environment” (DeCoste, 2004, p. 2). UDL is an extension of differentiation, however, because UDL “places a greater emphasis on using the technology” (DeCoste, 2004, p. 8), that is readily available in today’s 21st century classroom. Pisha & Meyer (1998) as cited in Bart & Pisha (2001), suggest Universal Design for Learning is based on thinking about the needs of all the learners in the classroom and that the teacher should “design curricula, materials, methods, and environments that support and challenge each learner as appropriately and consistently as possible” (p. 198). UDL allows for a whole new range of technological tools to be used to increase engagement, student access of curriculum and demonstration of learning. This allows educators to “develop a new generation of flexible curricula and materials that accommodate each student’s idiosyncratic pattern of strengths, weaknesses, styles, interests, and background knowledge” (Bart & Pisha, 2001, p. 199). Examples of strategies incorporating UDL into the classroom suggested by Rose and Meyer (2002) include:

(a) Start with manageable curriculum units,

(b) Identify the goals of the unit,
(c) Identify what students need to do to show mastery,

(d) Determine what the instructional barriers are for specific students,

(e) Determine what tools would help this, and

(f) Determine how goals, methods and assessments can be adjusted.

Examples of strategies and technologies I used to implement UDL principles in my classroom are explained in my unit plan (Appendix E).

Rockyview Schools has posted a list of 21st century teaching strategies on their website for all teachers and administrators to access. This information states that teachers should:

A. Provide Clear learning objectives and goals

1. Ask the question "What do you want the learner to be able to remember in 5 years?"

2. When possible connect the outcomes and goals to examples the learners can identify with.

B. Provide a variety of learning resources that appeal to the various learning styles

1. Become familiar with each learner and any individual differences by reviewing those strategies that work.

C. Provide opportunities for formative learning thus checking understanding (practice and feedback)

1. Work toward the key understandings by providing multiple learning pathways that chunk the learning in stages and that move the learner toward the outcome.

D. Provide Rubrics for self-assessing quality of work and/or level of understanding

1. Allow learners to demonstrate understanding through multiple forms of representation
E. Provide opportunities for learners to exchange ideas and construct meaning

1. Provide opportunities for learners to co-construct knowledge with each other.

F. Provide multiple learning pathways that appeal to the learning styles of each learner

1. Allow the learners to attempt alternate pathways if unsuccessful with the first attempt
2. Provide enrichment and remedial activities that provide differentiated learning pathways

G. Accept different representations of learning that demonstrate understanding of the course objectives (Rockyview Schools, 2009).

These strategies correlate to the implementation of UDL strategies in that Rockyview is encouraging its teachers to try to find avenues to differentiate and allow learners to demonstrate their knowledge in a plethora of ways. This will allow students to demonstrate their ongoing development of 21st century learning skills. I have attempted to follow the strategies Rockyview has set out to implement UDL strategies in my classroom, as explained in my unit plan (Appendix E), to enable my students to increase their learning and develop 21st century learning skills.

Much of the focus on Universal Design for Learning is centered on how using those strategies in the classroom will benefit those students who encounter adversities in learning environments. But how do these strategies affect those mid and high-ability students? When changing classroom practice to reflect UDL practices, often mid and high-ability learners struggle because they have not yet been challenged and have not had difficulty in the past attaining decent grades, and it can take some time for those students to adjust to a new routine of challenging themselves to develop a work ethic that truly
demonstrates their ability (Tomlinson, 2001). Tomlinson advises that “learning to face challenges earlier gives these students more time to develop the planning, self-evaluation, and study skills they need to maximize their potential as learners” (p. 94). Delisle and Berger (1990) claim, “Providing an early and appropriate educational environment can stimulate an early love for learning. A young, curious student may easily become "turned off" if the educational environment is not stimulating; class placement and teaching approaches are inappropriate; the child experiences ineffective teachers; or assignments are consistently too difficult or too easy” (p. 3). It would seem then, that the implementation of UDL strategies should allow gifted students to focus their learning according to their interests and learning styles, alleviating many of the concerns mentioned above.

Baseline Data: Student Exposure to UDL Strategies in Previous Years

Students in my 7/8 Humanities class were given a questionnaire to assess their level of familiarity with Universal Design for Learning strategies at the beginning of this study. Through this questionnaire I hoped to determine how comfortable and knowledgeable the students were with UDL principles, and how / if these had been used with these students in the past. I analyzed only the results from the five gifted students in my Humanities 7/8 split class, as these were the students I had chosen to include in the study. All of these students are in grade 8. The sheet was given out in class, and all questions were read to the students, re-phrased, and explained in detail. The students answered each question at the same time (so no students would rush ahead and answer questions without fully understanding what they were being asked).
Analysis of question 1: What kinds of assignments have teachers given you in the past?

All five of the students I chose to study listed the types of projects they had completed in previous years, in point form. They did not describe the projects as I had asked. The students mostly listed paper and pencil tasks, such as: Notes, textbook work, tests, timelines, creation of passports, worksheets, and writing assignments. Four out of the five students also listed PowerPoint presentations, creation of videos and podcasts as projects they had completed in the past.

Analysis of question 2: What technology was available to you for project work in the past? What did you choose to use?

Computers were the main technology listed by the students for question 2. Two students identified that they had a choice between using a PC or a Mac, and three of the students also listed specific programs they had used: Word, PowerPoint, and Garageband. The students also stated that they had access to the Internet for research, as well as video cameras for filming. Two students out of five also listed pens, paper, and textbooks as technology they had access to. The students did not distinguish between what was available to them and what they chose to use.

Analysis of question 3: Did you feel engaged while working on these projects? Explain why or why not.

Yes – 1

Sometimes – 3

No- 1

The general sense I got from the students’ answers was that whether or not they were engaged depended on the project they were working on:
“Yes [I was engaged working] on the podcast because it was fun to learn about Garageband and the Mac.”

“Sometimes, because some projects were boring, but some were fun like the videos.”

“Most of the time no. Except for the last project in Science [last year]. We could choose anything we wanted so we chose something that was interesting to us.”

“The only one was a video we made because it was just a lot of fun.”

“It depends on the subject and the project I am working on.”

The students seemed to be suggesting that projects that involved technology were more engaging for them. Four of the five students also mentioned that they were usually not given a choice in what project they could complete, which made them less engaged in the work.

*Analysis of question 4: How did these projects improve your understanding of the content of the course you were in at the time?*

The answers to question 4 were quite varied. Three of the answers were vague and generalized, and suggested that the students learned more about the technology than they did about the subject matter, or curricular objectives. One student stated that completing these projects didn’t improve her understanding of the course because, “They usually weren’t interesting so I didn’t get into it and didn’t remember it later”. However, another student stated, “It forced me to research and study the subject in more detail”. This would have been an interesting answer if the student had elaborated on the subject and what they had learned.

*Analysis of question 5: What curricular objectives (clear targets) did you meet through the completion of your project(s)?*
Only one student out of five mentioned that her teacher had given her a sheet with all of the clear targets the students were expected to know. She did not mention, however which of these clear targets she met through the completion of her project(s). The other 4 students said they didn’t know what clear targets they had met, and some didn’t know what clear targets were. One student commented, “my teacher never talked about how a project fit into my curriculum”.

*Analysis of question 6: How did you meet these objectives in your project?*

Because most of the students couldn’t answer question 5, they were also unable to provide detailed answers to question 6. Most of the students simply said that they think they met curricular objectives because they received good grades on their projects.

*Analysis of question 7: In previous years, did you do more pencil-paper tasks, or more project-based class work?*

All five students stated that they had completed more paper-pencil tasks than project based work in previous years.

*Analysis of question 8: What kinds of marks did you receive on assignments in the past (in general)? Do you think you deserved the marks you received?*

All of the gifted students said that they usually received marks of A’s and B’s on their work and they felt they deserved those marks because they had worked hard on their projects.

*Analysis of question 9: What projects, that you have completed in the past, would you like to do again (not the actual assignments, but the same type of project)?
All five of the students said that they would like to do technology-based type projects again. Some specific examples given were: Creation of videos, Comic Life, Podcasts, as well as poster projects, and hands-on activities.

**Analysis of question 10: If you were to do a project like this again, what would you do differently?**

The students stated that if they were to do a project like one they had completed in the past, they would do a few things differently: choose a smaller group, choose a different medium, put in more detail, write a better script, be more organized, and ask the teacher what needs to be included in the project.

I also asked the students if their teachers had let them help create rubrics for their work in the past, and the overwhelming response was no, the students had not had any say in how or on what they were being graded.

**Analysis of students’ progress reports from previous years:**

All five of the gifted students in my Humanities class had previous Humanities marks ranging from B- to A+, as documented in past progress reports from grades 5 to 8. I analyzed their grade 6 achievement scores for language arts (reading and writing sections), and social studies (both knowledge and skills). I decided to give a general overview of these 5 students’ achievements in Humanities over the past 3 years, so that I could track whether their progress in grade 8 Humanities differed from that of previous years, and in what ways and to what extent their exposure to UDL strategies had affected their learning. The students are referred to as Students #1-5 throughout this paper to protect the privacy of the students.
| Student #1 | Male | Age 13 | Grade 8 | LA: A-, B+, B | SS: A-, B, B- | LA: A, A, B+ | SS: A, A, A- | A-, B+, B | LA reading: 40 | All Excellent and Very Good for all 3 years | -confident, independent, diligent ...
| Student #4 | Female | Age 13 | Grade 8 | LA: A-, A-, A | SS: A, A, A | LA: A, A, A+ | SS: A, A, A | A-, A+, A | LA reading: 45 | All Excellent for all 3 years | -could take more time to put in best effort ...

Note: The table above lists the grades and comments for various students across different subjects and terms. The grades are categorized as Excellent, Very Good, Good, Satisfactory, and Unsatisfactory. The comments highlight various strengths and areas for improvement.
As illustrated in the chart above, all of the students involved in the study had consistently high marks in Humanities throughout grades 5-7. This presented a challenge to track improvement in learning based on grades alone. Because of this, I not only analyzed the students’ marks, but personal reflections from the students as well as my own anecdotal comments to assess the impact of UDL strategies on their learning. The students each had their own Clear Target Tracking Sheet (Appendix F), which was filled out once before we started the unit (under the Background Knowledge column), once mid-way through the unit (Checking In column) and once when the unit was completed (Looking Back column). The students colored the traffic light red if they did not understand the clear target, yellow if the somewhat understood it, and green if they felt they had mastered the concept. If the students colored a light green, they had to provide evidence of that learning by explaining the clear target in the Evidence section. The tracking sheets showed a progression from red at the beginning of the unit to a mixture of red, yellow and green at the mid-point of the unit, and finally the goal was that all lights be colored in green at the conclusion of the unit, which was what occurred.
General Reflection on Student Baseline Data

Universal Design for learning is not just about completing inquiry-based learning projects. It can be difficult to track how using UDL strategies in everyday classroom practice effects students’ learning; therefore, I decided to focus my data analysis on the UDL project work these students had completed. In analyzing the student responses from the baseline data survey, I discovered that the students had some experience in using technology to complete projects, however, they did not know how these projects fit into the curriculum or why they were expected to complete them. Universal Design for Learning focuses on differentiating for students in three areas: representation, expression, and engagement. In the past, these students had been exposed to a few projects that would allow for an increase in individual expression and engagement, but there was a definite lack of accommodation to increase the students’ options for acquisition of the required information.

My goal during this study was to increase the students’ understanding of Universal Design for Learning, and to allow for multiple means of representation, expression and engagement, not only during inquiry-based learning projects, but during everyday class work as well. This seemed like a daunting prospect initially, but once I wrote out my UDL unit plan, it became clear that integrating UDL principles into my every-day teaching practice would increase all of my students’ learning and chances for success. I also wanted to focus on clarity of curricular connections, so that the students could identify the clear targets in their work, and gain an understanding of why they were completing these projects. I decided that I would focus on the nine Universal Design for Learning Guidelines as detailed by CAST (Center for Applied Special Technology, “a
UNIVERSAL DESIGN FOR LEARNING AND GIFTED STUDENTS

nonprofit research and development organization that works to expand learning opportunities for all individuals, especially those with disabilities, through Universal Design for Learning”:

Provide options for:

1. perception
2. language and symbols
3. comprehension
4. physical action
5. expressive skills and fluency
6. executive functions
7. recruiting interest
8. sustaining effort and persistence
9. self-regulation

I integrated these accommodations into my UDL unit plan (Appendix E), and separated them into the three areas of focus: representation, expression and engagement.

As well as implementing UDL teaching strategies into my everyday classroom practice, I also constructed four UDL style projects to give the students an opportunity to demonstrate their understanding of curricular content taught throughout the unit. I explored the successes and challenges the students faced while working on these projects, and in what ways and to what extent these UDL projects affected the learning of the gifted students. The first large-scale project I assigned the students was a culminating activity for chapter 1 of the Social Studies textbook: “Times of Change”. The focus of
this activity was for the students to identify with a person from the Medieval era, and profile a day in the life of this person.

Analysis of UDL Project #1 – September 2009

**Objective:**

The students demonstrated their understanding of a typical day in the life of a Medieval person. The students chose from any class on the Medieval social or Church hierarchy – peasant, noble, monarch, monk / nun, bishop, archbishop, pope, etc. The students brainstormed ideas on how to demonstrate their knowledge, and were reminded of the learning styles questionnaires that were handed out at the beginning of September. Students were encouraged to choose a media that would best represent their individual strengths and talents, while at the same time demonstrating an in-depth knowledge of the content covered in chapter 1 of the social studies textbook. Students were required to create a piece of writing and a visual representation, however the forms of these two pieces were up to the student (Appendix A). Students were also reminded of the curricular objectives (clear targets) covered in this chapter that they were to express in the project:

8.2.2: Recognize that different people have different beliefs, values and worldviews.

8.2.3: Understand that beliefs and values are affected by time, geographic location, and society.

**Assessment:**

The students were given an opportunity to discuss what they would like to be assessed on for this project, and the students were directly involved in the creation of the rubric and category weightings (Appendix A). Students were given two weeks for the
completion of this project and access to various technologies according to individual needs (video cameras, digital cameras, use of the Mac computers and the ilife suite, use of the internet and pre-selected library books for research, earphones, premier technology reader, etc). The students were allowed to complete the visual representation part of the project individually or in groups, but the writing part had to be done alone. The students were also required to complete a peer review of another group / person’s project as part of the editing process. The students were given one class to peer edit, and then fix their own work in preparation for the presentations. They were then required to self-reflect on their work as part of a self-evaluation process. The reflection sheets for all of the UDL projects completed by the students contained similar questions to the Baseline Data questionnaire (Appendix G).

**Outcome:**

I was somewhat disappointed with the work produced by the gifted students. I felt that I had supported and encouraged the use of technology, I allowed for different means of representation, I tried to stimulate the students interest to increase engagement, and provided different media of information. However, although the students did seem engaged during class time, as there was no off-task behavior, the results were mediocre at best. I received better projects – projects that demonstrated a deeper understanding of content and an expression of personal interest from students who, although are high achieving, are not considered gifted. I also found that only three of the five gifted students performed better than their peers on the chapter 1 written exam. I thought that having the students create this project would enhance their understanding of the content in a way that would be reflected on the written exam. But this did not occur in all cases.
The marks on the projects for the gifted students ranged from 77% - 80%, compared to the class average of 81%, and the exam marks for the gifted students ranged from 66% - 94%, compared to the class average of 76%, with two of the gifted students scoring significantly below the class average.

The student reflection sheets showed that the students were able to identify the clear targets they had met through completion of the projects, and that they felt they were more engaged while working on the projects. However, I didn’t feel that the students were fully taking advantage of the creative opportunities they were given, to work within their own individual talents and abilities. The students were choosing to create projects in a format they were already familiar with (i.e., creating a video interview, or a PowerPoint presentation) rather than “thinking outside the box”. On the individual reflection sheets, the gifted students each mentioned that they felt they deserved marks in the A-B range (depending on the student). In general, they had given themselves marks that were a grade level lower than what I had wanted them to achieve (i.e., Student #1, who should have been aiming for an A, reflected that he felt he deserved a B on this project).

I was not yet convinced that using UDL techniques had produced an increase in the gifted students’ learning more than what would have been expected using traditional classroom practices (i.e. paper and pencil tasks, notes, lectures, etc). My hope was that the students would begin to challenge themselves and produce projects that would exemplify their knowledge as well as individual talents and interests, as they had more exposure to and practice with UDL strategies and techniques.
Analysis of Project #2 – October 2009

Objective:

This UDL project was designed to showcase the students’ understanding of the topics covered in chapter 3 of the Social Studies textbook: The Humanist Approach. The students were given three choices of projects, as choice is an integral part of UDL practice. I wanted to see if being given a choice in the project to be completed would increase student engagement and quality of work, compared to the first UDL project the students had completed. Refer to Appendix B for the three project options. The clear target the students were required to meet was 8.2.4E: *Explain how thinkers and philosophers contributed to the humanist worldview during the Renaissance.*

Assessment:

The students were again given the opportunity to decide, as groups this time, what they would like to be graded on for this project. The rubrics the groups came up with were tailored to their individual projects with different categories and weightings based on what the students felt was important, and what they had done well in their first UDL projects. All of the students agreed, however, that it was important to include the clear target in the rubric. I believed this to be a positive step in the students’ realization of what was important in the completion of these projects – they were coming to the understanding that it wasn’t the aesthetics that were as important as the information presented. The only stipulation I made was that the rubric had to be out of 12 marks (for ease of creation of the rubric, and ease of inputting marks into my grade book).

The students were also given the choice to complete the project individually or in pairs – but group work was discouraged this time, as I felt that allowing the student to
work in groups on the last UDL project diluted the quality of work being expressed by each student. I also did not have the students do a peer assessment of work this time, as the students were all working on different projects, and I didn’t feel that the peer assessment for Project 1 made a significant difference in the final product handed in to me by the students. The students didn’t take advantage of their peers’ critiques and go back to their project to improve areas that were lacking. I did include an individual reflection and self-assessment component to the project to make the students think about the work they had done and how they could improve from the last project they had completed.

Outcome:

The projects completed by the gifted students included: A puppet show illustrating a conversation between Raphael and Michelangelo, an imitation of *The David* sculpted out of clay with an accompanying written explanation of how/why Michelangelo completed the piece and how it demonstrates the concept of humanism, and an illustrated booklet on the life and works of Michelangelo. Again, I felt that the amount of effort put into these projects by the gifted students, compared to the quality of work produced by other students in the class, generally did not live up to my expectations. I was only impressed by the work produced by one of the gifted students, who worked in a pair with a non-gifted, but high-achieving student. This was Student #4, who created the puppet show, and received a mark of 11.5/12 or 96% (A+).

Students #1 #2 and #5 worked together to produce the illustrated autobiography (even though I had said there should be no more than 2 people working together), and received a mark of 7.5/12 or 63% (C), which proved my hypothesis that the quality of
work decreases as the number of students working on a project increases. Student #4 worked with a partner who is a non-coded, but high-achieving student, on the sculpture of The David with the accompanying written component. She received a mark of 9/12 or 75% (B) based on the rubric she and her partner created. The class average for this project was 81% (A-).

In analyzing the student reflections and self-assessments for this project, I noticed that all of the gifted students listed the clear target they were expected to meet, and they all explained, in detail, how they met the target in their projects. Interestingly, all of the students said that they would give themselves a grade between the range of B+ to A. All of the students also said that they were very engaged while working on the project and that they felt they had increased their learning on the concept of humanism, as well as their understanding of important thinkers from the Renaissance who contributed to this school of thought. The students felt they could improve on their time-management skills, and working with people whom they don’t just get along with, but whom they would produce the best work with.

The students also mentioned that they would like another chance to complete a UDL project, because they felt that they could increase their quality of work, and would like to try a different medium for expressing their knowledge. Even though the students’ marks were not yet reflecting an impact on the students’ learning, the student self-reflections were demonstrating an increased understanding of curricular clear targets. The students also performed significantly better on this chapter test, compared to their results on the chapter 1 test. The gifted students scored between 80-98% on the chapter 3 exam,
demonstrating that UDL teaching strategies used in the classroom were positively impacting their learning of the social studies curriculum.

For the third UDL project, I wanted to focus on ensuring that the students created rubrics that truly reflected their understanding of curricular content, so their marks reflected this as well. I also hoped for more effort from the gifted students, which would need to come from an internal motivation to do well on the next project.

Analysis of UDL Project #3 – November 2009

Objective:

In conjunction with the Renaissance unit in Social Studies, I taught a Shakespeare unit, with a focus on the play *Twelfth Night*. The clear targets the students were to meet while completing this project are from the Grade 8 Language Arts curriculum as set out in the Alberta Program of Studies:

- 1.1 Discover and Explore: *Discuss and respond to ways that forms of oral, print or other media texts enhance or constrain the development and communication of ideas, information, and experiences,* and

- 2.2 Respond to Texts: *Interpret the choices and motives of characters portrayed in oral, print, and other media texts, and examine how they relate to self and others, and identify and describe characters’ attributes and motivations,* using evidence from the text and personal experience.

The students had a choice of projects they could complete to demonstrate their knowledge of the plot, setting, and characters in *Twelfth Night* (Appendix C). I decided that these projects would be completed individually, due to the issue of decreased quality of work produced during the two past UDL assignments.
Assessment:

The students were again given the opportunity to create their own rubrics that would suit their projects. I offered more support and suggestions on what could be included in the rubric for this assignment, as the students had struggled with this during the creation of the rubrics they constructed for the last UDL project. After a class discussion, the students all decided to work with the same rubric that they had helped to create with my guidance. This still allowed the students a sense of responsibility for their grades, even though I had been able to direct them in producing an authentic assessment tool. The rubric can be viewed in Appendix C.

Outcome:

Because I had not put the clear targets on a poster, or a handout (as I had done with the Renaissance clear targets), the students had difficulty remembering and identifying the clear targets they had met through the creation of their projects. On the student self-reflection sheets, three of the five gifted students confessed that they didn’t know what clear target they had met, one student stated that he was able to understand the play, and one student stated that she was able to imagine what the play would be like if it were written today, although none of the students were able to clearly state the two clear targets I had set out for them at the commencement of the project. I was impressed, however, by the reflective answers the students gave for the question “How did this project improve your understanding of the content of this course?” The student responses to this question directly related to the clear targets:

- “It helped me summarize the play”
- “It helped me think about the play and review the important scenes”
• “It forced me to search for words I didn’t understand, so now I understand Shakespearean English better”

• “It helped me organize all of the events in order in my head”

• “It helped me understand the characters and what happened in the play”

Student #1 chose to complete the restaurant project, and received a mark of 17/24 or 71% (B-). He stated on his self-reflection that he deserved a B because he didn’t put as much effort into it as he could have. Four of the five gifted students wrote that they were engaged while working on the project, but one student claimed that the project he had chosen to complete wasn’t that exciting. This particular student, Student #2 received a mark of 17/24 or 71% (B-) on his project, based on the rubric the students helped to create. On his self-assessment, he suggested that he receive a mark of B+ or A- because “that is how much effort I put into it”. He chose to work independently on the restaurant project. I wrote on this student’s rubric, “…if a project doesn’t pique your interest, don’t choose it. I want you to choose a medium that will showcase your talents, interests, and knowledge. The project you have completed has not given you the opportunity to do that”.

Student #3 selected the movie poster assignment, and received a mark of 22/24 or 92% (A). This student gave herself a mark of A on her self-assessment due to her effort, and inclusions of specific scenes and characters from the play. Student #4 created a movie poster based on the play, and received a mark of 21/24 or 88% (A) This student gave herself a B on her self-assessment because she felt she “didn’t spend enough time on it, but … still had the correct information”. Student #5 completed an independent study on Shakespeare’s A Midsummer Night’s Dream, as he had already studied Twelfth Night the previous year. He chose a specific scene from A Midsummer Night’s Dream to
translate into modern English, and expressed his desire that we read it aloud in class as a reader’s theatre (an activity we had completed in class using Twelfth Night). Student #5 received a mark of 22.5/24 or 94% (A). He also gave himself an A on his self-assessment.

Three of the five gifted students met my expectations for this project and received marks higher than the class average of 81%. The gifted students also scored remarkably high on the Twelfth Night final exam, with grades ranging from 90% (A) – 97% (A+). I was finally starting to see the positive effects of UDL strategies on the learning of the gifted students.

My next challenge was to have the students create their own UDL inquiry-based learning project and rubric that reflected their understanding of the curricular clear targets for all of Unit 1: The Renaissance. This final project for Unit 1 allowed the students to demonstrate an increase in their learning based on the grades they received on the project, as well as their ability to clearly state, on the student self-reflection sheets, the clear targets for the unit and how they met these in the completion of the Unit 1 final project.

Analysis of UDL Project #4 – December 2009

Objective:

This project was designed as a culminating activity for Unit 1 of the Social Studies grade 8 curriculum: The Renaissance (Appendix D). The students were required to demonstrate their understanding of all of the clear targets outlined in the Alberta Program of Studies for Unit 1 of the Grade 8 curriculum. The students were given the option to either complete the inquiry-based learning project, or an open-book final exam, to be completed during class time.
Assessment:

The exam was graded using a scantron key (wherein the students colored in the correct answer in pencil). The exam was worth a total of 63 marks, which was converted into a percentage grade. The projects were assessed using student-created rubrics, and these marks were also converted into percentage grades for ease of inputting the marks into my gradebook.

Outcome:

All of the gifted students, with the exception of Student #2 chose to complete the project. Student #1 chose to create a game board, complete with questions and activities based on the clear targets for Unit 1. He created this project with Student #5 and another non-coded student. Both Students #1 and #5 were able to clearly list and describe the clear targets they had demonstrated their knowledge of in their project. They also both stated that they felt very engaged while working on the project because they “had fun, enjoyed the group, and worked hard on the project”. Student #1 gave himself an A- for his part of the project, and Student #5 gave himself a B+.

I enjoyed marking this project very much, and had the students in the class play the game, so that this group had a chance to showcase their work. Due to the rubric the students created, however, the project only received a mark of 15/20 or 75 (B). I felt that guiding the students in the creation of the assessment rubric would have increased the chances of the students getting a higher mark on the project. The students did not include categories in the rubric that they would have scored well on (i.e. including all clear targets), but rather focused the rubric on the aesthetic qualities of the work, which was
mediocre, compared to other game boards their peers had handed in. There were a few game boards handed in as final projects between my two Humanities classes.

Student #2 decided to write the exam, as he does very well on paper-pencil tasks and exams. I believe that giving the students the option to complete either an exam or a project was a UDL strategy in itself, as the students had the choice to complete the work that they believed would best demonstrate their learning, and for some students, like Student #2, an exam was the best option. Student #2 received a mark of 90% (A) on his exam, proving that a written task really was the best option for him to demonstrate his understanding of the curricular clear targets (which were represented as questions on the exam). On his reflection questionnaire, Student #2 could clearly list and describe each of the clear targets we had covered in the Renaissance unit. He also remarked that writing a test was easier for him than completing a project, and that he preferred teacher-directed work to an inquiry-based learning project. He also stated that he would give himself an A for the test, because he had studied the material “pretty hard for it”.

Students #3 and #4 also created board games, but each worked in a pair with non-coded, high-achieving students from the class. Both Student #3 and Student #4 clearly listed and described the clear targets on the self reflection sheets, and stated that they felt engaged while working on the project because it was “simple and fun”. Student #3 rated her work as an A, and Student #4 gave herself an A- for this project. Based on the rubrics each student created with their group, Student #3 received a mark of 19/20 or 95% (A), and Student #4 received a mark of 17/20 or 85% (A-). Both students’ predictions for how they would do on this project were accurate.
Conclusion

At the conclusion of the Renaissance unit, the students revisited their clear target tracking sheets for a final time and completed the “Looking Back” column (Appendix F). As I had predicted, all of the gifted students had colored in the lights green for all of the clear targets, with one exception. The students had difficulty mastering the last clear target 8.2.4.G: Provide examples of how exploration and intercultural contact affected the citizenship and identity of Europeans. Even though the students had demonstrated their knowledge of this clear target in their projects, they had difficulty describing this clear target in succinct language. Three of the five gifted students colored this target yellow, and did not write anything under the Evidence section. I decided that this would be an area I will focus on clarifying next year when I teach the Renaissance unit. The following chart illustrates the growth each student demonstrated throughout the unit based on project percentage grades:
Based on the chart alone, it seemed that the students had demonstrated only minimal growth in their learning. However, I was encouraged by the growth and depth of knowledge the students demonstrated in their projects throughout the term. With practice and guidance, the students were able to meet my expectations for growth in their learning as reflected in their grades, reflections, and self-assessments. Consistent use of Universal Design for Learning strategies eventually produced the results I had hoped for. All five gifted students involved in this study were engaged in the curriculum, demonstrated an increase in learning of the clear targets due to various means of representing the information, and were able to express their knowledge in creative ways that demonstrated personal strengths and talents of each student.

I found it interesting that many of the non-coded and Learning Disabled students in both of my Humanities classes made as much, if not more, progress in their learning as the gifted students (as demonstrated in their understanding of curricular targets in their projects and an increase in grades on these UDL projects). Due to this occurrence, I have deduced that Universal Design for Learning strategies is an effective tool to use for all students, not just those with special learning abilities or disabilities. This is not to say that the implementation of UDL strategies is an optimal solution for everyone, however it can allow teachers and other persons in the school community to accommodate and create success for students with different backgrounds, learning styles, abilities and disabilities (Rose & Meyer, 2002).

Next Steps

I will be sharing the results of this study with the staff of Mitford Middle School during our final AISI day of this school year, to encourage the use of UDL practices and
share the positive results my students achieved during this unit. I will continue to use these strategies and act as an embedded coach for all teachers at Mitford Middle School to assist them in the creation of their own UDL unit and lesson plans. At the end of this school year, all teachers at Mitford Middle School will be able to produce at least one UDL unit plan, and I will create UDL unit plans for the other two social studies units for grade 8: The Aztec / Spanish conflict, and Historical Japan.

I will also make this report available on the Mitford Middle School homepage, under the AISI tab, so that it may be shared with the educational community at large. Teachers, administrators, parents, and students will all have access to this report. The results of this study may prove to inspire other education professionals to integrate UDL strategies into their professional practice, ultimately having an advantageous impact on the learning of all students.

Universal Design for Learning Assignment
“A Day in the Life of…”

In order to help you achieve success, you will be given the opportunity to demonstrate your understanding of the curriculum in multiple ways. You will be given choice in the format and presentation of your assignment, and you will have input into how your project is assessed. This is a great way for you to take responsibility for your learning by choosing a format that is interesting and engaging for you, and that will allow you to show your knowledge of the subject to the best of your ability! Show me what you are good at; show me what you know. 😊

There are 2 parts to this assignment:

Part 1: A piece of writing
In a piece of writing, demonstrate your understanding of the worldview of someone from the Middle Ages. You can choose to be a peasant, knight / squire, noble, king (or queen), priest/nun, bishop, arch-bishop, or pope (see the hierarchies on pages 18 & 31 of the textbook for more info). You must include an example from each of the worldview elements: geography, time, beliefs, society, values, economy, and knowledge in your piece of writing. For example, for geography, you might describe the landscape where you live. For time, you might describe how you tell time, and if time, or the seasons are important to you. Your piece of writing could take many forms. For example, you could write a story, a script, create a storyboard, a comic strip with dialogue, write an essay, create a journal or diary entry, write a poem, etc. Choose a format that you enjoy to express your knowledge!

Part 2: A visual representation
Your visual representation will accompany your piece of writing and will help to illustrate your knowledge of the medieval worldview. You may complete this part of the assignment individually, in partners, or in a group (however, each group member must represent a different character). Your visual representation could take the form of a poster, a puppet show, an interview, a short film or documentary, a pod-cast, a slide show or photoessay, a children’s picture book, a painting, a diorama, a graphic novel or comic book, etc. The possibilities are endless!
You will have about 6 classes to work on this project in the Mac Lab—allowing you access to many technologies to aid you in the completion of this project. If you would like to complete some of this work after school, you may (for example, filming in different locations around the community or at your house), however, ample class time will be given.

How do you find information to include in this project? You can use many resources available to you, such as the textbook, my notes (which are posted on my plone), your notes from the videos watched in class, information you find on the internet (make sure the source is reputable), videos you find on the internet, books from the library, etc. Make sure to use quotation marks and site any sources that you quote (see your agenda on how to create a bibliography).

The assessment of this project will be discussed in class, and students will have an opportunity to suggest what should be included in the rubric. This project is due at the end of class on Monday, September 28, 2009 (digital projects can be blue-toothed to your teacher’s laptop).

Remember, this is an opportunity for you to show me what you know. Be creative, get into it, and have fun! 😊

Appendix B

Chapter 3 UDL Activity – Choose ONE of the following activities to complete: (may be done in pairs)

- Choose an artist, sculptor, architect, musician, or writer of the Renaissance. Research his/her life and work and complete a 500-word report on what his/her work tells us about Renaissance society and the concept of “humanism”. Include at least 3 visuals in your report. This may be presented as a written report, PowerPoint presentation, podcast, or website.

- Create a LARGE color poster that illustrates and describes the musical instruments and composers that were popular in the Renaissance, and how these demonstrated the concept of “humanism”. Include a 1 page (double spaced) write up to accompany your poster. (Hint: think about the difference between Medieval music and Renaissance music, as was discussed in class).

- Design a political cartoon (in color) that comments on what art tells us about society in the Renaissance and the emerging idea of “humanism”. Include a typed explanation of your cartoon and how you think art in the Renaissance reflected the society of that time.

- Design your own UDL project demonstrating your understanding of the clear target presented in this chapter: “Explain how thinkers and philosophers contributed to the humanist worldview during the Renaissance”. This project must be approved by the teacher before you start.

Appendix C

**Twelfth Night Final Project Options**

Choose ONE of the following projects to complete your *Twelfth Night* portfolio:

**Newspaper Article - Written Assignment**

Write two newspaper articles. Choose two major events that took place in the play and write one newspaper article for each event. Or write two articles about one event but write each from a different perspective.

This assignment should look like a page of a newspaper, therefore it must:
- include a catchy caption for each story
- be typed with two or three columns on a page
- include at least two graphics, either created using a graphics program, inserted from a web site or drawn.
- include at least one “interview quote” with a character from the novel
- be creative

**Report Card - Written Assignment**

Design a report card to evaluate the qualities of the main characters (Viola, Olivia, Duke Orsino, Malvolio, Toby Belch, Andrew Aguecheek). Include a few qualities for each main topic: personality, physical make-up, heroic qualities and friendship qualities.

For each group of qualities write a brief comment on why you gave the main character that grade.

You should have a minimum of 10 qualities for each character. Make the report card look realistic.

**Movie Poster - Art Assignment**

The play is being made into a movie. Why not? Most great plays are. You must make a movie poster to advertise the movie.

You must think about what elements are on movie posters. Think about the style, the title, actors used to portray main characters, important scene you may want to include, producer, setting, graphics, etc.

Project must be poster size, and must be done by hand. You may use pencil crayons, paint, markers, etc., but make it look professional!

**Design A Restaurant - Art Assignment**

Pretend you are one of the main characters from the play and you are opening a restaurant based on your adventure. You need to demonstrate your understanding of plot, theme, characters and setting of the play. You must include these elements:

- Catchy title for restaurant – based on characters, theme or setting of the play
- Design artwork for menu – should reflect Shakespeare’s era
- Must look professional.
- You must connect the item menus to characters in the play – based on the characters personalities. Be creative!
Radio / TV Interview - Presentation Assignment
You and a partner must record an interview of the main character. Both you and your partner must write a list of good interview questions that are open-ended. (These must be handed in.) One person must pretend they are the main character and answer the questions as the main character would, while the other person acts as the interviewer. Think about using interesting voices. You must record this on a blank tape for the class to listen to / watch.

Acting Out - Presentation Assignment
This can be a group project. 2-6 group members. You must choose a main scene from the play to act out. As a group write dialogue (in modern English) based on the events of the story. Bring in props and costumes and rehearse skit. Be prepared to perform scene for class. This may be recorded or live.

Web Page on Author - Technology Assignment
Create a simple web page about the author. Include reviews of his or her novel, facts about the author's life, a graphic and a link to another site. Save the html and all graphic files on a disk to be handed in (if using Microsoft. Or send me the address of your webpage.

Slide show - Technology Assignment
Create a 10-15 page slideshow illustrating your opinion of the play. You can include things like character sketches, plot summary, your review of the play, your own original artwork depicting different scenes from the play, a comparison of the script and the film version, biography of Shakespeare, etc. MUST include a bibliography.

Open to your Suggestions
Decide on a project and get it approved by the teacher before you begin. Must hand in a written proposal (typed and edited) to be approved.
UDL assignment Shakespeare: Twelfth Night

### Creativity / Originality of ideas
- **X2**: Assignment is exceptionally creative. Student went beyond expectations in the creation of this project.
- **X3**: Assignment is fairly creative. Student met expectations in the creation of the project.
- **2**: Assignment could have been more creative. The student met some of the expectations in the creation of the project.
- **1**: Assignment is minimally creative. The student did not meet expectations in the creation of the project.

### Information / Inclusion of Clear Targets
- **X2**: Student demonstrated an in-depth understanding of plot, theme, characters and setting. Student demonstrated an integration of prior knowledge and new concepts learned.
- **X3**: Student demonstrated a concise understanding of plot, theme, characters and setting. Student demonstrated some integration of prior knowledge with new concepts learned.
- **2**: Student demonstrated an incomplete understanding of plot, theme, characters and setting. Student had difficulty integrating prior knowledge with new concepts learned.
- **1**: Student demonstrated a limited understanding of plot, theme, characters and setting. Student was unable to integrate prior knowledge with new concepts learned.

### Organization / Aesthetics / entertainment value
- **X2**: Assignment is expertly organized. Has a clear flow from one idea to the next. The project has great aesthetic appeal and/or entertainment value.
- **X3**: Assignment is well organized. Has a flow from one idea to the next. The project has some aesthetic appeal and/or entertainment value.
- **2**: Assignment is partially organized. Some elements may not fit with the rest. The project has a little aesthetic appeal and/or entertainment value.
- **1**: Assignment is not well organized. Many elements do not fit together. The assignment is confusing. The project is not aesthetically pleasing and/or is not entertaining.

Appendix D

Student-directed UDL project

Unit 1 “Renaissance Europe” – Origins of the Western Worldview

You may choose to complete this self-directed UDL project, or the open-book unit final exam, which will be completed in class. The unit final is 63 questions, consisting of T/F, multiple choice, matching and mapping questions. This will be written on a scantron sheet. You may use your notes and textbook. This test will be written independently. Questions will come from the unit 1 of the text, notes, worksheets, and videos presented in class.

Using your experience with universal design for learning projects completed previously, you will have the opportunity to design your own, unique UDL project and rubric to demonstrate your understanding of the clear targets presented in Unit 1!

Keep in mind the projects you have completed in the past, and what kind of work will best demonstrate your talents and abilities. This project may be completed individually, in pairs, or in groups of up to 4 people (the more people, the more detailed I expect the project to be). You will also create your own rubric the way we did together in class – the total must add up to 20 marks.

Remember, the point of this project is to **demonstrate your understanding of the 10 clear targets presented in Unit 1**. You may not, however, do a project in the same style of one you have already completed.

Some project ideas to get you thinking:

- board game or role-playing game (like Dungeons and Dragons)
- write your own Unit 1 test complete with multiple choice, T/F, matching, and short answer questions (which you will answer and provide an answer key)
- write (and/or) perform a song or poem
- create a storyboard as if you were making a movie out of Unit 1
- film a talk-show using characters from Unit 1
- re-create one of the stories from Unit 1 using live action filming or animation software
- create a comic / graphic novel / picture book based on the events of Unit 1 (this should have a clear storyline and be entertaining)
- choreograph an interpretive dance and provide a written or recorded explanation of how the dance demonstrates events and important persons in Unit 1
- write a creative short story based on the information presented in Unit 1
- write or record a journal entry from the point of view of a person presented in Unit 1
- create a newspaper from the mid-late 1700’s with articles, pictures, and ads demonstrating what was happening in Acadia at that time
- create a current events package (in the style of the ones we do in class) based on Unit 1
- build a diorama illustrated an important event
- create a podcast
- create a legomation video
- paint a piece of artwork (abstract or realist) and provide a written or recorded explanation of how your art demonstrates events and persons from Unit 1.

*Rubrics were student-generated for this project*

Grade 8 Humanities

Unit 1: Renaissance Europe – Origins of the Western Worldview
Themes: Culture / Ideas / Worldviews
Focus Topics: Factors that shaped the Renaissance Worldview
How the Western Worldview grew out of the Renaissance

ELA connections: Reading, writing, listening, viewing, visually representing
Shakespeare “Twelfth Night” (critical analysis of a piece of literature that demonstrates the Renaissance Worldview)
Lois Lowry “The Giver” (critical analysis of a piece of literature that challenges our Western Worldview)

Social Studies Clear Targets (curricular connections):

8.2.1: Demonstrate how the worldview of Renaissance Europe has affected the Western worldview.
8.2.2: Recognize that different people have different beliefs, values and worldviews.
8.2.3: Understand that beliefs and values are affected by time, geographic location and society.
8.2.4A: Define the Renaissance.
8.2.4B: Describe how the Renaissance sparked the growth and exchange of ideas across Europe in the areas of Astronomy, Math, Science, Politics, Religion, and Art.
8.2.4C: Describe how the geography of Renaissance Europe affected trade and competition among European countries.
8.2.4D: Explain how increased trade led to the rise of powerful city-states, such as Florence and Venice.
8.2.4E: Explain how thinkers and philosophers contributed to the humanist worldview during the Renaissance.
8.2.4F: Define the Age of Discovery and explain how it led to the expansionist worldview.
8.2.4G: Provide examples of how exploration and intercultural contact affected the citizenship and identity of Europeans

UDL connections:

Multiple Means of Representation
(options for perception, language and symbols, and comprehension)

- notes are posted on the plone for students to print off
notes and articles are delivered orally to students, a highlighter and the document camera is used when students are expected to copy down answers

during exams, students are put into groups to either write the test individually or have the test read orally to them (test is also put up using the doc camera in this case)

online videos are shown to visually illustrate information presented and provide background knowledge (i.e. a cartoon found on Youtube.com about David and Goliath – to show who Michelangelo’s David was modeled after) (i.e. cartoon on Youtube.com of “Twelfth Night”)
documentaries are shown using the LCD projector and speakers (i.e. The Crusades)
pictures and maps are enlarged using the doc camera (which also allows the teacher to zoom in on areas of interest)
music is played to demonstrate worldview of the time (i.e. Gregorian chants were played for the class when we were discussing Medieval times, and how every area of life was focused on the secular worldview)
  o the song “Istanbul Not Constantinople” by They Might Be Giants was played and the lyrics were analyzed when students were learning about the trading centers of Europe and how the control of these cities meant increased power and wealth

Study guides for exams are posted on the plone and are given in paper copy to the students and are gone over and discussed orally in class

Class discussions, brainstorming, use of graphic organizers such as T-charts, Venn diagrams, thought webs, etc. to document important information

Audio version of the novel study played for students while they read

Poster displaying the Social Studies clear targets is on display for the students to see

Students are given paper copies of the clear targets sheets 3 times during the unit

Word wall is used to display important vocabulary from the chapters

Multiple Means of Expression
(options for physical action, expressive skills and fluency, and executive functions)

Inquiry-based projects at the end of important concepts / chapters (see assignments attached)

Class discussions, brainstorming, use of graphic organizers such as T-charts, Venn diagrams, thought webs, etc. to document important information

During exams, students are put into groups to either write the test individually or have the test read orally to them (test is also put up using the doc camera in this case)

Some students are offered a scribe during an exam, or have the use of a computer to type the answers

Some students may also be offered an oral exam rather than a written exam
Students are given choice in how they represent information, can use their talents (i.e. various computer software, singing, dancing, creative writing, model-building, etc)

Multiple Means of Engagement (options for recruiting interest, sustaining effort and persistence, and self-regulation)

- “Popsicle stick” technique to encourage participation in class discussions (every student’s name is on a popsicle stick in a can, and when students are expected to give an answer, a name is drawn out of the can so that the same students aren’t always providing the answers – no one can “hide”; students can also use a ‘lifeline’ if they really are stuck, but I come back to them to answer another question if this is the case – only allowed to use 1 lifeline)
- Students are given computers (PC’s and Macs) to use when completing inquiry based projects
- Alpha-smarts are given to students who have difficulty writing
- Students are given choice in how they represent information, which keeps them engaged
- Students are given the opportunity to have a say in the creation of the rubric – so they know and have input into how they are being graded
- Students are sometimes given the opportunity to work in pairs or groups to “think-pair-share”
- Some students are given the opportunity to work independently in the library if they need a quiet space to focus
- A variety of software is available for the students to create projects (comic life, podcasts, power point presentations, readwritethink.org, xtranormal.com – text to animation software, etc)

Evaluation / Assessment

- Student self-reflections, peer reviews
- Student and teacher created rubrics
- Written and oral exams
- Anecdotal comments (descriptive feedback) on student work
- Observation
- Checklists

Student Reflection on UDL project

Describe the assignment – what did you do?

What technology was available to you? What did you use?

Did you feel engaged while working on this project? Explain.

How did this project improve your understanding of the content of this course?

What curricular objectives (clear targets) did you meet through the completion of your UDL project?
How did you meet these objectives in your project?

Do you feel a project like this was more beneficial or less beneficial in increasing your learning on this topic than a paper-pencil task? Please explain.

What mark would you give yourself on this project (a letter grade please)? Why do you feel you deserve this mark?

Would you like to do a project like this again? Why or why not?

If you were to do a project like this again, what would you do differently?
ABSTRACT. This paper reports on a study of elementary preservice teachers’ inquiry-based practices, their efficacy beliefs, and the role beliefs had on two preservice teachers’ practices in urban classrooms. Results show inquiry-based practices can be cultivated through field-based experiences and preservice teachers’ efficacy beliefs, as it relates to practice in urban settings, are malleable. Specifically, personal efficacy beliefs about teaching science improved or were sustained for one cohort of preservice teachers. However, beliefs about students’ ability to learn science, that is outcome beliefs, were less stable. The results of two case studies show that science content knowledge was a factor in preservice teachers’ inquiry-based practices. However, why preservice teachers’ beliefs about student learning declined is less clear. More research is needed, along with follow-up data on teacher induction, to learn how preservice teachers’ beliefs impact urban students’ science education.
Can Strategic and Motivational Intervention Develop Second Language Reading Performance?

Hiroyuki MATSUMOTO  
Ehime National University

matsumoto@eec.ehime-u.ac.jp

Abstract
This study investigated whether strategic and motivational intervention based on a diagnosis helps a group of Japanese learners develop their L2 reading performance (i.e., reading comprehension, strategy use, and motivation). The participants were 40 EFL nursing students enrolled in a required reading-based course. Two types of instruments were used: reading scales for strategy use and motivation and reading comprehension tests. Although the intervention did not have positive effects on the quantitative development of the participants’ L2 reading performance, in the process of learning to read, motivation affected strategy use more significantly, one strategy use (identifying main ideas) affected reading comprehension most strongly, and each strategy was used in a more coordinated manner. In short, certain qualitative change continued to happen in the minds of the participants.

1. Introduction

Research on reading strategies has contributed to unraveling the reading process and also to improving reading instruction. A plethora of studies have reported positive effects on second language (L2) reading performance by employing intervention in reading strategies in order to improve comprehension (Carrell, 1985; Carrell, Pharis, & Liberto, 1989; Chung, 2000; Floyd & Carrell, 1987; Hudson, 1982; Oded & Stavans, 1994; Padron & Waxman, 1988; Tang, 1992; Yang, 2002). Further, the importance of the orchestration of reading strategy use has also been delineated in the literature (Anderson, 1991; Carrell, 1998; Fitzgerald, 1995; Guthrie & Taboada, 2004). Although strategy intervention has been validated for L2 reading performance, most of the interventional studies focused on one or a few strategies that researchers or educators had chosen for L2 learners in advance. These studies did not reflect individual differences, and particularly not the potential drawbacks (e.g., weak or inappropriate strategy use itself and combinations of relevant strategies that should be
employed simultaneously) inherent in L2 learners. Strategy intervention tailored to a group of L2 readers based upon their own individual differences appears to contribute most to the development of their L2 reading performance.

The importance of motivation in the domain of reading instruction has been emphasized in the related literature (e.g., Guthrie, 2008) because the development of L2 reading performance relates to the motivational aspect of language learning. Reading motivation encompasses several dimensions: self-efficacy, intrinsic motivation, and extrinsic motivation (Guthrie, Wigfield, & Perencevich, 2004). In reality, some students display an eager attitude toward reading; on the other hand, other students display a lack of interest to read. That is, a learners’ level of motivation affects L2 reading performance, thus any reading instruction must include some remedial measures for undermotivated learners. Taking students’ motivational differences into account is important in determining the measures to be taken during any course of reading instruction.

2. Objective

The objective of this study is to investigate whether strategic and motivational intervention based on a diagnosis at the outset of an L2 reading course helps a group of learners develop their L2 reading performance: measured in terms of reading comprehension, strategy use, and motivation. After the diagnosis, a strategic intervention was carried out in the fields of (1) identifying main ideas, (2) summarizing, (3) making inferences, (4) utilizing organization, (5) adjusting reading, and the coordination of these strategies. Concurrently, a motivational intervention was introduced in the dimensions of (a) self-efficacy, (b) intrinsic motivation, (c) extrinsic motivation, and (d) orientation to learning to read.

3. Method

The study was conducted in one 15-week semester of regular instruction, and strategic and motivational intervention was integrally combined into course activities. The participants were 40 second-year English-as-a-foreign-language (EFL) students who were enrolled in a required reading-based course at a nursing school. Using a commercially-produced textbook (Edmunds, Price, Ohtaki, & Hikichi, 2009), the course of 15 classes proceeded with reading comprehension and relevant activities from Chapter 1 to 10. All the topics covered in the textbook relate to nursing and medical care (e.g., the history of nursing, patient-nurse relationships, and nurses in the community).

Two types of instruments were used for data collection (see Appendices): reading scales for
strategies and motivation (RSs) and two multiple-choice reading comprehension tests (RCTs). RSs assessed the perception of strategy use and the level of motivation with 42 items on a 5-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). In pilot studies, the Cronbach alpha indices of internal consistency were confirmed: .84 for identifying main ideas, .87 for summarizing, .84 for making inferences, .80 for utilizing organization, and .78 for adjusting reading. The scale items include “I read for the purpose of content comprehension” and “I differentiate main ideas from supporting details” for strategy use, and “I can read English proficiently with effort” and “I would like to learn a lot through reading English” for motivation. RCTs were equivalent-form tests and evaluated identifying main ideas, summarizing, general understanding, making textual inferences, and guessing word meanings. Each test has two passages with 20 corresponding questions (the score is converted to 100 points). In pilot studies, no statistically significant difference was found to exist between the two forms, and the maximum correlation coefficient was .424.

Prior to the intervention, students were given RS 1 and RCT A, and cluster analysis and t-tests were performed in order to explore the individual differences in strategy use, motivation, and reading comprehension. After the intervention, RS 2 with an open-ended question and RCT B were administered. In order to estimate the development of L2 reading performance (i.e., reading comprehension, strategy use, and motivation), the scores on RCT A and B, the averages of each subscale in RS 1 and 2 for strategy use and motivation, and the relationships among reading comprehension, strategy use, and motivation were analyzed using t-tests, covariance structure analysis (CSA), and also multiple regression analysis. All the analyses were carried out among lower strategy use and motivation groups as well as among all the participants, except for the CSA because of its numerical limitation.

4. Intervention

Strategic and motivational intervention was integrally combined into the course activities, which every student participated in regardless of the diagnosis. The strategies explicitly taught and practiced were (1) identifying main ideas, (2) summarizing, (3) making inferences, (4) utilizing organization, and (5) adjusting reading. Before class, students were asked to read each chapter passage using specific strategies. During class, the strategies were explained and demonstrated to students by the instructor, followed up by practice with relevant activities. For example, for identifying main ideas, students were advised to find a topic sentence usually placed at the beginning of a paragraph, to differentiate which information is the most important in a paragraph, and to pay attention to how key words are
connected. In other words, hands-on training for identifying main ideas was implemented using passages and exercises. At the end of class, they were frequently asked about how effective (i.e., goal-wise) and efficient (i.e., speed-wise) each strategy use was. After class, students were instructed to review each strategy based on what they learned during the class. They were also encouraged to utilize the strategy learned in class when reading the next chapter's passage. In later classes, they were taught how to coordinate strategies (e.g., from identifying main ideas to summarizing).

Motivational intervention was carried out during the whole semester by emphasizing the importance of reading in the academic domain of nursing. Based upon the fact that it is compulsory to be able to read related literature in English, the students, as future nurses, were encouraged to be confident in reading English, set the development of reading proficiency as a goal, and find various opportunities to practice reading.

5. Results and Discussion
5.1. Diagnosis

Cluster analysis using ward method and squared Euclidean measure was performed on RS 1 and RCT A in order to explore the individual differences in strategy use and motivation. With the aid of dendrograms, or graphic representations of the grouping, students were divided into two groups in each of strategy use and motivation (N = 39): (1) high and low strategy use groups (Figure 1 & 3) and (2) high and low motivation groups (Figure 2 & 4). In several t-tests, all the averages except for orientation to learning to read in motivation were statistically different between the high and low groups (p<.05). It is noted that 11 students overlapped in the high groups and that 17 students overlapped in the low groups: Motivation and strategy use co-varied to a large extent.
Two *t*-tests were performed to see if there were statistical differences in RCT A between the high and low groups. The mean of the high strategy use group (\( n = 16 \)) was 41.88, with a standard deviation of 13.40; the one of the low strategy use group (\( n = 23 \)) was 33.26, with a
standard deviation of 13.78. The difference between them was 8.61, the \( t \)-value was 1.941, and its probability was .060 (two-tailed). This implies that reading comprehension was affected to some extent by strategy use, although the difference was not found to be statistically significant.

Next, the mean of the high motivation group (\( n =17 \)) was 40.00, with a standard deviation of 12.37; the mean of the low motivation group (\( n =22 \)) was 34.32, with a standard deviation of 15.14. The difference between them was 5.68, the \( t \)-value was 1.256, and its probability was .217 (two-tailed). This implies that reading comprehension was less affected by motivation than by strategy use, although there was an actual difference between the two means.

In sum, one group of students with higher strategy use and motivation tended to display higher reading comprehension ability; while the other group with lower strategy use and motivation tended to display lower reading comprehension ability.

5.2. Reading Comprehension

A \( t \)-test was performed between RCT A and B (\( N =39 \)). In RCT A, the mean was 36.79, with a standard deviation of 14.12; in RCT B, the mean was 33.46, with a standard deviation of 11.07. The difference between the two means was 3.33, the \( t \)-value was 1.302, and its probability was .201 (two-tailed). Thus, the two means were not found to be statistically different. This indicates that the intervention did not contribute to the enhancement of reading comprehension ability among students.

Two \( t \) tests were also performed in the low groups in the diagnosis in order to see if the intervention contributed to the enhancement of their reading comprehension. The mean of RCT A in the low strategy use group (\( n =23 \)) was 33.26, with a standard deviation of 13.78; the one of RCT B in the same group was 29.78, with a standard deviation of 9.11. The difference between them was 3.49, the \( t \)-value was .984, and its probability was .336 (two-tailed). Next, the mean of RCT A in the low motivation group (\( n =22 \)) was 34.32, with a standard deviation of 15.14; the one of RCT B in the same group was 31.36, with a standard deviation of 12.17. The difference between them was 2.95, the \( t \)-value was .771, and its probability was .449 (two-tailed). Because of no statistically significant differences, the intervention did not contribute to the enhancement of reading comprehension ability in the low groups.
5.3. Strategy Use

Several *t*-tests were performed between RS 1 and 2 for strategy use (*N*=39). The results are shown in Table 1, where all the means were not found to be statistically different. This indicates that the intervention did not contribute quantitatively to the enhancement of strategy use among students.

5.5. Relationships between Motivation, Strategy Use, and Reading Comprehension

The relationships between motivation and strategy use were compared using CSA models in RS 1 and 2 in order to examine if there were any qualitative differences between them. Figure 5 shows the overall relationships from the data in RS 1 before the intervention. This model was constructed with two latent variables (i.e., strategy use and motivation) that define observed variables (i.e., the subscales of strategy use and motivation) because motivation is considered as one of the most powerful factors that affect strategy use (Oxford & Nyikos, 1989). Standardized coefficients along the arrows mean how strongly the variables...
affect the other ones, and squared multiple correlation coefficients on the variables mean how much they are explained by the other ones (the maximal value of each coefficient is 1.00). The most important relationship in this model is from motivation to strategy use: Motivation affected strategy use by the strength of .50 (p = .056, which means the value is not significant at the probability level of 5 percent), and strategy use was explained by motivation by 25 percent. NFI and CFI, which back up the appropriateness of this model when the values come closer to 1.00, were .770 and .883 respectively. In the same way, RMSEA, which does so when its value is near zero, was .117.

Next, Figure 6, which adopted the same modeling as in Figure 5, shows the overall relationships from the data in RS 2 after the intervention. Motivation affected strategy use by the strength of .80 (p = .001, which means the value is significant at the probability level of 1 percent), and strategy use was explained by motivation by 64 percent. Both values are higher than those in Figure 5. NFI and CFI were .832 and .948 respectively, and RMSEA was .083. These indices demonstrate more appropriate goodness-of-fit than in Figure 5.
What follows are some learners’ comments to the open-ended question on strategy use and motivation from RS 2. Approximately 80 percent of the participants reported on some strategic change, and no less than 60 percent of them reported on motivational development.

[Strategy Use]
“l pay more attention to main ideas of each paragraph.”
“l pay more attention to key words (which seem so to me) in a paragraph.”
“l try to find a topic sentence in a paragraph.”
“l pay more attention to the whole passage than to details.”
“l pay more attention to the connection of each sentence.”
“l guess the meanings of unfamiliar words and infer what comes next in a passage.”
“l think about what the author is trying to say in a passage.”
“l weigh the importance of information in a passage.”
“l try to understand main ideas, but sometimes guess the meanings of words if necessary.”

[Motivation]
“l do not give up reading a passage until l gain a general understanding.”
“l have understood that reading English is one of the goals in studying English.”
“l want to be able to read English more proficiently.”
“l am sure I can read English almost successfully if I find key words, guess meanings, and gain main ideas.”

In summary, the relationships between motivation and strategy use changed qualitatively after the intervention, although any quantitative increase of motivation and strategy use was unfound. That is, in the process of the participants’ learning to read, motivation affected
strategy use more significantly, and strategies were used in a more coordinated manner.

Similarly, relationships between motivation, strategy use, and reading comprehension were compared using other CSA models with observed variables (i.e., the scores on RCTs and the averages of each subscale in RSs). Figure 7 shows the results before the intervention, in which making inferences significantly affected reading comprehension (.42, p < .01). In a confirmatory multiple regression analysis, it predicted reading comprehension (t = 2.113, p = .043).

NFI = 0.053 CFI = 0.000 RMSEA = 0.29;** p < .01

Figure 7. CSA Summary in RS 1-2

Figure 8 shows the results after the intervention, in which identifying main ideas and intrinsic motivation significantly affected reading comprehension (.44 and .43 respectively, p < .01). In a confirmatory multiple regression analysis, identifying main ideas predicted reading comprehension (t = 2.778, p = .009), but intrinsic motivation did not (t = 1.506, p = .144).
In short, **making inferences** affected reading comprehension most strongly before the intervention; on the other hand, **identifying main ideas** affected reading comprehension most strongly after the intervention, although both models are insufficient in the goodness-of-fit indices. This suggests that the participants’ strategy use that can explain reading comprehension mostly shifted from **making inferences** to **identifying main ideas** in the process of learning to read. That is, **identifying main ideas** became the main focus of their strategy use.

6. Conclusion

The intervention did not have any positive effects on the quantitative development of L2 reading performance (i.e., reading comprehension, strategy use, and motivation) among the participants. The effects expected among the low strategy use and motivation students were not found to arise, either. However, it was found that, in the process of the participants’ learning to read, motivation affected strategy use more significantly, **identifying main ideas** affected reading comprehension most strongly, and that each strategy was used in a more coordinated manner. To paraphrase, some qualitative change continued to happen in the minds of the participants. Motivational aspects in relation to reading strategy use must be studied more elaborately in various situations because both motivation and strategy use abide by individual differences, although motivation is regarded as a powerful factor that affects strategy use (Guthrie, 2008; Oxford & Nyikos, 1989).

Appendices

Reading Scales for Strategies and Motivation * reverse items

(1) Identifying Main Ideas

3. I pay attention to the connections of key words for main ideas. (S01)

4. I pay attention to the connections between sentences or paragraphs for main ideas. (S02)

19. I search for a topic sentence representing a main idea in each paragraph. (S03)

20. I read for the purpose of understanding main ideas. (S04)

21. I differentiate main ideas from supporting details. (S05)

12. I always understand the exact meaning of each word in a sentence. * (S06)

(2) Summarizing

6. I check my overall understanding of a text. (S07)

7. I check my understanding when I come across new information. (S08)

22. I organize the whole picture from a series of text information. (S09)

8. I check to see if my understanding of a text is correct after reading. (S10)

13. I deal with a series of text information in a separate way. * (S11)

(3) Making Inferences

23. I relate text information to what I already know. (S12)

15. I predict what is going on in a text. (S13)

9. I check to see if my guesses are right or wrong. (S14)

17. I infer the meaning of preceding parts while I continue reading. (S15)

18. I guess the meaning of unfamiliar words. (S16)

16. I interpret what is not clearly written in a text. (S17)

14. I depend on only text information for my understanding. * (S18)

(4) Utilizing Organization

5. I pay attention to text types, organization, and linking words. (S19)

24. I make use of what I know about text type and organization. (S20)

1. I take an overall view of the text content to see what it is all about. (S21)

2. I take an overall view of the text type and organization. (S22)

(5) Adjusting

25. I translate difficult parts into Japanese. (S23)
11. I read important or difficult parts carefully again. (S24)
26. I go back and forth in a text for necessary information. (S25)
27. I change the speed of reading according to the text type and difficulty level. (S26)
10. I read slowly and carefully when a text is difficult. (S27)

(a) Self-efficacy
28. I can read English proficiently with effort. (M01)
29. I will be able to read English in the future because I can read Japanese now. (M02)
30. Special talent is unnecessary for English reading comprehension. (M03)
31. I will not be able to read English well because I do not like English. * (M04)

(b) Intrinsic Motivation
32. One of my goals in learning English is to become able to read English well. (M05)
33. I would like to learn a lot through reading English. (M06)
34. To read English is enjoyable. (M07)
35. I like challenging books written in English. (M08)

(c) Extrinsic Motivation
36. I would like to be recognized as a proficient reader of English. (M09)
37. I would like to gain more scores than my classmates on reading tests. (M10)
38. I would like to gain good scores in the reading sections on the TOEIC or STEP tests. (M11)
39. It is worthless to be able to read English well. * (M12)

(d) Orientation to Learning to Read
40. I would like to read a lot of English fast and extensively. (M13)
41. I would like to read English carefully with the focus on grammatical structures. (M14)
42. To read a variety of texts is important. (M15)

Reading Comprehension Test A

Educational systems and environments across the world are different from country to country, and appear to reflect on what the society expects. Many educational rankings find that Finland has the most educated population in the world. Sixty percent of Finns enter university, so Finland is possibly the most literate society on earth. Singapore also ranks very high for its educational system, but the methods and atmosphere are completely different.

Finnish students are allowed to relax and find a setting that is most comfortable for study. When you visit a Finnish high school, you will notice that students take off their shoes at the entrance, just as they do in their homes. The intention is that students feel they are at home while in school. In such a setting, a culture of literacy and learning is encouraged. Finland has long been a nation of readers. Even when they read in English, they might attempt a 600-page book just three years after they
start learning the language! No one in Finland ever thinks a lengthy book is something that only the best scholars should attempt. Also, students study a great amount on their own and write lengthy essays. The basic concept accepted in society is that students find their own favorite topics, study them extensively, and then write about them. In sum, Finnish students are expected to read and write a lot, and to study in a relaxing atmosphere.

The methods in Singapore are almost exactly the opposite of those in Finland. Society, parents, and schools push students very hard to succeed. Students must accept strict rules, tight schedules, and detailed procedures, so school is not informal at all. Everything is strictly controlled, so students never have the freedom to study. They do not choose what and how they want to study, and must take many standardized examinations. That is, the pace of instruction is decided by the school and the nation. However, large numbers of students follow the demanding schedule without complaint because in the future they are expected to work hard in a hectic society.

How can two completely opposite environments both produce well-educated students? In both Finnish and Singaporean cases, much thought is given to what the society expects, and students must reach those expectations constantly. In other words, students need to understand and adjust to the social system so that they can work and succeed in the society.

1. What is the BEST title for this passage? [Identifying Main Ideas]
   A. Educational rankings in the world
   B. Finland and Singapore: Educational giants all over the world
   C. Educational systems that reflect on social expectations
   D. Different educational methods and schooling systems

2. What is the MAIN idea of the passage? [Identifying Main Ideas]
   A. Finland has the most educated population in the world because of its system.
   B. The educational methods in Singapore are different from the ones in other countries.
   C. One educational system is more effective than the other one.
   D. An educational system that matches social needs works best.

3. Choose the BEST summary for the second paragraph? [Summarizing]
   A. Finnish students are expected to relax by taking off their shoes at school and to enjoy studying there.
   B. Finnish students are expected to study their favorite topics by reading and writing a lot in a comfortable setting.
   C. Finnish students are expected to read 600-page English books three years after they start learning the language.
   D. Finnish students are expected to make presentations about their own favorite topics and to discuss them with other students.

4. Choose the BEST summary for the third paragraph? [Summarizing]
   A. Singaporean students are expected to follow what is determined by the school in order to work hard in their society.
   B. Singaporean students are expected to accept strict rules, tight schedules, and detailed procedures that they have decided upon with their schools and parents.
   C. Singaporean students are expected to take many standardized tests, but not to compete against each other at school.
   D. Singaporean students are expected to feel free to study at school and to decide what they want to learn.

5. Why do Finnish students take off their shoes at school? [General Understanding]
A. To keep the school clean  B. To reduce stress
C. To read a 600-page book  D. To write a long passage.

6. What is traditional in the Finnish educational setting?  [General Understanding]
   A. To be high in educational rankings  B. To study in a relaxing way
   C. To be taught by scholars  D. To read a lot

7. What is the MAIN reason why Singaporean students study hard at school?  [General Understanding]
   A. Their futures may also be difficult.  B. They must take exams.
   C. They must follow the pace of instruction.  D. The expectations of the nation are high.

8. Which of the following is NOT expected of Singaporean students?  [Making Inferences]
   A. To obey the school rules  B. To follow the tight schedules
   C. To study very hard  D. To find interesting topics

9. What opinion does the author have of the two educational systems?  [Making Inferences]
   A. The author supports one system, and rejects the other system.  B. The author supports both systems.
   C. The author rejects both systems.  D. The author does not have clear notions about both systems.

10. What is the meaning of demanding in the third paragraph?  [Guessing Meaning]
    A. Tough  B. Clear  C. Opposite  D. Favorite

    In these early years of the 21st century, the world faces serious environmental challenges. The environmental costs of these problems are huge and require an immediate change in behavior by businesses and consumers worldwide. Our oceans are being polluted, and fish populations are being destroyed. Our forests are disappearing quickly, reducing the planet’s ability to produce oxygen. Climate change threatens human, animal, and plant life on Earth.

    The first problem that must be changed is fishing practices. Today’s fishing fleets catch too many fish. They keep certain fish that they catch, and throw away the rest. According to environmental groups and government agencies, overfishing has reduced the population of many fish families by between 75 and 90 percent. Furthermore, the huge nets used by the fleets destroy the sea bottom that other creatures depend on for life. The cost of such greedy resource management is not only to fish. The loss of fish populations often means that local communities that depend on fishing for income will become economically deprived. It also means that many countries including Japan will see their traditional food culture changed forever because tuna, halibut, cod, and others become unavailable or unaffordable.

    The second problem that needs attention is the loss of our forests and grasslands. Unfortunately, the trend is still toward cutting trees and reducing natural grass cover. Large areas in the world have become deserts due to deforestation. Re-planting trees is vital to restore a healthy ecological system. The world needs to increase forest cover in order to promote the conversion of carbon dioxide to oxygen. The disappearance of grasslands is as serious as the disappearance of forests. For example, the growing demand for meat in China has caused sheep and goats to be raised in areas that are naturally quite dry. As these animals eat more of the grass that grows there, deserts expand and dust blows to the east. Japan and Korea have the
misfortune of being in the path of the worst dust storms and air pollution. This pollution sometimes goes across the Pacific Ocean to North America.

The trend in the world that is toward more consumption and more environmental damage must be cut off with people's efforts. For one thing, people in developed countries should not waste valuable resources and damage the globe. Further, however prosperous people in developing countries become, they should not just copy the lifestyles in developed countries that consume too many resources.

11. What is the BEST title for this passage? [Identifying Main Ideas]
   A. Serious environmental challenges 
   B. Overfishing and fish populations 
   C. Deforestation and desertification 
   D. Changes that protect the environment

12. What is the MAIN idea of the passage? [Identifying Main Ideas]
   A. Immediate action should be taken to keep fish populations.
   B. Immediate action should be taken to preserve forests and grasslands
   C. Immediate action should be taken to save the Earth.
   D. Immediate action should be taken to help local communities.

13. Choose the BEST summary for the second paragraph? [Summarizing]
   A. Methods for commercial fishing should be changed for the sake of resource management and people's needs.
   B. Fishing fleets must keep all the fish they catch and must not throw away what they do not want to keep.
   C. Overfishing has reduced the population of all fish families, and fishing fleets have destroyed the sea bottom where other creatures live.
   D. Traditional seafood cultures in many countries must be protected so that their favorite sea products will not become unavailable.

14. Choose the BEST summary for the third paragraph? [Summarizing]
   A. Large areas in the world have become deserts only because a lot of forests are rapidly disappearing.
   B. Planting billions of trees is important to promote the conversion of carbon dioxide to oxygen for a healthy ecological system.
   C. Deserts spread further in China because a number of animals like sheep and goats eat too much grass.
   D. Grasslands as well as forests on earth should be preserved in order to stop desertification and air pollution.

15. According to the passage, what threatens living things? [General Understanding]
   A. Water pollution 
   B. Air pollution 
   C. Deforestation 
   D. Climate change

16. According to the passage, how do local communities suffer? [General Understanding]
   A. They become polluted 
   B. They become poor 
   C. They become unavailable 
   D. They become unaffordable

17. According to the passage, why are sheep and goats raised in China? [General Understanding]
   A. For wool 
   B. For work 
   C. For food 
   D. For milk

18. If fish populations remain unreduced, what can we expect? [Making Inferences]
Reading Comprehension Test B

Helping people is important not only for those who get help but also for those who give help. The book by Catherine Ryan Hyde, *Pay It Forward*, tells us about this lesson. The book was then made into a movie. In the movie, a young boy announced that he would be helpful to others. He asked people not to return the favor to him, but instead to help others in need. Instead of paying a kindness back, he told them to *pay it forward*. Throughout the story, people received kindness and then gave kindness. Happiness spread around them. The movie had such a strong impact that an organization was created to get people to follow his example. In real life, the organization hopes that children will volunteer to help others.

If you want to do a volunteer activity to help others, first of all, it is very important to choose what you are actually interested in. A good question to ask yourself for confirmation is: what are you willing to do for a long time? No volunteer activity is very useful if you stop doing it. Therefore, you need to find an activity that you can enjoy. Because organizations or citizen groups all around you are always asking for volunteers, you should check them in detail and try different activities. For example, if you like working with animals and elderly people, then you could take pets to visit the elderly. If children’s education is important to you, you could take part in activities at a local school. If you care about environmental problems, you could plant trees or pick up trash. The most important point is that the volunteer work you do should not feel like a burden.

Once you find a volunteer activity you like, continue doing it on a regular basis to find some meaning in it. Over time, you will discover new aspects of the activity that you did not first notice. You will also develop expertise in the activity and be able to help people and society. When you reach this stage, the activity that you keep on doing will make your own life satisfactory and meaningful. Surely, it will become a precious part of your life. If you continue with it long enough, it may even become something to live for.

As our society has economically grown, people are likely to forget kindness to others. In order to change this tendency, you should do what benefits others and gives you satisfaction. Then the kindness goes on to other people and makes everybody happy. If everybody across the world *pays it forward*, the world will be a better and more comfortable place.

1. What is the BEST title for this passage? [Identifying Main Ideas]
   
   A. Volunteer work for people in need     B. Various types of volunteer work
   C. Volunteer work for others and yourself  D. Continuation of volunteer work
2. What is the MAIN idea of the passage? [Identifying Main Ideas]
   A. Volunteer activities are always necessary for our society.  
   B. We must choose volunteer activities that help poor people. 
   C. We must continue doing volunteer activities for years.  
   D. Volunteer activities help other people and satisfy our lives.

3. Choose the BEST summary for the second paragraph? [Summarizing]
   A. Choosing a volunteer activity is important because an uninteresting activity cannot last for a long time. 
   B. Researching organizations or citizen groups in detail and trying different types of volunteer work are necessary. 
   C. Taking animals to elderly people is a kind of volunteer work if someone likes both animals and elderly people. 
   D. Planting a lot of trees and picking up trash are recommended if someone is interested in environmental problems.

4. Choose the BEST summary for the third paragraph? [Summarizing]
   A. Continuing a volunteer activity on a regular basis is important because it is useless to stop working on it. 
   B. Continuing a volunteer activity on a regular basis is important because different aspects must be found. 
   C. Continuing a volunteer activity on a regular basis is important because expertise must be developed. 
   D. Continuing a volunteer activity on a regular basis is important because satisfaction or a life goal may be found.

5. What actually happened after Catherine Ryan Hyde wrote the book? [General Understanding]
   A. A young boy said that he would help others.  
   B. A young boy asked people to help others. 
   C. Happiness spread around the world.  
   D. An organization was established.

6. According to the passage, what is the point of volunteer work? [General Understanding]
   A. To help others  
   B. Not to be burdened  
   C. To try many activities  
   D. Not to quit for a long time

7. According to the passage, where are people unkind to other people? [General Understanding]
   A. In a comfortable community  
   B. In a rich community  
   C. In a poor community  
   D. In an old community

8. What do you think will happen if someone has chosen the wrong volunteer activity? [Making Inferences]
   A. The person will worry or quit.  
   B. The person will ask for help. 
   C. The person will get desperate.  
   D. The person will see a doctor.

9. What can you guess logically from the whole passage? [Making Inferences]
   A. If people are rich, they feel happy.  
   B. If people work hard, they feel happy. 
   C. If people have life goals, they feel happy.  
   D. If people have hobbies, they feel happy.

10. What is the meaning of expertise in the third paragraph? [Guessing Meaning]
    A. Long experience  
    B. Talent  
    C. Understanding  
    D. Special skills and knowledge

As globalization continues to influence countries, economies, and cultures, it is important for people everywhere to recognize that members of other societies might not think in the same way. For example, Japanese living in America have been surprised by receiving chrysanthemums. They commonly represent death in Japan, but have no such meaning in America. This is an example of people's first experience of culture shock, when they first realize that their own cultural standards are not universal. After they meet such situations, they may notice that not everyone shares their way of thinking.
In cases of cultural mix-up, people may feel someone is offensive. An example is seen in the distance that people keep between each other while talking. When two people of different cultural backgrounds are speaking, one person may step forward and another person may step back because they try to establish a comfortable distance. Neither person is doing anything wrong, but the person who steps back may feel the other person is being offensive. Another example is seen with eye contact. In some societies, eye contact is regarded as a positive thing; however, in other societies, too much eye contact is seen as an offensive attitude.

If people continue to stay in different societies, they are likely to learn how to behave properly there and no longer suffer from culture shock. However, this adjustment may cause a different type of culture shock. In some cases, people feel it when they return to their home countries and have to go back to their old behaviors. This is known as reverse culture shock. Many people say that they are surprised by reverse culture shock because they do not expect any difficulties in getting back into their own society. They do not realize how much they have actually changed while adjusting to the culture of the other country. They become foreigners to a certain extent.

In sum, various types of culture shock may worry people not only in other cultures but also in their own cultures. It is one solution for them to learn how those with different backgrounds are likely to think and behave. It is also important for them to have their own standards of thought and behavior regardless of cultural differences. In other words, in order not to worry about culture shock, knowing different cultures is one thing, and establishing a person's identity is another.

11. What is the BEST title for this passage? [Identifying Main Ideas]
   A. Different ways of thinking  B. Personal space and eye contact  C. Reverse culture shock  D. Taking care of culture shock

12. What is the MAIN idea of the passage? [Identifying Main Ideas]
   A. Not everyone shares the same way of thinking.  B. Various types of culture shock worry people.  C. Problems caused by culture shock can be solved.  D. It is important to behave regardless of cultural differences.

13. Choose the BEST summary for the second paragraph? [Summarizing]
   A. The distance between people while talking is different from culture to culture, so people always feel uncomfortable
   B. Only eye contact causes different reactions from culture to culture, so sometimes people may feel offended.
   C. The degree of personal space and eye contact is different from culture to culture, so sometimes people may feel worried.
   D. The degree of personal space and eye contact is different from culture to culture, but usually people are not surprised.

14. Choose the BEST summary for the third paragraph? [Summarizing]
   A. People who continue to stay in different cultures tend to know what behaviors they should take there and no longer suffer from culture shock.
   B. People who continue to stay in different cultures tend to adjust to the cultures properly and feel comfortable there.
   C. People who return to their home countries may feel confused because of their adjustment to the other country's culture.
   D. People who return to their home countries are regarded as foreigners by citizens because of their adjustment to the other country's culture.

21
15. Why have Japanese living in America been surprised by receiving chrysanthemums?  [General Understanding]
   A. They mean people's death.  B. They mean cultural differences.
   C. They mean different societies.  D. They mean culture shock.

16. According to the passage, how is eye contact regarded in different cultures?  [General Understanding]
   A. Positive  B. Negative  C. Both positive and negative  D. Neither positive nor negative

17. According to the passage, what is the main reason for a different type of culture shock?  [General Understanding]
   A. Reverse culture shock  B. Adjustment to a different culture  C. Old behaviors  D. People's identities

18. What can you guess logically about distance while people in the same society are talking?  [Making Inferences]
   A. They keep the distance that they feel comfortable.  B. They do not keep the distance they feel comfortable.
   C. They do not care about the distance.  D. The distance depends on individuals.

19. What can you guess logically from the whole passage?  [Making Inferences]
   A. Humans are different.  B. Humans are positive  C. Humans are changeable  D. Humans are social.

20. What is the meaning of *chrysanthemums* in the first paragraph?  [Guessing Meaning]
   A. Flowers  B. Toys  C. Clothes  D. Books
Abstract:

Student loss in nursing educational programs may exceed 35%, especially with minority populations. Retaining students in a nursing educational program is critical and requires a unique approach to student instruction and support. A “Prescription for Academic Success” program was instituted at a 4 year baccalaureate nursing program in southern United States following a population and cohort analyses of student failures and successes. As the United States struggles to identify solutions to the mounting nursing shortage, one strategy recommended to address this crisis is to attract more men and minority students. Today’s nursing students in baccalaureate programs are 90% Caucasian and female. Nursing students today do not mirror the nation’s population. Studies have demonstrated that members of minorities are more likely to seek services from and follow the health care advice of minority providers. A culturally diverse nursing workforce is essential to meeting the health care needs of the nation’s population. This presentation will reveal the findings of the analyses conducted as well as the progress made to date regarding the second year implementation of a dynamic program aimed at retaining students and tailoring support to the needs of the students (n = 61). Retention data reflect positive outcomes and trends. Ideas for implementation at other institutions will be shared.
Teaching methods and student learning are two separate issues. The emerging educational genre refers to teaching “methods” as traditional, blended, or on-line. Student “learning” has been identified by styles such as auditory, visual and kinesthetic. The Dunn and Dunn Learning Styles Inventory and others have been used by Colleges of Education in an attempt to better prepare their teacher candidates who, in turn, will be better prepared to enhance student learning.

In determining which delivery “method” to employ, teaching faculty must deal with several considerations such as....am I prepared to use this delivery method? Do we have the technological resources to allow for student success, and does the students’ learning style complement this method?

It was the purpose of this project to answer the following questions:

(1) Will students enrolled in a university Anatomy and Physiology class see similar learning gains under a traditional versus a Blended/Hybrid method of delivery?
(2) Will the students in either of the two classes be equally satisfied with the course?
(3) Are the learning styles different between the traditional and Blended/Hybrid delivery methods and a control group of education majors?

The Department of Health and Kinesiology at NSU has two sections of Anatomy and Physiology taught by the same faculty member. During fall 2009, the instructor taught one class with the traditional method and the second class under a Blended/Hybrid model. The students were not aware of any difference until the first day of class and there were no students who switched classes. The traditional class met two days per week and met face to face with the instructor for 3,400 minutes, the equivalent of a four hour semester course. After several initial class meetings two days per week, the Blended/ Hybrid class met one day per week and the additional minutes were not face to face. Both classes had the equivalent of 3,400 minutes of instruction.
In answering question one, a two-way ANOVA determined that there was a significant difference between a pre and post assessment using the identical instrument (F=205.1, p < .001). This was a knowledge test that was directly related to the student learning objectives. When determining if a difference existed between the Blended/Hybrid versus the traditional method, no significant difference was found (F=.87, p=.35). This means that both methods of delivery produced student learning gains where one met once per week (Blended/Hybrid) compared to a similar class that met twice per week.

In answering question two, there was no significant difference between the Blended/Hybrid and the traditional delivery on any of the 14 satisfaction questions.

In answering question three, there was no significant difference between either the Blended/Hybrid, traditional delivery, of a control group of education students on any of the 20 question in the Dunn and Dunn Learning Styles Inventory.

The results of this study indicate that teaching Anatomy and Physiology under a Blended/Hybrid versus traditional delivery method produced significant learning gains in both methods, students in either type of delivery were equally satisfied and there was no one learning style that dominates this subject.

DOCTOR OF PHILOSOPHY in

Education Curriculum and Instruction

UTAH STATE UNIVERSITY
Logan, Utah
2010
Introduction

There has been much effort in the last few years to address the needs of minority students in schools in the United States, especially those who are English Learners (ELs). The No Child Left Behind (NCLB) legislation of 2001 has added emphasis to this effort (Nesselrodt, 2007). Schools are now accountable for all students achieving at grade level, including subgroups of ELs (No Child Left Behind Act, 2001). This has been a struggle in the state of Utah. According to information from the Utah State Office of Education (USOE) website (http://schools.utah.gov), scores from the 2005 (according to the latest available records of scores on the state website) National Assessment of Educational Progress (NAEP) for grade 4 students show that only 33% of ELs scored at the basic level or above on the reading portion of the NAEP test. This means that 35% of ELs scored below the state average of 68% for all students. On Utah’s Language Arts Core Criterion Referenced Test (CRT) for 5th grade in 2008, there has been a steady decline in EL scores since 2006, dropping from 53% proficient to 40% in 2008. This is in comparison to a 76% proficiency rate for all students in 2008, meaning that ELs score 36 percentile points below the state average. These tests are normed on English speaking children, and are given to all children in the state. On a 2009 state-wide report, overall scores were 79% proficient on language arts, whereas ELs scored 49.5% of students proficient on the same test. On the IOWA Test of Basic Skills, which is administered to all 3rd, 5th, and 8th grade students, grade five EL students in Utah scored at the 23rd percentile in both reading and language, compared to the whole school average of 55 and 51 percentiles, respectively.
Problem Statement

Given the academic struggles represented in the fore-mentioned data, it is apparent that current approaches to educating ELs have not proven to be effective. There are many facets in reading and language acquisition, including phonemic awareness, phonics, fluency, vocabulary, and comprehension (August & Shanahan, 2006). However, there is an apparent paucity of research that addresses these necessary reading skills for ELs. August and Shanahan (2006) report that

Despite the finding of research that reading comprehension is an area of weakness for language-minority students, minimal information is available on the nature of their comprehension difficulties and the specific skills having the greatest influence on reading comprehension (e.g., vocabulary, reading fluency). (p. 67)

Purpose

The purpose of this study is to determine if using explicit instruction in combination with peer-mediated task-based activities is an effective way to teach vocabulary to English learners.

Literature Review

Vocabulary

One factor contributing to reading and language achievement scores is vocabulary knowledge. Vocabulary plays a critical role in all of our lives. It is the hallmark of an educated person, and impacts a student’s future possibilities. Academic vocabulary knowledge is strongly related to reading proficiency and school achievement (Beck, McKeown, & Kucan, 2002; Freeman & Freeman, 2009), and is a factor indicated in the achievement gap (Barton, 2004; Diamond & Gutlohn, 2006; Marzano, 2004). In one
study examined by August and Shanahan (2006) it was found that English oral proficiency measures of vocabulary and syntactic processing correlated significantly with performance on an English word reading test, and a regression analysis showed that knowledge of English vocabulary maintained a significant relationship with reading even after other effects were taken into account. Another study indicated that after general cognitive ability had been controlled for, one of the two skills that contributed most significantly to word reading ability was English vocabulary, and another found that English vocabulary scores correlated significantly with English word reading scores (August & Shanahan, 2006).

Not only does vocabulary impact word reading skills, but it also has an effect on comprehension (Flynt & Brozo, 2008; Cummins, 2003; Blachowicz & Fisher, 2006; Beck, et al., 2002; Genesee, Lindholm-Leary, Saunders, & Christian, 2005). In a study done by Pérez, cited in August and Shanahan (2006) and Genesee, et al. (2005), it was found that systematic daily instruction in receptive and expressive vocabulary skills improved reading comprehension skills in third-grade ELs. A study done in 1984 by Saville-Troike also found that oral vocabulary knowledge is crucial for reading comprehension (August & Shanahan, 2006; Genesee, et al., 2005). In a meta-analysis conducted by Stahl and Fairbanks, researchers found that students who had placed at the 50th percentile on reading comprehension measures increased their comprehension scores by as much as 30 percentile points when they received explicit and meaningful vocabulary instruction (Flynt & Brozo, 2008).

One way to ameliorate the situation of low achievement scores could be the vocabulary instruction that takes place in schools. However, there is little emphasis on
the acquisition of academic vocabulary in school curricula (Beck, et al., 2002). Teachers often state that they are teaching vocabulary, but in observations done on 23 ethnically diverse classrooms, it was found that only 6% of school time was devoted to vocabulary development, and that amount dropped to 1.4% in the core academic subjects. The instruction that was observed consisted mainly of mentioning and assigning rather than teaching the vocabulary. In examining the most popular basal programs, none of them did a sufficient job of teaching academic vocabulary enough to increase comprehension (Flynt & Brozo, 2008).

This becomes an even bigger issue for ELs who are trying to not only acquire basic language, but also the vocabulary of academic content. A study by Becker (1977) linked vocabulary size to the academic achievement of disadvantaged students. He posited that with good instruction all students can master basic reading skills, but the main difficulty in sustaining those early foundations is the lack of adequate vocabulary to meet the academic demands that begin in the upper-elementary grades. It is essential that academic vocabulary become an integral component of every day instruction in all content areas, especially for ELs. For English language learners, it is important to make meanings explicit and comprehensible through explicit instruction, teacher modeling, guided practice, and usage. Comprehensible input is a central component to language acquisition for ELs. The basic information ELs have for building some kind of mental representation of language is the input they are exposed to (VanPatten, 2000). Explicit and systematic instruction is one of the keys to successful academic vocabulary acquisition (Beck, et al., 2002; Marzano, 2004; Diamond & Gutlohn, 2006; Marzano & Pickering, 2005; Flynt & Brozo, 2008; Freeman & Freeman, 2009).
What exactly is meant by academic vocabulary? Marzano (2004) defines academic vocabulary as terms that relate to specific academic subjects. General academic vocabulary terms are words that are used across content areas, have abstract definition and are difficult to master (Townsend, 2009). Beck, McKeown, and Kucan (2002) describe three levels, or tiers, of vocabulary words. The first tier includes the most basic words; tier two words are high frequency words that are usually utilized by mature language users and cover a variety of domains. Tier three words are words that are specific to content, are not used very often, and should be taught only when the need arises, such as in a subject area. This is what would be termed academic vocabulary, or words that are used in subject matter lessons (Manyak & Bauer, 2009).

Another definition from Flynt and Brozo (2008) is that academic vocabulary refers to word knowledge that makes it possible for students to engage with, produce, and talk about texts that are important in school. Townsend (2009) supplies a definition of academic English that describes it as a variety of English used in professional books and characterized by specific linguistic features associated with academic disciplines. It is primarily accessed through texts rather than conversation. Coxhead, as cited by Townsend (2009), has developed an Academic Word List that contains 60 general academic words; these are not discipline-specific words, as they may cross contexts. An example from the list would be the word *structure*, which has different connotations in science and the study of the *structure* of cells, in contrast to the word used in relation to literature, or the *structure* of a poem (Townsend, 2009).

Cummins, as cited in Williams (2001), describes language proficiency as falling on a continuum, with cognitive academic language proficiency as the desired goal.
Academic language, in contrast to interpersonal communication skills, is context reduced and cognitively demanding (Williams, 2001; Goldenberg, 2008). Academic language is used to describe vocabulary and language used in U.S. classrooms (Echevarria, Vogt, & Short, 2008). Success in school depends on proficiency in academic language, and academic language occurs in content lessons (Williams, 2001; Swanson & Howerton, 2007; Goldenberg, 2008). Echevarria, Vogt, and Short (2008) define academic English as semantic and syntactic knowledge along with functional language use. They list three key elements of academic language: content words, process/function words, and words and word parts that teach English structure, based on English morphology. Freeman and Freeman ((2009) also break academic words into two categories, content-specific and general academic words. Content-specific words are related to a specific academic domain, while general academic words cut across disciplines, such as the terms hypothesis, therefore, and analyze.

In summary, it seems reasonable to conclude that academic vocabulary refers to words that are used in content areas and that are more abstract and thus more difficult to learn than basic vocabulary terms. One area that is not specifically focused on in these descriptions of academic vocabulary is vocabulary that is found in reading basals. When the stories in a reading basal are expository, then the academic vocabulary descriptions apply. But in narratives, the words are not so content specific, but are still important vocabulary for students to learn to be able to comprehend the story they are reading. Some may not describe those words as academic vocabulary, but they are content words in texts that students read almost on a daily basis. Many of those words may be classified by Beck, et al., (2002) as tier two words, which are words used by more mature language
speakers. As they explain, these are words for which students generally have a basic conceptual knowledge. These would be important to teach in narrative reading to enhance comprehension for ELs.

**Social Learning**

As we look at teaching the English language, it is important to think about the context of the instruction. According to Vygotsky (1978), instruction should take place in a socially relevant context. Vygotsky focused on how people learn socially, and how learning can be related to language. Learning is a social process, where students learn through communicating and interacting with adults or peers (Vygotsky, 1978; Nilsen & Nilsen, 2004; Moll, et al., 2001; Trueba, 1989). Cognitive development is rooted in social interaction, and is inseparable from social development. This development is possible only if children participate in culturally meaningful activities. Children learn their first language by communicating with real people in real situations (Andrews, 2006). This is the same for second language learners (Bauer & Manyak, 2008). Educational theories based on Vygotsky’s ideas tend to accentuate project-oriented and group-based classroom procedures (Cummins, 2003), including the Communicative Approach to language learning (Ballman, Liskin-Gasparro, & Mandell, 2001).

Vygotsky’s ideas can be used to inform us about how we can help ELs be successful in school. It is imperative that teachers assist students in mastering the semiotic devices, or tools of communication, used in the country or culture the students live in. When children are unsuccessful in the oral language, text, or other symbolic systems, it is because of failure to provide opportunities for them to engage in social and cognitive activities for learning (Trueba, 1996). It is important that there be emphasis on
functional communication between teachers and students, and between classmates (Abadiano & Turner, 2002; Genesee, et al., 2005). Activities need to involve the students in meaningful communication with each other (Ballman, et al., 2001; Echeverria, et al., 2008; Goldenberg, 2008). In the Communicative Approach to language instruction, the goal is communicative competence and the development of linguistic skills, which are achieved through student interactions within the four modalities of communication, listening, speaking, reading, and writing. These play an important role in learning language, and frequent student interaction within these four modalities is crucial to language acquisition (Abadiano & Turner, 2002). An additional aspect in the Communicative Approach involves using authentic tasks and materials (Larsen-Freeman, 2000, Ballman, et al., 2001). It is only through producing language and using it in new and authentic ways that students acquire proficiency in a language. Students must be given many opportunities to make meaning of the content and academic language they are trying to learn (Flynt & Brozo, 2008; Diamond & Gutlohn, 2006; Peregoy & Boyle, 2008). The input they receive should be explicit, should be comprehensible, and should contain a message that is intended for the learner to capture (VanPatten, 2000). Providing authentic tasks where students know they are to use the language in order to learn is an excellent way for a new language to be internalized (Lewis-Moreno, 2007).

Language learners can only assimilate so much before their attentional resources are depleted and their working memories have to dump information to accommodate more input (VanPatten, 2000). ELs may struggle to identify important terms, especially academic vocabulary, when they appear amid large amounts of language, whether oral or written (Lewis-Moreno, 2007). Theorists believe that learning takes place when
collaborative conversations happen in the classroom, and children who participate in group-learning experiences internalize knowledge (Anthony, 2008); socially authentic activities facilitate learning. Unfamiliar content words, or academic vocabulary, may be better understood when students manipulate words through group activities requiring word association, categorization, or semantic analysis (Flynt & Brozo, 2008; Marzano, 2004; Marzano & Pickering, 2005).

There are a number of teaching and learning strategies that involve social interaction, including cooperative learning. These strategies often share components with and encourage the use of explicit teaching. There is a growing research base on the benefits of peer-mediated instruction, which include improvement of student engagement, modeling correct answers, providing on-going feedback, monitoring progress, and increasing student verbal interaction as well as the quality of that interaction (Vaughn, et al., 2001). Partner Reading (PR) (Vaughn, et. al., 2000) involves the students working in partners to read stories. Collaborative Strategic Reading (CSR) (Klingner & Vaughn, 1999) entails students working in small groups to read informational text. Each student has a role in the group, and students help each other read through and analyze their comprehension of a reading passage, using four specific comprehension strategies. In Kindergarten Peer-Assisted Learning Strategies (K-PALS) approach, lower-performing students are paired with higher performing students to practice reading skills. There is a component of teacher- explicit instruction of the skill being taught, which is important for ELs. The partnering of students incorporates interactive teaching and student engagement, as well as frequent opportunities for
accurate responses and peer-mediated learning, which are all a benefit to ELs (McMaster, Kung, Han, & Cao, 2008).

**Methodology**

**Purpose and Objectives**

The purpose of this study is to determine if using explicit instruction to teach specific academic vocabulary from reading basals in the context of socially meaningful and authentic activities, using a task-based activity (Ballman, et al., 2001) will improve knowledge and retention of academic vocabulary. This study will benefit teachers of ELs who are in mainstream classes and find themselves struggling to find effective ways to teach English learners. It will also benefit ELs themselves who are in the transition period of learning to read to reading to learn (Cummins, 2003), and need support in vocabulary as well as language acquisition.

The study may have an impact on instruction of English language learners throughout this district. This district is involved in program improvement through NCLB because they have not made adequate yearly progress with a number of subgroups, including Limited English Proficient students. It is important that instruction for ELs be as effective as possible. If it is found that a more explicit and direct approach to vocabulary instruction using peer-mediated and socially authentic activities, such as a task-based activity, increases vocabulary knowledge, that will be of great benefit to the high number of ELs who struggle with second language vocabulary acquisition, and will be a way to strengthen ELs as they progress to a higher language proficiency level as well as to more difficult linguistic demands in content instruction. In contrast, if the study shows that there is no effect on student achievement of acquisition of academic
vocabulary, that information will benefit district administrators as they frame district goals and give direction to teachers.

**Rationale for intervention.**

It is imperative that vocabulary instruction be explicit (Marzano 2004; Tran, 2006; Goldenberg, 2008; Flynt & Brozo, 2008; Collins, 2010). Explicit instruction is the idea that teachers are very deliberate in explaining what is going to be taught (Cambourne, 2002). Teachers first describe what the students are going to learn, using clear objectives. They model how it is to be done, and then guide students through practice before students ever practice the concept independently.

It is thought that instruction for ELs is just good instruction; however, that is not the case. English learners require explicit instruction plus instruction that addresses their linguistic and cultural needs (Harper & de Jong, 2004). ELs are processing information differently than native English speakers, and instruction needs to include input that is presented in a comprehensible way for them (VanPatten, 2000). Clear explanations and examples of the new vocabulary are crucial for all students (National Reading Panel, 2000), but especially for English learners (Goldenberg, 2008). Many times content words are the main source of meaning for ELs, before grammar starts to help inform comprehension. Therefore it is important that the words are presented in an explicit and comprehensible manner (VanPatten, 2000). When introducing new vocabulary, a nonlinguistic representation must be present to provide a way to understand the new term without having to rely on English language proficiency (Marzano & Pickering, 2005; Goldenberg, 2008). Even abstract concepts can be represented through a picture or diagram that students can use to make connections. A visual representation gives the
students something nonverbal to connect the new term to, and provides good comprehensible input (Ballman, Liskin-Gasparro, & Mandell, 2001; Townsend, 2009). Having students construct their own picture or symbol for the word helps them express the meaning without being constrained by limited linguistic skills (Marzano & Pickering, 2005).

Recommendations for strong vocabulary development include the ideas of giving students opportunities to use the word in different contexts, providing opportunities for deeper processing of word meaning, and engaging students in using the newly learned words (Peregoy & Boyle, 2008; Flynt & Brozo, 2008; Marzano & Pickering, 2005; Diamond & Gutlohn, 2006; Echevarria, Vogt, & Short, 2008). Multiple opportunities to use the word encourage additional vocabulary acquisition (Marzano, 2004; Goldenberg, 2008; Flynt & Brozo, 2008; Beck, et al., 2002).

Students benefit from developing word relationships rather than just learning the meaning of the word. Word association is one means of promoting in-depth word knowledge (Beck, et al., 2002). It helps students make a connection between the new word and words they are already familiar with, which is important in vocabulary development (Peregoy & Boyle, 2008; Collins, 2010). Using word association also helps students review the words that were introduced and prepares them to construct their own nonlinguistic representations.

It is generally accepted that the focus of learning a new language is the ability to communicate in that language (Andrews, 2006; Moll, Saez, & Dworin, 2001; Ballman, et al., 2001), which is even more vital for ELs whose academic success hinges on language skills. However, as is often the case in foreign language instruction, students are not able
to communicate effectively outside of the classroom with traditional language instruction (Reagan & Osborn, 2002; Larsen-Freeman, 2000). Being able to communicate requires more than linguistic competence, it requires communicative competence (Larsen-Freeman, 2000; Ballman, et al., 2001), or the capability of using the language in social situations (Moll, et al. 2010). Language should be looked at as “…a real activity used in real society by real people for authentic and real purposes…” (Andrews, 2006, p. 59).

It is important that there be emphasis on functional communication between teachers and students, and between classmates (Abadiano & Turner, 2002; Genesee, Lindholm-Leary, Saunders, & Christian, 2005). In the Communicative Approach to language instruction, the goal is communicative competence, which is achieved through student interactions using authentic tasks and materials (Larsen-Freeman, 2000, Ballman, et al., 2001); the activities should involve students in meaningful communication with each other (Ballman, et al., 2001; Echeverria, et al., 2008; Goldenberg, 2008). Two types of activities that are used in the Communicative Approach are information gap and task-based activities. There are three main aspects of task-based activities: the activity is student centered, there is an exchange of information between the students, and there is a goal the students are working together to achieve (Ballman, et al., 2001). The task is the path to a deeper understanding of the concept being taught.

**Explanation of intervention.**

This intervention will be based on a weekly schedule that will emphasize explicit instruction and social interactions. The classes will contain a mix of native English speakers as well as ELs, providing interaction between students with varied language proficiency, as well as peer-mediated learning during the task-based activity. The
experimental group will be given a weekly schedule with prescribed activities that are directly linked to teaching tested vocabulary from the basal being used. The first day the teacher will administer a pretest of the vocabulary from the story, and then will explicitly teach the new vocabulary using descriptions, explanations, or examples of the words along with non-linguistic representations. Students will restate the description in their own words, and then write that restatement in a vocabulary notebook.

The second day will involve a word association activity, where students will relate the word to a word or phrase they are already familiar with. For example, if one of the new words in a given list was *virtuoso*, the association would be created by the teacher asking the question, “Which word goes with piano? (*virtuoso*). Explain why”. Word analysis will also take place on day two, where it will be determined if the words contain prefixes or suffixes that will aid in the knowledge of the word. Students will then create a picture, symbol, or graphic to illustrate the vocabulary word in the vocabulary notebook.

On days three and four, students will complete an interactive task-based activity. This will be the task of partners working together to complete a graphic organizer for each of the vocabulary words. The activities included in the completion of this organizer will add to the students' knowledge of the words, as well as provide time for students to interact and discuss the words with each other. One partner will be the reporter, the other the recorder. These roles will alternate between the partners.

The last day of the week will consist of a review game, and then a posttest. Review games will be one of two powerpoint template games, Jeopardy or Pyramid. Students will work with partners or teams to participate in these games.
In the intervention, the words are explicitly taught by the teacher, providing explanations of the words and using nonlinguistic representations in the form of pictures, diagrams, or symbols. The students also write their own description of the word in their vocabulary notebooks after the teacher has shown them the words and modeled creating descriptions of the terms.

The intervention implements both concepts of information gaps and task-based activities, the task being the completion of a graphic organizer (see figure 1) for each new vocabulary word. The aim of using the graphic organizer is not only communicating with each other, but also helping students to increase their lexical knowledge of the vocabulary words they are studying. Using the graphic organizer, students will complete five tasks as partners. One partner will be the reporter, and the second partner will be the recorder. The reporter will tell the recorder what to write in two sections of the graphic organizer. The reporter will give the description/explanation in his/her own words, and will tell the recorder what to draw for a representation of the word. Together they will determine examples and non-examples of the word. These can be linguistic or nonlinguistic representations. They will also analyze the word to determine if the word has affixes, but the recorder continues to be the one doing the writing. Students will interchange roles with each word.

The use of graphic organizers can enhance the learning of vocabulary for ELs (Townsend, 2009; Freeman & Freeman, 2009). The graphic organizer (see Figure 1) used in this intervention provides many beneficial activities for students. These include creating a nonlinguistic representation of the vocabulary term, restating the term in their
own words, multiple opportunities to interact with the word, determining differences and similarities, and analyzing the word. One of the benefits of restating the term in their own words is that it helps with clarification and comprehension of the word (Beck, et al., 2002; Marzano & Pickering, 2005; Diamond & Gutlohn, 2006). One of the most effective methods to teach a topic in an in-depth way is to help students see differences and similarities (Marzano, 2004; Beck, et al., 2002). Providing opportunities for students to implement words that are different and similar to the vocabulary term, as may occur in completing the examples and non-examples section, is an effective way to teach vocabulary (Vaughn & Linan-Thompson, 2004; Beck, et al., 2002). Analyzing the parts of the word is an opportunity to increase knowledge about the word (Marzano & Pickering, 2006; Manyak & Bauer, 2009; Nilsen & Nilsen, 2004; Freeman & Freeman, 2009). The end goal of the specific task-based activity in this intervention is the acquisition of specific vocabulary words and a comprehensive understanding of the meaning of those words.

Not only is it important for students to interact with each other in authentic situations, it is also important that they have enjoyable activities and play with the language (Marzano & Pickering, 2006; Vaughn & Linan-Thompson, 2004; Townsend, 2009; Blachowicz & Fisher, 2006; Diamond & Gutlohn, 2006). Marzano (2004) describes seven characteristics of explicit vocabulary instruction, and giving students the opportunity to play with the words is one of those characteristics. Two games will be played interchangeably the last day of the intervention: Jeopardy and Pyramid. However, Jeopardy requires 20-25 words, and each unit only has six-seven words. So Jeopardy will not be played until the third week, and each time it is played it will use words from
previous lessons as well as the current lesson. Review of prior words helps increase retention of learned vocabulary (Goldenberg, 2008; Flanigan & Greenwood, 2007). On the alternate fifth day, the pyramid game will be played. This game involves classification of terms; the students list words that are similar, synonymous, or descriptive of the vocabulary word on the board to provide clues to their partner to guess what the vocabulary word is.

Vocabulary notebooks will be an integral part of this intervention. Students will use a notebook for the activities of the weekly schedule. The use of notebooks helps students personalize their vocabulary learning (Tran, 2006; Marzano, 2004; Echevarria, et al., 2008; Freeman & Freeman, 2009). Writing in a notebook also assists students’ memories (Peregoy & Boyle, 2008). The notebooks used in this intervention will be created by the investigator of this study. It will be divided into a section for each story. The pages will be structured to provide students with a template to write each word, as well as a frame in which to write the nonlinguistic representations. There will be a section of pages with the graphic organizer printed on each page to eliminate loose and lost pages and to facilitate ease for the teachers in implementing the vocabulary notebook.

**Research Question**

The research question to be answered is: Will implementing explicit instruction with the use of socially authentic activities in the form of a peer mediated task-based activity in teaching academic vocabulary during basal reading instruction help ELs increase their knowledge of English vocabulary as determined by growth on an experimenter-developed test measuring specific academic vocabulary?
H₁ = Fifth grade English learners who receive explicit instruction on specific academic vocabulary words in socially authentic contexts, using a peer mediated task-based activity directly related to reading content, will have a higher mean score on an experimenter-developed test measuring academic vocabulary acquisition than students who receive vocabulary instruction as framed in the district-adopted basal who do not use the prescriptive socially authentic activities.

Procedures

For this study, there will be a comparison between ESL student scores on a pre- and posttest assessing knowledge of academic vocabulary from a district-adopted reading basal for grade five, when explicit instruction and peer-mediated task-based activities are implemented. The study will be based on the use of a district-adopted basal. This basal has three categories of vocabulary. The phrase “academic vocabulary” refers to language functions, such as paraphrasing, summarizing, and determining cause and effect. There is a section of vocabulary called “amazing words”. These are words that are conceptually related to the story but are not necessarily included in the story; they are used for oral vocabulary development. The category that will be used in this study is the “tested vocabulary”, or words that are found in the stories that are explicitly taught and assessed each week. The vocabulary words used in this basal series are chosen from two main sources, Coxhead’s Academic Word List, and a data-based which is compiled of thousands of commonly used words gleaned from student essays of English language learners from different countries with differing levels of proficiency. The essays are evaluated, and words are chosen based on needs the material writers see in their evaluations. These words are used to create dictionaries produced by this company, as
well as words to target in the basal instruction. Because the vocabulary words used in the basal are in part based on observed needs of ELs from a number of different linguistic backgrounds, these words are appropriate to use in this research study.

The study will use both a control and an experimental group. Both groups will use the district-adopted basal described above. The control group will receive the tested vocabulary instruction from the basal. The treatment group will receive explicit instruction on the tested vocabulary from the basal, and will complete a task-based activity. A five-day schedule will be implemented with the treatment group (See appendix).

**Population and Sample**

Participants will be students from a culturally diverse mid-sized urban school district in northern Utah. This district has approximately 53% of the total student population who are influenced by a language other than English in the home. Just over 30% of the total population is classified as Limited English Proficient (LEP), indicating that they require language services of some kind. There is an average of 13 different languages spoken in the district, with Spanish being the primary one. The district is economically impacted with 75% of the students qualifying for free and reduced lunch. The district has a 40% mobility rate, and the highest migrant population percentage in the state.

There will be six schools from this district involved in the study; they will be selected on the basis of the enrollment of ELs in their population. There will be a total of 18 classes and approximately 180 EL students. The two study groups will include grade five EL students immersed in regular classrooms. The English learners will be included
in the analysis as determined by their proficiency levels based on their Utah Academic Language Proficiency Assessment (UALPA) or Quick Informal Assessment (QIA) scores. Students who score as non-English proficient (NEP) or (LEP) will be included in the analysis.

The classes will be chosen randomly from within the six schools, and will include approximately 18 teachers. The groups will be determined by random selection of the teachers of the 5th grade classes. The students are nested within classrooms so there is no random selection of the subjects. The random sampling of teachers is important because of the differences in teacher ability, experience, and level of education that could affect results of the study.

**Design**

This study is considered a quasi-experimental design because of the inability to do completely random selection of the subjects. The classes/teachers will be randomly chosen, but the students themselves cannot be. Another aspect of a quasi-experimental design is the use of time series analysis, or observing data over a period of time. This will be in place with the use of an overall pre- and posttest, as well as the weekly pre- and posttests. The main focus will be quantitative, analyzing the results of pre- and posttests between a control and experimental group. This test will be experimenter-developed using specific vocabulary words from district-adopted reading basals. The researcher of this study will write the procedures and intervention for use with the treatment group as they relate to the tested vocabulary from the stories used in the basals for reading instruction. This will help ensure consistency in the experiment. The design is also unbalanced, because there will not be the same number of students in each group. It is
important in this study to keep all available subjects, even though numbers may be
uneven, because dropping students to get equal group sizes will reduce the power of the
analysis.

A pre-post test design will be used. The control group teachers will teach
vocabulary with no intervention. There will be observations and teacher information logs
(see Appendix) to record the type of vocabulary instruction being utilized. This will need
to be tracked and reported in the results of the study.

**Instrumentation**

A pre-test will be administered in August, and the experiment will be carried out
from August through December. A post-test will be administered in December. The
analysis design for the study will be multilevel modeling analysis. The variables for level
1, the student level, will be the amount of growth in academic vocabulary acquisition
demonstrated on the post-test, gender, and the language proficiency of the students, as
measured by the state language proficiency test, UALPA. The teacher level variables to
be considered in the analysis are teacher experience, length of time in the teaching
profession, the attainment of an ESL endorsement, other endorsements/degrees attained
since being in the teaching profession, gender, and ethnicity. This information will be
retrieved through a self-completed teacher survey.

**Validity**

There are some issues of external and internal validity. One factor for internal
validity could be the mobility of students. Often with EL students, there is a great deal of
mobility. This is due to economic and housing concerns, as well as the migrant
population who move to find agricultural jobs. The number of students who take the
posttest may be smaller than the number who took the pre-test. Having a sample size of over 100 students should minimize the effects of mobility in the analysis. The families of ELs often travel to their home country to visit family for weeks at a time. This usually occurs around the time of the winter break. By ending the study in mid-December, this should minimize the chance of so many absences during the study time.

Another issue of internal validity is the experimenter-developed test. Two considerations that make this a difficult issue are a) there are no valid academic vocabulary measures normed on EL students to measure academic vocabulary acquisition, and b) the use of specific academic vocabulary linked to the basals being used in the classrooms precludes the use of a standardized vocabulary test for this study. However, concurrent validity can be developed by using similar measures to those used in standardized tests. The Utah state criterion-referenced test (CRT), the Stanford Achievement Test and the Stanford Reading First use multiple choice responses that include defining the word in context using synonyms and antonyms. The Peabody Picture Vocabulary Test, Expressive One-Word Picture Vocabulary Test, Gray Diagnostic Reading Test, and the Gates-MacGinitie Reading Test use pictures that match with either written or oral vocabulary words to measure word knowledge.

The experimenter-developed test will incorporate two facets of these standardized tests, the picture matching and the multiple choice sections using synonyms or antonyms of words used in context from the basal stories. The experimenter-developed test will be correlated against a standardized test, the 4th grade Utah state CRT tests. This information will be used to determine criterion validity; the students should have a similar ranking on their 4th grade CRT sections on vocabulary in comparison to the experimenter-developed
test. Although the standardized test has been normed on English-only speaking students, there may be some interesting and applicable comparisons acquired with this. With other measures from the basal weekly tests and the Dynamic Indicators of Basic Early Literacy skills (DIBELS) scores, validity will be increased.

The short time of the study could be an issue of internal validity. However, there are other studies that have been conducted in short periods of time. One of the first studies on Reciprocal Teaching was performed for just 15-20 days, and resulted in increases on comprehension assessments (Oczkus, 2003). A study done on peer pedagogy and student collaboration with 4th and 5th graders was conducted over a period of ten weeks (Ching, 2008). Another study on the effects of constructivist-oriented instruction on 11-year-olds in Taiwan was conducted for three weeks (Wu & Tsai, 2005). This study will be conducted for 16 weeks. With explicit direction in this study, focusing on a specific number of vocabulary words, validity should be increased.

Some external threats to validity involve the number of interruptions that occur that could cause teachers to not teach the prescriptive intervention each day. Some of these involve assemblies, fire drills, and other unforeseen circumstances. Having the study length of 14 weeks will help compensate for days missed.

Another threat to validity would be any teacher illness or mobility. It is unusual to have a teacher move in the middle of the year, but it is possible. Teacher illness is a likely event that could affect the validity. If a long-term sub is used, that sub would need to be trained on using the prescriptive intervention. The information of the sub would need to be included in the analysis of teacher factors. It may be possible that that group may have to be excluded from the study. Again the number of students in the study should help
offset an event such as this, as there will be approximately 15 EL students in each group. If a group were to have a student teacher, the information on that teacher will need to be analyzed with the other teachers, but being under the direction of the regular classroom teacher the student teacher should be following either the control group or the treatment group directives.

**Analysis**

A multilevel model design will be used to analyze the data from the experiment, using a statistical software package. A multilevel model is used to analyze data on more than one level, and also allows examination of cross-level interactions between variables that occur at different levels of aggregation (Cohen, Cohen, West, & Aiken, 2003). This analysis will have two levels, with the possibility of a third level. With students nested within the classrooms, this creates the two levels of the analysis, the student level, and the class level. Because this study involves students nested within classrooms, a multi-level model is an appropriate tool to analyze the data. A third level of analysis that could be included is that of the school level. Some of the schools chosen from this district for this study are not as highly impacted as others. The percentage of free/reduced lunch is much higher in some of the schools than others, indicating a neighborhood or population with a lower socioeconomic status. This may need to be included in a preliminary model to determine if school location and demographics actually play a part in the success of vocabulary acquisition as presented through this intervention.

The pre- and posttest will be administered to both the control group and the treatment group. These will be given in August and December, respectively. Growth on the posttest as compared to the pretest will be determined for both the control and the
treatment group, which will be the dependent variable. Weekly pre- and posttests will also be administered and included in the analysis. A mid-point test to measure retention of words taught from the beginning to the middle of the study will be administered, rather than waiting until the end of the study to determine retention factors.

Weekly Schedule for Intervention

Vocabulary Intervention

Materials: Vocabulary notebook

Day 1:
Pre-test of vocabulary words from the basal story is administered by teacher.
Teacher then provides a description, explanation, or example of each word with a non-linguistic representation.
Students restate the description in their own words. They write their restatement in the vocabulary notebook.

Day 2:
Word association activity: Relating the word to a word or phrase the students are already familiar with. For example, if one of the new words in a given list was virtuoso, the association would be created by asking the question, “Which word goes with piano? (virtuoso). Explain why”. Students should also be given the opportunity to associate the word with things known to them from their own cultures and backgrounds.
Students create a picture, symbol, or graphic to illustrate the vocabulary word.

Day 3 and 4:
Peer-mediated Task-Based Activities (TBA) are used. These will be activities that add to the students' knowledge of the words, as well as provide time for students to interact and discuss the words with each other. Students will complete a vocabulary graphic organizer for each vocabulary word, working in partners. One partner is the reporter, the other is the recorder. These roles will alternate between the partners.

Day 5:
Review games are played. Posttest is administered.
Games will include 2 powerpoint template games: Jeopardy and $100,000 Pyramid

Note:
For weeks that only have 4 days, there will only be one day of TBA activities.

Ignoring New Literacies is Not an Option: Finding Critical Spaces for 21st Century Literacy Practices in an Era of Scripted Reading Programs

Connie L. White
California State University Northridge

Connie White, Literacy Education, Department of Elementary Education, California State University, Northridge.

Correspondence concerning this article should be addressed to Dr. Connie L. White, Department of Elementary Education, Office # 2213, 18111 Nordhoff Street, 18111 Nordhoff Street, Northridge, California 91330-8252 or connie.white@csun.edu
Abstract

Theories and practices relating to “New Literacy Studies” or “Literacies for the Twenty-First Century” have been evolving for more than four decades. However these theories and practices are absent in most public schools today. This study focuses on twelve graduate students, who were elementary classroom teachers practicing in southern California, where they were mandated to teach scripted reading programs and administer standardized assessments. As part of a Language Arts Seminar the teachers were immersed in theories of literacy learning and required to undertake Action Research that focused on New Literacies in their classrooms. The study found most teachers did make spaces for these ‘new literacies’ in their practices but it left them with dilemmas as to how they might bring mutually exclusive literacy theories and their associated practices into their classrooms.
Ignoring First New Literacies is Not an Option

Every semester when I meet my graduate students in the Language Arts seminar that I teach, I discover the same thing. They do not know or understand literacy theory. The beliefs that they do have about how one becomes literate or how literacy should be taught are deeply imbedded in the scripted practices they have been mandated to teach. I learn this early in the semester, because I ask them to do a free write, followed by discussion of what they believe literacy to be and how one becomes literate. I receive such responses as these:

Sandra: “I believe we become literate by knowing the sounds of the letters and then knowing the basic sight words until we can read enough text to understand what it is saying. That is what we are told to do when we teach, so I guess that is what I believe literacy is and how we should teach it.”

Jennifer: “Literacy is the process of decoding sounds to make phrases and sentences and simultaneously make sense out of what is being decoded. Literacy also includes the ability to express oneself coherently in writing.”

Dawn: “One becomes literate through learning to read and comprehend text. Reading begins with phonemic awareness, then phonics and sight words, ultimately fluency.”

Kelly: It’s easy to tell an illiterate person. All one needs to do is give them some instructions in the text or have them write on a topic to see if they can apply the written word and what they know about language to achieve the task.”

There are many more suggestions of what my students understand about literacy among the papers that I gather after the free write and subsequent class discussions are completed. However, virtually all of them are positioned in the traditionalist views of reading. It’s a view that they may or may not have been taught in their methods classes but certainly it is the model they have been instructed to follow in their daily teaching.
Ignoring First New Literacies is Not an Option

Traditional views of reading purport that we become literate through the successful acquisition of specific skills offered in linear fashion. Gee refers to it as an assembly line (Lankshear & Knobel, 2007). First phonemic awareness must be mastered, then phonics, followed by fluency and then comprehension. All of these skills are taught in isolation and through direct instruction. This is what my students know. When they want to question why their students are struggling or bored and why they, themselves are bored as they follow through on these daily mandates and scripts they have no other perspectives on literacy to which they might turn for understandings. They are unable to step outside the discourse of the reading programs and school districts’ instructions to critique what it is they do with children and to look at their beliefs and practices through a different lens (Gee, 2005).

I teach at California State University, Northridge, which is located in Los Angeles County. The majority of my graduate students teach in schools in the San Fernando Valley, which is also located in Los Angeles County. Their students are struggling and the teachers themselves are struggling under the burden of standardized tests and fast paced programs, which direct their teaching minute-by-minute, day-by-day, and year-by-year. I am concerned about my students, teachers who care and who are not invited to think, question and construct knowledge about good literacy teaching for themselves. In fact these teachers often worry about punitive action by their schools or school districts if they veer away from the prescribed curriculum to try ‘other things’ in their efforts to meet the needs of their students.

This research was prompted by my desire to examine whether the learning opportunities I offered my students in the Language Arts seminar were achieving my goals. Teachers’ lack of understanding of literacy theory was a specific concern. To that end I assigned readings and assignments with the intent that students come to an understanding that literacy theories existed, that the mandated teaching practices associated with their jobs were connected to a specific theory of learning and that they were capable of critically examining these practices through the theoretical perspectives and practices of New Literacies Studies. I was also curious as to how the students would understand what “New Literacies” theories were coming to mean for educators in the twenty-first century. My goal was to have them move beyond thinking literacy was a set
Ignoring First New Literacies is Not an Option

of skills and realize it was an ever changing phenomena as the world and people’s use
and needs for literacy grew to encompass new kinds of texts and modalities.

This paper will discuss the current literacy teaching of the teachers in my class. It
will give a rationale for having these graduate students learn about New Literacies. It
discusses theoretical perspectives of some literacy studies associated with the New
Literacies’ theory and agendas. It will then talk about the major assignment the students
undertook in the Language Arts Seminar and students’ responses to this assignment. The
paper discusses how teachers can critique their practices, develop theory and create
curriculum with their students when they are able to find spaces to practice, question and
articulate thoughts about literacy learning, Finally this paper will argue that changing
practices in today’s political climate can be very difficult for teachers, even when they
see the need or have the desire to do so. These difficulties leave teacher-educators with
key questions to ask of their own teaching.

Times Are A-Changing. Or Are They?

Literacies and the way people need them and use them are vastly different from
the way literacy was used and needed when governments first mandated that all children
attend school more than a century ago (Brandt 2001, 2009). However, literacy practices
in today’s public schools look remarkably similar to those children encountered in those
early days of public schooling. Children were taught to read through basal reading
programs such as the familiar Dick and Jane series as early as the 1930’s in the United
States. Writing was taught through practice sheets of printing, cursive writing, spelling
and grammar. Literacy learning was thought to be a cognitive process of mastering
isolated skills, each building on the other in linear fashion before reading and writing for
meaningful purposes was ever considered. Teachers required little if any official teacher
preparation before entering the classroom. A year of normal school, following high
school graduation was seen to adequately train teachers to educate their young charges. In
many rural and urban areas even that training was not viewed as necessary. Teachers
were expected to follow the instructions in the teacher manuals that accompanied
mandated basal reading programs. They were to use the answer booklets that
accompanied these programs to score the workbook and test sheets that named their
students as successfully literate or not. Children who were unable to grow literate in this
way were thought to be deliberately resistant to learning or to be of low intelligence.
Programs or the views of literacy learning behind them were not questioned.

Today children and their teachers live in a world vastly different from the children
of the Dick and Jane era. Their worlds are full of new technologies such as iPods, cell
phones, video games and computers. All of these technologies offer new forms of
literacies such as social networking, interactive websites, texting, i-movies and video
games. Schools have become desegregated since the Dick and Jane program, representing
pristine, white, middle class life, first made its way into public schools. Today’s
classrooms are made up of children from many different ethnicities and cultural
backgrounds. Although the teaching profession is still made up of primarily white,
English-speaking teachers, this is slowly changing. Women and men of color, different
cultures and native languages are taking their place as educators in classrooms throughout
the United States. Today’s teachers are expected to be well educated; many of them (like
those in my Language Arts Seminar Class) seek a Masters degree early in their teaching
careers. Yet these well educated teachers living and teaching in a world immensely
different than their counterparts of fifty and sixty years ago are still mandated to teach
from scripted reading and writing programs based on the same notions of literacy
learning that dominated the classrooms of generations ago. Children who are not
successful are often still thought to have something cognitively wrong with them. More
often these days teachers too are thought to have something wrong with them and how
they teach. Yet the scripted reading programs and the high stakes tests that mark children
and teachers alike as inadequate in our twenty-first century schools remain unquestioned
at virtually every level of the public school system.

Eisner (2003) says that bringing about change in public school is difficult
because:

All of us have served an apprenticeship in them- and from an early age. Indeed
teaching is the only profession I know in which professional socialization begins
at age 5 or 6. Students, even those of so tender an age, learn what it takes to “do
school.” They learn early what a teacher does in a classroom. They learn early
Ignoring First New Literacies is Not an Option

how they must behave in order to get on. In fact, aside from their sleeping hours, most children spend more time in the presence of their teachers than they spend in the presence of their parents. In short, students and parents, like the rest of us, know what to expect of schools. Those expectations, rooted as they are in our past, also shape our future. (p.648)

The graduate students in my study learned to “do school” through their own public schooling years. They believe they became literate in a similar fashion to the way that they are required to teach the children in their classrooms. Although some were considered strong readers, while others may have struggled, ultimately all of them succeeded in attaining literacy levels that allowed them entry into undergraduate and graduate college programs. Those who struggled rarely saw the problem existing outside of themselves. They thought there was something about them that made them poor readers, in spite of the fact they remember the skill and drill sessions in their classroom as the only literacy that was offered to them. As Eisner suggests, these teachers shaped their expectations of their literacy teaching though the roots of their past. They believed they only needed to teach the programs better, care more about their students and they would see success in their students’ test scores and consequently their abilities as literate human beings.

Teachers who are discursively positioned by the discourses and practices of the mandates of the institutions in which they do their work acquire particular discourses that allow them to function successfully within the ideologies of that institution. Examples of this can be seen in my students’ statements about their literacy beliefs found at the beginning of this paper. Sandra’s comments may underscore this most poignantly when she says “That is what we are told to do when we teach, so I guess that is what I believe literacy is and how we should teach it.”

Gee’s Discourse theory helps us further understand why teachers’ assumptions about schools and learning go unexamined and consequently why changes that might align literacy teaching and learning with more current research understandings do not get taken up by concerned educators (Eisner, 2003). Gee (2005) explains Discourse in this way: “Think of discourse as an “identity kit” which comes complete with the appropriate
Ignoring First New Literacies is Not an Option

costume and instructions on how to act and talk so as to take on a particular role that others will recognize” (p.1).

The identity kit afforded teachers in this study came through mandated reading programs that had not only shaped their understandings of their own early literacy learning but also, now scripted their own instruction as teachers. It came from administering local and state tests and being held accountable to the results of those tests. It came from professional development days where teachers were instructed on how to work to present the scripts better and raise their students’ test scores. It came through admonishments by senior educators in the schools and Districts for poor test results or veering away from anything but the legislated curriculum. It came from filing out report cards that correlated completely with test results and curricular outcomes. It came from conversations with parents about the progress or failures of their children. It came from the local, national and international media. The official discourses and practices of the school attired these teachers in costumes of compliance, instructing them to act and talk as rote-knowers of something they had not truly come to know for themselves.

Gee’s (1990) Acquisition Principle and Learning Principles offer us a way to explore what happens to teachers who are told to practice without theory.

The Acquisition Principle

Any Discourse (primary or secondary) is for most people most of the time only mastered through acquisition, not learning. Thus literacy (fluent control or mastery of a secondary Discourse) is a product of acquisition, not learning; that is, it requires exposure to models in natural, meaningful and functional settings, and (overt) teaching is not liable to be very successful – it may even initially get in the way. Time spent on learning and not acquisition is time not well spent if the goal is mastery in performance.

The Learning Principle
One cannot critique one Discourse with another one (which is the only way seriously to criticize and thus change a Discourse) unless one has meta-level knowledge about both Discourses. This meta-knowledge is best developed through learning, though often learning applied to a Discourse one has to a certain extent already acquired. Thus ‘liberating literacy’, as defined above, almost always involves learning, and not just acquisition. (p. 154)

The goal I had for my teaching and my students’ learning was to have them learn about literacy theories. And I did not expect to do this through overt teaching. I wanted them to do more than simply acquire an alternate discourse about literacy learning to the one they were operating in as teachers. I wanted them to develop meta-knowledge that might become a part of who they were as learners and teachers, giving them a different discourse and sets of practices to consider in response to their articulated concerns about the state of failure and boredom in their classrooms. As Gee (1990) says: “Meta-knowledge is power, because it leads to the ability to manipulate, to analyze, to resist while advancing” (p. 148).

When the students first entered my Language Arts Seminar they had not identified the need to analyze or resist the discourses of literacy teaching in which they were caught up. Although they wanted the power to have their students become more successful, that equated to wanting them to have higher test scores. Their desires as teachers were firmly caught up in the ideologies of unexamined school discourses and practice. Meanwhile, although they were adults living in the 21st century, participating in at least some of the twenty first century literacy practices themselves, these teachers had yet to explore how these new literacies were an integral part of their own students’ lives. It was expected by the school system that these integral parts of students’ lives would be extricated from who they were as literate human beings and be left outside the school-house doors each morning. There was a fear that these practices would distract the students from the only learning valued by the institution; rote school learning.

Moving into the Twenty-first Century: Some Theoretical Perspectives
We are ten years into the twenty-first century and there is no shortage of research that offers a much broader knowledge of literacy than we had decades ago (Compton-Lilly, 2003, 2007; Gee, 2003, 2005; Hull & Schultz, 2007; Lewis, 2001; Purcell- Gates, 2007). New Literacy research presents an abundance of examples of literate practices that look and function very differently than today’s school literacy practices (Finders, 1997; Gee, 2000; Hicks, 2002; Lankshear & Knobel, 2003; Pitt, 2000). Focusing on rich descriptions of these practices in real life situations, this research finds a plethora of opportunities to conceptualize literacies as multiple, successful and always enacted within social contexts. Although New Literacy Studies are often thought these days to be solely about the world of digital texts, I take a broader view for this paper. Here I discuss the changes in understandings about literacy brought about by anthropologists such as Heath (1983) and Street (1984) in the latter part of the twentieth century. I also discuss the work of Critical Literacy researchers who build on the work of Brazilian educator and philosopher Paulo Friere explicating the rationale behind including this body of work under New Literacies. Finally I discuss digital texts and new technologies and how this rapidly changing field is impacting what literacy looks like in the lived lives of 21st century peoples. New Literacy Studies then encompasses broad understandings of literacy. The fields of Family Literacy Studies, Out-of-School Literacy studies, Critical Literacy Studies and New Literacy Studies in the age of digital texts often intersect and overlap, but always show us that literacy can no longer be narrowly defined if our children, indeed our citizens are to inhabit this century as fluent, modern, literate human beings.

Assuming the goal of public schooling is to provide equitable education and opportunities for all children, there would seem to be little excuse for ignoring this current research. However today’s schools, teachers and students, driven by government mandates and definitions of accountability trudge onward entrenched in out-dated practices that continue to name many children as deficit. These are the same children research has found to be productively and successfully literate in their homes and out-of-school practices (Compton-Lilly, 2003, 2007; Finders, 1997; Skilton-Sylvester, 2007). Yet their teachers rarely, if ever are drawn to the understandings that literacy can mean something beyond what they have been told they must teach.
Over the years Street has repeatedly raised the question: When there are so many different types of literacy practices, why is it that school literacy has come to be seen as the defining form of reading and writing. He describes the pedagogization of literacy or the defining of literacy solely in terms of school-based notions of teaching and learning while marginalizing other forms of literacy. 

(Hull & Schultz, 2007, p. 23)

The late twentieth century saw a shift in how some researchers wanted to understand literacy. In the 1960’s and 1970’s anthropologists and linguistics looked to ethnographic studies as a way of documenting what literacy looked like and what it did for people living and using literacy in the real world. (Heath, 1983, 1986, 1991). There was a growing concern for how particular groups of students (Blacks, and children from lower socio economic homes) consistently failed to meet with school success. This research moved away from the scientific kinds of research that measured literacy by means of assessments that showed successful or unsuccessful acquisition of isolated skills. This qualitative research, relatively new to the field of literacy education, moved instead to understand literacy by studying the complexities of literate lives in the real world.

Brian Street’s work was seminal to the evolution of early theoretical understandings of New Literacies, challenging the narrow vision of literacy held by Western schools. Street (1984) spent time documenting three different types of literacy he found existing among adults and young people in Iran. His research discovered that many who had been considered illiterate by the state schools were in fact most successful with the literacies tied to their country’s economic changes and success. These were literacies learned outside of school. Such examples of powerful out-of-school literacies suggest how important it is that governments and schools validate rather than marginalize these ‘other forms of literacy’. Yet, as is clear from the stories of teachers such as Sandra, Jennifer, Dawn, Kelly and others in this study, such literacies are rendered invisible in their California classrooms.

Compton-Lilly (2007) says: “As we move through our daily routines, we are caught up with the curricular expectations and school policies and it is easy to miss the stories children and their families tell (p.113). Teachers held accountable for fast paced
Ignoring First New Literacies is Not an Option

programs and raising test scores have not been given time to listen and validate the stories their students have to tell. Yet many of these stories are the very source of information and understandings that have the potential to change how we practice literacies in our schools.

American philosopher John Dewey saw schools as a site of wasted human potential almost a century ago.

Dewey (1899/1998) argued many years ago that there is much we can learn about successful pedagogies and curricula by foregrounding the relationship between formal education and ordinary life. “From the standpoint of the child, “ he observed, “the great waste in the school comes from his inability to utilize the experiences he gets outside of the school in any complete and free way within the school itself; while, on the other hand he is unable to apply in daily life what he is learning at school (pp. 76-78).” (Hull & Schultz, 2007, p. 3)

Dewey’s suggestion that schools utilize children’s out of school lives to inform pedagogy in such a way that school was about their lived lives would appear to have made little impact on the world of education at the time. Today, many decades later, with research such as Street, (1984, 1995, 2001; Gee, 2004, 2008) demonstrating how fully and differently literate children can be in their everyday lives we continue to see little if any change in policies and mandates that drive school curriculum and assessments.

Critical Literacy takes its place under the New Literacies umbrella because it addresses the stories of children and families consistently left on the sidelines through school practices (Compton-Lilly 2003, 2006, 2007). Paulo Friere (1971) argued that schools needed to draw on the culture and knowledge of its students. He explicitly criticized school pedagogy that treated children as passive learners with minds like empty vessels. Friere likened such learning to a banking system, where learning was regarded as little more than deposits of piece meal information. He considered such education to be silencing and repressive.

Critical Literacy has an explicitly political agenda. It questions a world of truths and singular ways of viewing the world. Taking a post-modern perspective, critical literacy seeks to make visible how privilege is constructed in our schools and in our world. It offers ways to look at discourses and practices to understand the marginalizing
Ignoring First New Literacies is Not an Option

work they do. Critical literacy expects uncomfortable questions to be asked as previously unexamined but taken for granted ways of the world become open for interrogation. Under such theories and practices, children and teachers should be able to inquire about school and how they are being positioned through hegemonic discourses and practices. Critical literacy makes a place for the stories of marginalized children and families legitimizing them as successful learners in a world that has long silenced them.

According to Greene (2008), social justice teaching means three things: access to materials and rigorous work, engaging study, and "a learning environment that promotes critical thinking and agency for social change, and that views students and teachers as actors in the struggle for social justice" (p. 4-5).

State standards, regimented curriculum and high stakes tests allow no space in the school day for rigorous work and engaging study. Students and teachers are given no time to engage in the critical work associated with the social justice issues that permeate their twenty-first century everyday lives.

Leu, Kinzer, Corio & Cammack (2004) say that critical literacy is even more important for young people in today’s world if they are to understand how the vast array of messages and images are targeting them as consumers in an economically competitive world. They write: “During an age of information, any theoretical perspective that seeks to capture the changes taking place to literacy must include these essential critical literacies” (p. 1587).

Young people in classrooms today were born in the digital age. Twenty-first century students are actively engaged in such literacies as video casting, emailing, video gaming, photo sharing, texting, face book, blogging, fan fiction and more. It is the age of information, where children must not only be aware of how they are targeted as consumers of literacies broadly distributed through the world-wide web, they must also be aware of themselves and their responsibilities as producers of digital information. With the majority of these literacy practices taking place beyond classroom walls, there is little opportunity for young people to be engaged in the kinds of rigorous thinking associated with critical analysis of such texts in schools. As previously stated, these are the literacies that are more often than not prohibited in schools.
While theories behind new literacies associated with digital technologies are still under construction (Leu et al. 2004), well-known researchers such as Black (2008), Gee (2007) Lankshear and Knobel (2006) view these practices through a sociocultural perspective. Lankshear and Knobel (2007) write: “Understanding literacies from a sociocultural perspective means that reading and writing can only be understood in the contexts of social, cultural, political, economic, historical practices to which they are integral, of which they are a part (p.1). The new literacies associated with the digital age are then meaning-making events, where understandings of the world are negotiated, contested, constructed and reconstructed.

The Language Arts Seminar Class and Action Research

The purpose of the study was to examine whether requiring graduate students to engage in Action Research that juxtaposed traditional classroom theory and practices with new literacy theory and practices would help them understand the most prominent competing literacy theories existing in the field today. The research sought to discover whether students would come to know the theoretical perspectives behind twenty-first century literacies and whether they would be able to use these understandings as a lens to explore the questions they asked of their own teaching practices. This study focused on the major assignment for The Language Arts Seminar Class.

The Language Arts Seminar was a compulsory course for Masters of Arts students in both the Curriculum and Instruction pathway and the Language and Literacy pathway. There were twelve students in the Language Arts Seminar class. All of them were elementary or middle school teachers. Seven of the students in this study were from the Language and Literacy pathway; five were from Curriculum and Instruction. All of the students were female.

The Action Research Project was embedded in a sixteen week, three-unit class that met once a week for three hours. The Action Research assignment was one of a number of assignments in the course. Prior to and during the research, students read a number of peer-reviewed articles and theoretical papers, which discussed learning theories. They responded to them through writing and discussion.
I selected one book as the focus for reading for the Action Research. That book, edited by Janet Evans (2005) was *Literacy Moves On*. The book is divided into three themes each of them connected to ways Literacies in the Twenty First Century are conceptualized and practiced. The three themes are: “New” Literacies and Children’s Ways of Using Them; Focusing on Texts with a Critical Eye: Critical Literacy in the Primary School and Bridging the Gap Between Children’s Personal Interests and Teachers’ School-Based Curriculum Demands. Each of the themes contains from three to five teacher-research articles. These articles allow readers to see the different ways New Literacies are taken up in practice.

The Evans text itself does not go into theory in an extensive way. Hass Dyson’s Foreword and Evan’s Introduction contextualize the themes and the research included in them through brief discussions of what we have learned in the past few decades about how children learn.

Students began to read the Evans book by the second week of class. They were required to react to it in writing. The writing was handed in to me each week for my written response. Students also used their responses for group discussions. Following group discussions, the students would bring their most urgent questions, concerns or aha moments to the whole class for further discussion.

The Action Research Project (Appendix A) was introduced and discussed in Week Six, just as students completed reading the final theme in the Evans’ book. They were also given a proposal prompt. (Appendix B) During the sixth and seventh weeks of class, students emailed their proposals for comments and suggestions. I approved them when I believed they were focused with a manageable plan for the five weeks allocated for the research.

Students began researching in their classrooms during the eighth week of the seminar and finished collecting data on the thirteenth week. They wrote up their research over a two-week period, presenting it to the class during weeks fifteen and sixteen. They submitted their Action Research papers on the final day of class.

The data I collected consisted of the ‘free writes’ about Literacy Learning, collected after the first class, my reflective notes after classes, the proposals, the Action
Ignoring First New Literacies is Not an Option

Research Papers submitted by students and notes taken during the class presentations of the Action Research.

Findings

Conflicted Proposals

The research proposals presented early data indicating that by weeks six and seven (when the proposals were written, revised and approved) students had not moved to an understanding of socio-cultural theories of twenty-first century literacies. The three examples below are representative of the thoughts and research planning of students in the class.

Loretta: There are two students in my class who have very low reading capabilities. I teach second grade, where students should already know how to read, whereas these two don’t. They even get confused with certain letter sounds. I don’t have enough time in my day to teach them how to read. I am using Open Court but they are too far behind the second grade program. I try my best to work in small groups with them but I feel like it is not enough for them to catch up. I was thinking I could use the Internet as a technological tool in helping them learn to read. There is a web site that I have looked over (starfall.com) and I think it may serve them well, perhaps have them use the computer about twenty minutes a day on this. I can have them on the site during silent reading (with the rest of the class) so that I can monitor and make sure they are effectively using the site. I have to consider if they will work alone or together. I assume they will enjoy this since it is an interactive site. What do you think?

Maria: My students are bored when I try to teach them the sounds of the letters the way Open Court has me do it. I would like to teach letter/sound recognition by having students take pictures or bring in pictures of things that they are interested in popular culture and then having them sort them by the letter that they start with and then they can make their own alphabet book. I believe this would motivate children because they would be producers of their own educational material.
Christina: The question I am asking is how can I motivate my “low” readers to be excited about and pay attention during reading group time. I teach from the Houghton Mifflin series and I teach first grade. There are five readers in each group. In my three higher groups I do not have a problem keeping students on task and they seem to enjoy reading. However when it comes to my lowest reading group they are constantly showing signs of disengagement. I want to use Bridging the Gap theme and I hope by doing this I will learn about my students’ interests and I can use that to create a Big Book together that they will really want to read. I will ask them to bring toys or books from home that they would like to write about.

Clearly students had not taken up a discourse or developed understandings that allowed them to critique the theoretical perspectives that were the underpinnings of the teaching they did in their classrooms. Loretta looked to a website that taught phonics to children through a cute program on the computer, Maria wanted to teach the sounds of the letters and letter recognition through a popular culture alphabet book and Christina wanted her low group of readers to be more motivated with their first grade reading basal readers.

Teachers’ concerns for their students’ progress in reading and writing still resided with the children themselves. They did not question the practices or associated theories that compelled them to break language down into its smallest parts to teach their young charges to become literate. They may have thought activities associated with New Literacies that they had read in the Evans book would offer them new ways to teach the isolated skills but certainly at this point they were not understanding literacy as a social act. Loretta, for example was going to use a computer to teach phonics (taken as her understanding of “new modalities’ in theme one). Maria drew on theme two (popular culture) as her way of fixing the boredom she witnessed with her students as she tried to teach them letter names and sounds. A cultural alphabet book was to address that skill. Christina was the only one who appeared to move away from the prescribed curriculum slightly to look at the low motivation of her first grade struggling readers. She planned to have them produce a book based on their interests (taken from her understanding of theme three; bridging the gap).
Ignoring First New Literacies is Not an Option

Six weeks was clearly not long enough to expect students to learn new theory (the meta-cognitive kind of learning Gee references). They had not had a lot of time to read theory. The Evans’ book, while offering some rich examples of new literacies in practice, did not ground these practices strongly in theory. For teachers who had never been expected to have ideas of their own about how to teach reading and writing, it should not be surprising they saw the activities presented in the Evans’ book as their source for new ideas to solve the learning problems they worried about in their classrooms.

Most of the teachers expressed concerns that this assignment would interfere with their mandated pacing plans. Their proposals indicated to me that they were trying to marry my expectations of them as graduate students with the expectations of their schools and School Districts.

The Action Research

Once teachers began their research most appeared to find space to create curriculum with their students in ways they had not appeared to imagine possible when they submitted their proposals. Of course, none of these teachers were able to change the curriculum and associated practices they had been mandated to teach each day. However, many of them found ways to make spaces for exploration into the world of New Literacies’ theories and practices.

The following summaries allow a glimpse into the action these teachers took in their classrooms.

Nancy had a concern about her more privileged students. Their writing was filled with experiences of taken-for-granted treats and lifestyle. Like the children in Evans’ chapter about Beanie Babies, Nancy felt her students’ lives were propelled by desires to buy and consume what the media told them they needed to have. She had her children research ingredients in the popular cereals they ate. They explored what those ingredients were and what they did to their bodies. These second grade students identified the reasons they had wanted these cereals in the first place and then began to design provocative looking boxes for more nutritional kinds of cereals. They
created television commercials that spoke back to the tantalizing advertisements of the sugary sweet cereals they had begged their parents to purchase.

Katriana could not step aside from using books associated with the Open Court program, but she was able to address concerns about what she identified as her students’ shallow comprehension skills. She had her students use Plaster of Paris, sand, clay, paints, charcoal and pastels to respond to the books they had to read. She encouraged discussions, questions, and critique among her students as they worked in new mediums to create broader understandings of their readings.

Ariel responded to her own concerns about shutting out her students’ interests when they came to school eager to share them with her each day. She noted in her research paper: “I had always felt that listening to them was wasting our time. I had so much curriculum to cover. But as soon as I told them we needed to be quiet and get to work on reading and writing, their eager voices became quiet. They weren’t the same kids anymore. It was like nothing I was doing with them counted compared to all the things they were excited about doing outside of school.” Ariel decided to capitalize on her students’ interests. She had them interview one another about their out-of-school interests and she created video clips of their interviews. They viewed them together and she opened discussion inviting them to talk about what it was that made them so interested in all of these television shows, Pokémon cards, video games and computer websites. Ariel’s students begged her to create more video clips about things they could talk about together as a class.

**Graduate Students’ Reflections**

This research afforded me the opportunity to look at an important goal I’d set for my teaching. I wanted the teachers who came to my Language Arts seminar to understand that different theories of literacy learning were tied to very different literacy practices. I wanted the teachers to know there were other ways to look at literacy than those they experienced each day and those they expressed in their free writes at the beginning of the semester. I wanted them to know that literacy had moved on, and to
Ignoring First New Literacies is Not an Option

offer them the opportunity to explore their practices through a new lens. I hoped the teachers would find different questions to ask about practice, than the ones they’d brought to class originally when they wanted ways to teach the skills. I hoped that these teachers would realize they could construct knowledge that was valuable and important to their practices.

The following reflections are taken from the Action Research papers. They offer a look into the understandings teachers took from their research and reading. They suggest analytical thinking, surprises, questions and hope for teaching and learning.

Miranda: This action research left me with hope for the future of our children’s education. I think that there really can be a space for critical literacy in the classroom using multimodal texts. If a curriculum is created with the integration of critical literacy we will have expressive students who inquire about social injustices in the world around them and these injustices will not have to be perpetuated in society.

Ariel: I have come to realize that the way to my students’ hearts and minds is through their own interests. I feel that I have unlocked their minds that they keep separate from school. I will continue to incorporate things that are of personal interest to my students. I have already shared my research findings with my grade level as well as with the literacy coach at school. This action research is the beginning of my experience of incorporating popular culture into the curriculum. I look forward to exploring this concept in many new ways.

Jenny: This study left me with much to consider. Television and video games are a tremendous part of today’s popular culture. Many believe that it is a waste of time. However we cannot ignore the fact that they are the teachers of our society and as literacy is changing so must we. Teachers are the facilitators in their students’ education and if they can’t understand the many faces of literacy they cannot help their students learn or think critically of the world around them. Mario is a child of the twenty-first century who is “fervent about new technologies” (Evans 2005). I now
Ignoring First New Literacies is Not an Option

understand that the great imagination has been molded by his experiences with
technology and popular culture, and it is imperative that I incorporate his knowledge
into my curriculum. My next goal will be to understand and teach Mario and students
like him.

Christina: I couldn’t believe it. They went from slumping in their seats to leaning
over the reading and trying to get closer to me as we created their Big Book. Their
interest levels were piqued and with this motivation levels and willingness to go
above and beyond skyrocketed. My top groups all wanted to join the ‘low” reading
group. They said: “They have more fun learning than we do.”

These teachers moved from a place of thinking of themselves solely as ‘doers’ of
prescribed literacy curriculum. Their primary thoughts about their teaching was no longer
focused on how to do what they were already doing better so their students’ test scores
would improve. These teachers speak of thoughts and ideas about their students’ learning.
They speak of children who are showing them what is important in their lives and why
it’s essential teachers listen. They have set goals to try and understand teaching and
learning differently. Jenny says: “This study has given me much to consider.” Ariel says
she looks forward to exploring ‘this concept’ in many new ways. Miranda gave a
presentation to her grade level at school and shared what she had learned with the literacy
coach.

Not all of the teachers were able or willing to find the spaces to take the risks. For
example Donna decided to research whether her children could identify their sight word
better if she put Pokémon cards on the back of sight word flash cards. After talking to
her students about out of school interests, Susanna created comprehension worksheets for
her Open Court unit. She adorned the work sheets in popular culture images that her
students had told her they liked. Donna and Susanna both believed they had used the
New Literacies’ theme ‘bridging the gap’ for their research project and did not see that
they had not brushed with the socio-cultural theories underlying New Literacies’ theory
at all. It was not clear whether these teachers chose not to engage more fully in the
assignment because they did not understand it, because they were worried about their
Ignoring First New Literacies is Not an Option

safety as teachers if they digressed from the everyday expectations of their administration or whether they were simply more comfortable getting the course assignment done while doing what they always did in their classrooms. The papers and presentations of these declared excitement and learning had taken place as a result of the infusion of popular culture icons in their curriculum.

**Teachers’ New Concerns**

Miranda, Ariel, Jenny, Christina and others like them who found the research exciting and hopeful for their teaching raised other concerns that had not surfaced in their scripted programs. They recognized the theories that took them to these new practices did not align themselves with the assessments they were required to give regularly in their schools. What follows are examples of serious issues these teachers faced as they began to consider the implications of teaching from the socio-cultural perspective, while working in a school that valued only the standardized measurement of children’s learning.

*Miranda: How do I assess my students with multimodal texts? I need to ensure that my children are learning but how do I assess that they are?*

*Christina: How can I grade this project based on so many different factors?*

*Nicole: Another big question I have is regarding assessment, which is a major requirement at most schools. I would not want to put more pressure on my students by telling them I have to grade them on exciting projects they just did but then how do I measure learning?*

*Andrea: We are pressured nowadays to demonstrate with tangible numbers and scores that learning has taken place. How to obtain a score or a number from lessons like this one represents a real challenge for me. However I feel strongly that literacy is a personal manifestation of our lives and therefore it needs to be lived and experienced. How do I justify this is a world of accountability through test scores?*
The teachers’ concerns are representative of many who work and do research in the field of New Literacies. Hull & Schultz (2002) discuss researchers who found that when schools imposed white, male genre of writing it marginalized the kind of writing women had historically used to fulfill their personal needs at home and in their communities.

When we attempt to bridge the gap by bringing children’s family and out-of-school literacies into school we run the risk of turning the vibrant literacy practices of our students into everyday school literacies. We domesticate them, changing what they were, to what they have to be ‘to fit’ school. (Finn, 1999) Children become bored and often unhappy with the way their interests have been made to look like school. In today’s world it is far more likely that the out-of-school literacy will get changed to fit school, rather than school changing because of the new literacies the children bring to it.

Finn (1999) says: “… there is domesticating education which leads to functional literacy, literacy that makes a person productive and dependable, but not troublesome” (p. ix-x). He identifies some of the features of domesticating education in the following way:

1. Teachers are gatekeepers. They focus on correctness, before expression.
2. Students are rarely given the opportunities to express their own ideas.
3. Students are rewarded for their passivity and obedience, not for initiative and inquisitiveness.
4. Both teachers and students focus on good grades and a diploma as the objective of schooling.

The teachers who brought forth concerns about accountability to a system that didn’t fit the kind of teaching they wanted to do were conflicted. They saw that they were held accountable to gate keeping, correctness and good grades or test scores. They realized their school’s expectations of them did not fit with teaching that allowed children to express their own ideas, encouraging inquisitiveness and initiative. They had reached a place with their learning that showed them the theory of learning guiding their mandated scripted reading programs and the theory of learning that had provoked their Action Research were mutually exclusive. It left them in an uncomfortable place.

**Implications for Teacher Educators**
All of the teachers in the Language Arts Seminar taught in public schools, which required they teach to scripts and administer high stakes tests. This research found that teachers who read theory and do research could learn to think of literacy differently. The research also found that asking teachers to change or find spaces in their tightly scripted days could be stressful. Their desires to do well as teachers and their desires to do well as graduate students in my class created dilemmas for those who feared reprisals from their schools or from me. The schools and I expected outcomes that were polar opposites of one another. While, I knew I had to give students enough leeway to be safe in their jobs, while urging them onward with their research, the lengths I was willing to go to make those compromises was never articulated. Rather, it was negotiated on a one-to-one basis through on-going conversations during the proposal stage. Once the research began, I played no part in what they actually carried out in their classrooms.

The majority of the teachers did come to question their practices and wanted to teach in ways they found to be different and more meaningful for their students. Their research findings left them with unresolved struggles related to the realities of where they worked and what was required of them in that setting. Many were angry that they now had knowledge they could not easily use in their classrooms.

I did not collect data after the students turned in their final papers and the semester ended. I do not know how the students took their learning into their practices after the course ended or in fact whether they were able to at all. I am left with questions about the responsibility of professors who teach new literacies to their students. What happens when these students go back to their classrooms, feeling frustrated that they cannot take all that have learned with them? What happens when they feel alienated without the support of their classmates in graduate studies and their professors who pushed them to learn new things?

Corvetti, Damico and Pearson (2006) remind us that teaching teachers about multiple literacies comes with many complexities. Teachers must be prepared to work in schools as they are, while learning and preparing for schools, as they will become. The teachers, who were part of this study, demonstrate how difficult that can be

Appendix A

Action Research Paper and Presentation

The action research you will undertake for this assignment is imbedded in the theme of Twenty-First Century Literacies. You will create and carry out a mini action research project, which is situated within questions you have about teaching and learning in your classroom and also within one of the themes in your “Literacy Moves On” text. Those themes are 1. New Literacies and Children’s ways of Using Them; 2) Focusing on Texts with a Critical Eye: Critical Literacy in the Primary School and 3) Bridging the Gap Between Children’s Personal Interests and Teachers’ School-based Curriculum.

NB. While you will draw on the theories and see ideas through the examples given in the chapters of Evans book, the questions you ask must come from your own teaching and the research you undertake must be your own original action research project.

Your Action Research Question:
You will need to select a question relating to teaching and learning in your classroom. You must be explicit about the question. State what it is that is concerning you about literacy practices and learning in your classroom. (Focusing on a small group to explore your question is fine.) You will then respond to the pedagogical questions you have by choosing a theme from the Evans text to use as a lens for examining and taking action on that question. You will need to be explicit about the question and how you see it connecting to the theme you have selected. You will also need to be clear on how this question is important to you right now as a teacher. This mini action research must take place over a minimum of five weeks. It will be important to demonstrate the evolution of this research over this period of time. (Dated journal entries, data collection etc.) Be explicit about the context within which the action research will take place. (School, grade, literacy program and practices currently in place, technology/new literacies currently in use, support/resistance known or assumed to bringing ‘new literacies’ into the classroom).

Preparation:
You will need to be specific about the groundwork you did to begin the research. (For example did you have to access equipment, obtain approval from parents, administrators etc; make a new space in your daily agenda to incorporate the new literacies practices or were you able to assimilate it into something you were doing?) This of course is not a ‘one-shot effort”. Remember the project is to take place over a period of at least five weeks. As with any lesson plan it is expected that you will need to bring in and/or implement new things on an on-going basis as you undertake the teaching involved in the ‘discovery; processes of this action research. Make the beginnings and the processes of these plans explicit in the presentation of
Ignoring First New Literacies is Not an Option

your work.

**Data:**
You will need to gather data to see how the ‘action-plan’ you initiated is evolving. You should consider anything that helps you undertake and understand the action research, as it relates to your questions as data. Your data should be dated and referenced by date, as you present it in your paper or class presentation. (This could include anything from journal notes, student samples, lesson plan artifacts or realia, audio/video taping sessions etc.) You will want to talk about how you decided what was data and what was not. Was the method of data collection effective? Did you change your methods of data collection over time (eliminating some? adding others?) Show how the data you collected informed the decisions you made in the planning processes. As a culminating reflection on the action research how did the data inform your thinking on the question you pursued?

**Research Literature:**
You are expected to refer to the section in your text that influenced your thinking in pursuing this project. Additionally you should read, discuss and reference a minimum of five other pieces of professional literature, theory or research, which will connect to the theme you are exploring in your research. These readings (including the selected sections of Evans text) must be referenced appropriately in your paper and must also show how they influenced your understandings of your own research. Of course all literature must also appear in your bibliography.

**Conclusions and Reflective Statement:**
Where has this action research left you in your thinking? This should be a clear, culminating statement, which pulls together all of the components of your research to tell the story of what you have learned through doing this project. Additionally you will want to discuss what the obstacles were, what your current questions are, where you would like to go (if anywhere) with the investigation you began here. Make this a well-connected and clear conclusion ‘statement’ on where you are in your thinking regarding the questions you had/have and on the process itself. Be certain to include any frustrations, concerns, limitations or hopes you experienced.

**Presentation:**
You are expected to present your research in a professional manner to the other members of your class. During this presentation you will discuss your question (it’s origin) and the theme you decided to use to explore the question through a new lens. You will show pertinent pieces of data that helped you see your practice and your question differently. You will discuss changes you made in your practice, along with any concerns that arose as a result of the process or end result. As part of your conclusion you will discuss how your questions have changed or been reshaped as a
Ignoring First New Literacies is Not an Option

result of engaging in this research. It will also include new questions to which your research has led you.

It is expected that you will use some form of new literacies technology to enhance the presentation of this research to your classmates. (i.e. power point, video, CD, Inspiration etc.)
Appendix B

Proposals for Your Action Research

1. What is the concern or problem with your student(s)' literacy learning right now? (Describe in a few sentences).

2. What is the instructional technique (theory and practice) you are enacting at the time you cite your students(s)' difficulties? (Describe in a couple of sentences).

3. What theme/theory are you going to use for the action research? Show you know something about the theory/theme and give a brief rationale for why you would want to offer this 'new literacy' practice to your student(s). For example in your rationale talk about why you think implementing literacy engagements & lessons from this particular theme might support your student(s)' learning.
Title
Developing Students’ Capacity for Innovation, Creativity and Critical Thinking through Contemporary forms of Assessment.

Abstract
In continuing with the forms and methods of assessment that for decades have pervaded higher education, are we devaluing the education we provide and disengaging students in the process? Why do we assess? What is our purpose and for whose benefit do we assess? Are these benefits achieved through current practices? These are the questions that need to be addressed.
The demands on educators to provide valuable, student-centred assessment and feedback have never been greater. Feedback is one of the most powerful influences on learning and achievement (Hattie & Timperley, 2007), and how we construct and evaluate these tasks to provide feedback determines the potency of such feedback.
The focus of tertiary education needs to be on developing students’ capacity for innovation, creativity and critical thinking. The perpetuation of the dichotomy in universities between traditional approaches and the ideals of critical and lateral thinking, autonomy, and thoughtfulness in education, make current traditional practices impractical and unacceptable.
The arbitrary nature of creating, marking and providing feedback for tasks without consideration for the learning that should result from the task seems illogical and counter-productive to the purpose of assessment. Peer assessment, self-assessment and the democratization of assessment for learning all need to become part of the repertoire of the university tutor, lecturer and professor if we want students to be engaged with and value their learning.

Key Words
Higher education, Assessment, Innovation, Self-Assessment, Peer-Assessment
Introduction

Current trends for reform in the tertiary sector are focused on meeting the needs of 21st century learners (Australian Government, 2009) through new, innovative forms of assessment (Boud & Associates, 2010). In addressing the shift from traditional forms of assessment to new, innovative assessment practices that are both summative (assessment of learning) and formative (assessment for learning) it is important to recognise the need for pedagogical approaches that can facilitate and ease this change.

This paper illustrates some of the key ideas surrounding assessment in higher education in Australia; gives an overview of the Australian context with regards to reform in the tertiary sector; and, presents a new, innovative model of assessment that addresses the key features of reform in higher education assessment. The model presented has multiple components that form the assessment process: Authentic Assessment for Sustainable Learning (AASL) is the assessment model; and, Authentic Self & Peer Assessment for Learning (ASPAL) is the delivery method for the implementation of AASL.

Although the model presented has undergone trials at the University of Notre Dame, Australia this past semester, this paper concerns the conceptual and theoretical development of the model and its justification. Through a review of relevant literature we were able to address our key questions that formed the basis of the research:

- Why do we assess?
- What is our purpose and for whose benefit do we assess?
- Are these achieved through current practices?

In the development of the AASL and ASPAL models we drew inspiration from the Australian Teaching and Learning Council and the paper: Assessment 2020 Seven propositions for assessment reform in higher education, in which the authors contend: in which, Boud & Associates contend:

Universities face substantial change in a rapidly evolving global context. The challenges of meeting new expectations about academic standards in the next decade and beyond mean that assessment will need to be rethought and renewed (2010, p.1).

The idea of sustainable assessment has been described by Boud (2000) as “the knowledge, skills and predispositions that underpin lifelong learning activities” (p.151). Lifelong learning is at the heart of the Australian government’s goals for higher education: ‘self-fulfilment, personal development and the pursuit of knowledge as an end in itself;’ (Australian Government, 2009, p.7) this reflects the ideals sustainable learning is based upon. Through the implementation of sustainable assessment what we endeavour to achieve is assessment that, “meets the needs of the present without compromising the ability of students to meet their own future learning needs” (Boud, 2000).

Research has shown strong links between the implementation of authentic assessment and high quality learning (Darling-Hammond & Snyder, 2000; Ridley & Stern 1998; Brown, Collins & Duguid, 1989). The use and implementation of authentic assessment has two significant features; it has the ability to re-engage students in the development of content-based knowledge through strengthened links with the outside world; and, it has the capacity to enhance student learning through the provision of skills such as critical thinking and creativity.
This paper seeks to open a discourse about the level of engagement we currently face in our lecture halls and tutorials and to provide colleagues with ideas about innovative assessment practices that can be incorporated into their own teaching and learning to enhance the learning experience and increase engagement among their students.

Key Features from Recent Research

Recognition of the importance of assessment for learning and assessment of learning has been central in research concerning recommendations for reform in higher education in recent years (Boud & Associates, 2010; Lamprianou & Athanasou, 2009; Elwood & Klenowski, 2002; James, McInnis & Devlin, 2002). The literature makes clear that assessment is a driving force of learning (Lamprianou & Athanasou, 2009; Boud, 1990); there is simply nothing else in the learning continuum that garners as much student attention than what the student will be assessed on (Lamprianou & Athanasou, 2009). Lamprianou and Athanasou (2009) make the assertion that according to student diaries, less than 10% of students’ time is spent on non-assessable activities; if assessment has the ability to drive learning it seems logical that curriculum should be designed around assessment that encourages the skills necessary for success, both within their course and in life. The idea of authentic, sustainable assessment is one that not only can meet the needs and skills required for success in the 21st century, but also has the ability to engage interest and enhance student learning (Boud 2000; Vu & Dall’Alba, 2008).

Learning, and indeed assessment, have changed focus in recent years. Traditional education assessment was seen as a way to evaluate learning; now assessment is considered to be an integral part of the teaching and learning cycle (Elwood & Klenowski, 2002). As far back as 1999, the research was promoting the development of professional skills such as problem-solving, critical thinking, creativity, autonomy in learning, and authenticity in learning through innovative forms of assessment (Dochy, Segers & Sluijsmans, 1999). If this ‘new era’ in assessment started over a decade ago, we should be thoroughly entrenched in the practice of authentic learning and sustainable assessment, but sadly this is not the case. Instead we have, “overall dissatisfaction with educational attainment” (Klenowski 2006 cited in Chen & Klenowski 2008 p.) and the desire to raise the quality of education to be competitive in the global context (Murphy 2007). The suggestion of enhancing the quality of education through assessment has been building and evolving over the past two decades. Torrance noted in 1996 that, “real change will not take place in schooling until a significant change happens to assessment” (p.i).

The Australian Context

The Australian government’s position with regards to higher education is in line with the current international trends which are focusing on authentic and sustainable assessment that has relevance beyond the classroom (Boud & Falchikov, 2005; Segers, Dochy & Cascallar, 2003).

Self-fulfilment, personal development and the pursuit of knowledge as an end in itself; the provision of skills of critical analysis and independent thought to support full participation in a civil society; the preparation of leaders for diverse, global environments; and support for a highly productive and professional labour force should be key features of Australian higher education (Australian Government 2009, 7).

The government’s contention about the key features of Australian higher education are dichotomous in nature: On the one hand, they emphasize the importance of knowledge for the sake of knowledge, critical thinking, and independent thought; however, on the other hand they believe that universities should instil the skills necessary for students to become members of a highly productive and professional labour force. While the two ideals are not mutually exclusive, it does present a challenge to the higher education sector. That challenge can be met through authentic learning and authentic assessment of learning.
There are currently 37 public universities, 2 private universities and 150 or so other providers of higher education in Australia. In their reform of higher education, the Australian government is seeking to increase the number of 25-34-year-olds holding a bachelor-level qualification to 40% by 2020; this is an 11% increase over current attainment levels (Bradley et al. 2008). If this intended increase transpires, the higher education sector in Australia will see an additional 217,000 graduates by 2025; this will place an enormous amount of pressure on institutions that already struggle with retention rates in the present environment.

Currently, the student attrition rate in the tertiary sector in Australia is approximately 28%. To keep Australia competitive in the modern global market and meet government targets, universities and other higher education institutions will need to address this high proportion of student attrition. The government recognizes this challenge and makes comments with regards to student engagement in higher education:

Although student satisfaction levels remain high, Australia has fallen behind its major competitor countries on key teaching and student experience indicators and drop-out rates remain high at 28 per cent in 2005. Similarly, the dramatic rise in student-to-staff ratios—from about 15:1 in 1996 to over 20:1 in 2006—is probably a significant contributor to the relatively low levels of student engagement (Australian Government 2009, p.14).

Student engagement is the key to reform in the education sector, not only to ameliorate attrition rates, but also to enhance the development of critical skills necessary for students to prosper in a technology driven, global world. It is our contention that students need to develop skills such as: creativity, innovation, critical and lateral thinking and autonomy to flourish in an unpredictable global market. The disappointing level of engagement of students in higher education is a problem that must be overcome if government targets can be met. Students need to be engaged through a means in which they have an investment, one that they understand and respect; assessment has that capacity (Lamprianou & Athanasou, 2009).

While the government argues that a “highly productive and professional labour force should be key features of Australian higher education,” (Australian Government 2009, p. 7), we believe that such a labour force is a by-product of a high quality education that fosters the growth of the individual learner by teaching those skills that are crucial to the development of sustainable learning.

**Student Perceptions of Assessment in Higher Education**

The research on student engagement in higher education is prolific; however, one feature that the research continually highlights is that assessment, rates very highly in importance according to students (Boud, 2000, Lamprianou & Athanasou, 2009, Elwood & Klenowski, 2002; James et al., 2002). According to Lamprianou and Athanasou (2009):

As far as students are concerned, there is nothing more central to the learning experience than assessment. Some learning researchers call this the backwash effect. The type of assessment students know will be coming determines when they “tune in” to a lecture and when they “tune out.” Evidence from student diaries indicates that students spend less than 10 percent of their time on non-assessed academic work (15).

For most students, assessment is the most important aspect of their coursework (Lamprianou & Athanasou, 2009; James et.al, 2002); therefore, we as educators need to use this element of student perception to maximise the learning potential it harbours. If we can engage students through what they value in our courses and ensure that the assessments we assign are authentic and inspire the development of innovation, creativity and the skills of critical and lateral thinking, we can maximise the potential for our students’ future success. Boud (1990) asserts that students focus on what is assessed; therefore, assessment has the power to drive student learning. This same contention was echoed by James et al (2002):
For most students, assessment requirement literally define the curriculum. Assessment is a potent strategic tool for educators with which to spell out the learning that will be rewarded and to guide students into effective approaches to study (James et al., 2002, 7).

Additionally, Taylor (2008) has found that courses with the highest retention rates are those that employ formative assessment that also count towards a student’s final mark. The AASL and ASPAL models incorporate the best aspects of both formative and summative assessment by informing student learning throughout the process and counting towards their final mark. Taylor suggests that formative assessment, while very good in both practice and principle, cannot by itself engage students: “students will not necessarily value and thence undertake [assessment] unless it is worth something more concrete in their eyes” (2008, 22).

Gibbs (2003) points out that the issues associated with measuring student achievement and meeting standards are addressed at the expense of engaging student learning. If assessment drives student learning, yet it is also responsible for disengaging students, then current methods of assessment need to change. If it can be agreed that students value assessment, albeit possibly for the wrong reasons, we can utilize the value they accord it to positively impact their learning experience. By ignoring this ‘driving force’ we perpetuate the inauthenticity in learning and continue to actively disengage our students by ignoring what they value.

Through the implementation of innovative forms of assessment, such as AASL and ASPAL, educators hold the key to enhanced learning (Elwood & Klenowski, 2002).

Are current assessment practices achieving the goals of the assessment process?

Why we assess is one of the most important questions surrounding issues pertaining to effective teaching and learning and engaging student interest in their coursework.

The Australian Commonwealth Government (2009, p.7)) states that, “self-fulfilment, personal development and the pursuit of knowledge is an end in itself.” If this is the case, why do we assess? In basic terms the education sector assesses students for accountability purposes; to ensure that the degree they tender at the end of a course has meaning. James et al (2002) contend that:

Assessment is often treated merely as the endpoint of the teaching and learning process. There remains a strong culture of ‘testing’ and an enduring emphasis on the final examination, leaving the focus predominantly on the judgmental role of assessment rather than its potential to shape student development (1).

Assessment at the tertiary level should not only assist the lecturer to evaluate students against a set of criteria required to pass a course, rather it should also provide an opportunity for students to monitor and evaluate their own learning (Boud & Falchikov 2005). The forms of self and peer assessment that are employed in the ASPAL model aim to create a ‘learning community’ in which assessment is no longer something that happens to students, but instead draws the entire class into a cohesive group that learns together. By incorporating aspects of both self and peer assessment the aim is to engage students in assessment, through assessment. What is essential is that students are part of the assessment discourse and that they are given the opportunity as well as the responsibility to learn the language and skills of assessment, as these skills form a fundamental component of their tertiary studies. In the particular case of pre-service teachers, these skills are even more relevant; as they form part of the professional skill-set students will require when they enter the profession.

Assessment offers us, as educators, the opportunity to reengage students in their learning and help to foster those critical skills our students will need in the workplace. What is proposed through the implementation of these models is that all assessment, whether diagnostic, formative or summative, focuses on student learning more explicitly than student evaluations suggest it currently does (Lamprianou and Athanasou, 2009). What we hope to foster through the implementation of this model...
is the encouragement of 21st century skills: innovation, critical thinking, reflection and autonomous learning.

The AASL & ASPAL Models

The development of the models of assessment presented was based on the seven propositions for assessment reform in higher education made in the Assessment 2020 paper by Boud & Associates (2009). Through an intensive literature review on assessment, with specific emphasis on the implementation of self and peer assessment at the tertiary level; informal interviews with undergraduate education students; and, our own perceptions of the limited levels of engagement in our units, we sought to develop a model of assessment that could have the potential to shift the ways in which students regarded assessment and transform the manner in which assessment occurs.

The key questions that the researchers sought to answer in the development of an innovative assessment model were:

- Why do we assess?
- What is our purpose and for whose benefit do we assess?
- Are these achieved through current practices?

The answers to these questions were not difficult to determine, and in answering the questions, the path towards a new model of assessment became evident. The short answers to these questions are:

We assess firstly to inform student learning, and secondly to evaluate that learning against a set of standards or outcomes. In ensuring that student learning is paramount and evaluation secondary, we change the traditional focal point of assessment from assessment of learning to assessment for learning.

Our purpose of assessment, in differentiating this question from the first, is our contention that assessment, and indeed all aspects of the teaching and learning continuum, should be directed towards engaging students in the professional discourse of the unit or course they are undertaking. Therefore, we assess for the benefit of the student and ourselves, not exclusively in an evaluative way, although this is one component of assessment, but rather to engage students in the authentic manifestation of their course with regards to the world outside of the classroom. And, for ourselves, assessment should guide and direct our teaching.

Whether or not these outcomes are being achieved by current practice is open to conjecture. However, what is clear, both in our experience and in the literature, is that while innovative forms of assessment have been gaining traction in recent years, there is still a significant sector of the tertiary community that has not relinquished its hold on traditional assessment practices that have the potential to disengage students and have a negative impact on their learning (James et al. 2002).

In creating these models we relied heavily on the ideas of communities of practice, situated learning and legitimate peripheral participation (e.g. Lave & Wenger 1991; Wenger 1998) and sought to develop learning communities within our courses. The introduction of learning communities is an essential aspect of the successful implementation of the models as we are seeking to share knowledge and experience with our students as a part of their induction into the teaching profession. By democratising the assessment process and allowing our students to be integral in the development of assessment, the marking of the assessment and providing feedback on the assessment, we are not only reengaging them in their course content, but also providing them with the professional skills they need when they enter the workforce. Additionally, we are seeking to instil in our students the capacity for the development of innovative ideas and to demonstrate to them how the successful implementation of those ideas can change the educative process so that they can be creative in their own pedagogical approach to teaching.
AASL – Authentic Assessment for Sustainable Learning (see appendix 1a)

In the AASL model, self-assessment, peer assessment and lecturer assessment are combined to produce a summative grade for the student. In this model:

- Lecturer assessment accounts for 40% of the overall mark, allowing it to act as a moderator for the self and peer assessment.
- Two peers will collaboratively mark another student’s anonymous task. While the peers must collaborate during the process, with verbal communication being an integral aspect, they do not have to agree on the mark given. Each peer’s mark will account for 15% and the total peer assessment accounts for 30% of the overall mark.
- Lastly, the student will mark their own task against the set criteria. The self-assessment will account for 30% of the overall mark, thus empowering the student to critically reflect on their work in relation to their peers.

ASPAL – Authentic Self & Peer Assessment for Learning (1) (see appendix 1b)

While the AASL model is our model for assessment, ASPAL constitutes the delivery method for the AASL model. In our research at UNDA, we have also compartmentalised this process into various stages and have differentiated the process for individual assessment tasks and group assessment tasks, but the premise of the model is as follows:

In the delivery of AASL, we begin with a formal survey of the students to ascertain their attitudes and perceptions of engagement at the tertiary level; their level of satisfaction with the current assessment practices at the institution; and, their preliminary thoughts with regards to the AASL and ASPAL model of assessment which they have explored theoretically prior to the actual process. The next stage in the process is collaboratively developing marking criteria for their task. In an ideal environment, the task itself would also be collaboratively developed, but current institutional requirements restrict this. The next stage in the process is the pilot marking session. This provides the students the opportunity to mark assignments similar to the one they have been asked to produce and serves multiple purposes: it builds confidence in the students with regards to their ability to mark their peers’ work; it allows them the opportunity to see what constitutes a ‘good’ and ‘bad’ mark on a task similar to the one they will hand in; it helps to develop a mutual understanding of the marking criteria and how it is applied to the task; and finally, it helps the student to develop the skills of judgement with regards to their own work and the work of others. The next stage of the process is the marking itself; while detailed plans have been created to deal with this part of the process these will not be discussed at this time. Accurate and timely feedback is a crucial component to assessment (Hattie & Timperley, 2007), and this process facilitates this by allowing the immediate return of peer assessed papers containing written feedback and grades. Students will receive feedback - both quantitative marks and qualitative comments - from each of the peers who marked their paper and from the lecturer. Those three forms of feedback, along with their own reflections from their self-assessment, enhance the depth and breadth of the feedback they receive and form the basis for improved performance in the future. The students are then surveyed at the end of the semester to note any changes in their perceptions.

1 While extensive research has been conducted with regards to self and peer assessment and the implementation of those assessments, this paper concerns the development and theoretical justification for the development of these models and does not seek to justify their validity at this time. These models have been implemented in undergraduate education units in both the primary and secondary courses at the University of Notre Dame, Australia and the results of those trials will be published separately.
Implications

The propositions put forth in this document are in-line with what the current research suggests from around the world: traditional assessment practices in the tertiary sector are not meeting the needs of 21st century learners (Lamprianou & Athanasou, 2009; James et al., 2002; Falchikov & Thomas, 2008).

Shepard (2000) suggests that traditional forms of assessment perspectives emphasise a theoretical framework of ‘scientific measurement’ and were aligned with the traditional ideas and beliefs about learning. The problem with this type of conceptual framework is that it seems to be the prominent ideology in many courses in higher education today, and it does not align with current ideas with regards to constructivist learning that is focused on critical thinking, creativity, and autonomous learning. In specific relation to pre-service teacher education, it is imperative that we cultivate the educational and pedagogical environments that our students are accustomed to and will be working within, in the teaching profession.

The conceptual development of these two models occurred over the length of a semester and we are currently trialling these models with approximately 300 undergraduate education students. There are considerable implications in the implementation of these models that could make it unsuitable for many university courses. The size of courses and the absence of tutorials in certain courses may not suit this model of assessment. We believe that this model of assessment is suitable in all faculties; however, we do recognise our bias towards education students and the development of professional skills that are required for the teaching profession. That said, we consider that the skills encouraged throughout this assessment process: critical thinking, judgement, autonomous learning are skills increasingly required by all students entering the 21st century workplace and should be promoted in all courses of study.

The development, evaluation and implementation of pedagogical practices which engage students is a never-ending process that must be revisited in order to ensure that we are providing a useful, authentic and sustainable education to our students that will have value throughout their lives. Our focus in the development of this model has been with regards to engagement and our fundamental belief that education is about building relationships with students. Through the development of learning communities in higher education we invite students into the world in which we operate, and in which they will operate upon completion of their degree. As educators we are initiating our students into an understanding of the professional skills and attributes they will require in their careers.

In pursuing the objectives of authentic and sustainable assessment, it is paramount that the focus be on enhancing the students’ capacity for learning and engagement with the curriculum. Through a shared understanding of the assessment process and the criteria for success, we open up the educative realm to the students and invite them to be a part of the process rather than an observer on the periphery seemingly subject to arbitrary pronouncements. If we can encourage students to become part of the assessment process we are encouraging them to become autonomous in their learning and then educative transformation can occur.

Meeting the Needs of the Stakeholders through Effective Communication: What Teachers Can Do

In a climate of high-stakes testing, teachers feel a great deal of pressure to have students meet benchmarks and state standards as student learning comes first. Building principals are concerned about students’ overall performance and the need to communicate student performance to parents. Parents/guardians are concerned about how their children are behaving at school, their grades, and their social interactions. Yet, there are many are concerned about spending taxpayers’ dollars, while others are concerned about high school graduates’ acceptance into college. These individuals are stakeholders in what happens in the classroom. This paper will focus on the four groups of individuals who have a vested interest in students’ learning and school success, will provide ideas that teachers can do to communicate with those individuals, and will illustrate ways to support each group’s efforts to make school a meaningful place for students to learn.
Analyzing The Cost-Effectiveness of Instruction Expenditures Towards High School Completion Among Oahu’s Public School Districts

Larson Ng, Ph.D.

Email: Lng@hawaii.edu

ABSTRACT

The following study attempted to ascertain the instructional cost-effectiveness of public high school teachers towards high school completion through a financially based econometric analysis. Essentially, public high school instruction expenditures and completer data were collected from 2000 to 2007 and bivariate interaction analyzed through a correlation and linear regression procedure. Based on the collective results, with the exception of the Leeward District that reported a statistically significant positive relationship, a statistically insignificant positive relationship was noted for the Central District; and a statistically insignificant negative relationship noted for both the Honolulu and the Windward District. Consequently, based on the findings of this study, public high school teachers in the Leeward District had a more economically positive influence towards high school completers in contrast to the other school districts on Hawaii’s Island of Oahu from 2000 to 2007.

INTRODUCTION

Instruction is one of the most critically important factors that contribute to high school completion, where it is the teachers that facilitate the transfer of knowledge necessary for students to graduate high school (Westfall, Peltier, Sheehan, & Weber, 2006). Although there are many techniques to measure the productivity of educational instruction, assessing its effectiveness through a financial perspective remains one practical way to accomplish this task (Beard, 2009). Consequently, this study will specifically analyze Hawaii’s Department of Education’s (DOE) high school instruction expenditures (i.e., teacher salaries and benefits, substitutes, instructional paraprofessionals, pupil-use technology, software and instructional materials, trips, and supplies) and its econometric relationship with high school completers among the four school districts on Hawaii’s Island of Oahu (Hawaii Department of Education, n.d.). With this research, it is hoped that the findings will provide a current snapshot of the effectiveness of Hawaii’s DOE high school teachers in fostering completion within the four school districts on Oahu from an economics perspective.

INSTRUCTION EXPENDITURES, GRADUATION CLASSES, AND COMPLETERS

The following section will go over the DOE’s high school instruction expenditures, size of its graduation classes, and high school completers for the four school districts on Oahu from 2000 to 2007.
Historical Results: Honolulu District

Table A1 summarizes the DOE’s inflation adjusted (i.e., Base Year = 2000) high school instruction expenditures, size of graduation classes, and high school completers in the Honolulu District from 2000 to 2007. Based on Table A1, high school instruction expenditures have been consistently increasing on an average of 6.3% with a standard deviation of $5,777,270 per year, respectively. The lowest increase in high school instruction expenditures was actually a decrease occurring during 2000 to 2001 and its highest increase seen during 2002 to 2003. Graduating classes has been slowly declining during this period and had an overall negative average growth rate of -0.7% with a standard deviation of 96 students per year, respectively. The smallest graduating class was reported in 2003 and its largest reported in 2000. Completers also experienced a similar trend during this time frame with a negative average growth rate of -0.7% and a standard deviation of 99 students per year, respectively. The lowest number of completers was recorded in 2003 and its highest recorded in 2000.

Historical Results: Central District

Table A2 summarizes the DOE’s inflation adjusted (i.e., Base Year = 2000) high school instruction expenditures, size of graduation classes, and high school completers in the Central District from 2000 to 2007. Based on Table A2, high school instruction expenditures have been consistently increasing on an average of 7.6% with a standard deviation of $6,225,588 per year, respectively. The lowest increase in high school instruction expenditures was actually a decrease occurring during 2000 to 2001 and its highest increase seen during 2002 to 2003. Graduating classes has been slowly increasing during this period and had a low average growth rate of 1.2% with a standard deviation of 71 students per year, respectively. The smallest graduating class was reported in 2001 and its largest reported in 2007. Completers also experienced similar growth during this time frame with a low average growth rate of 1.2% and a standard deviation of 77 students per year, respectively. The lowest number of completers was recorded in 2003 and its highest recorded in 2007.

Historical Results: Windward District

Table A3 summarizes the DOE’s inflation adjusted (i.e., Base Year = 2000) high school instruction expenditures, size of graduation classes, and high school completers in the Windward District from 2000 to 2007. Based on Table A3, high school instruction expenditures have been consistently increasing on an average of 7.3% with a standard deviation of $4,333,084 per year, respectively. The lowest increase in high school instruction expenditures was actually a decrease occurring during 2000 to 2001 and its highest increase seen during 2002 to 2003. Graduating classes has been slowly declining during this period and had a negative average growth rate of -0.5% with a standard deviation of 37 students per year, respectively. The smallest graduating class was reported in 2003 and its largest reported as a tie in 2001 and 2002. Completers also experienced similar slow declining growth during this time frame with a negative average growth rate of -0.5% and a standard deviation of 36 students per year, respectively. The lowest number of completers was recorded in 2005 and its highest recorded in 2001.

Historical Results: Leeward District

Table A4 summarizes the DOE’s inflation adjusted (i.e., Base Year = 2000) high school instruction expenditures, size of graduation classes, and high school completers in the Leeward District from 2000 to 2007. Based on Table A4, high school instruction expenditures have been
consistently increasing on an average of 9.7% with a standard deviation of $9,535,619 per year, respectively. The lowest increase in high school instruction expenditures was seen during 2000 to 2001 and its highest increase seen during 2002 to 2003. Graduating classes has seen much consistency during this period and had a low average growth rate of 2.7% with a standard deviation of 185 students per year, respectively. The smallest graduating class was reported in 2001 and its largest reported in 2006. Completers also experienced similar consistency during this time frame with a low average growth rate of 2.8% and a standard deviation of 162 students per year, respectively. The lowest number of completers was recorded in 2000 and its highest recorded in 2006.

METHODOLOGY

In order to investigate the econometric relationship of high school instruction expenditures towards high school completion among the DOE’s four school districts on Oahu, this research employed the following methodology. The study initially acquired the DOE’s high school instruction expenditures and completer data from 2000 to 2007. Upon separating the data by high school and adjusting instruction expenditures for inflation (i.e., Base Year = 2000), econometric techniques consisting of both correlation and linear regression were utilized and key statistics recorded. The study then analyzed the statistical relationship between high school instruction expenditures and completers. Data used for these analyses were acquired from Hawaii’s DOE websites and the study’s econometric results were generated with the use of PASW 18.0 for Windows.

RESULTS

The following will initially present the econometric results of both the correlation and linear regression analyses that were utilized to ascertain the statistical relationship of the DOE’s high school instruction expenditures towards completers among the four school districts on Oahu.

Quantitative Results: Honolulu District

Based on Table A5, the Pearson correlation coefficient was -0.333 and found statistically insignificant. This figure suggests that there was a weak negative correlation between the DOE’s high school instruction expenditures and completers from 2000 to 2007. In looking at the results of the linear regression, an \( R^2 \) of 0.111, ANOVA significance value of 0.420, and an unstandardized coefficient of \(-0.000005707\) were reported (See Table A5). Hence, although the results of the linear regression revealed the existence of a negative relationship between the DOE’s high school instruction expenditures and completers, it was not a statistically significant relationship during 2000 to 2007.

Quantitative Results: Central District

Based on Table A5, the Pearson correlation coefficient was 0.544 and found statistically insignificant. This figure suggests that there was a moderate positive correlation between the DOE’s high school instruction expenditures and completers from 2000 to 2007. In looking at the results of the linear regression, an \( R^2 \) of 0.296, ANOVA significance value of 0.163, and an unstandardized coefficient of \(0.000006762\) were reported (See Table A5). Hence, although the
results of the linear regression revealed the existence of a positive relationship between the DOE’s high school instruction expenditures and completers, it was not a statistically significant relationship during 2000 to 2007.

Quantitative Results: Windward District

Based on Table A5, the Pearson correlation coefficient was -0.587 and found statistically insignificant. This figure suggests that there was a moderately negative correlation between the DOE’s high school instruction expenditures and completers from 2000 to 2007. In looking at the results of the linear regression, an $R^2$ of 0.344, ANOVA significance value of 0.126, and an unstandardized coefficient of -0.000004837 were reported (See Table A5). Hence, although the results of the linear regression revealed the existence of a negative relationship between the DOE’s high school instruction expenditures and completers, it was not a statistically significant relationship during 2000 to 2007.

Quantitative Results: Leeward District

Based on Table A5, the Pearson correlation coefficient was 0.889 and found statistically significant. This figure suggests that there was a very strong positive correlation between the DOE’s high school instruction expenditures and completers from 2000 to 2007. In looking at the results of the linear regression, an $R^2$ of 0.791, ANOVA significance value of 0.003, and an unstandardized coefficient of 0.00001512 were reported (See Table A5). Hence, there was a very strong statistically significant positive relationship between high school instruction expenditures and completers during 2000 to 2007.

CONCLUSIONS

The following will present this study’s major findings/implications, limitations, and areas for future research.

Major Findings / Implications

The results of this study provided an econometric view of the nature of the relationship between the DOE’s high school instruction expenditures and completers among Oahu’s four school districts from 2000 to 2007. From a historical standpoint, although instruction expenditures had increased in each case, the expected symbiotic increases in completion did not positively correlate for both the Honolulu and Windward Districts during that period. Based on the econometric analysis, only in the Central and Leeward Districts did positive linear relationships were observed and with only the Leeward District having any kind of statistical significance. In summary, instruction expenditures were statistically observed as cost-effective for only the Leeward District, but seen as a marginal influence in the Central District and actually observed as a negative influence towards high school completion in the Honolulu and Windward District from 2000 to 2007.

Based on the results, it would appear from this study that instruction expenditures had lackluster influence on high school completion in only half of the school districts on Oahu. Given the current budgetary crises facing Hawaii, it would behoove DOE officials and State lawmakers to begin assessing and refocusing their efforts in making those deciding on the use of district and high school funds for instruction more accountable to the benchmark goals set forth
by the DOE in conjunction with their communities. Fiscal accountability to the parents whose children attend public school is one of the major keys in sustaining quality education. Hence, active scrutiny from both the DOE and its community partners must be practiced to ensure what little educational funds are available are maximized in the public school students’ interest.

**Study Limitations**

The first major limitation of this study revolved around the issue of representation. The independent variables of this study were more of a vector rather than scalar in nature. In particular, the aggregated values for each of the examined Oahu school district does not actually represent the actual data for each of its high schools; hence, possibly giving the wrong impression that all the high schools within the district as having the same performance with the district as a whole. The second major limitation of this research lies with the complexity of measuring instructional effectiveness. In any assessment oriented quantitative studies that are undertaken, it is not sufficient to gauge instructional effectiveness by quantitative means alone. Consequently, this study should serve as but one quantitative study in a succession of other studies that tries to assess the cost-effectiveness of instruction towards high school completion.

**Areas for Future Research**

This study compared the econometric relationship of the DOE’s high school instruction expenditures towards completers among the school district’s located on Oahu. However, similar studies on the individual high schools should be conducted. Such studies would allow for a clearer picture on what schools were seen as being most influential in steering the current trends for their respective school district. In addition, research that seeks to uncover the econometric relationship between the other functional areas of the DOE’s educational expenditures (i.e., instructional support, leadership, operations, and other commitments) towards high school completion should be conducted (Hawaii Department of Education, n.d.). Such studies would provide a cross-expenditure effectiveness perspective as well as illustrate how the other functional expenditure areas of the DOE contribute to high school completion. Finally, given the budget shortfall besieging Hawaii, the suggestions above should be undertaken with a sense of urgency by educational, legislative, as well as community researchers. Such research would ultimately work making sure that educational quality is not being circumvented, despite the current financial situation.

Abstract

Beginning teacher induction is an important process in acculturating teachers to their new profession (Kearney, 2010). Researchers argue that the first year of teaching is crucial in the success, retention and development of teachers (Smith & Ingersoll 2004). The aim of this research is to ascertain the effectiveness of induction programmes in Catholic Independent High Schools in NSW; establish whether those programmes are congruent with what the literature deems as best practice; and to determine the implications this has for policy for the independent school sector. The study will comprise: an extensive literature review; a document review of induction/mentoring policies in NSW and in the schools chosen for the research; and in-depth interviews with administrators and participants of induction programmes. Researchers point out that the support and guidance in the first year of teaching is critical in arresting growing attrition rates and enabling the capacity to establish beginning teachers as valuable members of the profession (Smith & Ingersoll 2004, Wong 2004). With a looming teacher shortage crisis in NSW, effective induction programmes could be the answer; however, there has been insufficient research, especially in the independent sector, with regards to these programmes.

Key Words
Induction, Beginning Teacher, Teacher Attrition, Mentoring
Introduction
The art of becoming a successful and effective educator is not one that happens overnight; however, in most cases this is what beginning teachers are faced with. Recent graduates who apply for a teaching position and get offered a job are often required to carry out the same responsibilities and function as the seasoned veteran in the next classroom, on the first day of their new career. Can this be right? Is there another profession that demands of its new recruits what it expects of their more experienced colleagues?

It is no wonder that in New South Wales, in particular, we are facing a teacher shortage crisis (Australian Associated Press [AAP], 2008). With the baby-boom generation of teachers nearing retirement and an estimated 40% of the teaching community retiring in the next five years, coupled with a 25% attrition rate of teachers within their first five years of teaching (Department of Education, Science & Training, 2003), we face an uncertain future. Is New South Wales, or Australia, any different from the United States or Britain? In the U.S., Ingersoll & Smith (2004) found that up to 40-50% of beginning teachers leave the profession in the first five years. The numbers are similar in the U.K. where 30% of teachers leave in the first five years (Adams, 2003).

There seems to be a growing trend in Australia for teachers to abandon their training and move on to other fields. While this was also the case in the United States, this trend has slowed significantly since the Global Financial Crisis and growing unemployment rates in the U.S.; however, it is possible that this trend will continue once the economy has improved and unemployment rates are low and steady. While it is difficult to speculate about the varying reasons teachers are leaving the profession, Smith and Ingersoll (2004) report a correlating link between teachers who are inducted into their workplace and attrition rates; they say that involvement in an induction program reduces the probability of teachers leaving the school or the profession by up to 20%. Noting this link between attrition and induction, and the ‘looming teacher crisis’ in New South Wales, it would seem practical and reasonable to suggest that implementing effective induction could help to improve the situation in the long-term.

The promotion of effective on-going induction is not new, nor is it unfamiliar in the New South Wales public school system. In 2002, the Australian commonwealth Government published, An Ethic of Care: Effective Programs for Beginning Teachers, which recommended induction and mentoring for all beginning teachers in Australia, and subsequently, NSW has instituted policy that mandates some aspects of the recommendations. This however, is not the case in many independent schools. Because all registered schools, public, independent, and Catholic systemic in Australia receive funding, there is scope to ensure that government recommendations are upheld; however, because of the lack of government monitoring and bureaucracy in independent schools, this does not seem to be the case.

This paper presents initial findings from research currently being conducted and will illustrate some of the key issues surrounding the problems faced by beginning teachers and how, through the implementation of effective on-going induction, these problems may be ameliorated. First, key ideas from the research and the literature in both the United States and Australia regarding induction will be presented. Second, findings from the literature review with regards to what constitutes effective induction will be presented and justified. Lastly, a discussion of the proposed methodology and expected outcomes of the research will be presented followed by concluding comments.

Key Findings from the Research
Defining Induction
If one inference can be made from the literature, it is that induction has various meanings and can be described in many different ways. Definitions of induction range from simple orientation (Martinez, 1994) to system-wide, on-going support that becomes part of an integrated professional development program (Wong, 2004). With such varying degrees of interpretation it is difficult for schools, and teachers, to understand what constitutes effective induction and for school leaders to implement...
programs. In Australia, the Department of Education, Science and Training (2002), notes that the term induction denotes a ‘critical phase’ in a ‘continuum of professional development’ (p.11).

Martinez (1994) says that the term induction needs to be considered very carefully to avoid an interpretation that results in orientation to the workplace. Therefore, for the purpose of this research project it was essential to determine what constitutes effective induction as a starting point in analysing current programs. The operational definition of induction for this research is based on the Australian Commonwealth Government’s recommendations and the Victorian state government’s definition, which is founded on the premise of developing learning communities:

Beginning teacher induction is defined as, “the primary phase in the continuum of beginning teacher professional development towards their progression into the learning community and continuing professional development throughout their career” (Kearney, 2010).

Problems Faced by Beginning Teachers

The difficulties beginning teachers face in commencing their career are well documented in the literature: failure to receive mentoring and supervision, receiving support for behaviour management, excessive responsibilities and lack of recognition for professional growth (McCormack, 2005; Ramsey, 2000) are all common issues raised by beginning teachers. While many of these same dilemmas might be faced in similar professions among newcomers, the extent to which teaching happens in isolation from professional peers, as well as the obvious variables of dealing with up to thirty students simultaneously, compounds these problems to the point that teachers face burnout (Wojnowski et al., 2003).

King and Newman (2000) report a correlating link between the extreme challenges faced by beginning teachers and the quality of teaching and learning that is occurring in those classrooms where teachers struggle. This is not a problem realised solely by academics and those conducting research, most of this criticism comes from anecdotal feedback received and research concerning the perceptions of teachers in their early career who indicate that professional development and support, specifically in their early years of teaching, would help alleviate some of the difficulties faced during this time (Desimone, Porter, Garet, Suk Yoon & Birman, 2001).

Attrition and Retention

Although the alarming attrition rates amongst teachers have been discussed, it is important to look at this from an alternate point of view, teacher retention. What is the responsibility of the profession with regards to teacher retention? Smith and Ingersoll (2004) found a correlating link between induction and a 20% increase in retention of teachers who were inducted into their workplace. The DEST in Australia, has stated that an on-going induction process “is essential for effective teaching” (2002, p.11). If the research confirms that induction is successful at retaining teachers, why do Smith and Ingersoll (2004) point out that in many cases, beginning teachers are left on their own, “to either succeed or fail in their own classrooms?” (p.682).

In 2002 the DEST found that administrative supervisors reported that 82.6% of teachers were mentored, while only 39.9% reported that they received mentoring. The overall findings in this study indicate, “variation and inconsistency in the management of induction” (DEST, 2002 p.16). The Australian Education Union has been conducting surveys of beginning teacher over the past few years and they have found that in each of the past three years, there has been an increase in the number of beginning teachers who report not having participated in either on-going induction or formal mentoring. In 2007 they found that 55.3% of teachers in their first three years of teaching had not had on-going induction and 52.7% had not had formal mentoring; this was a 7% increase from the findings of the previous year. These findings are in stark contrast to the recommendations of the Australian DEST (2002), which states that all beginning teachers should undergo an induction process that includes mentoring and on-going support. According to the Ramsey Report (2000) this systematic ambivalence towards recommendations is not uncommon in Australia:
Teaching is the most reviewed profession in Australia ... since 1980 there have been 20 significant national and state reviews of teacher education. The most common characteristic of these reviews has been the lack of action on their recommendations. This situation contrasts markedly with other professions (par. 35).

These findings are astounding when compounded with the current rates of attrition amongst beginning teachers. Induction programs for beginning teachers are thought to be the most useful practice to assist new teachers and prevent attrition and burnout (Serpell, 2000; Wojnowski et al., 2003), yet we ignore this aspect and complain about the looming ‘teacher shortage crisis’. Attrition however, should not be the sole justification for the introduction of induction, rather, there should be a focus on support, longevity and the subsequent effect it will have on the quality of teaching and learning in the classroom.

Theoretical Underpinnings of Induction

The conceptual groundwork for this research project relied heavily on Lave and Wenger’s Situated Learning (1991), which further relates to Vygotsky’s theory that learning is a social construct and that people best learn through social interaction. Based on the premise of social cognition, Situated Learning and Legitimate Peripheral Participation (Lave & Wenger, 1991) form the basis for the construction of learning communities in schools and amongst staff. Lave and Wenger (1991) suggest that such learning is situated in a specific context and embedded within a particular social and physical environment; in this case the school. Through a process of Legitimate Peripheral Participation, the beginning teacher becomes accustomed to the community (teaching profession) they have newly entered and through participation in that community they move from the periphery into full participation in that community; in this instance, through the process of on-going induction.

The transformation to a learning community is the purpose of an effective on-going induction program not only designed to relieve the stress of early career teachers, but also to acculturate that teacher into an organisation that is focused on professional learning and quality teaching and learning in the classroom (Kearney, 2010).

Characteristics of Effective Induction

A review of five relevant studies1 was conducted to determine what constitutes effective induction: AEU 2006, which surveyed beginning teachers across Australia; NCTAF 2005, which examined induction into learning communities in schools across the U.S.; Smith and Ingersoll (2004), which investigated the effects of induction on beginning teacher attrition; Wong (2004), which considered the ways that induction programmes help improve beginning teacher practice; and, DEST (2002), which examined effective programmes for beginning teachers in Australia. Of the fifteen elements of induction mentioned in the five studies, the elements that were chosen to denote effective induction for the purpose of this project had to be represented in three of the five studies. Only one element of induction was advocated by all five of the studies as being essential for effective induction, Provision of a Mentor. Structured time release, external meetings and seminars, and being part of a larger professional development program were deemed essential by four of the five studies. Lesson observation and multi-dimensionality scored lowest, only being mentioned by one of the five studies. The other three elements that make up the seven ‘best practice’ characteristics for effective induction are: professional support, collaboration with staff and beginning teacher conferences.

The seven characteristics of ‘best practice induction’ for the purpose of this research are:

- Professional Support
- Structured Time Release
- Collaboration with Staff

---

1 Wong 2004; Ingersoll & Smith 2004; NCTAF 2005; AEU 2006; DEST 2002
• External Meetings or Seminars
• Beginning Teacher Conferences
• Provision of a Mentor
• Induction as part of a larger school, district, or state based programme of learning

Methodology
A qualitative, collective case study has been selected for this research project to examine the nature of effective induction in the particular schools chosen. Because this study specifically involves independent Catholic schools, it will be important for the researcher to focus solely on the particular characteristics of those schools and their programs in the given context. Stake (2000) states that collective case studies are chosen because it is believed that, “understanding them [the various cases] will lead to a better understanding perhaps better theorizing, about a still larger collection of cases” (p.437). While this study will concentrate on the six cases chosen, it is not intended that these cases will be typical of the norm; rather, it is the exceptionality of these cases that will be showcased. This project is concerned with the process and nature of induction on a broader scale throughout the independent education sector; therefore, it hopes to present the nature of effective induction and make recommendations to apply this on a broader scale.

The study will comprise four phases:

• The first phase is an extensive literature review, the purpose of which is twofold:
  o to develop an operational definition of induction for the purpose of the study, and
  o to determine the critical elements for ‘best practice’ induction, which will establish the schools that are selected for the study and their congruence with the literature.

• The second phase will be the selection of the schools to be part of the collective case study.
  o This will be done through purposive sampling. The researcher has worked in the Independent Catholic education sector and will use contacts at particular schools, the AIS (Association of Independent Schools) and the IEU (Independent Education Union) to ascertain what schools are conducting effective induction.
  o The collective case study will comprise of three boys’ and three girls’ Catholic Independent high schools in the Sydney region. Sydney was chosen because it has the densest population of these schools in NSW. And single gender schools were chosen because there are only two co-educational Catholic independent high schools in Sydney, and therefore are not typical of the population.

• The third phase is a policy review.
  o An examination of policies and policy statement of administrators of induction programs and/or executive boards of the schools that are chosen for the study.
  o An extensive review of policies, documents, recommendations and procedures regarding induction by government departments, unions, and other organisations that work in conjunction with the independent education sector, i.e. IEU, AEU, AIS.

• The final phase of the research will be interviews with the administrators of the induction program and beginning teacher participants of those programs.
  o In-depth interviews will first be conducted with administrators of the program to ensure that the program selected meets the criteria for ‘best practice’ induction.

---

2 The first phase has been completed and has been reported in this paper
These interviews will be used to identify: congruency with administrative expectation and teacher goals; compatibility with best practice; how the programs were developed; and, how the program is evaluated and improved.

- In-depth interviews with teachers who are or have participated in the program.
- These interviews will be used to determine the nature of the program implemented, specifically: purpose, success factors, limitations and the processes of administration of the program.

**Expected Outcomes & Implications**

This study hopes to ascertain the nature of effective induction in independent Catholic high schools in NSW and make policy recommendations to the AIS (Association of Independent Schools) to implement professional development programs for school administrators to instruct them with regards to the value of implementing induction for their beginning teachers. A central aim in this research project is to give teachers a voice with regards to what they think and what they need to support them through those critical first few years in their careers so that they may flourish as educators and provide the best educational experience to their students. Lastly, this study can provide a platform for further research within the independent education sector nation-wide in Australia to ensure that there is more monitoring in these schools, and government recommendations and policies are being implemented and adhered to. Further research could examine the positive and negative effects of the programs in this study, to validate the findings that these programs are successful.

**Concluding Comments**

The definition of induction can be determined through a review of the literature; however, further research is needed to determine how schools in the independent sector define and implement induction. The finding by the DEST (2002) about the discrepancy between what is reported and what is actually happening suggests that induction is not fully understood by administrators or inductees. The research also reveals that many systems fail to differentiate between the terms mentoring and induction and often use the terms interchangeably (Wong 2004). This fundamental misunderstanding of the rationale and objective of induction makes further research necessary.

While significant research has been conducted in induction, most of the pre-eminent studies in Australia are nation-wide studies, which, while significant, have not focussed on any particular system in order to propose detailed modifications to improve current practice. What is needed is additional rigorous and specific research that examines the nature and context of beginning teacher induction in particular sectors of education so that policy proposals can be made where current policy is either inadequate or does not currently exist. The independent sector of education, because it is the least regulated by both federal and state agencies and has no bureaucratic hierarchy, can potentially be seen as the sector that may be the most non-compliant with current trends, suggestions and mandates by the governing institutions.

In NSW, the governing body for teacher certification is the NSW Institute of Teachers. While this body does not implement policy, they have the capacity to mandate certain criteria for beginning teachers before they become ‘professionally competent’. In 2005 the Institute welcomed the Australian Government’s establishment of a National Institute of Quality Teaching and School Leadership, which listed induction and mentoring as key elements for improving teaching across Australia; this however, has not resulted in mandating any such programmes or requirements for beginning teachers in NSW.

The successful development of early career teachers into effective educators needs to be at the forefront of educational reform. If we acknowledge that quality teaching is one of the most, if not the most, significant factor effecting student achievement levels (Hattie 2003), then ensuring that teachers are capable of delivering quality education has to be at the forefront of educational reform.

This paper seeks to open the discussion with regards to the importance of induction and mentoring to new teachers. The ‘sink or swim’ mentality of the 20th century needs to be revolutionised to foster the
career and the development of our young teachers, to make them effective educators of the next generation. By ignoring our teachers’ development into successful and effective educators, we are subsequently overlooking their impact on future generations.

Abstract

The purpose of this study is to investigate the implementation of kindergarten-primary transitional strategies on children of the new immigrant in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County. The study adopts literature analytic method and questionnaire survey. The results of the study are as follows:

1. The implementation of kindergarten-primary transitional strategy of "School adaption": the result of the dimension in "Life adaption" is “good”, and the results of the dimensions in "Curricular content", “Learning attitude” and “Learning methods” are “normal”.

2. The implementation of kindergarten-primary transitional strategy of "Life adaption": the result of the dimension in “Adaption for self-life-management” is “very good”, the results of the dimensions in “Adaption for regulations” and “Adaption for interpersonal relationship” are “good”.

3. The implementation of kindergarten-primary transitional strategy of “Special assistance for children of the new immigrant”: the results of the dimensions in “Link between kindergarten and primary school”, “the link among family, school and the community”, and “personal needs of children of the new immigrant” are "remain to be improved”.

4. The implementation of the kindergarten-primary transitional strategy of “School life adaption”, “Life adaption” and “Special assistance for the children of the new immigrant” reaches significant difference on variable “Scale of the preschool educational institution”, “Number of teachers”, “Number of students in top class in kindergarten”, “Number of children of the new immigrant”, “Implementation of the subsidiary service of after-school nursery” and so on.

Keywords: Kindergarten-primary transitional education, Education for children of the new immigrant, School adaption, Life adaption
I  Preface

The purpose of preface is to explore the related study background and the main focus of the study, including: (1) Study background and motivation (2) Purpose of the study (3) Study questions.

1. Study motivation and study background

In Taiwan, post-industrialization has widened the difference in personal income and enlarged the gap between the rich and the poor. What’s worse, the influence of globalization has resulted in more violent competition in trading, increasing unemployment rate and the deterioration of gap between the rich and the poor; therefore, students with deficient social resources have greater difficulty adapting themselves to this society. In the process of fulfilling the dreams, it happens that some children can’t make their dreams come true, such as the physically-challenged, the poor or children living in a remote area. These children are categorized as those who have deficiency in physical condition, economic status, living environment, cultural incentives and access to information. Lin(2009) specifically pointed out that education is the only effective way to get these children out of poverty and help them catch up with others in their studies regardless of the fact that they come from either the new poor family or the near poor family. Chen(2009) also put forward that school along with the social administrative organization can work together to help disadvantaged students to maintain equal opportunity and quality in learning; besides, to help them study in class without worrying their basic living quality has become the top priority.

In Taiwan, some countries in remote areas are surely categorized as disadvantaged school district. They have to face the problem of increasing outward migration of population. Lin(2009) pointed out that the formation of disadvantaged school district usually derived from the outward migration of economy as well as population. The gradual lack of economic capital and cultural capital year by year causes the serious problem in outward migration of outstanding students. As a result, the situation of the disadvantaged school districts has become worse and worse.

Hung(2009) pointed out that in the context of globalization, formation of international enterprises, and global labor market cause the international movement of working population and the immigration of foreign workers. Besides, the revolution of transportation has made the international marriage and multiple nationalities much more common. Thus, when speaking of education for immigrants, we should put emphasis on the following issues, such as social and cultural adaption, the education on children of the new immigrant, the understanding and acceptance of multiple cultural differences. (Hung, 2002)

Ryan and Grieshaber(2005) advocated that more globalized issues be emphasized in our child education, such as racial and economic subjects. The existing elements of active, heterogeneous, multi-linguistic, multi-cultural facts draw our attention to the upcoming child education. Page(2000) also hold the point that family, culture and community play an vital role in the development of skill, ability, life experience, value, and achievement in a child’s future life. Currently, in our educational reform, the understanding of both local racial culture and various kinds of
international cultures is being emphasized in the Nine-year Compulsory Education as well as seen as the required characteristic of a future citizen. The enforcement of multi-cultural education has become the top priority. (Hung, 2009) The child education and its system are part of the cultural environment which are constantly shaped and changed by the ongoing globalization. (Hsu, 2009)

The immigrant population from south-east Asia has increased in these two decades. (Hsu & Hsu, 2008) The former studies showed that the new south-east Asian immigrant will face a number of problems after moving to Taiwan, such as communicating problem, different eating habit, varied climate, confined interpersonal relationship, deviant family concepts, excessive self-protection, unstable family structure, and limitation on their educational degree and ability of Chinese, and so on. These studies also showed that the new immigrants not only face those personal problems but also their children may confront many educational difficulties (Yang, 2006; Chen & Chou & Huang & Huang, 2004; Ke, 2004), including problems in children’s mental development because their immigrant parents are lack of nursery information, problems in children’s school learning because their immigrant parents have difficulty in interpersonal communication. What’s worse, some immigrant marriage may fall into commodification. (Wang & Chang, 2001; Hsia, 2000) If these children of the new immigrant don’t get good care, or enough social stimulations, it’s highly possible that they will have problems in future adaption in the society. Therefore, preschool education should take responsibility for educating these new immigration children and help them adjust to the society well during the kindergarten-primary transitional period.

In Taiwan, the enrollment rate of children of the new immigrant has reached the climax since 2002. In schools of certain counties, the children of the new immigrant will occupy over 20 percent of the first grader in primary school. (Chinatimes, 2002) In addition, the number of children of the new immigrant of 2006 has transcend the number of aboriginal students and become the largest group subsidized by the government in nine-year compulsory education system. (Yang, 2006) Based on the statistics, the number of children of new immigrant from different cultural backgrounds is on the rise, at the meanwhile, the whole Taiwan society is now in the trend of the decline in birth-rates. The above-mentioned phenomenon has become an important part of Taiwan education.

As for the learning condition of children of the new immigrant in the preschool phase, Hsu and Hsu (2008) discovered that if we utilize after-school picture book reading method, the designed interventional guiding activities, their linguistic comprehensive competence, pronouncing ability, oral expression and other aspects of development in language will be greatly improved. Therefore, we can infer that the poor academic performance of these students result from limitation on the non-personal background, especially the lack of social stimulations. If we can be active in providing adequate support for these students in the kindergarten-primary transitional phase, that will be a great help for their adaption in learning.

Hsu (2009) also mentioned that the preschool education is essential to the children of the new immigrant especially in their communication skill, interpersonal interaction, social adaption and the formation of recognition, which pave the way to
get better competitive ability. Both government and civil organization all pay attention to the issue that how to effectively improve the linguistic ability of children of the new immigrant now.

The purpose of promoting the kindergarten-primary transitional education of the children of the new immigrant is to improve their adaption ability, which is greatly emphasized in top class of kindergarten. Sun(2005) proposed that the implementation of kindergarten-primary transitional education in top class should adopt gradual management for group regulation, rearrange the classroom tables and chairs, help them adapt to primary school classroom in advance and so on. Hsu(2009) also advocated that improvement of their adaption can be done by helping them adjust to the school bell rings and how to use the toilet, by guiding them to get familiar with the school surroundings, by the cooperation between kindergarten or primary teachers, even by teaching them Chinese spelling and word recognition in advance. However, as the parents’ excessive expectation come along with the test-oriented education system, our teaching may fall into the dull and repeated drill.

Chang(2003) pointed out that special children from kindergarten to primary school phase need the transitional educational measures which has at least five following features: 1. A well-designed and individualized transitional plan: which takes children’s individual differences into consideration, make good use of their critical time and can assess the implementation of various service of in-time intervention. 2. development of ones’ fundamental ability in adjusting to the environment: which includes ability of taking care of oneself, obeying regulations, managing one’s life, interacting with others and controlling one’s temper, ect. 3. the efficient use of family supporting system: which is the key element to successful transitional education. 4. system of providing supportive service in group work: which makes adquate project, has good filing management, cooperates with others well and provides various supportive and related transitional service. 5. Government’s providing measures of transitional service: which includes the enactment of regulation relating to kindergarten-primary school, establishment kindergarten-primary transitional system, opportunity offered to teachers for retraining, promoting of parenting education, providing resource room, professional assistance, individualized family service project and so on.

Hains, Rosenkoetter & Fowler(1991) once pointed out that during the transitional process, we need systematic planning, formative assessment, continual refinement and parental involvement to meet individual’s need. Although children of the new immigrant aren’t categorized as special children, in their growing process, they have to face plenty of limitation on language, culture, living surroundings and self-recognition. Therefore, compared with normal students, children of the new immigrant need more assistance for adaption, and that’s why the strategies of kindergarten-primary transitional education become so much more important.

In school adaption, Xu(1987) indicated that this issue should contain student-teacher relationship, adaption in learning, and peer relationship and so on. Tsai(1993) pointed out the problems of adaption in the first grader in primary school, including problems in curricular comprehension, adjusting to learning environment, learning style and learning pressure which make these children feel ill at ease in
school. Chen(1999) mentioned that the problems of adaption should include the aspects of learning behavior and attitude toward school. Sun(2004) also advocated that on one hand, with the change in curricular design in nine-year compulsory education, the teaching content has become more interesting and attracting, but on the other hand, more pressure in learning has increased. Other factors like the number of students of a class, the proportion between teacher and student, children’s cultural and social background and parents’ attitude toward education still affect the adaption to school and learning in the kindergarten-primary transitional phase. The main difference between kindergarten and primary school is the way of teaching, class management, regulation enactment, curricular design, assessment on learning, classroom decoration, communication between parents and teachers. The above-mentioned differences actually accounts for the difficulty in their adaption in the transitional phase.

Xu(1987) proposed that life adaption should include adaption for regulation and ability in self-management. Chen(1999) mentioned that the factors accounts for the poor life adaption should contain student-teacher relationship, and interpersonal relationship and so on. Sun(2004) also advocated that the main problem in adaption can be divided into three aspects: in life aspect, it includes adaption in regulation, interpersonal relationship, self-management; in learning aspect, it includes curricular content, learning environment, learning attitude, learning methods. The reasons to the problems may include the different type between kindergarten and primary school, personal problem as the first grader, parental attitude, and teaching staff in both two types of education institutions as well as the different learning surroundings.

Foreign studies showed that the early experience in school will affect the learning behavior, academic performance and peer relationship afterwards. (Alexander · Dauber & Entwisle · 1996; Kagan & Neuman · 1998) As a result, during the transitional process, the problem of the adaption in school and life can’t be overemphasized, of which the adaption of children of the new immigrant in disadvantaged school district requires much more active intervention to promote their study. In conclusion, the kindergarten-primary transitional education is more common in normal school district, but it doesn’t aim at meeting the need of children of the new immigrant and those disadvantaged school districts. Therefore, this study focus on how these kindergarten-primary transitional educational institutions in remote areas of Taoyuan, Hsinchu and Miaoli county provide more concrete assistance for improving their adaption in school and in daily life.

2. Purpose of Study

Based on the above-mentioned study background and motivation, the purposes of this study are as follow:

(1) To get a clear understanding of the implementation of kindergarten-primary transitional strategy on “School adaption” in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County.

(2) To get a clear understanding of the implementation of kindergarten-primary transitional strategy on “Life adaption” in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County.
(3) To get a clear understanding of the implementation of kindergarten-primary transitional strategy on children of the new immigrant in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County.

(4) To provide concrete strategies and suggestions for the implementation of kindergarten-primary transitional education as reference.

3. Study Questions
Based on the study purpose, the study questions are as follow:
(1) What’s the implementation of remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County?
(2) What’s the implementation of kindergarten-primary transitional strategy on “School adaption” in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County?
(3) What’s the implementation of kindergarten-primary transitional strategy on “Life adaption” in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County?
(4) What’s the implementation of kindergarten-primary transitional strategy for children of the new immigrant in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County?
(5) What’s the connection between the implementation of preschool educational institutions and the kindergarten-primary transitional strategy?

II. Study method

1. Study sample
The sampling of this study focuses on the 30 remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County, 10 schools for each county, including public and private ones. Questionnaire survey as the study method is mainly delivered to the president or owner of the preschool educational institution. The delivery of the questionnaire is handing in person by a designated agent. Thirty questionnaires is delivered and recycled; thus, the recycling rate reaches to 100%.

2. Study tool
This study adopts literature analytic method and focuses on the analysis of kindergarten-primary transitional education. These analyses are divided into four parts: (1) the implementation of preschool educational institutions; (2) scale for the school adaption; (3) scale for the life adaption; (4) scale for the special assistance for the new immigration students. The questionnaire survey is based on Likert-type scale. The higher scores one gets in mean, the more common it is in the implementation of this strategy. The mean scores between 4.01~5.00 represents that the condition of implementation is “very good”; the mean scores between 3.01~4.00 represents that the condition of implementation is “good”; the mean scores between 2.01~3.00 represents that the condition of implementation is “normal”; the mean scores between 1.00~2.00 represents that the condition of implementation is “remain to be improved”.

The pretest sample of this study is the 20 preschool educational institutions in Taoyuan, Hsinchu and Miaoli County. To examine the consistency of the questions in the questionnaire, the study adopts Factors Analysis approach to test the Construct Validity. Besides, to examine the consistency of the subject’s answers to the questions, the study adopts Cronbach’s α to test the Reliability. According to Nunnally (1979), ,
Cronbach’s $\alpha$ has to reach above 0.7 to get good internal consistency reliability. The fact that the Cronbach’s $\alpha$ of this study reaches 0.83 indicates that the study tool has good internal consistency reliability.

3. Procedure
The questionnaire survey is proceeded by designated agent during October, 2009. While recycling the questionnaire, this designated agent is asked to examine whether the questionnaire is missing or not finished. The result is that the recycling rate reaches 100% and the validity rate also reaches 100%.

4. Study analysis method
The information derived from questionnaire survey is then analyzed by SPSS 13.0 to get the mean, standard deviation, t-test, and one-way ANOVA. If the result reaches the significant difference on one-way ANOVA, then it will be examined by Scheffe method later.

III．Study Result
1. The implementation of remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County

(1) Scale of preschool educational institutions
Preschool educational institutions with only 1 bottom class, only 1 middle class and 1 top class in the kindergarten (or less than 3 classes in a kindergarten) are called small scale; ones with 2 classes in each level in the kindergarten (or less than 4~6 classes in a kindergarten) are called middle scale; ones with over 3 classes in each level in the kindergarten (or more than 7 classes in a kindergarten) are called large scale. The study subjects consist of 25 small scale ones, which occupy 83.3%, 4 middle scale ones, which occupy 13.3% and 1 large scale one, which occupies 3.3%. (See Chart 1)

(2) Number of teachers in preschool educational institutions
This study divides the number of teachers in preschool educational institutions into 5 groups, which are 1~3, 4~6, 7~9, 10~12 and over 12 teachers in one kindergarten. Of all the study subjects, there are 20 kindergartens with 1~3 teachers per school, which occupy 66.6%; 6 kindergartens with 4~6 teachers per school, which occupy 20%; 2 kindergartens with 7~9 teachers per school, which occupy 6.6%; 2 kindergartens with 10~12 teachers per school, which occupy 6.6%, but none with over 12 teachers. (See Chart 2)

(3) **Number of students in the top class of preschool educational institution**

The study divides the number of students in top class in preschool educational institution into 5 groups, which are below 10, 11~15, 16~20, 21~25 and over 26 students in top class per school. Of all the study subjects, there are 15 kindergartens with 11~15 students in the top class, which occupy 50.0%, 6 kindergartens with below 10 students in the top class, which occupy 30.0%, 4 kindergartens with 16~20 students in the top class, which occupy 13.3%, 3 kindergartens with 21~25 students in the top class, which occupy 10.0% and 2 kindergartens with over 26 students in the top class, which occupy 6.6%. (See Chart3)

(5) Implementation of the subsidiary service of after-school nursery in preschool educational institutions

The subsidiary service of after-school nursery is the same as the so-called day care center in Taiwan. Of all the study subjects, there are 18 kindergartens with the subsidiary service of after-school nursery, which occupy 60.0%, 12 kindergartens with no subsidiary service of after-school nursery, which occupy 40.0%. (See Chart 5)

2. Implementation of kindergarten-primary transitional education in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County

(1) School adaption

1. Curricular content

Study on this variable contains dimension of “Increase in subject teaching and knowledge memorization” (M=3.55), “Increase in paper-based assignment” (M=3.87), “Learning scheduled assignment and lesson” (M=2.32), “Static activities more than dynamic activities” (M=2.05). The mean of “Overall assessment on variable Curricular content” is 2.94, which means the implementation is “normal”. (See Chart 6)

B. Number of teachers in preschool educational institutions

This study divides the number of teachers in preschool educational institutions into 5 groups, which are 1~3, 4~6, 7~9, 10~12 and over 12 teachers in one kindergarten. Of all the results, there is no preschool educational institution with over 12 teachers; thus, after deleting this group, this study adopts one-way ANOVA to analyze the variable “Number of teachers in the preschool educational institutions” on the dimensions of “Link between kindergarten and primary school”, “Link among parents, schools, and community”, “Individual need of children of the new immigrant” and “Overall special assistance for children of the new immigrant”. The result of the dimension of “Link between kindergarten and primary school” (F=3.87, \( p < .05 \)), “Link among parents, schools, and community” (F=2.69, \( p < .05 \)), “Individual need of children of the new immigrant” (F=4.51, \( p < .05 \)) and “Overall special assistance for children of the new immigrant” (F=3.49, \( p < .05 \)) reaches the significant difference because of the different number of teachers in preschool educational institution. After being analyzed by Scheffe method, only the result of the
dimension of “Overall special assistance for children of the new immigrant” reaches significant difference ($p < .05$). Besides, the result of school with 4–6, 7–9, 10–12 teachers has much higher scores than that of school with 1–3 teachers. (See Chart 27)

**C. Number of students in top class in preschool educational institution**

The study divides the number of students in top class in preschool educational institution into 5 groups, which are below 10, 11~15, 16~20, 12~25 and over 26 students in top class per school. This study adopts one-way ANOVA to analyze the variable “Number of students in top class in preschool educational institution” on the dimensions of “Link between kindergarten and primary school”, “Link among parents, schools, and community”, “Individual need of children of the new immigrant” and “Overall special assistance for children of the new immigrant”. The result of the dimension of “Individual need of children of the new immigrant” (F=2.11, $p < .05$) reaches the significant difference because of different number of students in top class in preschool educational institution, but doesn’t reach significant difference after being analyzed by Scheffe method ($p > .05$). (See Chart 28)

D. Number of children of new immigrant in the preschool educational institutions

The study divides the number of children of the new immigrant in the preschool educational institutions into 5 groups, which are below 10, 11~15, 16~20, 21~15 and over 26 children of the new immigrant per school. Of all the results, there is no preschool educational institution with over 26 new immigration children in a kindergarten; thus, after deleting this group, this study adopts one-way ANOVA to analyze the variable “Number of children of the new immigrant in the preschool educational institutions” on the dimensions of “Link between kindergarten and primary school”, “Link among parents, schools, and community”, “Individual need of children of the new immigrant” and “Overall special assistance for children of the new immigrant”. The result of the dimension of “Individual need of children of the new immigrant” ($F=1.89, p<.05$) reaches the significant difference because of different number of students in top class in preschool educational institution, but doesn’t reach significant difference after being analyzed by Scheffe method ($p>.05$). (See Chart 29)

E. Implementation of the subsidiary service of after-school nursery in preschool educational institutions

The study adopts T-test to analyze two groups “With subsidiary service of after-school nursery” and “Without subsidiary service of after-school nursery” on the dimensions of “Link between kindergarten and primary school”, “Link among parents, schools, and community”, “Individual need of children of the new immigrant” and “Overall special assistance for children of the new immigrant”. The result of the dimension of “Link between kindergarten and primary school” ($t=8.53, p<.05$),
“Link among parents, schools, and community” ($t=11.47$, $p<.01$) and “Individual need of children of the new immigrant” ($t=7.35$, $p<.001$) reaches the significant difference because of whether the preschool educational institution has subsidiary service of after-school nursery or not. (See Chart 30

**IV、Conclusion and Suggestion**

Based on the study results, the conclusion and the suggestion are as follow:

1. Conclusion

1. The implementation of the remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County

   A. The remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County are mainly in small scale.

   This study shows that the remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County are mainly in small scale, then in middle scale, then in large scale.

   B. The number of teacher in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County is mainly in the form of one teacher in one classroom.

   This study discovers that the number of teachers in each classroom is mainly in the form of 1~3 teachers in one classroom, then 4~6, then 7~9, then 10~12. Besides, the classroom with over 12 teachers is none. Based on the findings of this study, the number of teachers in the remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County is mainly in the form of one teacher in one classroom.

   C. The number of students in top class in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County is mainly in the
form of 11~15 students in one classroom.
This study discovers that the number of students in top class of kindergarten is mainly in the form of 11~15 students in one classroom, then below 10, then 16~20, then 21~25, then above 26.

D. The proportion of children of the new immigrant in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County is rather high.
This study shows that the number of children of the new immigrant in each classroom is mainly in the form of 16~20 children of the new immigrant in one classroom, then 21~25, then below 10, then 11~15. Besides, the classroom with above 26 ones is none.

E. The remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County mostly have subsidiary service of after-school nursery.
This study shows that the number of remote preschool educational institutions with subsidiary service of after-school nursery is much more than that with no subsidiary service of after-school nursery.

(2) The implementation of kindergarten-primary transitional strategy on remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County.

A. The implementation of kindergarten-primary transitional strategy on “School adaption”: the result of the dimension of “Learning environment” is “good”, the result of the dimension of “Curricular content”, “Learning attitude” and “Learning method” are “normal”; The result shows that the kindergarten-primary transitional education in remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County puts more emphasis on the planning of the learning environment; however, it still remain to be improved on the dimensions of “Curricular content”, “Learning attitude” and “Learning method”.

B. The implementation of kindergarten-primary transitional strategy on “Life Adaption”: the result of the dimension of “Life management” is “very good”, the result of the dimension of “Adaption for regulations” and “Adaption for interpersonal relationship” is “good”. As a result, the implementation of strategy on “Life adaption” is better than that on “School adaption”; Strategy on “Life management” receives more emphasis than strategy on “Adaption for regulations” and “Adaption for interpersonal relationship”.

C. The implementation of kindergarten-primary transitional strategy on “Special assistance for children of the new immigrant”: The result shows that the dimensions of “Link between kindergarten and primary school”, “Link among family, school and the community”, and “Individual needs of children of the new immigrant” are “remain to be improved”. It indicates that the proportion of children of the new immigrant enrolling in these remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County is rather high; however, these preschool educational institutions are not especially active in providing assistance for students of the new immigration. Therefore, the variable “Special assistance for children of the new immigrant” is “remain to be improved”.

- 24 -
(3) The connection between the current implementation of the remote preschool educational institutions and the kindergarten-primary transitional strategy in Taoyuan, Hsinchu and Miaoli County.

A. The connection between the current implementation of the remote preschool educational institutions and the kindergarten-primary transitional strategy on “School adaption”:

a. The scale of the preschool educational institutions: the scale of the preschool educational institutions will affect the implementation of kindergarten-primary transitional strategy on dimensions of “Learning attitude” and “Learning method”.

b. The number of teachers in preschool educational institutions: the number of teachers in preschool educational institutions has significant difference on the implementation of the kindergarten-primary transitional strategy.

c. The number of students in top class in preschool educational institutions: the number of students in top class in preschool educational institutions has significant difference on the dimensions of “Curricular content”, “Learning environment”, “Learning attitude”, “Learning methods” and the whole “School adaption”. The limitation that there is only one teacher in each classroom results in the difficulty of teachers in the implementation of kindergarten-primary transitional strategy in the sampling preschool educational institutions. Thus, the number of students in top class of kindergarten has become the key to the implementation of the kindergarten-primary transitional strategy.

d. The number of children of the new immigrant in preschool educational institutions: the number of children of the new immigrant in preschool educational institutions has significant difference on the dimensions of “Curricular content”, “Learning environment”, “Learning attitude”, “Learning methods” under the limited number of teachers and the high proportion of children of the new immigrant.

e. The implementation of subsidiary service of after-school nursery in preschool educational institutions: whether the preschool educational institutions has subsidiary service of after-school nursery has significant difference on dimensions of “Curricular content”, “Learning environment”, “Learning attitude”, “Learning methods”. Besides, the school with subsidiary service of after-school nursery has better performance than those without subsidiary service of after-school nursery. The reason may be that school with subsidiary service of after-school nursery has better understanding on the educational system of primary school, but the exact reason still remains to be studied in the future.

B. The connection between the current implementation of the remote preschool educational institutions and the kindergarten-primary transitional strategy on “Life adaption”:

a. The scale of preschool educational institutions: the scale of preschool
educational institutions has significant difference on the dimensions of “Adaption for interpersonal relationship” and “Adaption for self-life-management”. This result indicates that the kindergarten-primary transitional strategy put varied degree of emphasis on “Learning attitude” and “Learning methods” because of different scale of the preschool educational institutions.

b. The number of teacher in preschool educational institutions: the number of teacher in preschool educational institutions has significant difference on dimensions of “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-life-management”. This result indicates that the number of teacher is one of the factors in affecting the adaption for these dimensions.

c. The number of students in top class of preschool educational institutions: the number of students in top class of preschool educational institutions has significant difference on dimensions “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-life-management”. When there are more students in top class of preschool educational institutions, the lack of teaching staff will cause difficulty in students’ life adaption; therefore, it may affect the effectiveness of the implementation of kindergarten-primary transitional strategy on dimensions of “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-life-management”.

d. The number of children of the new immigrant in preschool educational institutions: the number of children of the new immigrant in preschool educational institutions has significant difference on dimensions of “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-life-management”. The high proportion of children of the new immigrant in preschool educational institutions along with the one-teacher-to-one-class limitation will cause difficulty in the implementation of kindergarten-primary transitional strategy on dimensions of “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-life-management”.

e. The implementation of subsidiary service of after-school nursery in preschool educational institutions: the implementation of subsidiary service of after-school nursery in preschool educational institutions has significant difference on dimensions of “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-management”. We can infer that preschool educational institutions with subsidiary service of after-school nursery have more experience and put more emphasis on kindergarten-primary transitional strategy on “Adaption for regulation”, “Adaption for interpersonal relationship” and “Adaption for self-life-management”. The inference can be studied in afterwards research.

C. The connection between the implementation of preschool educational institutions and the kindergarten-primary transitional strategy.

a. The scale of preschool educational institutions: based on result of the study, in the kindergarten-primary transitional phase, the individual needs
of the children of the new immigrant vary from different scales of preschool educational institutions.

b. The number of teacher in preschool educational institutions: the number of teacher in preschool educational institutions has significant difference on dimensions of “Link between kindergarten and primary school”, “Link among family, school and the community”, “Individual needs of children of the new immigrant” and “special assistance for new immigration students”. The result indicates that schools with more teachers may provide more effective assistance in kindergarten-primary transitional phase.

c. The number of students in top class of preschool educational institutions: the number of students in top class of preschool educational institutions has significant difference on dimensions of “Individual needs of children of new immigrant”. When the preschool educational institutions with few teaching staff face too many students in senior class of kindergarten, the teachers may be unable to take care of each individual and meet their needs respectively.

d. The number of children of the new immigrant in preschool educational institutions: the number of children of the new immigrant in preschool educational institutions has significant difference on dimensions of “Individual needs of children of the new immigrant”. We may infer that teacher in class with more children of the new immigrant may be unable to focus on individual needs when teacher employs the kindergarten-primary transitional strategy.

e. The implementation of subsidiary service of after-school nursery in preschool educational institutions: the implementation of subsidiary service of after-school nursery in preschool educational institutions has significant difference on the dimensions of “Link between kindergarten and primary school”, “Link among family, school and the community”, “Individual needs of children of the new immigrant”. The result indicates that schools with subsidiary service of after-school nursery have more experience and understanding about kindergarten-primary transitional education.

2. Suggestion

(1) Suggestion for the preschool educational institutions

A. Increase the number of teacher in preschool educational institutions

This study discovers that the number of students in top class of preschool educational institutions is mainly about 11~15 students per classroom. However, due to the fact that there is usually only one teacher per classroom, teachers always face the problems in the implementation of kindergarten-primary transitional strategy in addition to their daily teaching and nursery task. The result of this study also shows that the increase in the number of teacher in preschool educational institutions has significant difference on dimensions of “Learning attitude”, “Adaption for regulation”, “Adaption of interpersonal relationship”, “Adaption for self-life-management”, “Link between kindergarten and primary school”, “Link among family, school and the community”, and “Individual needs of
children of the new immigrant”. In conclusion, to provide children of new immigrant good assistance for adaption in life and school by increasing the number of teaching staff has become the top priority.

B. Balance the proportion of teacher, student and the children of the new immigrant

This study shows that both the number of students in top class in kindergarten and the number of children of new immigrant have significant difference on the dimensions of “Learning attitude”, “Adaption for regulation”, “Adaption for interpersonal relationship”, “Adaption for self-life-management”, “Link between kindergarten and primary school”, “Link among family, school and the community”, “Individual needs of children of new immigrant” as well as the strategy on “Learning environment”. Although the number of teachers, around 11~15 per classroom, in preschool educational institutions of the sample schools meets the requirement of “Enforcement rule of the act of preschool education”, rule 8 “The number of students in kindergarten should be no more than 30 students per classroom”; however, the fact that there is only one teacher per classroom doesn’t meet the requirement of “Enforcement rule of the act of preschool education”, rule 7 “The class grouping should be base on the age of students in kindergarten and there should be two teachers in a classroom”. Thus, when it comes to the enrollment of many children of new immigrant and their poor learning condition, we should balance the proportion between teacher and student and adequately relief teachers’ amount of work in order to have better implementation of kindergarten-primary transitional strategy.

C. Increase the subsidiary service of after-school nursery in preschool educational institutions

This study reveals that the implementation of the subsidiary service of after-school nursery in preschool educational institutions has significant difference on dimensions of “Learning attitude”, “Adaption for regulation”, “Adaption for interpersonal relationship”, “Adaption for self-life-management”, “Link between kindergarten and primary school”, “Link among family, school and the community”, and “Individual needs of children of the new immigrant”. Schools with the subsidiary service of after-school nursery in preschool educational institutions may have more experience and better understanding of the educational system in primary school and, thus, can put more stress on the implementation of kindergarten-primary transitional strategy.

(2) Suggestion for the implementation of kindergarten-primary transitional Strategy

A. Emphasize more on curricular content, learning attitude and learning methods in “School adaption”

This study shows that the remote preschool educational institutions in Taoyuan, Hsinchu and Miaoli County put more emphasis on the dimension of “Learning environment”. However, implementation on the dimensions of
“Curricular content”, “Learning attitude”, and “Learning methods” still remains to be improved. The mean of the result of the following detailed dimensions - assignment on homework, learning according schedule, more static learning activities than dynamic ones, establishment of classroom facility based on the kindergarten-primary transitional pattern, as well as the assistance for developing their favorite subjects, enhancing their motivation to go to school, maintaining their attention span, arranging their learning time, developing the ability of self-learning, and skills in asking questions and communicating with teachers- is below 3.00. Therefore, these seem to be feasible strategies in the implementation of kindergarten-primary transitional education.

B. Emphasize more on the detailed items of “Life adaption”

The result of implementation on variable “Life adaption” is mainly “good”. However, as for the dimensions whose average is below 3.00, such as the enactment and obedience of class regulations, assistance for helping students ask questions and communicate with teachers, learning to make good friends, comforting classmates, decreasing the chances of argument with classmates, acceptance for unwelcome classmates, we should emphasize more on the implementation on these dimensions of “Life adaption”.

C. Strengthen the dimensions of “Link between kindergarten and primary school”, “Link among family, school and the community”, and “Individual needs of children of new immigrant” in variable “Special assistance for the children of the new immigrant”

In variable “Special assistance for children of the new immigrant”, the implementation of kindergarten-primary transitional strategy on the dimensions of “Link between kindergarten and primary school”, “Link among family, school and the community”, and “individual needs of children of the new immigrant” still remain to be improved. As for those whose average is below 3.00 are as follow:

a. Link between kindergarten and primary school: hold a transitional conference on the information of teaching staff for children of the new immigrant so that they can take part in the activities of primary school, and get familiar with the school system by letting them walk into the classroom in primary school to inspect and learn in a real context.

b. Link among family, school and the community: emphasize the importance of parental education so that parents of children of the new immigrant will get a better understanding about their children’s learning condition, the concept behind the kindergarten-primary transitional strategy and have a more adequate expectation on their children by combining the resources of the community and increasing the cooperation among family, school and community.

c. Individual needs of children of the new immigrant: focus on the promotion of appropriate education on interpersonal interaction and the development on every aspect of children of the new immigrant.

(3) Suggestion for parents, school and community

A. Suggestion for parents
a. Promote parents’ cooperation in the kindergarten-primary transitional phase: the study discovers that the kindergarten-primary transitional strategies which get lower mean scores in “School adaption, “Life adaption” or “Individual needs of children of the new immigrant” can be implemented at home; thus, it’s necessary to enhance the parents’ cooperation to stimulate more active involvement.

b. Promote parents’ active participation in parental activities and cooperation with teachers: the study indicates that the kindergarten-primary transitional strategies, including promotion of the parental education and the increase of parents’ understanding about their children’s learning condition, making adequate expectation, stimulation of cooperation among parents, teachers and community, are categorized as the parental dimension whose mean score isn’t over 3.00. It’s true that the implementation of strategies can’t be done only by school. We need parents’ involvement and cooperation. Thus, promotion in parents’ active participation in parental activities and emphasis on cooperation with teachers has become a top priority.

B. Suggestion for school
a. Promote active enforcement of kindergarten-primary transitional strategy in preschool educational institutions: the study shows that in variable “School adaption”, the mean scores of many dimensions are below 3.00. School need to be more active in enforcing related kindergarten-primary transitional strategies if the teaching staff and the arrangement of curriculum are permitted.

b. Emphasize the vertical connection between kindergarten and primary schools in preschool educational institutions: this study result indicates that preschool educational institutions with the subsidiary service of after-school nursery have significant difference on the implementation of kindergarten-primary transitional strategy. If preschool educational institutions can emphasize more on the vertical connection with the primary schools and its educational system, it’ll help to arrange feasible kindergarten-primary transitional strategy.

C. Suggestion for the community
a. Promote community’s providing resources and related activities to help children of the new immigrant: this study finds out that the mean scores of providing resources and related activities to promote the implementation of kindergarten-primary transitional strategy for children of the new immigrant is rather low (1.20). The mean scores indicate that the resources of community aren’t put to good use. If the preschool educational institutions can make good use of the resources in community, such as the places, activities or financial support, it’ll make the implementation of kindergarten-primary transitional strategy much more smooth and thorough.

b. Promote community’s Creation of safe and total acceptive mental environment to help children of the new immigrant: the study shows that the number of children of the new immigrant is one of the factors affecting the implementation of kindergarten-primary transitional
strategy in preschool educational institutions. To avoid the formation of bias, community should create a safe and total acceptive mental environment for these children of the new immigrant by holding activities, promoting the communication among parents, teachers, and people living in the community.

Training Pre-Service Teachers in Career Education

Abstract

This presentation will describe a program designed to train pre-service teachers in career development. An in-depth evaluation of this program will be discussed along with a presentation on the data gathered to date on this initiative. Implications for enhancing the career development of students in Grades 1-12 will be discussed.
Response to Call for Papers

Submission Title: How Job Corps Helps the Communities?
Topic Area: Vocational Institute – Education
Presentation Format: Workshop Session
Author: Judy Economou and Sasisopin Kobayashi
Department and Affiliation: Hawaii Job Corps Academic Department - Reading
Mailing Address: 41-467 Hihimanu Street, Waimanalo, Hawaii 96795
E-mail: Economou.Judy@jobcorps.org
Phone: 808-259-6031
ABSTRACT

Motivation

Today's youth needs an opportunity to get proper training and education to support themselves and their families. Getting a second change at Job Corps can give youths an opportunity to acquire the education and training need to successfully obtain a job is essential for any community to function positively and prosper. Encouraging youth to continue their education in order to provide an adequate living for themselves not only help a community financially but also strengthens self-esteem and positive growth from within. Job training, along with the proper certificates and credentials ensures good matches for job expectations and quality work. Families that are self supporting are not on welfare and become a positive addition to the community. A win-win positive situation for all involved.

Problem statement

Several significant investigative studies release since January 2010 has exposed how unemployment is devastating for the uneducated, untrained and unqualified workers.

Job scarcity due to company closings and budget cuts are becoming a common occurrence. How can youth better prepared for the job market?

Approach

These finding were the genesis of a government call action in 1964 when President LB Johnson enacted the bill for programs. Job Corps was created in 1964 by Economic Opportunity Act (EOA). Sergeant Shriver, Director of the Office of Economic Opportunity, modeled the program on the Depression-era Civilian Conservation (CCC) which was established in 1930s as an emergency relief program. The CCC provided room, board, and employment to thousands of unemployed young people. Though the CCCs were discontinue after World War II, Job Corps built on many of its methods and strategies.

The first Job Corps center was opened on January 15, 1965, at Camp Catoctin, Maryland, near the Presidential retreat at Camp David. Although the Job Corps concept was originally designed to serve only men, Representative Edith Green of Oregon convinced Job Corps administrators that growing numbers of women were destined to become heads of households, and needed the skills to succeed in the workplace. The first women’s center was opened in Cleveland on April 9, 1965. By the end of 1965, 87 Job Corps centers serving 16,968 young people were operational.
Early Job Corps students typically attended more than one center to complete their training. Small rural centers provided basic education to 100 to 200 “corp members,” who graduated to larger center for more focused vocational training. “Women’s center” offered vocational training in food preparation, household service, health occupations, and clothing industries. Vocational offerings at men’s centers focused on construction trades. Over time, Job Corps’ training – and its student’s populations – have evolved. Co-educational was introduced at Tongue Point, Oregon in 1970; today, Job Corps centers are open to both men and women. Students can choose from more than 100 trades, including the following: infrastructure trades (carpentry, masonry, electrical, welding, etc.) including green trades, healthcare, apartment management, business, culinary arts, and many more.

Today, 123 Job Corps center in 48 states, the District of Columbia, and Puerto Rico, train nearly 60,000 students each year. Over 45 years, Job Corps has earned a reputation as the nation’s premier workforce training program for disadvantaged youth. By consistently being responsive to employer’s demands and the nation’s workforce needs, Job Corps has succeeded in meeting those needs by offering top-notch vocational training to students. As a testament to these successes, numerous bi-partisan political initiatives have supported Job Corps’ expansion to serve more disadvantaged young Americans with delivering results for the nation and the next generation. These programs led to reforms in many areas of education both academic and vocational.

**Results** - As a result of students attending Job Corps in Hawaii on Oahu:

- **2009** Hawaii Campus enrolled 241 trainees
- **2008** Nationally
  - GED 19.2%
  - High School 24.9%
  - Career Technical Trade 46.6%
  - Job or Military 51.8%
  - Average wage $8.85
  - School 10.4%
Community Projects:

Students and staff are involved in many community services projects and activities which includes the following:

- Kailua High School (painting)
- Aikahi Playground (constructed community playground)
- Academy of Pacific (fundraiser)
- Hawaii Food bank
- City and County of Honolulu
- City and County of Honolulu Parks and Recreation
- American Cancer Society
- Honolulu Police Department (traffic safety campaign)
- Harbor House (food distribution program)
- Salvation Army
- Senior Housing

Conclusions

As a result of Job Corp program today we have successfully educated youth who are now contributing back to the work force and to their communities. Professionals who owe their success to the program are famous alumni including George Foreman

Abstract:

Storytelling can be an entertaining technique for education and language development in teaching English as a Second Language. Students often read stories in books, listen to stories from friends and watch stories on film. Storytelling becomes even more meaningful when students are asked to read folktales from their native countries in the classroom, the community and on community television. The practice and performance sessions of storytelling can lead to additional opportunities for language development. This poster session will share a storytelling project created for university ESL students from Japan studying in the U.S. This project was based on engagement theory which states when educators equip students with the tools to become self-motivated, real engagement in learning takes place (Wasserstein 1995) and when students see practice activities as meaningful, yet challenging, they will work harder to give their best performance (Schlechty 2002). The practice sessions were also given a product or performance focus, which Zorfass & Copel (1995) assert make them more meaningful to students. This approach led to successful opportunities for language development in listening/speaking and reading/writing classes. The poster will include examples of student Microsoft Publisher newsletters, photos, reflective writing samples, handouts for reading/writing and listening/speaking activities, CCTV student created program screenshots (“Japanese Folktales”), survey results and rubrics for project evaluation. Participants will leave with ideas for using technology in education and with pedagogical applications for various topics, and settings, and for teaching ESL.

Resident Faculty Leader Program at West Virginia University

By Scott Rubin
History 794 B – Dr. Michal McMahon

Started in 1996, the Resident Faculty Leader program at West Virginia University is a direct result of a Presidential Task Force charged with finding ways to improve student life on campus and making the Office of Student Life more student friendly. One of the major proposed recommendations of this task force was to include more faculty involvement in the residence halls in order to promote a more academically oriented environment. Supported by the central administration under the new President, David C. Hardesty Jr., a team of house masters, student resident assistants, and resident directors were assembled in February 1996 and empowered to redesign the freshman experience.¹ This group became the Resident Faculty Leader program we have in place today.

Upon taking office in July 1995, President Hardesty set out on his first day to put students at the center of the strategic thinking on the university. According to his book “Leading the Public University: Essays Speeches, and Commentary,” the goal of recentering the university on the student experience was set so that students would get off to a successful start and stay at the university for their entire college career. Retention numbers showed at the time that there had been a slow decrease in the number of West Virginia residents enrolling over the three years before Hardesty took office.²

There was also a sense of urgency to retain as many students as possible due to University figures predicting a continued decline of enrollment with in-state residents going along with a large decrease of high school students graduating from in state schools. The

¹ Re-Engineering the Freshman Experience at WVU. 1996
Western Interstate Commission on Higher Education posted a report in 1992 indicating that West Virginia would see a 21% drop in high school graduates by the year 2009.\footnote{Re-Engineering the Freshman Experience at WVU. 1996. It is also interesting to note that the number of high school graduates from surrounding states were all positive in this report and marked as “clear opportunities” for recruitment by WVU in 1994. Those states and their projected change in graduation numbers are: Maryland (59%), Virginia (38%), New Jersey (23%), and Pennsylvania (17%). These states are still today considered Primary Market States by the university.} This, along with changing state budget requirements for the university, forced the new administration to look at all options on the table for retaining first time freshman and recruiting new ones from in-state and the surrounding area in order to keep financially afloat.

In addition to these retention based problems, there were other issues the university had been dealing with for years that the new administration chose to investigate. Student housing was one of those areas that seemed to be key to retention efforts and to meeting the goals of the new President to make the university more student centered. What better place was there than where the students spent the majority of their out of class time to make an impact?

The idea of the university being more “Student Centered” was one that was mentioned frequently in the early days of the Hardesty administration. The West Virginia University Board of Trustees, as well as other university governance groups, urged the administration to “take on” the image of student centeredness as a way of returning the university to its roots as an institution that cared about its students. It was feared that the image of the school had shifted away from one that focuses on academic life and that the students seemed to value social
activities more than their educations. Part of the result of this new push was the creation of a new vision statement for the university which read:

“West Virginia University is a student-centered learning community meeting the changing needs of West Virginia and the nation through teaching, research, service, and technology.”

A considerable effort was made to apply this new vision to Student Affairs as this was seen as an area that immediate changes could be enacted. The residence halls were one area that the administration wanted to see fixed up as there had been behavioral problems and vandalism occurring that did not fit in well with the university’s new vision. Some university officials considered the residence halls to be out of control and unmonitored.

There were four downtown residence halls at the time (Arnold, Boreman, Stalnaker, and Dadisman) and the four halls part of the Evansdale Residential Complex (Bennett, Lyon, Braxton, and Brooke). According to multiple interviews done while compiling this paper, there seems to be a consensus that discipline was way too relaxed in the halls, rules were not adhered to, and quiet hours were not observed regularly across the campus. It was common for residents to break established policies, but continue living in the hall due to lack of policy enforcement or sanctions. Some estimates put vandalism damage to hall property at around $300,000 a year in the early 1990’s. Beds and dressers being thrown from windows and balconies, furniture disappearing from lounges, and holes punched through walls were some of the regular examples of some of the vandalism. It was felt that these problems led to an unruly atmosphere in the residence halls that were counterproductive to the goal of making the

---

university more student centered. On top of this problem, leadership in the hall lacked an academic element and students seemed to not be getting the support they needed outside of the classroom.

In order to investigate ways to restructure and reorganize the residence hall experience, and Student Affairs in general, President Hardesty put together the Student Affairs Task Force on July 5, 1995 to study the current system in place and make recommendations on how to improve the residence hall atmosphere. This task force consisted of university officials as well as noncampus members and was charged with finding the biggest problem areas and offering ideas for improvement. Their preliminary report was submitted on September 6, 1995 and consisted of several recommendations to on how to move the university forward in a more student centered way. The task force listened to comments regarding their preliminary findings for several months and released their final report on January 16, 1996.

To live up to the new vision put in place by the administration, the Task Force recommended that a redesign of the residence halls could give students alternatives to going out, partying, or causing trouble inside the halls. By providing them with stable and entertaining programming in their residence hall, it was hoped that students would see there were different things to do on campus and that they would partake in some of the newly organized activities being provided to them by the residence hall staff.

In terms of addressing residence hall issues, one of the major recommendations made by the task force was to include more faculty involvement in residence hall life and to come up with a revised set of residence hall policies and sanctions to govern the every day conduct of

---

5 Oral interviews with Dean of Students Dr. David Stewart and Housing Director Corey Farris. Completed March and April 2010.
students living on campus. It was felt that in order to reign in on the out of control nature of the halls, a stable judicial system was important to ensure the smooth operations of every day hall life.

Having been a Rhodes Scholar at Oxford University, President Hardesty decided that a good way to involve faculty in hall life would be to appoint a Hall Master to each residence. At Oxford, students live in one of several dozen colleges. These colleges not only house the dining facilities and residences of their students, but also provide much of the teaching responsibility for their residents. While it would not necessarily work to shift the academic course load to the residence hall staff, bringing a faculty member in as an authority figure and mentor was something that appealed to Hardesty and a decision was made to launch Operation Jumpstart in February 1996 to bring some of the University’s energetic, charismatic, senior faculty members to live in the residence halls as “house masters or leaders.”

This would be followed by Project 2000, an experimental program aimed at inserting faculty leaders into more permanent roles within the residence halls. According to Hardesty, “the basic, most fundamental thing we are changing, or exploring, is changing the way we run the residence halls and going to a ‘house master’ system. There would be a resident house master who would be a full tenured professor living in the residence halls.” The goal was to have the class of 2000 act as a trial group since they would be the first class to feel the benefits of the reworked residence hall program. These students would also fill out surveys and serve on focus groups giving feedback as to how the program was progressing.

The task force believed that there would be many benefits that could come from this program. One large anticipated benefit was that it would help with retention if students had a positive residence hall experience and chose to return to finish their college careers. Other projected benefits included student academic improvement, positive recruiting, parent confidence and contact, improved stewardship, and community building. It was also hoped there would be a large reduction in vandalism with the enactment of a more structured environment.

Operation Jumpstart was put in place to test the waters for seven months ending on September 1, 1996. During this period, informational meetings were held in Elizabeth Moore Hall for faculty who were interested in learning more about the Hall Master role. It was also during this time that President Hardesty approached Dr. David Stewart, of the English department, to inquire about his interest in taking one of these Hall Master positions. Stewart was also an Oxford graduate and was familiar with the idea behind having faculty involvement in various aspects of student life. He, along with six other faculty members were selected during this period to serve as Hall Masters for the new school year starting the fall semester 1996. By the time the test period of seven months were over, Project 2000 was started in its place and the title of Hall Master was changed to Resident Faculty Leader (RFL).

---

8 These original faculty leaders were Dr. Richard Schreiber at Arnold Hall, Professor Augusto Paglialunga at Bennett Tower, Dr. David Stewart at Boreman Hall, Dr. Bernie Schultz at Braxton Tower, Elizabeth Doane at Brooke Tower, Dr. William Collins at Stalnaker and Dadisman Halls, and Dr. Dallas Branch at Lyon Tower.
Prior to the implementation of Project 2000, the Department of Housing and Residence Life (H&RL), which oversaw the residence halls, had not changed much through the 1980s or 90’s. Each residence hall on campus had a staff of Resident Assistants (RAs), a Community Advisor (CA), and a Resident Director (RD). There were also several graduate student assistants who oversaw the judicial board, learning center, and night staff. The RAs for each building were (and still are) full time students who act as the primary resource for residents living on their floor. The CA was a live-in staff member responsible for developing the community environment of the hall and planning social and educational activities. The RD for the hall was a graduate student responsible for supervising the RAs and CA as well as serving as a valuable resource handling counseling issues, student conduct, community development, administration, and emergency response situations.9 This in-hall leadership structure remained in place until 1993 when the CA role was eliminated.

In addition to these in-hall positions, the department also employed an Assistant Director for Residence Life, a Residence Educator, and two Area Coordinators. The Assistant Director was the one responsible for the overall operation of the program. The Residence Educator was in place to implement and supervise in-hall academic support services, and was responsible for hiring and training learning center staff. This person was also available for extended academic questions that the in-hall staff could not provide. Area Coordinators were

---

assigned to each campus to directly hire and supervise the student staff and coordinate
disciplinary action on their respective campus.

The Department of Housing and Residence Life itself was split into several distinct
divisions, each with separate leadership. These divisions were Residence Life Division (outlined
above), the Housing Division, Food Service Division, Administrative Division, Custodial/
Maintenance Division, and Conference Divisions. Each unit was led by an Assistant Director
who answered to the Director of the Department of Housing and Residence Life. This Director
was responsible to the Dean of Student Affairs.

With the introduction of the RFLs in 1996, they would act as a
go between for the in-hall staff and the rest of the department. One of
the ways the RFLs were encouraged to get involved was to learn the
system and take ownership of their respective hall through the direct
supervision of their building’s staff. Any hall business would be
directed through them and relayed higher if necessary. The RAs were
supervised and still reported to the RD who in turn worked closely with
the RFL to set the tone of the hall in accordance with the RFLs individual hall plan. Along with
the RD and the RFL, an Assistant RFL, usually the RFLs spouse, would now make up the
leadership team for each individual hall. Over time, each hall began to take on an individual
personality as RFLs worked to hire and train staff in a way consistent with their ideas and
values.

To facilitate the RFL taking over as the leader of their hall, the Student Affairs Taks Force
recommended they do several things. Their overall role was to provide general leadership to
both the staff and residents of the hall. They were also tasked with creating a hall specific mission statement and helping the RD in the recruitment of RAs. It was recommended that they involve current and retired faculty in their programming and to establish the appropriate tone for the hall by being a live-in role model. It was hoped that through programming and regular contact, a positive atmosphere would develop and students would look forward to being active members of the campus community.

The RFL program, according to President Hardesty was one of the most significant efforts enacted early in his administration to give students a community within a larger institution. For each residence hall, the university constructed adjacent homes for faculty in-residence as well as new seminar rooms, computer labs, and meeting spaces for students. The RFL houses would be the setting for in-hall social and educational programs. These have ranged over the years from Super Bowl Parties to Hall Council meetings to sit down dinners with different faculty members. It was hoped that giving students a home-like environment run by staff that actually cared about their well being would promote a feeling of acceptance into the university community. By providing alternative programs that the students found interesting, there was anticipation that students would take advantage of them instead of going out and drinking.

This decision to have a faculty member closely tied to each residence hall was not unique to WVU. Other universities have used faculty to some extend in the past to include academic programming into dorm life. What did make the WVU plan unique was that the

---

10 Re-Engineering the Freshman Experience at WVU. 1996
faculty really took ownership of their buildings and were instrumental in changing how the entire university worked with freshman.

One of the first things the RFLs and RDs began to look at were the policies in place and their effectiveness. Each year during the August student move in, new residents were handed a guide book to the residence halls called the Eyes & ’Eers (or the Lifesaver before the 1992-1993 school year). This book was, and still is, used by residents as a tool to answer many questions that a first time student may have. Included in the book is also a list of residence hall policies and sanctions for breaking those policies. The evolution of these policies and their respective sanctions can be seen by looking at each year’s book.

Going back to the 1988-1989 Lifesaver, the outline of the existing hall policies was very basic. One page was dedicated to simply listing out a set of “prohibited behaviors.” Some of these behaviors were: possession or use of firearms or weapons, noisy or disruptive behavior, interference with residence hall staff, tampering with fire equipment, setting fires, unlawful possession or consumption of alcohol or controlled substances, and harassment or assault. The visitation, quiet hours, and alcohol policies were the only listed behaviors that any additional information was given on. These three policies were given about three paragraphs of supplementary elaboration each.12

After this information, the Lifesaver listed the hearing and appeals process over a single page. The process consisted of a hearing officer, usually the RD, receiving an information report and scheduling a hearing with student judicial board. The board would decide on whether or not the resident was guilty of violating one or more of the residence hall policies

and would outline any sanctions to be placed on the violating resident. These sanctions were not explained, but simply listed in the Lifesaver. They consisted of restitution, educational projects, personal or academic referrals, written warnings, probation, relocation, filling out a behavioral contract, deferred removal, or removal. None of these sanctions were defined or attached to any specific policies.

For the 1991-1992 school year, simple one line sentences followed each of the listed prohibited behaviors and a computer use policy was added to the Lifesaver. Other than this minor change, the written rules for the halls did not experience much revision until a couple years later. The 1993-1994 book, now titled the Eyes & ‘Eers featured a bit more explanation of the process and included more definition to outline each policy and each sanction.

While the policies were rudimentarily listed in the Lifesaver and Eyes & ‘Eers up to this point, the process itself was part of the problem. Many times it appears that policy violations would go undocumented and unreported. If it was reported, hearings were not always set up and frequently, sanctions were not handed out at all. Another problem was that repeat policy offenders were often allowed to remain living in the residence halls because there was no clear written procedure for how to apply sanctions to specific policies. For example, someone might have broken the alcohol policy multiple times but would still be living in the hall because the case was either never reported or the judicial board did not assign uniform and consistent sanctions.

Another issue at hand was the ability of the hall RAs to control their floors and act as good role models. RAs were not consulted about any of the judicial proceedings taking place in

---

their buildings or on their floors by the judicial board or hearing officers. A RA might have reported an incident, but there was no follow up with them after the case was closed. They were not given any information about the outcome of the case and were not made aware of any sanctions imposed on the residents. This often caused residents to have a lack of respect for the RAs in the hall since they often did not know what was going on surrounding the judicial process. This led to a general feeling by the residents that the RAs were powerless and ineffective.

To combat these problems with the judicial system, the Student Affairs Task force had recommended that the residence hall policies be looked at for revision. For the first year of Project 2000 with RFLs in place in each hall, not many changes were made to the format that had been in place previously. In the second year (1997-1998), however, noticeable changes started to be made that reflected the increased input of the RFLs in the establishing a new judicial process.

The *Eyes & ‘Eers* itself was significantly overhauled and revised into a full color publication that included much more additional information about student resources on campus. It also featured a “Community Standards of Conduct” section that broke down the residence hall judicial system in great detail. A marked improvement over previous editions, this section explained in relatively simple terms the entire process. Also added in this edition was a section on “Resident Rights” for the first time. These rights included:

1. To read, sleep, and study free from undue interference, unreasonable noise and other distractions;
2. To expect that others will respect your personal belongings;
3. To a clean environment in which to live;
4. To host visitors with the exception that you will explain to them the accepted behavioral standards and that visitors will respect the rights of your roommate(s) and fellow residents;
5. To discuss grievances with a residence hall staff member who can assist in addressing the concern;
6. To be free from fear of intimidation and physical and/or emotional harm;
7. To expect that all of these rights will be respected.

Along with these Resident Rights, there was also a clearer explanation on how sanctions would be assigned. When determining appropriate sanctions, the judicial body considered the willingness to accept responsibility for one’s behavior, previous judicial history, severity of the situation, and any recommendations made by the complainant/victim.\textsuperscript{14} At this point, it was still up to the judicial board to decide which of the possible sanctions to assign for each policy violation.

For the next two years, only minor changes were made to the *Eyes & ‘Eers* while the Residence Life staff evaluated the progress being made. The next set of major changes to the residence hall policies came during the 1999-2000 school year. While the hearing process did not see any major format change, what is substantial is the fact that for the first time the sanctions for specific violations were made more uniform. In addition to this, monetary fines, community service, and parental notification were added as sanctions to further emphasize the importance of residents understanding and complying with the residence hall policies.

Under the old procedures, two different students could meet with the judicial board and be assigned two completely different sets of sanctions for the same policy violation. This could have been due to differences of opinion, failure of the board to reach an agreement, or personal relationships amongst the judicial board members. There was now one set of

sanctions assigned to each specific policy. For example, a resident violating the Alcohol policy
the first time would be assigned as a minimum, residence hall probation, a $25.00 fine, 5 hours
of community service, parental notification, and a referral to the Student Assistance Program
educational session at the university. For a second alcohol policy violation, a student would be
put on deferred removal, given a $50.00 fine, 10 hours of community service, parental
notification, and a referral to the Student Assistance Program for an individual assessment and
counseling session.15

Emphasis was also placed on using different wording in handling judicial proceedings
with residents to make the new system seem more personal. The old system was frequently
looked at as a court type proceeding where the guilt or innocence of the offending resident
would take place. Emphasis was placed on using the terms “responsible” and “not responsible”
to determine guilt and stress was placed on the importance of making personal decisions that
allowed the entire community to live in peace.

While these changes to the policies and sanctions were rolled out over the course of
Project 2000, other developments to the department were occurring at the same time.

Partially due to the increased involvement of the RFLs in the hall community, the administrative
end of the Residence Life and the faculty members seemed to have difference of opinion on
how to treat students and run the program. The RFLs had been charged with taking on the
leadership of their respective residence hall but were still having to conform to the policies
being put in place by the administrative branch of Residence Life from 1996 to 1999. During

this period of tension, the RFLs reported up to Carole Henry, the Director of Housing and Residence Life.

To help the RFLs have more of a voice, David Stewart was appointed “Head RFL” in 1998 in order to manage faculty issues and to be the link between the RFLs and H&RL. Some of these issues revolved around consistency of policy enforcement and treatment of the RA staff, who the RFLs had come to rely on as a key link between them and their residents. Upon the departure of Henry in 1999, Stewart was appointed Director of the Resident Faculty Leader Program as well as the Residence Life division of H&RL in Henry’s place. This new position as director of both programs put Stewart in a place to make many policy decisions for the department without having to go through much administrative back and forth. Essentially, he and the RFLs were able to set the vision for the program and steer it in a direction they felt was appropriate. It was also around 1998 that the RD position title was changed to a new title, Residence Hall Coordinator (RHC).

The whole of H&RL was reorganized to make operations run more smoothly between the 2000 and 2001 school years. The Department of Housing and Residence Life was dismantled and each division was shifted into new areas of management under Student Affairs. The divisions of Residence Life and Housing were kept together under a single Residential Education division. Conference scheduling was placed under the new Housing section of Residential Education. The Food Service division which managed individual hall dining facilities was combined with Mountainlair Dining under the newly formed Dining Services division. Custodial/Maintenance services were initially placed into a new division as well, Student Affairs
Auxiliary Facilities which managed the residence halls, the Mountainlair, and the Student Recreation Center before being put completely under Facilities Management in 2005.

Dr. Stewart was promoted again in 2000 to Associate Dean of Student Affairs and kept his job working as Head RFL and Director of Residential Education. Many of the problems encountered during the Project 2000 years were now a thing of the past as the RFLs had a faculty member working with them to make any necessary changes that came up. A new mission statement for Residential Education was written to reflect the feelings of the faculty leaders. This statement reads:

The West Virginia University Residential Education program creates a student-centered learning experience leading to the academic, social, and personal success of students living in Residence Halls and offers support to students throughout the larger University community.

The basic philosophy behind the new Residential Education division of student affairs, still in place today, is that learning should be integrated with living and that informal learning and personal support in the residence halls is integral to an education at West Virginia University.\footnote{Residential Education Mission Statement} A list of goals and hopeful outcomes were also put together along with this mission statement to give further explanation of the goals of the restructured program.\footnote{For a full list of the goals of Residential Education, see Mission Statement at end.} Some of the goals set for residence hall students were an increased familiarity with the University and its resources, better grades than non residence hall students, a decrease in mid terms received, and better time management and study skill practices. To accomplish meeting these goals, RFLs took to planning a programming calendar around them.

Given a significant budget to assist in the planning of these programs, RFLs and RHCs worked with each residence hall’s Hall Council to set up, promote, and carry out activities. The
Hall Council is the student group from each building tasked with being the voice of the residents. Officers were, and still are, elected each year and worked with the hall leadership to hold events the student body of the building was interested in. These officers worked with the leadership team to help with educational, cultural, and social programming. Each hall has certain events that are unique to it and have become traditions that have carried through even with changing RFLs and RHCs in the halls.

To promote an academic environment, RFLs have been encouraged to plan around and promote educational activities wherever possible. Some of these programs have included over the years taking cultural trips to the ballet, opera, and theater in Pittsburgh and Creative Arts Center, holding study sessions for major groups in their buildings, taking trips to big cities like New York or Washington DC, and organizing and chaperoning study abroad trips over spring break to places like Italy and Greece. In addition to large trips, most RFLs have found that a big impact can also be made simply by sitting down one on one with individual residents and discussing their grades and overall experience at the university.

Social programming has been an important anchor of the RFL program. Many RFLs would say that it is through social events that most students choose to interact with the rest of the hall community. Through social programming, many residence hall students have been exposed to new activities and opportunities that before seemed foreign to them. The RAs of the building have taken on much of the responsibility in organizing these social events. Some of these social activities have included in-hall sporting competitions, community service oriented events, annual Halloween parties, and watch parties for football games being played away. Some of these social activities themselves provide some sort of educational and cultural value.
Many international students living in the halls have commented that just attending a football watch party had been culturally significant to them even though they had no idea what was happening on screen!

From 2000 to 2003, Dr. Stewart remained the director of the Residential Education program while also working as a RFL and the Dean of Students. In 2003, Arnold Hall RFL Robin Jones took over as director while Dr. Stewart remained as Head RFL and Dean. As the Dean, Stewarts behind the scenes activity included recruiting more faculty into the program when vacancies arose, renewing appointments for current RFLs, and managing their academic appointments.

A new director, Trish Cendena, took over in 2006 in place of Robin Jones, who remained the RFL at Arnold Hall. From the time of her appointment to the present, the program has undergone only minor changes in terms of functionality but some larger changes in terms of department philosophy. While the mission statement for Residential Education has remained unchanged, how to carry out that mission has been slightly altered. Where the RFLs, working with a faculty director, were the main people responsible for guiding the vision of the department during its first few years, additional non-faculty staff members have been hired who are now steering the department forward.

Additional associate and assistant directors, who had been former RDs and RHCs, have been hired to work with the director on various aspects of the department. Although their duties change from year to year, these assistant directors have been focusing their time over the last several years on evaluation and assessment of RFL program activities and surveying resident reaction and participation in these events. They have also been assigned to handle
advising different residence hall groups like the Residence Hall Association and Resident Assistant Council.

One considerable component added to the residence halls that took shape in 2006 was the addition of Lincoln Hall. This new hall was planned to be WVUs first Residential College. The idea behind Lincoln was to have increased faculty involvement, in addition to the RFL, and a greater focus on academic themes in the programming for the hall. Professors would come in and teach special freshman seminars specifically for Lincoln Hall students and serve as Faculty Fellows to the hall. In addition to the regular housing application process, students wanting to live in the new hall originally had to fill out an additional application outlining how they would contribute to the hall community. Since trying the programming model at Lincoln, other residence halls on campus have made changes to a Residential College model as well and have worked to incorporate additional academic themes into their programming.

Perhaps one of the most important roles only briefly mentioned in this paper that warrants additional attention is the role of the Assistant RFL. While considered to be only a part time job, many of these RFL/Assistant RFL teams have put in a considerable amount of time to their hall in terms of programming even after having worked their full time jobs, sometimes outside of the university, all day long. Assistant RFLs have taken on additional duties over the years ranging from advising the Hall Council to organizing large scale ongoing hall activities like coffee houses, study sessions, and clubs. Having become such an integral and visible part of the leadership team, many residents assume both the faculty leader and spouse are considered to be the RFLs of each hall.
While the hands on activity of the RFLs and the rest of the leadership team have varied from hall to hall over the years, and even though sometimes major changes have been made in terms of the structure of the department, the role the RFLs have had in changing the face of WVU residence halls is undeniable. This change is seen not only in the numbers but in the changing behavior of the students. Since the program was founded during the 1996-1997 school year, the number of residence halls on campus has risen from eight to thirteen (with a fourteenth briefly). Along with these additions, new leadership teams were needed to lead these halls. WVU has experienced an increase in enrollment from 15,042 undergraduates in 1995 to 21,720 undergraduates in 2009. With this growing university population, the number of students impacted by Resident Faculty Leader Program and through Residential Education has grown as well each year.

The residence halls have gone from a wild environment full of rule breaking and uncontrolled partying to a much more respectful and peaceful place to live and study. By many accounts, the reason for this is because of the success of the RFL program and Residential Education in establishing a more student centered program. When asked what are the most significant accomplishments of the program, all people surveyed while writing this paper indicated that by the far largest achievement was bringing the halls into a more controlled and student friendly mode of operation. Not only has the program established reasonable policies, but through sanctioning policy breakers and having the RAs educate their residents on how to

---

18 Fieldcrest Hall, Pierpont Apartments, Summit Hall, and Spruce House were all added as residence halls in the 2003-2004 school year. That year several buildings at Sterling University Ridge (now just The Ridge) were also leased out but its use was discontinued for the 2009-2010 school year. Lincoln Hall opened in fall 2006. The Honors Hall opened fall 2009.
properly behave as members of the community, vandalism problems have declined and have saved the university hundreds of thousands of dollars over the last decade.

As the university continues to move forward, the RFL program has been forced to adapt as well. With so much effort being placed on social programming, a new challenge has been put out to the RFLs to start including even more academics related content into the halls. It is hoped that by doing this, the university may be able to raise its retention rate from approximately 80% to 85%. Planning meetings are still being held on how to accomplish this, but some of the ideas floating around at the moment consist of additional use of study halls and groups, cooperation with academic departments to bring faculty in to provide study sessions before large exams, and tracking class attendance as a way of making students more aware of their stake in their own education.

The restructuring of the residence halls have been a major contributor to helping students find the resources they need on campus and in getting started on the right footing. This was a part of the way in which President Hardesty wanted to accomplish his goal of making the university more student centered. By taking the recommendation of the 1995 Student Affairs Task Force into consideration, Hardesty’s administration showed that it was interested in pursuing an agenda of increased involvement in student life. In what would eventually be a complete departmental restructuring, Housing and Residence Life was transformed into Residential Education and full time faculty members found their way into the every day lives of thousands of residence hall students. Their continued academic support and guidance seems to be a positive thing each year in helping the university hang on to students and keep them enrolled at WVU.

RESIDENTIAL EDUCATION MISSION STATEMENT

Mission Statement
The West Virginia University Residential Education program creates a student-centered learning experience leading to the academic, social, and personal success of students living in Residence Halls and offers support to students throughout the larger University community.

Mission Philosophy
The essence of Residential Education is that learning should be integrated with living; that formal teaching, informal learning, and personal support in Residence Halls is integral to a WVU education. Residential Education programs build Residential Learning Communities within the larger University by extending the classroom into the Residence Halls. Residential Learning Communities complement the academic curriculum with activities and experiences essential to students’ preparation for a life of leadership, intellectual engagement, citizenship and service.

Goals of Residential Education
• Establish an integrated academic and residential learning experience.
• Create a climate and culture within the Residential Learning Communities that is conducive to academic success.
• Personalize the first year student experience.
• Provide clear expectations to students regarding academic achievement.
• Provide clear expectations to students regarding community standards in the Residential Learning Communities.
• Encourage high quality faculty, staff and student interaction in all Residential Learning Communities.
• Promote safety and security within the Residential Learning Communities.
• Create a framework for life-long learning skills.
• Foster the development of critical thinking skills.
• Encourage and support student involvement and leadership.
• Encourage responsible decision-making and accountability.
• Encourage healthy choices and personal well-being.
• Assist the University in recruiting and retaining quality students, faculty, and staff.

The learning objectives we expect for students in Residence Halls are:
• Students will develop and exercise responsible citizenship.
• Students will have a heightened awareness and appreciation of diversity and social justice.
• Students will have a greater appreciation for the arts and culture and their role in society.
• Students will be more successful academically.
• Students completing their first year will be well prepared for their future years at the University.

Intended Educational Outcomes:
• Students will be familiar with the University and its resources.
• Students will understand their rights & responsibilities as a Mountaineer and student living in Residence Halls at the University.
• Students will have learned time management and study skills practices.
• Students in Residence Halls will be less likely to receive multiple midterm reports or be placed on academic probation.
• Students in Residence Halls will earn relatively higher GPAs than non-residence hall students.
• Students will be more successful in moving from their freshmen to sophomore status.
• Students will understand their accountability to the University and the entire Residential Learning Communities and self-police their behavior to respect the rights of their peers.
• Students will engage in responsible decision-making and respect the physical conditions of their Residence Halls.

Students as Individuals
Title: Perception of Islam and Muslims among College Students

Parveen Ali
Assistant Professor
Department of Developmental Studies
Indiana University of Pennsylvania
Indiana, PA 15705, USA
Email: pali@iup.edu

Abstract

Islam is the second largest religion in the world after Christianity, and it is the fastest growing religion both globally and in the United States. There are an increasing number of American students who follow Islam; however, the religion is largely portrayed by many American political and religious leaders and in the popular media with false and negative stereotypes and as a religion of violence, terrorism, and extremism.

The primary goal of this study was to investigate American college students’ perception of Islam and Muslims. This study explored whether there was a correlation among individual’s perceptions and their knowledge of and exposure with Islam and Muslims. Furthermore, this study examined whether there were any gender differences in these perceptions. Finally, this study identified the influential factors that contributed to American college students’ overall attitude towards Islam and Muslims.

The total sample consisted of 398 students from a Western Pennsylvania University who were taking any prefix 100 level courses from the university in fall of 2010. The gender composition of the sample was 205 males and 193 females. The race distribution of the participants was: 325 white, 42 African-American, 10 Hispanic, five Asian, and 16 multiracial.
The median age of the participants was 19. The study used descriptive analysis, \( t \)-tests, correlation analysis, and multiple regression analysis.

The results of the study indicated that there was a significant positive correlation between students’ perception of Islam and Muslims and their knowledge about Islam and Muslims. Moreover, there were positive correlations between students’ knowledge of Islam and exposure to Islam; knowledge of Muslims and exposure to Muslims; exposure to Muslim and perception of Muslims; and exposure to Islam and perception about Islam. There were no significant gender differences for students’ perception of Islam or Muslims among this population. Multiple regression analysis indicated that perception of Islam and Muslims were the strongest predictor of the students’ overall attitude towards Islam and Muslims. Knowledge about Islam and Muslims and exposure to Muslims also had a significant impact on the overall attitude. However, gender, race, age, and the generations of family that were college-educated did not have any significant influence.

Educational institutions play a vital role in shaping perceptions and attitudes toward minority groups. Colleges and universities need to create more awareness about the religion of Islam by finding creative ways to integrate cross-cultural and religious studies across curriculums and actively seek high quality resources through local community organizations, students' families, and appropriate reading assignments.
Teacher Candidates and John Dewey: In the Context of NCLB and The Child and the Curriculum

One of the questions raised in educational discourse is whether education is for life or for the test scores. In other words, the focus in the former case is on “the child” and in the latter, on the curriculum. Historically, Dewey asked this question and gave his own answer. The same question is raised today in the context of No Child Left Behind. We, therefore, ask our teacher candidates: What relevance does John Dewey have for our children and teachers for the 21st century?

We are involved in teacher education at Dowling College as professors of undergraduate and graduate teacher candidates; and we use Dewey's works to give our students a strong
philosophical basis to guide their decisions in developing the curriculum for their pupils, particularly while doing their full time student teaching experiences in the public schools.

Our education students study in-depth Dewey's book *The Child and the Curriculum*; and they are able to discern his salient concepts of examining the logical and psychological aspects of experience. The logical part of the curriculum is the product of years of human experience logically and systematically synthesized into a final product. However, the psychological aspect of experiencing and “learning by doing” must also be included in the learning process for the immature learner.

Student candidates learn to look at the child and the curriculum in an interactive relationship and develop lesson plans based on their pupils' development, readiness, interests, and motivation. Dewey’s educational ideas guide them as they prepare lesson strategies for their own students. For example, when Dewey talks about education being a “continuing reconstruction of experience” our candidates learn that it is their responsibility to integrate the young child's prior knowledge and experiences into the new information they are trying to teach so the child is able to assimilate and accommodate as Piaget stated.

Dewey’s focus on the whole child and preparing her or him for critical thinking and creative problem solving are necessary in the 21st century. Our paper clearly identifies Dewey's relevance for today, especially in the context of NCLB. NCLB’s stress on the high stake accountability has created more tension and problems for teachers. Schools’ narrow focus on curriculum is worrisome for teacher candidates. Education has become a preparation for tests--not for real life. Our candidates are afraid that schools do not devote enough time and resources to subjects such as arts and science, or skills such as critical thinking and creative problem solving; and thus, do not prepare them properly for the 21st century.

In conclusion, we argue that Dewey’s perspective on the child and the curriculum is not a panacea for today’s educational problems; but he provides us with a set of lenses to look at contemporary educational issues. Dewey gives us some fundamental principles and good insights into the nature of the child and curriculum, as well as teaching and learning that are relevant for today.
Competitive and Collaborative Approach 
Towards a More Effective Education in 
Computer Science *

Tomas Cerny and Bozena Mannova

Abstract To provide a computer scientists with good materials and interesting topics 
in a class does not mean that their education is of a high quality, students need 
be motivated and evolve skills needed in a real-life employment. Social skills, 
communication, team work, collaboration and competition are valuable aspects they 
should know in other to be professionals in their future career. In this paper we 
look into experiences in competitive and collaborative learning in education and 
programming olympiads to improve a quality of education in our course. We provide 
criteria we applied for our course and present a student evaluation on the approach. 
Our approach showed increased motivation in students’ interest in the course. In 
addition students could handle a larger workload in the class as they were motivated 
to be better compare to others.

1 Introduction

Computer science has multiple disciplines where some may change and evolve quite 
quickly which is the trend of the industry where a five years old computer is seen as 
an archaic one. Computer science education in addition prompts for competition as 
many programs with different functionality, performance and interface are build by 
computer scientists every day. Schools produce a lot of students in the area but not 
all of the students are recruited as professionals, but rather as beginners in various

* This work was funded through SSME project CTU-131-05-101101 by the Czech Ministry of 
Education in frame of the Development Programs
companies. The goal for teacher is to prepare professionals that can succeed in the employment. It is not only important to train students in the knowledge of technologies, techniques, models and processes, but it is also important to build student’s social skills, communication capabilities, competitive nature and the ability to collaborate in a team which is in fact often the case in the employment. In this paper we present a competitive and collaborative approach towards more effective education in computer science. Based on previous research in the education we believe that our students can gain new abilities for their future career. In our computer science course we apply the research results and our rich experience we have from ACM International Collegiate Programming Contests (ICPC) [15]. We describe the way we applied the competitive and collaborative learning in our course and provide an evaluation and experience we received from the course.

This paper is organized as follows. In Section 2 we describe the background of computer science, competitive and collaborative learning in the programming olympiads and previous research in the approach. Next, we describe the way we applied the approach in our class in Section 3. Section 4 provides our experience and evaluation of the course. The last Section 5 concludes our work.

2 Background

Computer science has a long history which might be considered going back to ancient Summer and Babylon where a first tool we consider from that era abacus was invented. Simply rational behind this tool are lines drawn in sand with pebbles. Similar design is used even these days at modern machines [1]. The modern computer science as we build on started in 1936s with Church-Turing thesis where Alan Turing build a powerful computational model Turing machine [2]. Turing machine is an accurate model of general purpose computer and can do everything that a real computer can do. In addition, from this model we also find certain problems that cannot be solved by computers and are beyond the theoretical limits of computation. These days’ computer science spreads over a multiple disciplines such as theoretical computers science, algorithms, design patterns, databases, software engineering and many others. Education in these areas often involve math, graph theories, mathematical logic and statistics. For computer science courses often a lecturer follows a table-driven student evaluation. This often statistically distributes students in groups for grading. Table-driven system works and is proven by time, but we are raising a question if this is the right education direction for computer science.

Parallel to the institution education exists multiple competitions among institutions where students compete with each other or in groups and the best results are rewarded. In various locations we may see multiple programming olympiads [3] [13] [14] where among the well known world wide that we have extensive experience with is the ACM International Collegiate Programming Contest (ICPC) [15].

---

2 Both authors are members of the competition organization where one since 1994
The ICPC contests are very popular instrument for the Association for Computing Machinery (ACM) [16] for younger generation besides it’s known scientific conferences. In the ICPC competitions students form institutional teams and compete with other teams by solving small algorithmic exercises where the team with the most solved problems in shortest time and with less wrong answers wins. There are in addition annually multiple contest tears where teams compete in specific regions, super regions and the best team can compete in the world finals. These competitions started back in 1977 and the participation has grown to several tens of thousands student from almost 2000 universities. The participation is high even that some universities requires fees. The key question might be what motivates students to attend the competition. With no doubt there is a competition among students and also collaboration within a team which involves student to student interaction. In addition the competition started with its own symposium Collaborative Learning Institute (CLI) at the world finals [17].

Our motivation is to apply similar key factors to motivate students in our computer science courses and compare the results with standard table-driven student evaluation.

Similar approaches were already applied in many study disciplines. In [5] authors look at how students interact with each other and with materials. Authors discuss that often the student to student interaction is ignored and the course focus is solely on teacher student interaction. Authors describe three patterns for student to student interaction. The first pattern is a competition to see who the best is. Second, there is an individual work where students do not need to pay attention at other students. The last pattern is a team cooperation where they explore each others contribution to the goal. From these patterns the competition is the key. In addition research in the U.S. shown the key motivation for students is a competition where they want to be better than others. This in fact might not apply for other schools as in the Czech Republic where our experiment is applied. In addition to competition the cooperation among students will support the overall work as the individual success is support to the whole team. Authors suggest “that the team cooperation encourage each other to do the assigned work, and learn to work together regardless of ethnic backgrounds or whether they are male or female, bright or struggling, disabled or not”. The work then details on five conditions that support cooperative learning as more productive than the competitive one. These conditions are:

**Listing 1** Five conditions to support cooperative learning

1. Perceived positive interdependence
2. Face-to-face interaction
3. Personal responsibility to achieve the group’s goals
4. Use of the relevant interpersonal and small-group skills
5. Group processing of current functioning to improve the group’s future effectiveness

Authors suggest to keep the team size small. Where the size impacts the individual accountability. In addition role assignment in the team might be beneficial for larger teams. From the individual accountability perspective it is important to let
students to teach the others about what they learned. This in addition supports students social skills. The authors discuss in the conclusion that in result of cooperation of students build and maintain stable marriages, families, careers, and friendships.

Similar work was done also at Berkley [4] where the research shows that the students learn best when they are actively involved in the process. Also students that collaborate in a group seems to be more satisfied with their course. In addition the work provides a road map to similar approaches to the collaborative learning such as peer learning, study groups, team learning, etc. This work provides a general recommendation and strategies for a collaborative environment where the focus is on assigning a team roles. Useful is a discussion how to deal with student and faculty concerns that may raise during the course.

Recent work applying competitive and collaborative learning in senior secondary schools is from Nigeria [6] where they investigate the effect of the cooperative and competitive learning on academic performance of students in mathematics. The findings revealed that cooperative learning strategy is more effective than the competitive one and that males performed significantly better than females in both learning strategies. From this research we consider that also ethnical and cultural aspects may play role and as we see from the ICPC competitions there is significantly more male contestants than female ones, in addition there is a huge community and interest in the competitions in Asia or Russian Federation compare to the interest in Europe or Africa. This in addition means that the applicability of Competitive and Collaborative learning will fit better to disciplines where is a majority of men which in our region are technical universities and computer science.

In order to prepare students for professional employment [7] provides a team-like cooperation in a competitive business-like environment. Students then cooperate and compete by structuring learning activities that require them to cooperate in teams that compete against one another. This paper also provides definitions of terms competition and collaboration (originally [8]):

**Competition:**

a social process that occurs when rewards are given to people on the basis of how their performances compare with the performances of others doing the same task or participating in the same event

**Cooperation:**

a social process through which performance is evaluated and rewarded in terms of the collective achievements of a group of people working together to reach a particular goal

The work discuss combination of both cooperation and competition approaches with the positive aspects of motivational competition through inter-group competition between collaborative team. Where the rational in the real world is that a competition is evident throughout our society, our lives, and our recorded history. Authors see the benefits to the students whose outcomes often exceed content-driven and application-based objectives which also prepares them better for the professional career. Computer science is an area that matches with its professional ex-
Competitive and Collaborative Approach Towards a More Effective Education in C.S.

Expectation to this type of learning. In the next section we describe results of the application at our course.

3 Experiment

Based on our previous experiences with ICPC competitions, multiple interesting articles on the competitive and collaborative learning and the real life competitive trends in computer science employment we decided to apply the approach in our course Architectures of SW systems at Czech Technical University which is an eligible course for the 6th semester for Bachelor degree. The size of the course was 56 students, where 39 students passed the course. The course was structured in optional lectures and mandatory practice, which is a way all the curses at our institution are structured. The lectures consisted of a talk on topic of software architectures [12] (a), design patterns [9] (b) and enterprise design pattern [11] (c) and documentation [10] (d) which in fact covers content from four text books. Practices where divided in even and odd weeks, where the students either handed out a small demonstration program on a specific architectural type (e) with documentation (f) or read a large research paper and prepared for a discussion (g). Every odd week students were given a programming challenge (h) to solve where the first few correct implementations were progressively rewarded with points. The requirements were very high for an eligible course.

To apply the collaboration, students built teams of two members where they were working together on the architectural programs (e) and documentation (f), presentation of an enterprise pattern (c) in front of all the class and programming challenges (h). Students could define their own strategy to work on tasks together or sharing the tasks as individuals. Students were also evaluated individually during the research paper discussion (g) (in English) and two tests (i).

The competition was given by the grading, where the final score would be assigned by the best score and distributed to equally from A to F based on the result of others. Simply who will have better score than others will have a better grade than others. The points were assigned in the manner as shown in Table 1. An individual could receive up to 45 points and in a team up to 61 points. Teams had multiple tasks (c)(e)(f)(h) so they received a soon feedback on their work. In addition the

</table>
presentations (c) were graded by 10 point from the audience and 10 points from the teacher, so there existed also a communication and feedback from other teams. Students were directly involved in the education process as the tests contained questions form their presentations. Every team presentation was awarded with applause from the audience. Challenge winners were honorable announced every first upcoming lecture.

4 Experiment Evaluation

Our previous experience with the same class at Charles University where a table-driven evaluation took place shown that students were not interested much in the course and only a subset of topics were applied: (a)(c)(d) and a project. The application of competitive and collaborative approach brought more motivation to the course and allowed to extend the content of the course. The class with a lot of tasks and additional challenges made students feel a pace environment which they may face in real SW development. We mentioned earlier that students participated in the education process in form of patterns presentations. In our institution it is common that only a small group of students attend the lectures. In here it was about 35 students attending every lecture, because they seemed interested in the student presentations, their feedback and point evaluation of the other teams, second of all the results of challenges were announced at lectures.

Students had to collaborate in the team together in order to receive more points than other teams, often students split their tasks and solved them individually such as one did implementation part and one did documentation. If one team member in this case failed then both were punished with a low score on the other hand a good results were rewarded with full score, multiple tasks allowed a soon feedback for the team so they could improve in the next task. We believe that it is good to apply rather small projects with a soon feedback rather than a large project with the feedback at the end of the course. Many students had a problem with research papers as English is their second language, but often they said that after the first paper the rest was much simpler, in addition they had a chance to improve their English and lose the initial fear to talk. At the end of the course many student were able to understand the text and answer the questions.

From the perspective of our course we have applied all three patterns of communication in our course. First, students were collaborating in teams and evolving social skills, planning and collective strategies. Second, teams were competing in order the receive good grades and do better than others. Third, they had their individual responsibilities in reading and tests.

Our feeling form the lecturer perspective is that the students were positively motivated by the announcement of the challenge winners in the lecture and also by the applause for their presentation. With the students involved also in the grading process we believe that this motivated students to attend the lectures and learn multiple

disciplines which some of them might have learned in a passive way, such as the team work, planning and education other colleagues.

At the end of the course we passed evaluation forms for the class where individual elements were evaluated. All students that passed the class (A, B, C, D or E) could
fill out the evaluation. Students that canceled or failed the class (3) did not attend in the anonymous evaluation. Fig. 1 shows the grades distribution for the class.

Fig. 9 and Fig. 10 shows the attendance in the lecture and the practices. The evaluation of the student tasks from Table 1 can be seen on Fig. 4, Fig. 5, Fig. 7, Fig. 8 and Fig. 6. Fig. 3 and Fig. 2 shows how students likes team and competitions work.
5 Conclusion

In this paper describe application of competitive and collaborative learning known from programming olympiads and previous research in our computer science course. We have defined a specific tasks for students that were evaluated in this manner. At the end of the course we evaluated the course based on anonymous student feedback. From the feedback we see that majority of the students like to have a competitions for the grades and to work in teams where most of the A and B students liked the team work and most of the A students also liked the competition. Very popular among students shown to be challenges which directly support competition and also the presentation which is a place where students influence the education of others. Student projects shown to be positive as they played a role for both team and competition part. Tests and research papers had more balanced feedback in which we rather see a success because not many student like to do tests and read papers in foreign language. Something very positive we see is the attendance at lectures with is optional and in this case the distribution almost matches the practices attendance, we believe this has something to do with student presentations and their opportunity to influence the points of the presenter and also with the expectation from the challenge honorable mention. We believe that competitive and collaborative learning in education as we present in this papers have a positive effect on the course and will be applying it on our upcoming courses.

The Relationship of Mothers’ Acceptance of their Children who are Disabled with Age, and Employment

Dr. Ibrahim Amin Azem

College of Education
Sultan Qaboos University
PO.Box 32Al-Khoohd123
Muscat, Oman
ibrahimq@squ.edu.om
ibrahimaa2003@yahoo.com
Abstract

This study discusses mothers’ acceptance of their children with disabilities. The subjects of the study were 405 mothers of children with disabilities registered in schools and centers of special education. One hundred sixty seven subjects were mothers of children with hearing impairment, ninety-six subjects were mothers of children with visual impairment, sixty-five subjects were mothers of children with cerebral palsy and seventy-seven subjects were mothers of children with mental disabilities. A questionnaire with 43 items was administrated to the mothers; the items were prepared based on literature and the experience with children with disabilities in the domains used in this study. The questionnaire was tested for validity and reliability.

The results of the study revealed statistically significant differences in mothers' acceptance of their disabled children related to the type of disability in favor of hearing and visual disabilities vis-à-vis mental retardation. However the findings of the study showed that there were no statistical significant differences in mother's acceptance of their hearing- impaired children, visually impaired, cerebral palsy, and mental disability due to mother's wok or age. This study also suggests conducting further research in other Arab countries, to further understanding of the phenomenon of disability since the results here are not conclusive.

Key words: acceptance; hearing impaired; visually impaired; children with cerebral palsy; mentally disabled.
Introduction

A Mother's acceptance of her child with disabilities is considered a civilized model for coping with and humanistic individual differences among her children. This acceptance has been seen in the social relations inside the family and even may extend outside the family. This also affects the psychological structure of family members including the person with disability. The mother is considered to be the source of education, passion, and socialization, which may positively or negatively affect children. The mother's demonstration of acceptance of, understanding of, and communication with her disabled child constitute a positive model for the sibling to follow while interacting and communicating. However, mother's anxiety about the future of a child with disability may have a negative effect on the psychological atmosphere of all the family members. The behaviors that result in anxiety may encourage the siblings to neglect, reject, and isolate their disabled brother/sister. Consequently, he/she might feel or act as a stranger in the family (Llewellyn, Thompson, Whybrow & McConnell, 2003; Blacher & Hatton, 2001).

The mother's acceptance of her child's impairment offers a positive climate for the child to grow socially, psychologically and behaviorally. It also provides him/her with opportunities for early intervention in the educational, social, psychological and medical aspects. This, in turn, helps in adaptation, development, and providing the child with the right stimuli at the right time (Al-khateeb, 2001; Al-qarsi, 2003; Fahmi, 1983). However, the mother's rejection of her child's impairment, and using of defensive mechanisms may increase the child's feeling of being different from others. It ensures his/her weakness, inability and dependence. It also affects negatively self-
esteem, acceptance of the impairment, and interaction and acceptance of others around him (Abed-Allah, 1999; Marwan, 2002).

The related literature indicates that Mother's acceptance of her child's impairment depends on a number of variables such as family's socio-economic status; parent's awareness level; and parent's health. Elsoon (2000), in her study, showed that the majority of families with severely disabled children reported challenges with some aspect of their daily activities, social life and financial needs. Some researcher found that economic hardship has negative impact on the parent's behavior toward the child with disability (Mcloyd, 1990; Books-Gunn& Duncan, 1997; Garett, Nq'andu& Ferron, 1994).

The disabled person, the type of disability, severeness, gender, personal traits and other capabilities may also affect the degree to which mothers accept a child with disability (Al-zeriqat, 2006; Masood et al 2005; Al-khateeb, et al 1992; Smith 2004).

According to researches in the field of disability, some families don't accept their handicapped children and they can't cope with the disabilities; like Down syndrome (Lee, 1986). Other studies referred to maladjustment among family members and psychological stress, loneliness and inability to participate with others due to having disabled child (Howaidi, 1996; Al-hadidi & Al-khateeb, 1996; Al-hadidi et al, 1994; Hodapp & Kranser, 1995; Singhi et al, 1990). Other studies show that the degree of acceptance of the disability depends on its type. For example, hearing and visual impairment are seen as more acceptable than a mental disability. Scientific arguments were presented in few studies that indicated greater acceptance of the female disabled children as opposed to the male; while others indicated a tolerance with male disability (Mohammed, 1998; Al-qaryouti, 2008; Hassal & McDonald, 2005; Baroun, 2006).
**Study Questions**

This study was designed to answer the following questions:

1. Will there be significant effects of age and employment on the mothers' acceptance of their hearing-impaired child?

2. Will there be significant effects of age and employment on the mothers' acceptance of their visually-impaired child?

3. Will there be significant effects of age and employment on the mothers' acceptance of their child with cerebral palsy?

4. Will there be significant effects of age and employment on the mothers' acceptance of their mentally disabled child?

5. Is there any differences in mothers acceptance of there disabled children according to there type of disability?

**Method**

The current study follows the analytical descriptive approach. A specifically designed questionnaire was administered to a sample of mothers who have children with disabilities and were registered in centers and special education private schools in four major cities in Jordan. The mothers were included in the study on voluntary basis. Mothers who agreed to participate in writing were sent the questionnaire by a group of graduate students who lived in those cities. The same group of graduate students collected the filled questionnaires from the centers. Social workers in the four centers cooperated in data collection.  Four hundred eighty questionnaires were distributed, of which 405 were valid while 75 were in complete:

a. 167 mothers of hearing impaired children.

b. 96 mothers of visually impaired children.

c. 65 mothers of children with cerebral palsy.
d. 77 mothers of mentally retarded children.

Instrument

The current study used a questionnaire as a tool designed to address acceptance of individuals with disability. The questionnaire was developed in light of the related literature (Al-khateeb, 2001; Al-magloth, 2002; Al-qars, 2003; Howaidy, 1996; Smith, 2004; Baroun, 2006) and in accordance with the definition provided above. Also, the researcher relied heavily on working experience with all groups of disabled persons, their families and training specialists at the undergraduate and graduate levels.

The questionnaire was validated by a group of special education referees from The Amman Arab University for Postgraduate Studies and Mo’otah University. The referees acknowledged that the items measure the respective construct and the items were linguistically well formulated. Their response was 98% in agreement. Also, the referees indicated that tool was relevant, indicating questionnaire context validity. The internal consisting analysis revealed an alpha cronbach of is acceptable for the purpose of this research.

Results

This study was designed to address the mother's acceptance of children with disabilities. It addressed five questions that will be presented next. First, ANOVA was conducted and revealed (Table1) no significant effects for mothers' age and employment on the acceptance of children with hearing impairment.

----------------------------------
Insert Table 1 about here
----------------------------------
Table 2 shows that there are no statistically significant effects for mother's age and employment on the mother's acceptance of children with visual impairment.

In order to answer the third question, ANOVA (Table 3) shows that there are no statistically significant effects for mother's age and employment on the mother's acceptance of children with cerebral palsy.

In order to answer the fourth question, ANOVA revealed no significant effects for age and employment on mother's acceptance of children with mental retardation, (Table 4).

In order to answer the fifth question the researcher count the means and standard deviation of the mothers responses according to the type of there child disability. Table 5 shows that there are differences in the means and standard deviation among, the types of disability.
And to be sure about the indications of these differences, the researcher estimated the value of (f) for One Way ANOVA explained in Table 6.

------------------
Insert Table 6 about here
------------------

According to Table (6), it was clear that there was a statistically significant difference related to the type of disability. To know the recourses of the differences, the researcher mad Scheffe's test explained in table 7.

-----------------------------
Insert Table 7 about here
-----------------------------

Table 7 shows a statistical significant differences in mother's acceptance of there hearing impaired children vis-à-vis mental retarded children, also there were a statistical significant differences in mother's acceptance of there visual impaired children vis-a-vis mental retarded children.

**Discussion**

The current study aimed at investigating mothers' acceptance of their children with a disability. The findings of the study showed that there were statistically significant differences in mothers' acceptance of their disabled children related to the type of disability in favor of hearing and visual disabilities vis-à-vis mental retardation.

The mother's acceptance of their hearing and visual disabled children more than the mental retarded children, this result maybe revealed to the differences of their cognitive abilities, and social characteristics, the IQ of the mentally retarded person's less 30 degree on I Q test, more than non-retarded persons, and they faced more
problems in social interaction with others, which affect negatively to their mothers and they feel shy of the social behavior of their children, especially if they deal with other persons in the community or in some social activities. Although some researchers have found that mother's acceptance of disabled child is associated with the type of disability (Al-zeriqat, 2006; Masood et al 2005; Al-khateeb, et al 1992; Smith 2004; Al-qaryouti, 2008).

Also the finding of the study indicated that there are no statically significant effects for age or employment on mother's acceptance of their children who have any type of disability (hearing impairment, visual impairment, cerebral palsy, mental retardation). The present study found that, across all types of disability that are included in this study, acceptance is not related to age or employment. In this study, age was measured on an ordinal level with tow classes; and employment on a nominal level with tow classes. The cross-tabulation of the sample revealed a small number of mothers who were employed and had a disabled child. When age was broken into four categories and crossed over employment, some cells were empty or had cases fewer than five. This forced the researcher to collapse the classes of age into tow only. This may have disguised the real differences. Working mothers were less ready to cooperate in this study. Furthermore, the researcher was forced to drop mother's level of education due to some empty cells. Despite the lack of significance in the results, probably the most significant result is the difference between working (n = 40) non working (n = 365) mothers. This finding suggests that a mother of a child with disability needs education and rehabilitation to deal with her child. This is particularly true in Jordanian society since traditions and habits render mothers to be shy and guilty because of the disabled child (Al-khateeb, 2001; Al-khateeb, 2008)
In all types of disabilities included in this study, working and non-working mothers expressed similar levels of acceptance for their children. Of particular significance, the differences between working and non-working, young and old mothers regarding acceptance of a child with cerebral palsy, the result seem to be logical. This may be due to the fact that children with cerebral palsy need intensive follow up and much care in order to satisfy their needs such as feeding, dressing, bathing, and moving, etc. They also need various adaptations for their tools and supporting means of living. This is not easy to be carried out by the mother, and she may not be able to fulfill all the needs of her child such as carrying or taking him/ her home, and / or to rehabilitation centers. This disability is visible and may affect negatively the mother's attitude and make huge psychological stress. The stress may be compounded by the lack of understanding of the disability by other people. This disability is also evident and can be easily noticed which make it hard for mothers to adapt to it and accept it regardless of their age or employment (Abed-Allah, 1999; Marwan, 2002).

Similarly, the study showed that there were no statistically significant differences in the level of acceptance for mothers of mentally retarded children due to the age and employment. Whether they are working or not, old or young the mother who have a child with mental retardation would have negative impact on the mother's emotions and feelings, especially if the case is a severe one. This result supports Lee's (1986) conclusion.

The researcher recommends carrying out further studies in other Arab countries in order to identify the level of mothers’ acceptance of their children with special needs. He also recommends carrying out a comparison study between these countries, especially the effect of mother's acceptance on the self-esteem of their
child with disabilities. Also, it is recommended that further research be carried out
with consideration to the representation issue. Research as such should be designed as
Stratford with sufficient number of cases in different categories or levels (working
non-working, varies levels of age and education).

IS SELF-DIRECTED LEARNING A CHALLENGE TO HKUGA PRIMARY SCHOOL STUDENTS? A NARRATIVE INQUIRY OF THE “OTHER LEARNING EXPERIENCE” (OLE) OF HONG KONG PRIMARY STUDENTS AT THE EXPO 2010 SHANGHAI, CHINA

Abstract

This case study extrapolates the self-directed learning experience of HKUGA Primary School's students ("the students") who volunteered for the “Other Learning Experience” (OLE) in the form of a study tour to the Expo 2010 in Shanghai, China. The role of the teachers as the facilitators, knowledge co-constructors and advisors of the self-directed learning outcomes would be analysed. It is theorized that, based on a culturally-diverse and cross-disciplinary curriculum framework, the paradigm of learning would shift from teacher-centred to self-directed. Thus, students are capable of orchestrating their own learning experience with the end results of (i) interacting with teachers to refine the foci of their own self-directed researches for their projects, (ii) understanding and resolving the cultural divide between Hong Kong and the People's Republic of China (the PRC), and (iii) identifying innovative and pragmatic solutions to the global problems from a stakeholder's perspective.

Results would be deduced from quantitative post-trip questionnaires and qualitative interviews. The teachers and parents involved in the project design would be interviewed as well. Documentations and policy texts would be analysed in order to give an all-round picture of this innovative OLE.

This study would shed light on future OLE initiatives overseas, the essence of which would be to nurture students into global citizens who embrace diversity and solidarity.

Keywords: Self-Directed Learning, Expo 2010 Shanghai China, curriculum integration, cultural divide, Other Learning Experience (OLE), Hong Kong primary education
Background

HKUGA Primary School (hereafter as the “HKUGAPS”) organized the first and foremost cross-border “Student Learning Tour of the Shanghai Expo 2010” (hereafter as “the Tour”) in collaboration with the Parents-Teachers Association (PTA) within its 8 years of school history.

As a preparation ahead of the Tour, the HKUGAPS teachers embarked on the Pre-Tour Study Trip to the Shanghai Expo 2010 as a staff development initiative. Six teachers from different subject departments were appointed to sit in the Working Committee under the leadership of the Curriculum Development Officer. The committee was responsible for designing the learning framework, students' tasks and tour itinerary.

Two identical Tours were organized to cater for the P5 and P6 students and their parents. The Tours lasted for five days each (1st to 5th September, 2010, and 8th September to 12th September, 2010), with two full days of exposure at the Shanghai Expo, one day of cultural exchange at a suburban local primary school (the Shanghai City Xincheng School), the Sun Yat Sen's (Father of Modern China) Residence, Shanghai Science Museum and Shanghai Museum of Planning and Energy Conservation.

Research Questions in the context of “Other Learning Experience” (OLE) overseas

This paper postulates that, with case-specific and time-sensitive guidance received from the teachers and parents, the paradigm of learning would shift from teacher-centred to self-directed. It was postulated that HKUGA students would be capable of (i) refining the foci of their self-directed research questions for their projects, (ii) understanding and resolving the cultural divide between Hong Kong and the People's Republic of China, (ii) identifying innovative and pragmatic solutions to the global problems from a stakeholder's perspective after the Tour.

The research questions above could not be fairly assessed without reading the Tour with the backdrop of “Other Learning Experience” (OLE). As suggested by the Chief Curriculum Development Officer (Life-wide Learning and Library) of the Education Bureau, “OLE embraces a catalytic function in promoting students' whole-person development” (HKSAR Government's Education Bureau, 15th July, 2007). It was advocated by the HKSAR Government that OLE can (i) broaden and balance students' formal and informal learning, (ii) develop life skills (for example, creativity, aesthetics, art appreciation, interpersonal and intrapersonal skills etc.), and (iii) promote
lifelong learning.

Hence, this paper would attempt to delineate the potential, positive washbacks which are brought forth by this OLE in Shanghai, namely, (i) the application of critical thinking skills, (ii) global awareness and understanding and (iii) holistic personal development. All of the washbacks would be analysed in the subsequent sections with the use of narrative inquiry approach.

**The Research Study – “A Tale of Two Cities” told using the Narrative Inquiry Approach**

The focus of this article is a group of 104 students from HKUGAPS – a Direct Subsidy School in Hong Kong which has financial autonomy and a culture of school-based management, with the status of which is similar to that of a private school in the United Kingdom. The school serves a predominantly middle-class, ethnically Chinese community, whose students typically achieve better academically than the territory's average.

In this unique context of “Other Learning Experience” overseas, the holistic narrative inquiry approach ought to be adopted in this paper as the findings are divergent in perspectives, opinions and knowledge disciplines. This approach is desirable since the author was a third-party observer and participant of the Tour, the status of which would offer the readers with an objective lens in extrapolating the insights from all the stakeholders' reflections narrated in both verbal and literal forms. All names are made anonymous in this article.

It is undoubted that this paper is the mutually-constructed story about the Expo as told by all the student participants, parents and teachers who have joined the Tour. Therefore, the intertwining encounters between the individuals at the Expo would magnify the OLE experience and formulate the full story. Concurring with the theory of Connelly and Clandestine (1990), which stated that "humans are storytelling organisms who, individually and collectively, lead storied lives,” the study of narrative is thus the de facto study of how humans experience the world.

In order to examine the “stories” of stakeholders thoroughly, the following instruments have been analyzed –

- Interpretations of Pre-Tour school documents
- On-Tour observations of students, teachers, parents and state propaganda
- Post-Tour observations and interpretations of logbooks, reflection journals and presentations
Interpretation of Post-Tour questionnaires tailored for students
Post-Tour individual interviews with teachers, students and parents

Putting these aside, a quantitative survey (see Appendix One) for students was done to supplement the narrative stories and help verifying the research questions posed beforehand.

Pre-, On- and Post-Tour's Curriculum Designs

(i) Pre-Tour Curriculum Integration Week (16th-23rd June, 2010)

There are two strata of “learning foci”. The first strata one is teacher-centred (the guiding theme of “Heading into the Future City”), whilst the second strata allows a certain degree of autonomy, because it was up for the students to design their own project themes or work on one of the four given themes below.

- Environmental protection
- Technological advancement
- Architecture of the Pavilions
- Art in the Expo

As the student participants had never been to the Expo before the Tour, teachers were supposed to guide students through the Expo during the Curriculum Integration Week (June 2010) after attending the staff development trip to the Shanghai Expo (April 2010). All students, including the non-participants of the Tour, had to construct their own bilingual display boards, posters and models as assignments, no matter they were joining the Tour or not. All the subject-based tasks were set against (i) the genres of writing (e.g. narrative writing in Chinese Language, poster design in English Language) that student had learnt in the previous academic year and (ii) key learning areas (e.g. energy conservation and urban development in General Studies).

(ii) On-Tour Curriculum Design (1st-5th September, 2010 & 8th to 12th September, 2010)

*Figure 1. Types and Numbers of Participants attending the Tour to the Expo 2010, Shanghai, China*
The breakdown of the types of participants is shown in Figure 1 above. The teacher-to-student ratio is around 1:6 for the P6 cohort and around 1:8 for the P5 cohort. Each student must bring along one parent for the sake of guidance and safety. Each student was given a logbook to note down his/her findings after each day's program. Inside the logbook are the objectives of the Tour and a work schedule, which is followed by empty boxes of open-writing spaces with the simple sub-headings of “what I discovered today”, “my most memorable moment of today” and “my reflection”.

To follow up on the students’ written account on the logbooks, every teacher was assigned to a group of students to guide them through the writing. Written feedbacks, verbal comments and specific guidance on the notes written were given in a voluntary manner, though two compulsory debriefing sessions had to be conducted by the teachers to ensure that the students were on track with their research questions. For the regionally-specific issues, they were addressed by the local tour guide in Shanghai, who explained the culture, customs and heritage of Shanghaiese from an oriental, if not ethnocentric and biased perspective.

(iii) Post-Tour Curriculum Design

Students who joined the Tour were required to submit writings of their chosen genres and present their findings to the rest of the class. The execution of presentations varied in forms and frequencies since the teacher leaders of the student groups at the Tour may not necessarily be the subject teachers of the student participants in the academic year of 2010/11. In fact, the author was the only P5 class teacher who joined the tour, which in turn enhanced the engagement factor of the students. In the year ahead, the Principal has planned to reproduce the best artwork and writings in printed form as a means of knowledge management and information sharing, which in turn motivates the production of quality work.

Challenges posed to the Realization of “Self-Directed Learning”

(i) Limited “Self-Directed Learning” during the Curriculum Integration Week (June, 2010)

As explained earlier, students might work on one of the four standard themes which were shaped by the teachers during the Curriculum Integration Week, or work out their own research topic with the approval of the teachers before the trip. Without any exposure to the Expo in person and given the limited class hours during the Curriculum Integration Week beforehand, almost all
students (n = 93 out of 100 respondents, with 4 non-respondents in the survey) stayed inside their “comfort zones” and chose to work on the four given themes during the Curriculum Integration Week back in June, 2010 (i.e. three months before the Tour).

The fact that students managed to pick a theme to work on was not the end of the story. Students were expected to draw up a concrete action plan for data collection and analyses. Nonetheless, it was remarkable to note that 10% of the respondents admitted to have failed to draw up a concrete action plan for research on one of the four given themes after the delivery of class activities during the Curriculum Integration Week.

(ii) Challenges to be tackled at the Shanghai Expo (September, 2010)

According to the guidance note on the printed learning logbook, students had to “relate the research topic to future citizenship, future urban life and the ideologies behind such constructs”. During the Tour, however, student participants experienced quite a number of unresolved problems, which hindered them from comprehending the basics before the tasks could possibly be done (see Figure 2 below).

</tbody>
</table>

\(^1\) Students may check more than one problem in the questionnaires.
\(^2\) 104 students joined the Tour and 100 had turned in the post-Tour questionnaires, so there are 4 non-respondents.
(iii) Post-Tour Technicalities (October-December, 2010)

According to the school documents written by the school's Curriculum Development Officer, there were implied expectations that students have to present the post-tour reflections in forms of powerpoints, photo albums, speeches, portfolios and articles. Unfortunately, no tailored-made training was provided to equip students with the oratory skills. Peer learning was not facilitated, because other students who did not join the Tour were not as well-informed as the student participants, so the formers might not be at a good position to judge on the presentations.

Thematic Learning at the Expo and the Potentials for Self-Directed Learning

That said, HKUGAPS students were able to generate insightful findings upon the four given themes despite all the difficulties delineated in the previous section. The themes were well researched on during the Tour. The success of thematic learning can be reflected in the students' writing found within their learning logbooks. Ballantyne & Packer (1995, cited in Akerlind, 1999:102) has identified the same strategy to manage the gradual shift from teacher-centred to self-directed learning, which is the usage of learning journals “to encourage ongoing reflection by students on their learning and experiences over a period of time”.

In effect, students were made responsible for keeping track of their own learning process and self-management skills were enhanced. The notion of accountability / responsibility is the prima facie agenda behind learners’ autonomy. An illustration of the inter-relationship of the elements is found in Figure 3 (Silen, 2003:255) below.

![Figure 3. A Dialectic Relationship influencing students’ responsibilities and independences](image-url)
As suggested by Hmelo-Silver (2004:236), an important part of the problem-based learning cycle is to “identify knowledge deficiencies relative to the problem”, with “knowledge deficiencies” meaning the learning issues that students were researching on during their self-directed learning. Subsequent to the self-directed learning, students would evaluate whether their assumptions are correct or not. The excerpts below demonstrate how students defined the global problems and identified the solutions to tackle those problems.

Students' Reflections on Theme No.1 – Environmental Protection

HKUGAPS students were well aware of the existing problems in urban areas and after visiting the Pavilions and the showcase exhibitions in the Urban Best Practices Area (UBPA), as a result they have internalised the good environmental-friendly practices into their daily lives back in Hong Kong. For instance, “I would use my bike instead of private cars (1 student)”, “Save energy by not using the air-conditioner that often (10 students)”. The same happened to Student A, who noticed the greening measures, whilst for Student B, he was inspired to play his part in saving the world’s resources by all means.

Student A: “All the buildings should have their walls covered by climbing plants. It is indeed very environmental friendly for the Madrid's Urban Best Practices Area (UBPA) to decorate its outer walls with bamboos.”

Student B: “The plates people used at the 'Zero-Carbon Restaurant' of the London's Urban Best Practices Area (UBPA) are edible! They are made of chocolate and the practice seems to be very environmental-friendly! From now on I will not use any disposable cutlery anymore.”

Students' Reflections on Theme No.2 – Technological Advancement

HKUGAPS students were empathetic towards the disadvantageous social groups and alerted by the global problems. Bearing in mind the official slogan of “Better City, Better Life”, students could exercise their judgments pragmatically and fair-mindedly.

Student C: “The robots at the Japan Pavilion are incredible! They can play the violins...though it goes out of tune sometimes. I believe we can use the robots to help disabled people or the elderly in the future.”
Student D: “It would be great to turn the sewage water into drinking water using the new technologies. That will solve the problem of water shortage in many countries.”

Students’ Reflections on Theme No.3 – Architecture of Pavilions

According to description of the United Kingdom Pavilion on the official website, the “Seed Cathedral” aims to “demonstrate the concept of sustainability, the diversity of nature and the potential of life” (Expo 2010 Shanghai China, 16th October, 2010), and in fact, the “Seed Cathedral” is a seed bank with 60,000-plus transparent acrylic rods containing seeds. After visiting the “Seed Cathedral”, student E managed to apply the idea of biodiversity into the case of Hong Kong. Hence, one may infer that this HKUGAPS student was able to capture the essence of the architectural design with a critical mind.

Student E: “The Seed Cathedral of the United Kingdom Pavilion is amazing. The Seed Cathedral is built by 60,000 illuminating plastic tubes with one real seed stored in each tube. The structure is wonderful and I wonder if Hong Kong has 60,000 different types of seeds (plant species) too.”

Students’ Reflections on Theme No.4 – Arts in the Expo

Besides enjoying the aesthetic aspect of the pavilions at the Expo, HKUGAPS students were able to capture the hidden agendas behind the artefacts. Instead on focusing on the artistic techniques, Student F spotted the history behind the livelihood of ancient Chinese commoners from a famous painting on display in the China Pavilion. In effect, Student F’s learning curve is trans-generational and longitudinal, which brought him back to 900 years earlier in history.

Student F: “In the China Pavilion, there was an animated version of the famous 'Riverside Scene at the Qing Ming Festival' (a famous 12th century painting by Zhang Zehuan). It took us back in time to look into the ancient Chinese's daily life. Both day (time) and night (time) activities came alive in front of us. The missing horse in the original painting is re-constructed again, I believe this is really impressive!”
Paradigm Shift from “Teacher-Centred Learning” to “Self-Directed Learning”

Knowles (1975:18) stated that self-directed learning “is a process in which individuals take the initiative, with or without the help of others, in diagnosing their learning needs, formulating learning goals, identifying human and material resources, choosing and implementing appropriate learning strategies, and evaluating learning outcomes”. In the current case, HKUGAPS students required the assistance from third parties as this was the first OLE overseas for almost all of them (except for eleven P5 students who did a cultural interflow tour in Barcelona, Spain the year before).

Despite the potentials of self-directed learning which lie within this overseas OLE experience, Taylor (1986, cited in Akerlind, 1999:98) has documented the disorientation experienced by students when they shift to self-directed learning, which is “marked by confusion, anxiety and tension, plus loss of confidence”. He has described the adjustment required of students as a “cultural journey”. In face of such an obstacle in the form of paradigm change to self-directed learning, the roles of teachers and parents have become even more crucial than ever.

Fraser & Walberg (1991, cited in Naidoo & Searle, 1999:168) maintained that “home and school environments interact and co-determine school achievements”, and in the current case, 73% and 63% of respondents found the advice, feedbacks and comments by teachers and parents as “very valuable” or “valuable” respectively. This was so especially when they were in the course of refining their research topics and formulating their action plans. 96% of respondents also found it “very easy” or “easy” to formulate their own research topics and action plans after receiving assistance from their teachers or parents.

The Role of Teachers

Despite the capability of HKUGAPS students to infer meaningful insight from their observations at the Expo, that does not deter one from questioning the room for self-directed learning within the pre-existing curriculum, as the majority of student participants had failed to formulate their own research topics, as well as improvise and personalize their pre-tour experience. The only exceptions are the 7 students who managed to design their own research topics beforehand.
The self-directed research topics are listed below.

- (5th Grade) The Designs of Stamps given at Pavilions in the Expo
- (5th Grade) How local volunteers feel after serving at the Expo
- (5th Grade) The Mascots of World Expos
- (5th Grade) Differences between the Local Food of Hong Kong and Shanghai
- (6th Grade) The Influence of the Expo upon the Transportation, Infrastructure and Economy of Shanghai
- (6th Grade) The Food Culture of Different Countries
- (6th Grade) The Development of Transportation and Urbanization in Shanghai

Yet, self-directed learning started to take its shape when students started stretching the official curriculum further. This could be done by resorting to the time-sensitive and case-specific advice given by the teachers and parents during the Tour. Undeniably, the teachers were the catalysts of self-directed learning due to their multiple roles as the knowledge co-constructor, facilitator and counsellor.

It was suggested by Ausburn (2002:233) that instructional strategies have to be designed to prepare learners for a “customized, self-directed learning environment (which) help them maintain learning focus, direction, and momentum (that) may contribute to their success”. The challenge would be to resolve the dilemma between learners’ autonomy and meeting the expectations of the curriculum. Teachers as the facilitator bear the responsibilities to keep the students on track and lead them to fruitful conclusions. Student G’s written submission in the learning logbook with the teachers' comments below would shed light on the argument above.

First draft (Student G): “I feel very happy to walk around the expo. We will have lots of high-tech innovations in the future, like living in space.”

Teacher A’s comment: “When you fill in the logbook, you should compare and contrast what you observe at the Expo and your current living style. Reflect on what you would do otherwise in the future with the new technologies here in Shanghai!”

Second draft (Student G): “I learnt from the Expo that microalgae would affect the ecology and it can be processed into oil!”

Teacher A’s comment: “Why do we need the extra oil?”
Final Submission (Student G): “We humans have almost exhausted all the oil reserve, so we have to limit our use and discover new energy sources.”

Student G could never come up with the conclusion above without the guidance of the teacher. However, departing from his final submission, Student G subsequently embarked on a full study of the potential energy sources for the future world, which was entirely self-directed and self-motivated.

Student G has captured the essence of self-directed learning by “assimilating new knowledge and applying it to solve problems, thinking critically and performing self-assessment as well as that of communicating and collaborating with others” (Cornish, 1986, cited in Birenbaum, 2002:119). He went through the problem with a multi-dimensional perspective, bearing in mind the individual, national and global concerns.

Student H also mentioned about the positive washbacks brought about by the cross-disciplinary orientation tasks given by the teachers. He said, “Before I went to the Expo, the teachers gave us summer assignments relating to the Shanghai Expo. You may say I have learnt a bit about Geography from the Math assignment, because there are questions about the number of participating countries in the Expo and the names of the continents they are found within.”

The Role of Parents

In previous sections, quite a handful of obstacles stood in the way to effectuate self-directed learning. Fortunately, parents helped filling the learning gaps before and during the Tours, given the fact that 36% of respondents had proactively approached their parents for guidance. The sharing of the parents being interviewed would illustrate this argument further. While they were asked what the parents’ role is throughout this learning tour, they replied as below –

Parent A: “I was a Geography major back in college, that’s why I could explain how fossil fuels was formed in ancient times, after watching the 4D-movie on oil formation with my son at the Oil Pavilion.”

Parent B: “My child was too small when we were staying in Canada. Although all our family members are Canadian passport holders, he has little understanding of Canada, therefore I’d make use of the opportunity to explain the icons of Canada inside the Canadian
Pavilion. My child was pleased about the VIP passage for Canadians after all.”

Parent C: “Simplified Chinese is not taught in local Hong Kong primary school. Whenever my child failed to understand the text, then I would interpret that.”

From the HKUGAPS students’ perspective, the parents were not just their guardians but also their trainers of life skills, for example, time management skills, self-management skills and etiquettes.

Parent D: “My little girl cried pitifully after she tried to request a local to line up behind her, because that local called her a ‘fat piggy’. I comforted her saying that was a proper gesture to do.” (Teacher B then added, “I agree, it should be the local who should take in comments whole-heartedly.”)

Student I: “I freaked out when the locals jumped the queues when I was lining up for entry. My dad and other fathers literally protected us by forming a blockade. My mom said I should tell those people to line up probably.”

Student J: “My mother taught me how to pack my luggage and get ready for the trip. She said I should look after my own belongings at the airport.”

Student K: “My parents said it is impolite to leave my meal untouched because that is very rude. So I had to finish all the greasy, spicy and meaty meals in Shanghai!”

It should be highlighted that self-directed learning is “a matter of degree” because the learning process is normally non-linear with an ever-changing focus as learning occurs (Candy, 1991, cited in Rager, 2004:96). Hence it would be rather demanding to ask for complete autonomy and self-control on the part of the students upon their first OLE tour overseas.

The Role of Externalities

Often being overlooked are the influences of externalities beyond the formal curriculum. Teachers and parents are catalysts which channel the teacher-centred mode into a self-directed one, though there are intertwining external inputs like (i) media influence, (ii) state propaganda, (iii) domestic and community support and (iv) web knowledge which involved in the self-directed
process. All these externalities have contextualized this OLE experience, as supported by Greveson & Spencer (2005:348) and Merriam & Caffarella (1999), it was argued that “the ability, extent and motivation to be self-directed varies with the context of learning”, taking into account of the subject matter concerned; the social, cultural and educational setting; past experiences; self-concept; and relevant study skills.

Besides, it was observed that the application of the self-directed learning framework has allowed students to “identify their deficit in knowledge and target their learning needs to relevant sources of information” (Yeung et al., 2003:240). Therefore, students would proactively reach out to different sources for extra information to fill in their knowledge gaps, which is well proven by the data below.

88% of the respondents indicated in the questionnaires that they were exposed to the state propaganda from different media source. One significant example would be the theme song, “The City of Hope”, as sung by the famous Hong Kong artist called Eason Chan. The lyric is translated literally (see Appendix Two) and the Expo has been glorified as the “window to the world” and a platform for the “mingling of civilizations”. This is owing to the fact that China is the first developing country to host the event and the Expo would be a golden opportunity for China to demonstrate its soft power and win the hearts of everyone. Expo spokesman Xu Wei said the Expo “is a big platform, a big event for cultural exchanges...(and let Chinese have) 'face to face' contact with international society” (BBC.com, 29 April, 2010). It would be interesting to examine the extent to which HKUGAPS students were able to evaluate the Expo using a critical perspective, with due regard to the ethnocentric state propaganda.

44% of the respondents also acknowledged that they once approached relatives or friends who had visited the Expo beforehand, such that they could plan their time around the Expo wisely, but putting that aside, self-directed learning was evident as 82% and 53% of the respondents had done research on the internet alone and read printed matters or books about the Expo by themselves. Little is known though, about the quality of the data collection or syntheses due to the differentiated needs and motives behind the students’ intended research.

The interactions between the students and the external inputs throughout the learning process are visualized in Figure 3 on the next page. The emphasis is on how student-directed learning was made possible within the teacher-centred formal curriculum framework.
Figure 4. Flowchart of the Self-Directed Learning Process
Self-Directed Learning beyond the HKUGAPS Curriculum

The on-site personal experience, guidance from the parents and teachers, as coupled with the influences brought forth by the externalities, have paved the way for students to conduct self-directed learning. The students were not left wandering alone during the learning process. Given their limited experience and competencies, teachers and parents had to get involved to assist the undertaking of inquisitive learning.

The technicality involved is to guide learners to the right track, but the gist is still about letting students explore the subject matters by themselves first. Dewey (1931:424 cited in Dowden, 2007:58) insisted that learners should actively experience subject matter and engage in inquiry in order to authenticate the process of personal integration.

“The mentally active…(learner’s) mind roams far and wide…there is constant judgment to detect relations, relevancies (and) bearings on the central theme. The outcome is a continuously growing intellectual integration…within the limits set by capacity and experience…(this) is the process of learning.”

It is concluded from the students’ submission that this type of “Other Learning Experience” can fulfil its goals of widening students’ horizons, cultivating whole person development and promoting lifelong learning. Besides the four standard research themes, HKUGAPS students had explored several areas of learning which are hardly assessed and explored within the formal curriculum, namely –

- Socio-Cultural Environment of Shanghai
- Global Awareness and Understanding
- Character Building
- Critical Thinking
- The Design of An Ideal City

Again, time-sensitive and case specific stimuli from the teachers were fundamental in motivating students to conduct self-directed learning with the right approach. The correspondences between the students and teachers are quoted below to argue for the case.
On the Socio-Cultural Environment of Shanghai

The author overheard a dialogue between a student, her mother and another teacher when the three of them were queuing up outside one of the pavilions and as quoted –

Student L: “The tourists at the Shanghai Expo (who are mostly Mainland Chinese) always jump the queue and push the way through. I think we should line up while waiting.”

Teacher C: “Do you find those Mainlanders belonging to a certain age group particularly rude? They are mostly in their 40s. What happened some thirty years ago which affected the education of these people, when they were at your age?”

Student L: “I have no idea at all…”

Parent E: “My son, the Cultural Revolution took place in mid-1960s. Lots of people did not receive the proper schooling at all…(and he went on to talk about the history of the Revolution).”

This is indeed a significant example of the inter-dependency of both teachers and parents in facilitating self-directed learning. Student L might simply observe a phenomenon without the awareness or knowledge base to comprehend the rationales behind. Once the teachers and parents stepped in, it would be conducive to learn from an all-encompassing manner. On the bright side, the cultural divide derived from the socio-economic differences between the Hong Kong Special Administrative Region and Mainland China has been narrowed down as a result too.

On Global Awareness and Understanding

The Expo has housed the pavilions of 192 countries, with 50 extra organisations putting themselves on show. This OLE has obviously made a lasting impression upon the HKUGAPS students. Cultural diversity is appreciated and some students even handled the cultural divide well with empathy. The evidence are deciphered below –

Student M: “The most memorable moment of mine was that everyone (student) in my group made a wish at the ‘wishing stone’ inside the Latvia Pavilion – I hope there will be world peace!”
Student N: “We cannot judge and compare one pavilion against another, because they all have their own strengths, just like humans.”

On Personal Development

HKUGAPS students have been enlightened by the daily encounters at the Expo and hence they did take a step back in reviewing some of the etiquettes and mentalities which are often belittled.

Student O: “The signage at the Expo said you have to queue up for six hours to get into the Saudi Arabia Pavilion, however, we did that successfully in three hours only! We have to be persistent and believe in what you want to do, like the Chinese proverb said, 'you can sharpen an iron rod into a thin needle' if you work hard.” (Teacher D's comment: “Lots of great theories are sparkled by small incidents!”)

Student P: “Time management is crucial and we should use time wisely to learn the most out of the pavilions.”

Student Q: “Lots of people were smoking inside the restaurants this afternoon. I felt awful because there were no windows. I should not smoke indoors because that would affect others.”

Student R: “My classmates and I were interested in different pavilions, so we had to compromise among ourselves and take turns to visit the pavilions we each liked.”

Having experienced a lesson in life at the Expo, when being asked in the post-tour questionnaires what they would do to perfect their characters, the HKUGAPS students have pledged to uphold a number of positive, daily habits after the trip in the post-Tour questionnaires and as expected, lots of the reflections echo with what they have learnt, especially towards environmental protection and personal development.
<table>

Figure 5. List of Good Habits proposed by HKUGAPS students to be upheld after the Tour

On Critical Thinking

HKUGAPS students, though being coached during the Expo, were able to evaluate what was being said and told using a critical perspective without receiving training on that before.

Student S: “At the Technology Pavilion, it mentioned about the robots with thinking (artificial intelligence), so robots will supersede humans in the future. What should humans do then?”

Student T: “Lots of pavilions talk about environmental protection, but then all the countries have used lots of resources to make the Expo happen, isn't that a waste of resources in the first place?”

On the Design of an Ideal City

After consolidating all their personal experience at the Expo, HKUGAPS students have an ideal vision for a green and loving world. Their ideas have incorporated all the elements of the four standard themes, with a dash of innovative thoughts and ideas of world peace.

Student U: “My future dream city uses natural resources like sunlight, wind and rain. The roof is made of solar panels for generating solar power. The top of the roof has a wind turbine sticking out for generating wind power.”

Student V: “My future dream city is free from wars, and full of freedom and love. We can use renewable energy instead of fossil fuels. At last, if we save the environment, everyone
will be happy.”

Student W: “Inside my future dream city, all the cars, bus and trains are maglev-driven, which make our city free of carbon dioxide.”

Student: X “My dream city would be a green city without pollution and everyone would be very peaceful and healthy. The transportation network would be fast and convenient. The prices of the goods should be very low.”

An unintended, positive washback of the current self-directed OLE experience would be “multicultural education”. Consistent with Banks’ (2003:xxi, cited in Linskens, 2009:16) interpretation of multicultural education, the Tour has met the major goals of such, which are, “(i) helping students to deepen their cultural understandings and to interact effectively with people from diverse cultures and groups, and (ii) helping students to acquire the knowledge and skills needed to become effective citizens in pluralistic societies who are striving for ways to balance unity and diversity”.

The Recipe of Success for Self-Directed Learning

The author’s impression is that the HKUGAPS students have borne a sense of mission to help improving the livelihood of urban dwellers once they finished exploring the Expo. Therefore, this is a nice pivot for departure from self-directed learning to high-order thinking, since, without a picture in mind, there will not be any chance for success.

Without any doubts, high-order thinking is a prerequisite for self-directed learning to succeed. As Christensen & Hooker (2000:14) advocated, “self-directedness is based on a constructive capacity for high order integrative process modulation geared to managing interaction processes”.

Yet, does high-order thinking skills the sole prerequisite for self-directed learning? A definite “no” the answer would be, since a mature mindset does not necessarily motivate students to embark on self-directed learning and the creation of a sense of ownership is essential. The concept of a “negotiated curricula” (Boomer, 1992, cited in Hodgkin, 2007:40) may apply in OLE initiatives as it entails the contributions from all stakeholders, like parents, teachers and students, to contribute to and modify the curriculum. This would in turn nurtures the sense of ownership and it is this
“active, intentional and participatory involvement in the decision making processes that results in more effective learning”, rather than the passivity found within the teacher-centred curricula, which lead to themselves the undesirable tendency for rote learning (Stein et al., 1998:228) in most cases.

On the part of teachers and parents, they have to let go of the paternalistic and dominating control and establish students’ confidence, thus reinforcing students’ learning autonomy. This is owing to the fact that self-directed learning is a “design feature of the learning environment which stresses students’ freedom in the pursuit of their learning” (Loyens et al., 2008:418). Under such environment would the students be then have the freedom to select and critically evaluate their own literature resources to achieve that self-directed goals.

Conclusion

Brockett and Hiemstra (1991:29) reported that self-directed learning is a broad term that encompasses such factors as “the learner taking primary responsibility for planning, implementing and evaluating learning,” as well as “personality characteristics that predispose one towards accepting responsibility for one's thoughts and actions as a learner. As evident from the current case study, HKUGAPS students have embarked on setting parameters for their research and taken on board their own interpretation of cultural citizenship and empathy towards the global problems. The finding about their dispositions towards the positive personal habit has reinforced this belief.

The scope of influence ignited by this overseas OLE experience has reached beyond the student participants, and peer-to-peer sharing is expected to achieve the same goal of character building, albeit the fact that it can hardly be quantified. The Principal of HKUGAPS, upon her return from the Tour, once introduced the ideologies of ethics, patriotism and responsible citizenship to all other students.

“The Norwegian citizens have knitted and donated lots of handmade woollen gloves to the Norway Pavilion. These gloves are put onto the mannequin hands on the walls. However, some gloves have been stolen by the visitors, worse still, some mannequin hands have gone missing together with the gloves! What does it imply? Which elements are essential in realizing the official slogan of 'Better city makes our lives better'? Too often do people overlook the second phrase of the slogan, which is 'We makes the cities better” (emphasis added). Indeed, the key lies within the citizens
themselves......we have the responsibility to make everyone else’s life better.”

In order to optimize the effects of self-directed OLE experience, equipping the students with the research skill sets and high-order thinking skills are crucial for OLE to achieve and stretch its desirable results beyond what the formal curriculum requires. In a nutshell, “self-directed learning skills can be the factors that foster cross-cultural adaptability” (Kelley and Meyers, 1992) and this type of overseas OLE experience is a good springboard for engaging students in future dialogues with the other nationalities.

As a side note, 94% of the respondents indicated that they would like to join the future school-based OLE initiatives overseas and the author aspires for genuine self-directed learning with full student autonomy in future. This is probable that the more mature students are, the less dominant roles would the teachers and parents assume in self-directed learning, the finding of which may be a research question for further studies.

It is forecasted by the author that the self-directed OLE experience has engaged the HKUGAPS students into the cycle of lifelong learning as proposed by the Hong Kong SAR Government, for the OLE has equipped students with three facets of learning capacities, namely, (i) broad self-management skills for independent learning (e.g. research skills, critical thinking skills), (ii) expertise in the students’ favourite subject matters and (iii) learning competencies and self-control (Miflin, 2004:47).

Acknowledgements

The author would like to express her gratitude towards the management of HKUGA Primary School, which offered the author with the opportunity to get involved in this OLE program in Shanghai and granted her with a study leave for paper presentation at this international conference in Hawaii. The contributions from student participants, parents and my fellow colleagues are duly acknowledged here with the author’s heartfelt respect and grace.
Appendix One – Sample of the Post-Tour Questionnaire for Students

Post-Shanghai Expo Tour Questionnaire for Students

Please ☑ the option(s) that applies / apply to you.

1) Your Grade: P5 / P6 (please circle)

2) Gender: M / F (please circle)

3) Which group were you in during the Shanghai Expo tour? A / B / C / D (Please circle)

4) Did you manage to formulate your research question during the Curriculum Integration Week (June, 2010) and before the study tour?
   □ Yes (skip to question number 6)
   □ No (answer question number 5 below)

5) Did you manage to formulate your research question before your departure for the study tour?
   □ Yes
   □ No

6) Who helped you formulate and finalize your research topic most? (You may check more than one option)
   □ Teachers and Classmates
   □ Parents
   □ All by myself (skip to question number 8)
   □ Others

7) After receiving help from your teachers or parents, how difficult it was to formulate your own research topic? (Check one option only)
   □ Very difficult
   □ Difficult
   □ Neutral
   □ Easy
   □ Very easy
8) What is your research topic for the Shanghai Expo tour? (Check one option only)
   - Environmental Protection
   - Technological Advancements
   - Architecture of the Pavilions
   - Art of the Expo
   - Your own research question: ________________________________________________

9) What did you do to prepare for the Shanghai Expo Study Tour? (You may check more than 1 option.)
   - Ask my teachers for extra information
   - Ask my parents for extra information
   - Ask those friends and relatives who went there before for extra information
   - Look for information on the web alone
   - Read books and printed matters about the Expo alone
   - Get information from the open media (e.g. watch the TV channels, listen to the radio)
   - Others (please state): ________________________________________________

10) Have you ever listened to the theme song of the Shanghai Expo on the TV? (Eason Chan's City of Life”)
    - Yes
    - No

11) What were the problem(s) you had faced during the Shanghai Expo tour? (You may check more than 1 option.)
    - I did not understand simplified Chinese.
    - I did not speak good Putonghua.
    - I did not know how to fill in the logbook (e.g. I don't understand the meaning of “reflection”)
    - I did not know which pavilions to go to because of the time constraint.
    - My parents and I were interested in different pavilions, so I had no choice but to follow them.
    - Others: _____________________________________________________
12) How useful are your teachers' advice, feedbacks or comments to you when you were doing your research and logbook?

- [ ] Very valuable
- [ ] Valuable
- [ ] Neutral
- [ ] Not so valuable
- [ ] Not valuable at all

13) How useful are your parents' advice, feedbacks or comments to you when you were doing your research and logbook?

- [ ] Very valuable
- [ ] Valuable
- [ ] Neutral
- [ ] Not so valuable
- [ ] Not valuable at all

14) Do you like joining this type of study tours overseas?

- [ ] Yes
- [ ] Neutral
- [ ] No

15) Are you willing to join another study tours locally or overseas organized by the school?

- [ ] Yes
- [ ] No

16) Name one good and new habit you will do in Hong Kong after returning from Shanghai.
Appendix Two – Original Lyrics (in Chinese) and Translation (in English) of the Expo’s Theme Song “City of Hope”

[無限之城]

陽光輕撫城市臉龐 海風擁抱霓虹燈光 動人未來越過公路望

歷史在發亮 夢想在飛翔 時尚的行裝 無限的形象 小小地方 在地圖上發出光芒

為了世界開創 明天的曙光 新的力量 新的思想

一起歌唱 煙花在等待 你用力鼓掌

東方西方 過去現在 一起揮動 文明的翅膀

生活的感動在登場 繁榮的品牌在成長 吸引目光的世界之窗

打造了堅強城市的肩膀

東方西方 過去現在 創造輝煌 床前明月光

自由自在的時光 原始原創的力量 自由自在的時光 這城市燦爛像陽光

[City of Hope]

The sun shines over the city, the see breeze embraces the neon lights and our future can be foreseen over the highways.

Our history is glorious and we are flying away with our dreams.

The hip outfit and ourimaginative styling have made this little city well-known around the world.

We fight for the bright future, new source of power and new thought. Let us sing together with the backdrop of fireworks and your applause.

The East and the West, the Past and the Present. Let our civilizations interact and mingle.

The vibrant lives are on show and the flourishing brands are expanding. This eye-catching window to the world has shaped the wings for this strong city.

The East and the West, the Past and the Present. Let us build the glory and bring it into our dreams.

Carefree time, primitive and original source of power. Carefree time, this city shines like the sun.
REFERENCES

Abstract: Storytelling is a popular theme in many educational fields today and has become a trend in teaching English as a Second Language in higher education also. This paper discusses integrated skills activities for three parts of a storytelling project: “practice”, “performance” and “product” for university ESL students that included community performances and a recorded program for a local television station. The lessons in this project followed engagement theory which states when educators equip students with the tools to become self-motivated, real engagement in learning takes place (Wasserstein 1995) and when students see practice activities as meaningful, yet challenging, they will work harder to give their best performance (Schlechty 2002). Our lessons also took into consideration Keller’s ARCS model of Motivational Design based on Expectancy-value Theory. To achieve complete motivation students must advance through all four parts of the model: attention, relevance, confidence and satisfaction (Keller 2000). The practice sessions were also given a product or performance focus, which Zorfass & Copel (1995) assert make them more meaningful to students.

Introduction

ESL university students from Japan were asked to read aloud traditional folktales from their own culture for a variety of community audiences and a program for community television. The performances required students to spend considerable time in and out of class, practicing their pronunciation, intonation, voice expression, comprehensibility and speaking fluency skills. Repeated practice sessions were necessary to prepare these low intermediate level students adequately for the performances. The practice sessions and performances were all documented and shared using technology to further develop language fluency skills.

Theory

The project design used elements of both Engagement Theory and Expectancy-value Theory. The Theory of Engagement focuses on student motivation and Newman (as cited in Voke, 2002) states that engaged students make a “psychological investment in learning.” To design a project that would transform our sometimes shy, passive students into active learners with this psychological investment, we looked at Schlecty’s (2002) question,

“What do teachers…but do in order to insure that more students are engaged in learning activities more of the time?”.

We also looked at Keller’s ARCS model of Motivational Design which is based in part on Expectancy-value Theory. The four parts of this model are attention, relevance, confidence and
satisfaction (ARCS) and are all necessary for a person to be completely motivated. (Keller, 2000) It is important for these steps to be followed in order as each step builds upon the previous one.

According to Keller, the first condition that must be met is to capture the students’ attention. The final product for the project was a television program that would be aired on a local cable TV channel. The students were immediately interested in the prospect of being television stars—attention captured.

The second condition of the model is relevance. This step lets students know how they can use knowledge they already have and gives them some choice. We chose traditional Japanese folk tales that the students had heard as children. They knew the stories in Japanese and would now read them to others in both Japanese and English. Within each group they were given the choice as to how to organize the reading. For example, students chose who would read each part.

Step three, confidence is necessary for motivation. This step encompassed the largest part of instructional time. We set realistic goals that allowed the students to see that their success was clearly a result of their efforts. We also provided a safe environment where students could practice. They were able to take risks without fear of ridicule or failure.

The final step in Keller’s model is satisfaction. We provided our students with many opportunities to receive feedback. By reading the stories for peers, tutors, and American students they got rewards and praise which gave them a sense of accomplishment before they ever recorded the stories for the TV program. According to Starnes (1999), students take more care with their work when it will be seen by an audience outside the classroom. Zorfass & Copel (1995) also assert that a performance or a product result in higher student engagement.

The second part of our project involved the students’ creation of a Photo Story and a Publisher newsletter (both are Microsoft software programs) to document their learning experience. Hancock and Betts (2002) state that technology is one resource that affects student engagement and achievement in many ways. Our students were actively engaged in this part of the project as it gave them the opportunity to learn new technology while reflecting on their experiences throughout the project.

Practice Activities
The folktale unit began outside the classroom with a tour of the Capitol Community TV studio where the students would be recording their folktales for TV. The tour made the project “real” and provided the opportunity for students to meet the studio staff members and hear authentic language regarding the recording process. Seeing the studio also allowed students to visualize where they would be performing and helped reduce some of their stress of filming for television.

In class, students first read the folktales in English without translation. They discussed the vocabulary, heroes, elements of plot and cultural traditions and values in the stories. Then students practiced reading these traditional folktales aloud for peer, instructor and tutor feedback. They worked on eye contact, pronunciation, intonation and voice expression as they read. Performing for television required extensive practice in reading the stories aloud, changing the
picture cards and changing from speaker to speaker. The students spent quite a lot of time practicing both in and out of class. Once they were more comfortable in English, we added in the speaking practice in Japanese. In order to keep the progression going forward, we needed to add variety to the practices. We had students read aloud to other small groups of peers, to the entire class and then to another class of peers. Students were very helpful in providing positive feedback to one another on how they could improve their clarity, volume, pace and expressive voices. In Speaking/Listening class they recorded the stories on the Dartmouth Recorder for self-evaluation and instructor feedback which improved their speech even more. We documented the studio tour and each different type of practice activity with photos and posted them on the Sakai-based class management online site. In Reading/Writing class, students wrote short reflections about the practice experiences and chose photos to illustrate their assignments. The reflective journaling allowed students to discuss their fears and note their improvements as they progressed throughout the folktale project. Documenting the practice sessions with photos and written assignments increased motivation for practicing since this not only resulted in improved language skills but also in graded products.

**Performance Activities**

Students performed their folktales for community school groups. Dressed in their traditional “yukata” and “hapi coats”, students read the folktales in Japanese and English for local high school students who were studying Japanese. These native language partners provided feedback on eye contact, voice volume and corrected pronunciation difficulties. Our students listened very carefully and took their advice seriously even though they had heard it before from the instructors. This same advice from their new American friends was very meaningful to them.

Students also performed their folktales in costume for classes in a local elementary school. Since the folktales included great onomatopoeic sound effects, the children were delighted with the performance. When the children laughed and clapped their hands, the students felt a new sense of accomplishment and confidence with their performances.

The culminating storytelling performance took place at the community television studio as students recorded their folktales for a television program with all of the “lights, camera and action” authentic language directions from Capitol Community TV staff and community volunteers. Students checked their appearance in the “talent” dressing room and stood in front of the cameras for their performances. As students waited their turn, they were drafted into helping with the cameras and sound equipment. There were some retakes, but overall, the students performed exceptionally well.

A former TIUA student currently studying at Willamette University became a volunteer intern for our project. He was trained at the Capitol Community TV studio in camera operation, audio recording and film editing software. He assisted the classes on filming day in the studio and selected the Japanese music for the film. He co-wrote an introduction in Japanese for the program, performed for the opening scene and also spent about thirty hours editing the film for television. The course tutor spent many hours listening to students practice their folktales over and over and also wrote the television program introduction and performed for the opening scene in English.
This project included the participation of all the ESL students in two classes, two instructors, a tutor, an intern, high school language partners, several elementary school classes and five staff and community volunteers at the television station. We expanded our learning community beyond the walls of our classroom.

Again, we documented each performance with digital photos and students talked about their experiences in Listening/Speaking class and wrote about them in Reading/Writing class. For these activities, they were asked to use past tense verb forms and incorporate idiomatic expressions to describe their feelings as they reflected on these exciting experiences. Each performance also had a “product” focus and assignment afterwards.

Product Activities

In the product phase of the project, students wrote new stories to document their own memorable storytelling experiences using digital media. They created colorful newsletters in Microsoft Office Publisher with photos and reports and reflections of the project. Microsoft Publisher allows student work to look immediately professional with the graphics, borders, titles and other desktop publishing formatting devices. Students were pleased with their written products and we posted them on bulletin boards to share with others.

Students then recorded narratives of their experiences with the digital storytelling program, Microsoft Photo Story. Combining some reflective writing, photos, music and their recorded speech, they made their own digital memories of the entire experience. Their Photo Story projects were posted on a web page to share the storytelling experience (http://www.tiua.edu/en/component/content/article/226). They evaluated the storytelling project with a free online survey creation tool, SurveyMonkey. We asked students for feedback on each part of the project and whether we should make changes. Students actively discussed the results since they were invested in the data and implications it held for future classes. Finally, students enjoyed watching themselves on community television and received their own DVD copies of the television program to keep.

Evaluation

Each step of the storytelling project was evaluated by both Listening/Speaking and Reading/Writing instructors. Rubrics were used to evaluate the group practice sessions for contributions, quality of work, attitude and preparedness and the recordings for pronunciation, intonation, clarity, fluency and expressiveness. The newsletters were evaluated for grammar, transitional expressions, vocabulary and form. The Photo Story projects were graded by both instructors with rubrics that included pacing, clarity of voice, story detail, grammar, content, and pronunciation.
Conclusion
The storytelling project transformed our students into active learners by providing them with many types of engaging activities over an extended period of time. Students learned new technology to practice their folktales and record their experiences. These tools encouraged students to be self-motivated which led to real engagement in learning (Wasserstein 1995). Incorporating technology in practice activities made language development personal and meaningful so students worked harder to give their best performances (Schlechty 2002). The practice sessions were also given a product or performance focus, which Zorfass & Copel (1995) assert make them more meaningful to students. Recording a television program was a challenging project but yet very rewarding for students and they worked very hard on the practices, performances and final products. This project fulfilled all the requirements of Keller’s ARCS model of Motivational design and kept the students motivated and active participants in the learning process.

While not every ESL class may have the opportunity to perform for television, there are many other applications for these types of assignments with other themes. Microsoft Publisher, Photo Story and SurveyMonkey can be used for countless types of assignments. Photo Story can be downloaded from the internet at no cost, and SurveyMonkey is a free online survey creation tool. Teachers can incorporate practice activities with a product or performance focus in many types of situations surrounding many different themes.

Effect of Circuit Weight Training on Autonomic Nerve System Function and Whole Body Muscle Strength of Young Healthy Subjects

Purpose: In recent decades, studies have shown that exercise training affects autonomic nerve control of the cardiovascular system. Moreover, long-term aerobic exercise has been positively linked to reducing both heart disease and mortality caused by the disorder. Accordingly, researchers have found that aerobic training improves aerobic capacity and cardiovascular autonomic nervous system functioning, which leads to increased metabolic adaptability. Zoppini [6] found that after 6 months participation in a moderate aerobic training program held twice per week, Type II diabetes patients experienced HRV reduced sympathetic influence, increased parasympathetic influence, and more favorable cardiovascular autonomic nerve system balance. Similarly, Ekblom [7] et al found that after a 5-week program of cross-country running training, sports training mechanisms leading to reduced heart rate both increased parasympathetic activity as well as produced a reduction of sympathetic activity.

Resistance training has also been recommended for the general public to improve and maintain both good health and physical condition [10]. In fact, traditional resistance training programs have been adopted by many prominent health organizations [11]. To be sure, the literature has shown that participation in minimal resistance training programs occurring only 2-3 days per week and allowing for proper recovery time intervals increased muscle strength, size, efficiency, and endurance. In addition, bone mineral density increased and normal body weight maintenance was improved [12]. A recent meta-analysis investigating resistance training on arterial blood pressure also revealed significantly lower systolic and diastolic blood pressure [16,17]. Furthermore, at least two other studies have confirmed both a decline in blood pressure after resistance training and a decrease in muscle sympathetic nerve activity via aerobic training. However, although resistance training has been shown to influence factors associated with cardiovascular health, the research is thin compared to the extant literature on aerobic training and the effects of the regimen on Cardiovascular Autonomic Regulation is poorly understood. Indeed, whether resistance training of some type consistently reduces the internal mechanisms of blood pressure is still largely unknown. In sum, the literature clearly indicates that autonomic function can be improved by long term aerobic exercise training, while traditional resistance training has a limited impact. However, much less is known about one specific type of resistance training, circuit weight training, on both autonomic cardiovascular regulation and whole body strength. The present research involved 24 young healthy subjects and investigates the effects of a 12 week circuit weight training program on autonomic cardiovascular regulation and whole body muscle strength. The investigation seeks to add to the extant literature on cardiovascular health and muscle strength, and to provide support for choosing the appropriate exercise prescription for
different individuals.

**Methods:** 24 young (18 to 30 years) healthy subjects were assigned to exercise (EG, n =13) and control (CG, n =11) groups. Subjects in the EG group underwent a circuit weight training program that consisted of 7 exercises performed in 3 sets of 15 repetitions with 15-30 seconds rest 3 days per week for 12 weeks. Whole-body muscular strength, resting metabolic rate, body composition and aerobic capacity were measured before and after training. Blood pressure, pulse wave velocity and autonomic function were tested every four weeks throughout the 12 week program. Autonomic function tests consisted of subjects preforming 5 minutes controlled frequency breathing (0.25 Hz), and three Valsalva’s maneuvers while recording synchronous ECG and beat-by-beat blood pressure. HRV was estimated through time and frequency domain analysis of R-R intervals during controlled frequency breathing. Spontaneous cardiovagal BRS was estimated through sequence method during controlled frequency breathing, dynamic cardiovagal baroreflex sensitivity was derived from increases of R-R intervals as functions of increases in systolic pressures with linear regression analysis during phase IV pressure increases caused by Valsalva’s straining.

**Data Analysis:** Dependent variables prior to exercise intervention were assessed with a between groups (exercise vs. control) analysis of variance (ANOVA). The effects of circuit weight training on dependent variables of interest were assessed with analysis of variance (ANOVA) between groups (exercise vs. control) and for repeated measures (baseline, four, eight, and twelve weeks). Fitness variables were measured only pre- and post-training

**Hypotheses of the Study:**

H₁ Circuit weight training treatment will yield a positive effect on autonomic nerve functioning, resting metabolic rate, and blood pressure.

H₂ Circuit weight training will increase whole body skeletal muscle strength.

H₃ Circuit weight training will have a positive effect on pulse wave velocity, body fat percentage, and VO₂ max.

**Sample:** Participants in the study included 24 young healthy subjects, who were assigned to either Control Group (CG) or Experimental Group (EG). The Control Group contained 11 subjects. Seven of the subjects were male and four subjects were female. The average age of the Control Group subjects was 25±3.0 years, the average height of the subjects was 171.6±7.6 (cm), and the average weight of the subjects in the group was 79.7±17 (Kg). Likewise, the Experimental Group contained 13 subjects. Nine of the subjects were male and four subjects were female. The average age of the
Experimental Group subjects was 22.3±2.8 years, the average height of the subjects was 171.3±12.4 (cm), and the average weight of the subjects in the group was 86.3±16 (Kg).

**Instruments:** Omron Model HEM-907XL Professional --- BP, Doppler (MD6, Hokanson, Bellavue, WA, USA) --- PWV, Standard 4 - lead ECG --- ECG, Finger photoplethysmography (Finometer, Finapres Medical Systems, Arnhem, the Netherlands) --- beat by beat blood pressure, Infrared CO₂ analyzer --- end-tidal CO₂ level.

**Results:**

(1) Circuit weight training increased whole-body muscular strength (289±30.8 pre-, and 396.4±35.5 Kg posttraining; mean±SE; p<0.01 ) and VO₂ max ( 2.46±0.3 pre-, and 2.91±0.2 L/min posttraining; mean±SE; p<0.05 ), but RMR and body fat percentage were not changed.

(2) Peripheral and central pulse wave velocities, and arterial systolic and diastolic blood pressure remained static throughout 12 weeks of circuit weight training.

(3) Circuit weight training did not alter HRV or cardiovagal baroreflex sensitivity.

**Conclusion:**

(1) During the12-week strength training cycle, the lower limb muscle strength of young healthy adults in the investigation was significantly increased. Likewise, maximum oxygen uptake increased significantly. Hence, we believe that description cycle strength training can improve muscle strength and increase aerobic capacity.

(2) The circuit weight training cycle did not change the resting metabolic rate and body fat ratio of this group of young healthy adults. According to our study data, the training intensity and training volume applied by this treatment was not sufficient to affect non-diet, body composition changes.

(3) According to baseline data taken before the beginning the treatment and at 4 weeks, 8 weeks and 12 weeks, the training group systolic blood pressure, diastolic blood pressure, and central and peripheral arterial pulse wave speed indicator did not change significantly.

(4) Before training, after 4 weeks, 8 weeks and 12 weeks of training, both the Experimental and Control groups experienced no significant differences in measured
heart rate variability (HRV). This included training group stages between testing intervals.

(5) There were no significant differences in regards to the dynamic or spontaneous BRS measurements in either the Experimental Group (EG) or Control Group (CG) before training, after 4 weeks, 8 weeks, and 12 weeks of training.

In sum, the results of this study demonstrate that the 12-week circuit weight training cycle significantly increased muscle strength and improved the aerobic capacity of young healthy subjects, while maintaining arterial compliance and autonomic nerve function stability. However, although circuit weight training increases muscle strength and aerobic capacity, in this study, it did not affect blood pressure, arterial compliance and autonomic nerve function in young healthy subjects.

Changing Paradigms: Faculty Development in Higher Education for the 21st Century

ABSTRACT

In response to La Salle University’s new strategic plan, we are implementing a unique faculty development initiative. Our initiative grows from two of the strategic plan’s core goals: to increase the use of creative pedagogies that engage students in their learning, and to make greater and more intentional use of our urban location. Our initiative thus focuses primarily on supporting faculty efforts to use the city of Philadelphia and its surrounding region as instructional resources for their classes.

Our faculty development initiatives are rooted in contemporary pedagogical research (Bain, 2004), which suggests that the best college teachers regard their craft as a serious and challenging intellectual endeavor, and one that offers continual opportunities to learn how to teach. Rather than focus on raising awareness about general teaching strategies, as more traditional faculty development does, we began by first seeking to understand of our faculty’s attitudes and beliefs about the value of using the city as an instructional resource. We accomplished this through a survey, which provided us with data that importantly informed our programs.

Overwhelmingly, faculty thought that using the city and its region as instructional resources was a good or very good idea (91%), and that students enjoy field trips into the city (73%), yet over half of them almost never or seldom actually used these resources (62%). Additionally, those faculty who made use of the city reported that either their use was remaining about the same (54%) or actually decreasing (12%). The major concerns that faculty expressed about using our urban location were that it is difficult to fit such activity into their subject areas (32%), that there is not enough time to do so (26%), and that is was too much of a hassle (19%).

In order to address these data and in light of the importance of using our urban location to engage students in their learning as articulated in La Salle’s strategic plan, we instituted a faculty development program that included a unique Subway Series to help faculty consider ways to incorporate cultural and historic sites into their courses, and a Cultural Passport Program to help
address the hassle and cost of taking students on field trips. Further, we constituted *Faculty Reading Groups* and commissioned *Practitioner Research Projects* to create Professional Learning Communities. Finally, we partnered with related initiatives already extant on our campus to bring faculty and students together outside of the classroom through the *Explorer Connection*. The central component of the Explorer Connection is an essential question about which all first year students and many faculty members intellectually engage.

We have begun to collect data on the results of our faculty development initiatives as they compare to the benchmarks presented above. These data will be shared with participants during the workshop session. In addition, we will model several strategies and give participants the opportunity to discuss potential plans of action for continuing their own meaningful, sustained faculty development programs that are in line with contemporary research and principles of newer conceptions of pedagogy.
Innovative Methods to Optimize Power Production and Body Weight Reduction
Hashem A. Kilani
hakilani@squ.edu.om
Sultan Qaboos University
College of Education
Physical Education Department

Key Words: obesity, aerobic vs. anaerobic, resistance.

PREFACE:
Muscles generate force in slow or fast rate depending on many factors. One factor is the increasing size of the cross sectional area of muscle's bulk and corresponding mass. Another factor is the stretch reflex mechanism and related elastic energy storage in the muscle (Kilani, Palmer, & Gapsis, 1989). Based on Newton's Second Law, the more force a muscle produces, the greater the acceleration of its segments; while, the more mass a muscle has, the lower the acceleration of its segments. However, in jumping and other events, athletes need to combine a greater rapid force generation and a conserved or reduced body weight (Kilani, 2000). In vertical jumps, two components contribute to the power output: the amount of optimum impulse generated at take off and type of muscle contraction with related mass. So it is assumed that having more leg muscle mass would be associated with a better utilization of elastic component in the muscle and achievement of a higher jump height (Kilani et al., 1989). It has been well known that systematic resistance training, especially among initially untrained healthy subjects, has a potent effect in promoting increases in size and strength of skeletal muscle. This is true both in men and women. Although women have lower absolute strength than men, the relative increases in strength following a training programme are similar between genders, at least in the beginning of resistance training (Häkkinen and Pakarinen, 1994; Staron et al., 1994; Häkkinen et al., 2000a).

High intensity is not necessarily dependent upon the use of near-maximal or maximal loads but more to the degree to which the relevant muscle fibers are recruited during the effort. The terms “fast twitch” and “slow twitch” do not necessarily mean that fast movements recruit exclusively fast twitch fibers and slow movements recruit exclusively slow twitch fibers. The fibers involved are determined by the force that is produced. The explosive movements rely heavily on the action of the fast twitch fibers. Also, accelerated movements recruit the muscle stretch (myotatic) reflex, which can elicit a faster and more powerful contraction. The pre-stretch principle is well known in sports and in the plyometric method in explosive training.

Training the fast twitch fibers also includes the storage and release of elastic energy by the connective tissues in the muscle/tendon complex and should not be ignored by bodybuilders, powerlifters, power athletes, endurance athletes and for body weight reduction (Kilani, 2010; Kilani & AbuEisheh, 2010). This is done by involving the stretch reflex, which entails accumulation of energy in the muscle-tendon complex prior to a quick explosive contraction and accelerates the weight or object held. After this, the weight or object moves on its own momentum followed by some muscle involvement until the movement stops.

After approximately seven weeks of training based on applying the principle of stretch reflex training, Phil Murphy, a former lineman for the then Los Angeles Rams football team in the early 80s, lost 25 pounds of mostly fat and posted 255 pounds of lean muscle mass at a weight of 325 (Michael Yessis, 2006).

The use of vibration as a means for enhancing athletic performance is a recent issue in exercise physiology. Current evidence suggests that vibration is effective in enhancing
strength and the power capacity of humans with decreasing weight, relying on the stretch reflex utilization. (Cardinale, and Bosco, 2003, Kilani, 2000, Kilani & Qatami, 2006, Kilani, 2010, Kilani & Abu Eisheh, 2010). The purpose of this paper is to address this dilemma by shedding light on the innovative findings regarding the variables that are related to power production and body weight reduction. The interplay among aerobics, anaerobic exercises, intensity level, resistance training, reflex contribution, and nutrition will be examined. This review will support those people-obese and heavy weights- who are not able to lose weight and gain strength in short time.

BACKGROUND:
Nearly three fourths of the UAE’s population is battling with obesity – which has been termed as a silent killer by the World Health Organization (WHO) (MOH/UAE, 2003). It is also known that nine out of 10 cases of obesity develop into diabetic cases. Obesity is clearly becoming an epidemic which needs urgent attention (Mokdad et al., 1999). Some of the health problems associated with obesity include Type 2 diabetes, heart disease, cancer, stroke, back and joint pain, osteoarthritis, high blood pressure, gallstones, fatty liver, infertility, breathlessness, depression, snoring, difficulty in sleeping and excessive sweating. (Alhazza and Musaiger, 2010), (Physical activity and health Report, 1996; National Task Force on the Prevention and Treatment of Obesity (NTFPTO), 2000).

In the United States, an estimated 97 million adults, or more than six out of 10 men and women are overweight or obese (Mokdad et al., 1999). Approximately 300,000 deaths each year are attributed to a combination of dietary factors and physical inactivity—the two primary culprits of obesity—making these lifestyle habits second only to cigarette smoking as the leading cause of death in the United States. The trend of overweight and obesity in adults appears to be growing unabated, while an increase in the number of overweight American youths points to an even greater preponderance of adult obesity and its associated co-morbidities in the future. (MMWR, 1994)

Not many are aware that obesity not only affects the adults but also children, who incidentally are even more vulnerable, primarily because of the likelihood of growing up to become obese adults. Studies indicate that obesity is more likely to persist when its onset is in late childhood or adolescence and where children have obese parents. Problems associated with excess weight in children and adolescence includes heat intolerance, breathlessness on exertion, tiredness, and flat feet. (LeMura and Maziekas, 2002; Kilani, 2005; Alhazza, 1996)

No longer is there any serious doubt about the strong impact of physical activity on promoting health and preventing disease, or achieving and maintaining a healthy body weight. Despite the well-known benefits of regular physical activity, only about 15 percent of American adults regularly engage in the modest amount of activity required to obtain health benefits, while more than one fourth of adults are sedentary. The potential medical hazards of obesity have been documented extensively (Pi-Sunyer, 1993; NTFPTO, 2000). According to the American Heart Association (AHA), obesity is a major independent risk factor for coronary heart disease (CHD), and it appears to interact with or amplify the effects of other cardiovascular risk factors, including hypertension, dyslipidemia, insulin resistance, and hyperinsulinemia (Eckel and Krauss, 1998). Moreover, clustering of risk factors in obesity is important because obese persons face more than a 65 percent chance of having at least one additional risk factor for CHD (Yusuf, Giles, Croft, Anda, and Casper, 1998) and a 50 percent chance...
of having two or more other risk factors for heart disease (Wilson, Kannel, Silbershatz, and D'Agostino, 1999).

The World Health Organization (WHO) Eastern Mediterranean Region is exposed to NCD risk factors as part of risk-transition as a result of marked changes in the pattern of living in many countries of the Region, particularly countries of the Gulf Cooperation Council, where rapid increases in obesity are being recorded, primarily among children, adolescents and young adults. Overweight and obesity have risen 2-fold or more since 1980. Changes in food processing, production and type of food (fast food) have affected health in the majority of countries in the Region. The prevalence of overweight and obesity for males and females in a number of countries of the Region among males ranges from 10.5% in Pakistan to 64.0% in Saudi Arabia, while for females it ranges from 21.7% in Morocco to 79.0% in Bahrain (Wee, McCarthy, Davis, and Phillips, 1999). The regional adjusted mean for overweight and obesity is 54.2% for women compared to 31.4% among males. Obesity kills around 150,000 men and women a year in the Region.

According to the World Health Organization, the most important risk factors of non-communicable diseases in the Arab countries included high blood pressure, high concentrations of cholesterol in the blood, inadequate intake of fruit and vegetables, overweight or obesity, physical inactivity and tobacco use. Five of these risks are closely related to improper diet and physical inactivity (Hazzaa et al., 2010).

Because studies have demonstrated that obesity in childhood tracks into adulthood, public health officials commonly refer to pediatric obesity as an “alarming trend” and as an “epidemic” research synthesis demonstrated the effectiveness of exercise as an adjunctive treatment for childhood and adolescent obesity. With regard to the development of an appropriate exercise prescription, the most favorable alterations in body composition were associated with low-intensity, long-duration exercise and aerobic exercise combined with high-repetition resistance training (LeMura, and Maziekas, 2002).

The 1998 NIH Clinical Guidelines on the Identification, Evaluation, and Treatment of Overweight and Obesity in Adults Report indicates that more research is needed on effects on body weight/obesity of different lengths of physical activity interventions, different formats and intensities of physical activity, and different forms of physical activity in combination with diet, as well as effects of physical activity on body fat distribution, e.g., abdominal fat. The recommendations of this report for future research includes the need to determine the optimal amount of physical activity to promote weight loss, maintenance of weight loss, and prevention of obesity, as well as strategies to preserve muscle and bone in the face of weight loss. This corresponds to our purpose of this paper. Therefore, research is needed on the effects of pharmacologic intervention for weight loss on cardio-respiratory fitness. Research is also needed on environmental and population-based intervention methods for weight control that incorporate physical activity. These studies should address high-risk populations for obesity and low levels of physical activity including underserved population segments, e.g., minorities and low socioeconomic (SES) groups.

Education about the long-term health consequences and risks associated with overweight and how to achieve and maintain a preferred weight is necessary. While many individuals attempt to lose weight, studies show that within five years a majority of them regain the weight. In order to maintain weight loss, good dietary habits must be coupled with increased physical activity, and these must become permanent lifestyle changes. It is still not clear; however, which methods are best for achieving these changes, particularly long-term. A 1998 NHLBI workshop on Maintenance of Behavior
Change in Cardiorespiratory Risk Reduction concluded that the following are examples of research topics and study approaches that are relevant. Applicants are encouraged to consider these questions, when relevant, in relation to persons with and without morbid conditions (such as hypertension, diabetes, arthritis). Likewise, applicants are encouraged to provide a rationale for the type of physical activity (e.g., aerobic, anaerobic, resistance) that they propose in their applications and are the outcome of this review.

METABOLISM:
The speed of basal metabolic energy depends primarily on body composition. Research shows that the leaner muscle mass is, the faster the metabolism. Another factor affecting energy expenditure is something called "dietary induced thermogenesis" (digesting, transporting and storing food). This is the least significant in terms of calories, and accounts for about 10 percent of total calories expended (about 75 to 200 calories burned per day). The third factor is activity, which accounts for approximately 15 to 35 percent of total calorie burning (Alhazzaa, 2010). Any activity we engage in, whether it is running, walking, or fidgeting, burns calories above and beyond our basal metabolic rate (BMR).

Some people have a higher metabolism than others, which can vary as much as 30 percent. More emphasis is being placed on the percentage of muscle and fat, and less on total body weight. Dieting shuts off metabolism and causes a loss of lean muscle mass. For every diet, there is an equal and opposite binge. Statistics show that people gain back more weight after dieting, and with a higher percentage of body fat. Evans, (2001) states, "By cutting back in calories, you will see an immediate drop in metabolic rate."

Sports nutrition is built upon an understanding of how nutrients such as carbohydrate, fat, and protein contribute to the fuel supply needed by the body to perform exercise. These nutrients get converted to energy in the form of adenosine triphosphate (ATP). It is from the energy released by the breakdown of ATP that allows muscle cells to contract. However, each nutrient has different pathways that determine how it gets converted to ATP. Carbohydrate is the main nutrient that fuels exercise of a moderate to high intensity, while fat can fuel low intensity exercise for long periods of time. Proteins are generally used to maintain and repair body tissues, and are not normally used to power muscle activity.

ENERGY PATHWAYS:
Because the body cannot easily store ATP (and what is stored gets used up within a few seconds), it is necessary to continually create ATP during exercise. In general, the two major ways the body converts nutrients to energy are: Aerobic metabolism (with oxygen) or Anaerobic metabolism (without oxygen). These two pathways can be further divided. Most often it is a combination of energy systems that supply the fuel needed for exercise, with the intensity and duration of the exercise determining which and when a method gets used.

ATP-CP Anaerobic Energy Pathway
The ATP-CP energy pathway (sometimes called the phosphate system) supplies about 10 seconds worth of energy and is used for short bursts of exercise such as a 100 meter sprint. This pathway doesn't require any oxygen to create ATP. It first uses up any ATP stored in the muscle (about 2-3 seconds worth) and then it uses creatine phosphate (CP) to resynthesize ATP until the CP depleted (another 6-8 seconds). After the ATP
and CP are used the body will move on to either aerobic or anaerobic metabolism (glycolysis) to continue to create ATP to fuel exercise.

**Anaerobic Metabolism - Glycolysis**
The anaerobic energy pathway, or glycolysis, creates ATP exclusively from carbohydrates, with lactic acid being a by-product. Anaerobic glycolysis provides energy by the (partial) breakdown of glucose without the presence of oxygen. Anaerobic metabolism produces energy for short, high-intensity bursts of activity lasting no more than several minutes before the lactic acid build-up reaches a threshold known as the lactate threshold and muscle pain, burning and fatigue make it difficult to maintain such intensity.

**Aerobic Metabolism**
Aerobic metabolism fuels most of the energy needed for long duration activity. It uses oxygen to convert nutrients (carbohydrates, fats, and protein) to ATP. This system is a bit slower than the anaerobic systems because it relies on the circulatory system to transport oxygen to the working muscles before it creates ATP. Aerobic metabolism is used primarily during endurance exercise, which is generally less intense and can continue for long periods of time.

During exercise an athlete will move through these metabolic pathways. As exercise begins, ATP is produced via anaerobic metabolism. With an increase in breathing and heart rate, there is more oxygen available and aerobic metabolism begins and continues until the lactate threshold is reached. If this level is surpassed, the body cannot deliver oxygen quickly enough to generate ATP and anaerobic metabolism kicks in again. Since this system is short-lived and lactic acid levels rise, the intensity cannot be sustained and the athlete will need to decrease intensity to remove lactic acid build-up.

**FUELING THE ENERGY SYSTEMS**
Nutrients get converted to ATP based upon the intensity and duration of activity, with carbohydrate as the main nutrient fueling exercise of a moderate to high intensity, and fat providing energy during exercise that occurs at a lower intensity. Fat is a great fuel for endurance events, but it is simply not adequate for high intensity exercise such as sprints or intervals. If exercising at a low intensity (or below 50 percent of max heart rate), you have enough stored fat to fuel activity for hours or even days as long as there is sufficient oxygen to allow fat metabolism to occur. As exercise intensity increases, carbohydrate metabolism takes over. It is more efficient than fat metabolism, but has limited energy stores. This stored carbohydrate (glycogen) can fuel about 2 hours of moderate to high level exercise. After that, glycogen depletion occurs (stored carbohydrates are used up) and if that fuel isn't replaced athletes fatigue occurs. An athlete can continue moderate to high intensity exercise for longer simply replenishing carbohydrate stores during exercise. This is why it is critical to eat easily digestible carbohydrates during moderate exercise that lasts more than a few hours. If you don’t take in enough carbohydrates, you will be forced to reduce your intensity and tap back into fat metabolism to fuel activity.

As exercise intensity increases, carbohydrate metabolism efficiency drops off dramatically and anaerobic metabolism takes over. This is because your body can not take in and distribute oxygen quickly enough to use either fat or carbohydrate metabolism easily. In fact, carbohydrates can produce nearly 20 times more energy (in the form of ATP) per gram when metabolized in the presence of adequate oxygen than when generated in the oxygen-deficit, anaerobic environment that occurs during intense efforts (sprinting).
With appropriate training, these energy systems adapt and become more efficient and allow greater exercise duration at higher intensity.

Fat needs oxygen to burn completely so in order to burn fat during an exercise we need to move slowly and smoothly. This enables muscle cells to be supplied with enough oxygen to continue with its aerobic capacity and utilize fat as the main energy source. Anaerobic exercise requires moving at an increased pace or with greater effort. Exercising this way burns more calories but results in a greater demand for oxygen which cannot be delivered in sufficient quantities to allow cells to continue burning fat. When we breathe heavy we start to develop an oxygen debt and muscle cells switch to burning mainly carbohydrates, this fuel burns quickly and does not require oxygen. Anaerobic exercises such as sprinting or weight training require more effort and up to 95% of the fuel used will be carbohydrates. While doing aerobic exercises, your body uses approximately 60% of the total calories burned during a low to moderate aerobic exercise from fat. As the intensity level increases, the body switches from using fat as the primary source of fuel to using readily available carbohydrates. At a high intense aerobic workout, you will use only approximately 35% of fat for fuel. At an extreme or vigorous workout level, or an anaerobic exercise, the percent of fat may only be 5% of total calories burned during exercise as your muscles do not require oxygen. Based on this most people assume that the low to moderate intense level gives you the most fat calories burned, however, it is all relative to the total calories burned during exercise. The low intense level aerobic exercises, while burning a higher percent of fat, will actually produce the lowest number of total calories burned. While the higher intense aerobic workouts give a lower percent of fat burn, it also gives you the higher calories burned.

Walking is one of the favorite activities common of older adults, but few of them might consider that increasing their speed and agility may prevent hospitalization or disability. However, Cesari et al. (2005) demonstrated that walking speed translates into important clinical outcomes. Among 3047 older adults, those with walking speed of less than 1 meter per second were more likely to have a hospitalization or lower extremity disability vs. older adults with a faster walking speed. They suggested that participants with a slower walking speed also experienced an increased risk for death. Alsears (2010) stated “Doing aerobics isn’t a smart way to exercise, and it doesn’t build your lungs or breathing capacity as the name implies. In fact, aerobics actually shrinks your heart and lungs - making you more vulnerable to fatal heart attacks”.

The notion of high intensity exercises went under various types of research methods as many studies have been done on the effect of training on V02max, but little information has been available about the effect on anaerobic capacity. Tabata et al. (1996) showed that moderate-intensity aerobic training that improves the maximal aerobic power does not change anaerobic capacity and that adequate high-intensity intermittent training may improve both anaerobic and aerobic energy supplying systems significantly, probably through imposing intensive stimuli on both systems. In the moderate-intensity group, seven active young male physical education majors exercised on stationary bicycles 5 days per week for 6 weeks at 70% of V02max, 60 minutes each session. V02max was measured before and after the training and every week during the 6 week period. As each subject's V02max improved, exercise intensity was increased to keep them pedaling at 70% of their actual V02max. Maximal accumulated oxygen deficit was also measured before, at 4 weeks, and after the training.

A second group followed a high-intensity interval program. Seven students, also young and physically active, exercised five days per week using a training program similar to
the Japanese speed skaters. After a 10-minute warm-up, the subjects did seven to eight sets of 20 seconds at 170% of V02max, with a 10 second rest between each bout. Pedaling speed was 90-rpm and sets were terminated when rpms dropped below 85. When subjects could complete more than 9 sets, exercise intensity was increased by 11 watts. The training protocol was altered one day per week. On that day, the students exercised for 30 minutes at 70% of V02max before doing 4 sets of 20 second intervals at 170% of V02max. This latter session was not continued to exhaustion. Again, V02max and anaerobic capacity was determined before, during and after the training.

In some respects the results were no surprise, but in others they may be ground breaking. The moderate-intensity endurance training program produced a significant increase in V02max (about 10%) but had no effect on anaerobic capacity. The high-intensity intermittent protocol improved V02max by about 14%; anaerobic capacity increased by an enormous 28%.

It was the first study to demonstrate an increase in both aerobic and anaerobic power. The results, of course, confirm the well-known fact that the results of training are specific. The intensity in the first protocol (70% of V02max) did not stress anaerobic components (lactate production and oxygen debt) and therefore, it was predictable that anaerobic capacity would be unchanged. On the other hand, the subjects in the high-intensity group exercised to exhaustion, and peak blood lactate levels indicated that anaerobic metabolism was being taxed to the max. So, it was probably also no big surprise that anaerobic capacity increased quite significantly.

What probably was a surprise, however, is that a 4 minute training program of very-hard 20 second repeats, in the words of the researchers, "may be optimal with respect to improving both the aerobic and the anaerobic energy release systems."

High-intensity Interval Training:
This commentary highlights recent work from Dr. Gibala's laboratory examining rapid adaptations in exercise capacity and aerobic energy metabolism after short-term HIT. Using the Wingate Test, he explores the effect of HIT on exercise capacity, skeletal muscle adaptations to HIT, and compares it with traditional endurance training.(Gibala, 2007). Tremblay et al., (1994), challenged the common belief among health professionals that low-intensity, long-duration exercise is the best program for fat loss. They compared the impact of moderate-intensity aerobic exercise and high-intensity aerobics on fat loss. They divided 27 inactive, healthy, non-obese adults (13 men, 14 women, 18 to 32 years old) into two groups. They subjected one group to a 20-week endurance training (ET) program of uninterrupted cycling 4 or 5 times a week for 30 to 45 minutes; the intensity level began at 60% of heart rate reserve and progressed to 85%. (For a 30-year-old, this would mean starting at a heart rate of about 136 and progressing to roughly 170 bpm, which is more intense than usually prescribed for weight or fat loss.)

The other group did a 15-week program including mainly high-intensity-interval training (HIIT). Much like the ET group, they began with 30-minute sessions of continuous exercise at 70% of maximum heart rate reserve (remember, they were not accustomed to exercise) but soon progressed to 10 to 15 bouts of short (15 seconds progressing to 30 seconds) or 4 to 5 long (60 seconds progressing to 90 seconds) intervals separated by recovery periods allowing heart rate to return to 120-130 beats per minute. The intensity of the short intervals was initially fixed at 60% of the maximal work output in 10 seconds, and that of the long bouts corresponded to 70% of the individual maximum work output in 90 seconds. Intensity on both was increased 5% every three weeks. The total energy cost of the ET program was substantially greater than the HIIT program. The researchers calculated that the ET group burned more than twice as many calories
while exercising than the HIIT program. But (surprise, surprise) skinfold measurement showed that the HIIT group lost more subcutaneous fat. "Moreover," reported the researchers, "when the difference in the total energy cost of the program was taken into account..., the subcutaneous fat loss was ninefold greater in the HIIT program than in the ET program." In short, the HIIT group got 9 times more fat-loss benefit for every calorie burned exercising.

In order to determine why high-intensity exercise produces so much more fat loss, Tremply et al. (1994), took muscle biopsies and measured muscle enzyme activity. "[Metabolic adaptations resulting from HIIT] may lead to a better lipid utilization in the post-exercise state and thus contribute to a greater energy and lipid deficit." In other words, compared to moderate-intensity endurance exercise, high- intensity intermittent exercise causes more calories and fat to be burned following the workout.

Similar metabolic adaptations during exercise after low volume sprint interval and traditional endurance training in humans was reported by Burgomaster, Howarth, Phillips, Rakobowchuk, MacDonald, McGee, and Gibala, (2007). They found that 6 weeks of low-volume, high-intensity sprint training induced similar changes in selected whole-body and skeletal muscle adaptations as traditional high-volume, low-intensity endurance workouts undertaken for the same intervention period.

Hawley, (2002), on the other hand, stressed that the key components of any training programme are the volume (how much), intensity (how hard) and frequency (how often) of exercise sessions. These ‘training impulses’ determine the magnitude of adaptive responses that either enhance (fitness) or decrease (fatigue) exercise capacity (Hawley, 2002).

One of the key tenants of exercise physiology is the principle of training specificity, which holds that training responses/adaptations are tightly coupled to the mode, frequency and duration of exercise performed. This means that the vast majority of training-induced adaptations occur only in those muscle fibres that have been recruited during the exercise regimen, with little or no adaptive changes occurring in untrained musculature. Furthermore, the principle of specificity predicts that the closer the training routine is to the requirements of the desired outcome (i.e. a specific exercise task or performance criteria), the better will be the outcome. However, Burgomaster et al., (2007), reported those 6 weeks of low-volume, high-intensity sprint training induced similar changes in selected whole-body and skeletal muscle adaptations as traditional high-volume, low-intensity endurance workouts undertaken for the same intervention period. Specifically, they show that four to six 30 seconds sprints separated by 4–5 min of passive recovery undertaken 3 days per week results in comparable increases in markers of skeletal muscle carbohydrate metabolism (i.e. total protein content of pyruvate dehydrogenase), lipid oxidation (i.e. maximal activity of β-3-hydroxyacyl CoA dehydrogenase) and mitochondrial biogenesis (i.e. maximal activity of citrate synthase and total protein content of the peroxisome-proliferator-activated receptor-γ coactivator-1α) as when subjects undertook 40–60 min of continuous submaximal cycling a day for 5 days per week. These findings are particularly impressive given that weekly training volume was ~90% lower in the sprint-trained group (~225 versus 2250 kJ week−1) resulting in a total cumulative training time of ~1.5 versus 4.5 h per week.

STRENGTH TRAINING:

Strength training is considered an anaerobic exercise regardless of how heavy the resistance or how many repetitions are done. Strength training is all about challenging the muscles through resistance in order to tone and strengthen. Strength training is not considered a fat burning exercise while performing the exercise. However, it will bring
you fat burning benefits. This is done by increasing your lean muscle mass and the more lean muscles you have, the higher your BMR.

There was a landmark study done some years back by Dr. James Rippe that really punctuates the benefits of anaerobic exercise versus aerobic exercise, or no exercise at all.

Dr. Rippe took 65 people and divided them into three groups. Each of them was put on the same diet. They simply ate fewer calories than they normally would, assuring that they would all lose some weight. They participated in this study for six weeks.

Group one did no exercise at all during the six weeks, group two did only aerobic exercise, and group three did only anaerobic exercise. The study showed the following findings:

Weight loss: Group one (no exercise) lost 9 pounds. Group two (aerobic exercise) lost 10 pounds, and group 3 (anaerobic exercise) lost 9 pounds.

So far things are very even. But here’s where it gets really interesting.

Muscle loss: Group one (no exercise) lost 11% of their muscle mass. Group two (aerobic exercise) lost 1% of their muscle mass, and group 3 (anaerobic exercise) lost no muscle mass.

Notice that even those who did aerobic exercise lost muscle mass!

Muscle gain: In the final category, only those who did anaerobic exercise gained muscle mass—9%.

Everyone lost weight, but it was only the strength trainer's who added calorie-burning muscle while losing fat.

**CONCLUSION:**

The above research findings suggested that one should consider the high intensity exercise for weight reduction and power gain. But, it’s always better to underestimate your ability at the start. Begin a little slower than you think you can handle, and then adjust the pace from workout to workout. Don't attempt high-intensity intervals unless you are in good condition; they’re not appropriate for beginners. The intensity of anaerobic exercise stimulates an increased demand for calories and an elevated body temperature. It stimulates the secretion of growth hormone (GH) and thus increasing the bulk of the muscle which increases surface area and enhances the BMR. These factors generate an increase in your metabolic rate (the rate at which you burn calories) that lasts for several hours after your workout.

Since your preferred fuel choice at rest is fat, you will burn more fat ceaseless because of your glucose-burning workout! However, many exercisers take shortcuts that sabotage the weight loss benefits of high intensity workouts.

The continuous increase in metabolism caused by an effective training program is the only true way to lose weight. Consider that during a vigorous hour of exercise, you burn between 500-800 calories. A bran muffin or a piece of eastern Kunafah gets you nearly back to even. Thus, the Aerobic Base Building is first then only will the dramatic benefits of high-intensity training be enjoyed. On this regard, research has shown that people who exercise regularly have far more fat-burning enzymes in their muscles than people who don’t exercise.

Exercise positively affects a number of hormones in your body which are related to fat storage such as insulin, adrenaline, and cortisol. Endorphins, small morphine-like chemicals, are secreted with exercise and can also help reduce fat storage, as well as create a feeling of well-being and alleviate stress. The more you do, the more you will want to do as the benefits continue to increase and you get the results you’re after. In short, aerobic and anaerobic exercises with various types of resistant stimuli such as vibration and stretch reflex mechanism that influence power production is a must for
losing body fat as well as improving the overall quality of life. It will add years to your life and life to your years.

FUTURE WORK:
Additional research is needed to examine factors associated with long-term maintenance of weight loss, long-term maintenance of increased physical activity levels, and the relationship between the two. In addition, the question of whether physical activity enhances long-term maintenance of weight loss has not been formally examined with increased power production with the aid of reflexes training methods.

Abstract

This paper studies the relation between student engagement activities and performance in a Principles of Finance course. The National Survey of Student Engagement (NSSE) survey is adapted for the purpose of examining how student coursework performance in Principles of Finance relates to his/her engagement activities in the previous two semesters. While there is no doubt that student engagement activities offer various benefits to students, the short-term impact of student engagement activities on coursework performance is not clear. Using the ordinary least squares estimation, a weak association is found between student performance and the extent of his/her academic outside-classroom activities. The relation between performance and academic inside-classroom activities and social and global engagement activities are not statistically significant. After controlling for possible survivorship bias due to student withdrawal, the results of this study suggest no association between all engagement activities and student performance. This paper also studies students’ perceived benefits of engagement activities in relation to their knowledge, skills, and personal development. The findings suggest that social and global engagement activities help personal growth during their college careers.

Diadora America: A Social Media Case Study
Authors: Garrett Wampler, Bryan Heasley, Bryce Johnston, Tim Newman
All authors are affiliated with York College of Pennsylvania

The Internet has become an integral part of society. According to the Pew Internet and American Life Project (2008), 63% of all Americans currently have high-speed Internet access at home and the figure is expected to grow to 90% by the year 2012. Statistics further indicate that more Americans are using the Internet to watch videos, visit social networking sites, blog and share photos (Universal McCann Wave 4, June 2009). Many are finding it difficult to ignore social media since over 122 million people now visit Facebook each month and Twitter grew 1551% last year (Compete.com, June 2009).

From a business perspective, it is not prudent to ignore the fact that millions of people are using these networks and tools. Not surprisingly, companies of all sizes are using social media as part of their public relations campaigns. In fact, 54% of Fortune 100 companies utilize Twitter for news updates, customer service, marketing, promotion and even employee recruitment (Mashable, August 2009). Wouldn’t it be prudent for educators to use the same networks and tools to engage students and prepare them for the future?

This presentation focuses on the many types of platforms, applications, tools and strategies associated with the constantly emerging world of social media. We will discuss how to encourage students to engage in an educated and systematic manner, how to maximize the benefits of social media without damaging one’s reputation, how to be responsible about the information broadcast over the Internet via online communities and networks and how to constructively spend time online to get internships, jobs and positive exposure. Students need to understand the world of social media, the positive and negative consequences associated with online information and the concept of personal branding and maintaining a positive online presence. We will include specific examples of how educators may embed social media into existing courses, demonstrate techniques and specific assignments designed to provide hands-on experience and share some of the best practices associated with teaching and using social media within the traditional classroom environment.

Social media is a growing phenomenon in the world that we live in today. Twitter, Facebook, and LinkedIn are all social media types which have come out over the course of this past decade. All of these different types of social media can be taught in classrooms, whether it be in high school or college. Using these tools in an educational manner can be beneficial for the student as well as the professor. However, they can also be damaging to a person’s reputation if used in an uneducated manner.

One may ask, how can social media be taught in class? This is a valid question with numerous answers. Professors can use social media such as Twitter to get in touch with students or give them a chance to find out information about a project. An example of this could be when the professor “tweets” information such as “first person to meet me at the cafeteria will find out information about project.” If the students are following their professors and see this, then they will try to get to the cafeteria in order to get that extra information for the project. The students will also be learning how to use this valuable resource which can help them in the future, whether at school or in the workforce.

Another project for Twitter can consist of making as many contacts over the course of one week in the same department. The incentives for this include networking, experiencing Twitter, and learning the benefits of this tool. Twitter can also be beneficial for students and
Commenting on blogs can be beneficial because it gives students the opportunity to learn about different topics. They can also see how to professionally write blogs, which can help them out in the future if they are to work for a job which includes writing.

LinkedIn is more professional than Facebook and should mainly be used for industry networking as opposed to socializing among friends. How can professors teach students about LinkedIn? The easiest way is to show them examples and have them set up a LinkedIn account while they are in their class. If this is done the professor can see what is being done correctly as well as what they need to work on.

Although Twitter and LinkedIn are more professional than Facebook, students still need to know about the benefits and consequences of Facebook as well as the other two vehicles. Students need to use social media in an educated manner; they need to know the consequences of what can actually happen if they do something wrong while posting on these sites. Professors can teach them this by giving them personal examples of what has happened to people who have posted inappropriate information to these sites. Examples would include people losing jobs, not getting hired, or ruining chances for future opportunities.

In order to make all of these different types of social media available, professors need to set up projects which use all of them. Over the course of the previous semester, the York College of Pennsylvania Sport Management Public Relations class did a project working with Diadora. This project consisted of trying to increase the world-wide knowledge and awareness of Diadora. This was done by using different types of social media including, Twitter and Facebook. For this project students posted information about Diadora on the social media sites in order to increase recognition. At the end of the semester, the Facebook Diadora group had grown to over 750 people. Contests were run weekly on the site to get people participating. The Twitter account accumulated over 200 followers as contests were also run on this social media site. The different sites were updated regularly by the students, and it was well-received as a great experience for the students to learn how to use the various social media sites.

Perhaps the most important aspect of social media that must be stressed to students is the potential it possesses to damage one’s reputation if used in an inappropriate and unprofessional manner. Students should be taught how to maximize the benefits of social media without damaging one’s name. This can be accomplished by being diligent with regards to responsibly broadcasting information over the internet via online communities and networks such as Facebook, Twitter, or LinkedIn. Instructors can employ a wide array of tactics to successfully drive home these concepts in the minds of their students.

The first, and most obvious, strategy to use would be to dedicate class time instructing on the topic of social media etiquette. Students cannot be completely expected to be responsible in their social media endeavors if they have never been told what this responsibility entails. Topics to cover include proper language, suitable photos, privacy settings, personal branding, and appropriate frequency of use. It is critical to avoid over-lecturing during a class such as this, as students will quickly tune out the instructor. Instead, the class period should be heavily focused on gathering the thoughts and opinions of the students, who will naturally have had a great deal of experience in this area. Another focus of this lesson should be on the practical implications of failing to maintain the previously discussed responsibility, namely the prospect of potential employers inspecting this information.

A second tactic in the strategy to stress the importance of social media responsibility to students would be for the instructor to actually check all of their accounts, much in the same way
as a corporation would. The instructor can easily search for the accounts of students, and a message describing all inappropriate activity contained on a particular page would certainly deliver a powerful message to the student in question. Facebook pages should be scanned for inappropriate pictures, offensive wall posts, and any other such red flags. If the student has not taken the time to enact privacy settings that would block the average individual from seeing such unsuitable content, than there is no chance that an interested company would fail to notice the infractions. Twitter accounts should be scrutinized to make sure that all Tweets are constructive, valuable, and contain no derogatory content. Furthermore, LinkedIn accounts ought to be examined for any obvious falsities regarding accomplishments, recognition, or experience. After receiving the initial information in class, students should be provided roughly a week to cleanse their accounts of inappropriate activity before these measures are taken.

After instructing students on the responsible ways to conduct themselves within the context of social media networks, and subsequently checking to see if they have taken heed to this advice, the third step in the strategy to impart this knowledge would be to bring in an outside voice to further reinforce these ideas. The instructor should reach out to a professional in the industry corresponding to the students’ career ambitions who conducts examinations of social media accounts while working in a human resources capacity. This individual would not only be able to provide impactful examples of qualified applicants who were denied employment due to inappropriate social-media-related activity, but would also be able to lend an extremely credible voice to the discussion. Allowing students to hear the message “straight from the horse’s mouth” would put an end to any doubt they may have left regarding the accuracy or significance of the original message. Other tactics may certainly be effective as well, but we feel that the three proposed provide a strong foundation in the effort to teach students how to responsibly broadcast information over the internet via online communities and networks.

According to Global Round Table, there are over 32.9 million users of LinkedIn in the United States of America alone (2010). A typical month on the professional social networking site averages 36.5 million site visits by professionals around the globe, either developing their own professional portfolio or viewing other’s portfolio’s in hopes of improving their own business. The question is not whether it is to the advantage of college-age students to be developing their own professional profile or not. The question is why haven’t they developed one yet?

LinkedIn gives a professional appeal to the users of other social networking sites, to link to other professionals in their fields and display their accomplishments on-line. The site offers a variety of features including recommendations, where former or current colleagues may give a recommendation on another’s work for prospective employers to view. This site also offers the chance to act in a professional manner and connect with a variety of other professionals students may have met or made contact with at conferences. LinkedIn is a great tool to be utilized in a classroom atmosphere as well. In a Professional Development course, an instructor may help the students realize the potential of a social network that displays one’s professional profile with over 32.9 million users.

Educational resources should not limit the student’s ability to produce networking opportunities; they should instead improve the student’s ability to meet new people. Setting up networking events for students to meet professionals in their field is a great way to get students more involved and interested in learning about their future. A professional networking event also allows students to practice acting professionally, knowing what types of language and gestures to use, and establishing a sense of professional dress. Acting professionally is a tool that students
will be able to carry with them through their career and potentially land a challenging job in their
career field. Through these networking events students can also realize a real-world concept of
how to make a good first impression and to continue to make positive connections in the
professional world. Students never know when they will be able to benefit from a past
connection in the business world.

Educators also may have the keen ability to help direct students’ searches for internships
or jobs. The ability for a student to locate an internship or job comes down to the student’s
ability to build on their professional development as well as the student’s ability to locate the
position. With a variety of job searching tools now at the finger tips of students via the Internet,
it becomes more necessary than ever for educators to help point students in the proper direction
to reputable sites such as Team Work Online and Work in Sports, both professional Sport
Management job and internship listing sites. It can also benefit the students to have a positive
networking connection with the educational staff, because the staff could have connections in
organizations that may have a position to fill.

Another task in developing a strong and professional network is the ability to continue to
stay in touch and build on your current networks. Many students will make a onetime connection
with someone and never contact them with a follow-up. A network is only as strong as the
relationship you build with the people who share the network. Students must learn how to
implement tactics in regard to following up on connections while still observing the interaction
in a positive and professional manner. This will allow the students to functionally use their
network in the future. A great way to target a follow-up in the classroom is for the educational
instructor to bring in guest speakers and allow students to build a network, while also
implementing a project that involves contacting the speaker later on in the semester. This not
only builds a professional networking relationship with the person, but could also potentially
teach the student how to keep a positive relationship and how to continue to follow up with the
professionals in their field. While this paper presents both general and specific topics included in
our presentation, we will also allow time for questions and answers regarding the vast number of
ways in which educators may embed social media into the traditional classroom experience.

Hawaii International Conference on Education, January, 2011  
Abstract  

Title: Engaging Undergraduates in Collaborative Research: A Model for Early Professional Development
Teacher candidates need an opportunity to study student learning and teaching practices. Standards for teacher education continue to emphasize the need for teacher preparation programs to prepare teacher candidates with a strong content knowledge and a strong pedagogical knowledge. Involving teacher candidates in field experiences that provide opportunities to engage in collaborative research with university faculty and teachers in a classroom setting can develop a strong content knowledge, a strong pedagogical knowledge and an understanding of implementing research-based teaching and learning strategies while investigating student learning and teaching practices.

In their joint statement of principles in support of undergraduate research, scholarship, and creative activities, the National Conferences on Undergraduate Research state the following: “We believe that undergraduate research is the pedagogy for the 21st century.” In our research, university faculty in partnership with professional development school faculty designed a teacher education model that engages undergraduate teacher candidates in systematic inquiry into student learning. This model implements both action and formal research methodologies.

The following purposes are the focus of the collaborative research model:
1. Do undergraduate experiences with action and formal research contribute to candidate professional development?
2. What learning gains for both candidate and children are documented?
3. How successful is the model, and what are the future directions?

Two types of research models are taught in an experiential approach during two semesters of the junior year. The formal research project in mathematics during the fall semester is faculty planned and directed with candidates involved in assessment, differentiated instruction, and data collection. During the spring semester candidates plan and direct a collaborative action research project in literacy in their assigned classroom with their teacher.

Our program began with formal research in mathematics focusing on teaching geometry in the kindergarten classroom. This geometry research has recently been added to Baylor’s international internship program in Queensland, Australia. With student progress evident in the geometry study, the Parkdale PDS principal requested a new focus on fractional understanding.
A graduate problems course in teaching mathematics chose as its research project to address elementary children’s learning of fractions. After an extensive background analysis of the fractional literature, they wrote the IRB for the university and school district, developed assessments, planned and field tested hands on interventions, and assembled evaluative instruments for candidates, students, and faculty.

Graduate students and faculty then instructed undergraduate candidates in the research process and videotaped candidate performance in assessment and instruction. The model used for formal research is summarized below:

- Pre/Post Assessment, including school district assessment, national and state standards
- Differentiated instructional intervention in small group settings
- Data collection and analysis
- Sharing in a public forum

Data collection involved extensive assessment, and candidates learned to assemble data to use for differentiation in their planning, instruction, and selection of materials. Preliminary results showed students’ retention of mathematics vocabulary is important to their further understanding of concepts. Kindergarteners could name the fractions ¼, ½, and 1/3, and they understood the concept of “fair share”. These aspects are beyond the requirements of our state standards for kindergarten. This research is a continuing longitudinal study that provides opportunities for presentation and publication.

During the spring semester candidates design an action research study in collaboration with their classroom teacher guided by a literacy-based question posed by university faculty. After assigned readings related to action research, candidates follow the prescribed action research sequence:

1. Identify the question, issue, or problem.
2. Define a potential solution.
3. Locate or develop pre and post assessments.
4. Apply the intervention and collect data regarding the intervention.
5. Analyze the findings.
6. Take action.
7. Share in a public forum.

This past year’s general question posed by the faculty was “Does using wordless picture books contribute to children’s oral language?” After the intervention period, candidates reported data that shows children’s improved use of appropriate vocabulary and sentences, increased descriptive language, and evidence of better engagement.

Candidates reported that their personal involvement in research improved their understanding of the research protocol, and that knowledge has enhanced their understanding and use of research and contributed to their professional development. They commented in reflections that they now know how to let assessment guide instruction.

The success of the research model is found in collaboration. Classroom teachers and university faculty collaborate with teacher education candidates to improve children’s learning by enhancing instruction in the classroom.

Governance in Independent Public Schools: the role of the new School Board

One of the most common practises in the general trend towards decentralisation in public schools in Australia has been the setting up of School Councils. This study explores the transition from School Council to School Board for selected schools, following the Government’s announcement of the Independent Public Schools Program. This new model of governance will give selected schools the opportunity to operate with increased flexibility and autonomy, including the authority to select and appoint staff, with additional curriculum and financial flexibilities (Western Australian Department of Education, 2010). The long term objectives of the research are to develop a governance framework for good processes and practices. A qualitative case study approach using analysis of documents in the public domain including policy, participating school data, media releases and reports will generate descriptive data of emerging governance issues. This paper will provide a context and track and analyse the implementation of the state-level educational initiative in order to inform the transition to new models of governance.

Abstract
This study describes research done with elementary pre-service teachers and the Education Outreach Project of the Gay Men’s Chorus of Los Angeles (GMCLA). The study summarizes research on the impact this Outreach Project had on these teacher candidates’ intersecting views of gender and sexuality. The presentation will share findings from this case study and the Project’s implementation in a large, comprehensive university teacher education program. It investigates how pre-service teachers bring to school their constructed meanings of gender and sexuality, and how the implementation of the Project changed pre-service teachers’ views of misogyny and homophobia. This study continues a dialogue about how to address issues of gender and sexuality in the classroom and how elementary school teachers might better be able to approach these topics in standards-driven appropriate ways.

Elementary pre-service teachers and homophobia: Curricular changes making a difference

This study describes research done with elementary pre-service teachers and the Education Outreach Project of the Gay Men’s Chorus of Los Angeles (GMCLA). The research summarizes the impact this Education Project had on these teacher candidates’ intersecting views of gender and sexuality.

Teachers have a fear of, and lack of experience, implementing ideas of sexuality in the classroom (Bickmore, 1999; Knotts, 2009; Macgillivray, 2004). Even if states have laws protecting school-age children from harassment based on sexual orientation or gender identity, those same laws rarely if ever require teachers to implement curriculum addressing those issues (Knotts, 2009). If administrators or teachers attempt to implement a curriculum addressing social change, it is often seen as radical or unnecessary (Deal & Patterson, 1999; Fullan, 1991, 1993, 2001; Skelton, 2007). Parental and social influences from the larger social/cultural world also contribute to the ways teachers understand their role in delivering content to students (Goodlad, 1984; Yanow, 1996). It is in this convoluted environment in which teachers operate that the Gay Men’s Chorus of Los Angeles presented their Education Outreach Project to pre-service teachers at a large, comprehensive university in Southern California.
Pre-service teachers

GMCLA’s Education Outreach Project, the A-Live Music Project (AMP), brings live music, personal testimony, and standards-driven curriculum to high school youth with the intended purpose of teaching content in innovative ways and encouraging students to think critically about personal, national, and international issues. This research study involved partnering with GMCLA in presenting curriculum on the biography of Billy Strayhorn, an African-American, gay composer from the early American Jazz Age, and his outstanding contributions both to music and the fight for Civil Rights equality. This initial AMP curriculum has now developed into further content comprised of contemporary civil rights issues, as well as biographies of other gay composers, and their histories involving immigration, religious persecution, race, and class. This study summarizes an adapted presentation of the Billy Strayhorn curriculum to elementary pre-service teachers, open-ended qualitative questions from pre- and post-assessment surveys, as well as lesson plans that the pre-service candidates created for K-5 students.

The discussion here is from a case study of the A-Live Music Project’s (AMP) implementation in a large, comprehensive public university teacher education program. It investigates how pre-service teachers bring to school their constructed meanings of gender and sexuality, and how the implementation of the Project changed students’ views of misogyny and homophobia, in theory, but not in practice. This study continues a dialogue about how to better address issues of gender and sexuality in the classroom and how elementary school teachers might better be able to approach these topics in standards-driven appropriate ways. The study encourages further research on standards-driven curriculum around these social/cultural issues.
History of the Project

The mission of the Gay Men’s Chorus of Los Angeles (GMCLA) is to use music and singing as a vehicle for changing hearts, minds, and attitudes (gmcla.org). GMCLA creates productions and performs music that reaches people with a message of unity that celebrates diversity, rather than condemning it. GMCLA was formed in 1979 as a volunteer effort of 99 gay men from all over the greater Los Angeles metropolitan area, and has grown in size, gained professional artistic and administrative staff, toured nationally and internationally, released fourteen CDs, and appeared with numerous stage, film, and television celebrities, and also appeared on several television broadcasts (i.e., *Will & Grace, Six Feet Under, MadTV*). GMCLA has also had many ‘firsts’ in its 30-year history. GMCLA was the first gay men’s chorus to perform for a sitting President of the United States: Bill Clinton, in 1999. The Chorus was the first gay men’s chorus to tour central Europe in 1991, the first openly gay chorus to be broadcast over Russian television in 1999, and the first openly gay chorus to tour South America.

GMCLA’s A-Live Music Project (AMP) is an attempt to address the fact that almost one-third of all California youth in grades seven to 11 have been the victims of bullying or harassment based on their actual or perceived race or ethnicity, religion, disability, gender, or sexual orientation (GLSEN, 2007). Eight percent of California students report being targeted for harassment because of their actual or perceived sexual orientation, according to the 2004 Safe Place to Learn report issued by the California Safe Schools Coalition and the 4-H Center for Youth Development at UC Davis. In addition, even if not the targets of harassment themselves, more than 91 percent of all youth in schools report hearing students make negative comments based on sexual orientation (GLSEN, 2007). AMP has been created in response to the fact that lesbian, gay, bisexual, and transgender (LGBT) people, or those perceived to be, are
Pre-service teachers disproportionately targeted as victims of hate crimes outside of schools (Herek, 2009). According to the Federal Bureau of Investigation, 14 percent of the hate crimes committed in 2005 were motivated by the victim’s sexual orientation (FBI, 2009).

California has a number of laws addressing perceived gender identity and sexual orientation in the schools [AB 537, AB 394, SB 777]. As early as 2000, California enacted a law, AB537: The Student Safety and Violence Prevention Act, that addresses harassment in the schools based on gender identity and sexual orientation (California Penal Code, 2005). In 2007, two additional laws were passed: the Safe Place to Learn Act, AB 394, and the Student Civil Rights Act, SB 777 (Equality California, 2008). The Safe Place to Learn Act attempts to enforce what AB537 did not by protecting youth, including those who identify as LGBT in California public schools, by ensuring that the state’s nondiscrimination and anti-harassment policies are rigorously enforced. This Act requires the state to actively monitor school district compliance of the already existing anti-bias law (i.e., The Student Safety and Violence Prevention Act of 2000). The Student Civil Rights Act establishes consistent civil rights protections in all public education programs and protects students from harassment and bullying. It also maintains that curriculum that is discriminatory or biased against LGBT people and other protected groups be prohibited. These recently passed laws, however, are being fought by a coalition of anti-LGBT activists in an attempt to undo student safeguards guaranteed by SB 777 (Campaign For Children and Families, 2007).

In response to statistics like these on LGBT harassment and the current state of legislation in the state of California, GMCLA developed an Education Outreach Project, titled the A-Live Music Project (AMP). AMP brings a personal and human connection to LGBT issues for high school students by including personal testimony from singing
Pre-service teachers

members that is aligned to the curriculum of the given presentation. Typically GMCLA sends 25 to 40 singing members to a high school site to present some version of curriculum addressing some combination of AMP’s stated goals: equality, diversity, music as message, LGBT history, and social action. AMP brings to life the larger sociocultural context of civil rights issues by presenting the music and biographies of outstanding gay American composers, or thematically addressing any of a number of the Project’s stated goals. The Project brings live music and standards-driven curriculum to youth with the express purpose of teaching content in innovative ways. The A-Live Music Project encourages students to think critically and construct their own social meanings, relating these to personal, national, and international issues. GMCLA has performed AMP in five southern California school districts, for audiences ranging from 25 to over five-hundred students and teachers.

In addition to thematic issues of civil rights, the A-Live Music Project oftentimes focuses on the lives and music of various composers (i.e., Leonard Bernstein, Marc Blitzstein, Stephen Sondheim, Billy Strayhorn) highlighting themes such as: racism, homophobia, escape from persecution and violence, poverty, and music as salvation. If focused on a composer, the presentations typically consist of live choral performance of several musical selections and short talk-spots to tell the biographical stories of the renowned American composers behind the music. Men from the chorus are also assigned the task of sharing experiences from their own personal life stories in order to make real and concrete the many issues raised in the biographies of the composers. These brief testimonials are meant to bring the potentially detached and disconnected stories of the composers into a vivid and personal context related to the particular Chorus member sharing the story.
This study summarizes an adapted and innovative presentation to elementary pre-service teachers. Moving the presentation to the university site, and targeting pre-service teachers, opened the possibility of GMCLA potentially bringing this presentation beyond the high school setting. This study summarizes the experience of 49 elementary pre-service teachers at a large, comprehensive, public university in southern California. The study used open-ended qualitative questions from pre- and post-assessment surveys, as well as lesson plans created for K-5 students.

**Literature Review**

*Teachers and Sexuality*

Teachers are conflicted when attempting to determine how best to present and frame gay and lesbian issues in the classroom, or whether to present them at all (Kempner, 2003; Lipkin 1999, 2004; Sears, 1999). There is little agreement as to how best to approach the issue of sexuality in the schools. Foulks (1999), however, presents the three most common perspectives of teachers as being the biological approach, the religious approach, and the societal/lifestyle approach.

The first notion is framing gay and lesbian issues in a biological approach. Teachers who support this approach and want to confront gay and lesbian issues at school feel that accurate information and clarification of misunderstandings in an objective framework is necessary for instruction. Teachers who support this approach, and feel that schools should not confront these issues, argue that these topics are best addressed at home and should be the responsibility of the family (Foulks).

Foulks (1999) also discusses proponents of the second paradigm, the religious approach. Teachers who support this approach feel that gay and lesbian issues at school should be
Pre-service teachers presented in a framework of broadening awareness to different beliefs and lifestyles with an emphasis on respect and acceptance. Religious approach proponents who do not want to instruct on these issues feel that often homosexuality can run counter to prevailing religious beliefs, is morally wrong, and is an inappropriate subject for the schools.

The third framework is the societal/lifestyle approach. Proponents of this ideology believe that since these issues are being addressed in the larger society through the media, the law, and general culture, then they cannot afford to be ignored in the schools. Proponents believe that these issues should be presented in a framework of respect, with tactics for disagreement of belief systems, and creating an atmosphere of safety for discussion. Proponents for this approach who do not want these issues addressed in school feel that children, especially elementary children, should maintain their innocence and not be exposed to sexual issues, and that the responsibility for discussion falls to the family (Foulks).

It would follow that whether a teacher is gay or straight would certainly influence which of these approaches might be adopted. The sexual orientation of a teacher also certainly would seem to impact how a teacher might want to implement these approaches, either to discuss or not discuss these issues in school. Unfortunately, studies of gay teachers are difficult to conduct, as there is still such social stigma to being an openly gay or lesbian teacher in school (Harbeck, 1992; Jennings, 2005; Kissen, 1996). Therefore it is difficult to know how the sexuality of a teacher influences which of these approaches might best impact the school environment. There have been studies, however, on teachers and how their sexuality generally influences the educational environment both negatively (Jennings, 1994) and positively (Jennings, 1994, 2005; Sears, 1992).
There is also the difficulty of a teacher’s gender. Haywood (1996) points out that there can be perceived sexuality and age related hierarchies that reorient themselves depending on the gender of both student and teacher. For instance, young boys often sexualize a female teacher through the use of overt or covert language. In addition, there is sometimes an interrelational dynamic of sexual disciplining between students and teachers when, for instance, male teachers, through flirting, can control female students in the class. In addition, the issue of curricular materials addressing sexuality, for instance, often depict minority sexualities negatively or not at all (Herr, 1997; Whatley, 1992; Whitlock & DiLapi, 1983).

**Pre-Service Teachers**

There is scant evidence about what pre-service teachers believe about sexual orientation prior to becoming teachers. Jennings and Sherwin (2008) found that only 55.6% of teacher preparation program even address issues of sexual orientation, and even then the issue is embedded in foundations courses and only somewhat couched in multicultural education. Elsbree and Wong (2007) did find teacher preparation programs that address sexual orientation by using the play “The Laramie Project” as a pedagogical tool to purposefully disrupt heteronormative and homophobic constructs. Using the dramatic arts allowed for these pre-service teachers to change their thinking on the need to address issues of sexual orientation and homophobia in the schools. Petrovic and Rosiek (2003) investigated Christian pre-service teachers and how they negotiate and explore their heteronormative suppositions and how that might affect their teaching. What is known about pre-service teachers is that very little is being done to consciously address sexual orientation as a systemic demographic variable for new teachers to consider as they begin their teaching careers.
Methods

This study summarizes the experience of 49 elementary pre-service teachers at a large, comprehensive, public university in southern California. The study used open-ended qualitative questions from pre- and post-assessment surveys, as well as lesson plans created by those pre-service teachers for K-5 students.

The study used two sections of a Social Studies and Performing Arts Methodology course in a post baccalaureate teacher preparation program for Elementary Education (candidates are studying to get their preliminary teaching credential to teach in the elementary schools). This course seemed in perfect alignment to the AMP curriculum, as the course has a stated purpose to help pre-service teachers better understand how to integrate the performing arts into the Social Studies curriculum. Between the two course sections, there were 49 pre-service teachers enrolled: 43 female, 6 male, with ages ranging from 21 to 50, with the majority of candidates (39) under the age of 26. The candidates were diverse ethnically, with 57% White, 31% Latino/a, 6% Asian, and 6% bi-racial.

A pre-assessment survey was administered to both sections. The pre-assessment survey asked questions of these pre-service teachers that discussed the value of social justice oriented curriculum generally, to including issues of race, class, gender, and sexual orientation into the curriculum, in addition to any specific knowledge they had of Billy Strayhorn, jazz music, and the Harlem Renaissance. This AMP curriculum was presented to both sections of the course. 12 singing members of GMCLA, the Artistic Director, and Assistant Director came to two different class sessions of each course; the class sessions were two weeks apart. GMCLA presented an adapted version of the Billy Strayhorn curriculum, which focuses on issues of race, class, and sexual orientation as the driving demographic features in Strayhorn’s life. Each presentation was
Pre-service teachers

one and a half hours long, which included biographical history of Billy Strayhorn, live singing of Strayhorn’s music, and personal testimony from the singing members that aligned with general themes of Strayhorn’s life (growing up poor, being a minority in the larger sociocultural world, and homophobia in various facets of life: the military, marriage, and the workplace.)

Immediately after the second presentation candidates were then given a post-assessment survey with the same questions from the pre-survey regarding the value of the content (social justice oriented curriculum generally, as well as including issues of race, class, gender, and sexual orientation into the curriculum specifically; in addition to any specific knowledge they gained about Billy Strayhorn, jazz music, and the Harlem Renaissance). As an adapted midterm, candidates were then asked to create lesson plans that would address any of the primary issues from Strayhorn’s life (race, class, sexuality; as well as gender and the use of the arts as a vehicle for social change), aligned to Social Studies content standards, in developmentally appropriate ways for the K-5 classroom. As the opportunity to have GMCLA present this curriculum came after the semester had begun, and a standard midterm was already listed in the syllabus, candidates had the choice of either taking the already prepared standard midterm (multiple choice, short answer, etc) or completing the adapted lesson plans. A rubric for the lesson plan was distributed along with already chosen, pre-selected Social Studies content standards (Attachment A) to which the candidates were to align their lesson plans.

The major limitation to the study is that the author was in various roles: professor of record for the two courses, singing member of GMCLA, and author of the study. Candidates could have been biased in their responses knowing that the study was being conducted by their professor, who happened to also be a member of GMCLA (and presenter of the AMP curriculum). As a participant observer and researcher, action research and qualitative analysis
Pre-service teachers certainly allows for these dual roles (Mason, 1996; Polkinghorne, 1988; Schwandt, 2001), and I believe I successfully navigated this duality and presented no untoward pressure on the candidates to agree (or disagree) with the presentation’s focus and content. As will be discussed further, the results of the surveys and lesson plans certainly demonstrate that the candidates appeared to honestly engage with the presentation and their response to it.

**Discussion and Analysis**

**Pre-assessment**

The initial survey, completed a week prior to GMCLA’s arrival, yielded interesting results from the candidates. There was a general tension between candidates who perceived some value in educating for social justice (and race, class, and homophobia/sexuality specifically) and those who believed that content not specifically addressed by standards and ‘the curriculum’ be left to the purview of the home. There was a general sense (36 candidates) that addressing these issues for the K-5 classroom would be difficult, at best, and perhaps even unnecessary, until students really “understand how the world works. Kids just don’t get it.” These more negative comments also included: “Is this in the curriculum?”, “Aren’t the parents going to cover this stuff?” and the more ubiquitous, “This sounds hard.”

There were positive, more enthusiastic comments (6) like, “As new teachers we should be open to many new ideas.” These more positive candidates (all female and all students of color) shared comments that new teachers should challenge themselves to step “outside the box and off the page” and bring “real lives in to [sic] the classroom.” There were also more neutral comments (7) like, “I don’t really know what to say about some of these things.” Generally, candidates were at odds with how to appropriately present the challenging social issues of race, class, and sexuality to K-5 students.
Post-assessment

The AMP presentation seemed to have profound effects on the pre-service teachers in terms of a raised consciousness and a call to social action and their willingness to approach these issues in their future classrooms. Generally, comments were coded into three major categories: Use of the Arts, Racism and Classism, and Misogyny and Homophobia. A summative look at these three major categories indicated that the pre-service teacher candidates experienced a consciousness raising and were willing, if not eager, to introduce these challenging social issues into their future classrooms.

Use of the Arts. There were a series of comments that simply addressed using and experiencing the arts as a pedagogical tool (26). Evaluative comments like, “You guys are really great….the vocals are really good!” and “I found the music to be awesome and I loved the performance!” are representative of the more pedestrian experience of simply listening to the music from the presentation. Other comments addressed the actual content of the music with comments like, “I learned a lot about the history of the music and Billy Strayhorn.” Other candidates experienced the presentation as a motivator for their future practice. “I can see I’d need to bring in some music and stuff to get them [the Ss] engaged.” And finally, some responses indicated an initial realization that the arts can be used in the classroom for an elevated purpose. “Easy to see how the Arts are used for social action.” These comments indicate that pre-service teachers had an immediate reaction to the use of music as a teaching tool in the delivery of the presentation.

Racism and Classism. Roughly the same number of candidates (24) made concrete comments about the presentation addressing the issues of race and class. In these comments there was a general sense that this kind of presentation was just “another tool in the arsenal” at
Pre-service teachers

breaking down stereotypes regarding race. One male candidate said, “I feel like we do a good job addressing race in the schools.” This was echoed by several others who felt that there were “posters, Culture Days, and books that help” teachers bring up the issue of race with their students. One candidate said, “I knew that music! It’s great now that I know an African American wrote it! Another great role model for kids.” The issue of class, socioeconomic status, and growing up poor resonated with candidates as well. “It just goes to show that we don’t have enough role models from poor backgrounds who grow up to do great things.” These and comments like them indicate that pre-service teachers see the value of addressing race and class in the classroom.

_Misogyny and Homophobia._ It is the area of sexual orientation and homophobia that seemed to resonate most with the pre-service teachers. 45 of the 49 candidates made some kind of comment regarding sexuality, homophobia, and the tacit presence of how those constructs contributed to a misogynistic culture. There were straightforward, descriptive comments like, “I’d never been in a room with that many gay guys before” and “Really great to see gay guys who can sing and also look so masculine at the same time.”¹ This idea of masculinity and the male construct was also echoed in comments like, “I learned that not all gay men are flamboyant” and “You guys just seem so normal.” These comments require further deconstruction beyond the scope of this study; perceptions of masculinity and femininity, and how teachers perceive those constructs in the classroom must be evaluated further, but it is clear that pre-service teachers are coming to be trained for the profession with constructed notions of gender and sexuality.

The pre-service teachers also reflected about the personal nature of the presentation and

¹ It is comments like this that made me realize that I must add individual interviews or focus group interviews to the next study because there is an obvious need to deconstruct the meaning behind terms like ‘masculine’ used in this context.
Pre-service teachers

how much they grew personally from listening to the personal testimony of the singing members. Many candidates made comments like, “I just never really thought about how hard it was for gay people” and “Your personal stories will haunt me. Honestly, I learned to be a little more accepting and less judgmental.” There was one nonevaluative comment from a male teacher candidate who said, “I guess it takes a lot of courage to be openly gay and not ashamed.” The comment neither affirms the openly gay singers, nor does it malign them; rather there is the presence of a number of possibilities that, again, would require further study in relation to the value of a presentation like this. For instance, is this the comment of a teacher perhaps biased against homosexuality, but acknowledging the courage of the presenters in their unapologetic presence as part of an organization with ‘gay’ in its title? Is it the comment of a closeted (or even as yet unacknowledged) gay youth who sees a presentation like this and realizes the courage he might need to live openly and honestly as a gay man? Is it the comment of a straight ally merely affirming that in the larger sociocultural world, it still does require ‘courage’ to live openly and out as a gay man? Again, this answer is beyond the scope of this study, but does require further investigation and research.

What is answered, however, is the immediate reaction the pre-service teachers had in relation to feeling the need to address sexual orientation and homophobia in the classroom. An overwhelming majority (34 candidates) made comments that said teachers needed to be more proactive in their treatment and delivery of these issues. One said, “I learned more about discrimination and how severe it is. It seems like an easy leap to tie these issues to bigger issues of tolerance and diversity.” Another said, “This presentation gave me a new perspective about this issue about gay people which I think is a cool feeling. I can see this is necessary to tell kids about.” And the more concrete, “Teachers can help eliminate all the negative
Pre-service teachers...about gay people.”

There was also a distinct minority (2) of teacher candidates who felt the presentation was inappropriate and unnecessary. One said she was, “Put off and offended” and “This presentation is wrong.” Another candidate seemed to struggle with her personal beliefs and the value of the presentation by saying, “I have never hated gays and I don’t even want anything bad to happen to gays. I know that isn’t right, but I simply don’t want to believe in the same ways that you believe.” There were also a few candidates (3) who were coded as neutral and who commented on the presentation with value-free remarks like finding the presentation “Interesting” and another who said she did not feel “any different [sic] than before I knew about your program.” And echoing some of the initial comments in the pre-survey, one teacher candidate said, “I don’t see how it’s connected to my job” referencing the fact that there are no content standards that specifically address sexual orientation in the K-5 curriculum.

Raised consciousness. 44 pre-service teachers, however, used positive words throughout their post-assessment surveys. Words like: proud, good, amazing, impressed, cool, happy, welcome, moved, admire, open-minded, entertaining, and enlightened were used throughout their responses. These positive comments fell, generally, into three major categories: Use of the Arts, Racism and Classism, and Misogyny and Homophobia. These three areas contribute to a general raised consciousness of the pre-service teachers. “I feel like I could intelligently educate others about acceptance of gays.” The teacher candidates felt compelled to treat their teaching like social action. “I feel as teachers we must act to end all these kinds of stereotypes” and “This can be used to crush all stereotypes and eliminate all of the negative things we think about gay people” were representative of the candidates who indicated a proactive, anticipatory commitment to addressing these issues in their teaching. A comment that seemed to capture this
Pre-service teachers sense of a raised consciousness is, “This presentation was exciting and challenging. I see how I have the opportunity to push the envelope with our kids in appropriate ways.”

Lesson Plans. In order to measure these ‘appropriate ways’ and the candidates’ understanding of how these issues could manifest in their teaching, I assigned the midterm, asking the teacher candidates to create a lesson plan addressing one of the issues captured in the presentation of Billy Strayhorn’s biography: race, class, or sexuality. The submissions yielded interesting results. Seven of the 49 candidates chose to complete the standard midterm (multiple choice, etc) and 42 chose to complete the amended midterm (attachment A) and submit a lesson plan addressing one of the issues from the presentation. Their submitted lesson plans addressed the three categories of comments found in the pre-service teachers’ post-assessment surveys: Use of the Arts, Racism and Classism, Misogyny and Homophobia. Table 1 indicates some representative examples of the general theme(s) of those lesson plans and the objectives for the K-5 students quoted from the lesson plans.

<table>

<tr>
<td>Use of the Arts</td>
<td>4&lt;sup&gt;th&lt;/sup&gt;</td>
<td>After viewing and listening to a power point presentation on the photographic art of Ansel Adams, his environmental work for the Sierra Club and national Parks, and specifically his photo book on Manzanar, the learner will complete a photo essay about a social injustice and a one paragraph summary explaining the injustice they photographed, to demonstrate the power of visual art as a mouth piece for commentary on social injustice.</td>
</tr>
<tr>
<td>Racism</td>
<td>2&lt;sup&gt;nd&lt;/sup&gt;</td>
<td>Following a lesson on Marian Anderson, the learner will write a reflection of at least five sentences about how racism affected Marian’s life, how it led to her singing at the Lincoln memorial, and why that concert was so important to her life and to the lives of others.</td>
</tr>
<tr>
<td>Misogyny/Racism</td>
<td>5&lt;sup&gt;th&lt;/sup&gt;</td>
<td>After a lesson on which groups of people were not allowed representation or the right to vote at the time of the writing of the Constitution, the learner will answer a question about how our country would be different if one of the groups had a voice in government and answer two additional “Below the Surface” questions in their journals.</td>
</tr>
</tbody>
</table>

It is clear from these examples that the pre-service teachers actively took many of the
themes from the Strayhorn biography, as well as the stories from the personal testimonies of the singers and created ways to address those themes in the K-5 classroom. There is higher order thinking, active learning, and an attempt to address issues of social justice in each of these representative examples. Pre-service teachers actively sought to integrate these challenging social themes in developmentally appropriate ways into the K-5 classroom. Table 2 indicates the ways in which those general themes were present in their submitted lesson plans.

Not one lesson plan addressed the issue of sexual orientation or homophobia. The presentation was given by the Gay Men’s Chorus of Los Angeles. It was about a gay composer who was also Black and poor. After this presentation, 45 out of 49 candidates commented on sexual orientation in the content of the presentation in some way. 28 said, in some way or other, they had gained ‘new perspectives’ on how to address the gay stereotype in the classroom. Yet not one candidate chose to address the issue in a lesson plan. There were a majority of candidates who made some version of the comment, “This presentation was valuable because it opens your mind and allows you to see things from someone else’s perspective.” The submitted lesson plans indicate that there is a congruence between this perceived value in presenting the perspective of race, class, and gender to elementary students. There is also an obvious dissonance between this perceived value in presenting the perspective of homophobia and/or sexuality to elementary students.
Conclusion

Elementary pre-service teachers believe in the importance of a raised consciousness and instructing their students about sexual orientation and homophobia. But there is a dissonance between this raised consciousness and the ability to move toward implementation of instruction. This study captures why some of this dissonance occurs.

In a class session after the midterms were submitted and graded, I presented initial findings and the outcome of the themes of the midterms to the students. These teachers’ reactions and rationales demonstrate some congruity with the present literature. Pre-service teachers are familiar with issues of race and class and feel that there are resources available to them (Molina & Wittig, 2006; Ortiz & Harwood, 2007; Swartz, 2003). The following comment seems to capture this notion, “I’ve already seen lessons on racial issues and tolerance so it was just easier for me to come up with those ideas.” The issue of identity (Brown & Kysilka, 2002; Castells, 1997) also seemed relevant from the teachers’ comments, like, “I’m a woman so I could talk about that issue easier….And isn’t that a beginning?” Teachers teach from what they know and have experienced (identity), and this comment seems to mirror this notion.

The following two comments indicate another kind of reaction: “Well when I sat down to actually do it I just couldn’t see how I could do it” and “I totally get it. I know I need to teach about it. But this presentation just wasn’t enough to get me comfortable talking about it.” These comments capture much of what is in the present literature about fear, lack of comfort, and not having confidence in the vocabulary to address issues of sexual orientation with elementary students (Bickmore, 1999; Knotts, 2009; Macgillivray, 2004). In the safe environment of the college classroom, after two presentations from the Gay Men’s Chorus, with an openly gay professor facilitating the dialogue, these two students’ comments seem to capture this
phenomenon: they could only say the word “it” when referring to sexuality. To even say the word ‘gay’ is difficult for some people. This lack of experience with even the word, let alone the sociocultural constructs it represents, captures a little of the difficulty in delivering instruction about sexual orientation to elementary students; or at all. It is clear that pre-service teachers are coming to be trained with constructed views of gender and sexuality (Foulks, 1999; Kempner 2003; Knotts, 2009; Quinlivan, 2006; Rienzo, Button, & Wald, 1996) and comments captured in this study (“You just seem so normal,” and “Really great to see gay guys who can sing and also look so masculine at the same time.”) seem to affirm this. And although presentations like AMP raised the consciousness regarding the need to implement instruction, when it came to writing lesson plans and intentionally planning to do this, not one pre-service teacher included issues of sexual orientation or homophobia in their lesson plans.

This study affirms Elsbree and Wong’s (2007) findings that it is possible to use the arts as a pedagogical tool to disrupt heteronormative and homophobic constructs in teacher preparation programs. Using the AMP curriculum disrupted the pre-service teachers’ constructs in theory, but did not move them to implement their new ways of thinking into their practice. Further work must be done on how believing in the need to instruct on issues of sexual orientation and homophobia is dissonant with implementation of content/curriculum regarding these issues.

ATTACHMENT A

MIDTERM (60 points): Adapt the content of the Billy Strayhorn presentation to make it grade-level appropriate for the K-5 curriculum by:

3 pts.  1) Using one of the following standards as a beginning point.

3 pts.  2) Write a criterion-based objective for a lesson.

9 pts.  3) Write three activities that support the objective.

5 pts.  4) Write a minimum of three double-spaced pages describing how your lesson idea is:

5 pts. a. Grade-level appropriate;

15 pts. b. Addresses at least one issue: racism, homophobia, and/or classism – the three main facets presented in the biography of Billy Strayhorn’s life;

10 pts. c. Incorporates the arts;

10 pts. d. Aligns to the standard you chose.

K.1.2- Students understand that being a good citizen involves acting in certain ways by learning examples of honesty, courage, determination, individual responsibility, and patriotism in American and world history from stories and folklore.

1.4.3 - Students compare and contrast everyday life in different times and places around the world and recognize that some aspects of people, places, and things change over time while others stay the same by recognizing similarities and differences of earlier generations in such areas as work (inside and outside the home), dress, manners, stories, games, and festivals, drawing from biographies, oral histories, and folklore.

2.5 Students understand the importance of individual action and character and explain how heroes from long ago and the recent past have made a difference in others' lives (e.g., from biographies of Abraham Lincoln, Louis Pasteur, Sitting Bull, George Washington Carver, Marie Curie, Albert Einstein, Golda Meir, Jackie Robinson, Sally Ride).

3.4.6 - Students understand the role of rules and laws in our daily lives and the basic structure of the U.S. government by describing the lives of American heroes who took risks to secure our freedoms (e.g., Anne Hutchinson, Benjamin Franklin, Thomas Jefferson, Abraham Lincoln, Frederick Douglass, Harriet Tubman, Martin Luther King, Jr.).

4.4.9 - Students explain how California became an agricultural and industrial power, tracing the transformation of the California economy and its political and cultural development since the 1850s by analyzing the impact of twentieth-century Californians on the nation's artistic and cultural development, including the rise of the entertainment industry (e.g., Louis B. Meyer, Walt Disney, John Steinbeck, Ansel Adams, Dorothea Lange, John Wayne).

5.7.5 - Students describe the people and events associated with the development of the U.S. Constitution and analyze the Constitution's significance as the foundation of the American republic by discussing the meaning of the American creed that calls on citizens to safeguard the liberty of individual Americans within a unified nation, to respect the rule of law, and to preserve the Constitution.

The State of Field Experience Management in the Five-Year Science Teacher Education Program in Thailand

Abstract

This research explored the current situation in managing the field experience of a five-year science teacher education program in one university in Thailand. A number of methods were used to assess field experience situation; a questionnaire about pre-service science teachers’ perceptions of the field experience management; participant observation of seminars; interviews; and analysis of supervisory comments on student teachers’ teaching performance. The findings indicate that the pre-service science teachers have a high level of satisfaction with the practice quantity and their own teaching characteristics. However, during their student teaching, they could not define clear and expected learning outcomes in lesson planning. They did not probe students’ prior knowledge, rarely asked questions, could not manage a classroom, and held misconceptions in science concepts. Despite the struggles, pre-service did improve in their ability to develop lesson planning techniques, teaching strategies, students’ learning, classroom management skills, and incorporate instructional materials.

Keywords: field experience, pre-service science teacher, cooperating teacher, supervisor, teacher education
C. Faikhama et al.

Introduction

The field experience is a key component of many teacher preparation programs. According to recent education reforms in many countries, there has been a number of universities have been re-examining, refining and implementing teacher education programs that are aligned with curricular, pedagogical and organizational reforms. These teacher education institutions have an increased focus on the development of field experience courses (Russell, 2005). Since the field experience is considered as a bridge between the academic coursework and the realities of classroom teaching, pre-service teachers can learn how to teach a particular content topic to specific students, in a specific context (Beeth & Adadan, 2006; Kagan, 1992). Based on a social-constructivist perspective, the field experience can offer pre-service teachers opportunities to construct or reconstruct their own knowledge and beliefs through support and guidance from knowledgeable persons (Watson, 2006), collaboratively working with other people such as cooperating teachers, supervisors, parents, other pre-service teachers and others (Bell & Gilbert, 1994; Watson, 2006), and reflecting on their own and other’s ideas (Abell & Bryan, 1997). Pre-service teachers also have the opportunity to work with students which serves as the preparatory activity before they assume the full responsibilities of an in-service teacher. In a real school atmosphere, pre-service teachers can negotiate classroom management, school policies, organization, lesson planning, and their own positions within the social structure of the schools.

Like other countries, teacher education in Thailand is currently undergoing a period of learning reform. The primary goal of the Thai educational reforms is to help teachers become more aware of ways to improve student learning, and how to modify teaching to meet the new learning standards. Since Thai science teachers are more
familiar with the traditional national curriculum, many struggle to develop and implement a school-based science curriculum. Fry (2002) argues that some teachers do not understand that activity-based learning is only one of many methods that can be used to promote active and student-centred learning. A main reason of this problem is that the curriculum and teaching provided in the teacher education institutions is not attuned to actual practice and learning process reforms in school (Amornvivat, 2002).

Adding a full-year field experience is the highlight of the new five-year teacher education program in Thailand. Prior to 2004, teacher education programs were four-years. The five-year program is considered a new hope for improving the quality of Thai teachers and consequently developing student learning. It intends pre-service teachers to develop their pedagogical content knowledge (Shulman, 1987) and apply this kind of knowledge in real situations (Institute of Promotion of Science & Technology Teaching [IPST], 2002). Pre-service teachers are also expected to implement constructivist-based teaching strategies as suggested by the National Education Act (Office of the National Education Commission, 1999). The new five-year program requires pre-service teachers to study coursework for four years. They have one early field experience in year four and a yearlong field experience in year five. The extended time in the field experience from one semester in four-year teacher education program to two semesters, or one academic year, in five-year teacher education program is expected to help pre-service teachers gain a better understanding of the teachers’ role, curriculum, classroom action research and students' growth and learning over the course of an entire year.

While research on the role of the field experience in teacher preparation has increased in recent years, it is still limited to studies which examined how field experience course in five year teacher education program has been implemented,
whether this program is successful or not. On way that we can learn how to improve teacher preparation program is to study how pre-service teachers are educated. So, a challenging aspect of this study was to begin filling the gap in the literature of science teacher preparation in Thailand by focusing on investigating the implementation of the field experience, perceptions of pre-service science teachers’ on their field experience courses, and the students' learning and struggles during their student teaching field experiences. The intent is that this in-depth information would be used to further refine the science teacher education program in accordance with the national learning reform.

**Research questions**

1. How was the field experience implemented in the science teacher education program in one University?

2. What are the perceptions of pre-service science teachers regarding the quantity of their own practice load and the desired characteristics of teachers that have been promoted?

3. What do the fifth year pre-service science teachers learn and struggle with during the field experience?

**Theoretical framework**

The research presented in this work was set within social constructivist views of teaching and learning. Constructivism provides a useful theoretical framework in science teacher education for the understanding and development of the learning of science pre-service science teachers. It is regarded as a driving force for science educators to move their attention from teachers’ teaching behaviour to teachers’
knowledge; how they learn, how they think, and how they construct their knowledge (Shulman, 1987). A significant implication of constructivist-based views of learning (Tobin, Tippins & Gallard, 1994) for science teacher education is the notion of a pre-service science teacher as a ‘learner’. A pre-service science teacher is a person who actively constructs their views of teaching and learning science, and brings to the science teacher education program prior knowledge and beliefs (Bell & Gilbert, 1994). From a social-constructivist perspective, within a particular social context, pre-service teachers construct or reconstruct their own knowledge and beliefs through support and guidance from knowledgeable persons (Watson, 2006), collaboratively working with other people (Bell & Gilbert, 1994), and reflecting on their own and other’s ideas (Abell & Bryan, 1997; Capobianco, 2007). As a result, in most science teacher education programs, pre-service teachers have been challenged to learn about teaching science from field experiences (Northfield, 1998), rather than learning about teaching and learning theories solely from their university-based classes. Field experiences activities are regarded as “social laboratories” which provide a variety of activities for pre-service teachers to establish their own knowledge in a specific context.

Collaboration and interaction with other people can help pre-service teachers to construct their own knowledge for teaching. Lowery (2002) suggests that pre-service teachers need to collaborate with children, cooperating teachers, supervisors, university instructors, parents, other pre-service teachers and others. These persons can support them in developing confidence about their teaching. A supportive atmosphere helps pre-service teachers to comfortably reflect on and observe the strengths and weaknesses of their own teaching (Bell & Gilbert, 1994).
Pre-service teachers who collaborate with in-service teachers or facilitators can construct their own meaning of how to teach. Zuckerman (1999) found that listening to, and discussion, with in-service teachers or facilitators is helpful for pre-service teachers. Discussion with in-service teachers motivates pre-service teachers to identify the relevant details for applying their practical knowledge in other situations. In-service teachers act as cooperating teachers who can strongly influence beginning teachers in terms of what and how they teach.

In a collaborative atmosphere of field experience, pre-service teachers have opportunities to become aware of their current knowledge and beliefs and engage in experiences which reconstruct their views (Loucks-Horsley and Matsumoto, 1999). Because knowledge and beliefs about science teaching and learning can be made explicit through reflection, pre-service teachers should be provided with opportunities to reflect on their own prior knowledge and beliefs. “Reflection is thinking and feeling: asking such questions as ‘What am I doing?’ and ‘Why am I doing it’; selecting procedures; and making decisions about what to do next” (Baird and White, 1996, p. 191). Abell and Bryan (1997) argue that through reflection, pre-service teachers can clarify and confront their ideas, beliefs, and values about teaching and learning science. They will be aware of and in control of what they are doing, and then possibly change their personal beliefs. The reflection can occur by means of dialogues and conversation with peers and colleagues, cooperating teachers, supervisors, university instructors, parents, other pre-service teachers, and researchers (Abell and Bryan, 1997; Collier, 1999). Manouchehri (2002) reports that peer discourse, peer observations, and peer feedback during field-based experience, has the potential to facilitate pre-service teacher development. Peer discussion can help the
C. Faikhamta et al.

pre-service teachers to confront each other’s thinking and force one another to defend their personal ideas, and then extend their own ideas to a theoretical level.

**Research methodology**

**Research Design**

This was a mixed-method research design study conducted in a five-year science teacher education program in a university in Bangkok, Thailand. In this program, field experiences were divided into two main parts: the first part consisted of three courses in observation and participation, and the second part consisted of two courses in student teaching. So, the design and questions of the research focused on the two main parts. In the first part, the researcher sought to find out the structure and implementation of participation and observation courses, and the perceptions of the pre-service science teachers regarding the quantity of their own practice and the characteristics of teachers; and their satisfactions towards the management of participation and observation courses. The second phase was designed to investigate pre-service science teachers’ learning and struggles about teaching science during their two courses of student teaching field experiences. This was a two-year study collecting both quantitative and qualitative data. Multiple data sources were used and triangulated to enhance validity.

**Data collection and analysis**

**The first part**

In this part, Research Questions (RQ) 1 and 2 were investigated. To answer the RQ1 "How is the field experience implemented for the preparation of science teachers in this program?", a variety of data were collected. The researchers made observations during the field experience courses and interviewed field experience coordinators.
They reviewed curriculum documents, field experience course manuals, pre-service teachers’ handbooks, and course syllabi. To analyze data, all data were combined in order to enhance validity (Patton, 2002). The analysis of the collected data started with curriculum documents, field experience course manuals and codes were developed. These codes were compared with data from field notes of observations, the transcripts of coordinator’s interviews, and course syllabi.

To determine RQ2, "What are the perceptions of pre-service science teachers regarding the quantity of their own practice and the desired characteristics of teachers that take place in field experience courses?", questionnaires were used. Since there were three observation and participation field experience courses (Field Ex1, Field Ex2, and Field Ex3), questionnaires were specifically developed for each. These questionnaires encompassed four sections: 1) personal data of pre-service science teachers, 2) their perceptions regarding the quantity of their own practice, and, 3) their perceptions regarding the characteristics of teachers. Students chose one of 5 levels of agreement on a Likert-style rating scale ranging from “strongly agree” to “strongly disagree” to answer the questions. For a fourth section, students responded to open-ended questions at the end of the questionnaire. The questions asked pre-service teachers to show their opinions about the implementation of the field experience. The questionnaires had been developed by the researcher/authors of this article and then validated by three panels of experts. The validity and reliability were enhanced by pilot testing with pre-service teachers who were not the subjects in this study. The Chronbach alpha coefficient of reliability of the questionnaires for Field Ex1, Field Ex2, and Field Ex3 were 0.96, 0.87 and 0.91, respectively. To collect the data, the questionnaires were administered to pre-service science teachers enrolled field experience courses as follows.
Second year pre-service science teachers, who enrolled Field Ex1 in the first semester of 2007 academic year, were asked to complete a questionnaire. Thirty-nine of forty pre-service science teachers returned a completed questionnaire.

Third year pre-service science teachers, who enrolled Field Ex2 in the first semester of 2007 academic year, were asked to complete a questionnaire. An overall response rate of 100% (23 pre-service science teachers) was obtained from the survey.

Third year pre-service science teachers, who enrolled Field Ex3 in the first semester of 2008 academic year, were asked to complete a questionnaire. Twenty two of twenty three pre-service science teachers returned a completed questionnaire.

After collecting a questionnaire on each course, semi-structured interviews were conducted to elicit additional information as well as validate responses to questionnaire items. Five pre-service science teachers were interviewed to explore their personal perceptions of the effectiveness of the field experience courses, implementations of the courses, their learning and problems. Interviews averaged forty minutes each. All were audio taped and transcribed for analysis. Questionnaires were statistically analyzed using computer program using frequencies, means, and standard deviations. The additional transcripts of interviews were inductively analyzed using content analysis.

The second part

In this part, RQ 3,"What do the fifth year pre-service science teachers learn and struggle with during a year-long field experience?", was investigated. The participants in this part were 33 fifth year pre-service science teachers enrolled on two student...
teaching field experience courses in the first and second semester during 2008. In order to understand pre-service science teachers’ struggles with and their learning about teaching science, multi-method evaluations were used throughout the research process. The methods included reviewing the students' written reflections in the logbooks, observation of seminar sessions and focus group interviews. Logbooks were the main source of data. It was designed to engage pre-service teachers in reflecting on and discussing their knowledge, learning and problems relative to the field experience.

To analyze data, data from written reflections in logbooks, field notes and interview transcripts were combined in order to enhance validity (Patton, 2002). In the first step, we began with a particular incident from pre-service science teachers’ written reflection in logbooks and transcripts of seminar discussion. Then in identified indicators for the categories of “struggles” and “learning” and coded them on documents. Sub-categories such as learning about teaching strategies, probing techniques were identified and coded thereafter. These codes were compared for their consistencies and differences. The consistencies between codes revealed tentative categories. In the second step, incidents were compared to initial versions of categories. New incidents were assessed to determine if they exhibited the category properties. In the last step, categories and their properties are reduced, refined, and finally linked together to formulate themes to interpret the data.
Research findings

First part

The implementation of field experience

Field experiences in the five-year teacher education program are a series of courses which consists two main components; observation and participation courses and student teaching courses. The observation and participation courses are a series of one credit field experiences designed to tie learning in teacher education courses to real classrooms, schools, and communities. These courses include Field Ex1 (observation and participation in schools, Field Ex2 (observation and participation in classroom), and Field Ex3 (observation and participation in teaching). The administration of the participation and observation courses was cooperative between Faculty of Education and University Laboratory School. However, overall guidance is the responsibility of University Laboratory School. Management is headed by the vice principal, then the field experience coordinator and followed by school teachers. The field experience coordinator has a meeting with the school teachers who assume roles of mentor teachers and lecturers. Course syllabi and worksheets are available for all participants in the field experience (pre-service teachers, mentor teachers and lecturers). Pre-service teachers were required to participate in the course for 15 weeks. In the first period which was the course orientation, course syllabus was distributed to pre-service teachers. The Field experience coordinator introduced lecturers and mentor teachers to pre-service teachers and explained assignments and field experience schedules to the pre-service teachers. In Weeks 2 – 15, pre-service teachers were divided into groups, each group consisted of 3-4 pre-service teachers, and then assigned periods of block practice. At the end of the course, pre-service science
teachers came to the seminar room to discuss their learning, problems and comments for the course.

The main objectives of Field Ex 1 are providing the second year pre-service teachers opportunities to learn and practice about school administration, school management, academic affairs, community relations, student affairs, and guidance. After course orientation in the first week, the school administrator team lectured pre-service teachers about the school management and administration. Then in week 3-15, pre-service teachers were assigned to observe and practice jobs in 11 school departments such as assessment and evaluation department and school library, under the guidance from mentor teachers in each department.

The purpose of Field Ex2 is to provide the third year pre-service teachers opportunities to examine student activities, sport activities for students and teacher jobs. Pre-service teachers were expected to learn classroom management, solving problems in some cases of students, teachers’ role and jobs. They were assigned to learn these by observing homeroom teachers in both primary and secondary levels.

The objective of Field Ex3 is to provide the fourth year pre-service teachers opportunities to understand and practice about organizing learning activities, students’ behaviour, classroom management, and development of learning through the classroom action research process. Pre-service teachers were assigned to learn these jobs in 6 stages; curriculum management and administration, student learning and extra-curricular activities, classroom action research, teaching science in the primary level, and teaching science in the secondary level. During field experience, they spent 2 hour - 5 weeks of observing and teaching students in each level.

After completing three observation and participation courses; Field Ex1, Field Ex2 and Field Ex3 courses, pre-service teachers move to the student teaching field
C. Faikhama et al. experience (Field Ex4 and Field Ex5) in their fifth year. The focus for student teaching is planning instruction, teaching lessons, managing the classroom, developing instructional media, assessing student progress, and conducting extracurricular activities and classroom action research. Overall guidance was the responsibility of the Centre for Field Experience. Management was run by the deputy dean of academic affairs, head of the centre, school principals, school cooperating teachers, and university supervisors. Duties and responsibilities for field experiences were provided to local primary and secondary schools. Arrangements for student teaching placements were made by Centre for Field Experience, specifically head of the centre. Cooperating teachers and supervisors took their roles to provide front line advice, support, and feedback to the student teachers. Besides, cooperating teachers were expected to assist student teachers in developing classroom management skills, gaining familiarity with teaching resources, lesson planning, and reflective practice. They were tasked with providing guidance and modelling professional behaviours through the development of supportive relationships. University supervisors acted as a bridge between the school and university and between student teachers and cooperating teachers. A handbook was available for all participants in the field experience (cooperating teachers, student teachers, supervisors, and schools). Supervision was standardized with a handbook and reporting form.

In the first and second week, pre-service teachers observed the cooperating teachers’ teaching. Observation and discussion with cooperating teachers were intended pre-service teachers to be familiar with classroom and school activities. Pre-service teachers were assigned periods of block teaching practice and then conducted their teaching, planed units and lessons, and became an integral part of the day-to-day events and extra-curricular activities of the school. Pre-service science teachers spent
an entire year (two semesters of 18 weeks) in a local elementary or secondary school. In the first semester, the pre-service teachers were expected to teach science 8-12 hours per week and conduct science extracurricular activities. Then in the second semester, they were required to teach science for 8-12 hours per week and do classroom action research. The student teaching, science extracurricular activities and classroom action research were supervised by university supervisors and school cooperating teachers at least four times a semester.

*The perceptions of pre-service science teachers regarding the quantity of their own practice and the desired characteristics of teachers*

This part presents the findings obtained from the questionnaire administered to pre-service teachers to determine their perceptions regarding the quantity of their own practice and the characteristics of teachers and satisfaction towards the management of observation and participation field experience courses. Pre-service science teachers found themselves practice in assigned jobs at high levels in all three field experience courses. Specifically, in the Field Ex1, they perceived at high level in practicing and learning about school management and structures, library jobs, guidance service, research in special needs education, public relations, welfare, and production of instructional materials. In the Field Ex2, pre-service science teachers’ perception on their practice quantity were found at high level in classroom management, producing worksheets, taking care of students, taking care of classroom cleanliness, making presentation board, learning reinforcement. In the Field Ex3, pre-service science teachers perceived at high level in observing school teachers’ teaching and classroom environment, planning science lessons, planning unit plans, developing instructional materials, designing assignments, classroom management skills, and practicing teaching in real classroom. However, they perceived that they developed tests, and
C. Faikhama et al.

learned assessment and evaluation strategies at medium level and conducted extracurricular activities at low level.

In all three courses, the perceptions of pre-service science teachers regarding the characteristics of teachers were at high level. Pre-service teachers consistently perceived that observation and participation experiences enhanced them to be good teachers. They learned how to control their emotions, about student individual differences, how to behave towards other teachers and students, about working with other people, and the importance of being on time, dressing well, and the codes and ethics of the teacher profession. However, the analysis of the interview and open-ended questions indicated that pre-service science teachers wanted to have more practice in observations and participations course. They argued that the mentor teachers mostly lectured or just observed them instead of giving them opportunities to practice and do their jobs. Additionally, pre-service science teachers had problems in making appointments because they had to study for their coursework in both faculty of education and faculty of science. They did not have time to participate and observe their mentor teachers’ teaching or doing their jobs. They also commented that University Laboratory School as a field placement did not reflect the real situation. They thought that observing and participating activities in a regular public school might help them learn more about teachers’ jobs and teaching and learning in real life situation.

Second part

Struggles with teaching science

Through written reflections in their logbooks, pre-service science teachers were asked to reflect on their problems, struggles and comments both from cooperating teachers
C. Faikhamta et al.

and supervisors about their teaching. Several themes and coded as “struggle” across all pre-service science teachers’ reflective statements were emerged. Pre-service science teachers reported that during their field experience they faced many obstacles in teaching science. Especially at the beginning of their field experience, several pre-service science teachers were concerned with designing and organizing activities when they planned their lessons. It was quite difficult for them to think of how to write expected learning outcomes and how to begin and sequence learning activities. Some reflected that learning outcomes they intended to reach were too general and did not show what science concepts or skills the students were expected to obtain.

In teaching practice, many pre-service science teachers were challenged by the complexity of teaching and student learning. They generally felt that they rarely probed student prior knowledge at the beginning of the lesson. Even though some asked questions at the stage of lesson introduction, those questions did not relate to the science concepts they were going to teach. When they asked student questions, they accepted or rejected student answers and then went to another concept, rather than asking students to give more details. They thought that asking further questions took time, so they seldom paid attention to students’ answers and conceptions. Additionally, some pre-service science teachers reflected that they struggled to ask students content-specific questions. They asked students questions, but most of questions were quite difficult for students to answer.

Classroom management was another problematic issue for the pre-service science teachers. They found it difficult to think about techniques to cope with students’ disruptive behaviour, especially in a diverse group of students in a classroom. They reported that students especially whose academic ability was below average and sat at the back of the classroom did not pay attention to their learning
activities. Those students could not answer or seldom responded to their questions, only those of high performance understood what were taught. The pre-service science teachers discussed the fact that a number of students in each class had also affected their classroom management. Since each classroom had forty to sixty students, it was difficult for them to assign students into a group of four members.

Another concern was the limitation of their conceptual understanding of science. Some pre-service science teachers discussed that science concepts were too complex and difficult for them to teach. They felt that they held misconceptions for many science concepts. This concern inhibited them to choose key concepts and design learning activities. They noted that when planning the lesson, they put many science concepts in one topic, so they could not appropriately sequence science concepts they were going to teach.

Finally, pre-service science teachers’ struggled with time management. Throughout their teaching practice, pre-service science teachers discussed that there were many extra school activities that affected the timetable of their teaching and they could not teach as they planned. They mostly coped with this by omitting some science concepts, and changing the hands-on experiment activities to lectures. With the limitations of time, they explained science concepts by writing on the backboard, instead of preparing hands-on activities for students.

Learning about teaching and learning science

In this section, the teachers’ learning about teaching and learning science during field experience is addressed. Despite the struggles they experienced, the pre-service science teachers also noted “learning”. These learning included more understanding of lesson planning, teaching techniques, student learning, classroom management and using learning materials. Many pre-service science teachers reported that they had
C. Faikhamta et al.

learned how to write a good lesson plan. As they mentioned in logbooks, the correct form of lesson plans should include learning outcomes, concepts, teaching and learning process, learning materials and evaluation. Particularly, some indicated that learning objectives or learning outcomes in the lesson plans should cover cognitive, science process skills, scientific attitude and attitudes towards science.

Another learning theme expressed by a significant number of pre-service science teachers was teaching techniques. The pre-service science teachers came to realize the importance of conducting hands-on activities, probing student prior knowledge, asking questions, and concluding lesson. In some cases, they were confronted with new ideas and knowledge. For instance, when they provided students opportunities to conduct hands-on activities, their students became more interested and participated in learning science. So the pre-service science teachers claimed that hands-on activity was important to science teaching and learning. Pre-service science teachers’ learning was supported by cooperating teachers and university supervisors. For example, they noted that they had learned how to introduce the lesson from specific feedback and advice from their cooperating teachers and university supervisors.

Even though pre-service science teachers had struggled with lesson introduction at the beginning, they improved and developed their teaching as suggested by cooperating teachers and university supervisors. Pre-service science teachers thought that probing student prior knowledge should be conducted at the beginning of the lesson rather than asking students what topics they were going to learn. They also found that time waiting was very important. When they gave students time to think, they could understand more about students’ ideas and conceptions.
Pre-service science teachers counted understanding their student learning characteristics as their knowledge gained from their student teaching experiences. They described that being a teacher in the real classroom helped them know the characteristics and abilities of their students. Understanding individual characteristics led them to think how to design teaching and learning activities, responsively.

Classroom management was another important specific learning. Pre-service teachers reflected that using cooperative learning and group work techniques helped them to control their classroom easier. Some reported that at the beginning of teaching, they had problems with classroom management. Even though they asked students to work in groups, their students did not want to work with their peers. When the time passed, the students became familiar with working cooperatively and understand their roles. The final learning theme was learning materials. Pre-service science teachers reflected that providing learning materials could encourage students’ learning and attention. They became aware that effective learning materials should help students understand an abstract science concept. So, they thought that concrete learning materials such as pictures and household apparatus needed to be prepared prior to teaching and use in learning activities.

**Conclusion, discussions, and recommendations**

This research study reflects the current understandings of the field experience component in a teacher preparation program in Thailand. We focused on investigating the implementation of the field experience, perceptions of pre-service science teachers’ on their field experience courses, and their learning and struggles in student teaching. The research findings indicated field experience consisted of three courses in observation and participation and two courses in student teaching. Field experience
courses were a series of experiences in which the pre-service science teachers learned about and practiced school administration, a teachers’ roles and content-specific teaching, respectively. Even though pre-service teachers perceived that the observation and participation in field experiences helped them to be well mannered, they thought they rarely had opportunities to practice teachers’ jobs, only observe them. This may cause pre-service teachers unable to link their learning in academic coursework and the realities of classroom teaching (Beeth & Adadan, 2006). Specifically, the three courses in observation and participation mostly focused on general jobs and general pedagogy rather than offered pre-service science teachers learn content – specific teaching practice (Shulman, 1987; Watsons, 2006). Consequently, they could face many difficulties in their teaching practice in real situations. They may not bring their learning from observation and participation field experiences into student teaching. Besides, when pre-service teachers moved to student teaching in the real classroom, they had struggled to develop their own pedagogical content knowledge (PCK) (Black, 2004; Shulman, 1987). They could not set clear and expected learning outcomes in lesson planning. They did not probe students’ prior knowledge, rarely asked questions and could not manage a classroom. They also had misconceptions in many science concepts. However, pre-service teachers did learn some lesson planning techniques and teaching strategies, and about students’ learning, classroom management, and how to incorporate instructional materials (Abell & Bryan, 1997).

The findings of this study confirm the notion that a direct experience in teaching is a key element in teacher education program (Sadler, 2006). Field experience has a significant role in assisting the pre-service teachers gain the expertise and confidence in their content-specific teaching. Since pre-service teachers have
C. Faikhamta et al.

learned from their cooperating teachers, supervisors and even their students, they could improve and develop their teaching. Cooperating teachers and university supervisors should collaboratively share ideas about pre-service teacher’s learning and problems and give them comments by focusing on content-specific teaching (Abell & Bryan, 1997). Importantly, the cooperating teachers, university supervisors, or other stakeholders may use the findings of this study as information to guide their supervision.

Future research could investigate how to further prepare students to develop their ability to do classroom action research. The research could aim to explore how classroom action research impacts pre-service science teachers’ teaching practice. Conducting classroom action research could be an effective tool to help pre-service science teachers reflect on their teaching practice, so it could encourage their understanding of teaching and learning in both theory and actions. This type of future research could provide data about an effective practice and guide the preparation of high quality science teachers.

Proposal Information

Title of Proposal:
The evolution of alternative school system; how far we’ve come, how far we have to go

Authors of proposal including affiliations and email addresses:
Lionel H. Brown, Ed.D.-University of Cincinnati; brownlw1@ucmail.uc.edu
Diana I. Regis, MA-University of Cincinnati: eda157@juno.com

General description of research questions, objectives and theoretical framework

Alternative school systems have existed in US for over 150yrs. Historically at first they catered to students that had different needs than what regular schools were able to address. As such schools began to grown in numbers they offered more and more innovative programs for students with special interests to flourish. Thus, such schools offered a much needed value to the community and were very favorably viewed.

Yet, after passage of time, the alternative school programs began to focus more on the student at risk development. Such programs have often been viewed with much skepticism due to the fact that students improvement as a result of the intervention was only temporary and upon return to regular schools the students fell back into their old patterns of behavior. (Thus, such schools were used by teachers mostly just to “warehouse” the disruptive students so that they would be able to teach the other students.)

In 1988 as the Cincinnati school board has outlawed corporal punishment the school district was struggling with new innovative approaches to discipline students. As a result they came-up with a system of expelling students for bad behavior. The suspensions were longer and longer at length and were not productive since the students were missing out on their education. Furthermore, the policy seemed to be bias in a sense that it did not take into account the upbringing of African American kids from impoverished neighborhoods whose parents were encouraging them to stand up for themselves if they felt threatened.

The primary author was able to track the initial historical success of such programs as he successfully tweaked a traditional approach to the alternative schools for the student at risk. Project Succeed was an innovative experimental alternative school. The school differed from the more traditional alternative schools because it focused on a younger students and was actually created as a permanent schooling for kids requiring extra mentorship and guidance. One of the strengths of the program was that it focused on making the parents and teachers work together in the classroom and at home on the same goals. Although initially the school provided additional resources to help educate the parents and to assist them in their personal struggles, the long term benefits were great. The parents became very involved in school and even often volunteered by assisting the teachers in monitoring the student’s behavior.

The primary author will reflect of the relevance of the historical evolution of alternative schools and how he was able to draw on that to improve the alternative school system. Furthermore, the author will reflect on the current state of the system and where it is heading.

Title of Proposal:
Lessons learned on diverse students and their parent body integration and how to effectively develop an interracial education policy for the Hispanic community.

Authors of proposal including affiliations and email addresses:
Lionel H. Brown, Ed.D.-University of Cincinnati; brownlw1@ucmail.uc.edu
Diana I. Regis, MA-University of Cincinnati: eda157@juno.com

General description of research questions, objectives and theoretical framework

As the congress is currently working on developing strategies on how to handle the large number of Hispanic immigrants who are illegally entering the county in large numbers, the school system has to prepare itself for yet another interracial integration. Yet do we need to start from the scratch, or can we learn from our own past?

In 1887, Cincinnati’s board of education adopted a policy of gradual integration. Such schools were officially open to both the black and white gender, however were primarily attended by the African American community. In 1954, Cincinnati’s school of education adopted the official policy of integrating students. At that time the primary author had lead the integration by employing interracial teachers, adopting innovative school programs and getting the parents involvement.

In this presentation the author will lead a discussion on lessons learned and how they can be of use today as the community once again is faced with another integration challenge of the Hispanic community into it’s educational system. What worked, what didn’t and what are the special needs of this segment of the population.

Abstract

Analysis of 259 rural Texas public school administrator assessments identified differences in principal leadership skills by campus student achievement. Rural principals from schools with the highest student academic ratings relied more on collaborative leadership skills than management skills. Recommendations are presented for building bridges between rural school leadership and student achievement in four areas: systems thinking, school improvement, best practice instruction, and leadership capacity.
Building Bridges Between Student Achievement and Rural School Leadership

Twenty-five years of educational research (Marzano, Waters, & McNulty, 2005; Lesotte, 1992, 1991; Reynolds, 1990; Edmonds, 1979) establishes quality school leadership is essential for rural public school success. School leadership is second only to classroom instruction in influencing student achievement (Leithwood, Louis, Anderson, & Wahlstrom, 2004). Furthermore, countries worldwide have recognized that as school administrator responsibilities expand, the need to cultivate school leadership increases (Olson, 2008). Among rural principals, unique community characteristics may also require different leadership skills.

Rural School Challenges

Rural principals work in schools that are demographically different than those in urban and suburban communities. Data collected from 2002-2005 by the National Center for Education Statistics (NCES) show that a third of all public schools are located in rural areas, but their enrollment represents only one fifth of the nation’s public school student population. Additional findings indicate that although rural schools enroll a larger percentage of White or American Indian/Alaska Native students, they enroll a smaller percentage of Black, Hispanic and Asian/Pacific Islander students than do urban or suburban schools. Likewise, a smaller percentage of rural school teachers are racial/ethnic minorities. English proficiency is found in greater percentages in rural than in either suburban or urban schools. Economically, NCES found 38% of rural students are eligible for free or reduced lunch; while 45% attend moderate-to-high poverty schools (Provasnik, et al., 2007).

Rural communities generally offer fewer educational opportunities for students. For instance, fewer rural students per capita attend prekindergarten classes and schools are less likely to have advanced placement, International Baccalaureate courses, or Internet access.
Nevertheless, according to NCES data, academically, rural students outscore urban children on National Assessment of Educational Progress (NAEP) assessments. On the other hand, rural students score below suburban students. In addition, rural students’ freshman graduation rate (75%) is higher than that of urban students (65%), but lower than that of suburban students (79%), while dropout rates in rural schools (11%) are higher than suburban (9%) and lower than urban (13%) rates (Provasnik, et al., 2007).

Rural schools receive a smaller percentage of revenue from the federal government, yet spend more per student than either urban or suburban schools. Rural schools are also more likely to have a smaller ratio between students and teachers, counselors, social workers, and special education specialists. There are fewer serious student behavior problems per capita and a larger percentage of teachers report satisfaction with teaching conditions in rural schools. In addition, rural parents are more likely to attend rural school events and take their children to athletic events (Provasnik, et al., 2007).

Rural parents are more likely than urban or suburban parents to have completed a high school diploma as their highest educational attainment. On the other hand, parents of rural school children (as compared to urban and suburban parents), are more likely to expect a bachelor’s degree as their children’s highest educational attainment. Despite these expectations, NCES reports that only 13% of rural residents acquire bachelor’s degrees (as their highest educational attainment) compared to 17% nationally (Provasnik, et al., 2007).

As the NCES data clearly show, rural campuses are unique. Because their roles and challenges are different, rural school principals may require specialized leadership skills that differ from those required of their urban and rural counterparts.
Principal Effect on Student Achievement

Studies in the U.S. from the last 40 years overwhelmingly support the notion that if a school has an effective principal, students are more likely to achieve academically (Cotton, 1995; Lezotte, 1992). A review of studies conducted worldwide (Hallinger & Heck, 1996) found similar results. In a definitive review of thirty years of research on the role of the principal in student achievement, Marzano et al. (2005) found both a practical and statistical significance in the relationship between student achievement and the quality of school leadership.

The importance of effective leadership is also recognized within the public school community, in spite of difficulty in identifying and assessing the composite required skills. According to Rammer’s (2007) findings, superintendents recognize the crucial role effective principals play in the development of schools even though they have no effective means of assessing those skills in potential administrative candidates. Likewise, Hallinger, Bickman, and Davis (1996) report that parents and teachers believe principals make a difference in the achievement of students and the learning environment.

Findings from these studies suggest that even when it is difficult to discern which skills are requisite to effective leadership, there is little doubt among researchers or stakeholders that effective leadership positively affects student achievement.

Challenges to Rural Principal Leadership and Campus Student Achievement

Research related to the rural principalship focuses on three challenges: retention of effective principals, community relations, and pressure to meet standards with limited resources. While there is a great need for effective, skilled leaders in rural schools, recruiting and retaining quality principals is a challenge. Administrative stability, a factor related to student achievement (Partlow & Ridenor 2008), might account for lower academic achievement in rural and urban
school (Provasnik, KewalRamani, Coleman, Gilbertson, Herring, & Xie, 2007). Principal turnover rates in rural schools are comparable to those of urban schools (Bainbridge, Lassley, & Sundre, 2003; Balfanz & MacIver, 2000). However, rural principals are generally paid less, asked to assume a greater number of responsibilities, and face greater community scrutiny than their urban and suburban counterparts (Winn et al., 2009a, 2009b; Arnold, Gaddy, & Dean, 2004). Community resistance, geographic isolation, and economic shortages also create difficulties when rural principals implement special education services (Cruzeiro & Morgan, 2006). The demands of finding and retaining highly qualified teachers (HQT), who can teach multiple subjects and assure adequate yearly progress (AYP) for students in special education, add to the challenges of rural administrators (Mitchem, Kossar, & Ludlow 2006; Jimerson, 2005). Furthermore, community resistance and lack of population diversity often impede the efforts to implement multicultural education in rural schools (McCray, Wright, & Beachum, 2004).

**Principal Skill Assessment**

Findings from research confirm that principal effectiveness is important, yet there is no consistent or formalized method for identifying the most highly skilled principals (Winn, et al., 2009a, 2009b). As noted in Rammer’s (2007) study for example, superintendents’ belief in the value of particular leadership characteristic does not guarantee that they have available tools to correctly assess these skills in potential employees. Adding to the complexity of assessment, findings from a study of new principals (Daresh, 2007) suggest it is not until principals become comfortable with the management of the school that they begin to consider critical instructional issues. Furthermore, new principals are likely to assess their own performance primarily in terms of management skills. Baxter (2008) posits this may result from university-based principal
preparation programs that apply a business manager metaphor to public school administration rather than one of community leader and public servant. Adding to the complexity of principal assessment, Anagnostopoulus and Rutlege (2007) found when schools face state and district sanctions for low performing schools, sanctions rather than best practice become the focus of school administrators. Additional findings suggest that, in this atmosphere, administrators are more likely to resort top-down managerial skills rather than collaborative instructional leadership skills. Another disconnect from instructional leadership may result from fewer (from 15% to 5%) principals coming to administration directly from the classroom. (“The Changing Face Of Principals,” 2008).

The convergence of these factors does little to guarantee quality leadership or stem rural school failure. In spite overwhelming evidence of the essential role played by principals in creating effective schools, measuring leadership effectiveness has not been adequately formalized either by rural school districts or by rural principals.

Method

Every five years in Texas, principals are required to participate in a state-approved professional development performance assessment. Records from one such assessment, Principal Assessment of Student Success (PASS), provided the data for this study (see Appendix A). One component of the PASS requires assessment of 14 leadership skills (see Appendix B) identified by Thompson (1993) and adopted by the National Policy Board of Educational Administration (NPBEA). PASS principal assessments from 2006 to 2008 determined which NPBEA skills predominated among Texas rural administrators in terms of student achievement as measured by the state of Texas public school accountability ratings Academically Acceptable (AA), Recognized (R) or Exemplary (E) (see Appendix C).
PASS data provided assessments from teams (two assessors per principal) as to the predominant NPBEA skills exhibited by each rural principal. PASS assessors were recruited among veteran campus and central office administrators, as well as from university educational leadership departments within the state of Texas. Sampled principals provided evidence of their job performance in a variety of ways (campus improvement plan, state accountability data, Adequate Yearly Progress phone interview, teacher performance data, and student performance data). Based on this evidence, assessors cooperatively identified each principal’s NPBEA leadership strengths. The top five skills identified by assessors for all principals sampled were tallied and categorized in terms of student achievement as measured by campus accountability ratings (AA, R, or E).

Finally, to identify the link between the leadership skills of rural principals and campus student achievement, 14 NPBEA skills identified by assessors were compared within student achievement categories as measured by Texas state campus accountability ratings (AA, R, or E).

Participants

PASS data accessed from principal assessments conducted throughout Texas from 2006 through 2008 yielded records of 259 rural school principals, representing 41.7% (108) elementary, 24.3% (63) middle, and 34% (88) high school campuses.

</tr>
</thead>
</table>
The 259 campuses of sampled principals were identified by Texas state accountability ratings (AA, R, E; see Table 1). High schools received more Academically Acceptable (AA) ratings compared to middle school and elementary campuses with 53.1% (76), 28% (40), and 18.9% (27), respectively. Elementary campuses led in Recognized (R) ratings 64.6% (62) compared to middle and high schools 24% (23) and 11.5% (11), respectively. In addition, more elementary schools were rated Exemplary (E) as compared to high schools and middle schools by 95% (19), 5% (1), and 0%, respectively. Unequal representation of schools at each instructional level (elementary, middle and high school) within each state accountability level (AA, R, E) may have affected interpretation of study findings. However, the dispersion of these data reflects the pattern of accountability ratings in Texas. Overall, rural campuses rated Academically Acceptable (AA) were associated with 143(55.2%) of sampled principals, the largest group, while rural campuses rated Recognized (R) and Exemplary (E) were associated with 96(37.1%) and 20(7.7%) sampled principals, respectively.

Analysis

Descriptive statistics were used to calculate principal and PASS assessor rankings. Chi-square cross tabulation tables were used to determine dependence/independence by school
accountability ratings and principal’s NPBEA skill ranking frequency counts per NPBEA domain. Significant differences and effect sizes were reported.

**Results**

**PASS Assessor Ratings of Principal NPBEA Skills**

Teams of two PASS assessors cooperatively rated the NPBEA skills of each principal based upon data from multiple sources. A total of 777 ratings were produced by 259 assessor teams (see Table 2).

Leadership produced the largest frequency count from assessors (137) while the lowest frequency count was found for Resource Allocation (13), a difference of 124 counts (See Table 2). Skills in NPBEA’s functional, programming, and interpersonal domains differed in frequency with 365/51%, 204/28.5%, and 145/20.3%, respectively. Functional domain skills netted greater totals than skills in the programming and interpersonal domains by 22.5% and 30.7%, respectively. Overall, within the functional domain, Leadership received the largest count while the highest counts in the programming and interpersonal domains were found for Instructional Management (57) and Sensitivity (91).

The five NPBEA skills with highest frequencies by campus accountability level appear in Table 3. Although ranked differently, both AA and R campus leaders shared four of the same top five NPBEA skills (Leadership, Information Collection, Sensitivity, and Organizational Oversight). Differences in AA and R leaders occurred in exclusive top ratings for Instructional Management (AA) and Judgment (R).

E campus leaders shared top NPBEA skills (Leadership, Information Collection, Sensitivity, Organizational Oversight, and Judgment) with AA and R campus counterparts. However, only E campus leaders demonstrated high degrees of Student Guidance and Development and Staff Development (see Table 3).

Discussion

Rural Principal Leadership Skill Proficiency and Student Achievement

The National Policy Board of Educational Administration (NPBEA) leadership knowledge and skill domains of 259 practicing rural Texas principals were analyzed by state campus accountability ratings. Findings suggest that rural school principals from campuses with the highest student academic achievement exhibited different skill sets than rural principals from campuses of low and moderate student achievement. The NPBEA skill sets are categorized into three domains: functional, programming, and interpersonal. Functional domain skills (see Appendix B) comprise base-level management and organizational structure to supervise daily, routine campus business (e.g. to run the buses on time, schedule classes, or maintain order). Evidence of effectiveness is, typically, quantifiably measurable (e.g. attendance records, disciplinary referrals). Programming domain skills (see Appendix B) provide systemic campus leadership requiring holistic perspectives that incorporate but surpass functional domain skills. More complex and difficult to quantify, these skills enable principals to develop frameworks, design anticipated outcomes, implement ongoing supervision, set goals, and draw inferences. In contrast, interpersonal domain skills (see Appendix B) employ functional and programming
domain skills, but are subject to individual perception, making measurement more difficult. For example, principals may perceive themselves to be sensitive while faculty members disagree. Nevertheless, these skills improve effective implementation of both functional and programming skills. Win et al. found that at campuses with the highest student achievement, campus leaders netted lower percentages of functional and interpersonal domain skills and higher percentages of programming domain skills than did leaders from campuses with low or moderate student achievement, findings supported by those of Baxter (2008), Daresh (2007), and Rutlege (2007).

Anagnostopoulos and Rutlege (2007) contend that looming state and district sanctions for low student achievement tend to adjust principals’ focus on the sanctions rather than best practice. In addition, when faced with performance pressure, administrators are more likely to resort to top-down managerial skills (functional domain) rather than collaborative instructional leadership skills (“The Changing Face of Principals”, 2008). Study findings appear to support the notion that principals at lower performing campuses feel compelled to monitor instruction through management (functional domain) solutions.

**Key Focal Points to Bridge Rural School Leadership and Achievement of All Students**

As noted in the review of literature, quality school leadership is second only to classroom instruction in influencing student achievement (Leithwood et al., 2004). More precisely, there is a need for professional development opportunities designed specifically for principals of rural campuses. Based on study findings, rural principals who demonstrate skills in the programming domain tend to address campus instructional needs in a systematic manner utilizing collaborative leadership. Conversely, rural principals of lower performing campuses demonstrate skills in the functional domain supported by personal skills of the interpersonal domain. Thus, helping rural principals develop the skills associated with the programming domain (instructional
management, curriculum design, student guidance and development, staff development, measurement and evaluation, and resource allocation) could impact student success on rural campuses. Many of the challenges identified in the literature note that rural principals must do more with less (fewer educational resources, limited staff, and less financial support). In addition, rural principals must carefully maneuver the community norms and traditions. The skills in the programming domain enable principals to develop frameworks, design anticipated outcomes, set goals, and draw inferences which could facilitate greater student success by providing a more stable learning environment that is driven by clear expectations and facilitated by well-defined processes. This type of learning environment frees teachers to focus on student needs and instruction verses campus procedures.

Principals working to develop their skills in the programming domain can begin by concentrating on the following items:

1. Build Bridges for Systems Thinking (Programming Domain)
2. Build Bridges for School Improvement (Measurement and Evaluation)
3. Build Bridges for Best Practice (Curriculum Design and Instructional Leadership)
4. Build Bridges for Leadership Capacity (Staff Development)

Build Bridges for Systems Thinking

The concept of systems thinking is at the heart of the programming domain in that it is about developing a framework for establishing clear expectations and well-defined processes to help reach those expectations. The process of systems thinking simplifies complex systems, because it examines how parts of the whole interact with one another to produce overall outcomes. Systems thinking encourages leaders to see patterns and interrelationships in order to solve problems more effectively (Gray, 1995; Hood & Hutchins, 1996; Senge, 1990; Wheeler,
Thus, systems thinking encourages leaders to examine the whole system and its interconnectedness, moving away from the “cause and effect” approach to solving problems (Norland, 1994; Senge, 1990, Wheeler, 1995). Utilizing systems thinking will help principals move from being reactionary to becoming proactive in solving problems before they happen. For example, a school may seem to have a problem with students being tardy to class. Often leadership will respond by establishing tougher consequences for students who are late to class. However, a systems thinking approach would require a school leader to reflect on the systems as a whole and how each part impacts each other. The questions should be asked: Why are students late to class? Is it a specific group of students? Does it happen at a specific time of day? How is this problem tied to instruction? Are teachers enforcing the existing tardy policy? How are teachers using the first ten minutes of class? Is the tardy problem tied to student engagement in the lesson?

Most likely issues in schools do not occur in a vacuum. Every action has a reaction; every decision sets a precedent for a future decision. School leaders who work to see the interdependent components versus the individual parts, will be able to eliminate some to the complexity and make the system more manageable (Wheately, 1992). Instead of viewing the tardy issue as only a discipline problem, if the principal uses systems thinking he/she would perhaps look at the issue from an instructional viewpoint. This would provide a bridge to tie the multiple issues back to the main purpose of schools, which is teaching and learning. If students are not in class, they are missing educational opportunities. Punishment usually results in more missed class time by removing the student from the classroom to in-school suspension, or time in the principal’s office - being late to class results in missing more class. Addressing the tardy problem through a systems approach would allow the principal to solve more than one issue at a
time. It also allows the principal the opportunity to focus on short-term and long-term results simultaneously. Principals should ask the questions: 1) How does this decision impact the campus, teachers, and/or students today and the immediate campus goals? 2) How does this decision move the campus, teachers, and/or students toward the long-term campus goals? Changes on the campus must be guided, so that both long term and short-term goals are met. Schlechty (2001) stated, “Systems not only define what must be done, they define what can be done. To bring about dramatic improvements in the results a given system is producing, the structural properties must be changed to accommodate the requirements of whatever new programs are to be included. To fail to make this structural change is to fail over the long term to manage change successfully (p.56).” Using systems thinking will help principals move the campus toward the established goals in a more succinct and sustainable manner.

**Build Bridges for School Improvement (Measurement and Evaluation)**

In addition to developing frameworks for managing systems within the school, the skills in the programming domain, also enable principals to set goals and design anticipated outcomes. The key NPBEA skills required to do this are measurement and evaluation, which entails the ability to examine the extent to which outcomes meet or exceed previously defined goals. Schools focused on continuous improvement have clearly defined goals and specific measurement to determine if the goals were achieved. Simply stated, *what gets measured gets done*. The campus planning process, when utilized correctly, is an excellent tool to guide campuses in the improvement process. However, too often the campus plan is seen as a task instead of tool. It is completed, presented to the school board, and then set aside until it is time to revise it next year. Highly effective principals use the plan as a means for both formative and summative assessment. When it is well developed, the campus plan provides clear expectations,
processes, measurements, resources, and outcomes. A well-written campus plan addresses the specifics needs of the campus on a yearly basis and narrows the focus of the measurement evaluation processes to the problem instructional areas on a campus. The instructional intensity of correctly identifying targeted needs, and correctly measuring and evaluating the progress of those needs, is essential to school improvement. Principals, who are truly focused on continuous school improvement, move beyond the state and national accountability requirements. They are focused on engaging students in relevant and meaningful learning, not just in meeting the test objectives. When students are empowered in the learning process to look beyond the tested objectives and to make relevant connections, learning occurs at a much higher level.

Creating a culture that values continuous improvement is imperative for measurement and evaluation to be an effective tool on the campus. The culture (values, beliefs, rituals, traditions) of the campus, and every member of the campus, must embrace and support continuous improvement through setting goals and constantly measuring the progress of the goals. The principals must collaboratively create and nurture the culture. Making campus planning an ongoing process and making the campus plan a “live” interactive tool can assist the principal in sustaining a culture of continuous improvement. The progress of the goals and strategies identified in the campus plan should be reviewed on an ongoing basis. Specific dates should accompany the targeted student performance goals associated with the formative campus assessments. After each assessment, student progress toward the goals should be evaluated, and instructional strategies and teaching methods should be adjusted.

**Build Bridges for Best Practice (Curriculum Design and Instructional Leadership)**

Principals who are strong instructional leaders ensure quality instruction is taking place on a daily basis and that every student has access to a curriculum that is both guaranteed and
viable. In today’s changing world, principals must create learning environments that at a minimal focus on: 21st Century Skills, quality instruction instead of instructional programs, and a guaranteed, viable curriculum.

Technology and globalization have radically changed the world eliminating many jobs that can be automated or outsourced. This change has created a renewed interest in education by politicians around the world. The mission of public education has moved from providing a public education to all and a college education to the elite, to providing a high standard of life-long education to all learners (Fullan, 2006). The educational system must now produce a workforce that can quickly apply new knowledge, solve problems, communicate, work well with others, use technology, and be highly innovative. Therefore, schools must adjust their curriculum to meet the needs of society. In order to do this, schools must begin emphasizing the 21st Century Skills. The 21st Century Skills adds three components to the existing core curriculum: learning and innovation skills; information, media, and technology skills; and life and career skills (Trilling and Fadel, 2009). Learning and innovation skills include critical thinking and problem solving, communication and collaboration, and creativity and innovation. Information literacy skills allow students to access information efficiently and effectively, evaluate information critically and competently, and use information accurately and creatively. Life and career skills provide students with flexibility and adaptability, initiative and self-direction, social and cross-cultural interaction, productivity and accountability, and leadership and responsibility (Trilling and Fadel, 2009).

In order to help prepare students for the changing world, strong instructional leaders should focus on quality instruction. First and foremost, students must be actively engaged in the learning. Too many times compliance is mistaken for engagement. If a teacher is lecturing and
students are taking notes, they are being compliant, but they are not actively engaged. Engaged learning is an active process, not a passive one. Engagement means that students are interacting at a high cognitive level with the materials, concepts, and each other in such a way that new learning is taking place.

Secondly, instructional leadership should focus on best practices in lieu of prescriptive instructional programs. While instructional programs may be research-based and aligned to the curriculum, any program is only as good as the teacher implementing it. Highly effective teachers will integrate best practices (Zemelman, Daniels, & Hyde, 2005) into instructional programs. Regardless of the content, they will work to ensure the lesson is student-centered providing learning opportunities that are holistic, authentic, challenging, and experiential. Highly effective teachers understand that powerful learning occurs from cognitive experiences that are developmental in nature, include constructing ideas and systems, practice many forms of expression, and allow for opportunities for reflection (Zemelman, et al., 2005).

Thirdly, the instructional leader must ensure curriculum design moves beyond vertical and horizontal alignment to the standards and toward incorporating more meaningful learning opportunities. For example, some believe memorizing the Periodic Chart of Elements is essential before students can begin engaging in science lessons, but the isolated facts without any connection to context or concepts limits students’ interest. After all, no one expects students to know all of the grammatical rules before engaging in the writing process. Marzano et al. (2005) defines a guaranteed, viable curriculum as one that can be adequately taught in the allotted time (viable), and one that covers specific content in specific courses at specific grade levels (guaranteed). This does not mean that every teacher must be on the same page on the same day. A principal who is a strong instructional leader should support the concept of a curriculum that is
horizontally and vertically aligned, but also allows teachers to move at an instructional pace that meets the needs of the students. The goal is for students to master the content at the expected level for that grade. In addition, the instructional leader should examine the viability of the expected curriculum. A common practice in elementary schools is to require 90 minutes of math and 90 minutes of reading each day. However, this often leaves little time for science and social studies. Thus, the expected curriculum is not viable based on the established schedule.

The principal’s role in developing curriculum may vary from district to district depending on available support staff; however, the principal’s role in instructional management is nonnegotiable. He or she must be engaged with the teachers to ensure appropriate instructional methods are used to create positive learning experiences that address the needs of the learner.

Building Bridges for Leadership Capacity (Staff Development and Resource Allocation)

The role of the principal is extremely difficult and, as previously noted, requires principals to facilitate complex systems, create a culture of continuous improvement, set clear goals and expectations for the campus, provide ongoing measurement and evaluation of expected outcomes, and ensure quality instruction, meaningful learning opportunities, and a guaranteed, viable curriculum. However, none of these things must be, nor can be, accomplished by the principal alone. Lambert (2002), noted, “The days of the principal as the lone instructional leader are over. We no longer believe that one administrator can serve as the instructional leader for an entire school without the substantial participation of other educators (p. 37). Highly effective principals develop leadership capacity on the campus by building both broad-based participation and skillful participation from staff members (Lambert, 1998). The key word is “skillful.” Principals who empower their teachers must have confidence that the teachers can effectively
complete the assigned task. Thus, the principal must ensure that the teachers have the knowledge and skills needed by providing relevant, meaningful, and aligned staff development.

As noted by Whitaker (2003), schools are improved by people, not programs, “There are really two ways to improve a school significantly: get better teachers or improve the ones you have” (p.8). School improvement depends upon quality professional development. Striving for continuous professional development within a school provides the content, process, and context that help create changes in school culture and teacher classroom practice (Lindstrom & Speck, 2004). One method of supporting teachers in their professional development is creating professional learning communities (PLC). The key role of the principal in the PLC is to ensure that teachers have time for planning and collaboration, as well as clear guidelines and expectations for what will be accomplished during that time. This also ties into resource allocation in that the principal is allocating, monitoring, and evaluating fiscal, human, material and time resources to reach campus goals and objectives. PLCs are most effective when the principal’s expectations clearly align the outcomes to the campus goals and objectives.

A second key component for developing staff and ensuring quality instruction is to redirect staff members who are not being successful with students. This entails having courageous conversations about improvement. While this task may be difficult and unpleasant, it is a must if principals are to lead campuses that are truly focused on continuous improvement and student success. Principals must become adept at dealing with conflict, especially when it involves actions that impede student success. Ignoring outdated teaching strategies, passive learning environments, and instruction focused on facts and low-level cognitive skills can be detrimental to the campus and to students. If all teachers are not held accountable, one of two things will happen: 1) the effective teachers will quit producing due to lack of accountability, or
2) the effective teachers will seek employment with a principal who demands all teachers to be highly competent. Principals cannot afford to lose the highly effective teachers in order to avoid the conflict of addressing a low performing teacher.

Conclusion

As noted in the review of literature, quality school leadership is second only to classroom instruction in influencing student achievement (Leithwood et al., 2004). Rural principals can benefit from professional development focused on the NPBEA skills found in the programming domain such as instructional management, curriculum design, staff development, measurement and evaluation, and resource allocation which could have a greater impact on student success on rural campuses. Four specific focal points for improvement in the programming domain include: Building Bridges for Systems Thinking (Programming Domain), Building Bridges for School Improvement (Measurement and Evaluation), Building Bridges for Best Practice (Curriculum Design and Instructional Leadership), and Building Bridges for Leadership Capacity (Staff Development).

Appendix A

Principal Assessment of Student Success (PASS)

Principal Assessment for Student Success (PASS) is a principal assessment that has been approved by the State Board of Educator Certification (SBEC) for principal assessment within the state of Texas. According to Texas Education Code (TEC) 21.054, all principals must complete an assessment in order to maintain certification. The overarching goals of PASS include:

1. To determine the level of knowledge and skills for the principalship that each principal assessed demonstrates.
2. To provide quality assessment activities relevant to the role of the principalship.
3. To provide purposeful and constructive feedback related to each principal’s demonstration of knowledge and skills.
4. To provide opportunities for each principal assessed to be reflective about his/her level of knowledge and skills, as well as to his/her plan for professional growth.

PASS is based on three sets of criteria: skills, standards, and knowledge. The skills included in the assessment comprise 14 of the 21 skills identified for the principalship by the National Board of Policy Educational Administration (see Appendix B). The standards are the seven State Board of Educator Certification (SBEC) Standards which are required by the state to be included in the assessment. The knowledge is a compilation of the Ten Components of Effective Schools, the framework components of Instructional Leadership Development (ILD), and the instructional processes from the Student Success Initiative (SSI).

Each criterion is measured multiple times in PASS through a variety of authentic activities within the assessment. PASS contains a self-assessment process, a campus component,
a teacher component, and a student component. All activities are based on authentic data provided by the principal being assessed and are directly connected to his/her campus.

The assessment process occurs over a 30-day period. All online activities are completed within 16 days and are then submitted for assessor review. The assessors are given 11 days to review the online responses and conduct a phone interview with the principal. Each principal’s data and entry is reviewed by two assessors. One assessor is considered the primary assessor and, in addition to scoring the rubrics for each activity, provides written feedback on each activity. The assessment also includes one, face-to-face feedback session in which principals expand on their previous responses with a state-of-the-campus report and a plan of action for a teacher in need of assistance. Each primary assessor provides up to one hour of verbal feedback to each principal being assessed.
Appendix B

National Policy Board of Educational Administration (NPBEA):

Knowledge and Skill Domains

**Functional Domain Skills:**

1. Leadership: Providing purpose and direction, formulating goals with staff and setting priorities based on community and district priorities and student and staff needs.

2. Information Collection: Classifying and organization information for use in decision making and mentoring.

3. Problem Analysis: Identifying problems, identifying possible causes, seeking additional needed information, framing possible solutions.

4. Judgment: Giving priority to significant issues then reaching logical conclusions and making quality decisions.

5. Organizational Oversight: Planning and scheduling own and other’s work so that resources are used appropriately and monitoring priorities so that goals and deadlines are met.

**Programming Domain Skills:**

6. Instructional Management: Ensuring appropriate instructional methods are used to create positive learning experiences.

7. Curriculum Design: With staff, planning and implementing a framework for instruction and aligning curriculum with anticipated outcomes.

8. Student Guidance and Development: Enlisting the support and cooperation of diverse professionals, citizens, community agencies, parents and students to promote the growth and development of all students.
9. Staff Development: Supervising individuals and groups and providing feedback on performance and initiating self-development.

10. Measurement and Evaluation: Examining the extent to which outcomes meet or exceed previously defined goals, or priorities and drawing inferences for program revisions.

11. Resource Allocation: Allocating, monitoring and evaluating fiscal, human, material and time resources to reach campus goals and objectives.

**Interpersonal Domain Skills:**

12. Sensitivity: Perceiving and responding to the needs and concerns of others.

13. Oral and Nonverbal Expression: Making oral presentations that are clear and easy to understand.

14. Written Expression: Expressing ideas and appropriately in writing for different audiences.

(Thomson, 1993).

(Note: only 14 of the original 21 NPBEA knowledge and skill domains were assessed as part of this study)

Strength Through Adversity:
The Struggles of the Beginning Teacher

Edwyna Synar, Ed.D.
Tulsa Public Schools

Reprint Requests: synared@tulsaschools.org
ABSTRACT

The current severe teacher shortage in the United States is exacerbated by the numbers of beginning teachers leaving the profession after only a few years in the classroom. What do beginning teachers expect? How does the reality of their experience match up to their expectations? Sarah Mitchell wanted to be a “good” teacher and defined “good” in terms of relations with other people – students, colleagues, and administrators. The actual social relations that the teacher experienced in the school differed from what she saw as ideal, particularly with respect to the students and other teachers.

The purpose of this qualitative study was to examine the expectations and experiences of a beginning teacher. The study focused on relations with her administrator, other teachers, and her students. The beginning teacher participating in this study was a high school mathematics teacher who taught in an urban, Title I school in a medium-sized Southwestern city. Data came from observations and written documents as well as from interviews with the teacher.

Keywords: beginning teacher, observation, interview, case study
INTRODUCTION

_Fully responsible for the instruction of his students from his first working day, the beginning teacher performs the same tasks as the twenty-five-year veteran. Tasks are not added sequentially to allow for gradual increase in skill and knowledge; the beginner learns while performing the full complement of teaching duties._

_Lortie (1975)_

Being a beginning teacher is a difficult challenge. According to Ellen Moir (1990), these teachers move through several phases from anticipation, to survival, to disillusionment, to rejuvenation, to reflection; then back to anticipation. During the _anticipation_ phase, they tend to romanticize the role of the teacher and the position. Beginning teachers enter with a tremendous commitment to making a difference and a somewhat idealistic view of how to accomplish their goals. This feeling of excitement carries new teachers through the first few weeks of school.

During the _survival_ phase, the first month of school is very overwhelming for new teachers. They are learning a lot and at a very rapid pace. Beginning teachers are instantly bombarded with a variety of problems and situations they had not anticipated. Most new teachers struggle to keep their heads above water. They become very focused and consumed with the day-to-day routine of teaching. There is little time to stop and reflect on their experiences. It is not uncommon for new teachers to spend up to seventy hours a week on schoolwork. Particularly overwhelming is the constant need to develop curriculum. Veteran teachers routinely reuse excellent lessons and units from the past. New teachers, still
uncertain of what will really work, must develop their lessons for the first time. Even depending on unfamiliar prepared curriculum such as textbooks is enormously time consuming. Although tired and surprised by the amount of work, beginning teachers usually maintain a tremendous amount of energy and commitment during the survival phase, harboring hope that soon the turmoil will subside.

After six to eight weeks of nonstop work and stress, new teachers enter the disillusionment phase. The intensity and length of the phase varies among new teachers. The extensive time commitment, the realization that things are probably not going as smoothly as they want, and low morale contribute to this period of disenchantment. New teachers begin questioning both their commitment and their competence. Many new teachers get sick during this phase. Compounding an already difficult situation is the fact that new teachers are confronted with several new events during this time frame. They are faced with back-to-school night, parent conferences, and their first formal evaluation by the site administrator. Each of these important milestones places an already vulnerable individual in a very stressful situation. Back-to-school night means giving a speech to parents about plans for the year that are most likely still unclear in the new teacher's mind. Some parents are uneasy when they realize the teacher is just beginning and many times pose questions or make demands that intimidate a new teacher. Parent conferences require new teachers to be highly organized, articulate, tactful and
prepared to confer with parents about each student’s progress. This type of communication with parents can be awkward and difficult for a beginning teacher. New teachers generally begin with the idea that parents are partners in the learning process and are not prepared for parents' concerns or criticisms. These criticisms hit new teachers at a time of waning self-esteem.

This is also the first time that new teachers are formally evaluated by their principal. They are, for the most part, uncertain about the process itself and anxious about their own competence and ability to perform. Developing and presenting a "showpiece" lesson is time-consuming and stressful. During the disillusionment phase classroom management is a major source of distress. At this point, the accumulated stress of the beginning teacher, coupled with months of excessive time allotted to teaching, often brings complaints from family members and friends. This is a very difficult and challenging phase for new entries into the profession. They express self-doubt, have lower self-esteem and question their professional commitment. In fact, getting through this phase may be the toughest challenge they face as a new teacher.

The rejuvenation phase is characterized by a slow rise in the new teacher's attitude toward teaching. It generally begins in January. Having a winter break makes a tremendous difference for new teachers. It allows them to resume a more normal lifestyle, with plenty of rest, food, exercise, and time for family and friends. This vacation is the first opportunity that new teachers have for
organizing materials and planning curriculum. It is a time for them to sort through materials that have accumulated and prepare new ones. This breath of fresh air gives beginning teachers a broader perspective with renewed hope. They seem ready to put past problems behind them. A better understanding of the system, an acceptance of the realities of teaching, and a sense of accomplishment help to rejuvenate new teachers.

Through their experiences in the first half of the year, beginning teachers gain new coping strategies and skills to prevent, reduce, or manage many problems they are likely to encounter in the second half of the year. Many feel a great sense of relief that they have made it through the first half of the year. During this phase, new teachers focus on curriculum development, long-term planning and teaching strategies. The rejuvenation phase tends to last into spring with many ups and downs along the way. Toward the end of this phase, new teachers begin to raise concerns about whether they can get everything done prior to the end of school. They also wonder how their students will do on the tests, questioning once again their own effectiveness as teachers.

The reflection phase beginning in May is a particularly invigorating time for beginning teachers. Reflecting back over the year, they highlight events that were successful and those that were not. They think about the various changes that they plan to make the following year in management, curriculum, and teaching strategies. The end is in sight, and they have almost made it; but more
importantly, a vision emerges as to what their second year will look like, which brings them to a new phase of anticipation. Recognizing the phases beginning teachers go through gives us a framework within which we can support these individuals to make the first few years of teaching a positive experience.

In the United States today, there is a major teacher shortage, exacerbated by the attrition of large numbers of teachers – approximately 50 percent – leaving the classroom each year (Ingersoll, 2003; NCTAF, 2003). Many of those teachers leave for retirement, but almost as many leave for other reasons, which include dissatisfaction with teaching (Boe, Cook, & Sunderland, 2008). The most serious levels of teacher shortages are in inner cities and the rapidly growing South and West (NCTAF, 2007).

With respect to the relations of beginning teachers with their students, the research has described major challenges that teachers experience, which include what has been known sometimes as “discipline” and other times as “classroom management”. Surprisingly, many beginning teachers in these studies said they were prepared for discipline with different techniques and ideas, but by the third month of school, they had no clue at what to do next. In the area of relationships with other teachers, studies found isolation and lack of support as major problems for beginning teachers. In many ways, there were on their own – to set learning objectives, to present units and lessons, to handle problems that might arise (Bullough, 1989; Marlow, Inman, & Betancourt-Smith, 1997). As for relations
with administrators, studies (Chester & Beaudin, 1996; Zepeda & Ponticell, 1997) indicated that beginning teachers needed support from administrators also. Often, it seemed, they did not get it.

**REVIEW OF THE LITERATURE**

The literature covers four main areas: the expectations of beginning teachers, the relations that beginning teachers have with their students, the relations that beginnings teachers have with other teachers, and the relations that beginning teachers have with their administrators. Beginning teachers tend to articulate their expectations and perceptions in terms of relations with others, and those relationships tend to be major considerations in their decisions to stay with teaching or leave the profession.

*Expectations of New Teachers*

In 1975 Lortie published a classic study of 94 teachers in the Boston Metropolitan Area called *Schoolteacher: A Sociological Study*. Lortie described five Attractors to Teaching:

1. the *interpersonal* theme, a desire to work with people;
2. the *service* theme, performance of a special mission in our society;
3. the *continuation* theme, work in an environment that they enjoyed in their youth;
4. the *material benefits* theme, attractions such as money, prestige, and security; and
5. the *time compatibility* theme, the work schedules of teachers.

From his interviews, Lortie learned that many people go into the field of education because they want to work with other people – want to *serve* others and
to work with others. The idea that teaching is a valued service is important to teachers. Lortie pointed out that if teaching is to be defined as reputable and honored as a service, then the cultural context – the community – must also uphold that service as a special ideal. Lortie said it is “service” that sets [teaching] apart from many other ways to earn a living” (p. 32). Other researchers have continued to find this theme of service. Joseph and Green (1986) also found that the desire to work with and serve others is a basic motive for people’s decisions to go into teaching.

Teachers’ Relations with Students

Relations with students for beginning teachers can be difficult. Veenman (1984) found that relations with students were the most seriously perceived problem for beginning teachers and those relations were often defined in terms of discipline. Odell (1986) suggested that, even though the new teachers needed help with management of students, the administrators did not feel the need to provide this type of support. The author also concluded that beginning teachers had a difficult time articulating their problems in dealing with their students, since that would seem to imply a lack of personal competence.

For many beginning teachers, the problem with student relations was of utmost importance. Applegate, Flora, Johnson, Lasley, Mager, and Ryan (1977) documented that beginning teachers expressed that, given their college training and natural abilities, they should not have had any problems in their relations with
students. Several of the teachers reported a concern with students’ attitudes that they had not expected, particularly in regard to the students’ lack of respect for authority. The new teachers especially felt that they should not have had so many problems with their students due to behavior, and some of them were unhappy with their inability to “control” their classes.

In *Voices of Beginning Teachers*, Dollase (1992) reported that when it came to classroom management strategies, these new teachers were lost by October and seemed helpless and overwhelmed by December. They did not realize they needed to adjust their management strategies periodically, especially during peak periods of the year – holidays and breaks during the year. New teachers who did not have alternatives to the classroom management problems seemed to be lost by mid-year.

*Teachers’ Relations with Other Teachers*

Researchers found that new teachers’ relations with other teachers were extremely important. There were several studies that explored the many facets of the relationships of these two groups of teachers: self-efficacy beliefs, mentor support, and support from other teachers. According to Chester and Beaudin (1996), it seems that younger inexperienced teachers need high levels of collaboration with their peers in order to feel good about themselves in their new career. If new teachers had received support from experienced teachers in their school, their self-efficacy beliefs were enhanced.
Punch and Tuetteeman (1996) conducted a study on the psychological distress that was associated with misbehavior of students and excessive societal expectations and found that teachers’ stress could be alleviated by praise and recognition from fellow colleagues. Those beginning teachers who had many opportunities to exchange ideas with their colleagues and socialize with the colleagues tended to have less stress in their work environment.

Huffman and Leak (1986) suggested that many beginning teachers simply wanted someone to be there for them. Several beginning teachers said that they just wanted someone “being available” or “having someone to go to with questions big and small”; they wanted the “help of a teacher who was genuinely interested” (p. 23).

**Teachers’ Relations with Administrators**

For many beginning teachers, the relations with other teachers seem to be an important factor, but relations with administrators can be as important. For these teachers, too much attention could be upsetting and cause great distress due to the comings and goings of the administrators. They feared that if they were being observed often, then they must be doing something wrong. Chester and Beaudin’s (1996) findings also suggested that putting off the observations until late in the year could lead to negative self-efficacy beliefs for the teacher, because the teacher might feel that the administrator did not value his or her competence.
Some research has shown that administrative support can help reduce the attrition rate of many beginning teachers. According to Chapman (1984), the more the administrators are involved with their teachers, especially the new teachers, the better the chance that the teachers would not leave teaching. Chapman also felt that, if administrators worked closely through observations and interactions with their beginning teachers, they could contribute to teacher retention in their schools.

**PURPOSE OF THE STUDY**

The purpose of this case study was to examine the teaching life of a beginning high school teacher, exploring her experiences during her first two years of teaching and the decisions that she made regarding her position as a teacher. The case study format was utilized to investigate the complexity of her experiences. According to Hamel, Dufour and Fortin (1993), case study provides the opportunity to establish close ties with the field through a detailed, descriptive story of the actors. This method allowed the researcher to observe how the teacher focused on her particular situation in the classroom and school environment – how she fitted in the social network of the school.

**SIGNIFICANCE OF THE STUDY**

Many beginning teachers are unaware of how to deal with the complex situations they face so they must be prepared to enter the classroom with the self-confidence needed to succeed and stay in the teaching profession. This case study
can help educators understand beginning teachers’ accomplishments and struggles, as they complete their first years in the classroom, and contribute to the literature on teachers’ lives and experiences. Finally, the insights gained might help in transforming teacher education and alternative certification programs to prepare beginning teachers more adequately for the classrooms.

RESEARCH QUESTIONS

Four major aspects of the beginning teachers’ teaching experience were the focus of this study: teacher perceptions and expectations, teacher relations with students, teacher relations with other teachers, and teacher relations with administrators. The following four questions guided the study:

1. What are the expectations and perceptions of the beginning teacher and how did her perceptions change over the course of her teaching career?
2. How does the beginning teacher relate to her students and manage her classroom?
3. How does the beginning teacher relate to other teachers in the school?
4. How does the beginning teacher relate to the administrators in the school?

These foci were chosen because prior studies suggested that beginning teachers’ difficulties are associated with unrealistic expectations, feelings of isolation, discipline problems with their students, and lack of support by administration and other teachers. Prior research suggests that beginning teachers tend to enter the field with high expectations for what they are going to accomplish socially, for instance, to keep students engaged (Marso & Pigge,
1997). These high expectations of beginning teachers may cause emotional exhaustion, according to Schwab, Jackson, and Schuler (1986).

**RESEARCH DESIGN**

*Context*

A medium-sized Southwestern city with a population of approximately 400,000 with an ethnic composition of 70 percent Caucasian, 15 percent African American, seven percent Hispanic, four percent Native American, and two percent Asian served as the setting for this study. The per-capita income is $21,534 and the median household income is $35,400. The percent of families living below the poverty level is 10.9%, with 51.9% of which were female-led households with children under five years.

The school district is the largest school district in the state, with nine high schools. Lincoln High School has a population of approximately a thousand students with three administrators and eighty teachers. The school usually ranks 3rd among the district’s high schools in academic performance. Lincoln High School was built in 1938 with two main buildings. The larger building houses the administrative offices, an auditorium, a cafeteria, two small gymnasiums and a library as well as numerous classrooms for the 10th, 11th, and 12th grade students. The smaller building houses administrative offices and classrooms for 9th grade students.
The participant in my study was a 28-year-old 9th grade mathematics teacher. This teacher was selected due to the fact that she had only taught two years, and her willingness to share her experiences as a teacher for this study. The name of the teacher and the high school used are pseudonyms. The first year she taught 10th, 11th, and 12th grade students in the main building. The second year she was assigned to the freshman academy.

Method

This inquiry focused on a single case and employed several methods of data collection: field observations, document collection, and formal/informal interviews. The study was conducted over a two-month period between October and December. The researcher focused on the teacher’s perceptions and expectations, particularly with respect to her relations with her students, her relations with other teachers, and her relations with the administrators.

Since the study on one beginning teacher’s expectations and experiences, the case-study approach was best suited for this purpose. The beginning teacher’s experiences inside her classroom were observed as a means of describing and analyzing the experiences unique to this teacher. As Stake (1978) explained, with a case study, the researcher and readers should be left with more to think about than less. The case study provides theory to build upon – causing more exploration of the phenomenon instead of a single answer to the question of “why”.
DATA COLLECTION PROCEDURES

Observations

There were three observations conducted in October, November, and December. The researcher kept a journal of informal observations and structured interviews. Following Briggs (1986), the field notes pages for observations were divided into two sections. One part of the notebook page was used to sketch the setting of the classroom and to record any type of interpretations or questions that came to mind during the observations. The other part of the page was used to write detailed descriptive field notes. The observations were conducted while the teacher was teaching her lessons. These observations focused on how the teacher adjusted to her students and her classroom as well as the design of the classroom, teaching techniques, and any other categories of themes that began to emerge during the study.

Interviews

There were three phases of the interview process accomplished with the teacher: (1) one initial interview based on the perceptions of her teaching career; (2) one follow-up interview about her remembrances of her first-year teaching experience; and (3) one final interview comparing her current teaching experience with that of her first year at the school. Although most interview questions were developed by some point before the interviews, all interviews were conducted in a conversational format in which the teacher was encouraged to elaborate on
information (Patton, 1990). The goal of the interview process was to get a detailed account of classroom activities and other occurrences in the school which dealt with students, other teachers, administrators, and mentors, and also the teacher’s interpretations and reactions.

The Phase I interview asked general questions about her teaching experiences, including her teaching style, her philosophy of discipline, effective ways to motivate students, components of an effective lesson plan, her philosophy of education, qualities of a good teacher, and current events in education. During the Phase II interview, the teacher was questioned about her recollections of the perceptions and expectations upon entering her classroom for the first time. This provided insight into how the teacher thought that first year progressed. She explained her struggles with the environment, the students, other teachers, the administrators, and the culture of the school. Finally, Phase III was a reflection interview comparing the kind of teacher she is now compared with the kind of teacher she was two years ago.

**FINDINGS**

*Research Question 1: What are the expectations and perceptions of the beginning teacher and how did her perceptions change over the course of her teaching career?*

The beginning teacher wanted to be a “good” teacher and being a good teacher meant having particular kinds of relationships with students, administrators, and other teachers. During her first year of teaching, Sarah tried to
form a relationship with her mentor but instead reached out to another teacher who seemed to relate to her during a time that she needed guidance and encouragement.

In the first year, she had a tough time adjusting to the mathematics classes that she taught. She was not able to accomplish what she wanted to with her students. When she was offered a similar position, the decision became easier.

I was asked at the end of my first year to move to the Freshman Academy. At first I didn’t know if I wanted to or not, but I decided to because I liked the idea of a smaller building and teaching the same subject all day. Plus I knew the math teachers better in that building and if I needed help I would have a stronger support system. (personal communication, November 30, 2009)

Research Question 2: How does the beginning teacher relate to her students and manage her classroom?

Sarah taught back-to-back double-block classes of math and math remediation. In her interviews she was clear about what type of teacher she wanted to be and how she wanted her students to react to her.

I don’t expect to be their best friend or their buddy. I expect them to respect me. I expect them to look at me as a person who is just trying to help them, not a person who is trying to ridicule them and make fun of them or trying to make them feel stupid. I’m hoping that they see me as someone they feel safe with, and they are not afraid to answer questions. I hope that they have fun. Learning shouldn’t be boring. (personal communication, November 3, 2009)

Sarah’s idea of how she wanted to relate to her students seemed to be a reaction to memories of teachers she had when she was a student. She recalled how teachers treated students – with disrespect and ridicule. Sarah wanted her
students to enjoy her classes and trust her as a teacher. She did not want to be a
teacher who made her students feel stupid and lower their self-esteem. She
explained:

I want to be the kind of teacher that students think they can come to and
confide in. I know it isn’t a contest about who likes whom best, but I don’t
want them to dread coming to my class. I want them to enjoy it or be okay
with it, [to] be comfortable and feel like it’s a safe environment for them
to learn and not feel ridiculed or feel stupid. (personal communication,
November 3, 2009)

Sarah focused on her efforts to make the lessons interesting. She
had the students participate in group work, cooperative learning activities, as well
as individual class work. When there were activities, most students seemed to
enjoy the lessons. However, some students took those opportunities to sleep in
class. All did not go smoothly with “discipline”. There were several students who
gave Sarah a difficult time. Those students talked out of turn, made unnecessary
noises, and were rude and disrespectful to Sarah.

Perhaps out of frustration or lack of knowledge about how to get the
students on task or interested in being in school, there were times when she
treated her students in a manner that she did not want to treat them. She criticized
them for not participating or not doing their work. At least four or five times
during the observation, she got upset with some of the students who would not
participate in the lesson. She remembered her disastrous first year:

My Algebra I class was terrible. It was a repeat class so if my
understanding is correct, most of the students were on at least their third
try to pass Algebra I. I felt like I was just babysitting these kids. There were about five students who really cared to learn anything. The rest were only there because they had to be and told me that. (personal communication, November 30, 2009)

Research Question 3: How does the beginning teacher relate to other teachers in the school?

Chester and Beaudin (1996) discovered in a large study of 173 newly hired and beginning teachers that support from experienced teachers was vital to their self-efficacy beliefs. They needed to know that other teachers in the school liked them and supported them. This was the case with Sarah, who spent quality time working on her relationship with other teachers. She felt she had a good rapport with the other teachers at the school (personal communication, November 30, 2009).

Sarah had the self-confidence that was needed to get through a tough year, and the emotional support that she gained from the staff was an enormous boost to her self-image. Her assistant principal had nothing but good things to say about her. Since Sarah had worked at the same school for two years, she felt that the teachers in her school were extremely helpful. In her first year, a mathematics teacher who shared the same planning period gave her pointers on teaching Algebra and Geometry. She said, “He told me always to have everything prepared before class and to never have to be writing on the overhead during class. That is probably the best advice anyone ever gave me.” (personal communication, November 30, 2009).
Sarah was accepted by many of the teachers. That was not the case during her first year. She lamented, “There were a few male teachers on the same hall as me who would watch my Algebra students walk in and laugh about it because apparently there were several gang members in the class and they found it funny that they would put these students in the same class.” (personal communication, November 30, 2009). Much stress was alleviated from Sarah because of the relationship that she had with the other teachers – the kind of “praise and recognition from fellow colleagues” that Punch and Tuetteman (1996) found to be so important for new teachers.

*Research Question 4: How does the beginning teacher relate to the administrators in the school?*

Sarah had three administrators: a principal and two assistant principals. The administrators divided the areas of responsibility. Mary Johnson, the female assistant principal was responsible for the mathematics department. There were only a few times when an administrator visited Sarah’s class, and that was to ask her questions about particular students.

That was different from Sarah’s first year of teaching when this particular administrator was part of the three-person committee to evaluate Sarah’s entry-year in teaching. In addition, the assistant principal took a personal interest in Sarah’s struggles. She said, “Ms. Johnson would always come by and smile and was helpful when she could be but she did have numerous other things to worry
about. But I always looked forward to seeing her smiling face and hear her words of encouragement.” (personal communication, November 30, 2009).

According to Sarah, the only time that she was observed by an administrator was for the monthly walkthroughs and the formal assessments. Other than that, every now and then, Ms. Johnson might poke her head in the door during a lesson to say hello. She spoke kindly of Ms. Johnson. “She was wonderful” according to Sarah (personal communication, November 30, 2009). During her two observations and the few times that she was able to walk into the room for a minute, she felt that Sarah had good classroom management.

As did the principals in Brock and Grady’s 1998 study, Sarah’s assistant principal equated “good” teaching with “good” classroom management skills. When she walked into her classroom the students were always quiet, and she hardly ever sent students to the office for discipline problems. If she did, it was for serious offenses. Sarah had much respect for this person, and felt that if she had a problem, or a need as a beginning teacher, she could go to her for help or advice. She prided herself on not being afraid to approach her principal or assistant principals with concerns she had with her classroom, students, or other teachers.

CONCLUSION

Research suggested that new teachers start their teaching careers with high expectations – expectations that are sometimes unrealistic. Many people go into
teaching because they want to *serve* others; but they also want to relate to others and interact with their peers and students (Lortie, 1975). Once *reality* enters the picture, many beginning teachers begin to struggle, sometimes changing perceptions of the role of a teacher.

As beginning teachers start their careers, some are prepared for the challenges of working with students in the classroom and some are not. A number of qualitative studies have focused on teachers’ relationships with students, showing that frequently new teachers have problems in this area. Veenman (1984) found that the idea of “classroom management” was an issue in classrooms twenty-five years ago and Goddard and Foster (2001) discovered that beginning teachers still struggle with the notion of “classroom management”.

There is considerable research on the relationships that beginning teachers had with other teachers (Chester & Beaudin, 1996), particularly the relationships new teachers had with their mentors. It is difficult to make generalities about *which* kinds of relations are best for *which* teachers, but, suffice it to say, these relationships were often important to the self-efficacy beliefs of beginning teachers, and without those relationships, many beginning teachers might not have lasted the entire year.

The literature also points to the importance of the beginning teachers’ relations with their administrators. It seems that many beginning teachers want and expect their administrators to visit their classrooms, give constructive
criticism, and say how much they value their presence (Chapman, 1984; Punch & Tuetteman, 1997). Many of the beginning teachers wanted access to their principals, to know that they could talk to their administrators about their students and any problems that they might have.

For many beginning teachers, the relationships that they have with their students, other teachers, and administrators can affect their decisions to stay teaching the next year. It was evident to this researcher that the isolation this beginning teacher experienced was her largest problem. Her classroom was down a long hallway far away from any other classroom, and because of this isolation she had no one to talk with if she had a problem. “I had a mentor teacher but she was in the other building and, by the end of the day, I usually had figured it out by then” (personal communication, November 30, 2009).

For her, a good teacher was someone who showed concern for her students’ academic as well as for their personal welfare, kept order in her classroom, and was actively involved with the staff of her school. She was not able to create the kinds of relationships she had hoped with some of her students. During the last few months of the school year, teachers are expected to make decisions about where they wanted to be the next year. Sarah reflected on her disastrous first year, “I never thought about quitting. I knew that this was the job that I wanted and I hoped that I would get to be a better teacher. I never really
thought that the kids were that bad, I just felt like I didn’t know how to manage them” (personal communication, November 30, 2009).

Contributions of the Study

What kind of contribution is made by a study of one beginning teacher in a unique setting in a medium-sized Southwestern city? What kinds of insights can be derived from it? The major contribution is what it takes to be a “good teacher”. Sarah wanted to be a good teacher, and she thought of quality in terms of relations with other people, including students, other teachers, and administrators. To Sarah, a good teacher motivated her students – got them excited about learning. Dolley’s (1998) study, good teachers were seen as being caring, committed, creative, reflective in thinking, and having internal locus of control; and in Norton’s (1997) study, good teachers were described as creative, flexible, enthusiastic, and intuitive in their teaching. These studies focused on qualities that are manifested particularly in the teacher’s interactions with students.

The beginning teacher’s perceptions of what makes a good teacher was complemented and complicated by perceptions from other educators in the building. The teacher’s administrator commented that Sarah was a good teacher because she had her classroom well organized, kept her students on task, did not have many discipline problems, and did not need an excessive amount of assistance (after the first year).
Beginning teachers, and especially first-year teachers, have to deal with learning the “ropes” of teaching, developing their own teaching style, understanding the culture and how it fits into teaching strategies and classroom management, and adjusting to teaching while still maintaining some type of personal life. This study addressed how extremely difficult it was for these beginning teachers. Without the support of administrators and other teachers, especially mentors, it would be difficult for a beginning teacher to get through a year of teaching.
ACKNOWLEDGMENTS

I would like to thank Dr. Lisa Bass for helping me to appreciate the qualitative side of research, Dr. Courtney Vaughn for showing me the tools of research, Dr. Jeffrey Maiden for making me become a better writer, Lyda for being a great administrator and friend, and Mandy for opening her teaching life to me.

The Muses of Sir Arthur Sullivan

Arthur Sullivan is widely known for his collaboration with W. S. Gilbert, which resulted in the celebrated operettas *The Pirates of Penzance*, *The Mikado*, and many others. The combination of Gilbert’s lyrics and Sullivan’s melodies has captivated audiences in English-speaking lands for well over a century. Considerably less well known are Sullivan’s more than 100 art songs, which have been little studied and are rarely heard today. Most of these songs were published during Sullivan’s lifetime, though a few remain in manuscript. Fewer than twenty are available in modern editions that are faithful to the original sources, and all the original editions are out of print. Thus a large body of the music of a man who was perhaps the most successful English composer of the nineteenth century remains unknown and unavailable to today’s musicians and educational repertoire.

Drawing from archival materials such as his original letters and diaries as well as published biographies, Sullivan’s solo songs can be easily placed within the context of his professional career and personal life. It is evident that Sullivan had two great lovers. He never married, but the relationships he had with these women greatly influenced his compositions, as displayed in his song dedications. For example, the turbulent love affair he had with Rachel Scott Russell corresponds with dark romantic art songs composed during this time. Their affair lasted almost five years and their engagement was quickly dissolved due to the Scott Russell family’s disapproval of Sullivan.

Sullivan set many of Tennyson’s texts for his art songs. Many of these compositions he dedicated to the women in his life and those that shaped his musical career. According to many scholars, Sullivan was the “undeclared” music laureate for the royal family and Queen Victoria herself. Tennyson and Sullivan collaborated on the song cycle, *The Songs of the Wrens*. It took five years to get it published due to Tennyson’s lack of interest and stubborn demeanor, even offering Sullivan £500 to terminate the project. Sullivan refused. My paper will focus on the relationship between Sir Arthur Sullivan and Lord Tennyson and the music Sullivan created as a result of this relationship. Also, I wish to explore the vast opportunities a rediscovery of his art songs may bring for music education.

Implementing Educational Gaming

Abstract

This document describes the use of the educational gaming technology, *Tabula Digita*, during the professional development phase of the *Dimension M Project*. Included is a brief introduction to *Tabula Digita* and a brief discussion of the evaluation of Phase I. The purpose of Phase I was to provide professional development to mathematics educators, with the goal of improving the quality of teaching using online, educational gaming software. It was found that teacher concerns about implementation of the software were associated with finding time to fit-in its use and obtaining time in a computer laboratory. Of the fifteen teacher participants, most felt that the Multi-Player Missions would have the most impact on students enjoying/appreciating mathematics, that the Instructional Modules would have the most impact on students learning mathematics, and that the Single Player Missions would have the most impact on students doing mathematics.
Implementing Educational Gaming in the Mathematics Classroom: Phase I, Professional Development

Phase I of the *Dimension M Project* was implemented during the Spring and Summer of 2010 at the Institute for Math Learning at West Virginia University (WVU). Support for the project was made available from the West Virginia Department of Education, The Center for the Advancement of Stem Education, and participating Blue Ribbon Mathematics Partnership Counties located in north central West Virginia (www.blueribbon.ws). This document focuses on the use of educational gaming technology, *Tabula Digita*, during the professional development phase of the project. The purpose of Phase I of this project was to provide professional development to mathematics educators, with the specific goal of improving the quality of teaching using online educational gaming software.

**Software Used**

*Tabula Digita* has four primary components for the *Dimension M* math product series. Those components include Instructional Modules, Single Player Missions, Multi-Player Missions and the Educator Portal. The Educator Portal includes an online management system for student performance data as well as many resources for a teacher implementing gaming technology. The Instructional Modules were developed based on the work on lesson planning by Hunter (1990). This component is made up of web-based flash modules. The modules are presented "in story" to complement the educational video game missions. The modules are meant to teach students concepts and skills that are practiced within the missions. The Single Player and Multi-Player Missions were developed based on the *Learning by Doing* instructional theory of Schank, Berman, and Macpherson (1999). The Single
Implementing Educational Gaming

Player and Multi-Player Missions are designed to foster skill development and the learning of key concepts through goal-based scenarios.

Program for Professional Development

Fifteen mathematics educators participated in the project representing seven middle/high schools in four counties in West Virginia. Due to several uncontrollable factors, the framework for the professional development included two one-day meetings during the spring semester followed by a three-day workshop in June. Phase II of the project will include three, one-day follow up sessions and online interactions throughout the academic year with the teachers, implementation of the materials in the classroom, and project evaluation using student performance data.

Phase I of the project had the following objectives for teacher participants:

• Demonstrate knowledge of educational pedagogy related to implementing digital gaming
• Demonstrate knowledge of philosophy of game-based, mathematical learning
• Demonstrate skills to navigate through Instructional Modules, Single Player and Multi-Player Missions in DimensionM and Dimenxian
• Demonstrate skills to navigate through the Dimension M Educator Portal
• Develop an Implementation Plan for next academic year (completed by August 1, 2010)

The project made use of the Tabula Digita mathematics gaming software. The activities were correlated to the West Virginia Content Standards and Objectives. Each school received a netbook computer with case and software and student licenses of Tabula Digita mathematics gaming software (1000 total seat licenses for each of three years of the project).
Implementing Educational Gaming

Reflection Sheets

Each participant was asked to respond to reflection prompts at the end of each meeting day. Overall, participants felt comfortable with the material to which they were being exposed. The last workshop reflection prompts were evaluated for trends regarding concerns for implementation of the gaming software into the classroom. Of the 15 participants, five were concerned about getting computer laboratory time for their students and three were concerned about finding time in their schedule to include the materials. Only one participant mentioned concern about learning to "play" the games.

Predictions

Each participant was asked to make predictions with respect to their students’ engagement with the educational gaming software materials during Phase II of the project. Reflective data will be collected at the end of the pilot implementation year. Selected, preliminary results of the predictions follow.

Teachers were asked to predict which of the three components of *Tabula Digita*, Instructional Modules, Single Player Missions, and Mulit-player Missions, would have the greatest impact on each of the following: a) students enjoying/appreciating mathematics, b) students learning mathematics, and c) students doing mathematics. Fourteen of the fifteen responded that the Multi-Player Missions would have the most impact on students enjoying/appreciating mathematics, thirteen of the fifteen felt that the Instructional Modules would have the most impact on students learning mathematics, and ten of the fifteen felt that the Single Player Missions would have the most impact on students doing mathematics.
Implementing Educational Gaming

Phase I Workshop Evaluations

Each participant was asked to complete an anonymous project evaluation. An analysis of selected questions on the evaluation follows. Some participants chose to not respond to all questions of the evaluation.

The content was at the appropriate mathematical level (average score out of 5).

10- 5's, and 3- 4's Avg. 4.77

The work assigned in this workshop will enhance my teaching.

8- 5's, and 5 - 4's Avg. 4.62

The workshop experience will help me teach more effectively.

9- 5's, 3 - 4's and 1 - 3 Avg. 4.62

The discussions about how to teach were useful.

8- 5's, 4- 4's and 1 - 3 Avg. 4.54

The materials provided were useful.

11- 5's, and 2 - 4's Avg. 4.85

Overall ratings out of 10 for material was Avg. 9.46

Discussion

Based on an analysis of the reflective responses collected during the workshop, it appears that most concerns surrounding the implementation of the gaming software into the classroom are associated with making time in the schedule to fit-in the use and obtaining time in a computer laboratory. Only one teacher expressed concern with learning to use the software herself. It should be noted that County Partnership Forms were required prior to registration and it is anticipated that resources such as computer laboratories will be available for the students. In addition, teacher participants were required
Implementing Educational Gaming

to turn in an implementation plan by the beginning of the school year and it is expected those will help
teachers to pace the year taking into account using the technology. It is intended that other
implementation concerns that arise throughout the year will be addressed in discussion boards via the
on-line project site during Phase II.

When making predictions with respect to how using each of the components would affect
students, most teachers felt that the Multi-Player Missions would have the most impact on students
enjoying/appreciating mathematics, that the Instructional Modules would have the most impact on
students learning mathematics, and that the Single Player Missions would have the most impact on
students doing mathematics. Teachers were asked to make the predictions after having several hands-on
sessions with each of the components. Recall that the Instructional Modules, according to Tabula
Digita, are meant to teach students concepts and skills that are practiced within the missions. In their
predictions, teachers validated the intent of the Instructional Module component use. It is not surprising
that teachers chose the Multi-Player Missions as the component most likely to impact students’
enjoyment. These missions are often played by using teams and almost always are played in groups.
There is a strong social underpinning connected to this component when used as intended. It could be
that teachers anticipate that students will enjoy the social aspect of Multi-Player Missions. Finally,
Single Player Missions set up the structure for students to do their own work in "real time". While
obtaining success in the multi-player team setting is more likely to occur if all team members are
"pulling their weight", in order to be successful in a Single Player Mission, an individual must be able to
"do the math". Again, the teachers validated the intent regarding how the missions are intended to be
implemented.
Finally, though the teachers plan to implement this gaming technology in 6th grade, 7th grade and Algebra I classrooms, analysis from the project evaluation indicates that teachers found the material to be at the appropriate level and felt that it would be useful. Some of the teachers plan to use the material to pre-teach concepts, others plan to use it for review or re-teaching. Some of the teachers will be using it in an Algebra Support course which is a companion course for Algebra I for students determined to be at risk of not succeeding. Some teachers plan to work sequentially through all missions, while others are planning only to use those that are directly tied to the content required in the course. These different implementation plans are being taken into consideration for the evaluation design which will be used in Phase II of the project.

ABSTRACT

Intercultural Field Experiences in Alaska: Contextual Learning in Teacher Education

This paper presents findings from research that examined intercultural field experiences as a strategy to prepare teachers in Alaska to work effectively with indigenous students and a growing diverse student population. Since 2007, pre-service teachers from the University of Alaska Anchorage have had the opportunity to participate in an optional program component which consists of spending two weeks interning in Alaska Native village schools. The study of this program component was guided by two primary research questions: 1) What do pre-service teachers experience during the intercultural field experience; and 2) What are the implications for using these kinds of experiences to prepare teachers for diverse classrooms in the Alaska context? Analysis of the longitudinal data indicate that the intercultural field experiences have provided opportunities for interns to examine and raise critical questions regarding the socio-cultural-political contexts of education that are particular to Alaska. Moreover, this contextualized learning approach has assisted interns in examining the relationship among their own sociocultural consciousness or identities and teaching and learning. These findings have implications for teacher education programs regarding the role of intercultural field experiences as intentional sites for contextualized learning in support of critical reflection related to social-cultural issues.

Culturally Relevant Teaching: Connecting Affirmative Beliefs with Practical Classroom Skills

Abstract

The changing demographics of children in grades K-12 in the United States are impacting the needs of pre-service teacher preparation. One practice that may address these factors is culturally relevant teaching. This study presents the reported beliefs and perceived competency related to culturally relevant teaching practices of pre-service and in-service general and special education teachers. One hundred and eight participants completed the Culturally Relevant Teaching Survey. Results of the two-way ANOVA demonstrated highly statistically significant differences in culturally relevant teaching skills by teacher type and ethnicity. However, no statistically significant differences were noted in participants’ beliefs about culturally relevant teaching. Implications for preparing pre-service and in-service teachers to provide culturally relevant teaching are discussed in addition to future research directions.

A Paper Presented at the Eighth Annual Hawaii International Conference on Education
Jan. 4-7, 2011, Honolulu, Oahu, Hawaii. This research is sponsored by a grant award from the National Institutes of Health: National Heart, Lung & Blood Institute, 2010.

ABSTRACT

We used Certified Asthma Educators (AE-C) to teach parents/guardians and their children asthma management and control techniques. Participating families (20) were low-income and recruited from local pediatricians and family practice physicians. They were scheduled to receive 3 in-home visits from the AE-C’s, 2 visits with an asthma specialist, referrals to local support resources and an asthma care package complete with
physician-approved medicines and inhalers. Goals were to improve overall Quality of Life of both the patients and their families by achieving the following objectives: 1. knowledge of asthma as a chronic but manageable disease, 2. skill in taking their medications, 3. skill in cleaning their asthma equipment (i.e., inhalers, spacers), 4. awareness of and removal or avoidance of asthma “triggers” in their home and school. We took baseline measures of FEV (forced expiratory volume), PER (peak expiratory rate) and related pulmonary assessments as well as knowledge, quality of life perceptions, number of days lost from school and number of visits to the hospital. The number of triggers identified in the home was also recorded. Participants were instructed on how to manage each without for example always having to “remove” them (e.g., pets could receive regularly washings or put somewhere else away from the patient). Follow-up visits were scheduled for 6, 9 and 12 weeks. Data was entered on EXCEL and “subjects as their own controls” over time was the analytic strategy. With the exception of “trigger removal” preliminary results show that the majority of objectives were favorably impacted by the program. Follow-up data is in progress and is encountering a wide array of challenges. These are examined with respect to the targets for this intervention: low income families. We present the program intervention as a prototype for effective asthma control and reduction in other states with a high prevalence of asthma related health problems in these populations.

Introduction
The prevalence (i.e., total existing cases) and incidence (i.e., total new cases) of both adult and adolescent asthma has increased over the past 5 years (*National Health Statistics Report, 2008*). While Fatality Rates (FR) for asthma are less than other diseases like pancreatic cancer or unintentional injuries, the cost of treating asthma is a horrific cost to the U.S. health care system as well as to the state of New Mexico. According to researchers at the Centers for Disease Control, the United States spends $18 billion dollars in asthma care yearly (*Moorman, Rudd & Johnson, 2007*). Moreover because asthma is relatively easy to control and manage with appropriate medication, lifestyle and environmental modifications, the NIH have provided a number of grants to states who have research and intervention teams in place for achieving this critical objective (*http://www.nih.gov/news/health/dec2009/nhlbi-02.htm*). Asthma Allies, a not-for-profit organization from New Mexico was one of 13 teams awarded funding to test out the effectiveness of various strategies in asthma control and management.

**Epidemiology**

New Mexico is among the poorest and most ethnically diverse states in the nation (*http://www.unm.edu/~shri/images/NMReport200304.pdf*). The 2004-2007 prevalence rate for young people with a diagnosis of asthma was estimated at 64,000 (*ICD-9 codes 493.0-493.92*). It also has an extremely high rate of asthma in its southeast quadrant (*http://nmhealth.org/ERD/HealthData/Asthma*). The average hospital stay during 2004-2007 for those under 15 statewide was 21.7 / 10,000 population. For the southeast quadrant it was more that twice this figure: 58 / 10,000 population. For Emergency
Department admissions the state reported 45.4 / 10,000 population while the southeast reported 89.1/10,000 population. For comparative purposes the ER rate nationally is 23.9 / 10,000 population. Reasons for these substantial discrepancies vary but the high concentration of petrochemical industries in this area remains a major public and adolescent health concern (http://nmhealth.org/ERD/HealthData/Asthma/Epi%20Report%202003_17_2009.pdf). It is also important to note that asthma causes more missed school days, ER visits and hospital admissions than any other disease in the nation in the adolescent population. Added to this is the daunting finding by researchers that population disparities in asthma prevalence, especially for African Americans, continue to persist (Gold & Wright, 2005).

Data from the National Health Interview Survey (CDC/NCHS, January-March, 2010, p.97), document this disparity in Figure 15.6
As shown both Black age cohorts (i.e., under 15 as well as 15 and over) relative to Hispanic and white cohorts, substantially higher prevalence rates of asthma are reported. Such disparities cause a heightened concern for public health authorities because of the excessive financial as well as personal costs associated with this disease.

Ultimately, since asthma can be controlled and effectively managed in an overwhelmingly high majority of instances, the health care dollars for multiple and chronic repeat visits to a provider for asthma complaints, is clearly a major financial drain. In a time of national recession and health care crisis for so many poor families, the need to rigorously test out innovative and cost-effective preventive and control interventions regarding asthma morbidity and mortality, is critical (The Nation’s Health, 2010).

**Methods**

Asthma Allies of New Mexico is a Not-For-Profit organization that has worked in various communities around the state for over five years. The team includes Certified Asthma Educators (AE-C), Registered Respiratory Therapists (RRT), university faculty and a cadre of volunteers who are trained to assist in a wide array of interventions. The specific focus of the current H-VAMP project was to secure 30 low-income families with diagnosed asthmatic parents and/or children. These patients were referred from pulmonary physicians, internists, community-based health clinics and organized community outreach activities as well as others in the state.
Participants.

Patients were visited by team members in their homes and provided a baseline evaluation of their: asthma severity, pulmonary function (FEV1, FEV1%, FVC), exhaled nitric-oxide (eNO), in-home asthma “triggers” (type, location and how to manage), number of ER visits, hospital stays, missed school days, knowledge of asthma, skill at using and cleaning their asthma tools, and perception of their Quality of Life. There were two instruments developed for assessing these objectives, one for adults and one for the children.

Conceptual Basis of the H-VAMP Program.

There has been minimal research exploring the effectiveness of using serial home visitations by Certified Asthma Educators to help families control asthma (Garbutt, Banister, Highstein & Sterkel, 2010). Research does clearly indicate that asthma triggers are consistently prevalent in homes. Pets, carpets, smoking and mold are but a few of the triggers for asthma (Phipatanakui, 2006). Yet many poorer families have limited knowledge of this wide array of triggers for their children’s or their own asthma. Knowledge of how to use available medications and skill in using as well as cleaning asthma tools (i.e., chambers, inhalers) are also deficient. Clearly, if such families need this kind of education it is probably best that the educators deliver it in the environment where the asthma occurs.
Bandura’s Social Cognitive Theory suggests that people learn new behaviors in their environment by: 1.) observing models, 2.) developing self efficacy, 3.) practicing performance accomplishments (i.e., skill acquisition) and, 4.) being provided with positive reinforcement for their efforts (Bandura, 1999). In H-VAMP each of these elements is targeted by the asthma educators and the respiratory therapists during each home visit. To the extent one agrees that people change behaviors via this logic, the H-VAMP intervention can be considered conceptually grounded and operationally implemented via contemporary health behavior theory.

Research Design, Data Collection & Time Analysis.

Recruitment of participants began during December of 2009 and is ongoing. Since a formal “control” or “comparison” group was not feasible we elected to employ a subjects-as- their-own-controls method (Gay, 2009). This approach allows researchers to collect baseline data on objectives, conduct multiple follow-up assessments at set intervals, plot the progress of each individual and then aggregate the data for the group over the total time period. We scheduled follow up on the patients at minimum 2 times and for some three times over an 8-month period. At each of these home-based visitations patients were interviewed and data collected on each objective. Figure 1 depicts this design.

Figure 1: Subjects (Ss) as Their Own Controls

For each Ss (N=21) , per Objective :

Baseline - > Follow-Up1 - > Follow-Up2 - > Follow-Up3 - > Final Aggregate Score
Individual as well as group “trend lines” over data collection points are also constructed in this design to show both individual gains across objectives and the entire group performance. Where statistical or more sophisticated quantitative analysis is desired, regression will be used to quantify (i.e., predict) both individual and group gains. This particular strategy was not seen as applicable to these preliminary data but will be planned for in future analyses when more complete and robust data sets are collected.

Data was entered into an EXCEL Database (Microsoft EXCEL, Book 1, 2003). With the exception of those objectives addressing frequency (i.e., number of days missing school, number of visits to a provider), scores were scaled for interval level measurement. Results were graphically portrayed by objective for both individual patients and for the entire group. At time of submission for publication these data were not yet ready for this plan of analysis.
Each patient was assigned apriori a code number for anonymous identification and tracking purposes. The first patient recruited, for example is: h2010004, gender was coded m/f, status was a (adult) or c (child). Major program objectives and the specific value ranges for the cognitive measures are presented in Table 1.

**Discussion**

The increasing prevalence rates for asthma in the state of New Mexico, especially in its southeast quadrant, stimulated the current research and intervention effort. The
multifaceted aspects of this disease make effective and long-term management of asthma in both adults and children, problematic. Not only must parents and guardians confront the fact that asthma has myriad and synergistic causes (i.e., genetic, environmental, behavioral) they must also be motivated to control it by way of sustained medication. Moreover they must be carefully persuaded to remove and/or neutralize asthma triggers in the home. Recognition of these as well as related challenges is crucial to effective asthma control in low income families. The major barriers experienced by our team are summarized next.

**Medication.**

Many families are poor and lack health and/or prescription coverage. A large majority of these patients require “controller meds” but are unable to obtain them because they cannot provide proper identification (i.e., social security #, birth certificates). Moreover the county does not have the resources to assist these patients obtain these medications.

**Language.**

More than fifty percent of the families speak only Spanish yet our team only has one asthma educator fluent in Spanish. The result is that many families have to wait to see that asthma educator and thus many become despondent which leads to lack of adherence to her recommendations.

**Socioeconomic status.**

Recommending that families remove or neutralize asthma triggers is problematic: some are inexpensive such as replacing pillow cases and mattresses with plastic covers, which H-VAMP provides. Others however are very costly: leaky gas stoves, moldy floors and roofs, formaldehyde-leaking cabinets, each require substantial financial investment. For
low income families such expenditures inevitably take a back seat to day-to-day requirements. Additionally, at the present time county resources and regulations do not cover these improvements.

**Literacy & Education.**

Home visitations as a method for improving control of asthma is considered the state-of-the-art strategy for managing this disease. We wrote all educational and behavioral action materials at a fifth-grade reading level yet many families had difficulty following instructions particularly those involving medication use and care of their devices (i.e., cleaning spacers, inhalers). The frustration generated from such scenarios for both the patient and the asthma educator, ultimately impacts adherence negatively.

**Family Dynamics.**

While the majority of patients had supportive families, there were two who had spouses that were chronic smokers. One of these was persuaded to always smoke outside, away from the patient. However there was one family where the spouse refused to smoke outside or even away from the patient and this caused great stress and strain on both the patient and the asthma educator. The degree to which patients have support from their spouse and family in following the recommendations from the asthma educator remains one of the most important factors in successful asthma control using home visitations.

**Conclusion**

The H-VAMP intervention to help low-income patients in New Mexico effectively manage their asthma showed promise in its first year of operation. Ultimately we were able to recruit approximately 19 patients and collect baseline pulmonary, health behavior,
cognitive and residence-based environmental data. Follow-up data consisting of second and third home visitations is still in progress. These data have been exceedingly difficult to collect due to the multiple barriers that surround this unique health promotion target.

Programs aimed at asthma control in other states in the U.S. and specifically those designed for implementation in low-income and/or minority populations, will want to consider these barriers closely during the planning stages of their interventions. The overall feedback from patients and families on the benefits of participating in the H-VAMP program have been highly and consistently favorable. We have ongoing qualitative data being collected that documents this impression. The high costs associated with uncontrolled asthma in low-income populations demands that states invest in campaigns that motivate to patients to take preventive action. Such interventions must be designed and implemented so that factors of convenience, expense, benefit, relative advantage and most importantly, self-efficacy are optimized for patients in the program. Our program has established a sound base from which to achieve these factors and in the long-term accomplish effective management of asthma as a disease.

Postscript

A recent paper published in the *American Journal of Public Health* (Garcia-Retamero & Galesic, 2009), examined adults with low “numeracy” skills (i.e., lower comprehension of quantified information) and the degree to which such individuals understand and thus act on treatment “risk reduction” advice from their providers. It was suggested that health
care providers at all levels investigate new learning methods that help such patients better understand what specific medical recommendations (i.e., prescription dose/frequency) actually mean. One such method consists of using “icon arrays” which present quantified information graphically instead of numerically or in narrative form (p.2199). Such teaching/learning techniques are at the forefront of a growing research literature designed to help patients with all varieties of disease and disability better understand what medical as well as general health and prevention advice entails (Duryea & Hrncir, 2009).

The H-VAMP program staff has integrated this new teaching into each of their home visitations. Yet despite this innovation many cross-cultural barriers remain with low-income patients with chronic asthma and continual testing of how to best overcome them remains a research imperative.

Digital Self: Primary Students and Computer Art

By Jenny Evans

ABSTRACT

This study evaluates primary students, aged 6-11, exploring their creation of a digital and virtual self, while learning they learned positive uses of blogging on Facebook for a research study at a small computer art camp. Using action research as well as a pre- and post survey that evaluated the growth of knowledge in digital art, along with separate analysis of meanings and expression identified symbols, colors, feelings, and subject matter.

This study offers an opportunity to combine computers, art, learning, and playing. Campers learned to use MS Paint, Adobe Photoshop, and the Virtual World of Pet Society to create a digital self in a decentralized classroom. This study demonstrated that primary students are capable of creating meaningful digital art and a virtual self with professional, 21st century technology. The campers in their self-portraits established individual meaning.

Author Bio: The researcher is a recent Master’s graduate of Art Education with an undergrad in Art History both from Arizona State University. She has spent several years teaching primary students in the school and community center settings. Currently she teaches high school students art appreciation and painting while looking forward to completing her Doctorate. Additionally, she is a mother of two, paints, and travels at every opportunity.

Purpose of Study

My intent with this study was to use spring break camp to determine whether primary aged campers (age 6-12) were capable of creating and editing meaningful digital and virtual art, while evaluating it via a social network. Experts, like Gude, state that art education must include helping students increase their capacities to make meaning (2008).

Following the theory that children learn by playing and experiencing, Gee (2009), stated, “Games and virtual worlds [microworlds] can allow kids to experience how the words [technological terminology] attach to the world and to experience it [virtual worlds]” (p. 7). This comparison contributed to ascertaining whether the art created by the students was meaningful.

Meaningful art is a broad term. This study used it in the simplest sense of the word that the campers explored. What do their pictures say without words? According to Rudolf Arnheim (1997), “Art is the capacity to express the nature and meaning of something through its sensory appearance” (p. 11). Another definition is “the ability to engage and entertain ideas and images; it is the ability to make use of images and ideas to re-imagine one's own life experiences. It is the ability to investigate and represent one’s own experiences” (Gude, 2008, p. 103). The art in this camp contains self-portraits.

The camp/study is about the self and by default necessary for the art to have meaning. Gude explained (2008) that the expression of the students’ emotions and feelings into meaning is necessary. Aesthetics matter because through aesthetic practices people make individual and collective meaning. Meaning making is the ability to utilize ideas and images, to re-imagine one's own life experiences in order to represent ones personal experiences (Gude, 2008).

As art educators, it is our job to introduce and engage our students to the techniques that
make or provoke deeply engaged experiences. In this study the campers connected meaning to expression by commenting on the virtual gallery.

**Research Questions**

1. What kinds of digital art can young campers ages 6-11 distinguish and identify?
2. What digital artworks can campers create and what do they mean to the campers?
3. What kinds of self-presentation (symbols, color choices, and patterns) do campers demonstrate when exploring digital identity?

**Methods**

Qualitative research is the collection and analysis of data in order to gain insights into a situation (Pitri, 2006). This study was qualitative and more specifically, used a participant observation approach. As a participant observer I taught, described, analyzed, and interpreted a class to fully understand it (Stokrocki, 1997) but also used an action research method to improve as a teacher from my participants.

Action research is a relatively new method of research in art education used to study teaching practice (Mertler, 2009), though it has been used in other fields. Margaret Riel (2007), and Ernest Stringer (2007) both used action research and argue that it necessary to evolve the teaching process. All styles of action research are cyclical with variations of study: action, analysis and reflection.

As recent as 2006, art education researcher, Sara McKay, challenged art educators to ‘live the question’ by encouraging participants to think broadly about sources of learning in art. Action research provides an opportunity to create situation-specific knowledge and is thus associated with qualitative methods. Other educators, such as Eisner (1991), Stout (1993), and
Sullivan (1993) agree that action research is natural to art education. Action research is describing a constantly changing educational situation, rather than generalized knowledge.

**Description of Program**

Campers (6 girls, 4 boys, aged 6-11) participated in a computer art camp in a decentralized classroom. The pre and post survey evaluated what the campers’ knowledge. There were four general lessons. They also completed one art criticism with the artwork that they chose from their virtual gallery.

A general and flexible outline is as follows:

- **Monday** – general introduction, with the pre-survey, lab etiquette, take photographs of the campers and follow Lessons: for Paint, for Opening a *Facebook* Account, and for *Pet Society*.

- **Tuesday** – begin Lesson for: *Adobe Photoshop* – Special Effects of Filters, continue with *Pet Society*, take additional class photographs, and continue social networking.

- **Wednesday** – begin Lesson for: *Adobe Photoshop* – Copy and Paste, continue in *Pet Society*, take additional class photographs, and continue social networking.

- **Friday** – complete comments, art criticism, all lesson plan requirements, post-survey, and share virtual gallery with parents.

Campers daily posted their digital art, comments on other students’ art, and responses to my questions posted via *Facebook*. I took digital photos and videos of the campers and uploaded them to *Facebook* to build the a library for the campers to use for editing during
camp. I created a secure Internet environment in order to ensure the safety of minors on the Internet and within a social network. I set up the entire social network, with privacy settings prior to camp. All parents signed a written consent allowing their children to participate in the study as well as be on the Internet and *Facebook*. I monitored the *Facebook* accounts for misuse.
Results

Description of Observations During Class

On Monday, the campers were introduced to MS Paint and Facebook following the MS Paint lesson plan and the Lesson Plan for Facebook. They completed self-portraits, some used the shape templates to create the roundness of the face while others drew it freehand with the mouse, see Figure 1 and Figure 2. The campers were quickly bored with limitations. They complained that they had done this type of art previously; this was not new to them. The campers were required to create at least three pictures, one being a self-portrait. Many did more than were required.

All of their artworks were posted to their virtual gallery within Facebook. Using the social network did not appear difficult. The campers quickly grasped the concept of “tagging” digital photos of themselves. By “tagging” the campers were identifying themselves in the digital photos or artworks, clicking on the picture and automatically attaching a label with their name. Campers made minimal comments in Facebook.

The introduction of the virtual world, Pet Society was a welcomed break from step-by-step learning of how to upload a picture to Facebook. The campers asked few questions, then explored the virtual space on their own. I challenged them to “dress” their avatar (virtual-selves). The second challenge of the day in Pet Society was to take a photo and post it to their virtual galleries, see Figure 3. All met the challenge. Many of the campers did not want to leave when the class was over at noon.

On Tuesday, I introduced Adobe Photoshop following the Special Effects Lesson. The campers noticed the similarities to MS Paint, the tool bars, the tools, the layout, and the menu bar. They were amazed at the simplicity of using the filters. Shouting out “oooo, aaahhh, you
did that with just one click!” After one five-minute demonstration, they were eager to try themselves. Students were required to edit at least three digital photos taken during camp, post them to their virtual galleries, and make comments on their own as well as others. All campers exceeded the minimum of at least three pictures, one camper made 13 variations. They quickly grasped the concept of “save as” and re-opening the original image to start the process again. They were eager to see what each other was working on and creating. The comments were easily made, see Figure 5. Grammar was not proper; complete sentences were a rarity; but the meaning was easy to interpret.

We also returned to Pet Society. They were required to take pictures of their avatar in their home, a friend’s home, and out shopping or around town. The Pet Society required that they work together rather than in competition, which is different than traditional games requiring competition, a winner and a loser. They were asking each other questions, such as where they got an item or so many coins, etc. I was only called for them to show me their progress, how they had redecorated, the fish they caught, or how the seed they planted turned into a tree. I was no longer the educator, but the spectator.

Wednesday, during transition time (drop off, sign in, etc), the campers explored an online program called Mr. Picassohead (www.mrpicassohead.com). This gave them the opportunity to create another self-portrait using tools based on the abstract designs of Pablo Picasso.

The campers were given a short ten-minute demonstration the Adobe Photoshop, copy and paste Lesson. They recalled finding an original digital photograph in the virtual gallery, saving it to the desktop, and opening the file in Photoshop. One picture, Figure 7, used copy and paste multiple times. Switching the heads of the boys to the girls was a very comical and
popular artwork, Figure 8. The boys were devastated when their heads were placed on a girl’s body wearing a dress.

*Pet Society* filled the final 50 minutes. The kids focused on checking on pets, petlings, planted seeds, friends, and the newest things in the shops. There were several image changes to their avatars. Today the theme was green, mostly due to St. Patrick’s Day. Some changed their color; others just changed their clothes. There was collaboration between campers on how to best achieve status or coins. The challenge today was to capture a picture of a special place in the Pet Society, post it in the virtual gallery, and explain why it was special. Unfortunately, camp ended before all could complete this task.

Thursday, the campers spent some time tagging digital photos that were taken the previous day. Campers were asked to select one image of their choice to work with in *Photoshop*. The challenge today was to use the copy and paste technique and apply a filter. Most of the campers saved the work by doing a “save as” after each copy and paste or filter process. When they posted their images to the virtual gallery, it documented the progression of their creation.

Friday the campers completed the post survey, and were asked to select from their virtual gallery “the best picture EVER.” It could be created with any of the software used during camp. I then asked verbally the following questions: “On the first comment line please describe your picture (what do you see), on the next comment line tell me what kinds of art do you see (colors, patterns, etc.), on the next comment line write what does it mean (the symbols, colors, shapes, etc.), and finally on the last comment write how well was the picture made and why.” There was a lot of prodding on my part to get them to respond with more than four words. I had to make a rule that the comments had to be at least five words in length, in order
to prevent them from saying: “it’s me, it’s cool, or I like it.” They appeared to want to work with Photoshop more than write comments.

Seconds upon completion of the art criticism, they quickly selected a picture to work with in Photoshop. I noticed that they used copy and paste and filters. They took risks (more extreme variations of the filters). In one image the camper copied herself six times, and used a different filter for each one, plus a filter for the background, for example: canvas, blur, neon, outline, and sketch. Other campers even used the drawing tools to add in their own graphics.

The campers spent the final hour in Pet Society. They were eager to share with each other “tricks” to getting around or finding the most coins or points. When their parents arrived the campers shared their virtual galleries, taking the time to explain how pictures were made, where the picture was taken, or why they chose that specific picture to alter and change.

Using action research posed its own challenges. At times I was pulled in either the direction of the teacher or the desire to collect data as the researcher. There were times when I was about take a picture when a camper called out my name, requesting assistance or wanting to share a new discovery. In this case documentation was lost in order to continue teaching. It would have been easier to have a third party in the room to document or a video camera set up in the back corner of the room.

Data Analysis

Responses from the pre survey identified the existing digital knowledge of the campers. All of the campers used computers; however, 91% use computers at home, 58% at school, 41% at the library, 25% local community center, or 16% at a friend’s house. Overall, 75% said that they created digital art, yet, when asked what digital art was 16% incorrectly identified it as
drawing and painting. The majority of campers 91% said it was art made on a computer, including 16% cartoons and eight percent pictures from a digital camera.

Campers responded to what a virtual world was with 58% as a computer game, or not the real world (66%). The campers stated that 66% visited Webkinz, 33% Club Penguin, 33% Neo Pets, 25% Barbie Girls, 16% Toontown, and 58% said they visited one that was not listed.

There were four types of artworks; digital art, pencil sketched art, painted picture, and a digital photograph. For each question, the campers were asked “Can you guess how this was made,” and given multiple-choice answers of the four different types of art. These questions would specifically answer: what kinds of digital art processes can campers ages 6-11 identify.

When the campers saw a digital drawing, 66% correctly identified that it was created on the computer. While the remainder 33% that thought it was painted picture. For the pencil drawing, 83% correctly identified it as drawn with pencil. When presented with a traditional painting, I thought the campers might be confused as technically it is a digital photograph of a painted picture. Eighty three percent correctly identified the painting as a painting. Finally the campers were presented with a digital photograph. One hundred percent identified the digital photograph correctly.

The post survey used the same four types of artworks. The campers were again asked “Can you guess how this was made,” exactly like the pre survey. These questions were designed to specifically answer: could they correctly identify digital art after spending a week in computer art camp. There was evidence of improvement in identification of digital art (36%), pencil drawing (20%), and painting (20%). Participating in camp assisted the campers in identifying different types of art.
In addition to art identification the post survey also included defining digital art. Campers defined digital art as art done/made on the computer (90%). When describing a virtual world, 81% responded “fake, not real, or on a computer.” There were questions about their avatars, (see Table 2); name, color, why that color, why that clothing, if they went to the style shop, and what did they change? When describing themselves seven mentioned the color while four listed emotional descriptors (happy, sweet, and cool). Clothing and outfit styles were chosen because of personal preference, regardless of cost. None of the virtual selves were naked. They responded that their virtual self was that specific color due to their favoritism of that color; none of the campers selected a color that matched their natural skin tone. Seven of the campers altered their avatar in the Style Shop during the week by changing a body part (eyes, ears, nose, mouth, head shape, or decorative symbol), while two changed their names. All of the other items visible the campers have purchased with their coins or earned by completing tasks, most left them in their room visible for all to see. Four of the campers included pictures of their “egg collection,” due to the spring season. There was not a dominant colored avatar, all were different from each other.

The post survey also asked the campers’ opinions about software, challenges, and enjoyment. The favorite software of all of the campers was Pet Society (63%), Photoshop (48%), Facebook (27%), and MS Paint (18%). Four campers noted having difficulty with Facebook. All of the campers (100%) responded that they enjoyed camp.

Analyzing the campers’ artworks and their meanings was key to this study to determine what the artworks mean to them and their symbolism. Table 2 satisfied the requirements for Feldman’s art criticism: describe, analyze, interpret and judge. The campers were unaware that they were doing an art criticism, they just responded to the questions asked. In reviewing
the art criticism, meaning seems minimal, yet it is there with statements like: “double friends and double me” or “who I want to be.” The campers shared what is important to them, what they thought was cool, who they wanted to be. For example, this student in Figure 9, not only describes the location of this picture, but also why he is “proud” of this picture. Not only is he collecting, but also he is 66% done with his egg collection, which in this game, in two days is a feat of luck that none of the other campers achieved. Yet, in his post he is not taunting or teasing the other campers.

This camp took place during the week of March 15th. This included St. Patrick’s Day, the first day of spring, and the middle of Lent. This was visible in the virtual world, *Pet Society*, but not reflected in any of the other art. Other variations included totally transforming the original image to be completely unidentifiable, Figure 10. The camper would not “tag” anyone in the photo and left a caption of “guess who?” Responses would lead to guesses of not only whom the mystery person was but also which filter was used to create the artwork.

One camper posted Figure 11, in her virtual gallery. It was obvious by the end of the week that she loved pets. She not only posted it in her virtual gallery, but also took it upon herself to make sure that if another camper had petlings (virtual pets for their avatar) that they took care of them, fed them, and did not lose them. She would post status reminders for the sake of the petlings. She carried her love of pets into the virtual world, making that her communal cause.

In Figure 12, the camper defended her pink spiral on her forehead as something cute and to match an existing mark on her forehead in reality. It is a representation of her, but not her exactly. She has a pet at home (in the real world), the same exact pet is not available in the virtual world, so she took another pet, a cat. Having a pet is important to her. She took
liberties to explore and try new things to improve her self-image. Throughout the week she tried several hairstyles, in various colors, a few different pairs of glasses, even her outfits changed, but the spiral on her forehead remained there the entire time.

What does this mean?

From the first minute of camp, the campers were on the computers using technology. We went through general instructions of opening a program, logging in to the social network, and uploading pictures. The repeat of those instructions was not necessary the remainder of the week as the campers completed the task without additional instruction. Couse and Chen (2008) found similar results when they studied young children’s (3-6 yr.) investment and motivation in learning using Tablet computers.

Ongoing throughout the camp, I also noticed that the campers were teaching each other. When students discovered something they announced an invitation to all campers to come over to their computers so they can demonstrate how to do it. Ryan Shin (2010) had the same experience stating “the digital world does not emerge from a vacuum state without having relationships… in a digital world people are connected, supporting and critiquing each other in the social context of their technologies”(p. 39).

Campers’ verbal communications during the week were similar to their posted comments. They shared their discoveries with each other rather than quietly keep it to themselves. There were other instances where a camper would ask “how did you do that?” Thus providing the opportunity for one camper to demonstrate to another camper on the desired effect was achieved. Catchings and MacGregor (1998) found a similar results stating, “Letting each student tell the group about her or his favorite effect and how to achieve it
provides a great way for them to learn more about the program and it encourages the collaborative tendencies that are paramount to the successful use of this medium” (p. 23).

**Gender Differences**

It is interesting to note the difference between genders. When looking at the examples in Figure 13 and Figure 14, anyone could almost guess as to which was created by a boy or a girl. But this gender specific style is only visible when the campers used the *MS Paint* software. When just using the filters or copy/paste in *Photoshop*, the gender differences are harder if not impossible to notice. Within *Pet Society*, the gender differences are obvious as the girls chose to wear dresses and the boys wore pants or shorts (one wore a tire).

**Age Differences**

When comparing the differences with age, the youngest camper was six and the oldest was eleven. Developmentally there is a large gap. One is just learning to read while the other is beginning puberty. In the first example, Figure 15, the youngest camper uses multiple techniques of a special effects filter and a painting tool. His title was “two mes,” meaning that in the original that he used the liquefy filter and the digitally painted version of him as well. Neither portrait is flattering or truly identifiable by the viewer. Figure 16, by the oldest camper was completed using multiple filters (the pixelating and the pencil effect). The digital outcome highlights the young lady, is flattering, and identifiable. She clearly wanted a nice digital artwork of herself that viewers could identify.
Conclusions

Primary students in this study, when given the opportunity to learn digital editing technology, are capable of creating meaningful digital pictures and using a social network responsibly (they chose the “be kind” rule). The children in this study excelled at learning in a decentralized classroom. They quickly met the requirements and went on to investigate the software and meet their own personal goals of exploration.

The first research question asked ‘what kinds of digital art can young campers ages 6-12 distinguish and identify?’ The survey demonstrated improvement. Previous studies by Unsworth et. al, (2005) and Slovie and Kloek (2007) also documented that children, under the age of 12 are capable of using computers, reinforcing this study. Thomas (2005) also studied children online. In her study, children, aged 13 learned how to use the online environment without an expert or educator. Marsh’s (2009) study with children aged 5-11, in Club Penguin, stated that 52% of the 175 children used virtual worlds on a regular basis. According to the pre-survey, this camp had different results. One hundred percent of the campers stated that they previously used a virtual world.

Research question two focused on meaning in the campers’ artworks: ‘what digital artworks can campers create and what do they mean to the campers?’ The campers utilized a variety of software in a progression allowed each lesson to build on the previous lesson. This created inquiry and invited the campers to be curious to learn more.

The art criticism questions were part of the data interpretation to obtain meaning. According to Gude (2008) a core concept of art education is students’ need to increase their ability to make meaning. Meaning-making is the aptitude to employ and think about ideas and images; the ability to make use of images and ideas to re-imagine one's own life experiences;
the ability to examine and symbolize one’s own experiences, to enhance students' abilities to engage, to analyze, to apprehend, to make, and to enjoy. These campers spent a week exploring their identities. Most of the students presented themselves in the moment. For example, if they were feeling sad, they altered their virtual self to be sad.

Figure 17 illustrates the expression of emotion. She is happy, giggling, she is in her favorite color, and her fellow campers concur that she is cute and laughs a lot. She was happy to be in a virtual world that she could easily manipulate. Later in the week, she posted the second image. She is clearly not happy, perhaps pouting even. She even takes the time to caption her photo and explain, “I am sad. I have no coins to shop.” Most campers followed the adage, ‘what you see is what you get.’ They were not looking to be something that they were not. They were just being themselves, making friends, and being cool.

These campers had individual meanings when exploring their identities. What is key here is to note that they were capable of expressing themselves and what was meaningful to them about their personality, lifestyle, pets, virtual collections, and culture. Karen Murphy (et. al, 2003) also concluded “images can lead children to discuss the events with adults and peers and then perhaps use them as a basis for writing, drawing, or other form of processing and expression” (p. 3). Drawing about their identity is another possible stepping stone in discussing it with parents, teachers, or counselors.

Leigh and Heid (2008) stated that children find comfort and greater ease in expressing themselves when drawing. Drawing is an opportunity to allow children to open up and share themselves with others. By exploring their art, we can learn what part of their culture is important to them and what they are willing to share. Educators can teach how the culture is shaped and how to shape the culture by providing the students with the tools of contemporary
aesthetic investigation. Through such signifying practices individuals make meaning of their lives and they make purposeful meaningful lives (Gude, 2008).

The third research question asked: “what choices of self-presentation (objects, color, and patterns) do campers demonstrate when exploring digital identity?” Girls were typically in dresses, with a bow or flower, while boys selected hats and pants. All of the items in their homes (with the exception of the items provided) were purchased and displayed by them, for example, their egg and pet collections or the trophies that they had earned. They most commonly chose room 1, to put their favorite or most important items in, which is the entry point to their house and the first room a visitor would see.

Campers had no problems creating pictures of their identity or a virtual self. For example, this camper posted these five portraits, Figure 18. All of the pictures, though created with different software, illustrate the same general statement about the same camper. She is feminine, and loves the color pink. Even at nine years old this camper knew what part of her personality she wanted to illustrate and share with others.

The virtual gallery within Facebook allowed students to see each other’s pictures in real time. As soon as they were created, they were posted for viewing and evaluation. A virtual gallery extends the exhibition experience beyond the physical space. Exhibiting student artwork completes the artistic experience. A virtual gallery provides opportunities for other people—teachers, classmates, students, school staff, and the public not only to view, but also appreciate, and praise student artists. Burton (2010) stated that, this contemporary gallery format “also creates venues for critique and discussion that would not be possible otherwise” (p. 48).
During this study campers did not receive a grade or were not forced (no consequence if not completed) to complete the requirements of the camp, yet every camper exceeded the requirements. What were their motivations if there was no incentive? These campers communicated, learned, played, posted, and taught each other without a dangling carrot. This kind of motivation is intrinsic motivation, coined ‘Motivation 3.0’ by Daniel Pink a 21st century philosopher, defines intrinsic motivation as “for artists, scientists, inventors, school children, and the rest of us, … it is the drive to do something because it is interesting, challenging, and absorbing – is essential for high levels of creativity” (2008, p 46).

Additionally, action research also needs to continue in the field of art education. Action researcher McKay (2006) challenges art educators to continue to inquire into the unknown, to continue to explore the new and unknown, to make new connections and reveal new knowledge about teaching and learning in art. The more educators know the more they can teach and share. “The goal is to work towards a better understanding of their situation in order to affect a positive personal and social change” (Riel, 2007, p. 1). Action research is a challenge. It is a give and take process of teaching and documenting, but the challenge is to do both to improve education.

Art, technology, and children are the seeds of our future and when carefully grafted together each cause the other to grow in unexpected and random ways furthering their potential and the impacts on future seedlings. As Aristotle once was quoted, "the whole is greater than the sum of the parts.” We, as a human race, need all of them, if we neglect any part, it's to our detriment. Everyday we are preparing children for jobs of the future. The careers of the twenty-first century work are more challenging, more creative. “Solving challenging problems requires an inquiring mind and the willingness to experiment one’s way to a fresh solution… it

Paper Description:

This is the first study that tried using another variation of the Moore’s Method on college students named as *Enhanced-Group Moore Method*, when it was originally meant for graduate level of students. Results revealed an increased van Hiele level of geometric understanding and proof-construction performance of the future mathematics teachers. The students' agreement on beliefs about proofs provided useful information for the difficulties encountered in doing proofs.

ABSTRACT

This study aimed to improve the van Hiele level of geometric understanding, enhanced proof-construction performance and determine the beliefs about proofs of the future mathematics teachers using the Traditional Method (Instructor Based) and the Enhanced-Group Moore Method. The impact of the two teaching methods was analyzed to find out which would yield better results in terms of van Hiele levels, beliefs about proofs and proof-construction performance.
The study used the quasi-experimental method of research and employed qualitative and quantitative analysis. The only section of Bachelor of Secondary Education (BSEd) major in Mathematics students (20) officially enrolled in Math 233 (Plane and Solid Geometry) at a State University in the Eastern Visayas was the subject of this study. These future teachers were alternately distributed into two groups (control and experimental) based on their ranked mean grade on their prerequisite subjects (Basic Mathematics and College Algebra). The two groups were comparable in terms of their mathematical ability.

The study used three instruments, the van Hiele Geometry Test, the Proof-Construction Test and the Proof Beliefs Questionnaire.

Within the framework of the limitation of the study, the Enhanced-Group Moore Method raised a higher van Hiele level (from level 1 to 3) of the future teachers compared to the Traditional Method (from level 1 to 2). The proof-construction performance of the prospective mathematics teachers was improved from clueless to intermediate which was better compared to that in the control group (from clueless to novice). In regards to the future teachers’ beliefs about proofs, they believed that a theorem has no exception, the dual role of proof is to convince and to explain and the validity of proof depends on its internal logic.

Quantitative results revealed that there was a significant difference on the van Hiele levels and proof-construction performance of the future mathematics teachers before and after the study. The future teachers exposed to the Enhanced-Group Moore Method yielded better results in terms of van Hiele levels and proof-construction performance compared to that
exposed to the Traditional Method (Instructor Based). In addition, there was a
significant relationship between the proof-construction performance and van
Hiele levels of the future teachers and no noteworthy changes occurred on
the future teachers’ beliefs about proofs.

Moreover, qualitative assessments showed that the Enhanced-Group
Moore Method creates “damay effect”, develops self-confidence, effective
communication, and exchange of ideas towards a common goal. It also
develops the values of sharing and helping others and both groups expressed
their difficulties in proving theorems attributed to poor prerequisite skills. They
prefer the two-column form of proof associated to direct proof compared to
paragraph form which they associate to proof by contradiction. The future
teachers from both groups were in favor with the sequence of the presentation
of the lesson and especially to the incentives given.
Access to UK higher education via a Life Sciences Foundation year at University of Manchester.

Amanda Bamford, Faculty of Life Sciences, University of Manchester, Manchester, UK. Email: Amanda.bamford@manchester.ac.uk

The Life sciences foundation year at Manchester University is designed to cater for students from a wide range of educational backgrounds and each application is considered individually. Students include those that have studied arts, languages or social sciences previously and have decided that they wish to pursue a degree in biosciences and those that have slightly underachieved in their school science exams through no fault of their own. Applicants are also accepted from non-UK establishments and those returning to higher education. Relevant experiences in employment, together with any previous qualifications, are taken into account for students returning to study after a period away from it.

This one–year programme covers common core units in biology, chemistry and mathematics. Following successful completion of the foundation year, students have a guaranteed place on the first year of any of the Faculty’s 3 and 4yr undergraduate degree programmes.

To cope with the problems of such diversity, the academic year consists of maximum exposure to small class teaching and continual access to tutorial help. Assessment is by frequent, short tests, practical write-ups, followed by end-of-semester exams. A student initiative for self-help groups has been supported with a mentoring scheme. The progression onto a Life Science degree programme demonstrates the successful achievement of this foundation year for these students and past students have shown excellent progression at degree level and onto postgraduate course.

6. Abstract:

   Health Care for America: A Grass Roots Health Care Campaign trained local university students to perform basic vital signs (blood pressure, heart rate, respirations). Once trained (tested and proficient status acquired) students provided a free door-to-door canvassing in an underserved, high-risk multicultural population in a central Illinois community. The final phase of the project
consisted of student and community member feedback obtained in an effort to identify successes and barriers.

This session provides an in-depth look at the implementation, methodology, results, and future plans for of this unique health promotions project. Attendees will be asked to participate in an experiential activity that conjures up creative ways to influence citizens of rural communities to utilize preventative health practices.
Shifting from a culture of deficit-thinking to a culture of success for all

Bret D. Cormier, University of the Cumberlands

bdclck@aol.com

3000 Colonial Parkway #5208, Cedar Park, TX 78613

Abstract: A culture of success is the conditions and campus culture which must be established in order to promote optimal learning for all students and move toward closing the achievement gap. This qualitative study was to examine the attitudes, values, beliefs, professional practices, and professional behaviors of an area superintendent and two principals and to measure their impact and effectiveness in closing the achievement gap. During the course of this study the researcher examined strategies that diminished low expectations and deficit-thinking in school leadership and in the teaching staff, which produced high achieving students.
Leveling the Playing Field: The Normed-Opportunity Paradigm

Bret D. Cormier, University of the Cumberlands & Alicia Walker, Texas State University

3000 Colonial Parkway #5208, Cedar Park, TX 78613

bdclck@aol.com and aliciawalkereditor@gmail.com

Abstract:

In order to begin the enormous task of truly providing a quality education for all students, we must examine our own values, beliefs, and practices. We must also begin to shift our outlook so that we can truly meet the students’ needs. The first step is to accept the student where they are, rather than expect the students to come prepared to meet our dominant culture ideals. No student has the same life or educational experience; this is not to be viewed as yet another difference or excuse or label to be used. This is really to begin to understand how unique it is to educate students in the 21st century versus the 20th century. The Normed-Opportunity Paradigm can begin to provide a framework so that we are able to evolve past the Deficit-Thinking Paradigm.
What's the Story?

A Study of Novice Teachers’ Narrative Understandings of Classroom Events
Kathy Carter and Kathy Stoehr, University of Arizona
Teaching, Language and Sociocultural Studies

Purpose of Paper

The objective of this paper is to report the most recent results from an ongoing, multi-year research initiative at a large Research I University in the Southwestern United States. The purpose of this line of inquiry is to learn about how novice teachers develop narrative understandings of teaching. In particular, this study explores the cognitive understandings and personal sense-making strategies used by novices to “story” the classroom events they routinely observe in the field.

The present paper is an analysis of the written well-remembered events and spontaneous stories told and recorded by a diverse group of 307 elementary and secondary preservice teacher education students during the first semester of their fieldwork and professional preparation sequence. The qualitative analysis of the content of these narratives focuses on the identification of basic story structures, themes, and meaning attached to these stories from the field. The most recent findings, to be presented in this paper, address some important, emergent, and heretofore unexplored issues in preservice teachers’ narrative understandings of teaching; these issues include considerations of audience, advice, and authenticity. This close examination into preservice teachers’ images of classroom events and schooling opens
questions for further study. In addition, the findings also provide promise in helping a teacher education community develop curriculum and tasks in narrative forms of pedagogy which allow both novice and practicing teachers to confront and reflect upon their personal and developing “storied” sense of classrooms within a professional community of meaning.

**Perspectives/Theoretical Framework**

Learning to teach is a pervasive and continuous process in the lives of teachers. As children, would-be teachers acquire cultural norms and expectations about schooling, and for long periods of time, they observe teachers at work. Basic knowledge and beliefs about teachers, teaching, curriculum, and learning are thus accumulated early. Later these conceptions and attitudes are shaped and refined through a variety of formal and informal experiences as teachers prepare for and enter the profession and as they develop through their careers (Lortie, 1975; Ovens & Tinning, 2009).

Despite general agreement that teachers’ understandings are fundamentally important in teaching and that these understandings change over time, much can still be learned about what teachers come to comprehend about teaching processes, their students and the curriculum, especially as they enter the field and begin to situate their knowledge in the complex settings where they will one day work.

In recent years, researchers have begun to explore the utility of a research framework which uses narrative methods in order to focus more explicitly on
what is learned, how that knowledge is acquired, and how observed classroom events are “storied” by novice teachers (see, for example, Carter, 1993, 2007, 2009; Carter & Doyle, 2003; Gudmundsdottir, 1997; Munby & Russell, 2001). During these years, and thanks to an active research community in teacher education, much has been learned about the promise of story in our attempts to understand teaching and teacher knowledge. Even so, the years have shown us not only promise in attending to the storied nature of teaching, but we have also come to understand that much still needs to be learned about the nature of story and its value to the educational enterprise.

In teacher education, much of this work on story has centered on the use of cases (Munby & Russell, 2001), teachers’ curriculum knowledge (Gudmundsdottir, 1997), and teachers’ life history (see, for example, Elbaz-Luwish, 2001). It is important to note, however that the teachers’ stories referred to in this tradition are still, for the most part, stories told to researchers or for research purposes rather than stories authored and shared spontaneously in an attempt to describe classroom life and the impact of one’s educative experiences. The present work is a gentle point of departure from earlier modes of inquiry as it aims to look closely at self-selected and spontaneous stories told by novices early in their professional coursework sequence and experiences in the field.

Data Sources
The sample for this study included both written and spontaneously told narratives of 307 students enrolled over a 2 1/2 year period in 10 sections of an introductory general teaching methods course offered at a large Research I University in the Southwestern United States. Nearly 65% of these students were female, 35% were minority group members, 20% were bilingual, and a wide range of both elementary and secondary teaching majors were represented.

**Methods and Context**

Participants in this study were enrolled in the first course in the teacher preparation professional sequence. This course focuses on general methods of teaching and classroom processes and instruction. Attached to this 4-unit course is a 45-hour field component, where students are provided various assignments aimed at reflection on course content and its application to teaching events. Two major assignments were designed with a narrative focus in mind: (1) well-remembered events (WRE’s) from the field (written and detailed descriptions of well remembered events of preservice teachers’ own choosing from their field-placement observations and/or teaching); and (2) detailed logs of stories related to schooling that preservice teachers spontaneously told to identified others during the semester. In addition, students kept descriptive journals of actual advice given them by individuals who listened to their stories. Finally, students were asked during each of the 14 weeks in the semester to select one narrative from their written well-remembered events or from their story logs to “retell” verbally to colleagues in the class. For purposes of this study,
these well-remembered event narratives, spontaneous story logs, and oral retellings were reviewed and carefully analyzed in order to identify the basic story structures (characters, sequence, plot, pattern of action) embedded in the texts. Using iterative and thematic qualitative analysis techniques, including constant comparison methods (see Bogdan and Biklen, 2006), attention then turned to the documentation of thematic elements in these stories, to the choices of the audiences with whom these stories were shared, to the students' reflections regarding the purpose in and the veracity of their oral retellings, and to the nature of advice given by the varied audiences who listened to preservice teachers' stories.

Results

In this work, we have begun to uncover and define some significant genres (such as “humiliation” and “victory and elation” narratives, “bumpy moment” classroom stories, “in the trenches” stories, personal stories of teaching fatigue and frustration, and “sheer joy of it” teaching narratives. Importantly, we have learned that the emergence of decidedly different genres of stories is loosely connected to temporal boundaries of the semester. For example, the results of this analysis suggest strongly that during the first few weeks of their field experience, preservice teachers regularly anchor their conceptions of teaching and learning in relatively simple story structures that are imbued with either powerful personal feelings of humiliation and pain or high levels of individual elation and triumph. By mid-semester, this genre of stories became noticeably
less in number. In their place, other stories emerged, suggesting a possible shift in interpretive lens, which ran parallel to expected increases in their fieldwork/classroom involvement. The majority of stories told in the midweeks of fieldwork were stories that clearly captured many cognitive complexities of classroom life for which they felt unprepared. Story genres in these weeks primarily involved two types of narratives: (1) “bumpy moments” and (2) stories of surprise and revelation in classrooms. This “bumpy moment” genre was a prolific period of storytelling for new teachers; reviews of story logs indicate that each teacher candidate told these stories more often than any other genre. Also prominent in this time period were stories which revealed preservice teachers’ shattered preconceptions, loss of idealism, and their feelings of cultural dissonance. These types of stories carried through the semester, with only a few new themes appearing in novice teacher stories late in the semester. Nevertheless, about 15% of students shifted to telling stories which were characterized by relatively more complex characterization and plot structure. Themes for these stories were: (a) “stories of repair” during difficult classroom events, “something wonderful happened to me today in class” stories, and “stories of sage advice” and “so much to learn.”

Finally, this study illustrated that for the most part, preservice teachers’ stories of teaching rarely find their way to the conversational floor in the teacher education professional sequence. In other words, a central body of novice teacher narratives are told to trusted audiences (significant others, spouses,
parents, and siblings), but are not often shared with teacher educators, university mentors, or supervising teachers. Following an iterative and careful analysis of preservice teachers’ records of reactions and advice given to them by “outside others” a number of potentially worrisome findings emerged. Across all of these “outside other” audiences, the central pattern of reaction was often directed toward lesson-like, single answer simplification of novice teachers’ stories. Indeed, one prominent finding was that the typical “outside” audiences who heard their stories often offered unsolicited directives to novices about how to get “authority” and “control” or how to achieve quick fixes to complex classroom dilemmas. Other regular patterns of outsiders’ reaction appeared to be rooted in gender-based expectations and relational roles. For example, themes of advice given to young female preservice candidates by male outsiders (such as fathers, older brothers, and boyfriends) were often reduced to simplifications based on protective concerns about the female preservice teachers’ age, physical appearance, and body shape and size. In short, reactions were not often about the teaching story itself, but rather were enveloped into deeply felt personal worries for the preservice teacher. Dated indicated that mothers of preservice candidates were the most commonly selected audience for preservice teachers’ stories. Importantly, thematic features were also present in mothers’ advice. Most prominent was a collapsing of the many narrative details of managerially difficult classroom events into an impromptu commentary on the lack of quality parenting. Preservice teachers
noted that their moms often circumvented the story to express their pride that their son or daughter was raised differently and therefore never behaved in such a “despicable” manner during school. Established patterns of personal reaction were also found to exist for other audiences (siblings, roommates) and will be described carefully in the paper.

Finally, data analysis resulted in a careful examination of the possible effect of audience on the expressions of preservice teachers’ narrative understandings. Results from the present analysis clearly indicate that rich and complex classroom stories are regularly reshaped into comparatively simpler ones, largely as a result of the demands to receive and attend to advice from personal and/or available audiences. This reshaping obviously has worrisome implications for authentic and careful reflection about classroom events.

**Educational Importance/Implications**

The completed analysis of the various genres of stories written and told by preservice candidates appears to have captured a portion of the distilled experience of teacher education students as they enter their preparation journeys. In analyzing these stories, it became clear that one possible peril embedded in fieldwork is that the reflection, accomplished alone and without conversation in a professional community of meaning, runs the risk of singular interpretation and a reconstruction of events with a personal bias to present oneself in a certain light. When confined to outside advice and purely personal reflection, then, preservice teachers run the risk of egocentric understandings
and may not be able to position their thinking in the professional perspectives of others, in moral or pedagogical dilemmas, or in contexts of systems, politics, and other contexts of meaning.

In summary, despite recent efforts exploring the use of narrative in teacher education, the question remains to be seen whether or not we as a community of teacher educators and scholars can revisit our pedagogical practice to encourage, through the use of story, communities of professional conversation and communities of meaning. In these contexts, story may still hold promise to open new interpretations of teaching, interpretations which better represent the complex work of teaching, the moral and social dimensions inherent in this work, and the memorable impact of judgment, analysis, and action in classroom events.

6. ABSTRACT AND/OR FULL-PAPER

ABSTRACT

This research is a three-phased descriptive and quasi-experimental study with an ultimate goal of developing an Interdisciplinary Teaching Manual that can be used by parents, teachers and health professionals to promote therapeutic healing of children with chronic illness (CWCI) through enjoyable education with incidental cognitive and psychomotor benefits.

The first phase of the study gathered baseline data on the demographic, health condition, learning / education, psychosocial and support system characteristics of CWCI which were used as springboard in analyzing the educational needs of these children. Moreover, the study also investigated on the practices of the interdisciplinary team members specifically the parents, teachers and health professionals in the education of CWCI which is crucial in achieving successful educational outcomes. Four research questionnaires were developed and validated to gather data from four groups of respondents comprising 80 CWCI, 80 parents of CWCI, 14 teachers and 28 health professionals handling CWCI. CWCI respondents of the study belong to 3 to 9 age group either confined or has regular outpatient check-ups because of their illness in the following six major hospitals serving as research locales, namely: a.) East Avenue Medical Center (EAMC) in East Avenue, Quezon City, b.) Fe Del Mundo Hospital (FDH) formerly Children’s Medical Center in Banawe, Quezon City, c.) National Children’s Hospital (NCH) in E. Rodriguez, Quezon City, d.) Philippine Children’s Medical Center (PCMC) in Quezon Avenue, Quezon City, e.) Philippine General Hospital (PGH) in Taft Avenue, Manila, and lastly f.) Philippine Orthopedic Center (POC) in Banawe, Quezon City.

Based on educational needs of CWCI realized in phase 1 of the study, and with special focus on the psychosocial characteristics of these children, the second phase of the study commenced as the researchers developed a manual that can address the special needs of the CWCI. The manual was validated by ten experts belonging to the field of special education, pediatric health care (i.e. developmental pediatrics, pediatric internal medicine and oncology, family medicine and pediatric nursing), rehabilitation medicine (physiatrist and physical therapist), educational psychology, research and administration.

In an attempt to further test the effectiveness of the manual in addressing the psychosocial needs of CWCI, the CWCI and parent respondents of the study were divided into control and experimental groups where the CWCI of the latter were given copies of the manual for utilization and monitoring. The CWCI experimental group was given at least three weeks of continuous manual use or at least a completion of ten manual activities prior to being post-tested for changes in psychosocial characteristics.

The third and last phase of the study involved the post-testing period wherein both the control and the experimental groups were made to answer the psychosocial characteristics part of the questionnaire used in phase 1 of the study. Results of the pre-test and the post-test scores for both control and experimental groups of CWCI and parent respondents were compared using t-test of paired samples.

Overall, results revealed that CWCI are faced with multifaceted challenges brought about by their health condition and other related socioeconomic factors. They are faced with health, cognitive and psychosocial issues that affect the quality of their lives including their family. Health and psychosocial issues intertwine to produce problems concerning school attendance, learning and cognition as well as intrapersonal and interpersonal relations of CWCI. Depressed health and emotional being of the CWCI contribute to daily activity limitations, including those in school that result eventually in pressing further psychosocial issues with the child including his/her family.
CWCIs, their parents, teachers and health professionals consider education and learning of CWCIs as a positive impetus for the well-being of CWCIs. Specially noted are those therapeutic teaching activities that improve the psychosocial characteristics of CWCIs like art therapy, play therapy, music therapy and drama/role playing. And considering such premise, the interdisciplinary teaching manual, which can be used by the parents or health professionals involved with the CWCIs even when the child is required to stay at home or be confined in the hospital, which was developed and validated in this study was proven effective in improving the psychosocial characteristics of CWCIs based on an improved post-test psychosocial scores in both intrapersonal and interpersonal psychosocial characteristics.

FULL PAPER SUMMARY

Chapter 1
INTRODUCTION

Background of the Study

Because of medical advances children with chronic conditions who decades ago would have died as a result of their condition are now surviving (Jackson et. al., 1992). The number of this diverse group of children is increasing in the classroom. Their needs pose a challenge to schools. Children with chronic health conditions are more likely to miss days from school (Sangler et al., 1991 in Bessel, 2001); experience school phobia and school avoidance that can cause re-entry problems (Lansky, et al., 1975 in Coniglio & Blackman, 1995); need specialized health care; require special education services or homebound teaching (IDEA, 1997); and experience psychosocial challenges that hampers the child’s concept of self (Paguio, 2005, Bramble & Curk, 1998, Falvo, 1999, Livneh, 2005).

In Paguio’s (2005) study, children with cancer experienced several side effects of treatment that affects their psychosocial functioning specifically self-esteem and anxiety levels. A child’s illness is often accompanied by stresses like hospitalizations, pain and malaise, extended diagnostic studies, surgery, medications, diet restrictions, activity limitations, school absences, and frequent medical crises. These stresses generate a number of fears, anxieties and grief reactions (Arnold, 1990).

This is where therapeutic teaching becomes very significant in the lives of these children since attitude change/behavior modification, values formation and self-improvement/personality development are its main concerns pedagogically. It is focused on achieving objectives from the affective domain with incidental learning from cognitive and psychomotor domains (Dizon, 2003).

School health advocates agree that meeting the needs of these children requires collaboration among students themselves, their families, school personnel, and health care providers. The call for a closer partnership has been recognized across the diverse missions of health training, service, and research and in reference to the needs of specific populations, such as those with chronic illness, children and adolescents with severe disorders, and ethnic minorities. Especially needed are studies that assess need and assist state and local agencies to plan for community-based services that are effective, consumer responsive, and cost-efficient. In times of resource limitations, needs assessments become essential tools for determining programmatic priorities, identifying gaps in service provision, and preparing grant proposals to secure funding for creation or expansion of programs (Wolf, 1994).

This study recognizes the importance of needs assessment in the education of children with chronic illness (CWCIs) as springboard for the development of an interdisciplinary manual that is effective, consumer responsive and cost-efficient. The manual is facilitative of education that promotes psychosocial healing and incidental cognitive learning and of these children despite the health challenges
they face. Likewise, the manual aimed to facilitate collaboration among the members of the interdisciplinary team (e.g. parents, teachers and health professionals) involved with the child by reiterating the roles and norms they can practice in the education of CWCI and by encouraging them hands-on delivery of the child’s education using the guided activities in the manual.

Meeting the needs of special children can pave the way towards successful educational programs which according to Hallahan et al. (2000) can be determined by how well parents and professionals are able to work together.

There is a dearth in the literature, however, of health service professionals’ delivering hands-on education to children whose health needs they cater to. Chronically ill children spend much time and exposures to health professionals and are vulnerable to hospital confinement that halts their formal school attendance. The financial burden of the families of CWCI brought about by the demand of the child’s condition affect the continuation of the child’s education (Morcos, 2000 & Nickel, 2000 in Medina, 2004)

There is a great need to develop a practical and feasible approach to promote continuity in the child’s education despite health and financial challenges of the child. Thus, other than parental participation, this study pioneered in the involvement and actual participation of health service professionals in the education of CWCI through direct delivery of early basic primary education to these children.

In the Philippines, only the Philippine General Hospital (PGH), East Avenue Medical Center (EAMC) and Fe Del Mundo Hospital (FDMH) have initiated the implementation of educational programs or projects that support or facilitate the education of children with chronic illness. There is great demand to address the educational needs of those children confined and regularly brought to hospitals other than through the means initiated and provided by these aforementioned hospitals. There is a challenge for special education in the country to develop and produce relevant materials that can support and facilitate quality education for these special children whose health condition and economic situations demand creative, flexible and adaptive techniques or materials that fit their current situation.

**Statement of the Problem**

The study was conducted to investigate the educational needs of children with chronic illness and the practices (roles and norms) of the members of the interdisciplinary team (e.g. parents, teachers, health professionals) involved with the children in facilitating their education. The study developed a manual that can be used by the members of an interdisciplinary team to ensure not only the continuity of a regular education in early primary level but also to address the therapeutic and cognitive needs of special children that affect their learning and development, thus enhancing the quality of their lives.

In gathering the baseline data as prerequisite for the development of the manual, answers to the following specific questions were sought:

1. What are the characteristics of Children with Chronic Illness (CWCI) in terms of the following aspects:
   a. Demographic profile
   b. Health condition
   c. Learning or education
   d. Psychosocial state
      i. Intrapersonal characteristics
         1. Anxiety manifestation
2. Self-esteem
   ii. Interpersonal characteristics
      1. Relationship with parents
      2. Relationship with teachers and classmates
      3. Relationship with health professionals

   e. Other support system
      i. Family support system
      ii. Health and Educational support system

2. What are the special education needs of CWCI based on the characteristics mentioned in specific question number one?
3. What does the literature say regarding the ideal practices of members of the interdisciplinary team in the education of CWCI specifically on the following:
   a. Roles undertaken as member of the team
   b. Norms in terms of:
      i. Prioritized responsibility
      ii. Communication to other members of the team
      iii. Level of involvement in educating the child

4. What are the perceived practices of the members of the interdisciplinary team specifically on items stated in specific question no.3?
5. Is there significant difference among the perceived practices of each member of the interdisciplinary team handling the CWCI?
6. Is there nonconformity between the ideal and perceived practices of the interdisciplinary team respondents?
7. What are the pre and the post-test scores of CWCI and parent respondents’ control and experimental groups regarding the psychosocial characteristics of the child specifically:
   a. Intrapersonal characteristics
      i. Anxiety manifestation
      ii. Self-esteem
   b. Interpersonal characteristics
      i. Relationship with parents
      ii. Relationship with teachers and classmates
      iii. Relationship with health professionals

8. Is there a significant difference between the pre and the post test scores of CWCI and parent respondents and between control and experimental groups regarding the psychosocial characteristics of the child stipulated in specific question no.7 after manual implementation?
9. Can the educational needs of CWCI be met by a manual intended for interdisciplinary use?

Significance of the Study

The study’s end goal was the production of a therapeutic teaching manual. The developed manual aimed at helping decrease if not eliminate the negative effects of chronic health impairment mainly in the psychosocial dimension that hampers the child’s intrapersonal behavior (e.g. self-esteem and anxiety level) and interpersonal behavior (e.g. relationship with other people) and incidentally in the cognitive and psychomotor domains. Regardless of whether the child is capable of reporting back to school, required to be confined in the hospital or even just stay at home to rest or recuperate, holistic learning can still be attained through the collaborative efforts of the parents, teachers and other professionals who can do actual hands-on teaching using the manual activities as a guide. This in the end can lead to an improved quality of life for CWCI.

The primary beneficiaries of this study and the manual output are the CWCI as they receive, at some point, the answers to their needs which are not only physical in nature but also psychosocial and cognitive. Moreover, the parents, teachers and health professionals servicing CWCI will
also benefit from this study as they learn new ways of helping their child achieve the benefits of education by learning basic instructional strategies and directly delivering the appropriate therapeutic teaching approaches for their child’s emotional healing along with the curriculum content for early primary education. Likewise, they will be able to understand the practices (roles and norms) of the other members of the interdisciplinary team in the education of CWCI. There will be better rapport among interdisciplinary team members involved in the care and education of the child. Such occurrence can open doors of better communication leading to optimal care and educational services for the child.

Most importantly, this research is significant as it pioneered the development of a teaching manual that can be used by all hospitals catering to the pediatric population to facilitate therapeutic healing. The country today does not have any existing locally published material on therapeutic teaching activities specifically designed for chronically ill children with psychosocial problems that is intended for interdisciplinary use in different hospitals.

Scope and Delimitation of the Study

The study aimed to develop and validate a manual that addresses the special education needs of CWCI mainly focusing on the therapeutic healing context with concomitant cognitive and psychomotor needs addressed. Likewise, the developed manual aimed to promote better collaboration among interdisciplinary team members (e.g. parents, teachers and health professionals) involved with the child by reiterating the roles and norms they can practice in the education of CWCI and by encouraging them on the hands-on delivery of the child’s education using the manual guided activities.

The study involved three phases. The first phase covered the preliminary data gathering to assess the needs of CWCI and the practices (roles and norms) of the members of the interdisciplinary team in the education of CWCI. The second phase involved the development of the manual output based on the needs assessed and collaboration practices analyzed in the first phase while the third and last phase covered the validation of the developed manual by experts and actual quasi-experimental testing. A general overview of the scope of the study is presented as an outline in Figure 1 of the succeeding page.
Figure 1. General Overview of the Scope of the Study

PHASE 1

Educational Needs Assessment of CWCI based on the following characteristics:
- a. demographic profile
- b. health condition
- c. learning and education
- d. psychosocial state
- e. other support system
  e.1. family
  e.2. health and education

Analysis of Interdisciplinary Collaboration Practices of Parents (P), Teachers (T), and Health Professionals (HP) in the Education of CWCI

IDEAL PRACTICES

PERCEIVED PRACTICES

P

T

HP

PHASE 2

Development of a Therapeutic Teaching Manual that Addresses the Psychosocial and Incidental Cognitive and Psychomotor Needs of CWCI and Reiterates Practices (Roles and Norms) of Interdisciplinary Team Members in the Education of CWCI

PHASE 3

Validation of the Interdisciplinary Manual

1. Does the manual explain how chronic health conditions affect the learning of the CWCI?
2. Does the manual promote enjoyable learning on the part of the CWCI thru therapeutic teaching methods?
3. Does the manual improve the psychosocial behaviors of the CWCI?
4. Does the manual promote incidental academic advancement of the child despite the challenges he/she facing as defined by his/her:
   a. Demographic characteristics
   b. Health condition
   c. Learning and educational characteristics
   d. Psychosocial state
   e. Available support systems
5. Does the manual promote interdisciplinary collaboration through reiteration of the practices (roles and norms) in the education of CWCI?
Chapter 2
THEORETICAL AND CONCEPTUAL FRAMEWORK

This chapter presents the review of related literature and studies, theoretical framework, conceptual framework, research hypotheses, and definition of terms used in the study.

Children with Chronic Illness (CWCI) are faced with psychosocial and educational challenges and needs that are results of multifaceted factors brought about by their: a) demographic profile; b) health condition; c) learning and educational characteristics; d) psychosocial state, and e) available support systems (e.g. family, education and health). Medina (2004) states that CWCI (e.g. school-age children with leukemia) manifest a wide range of special health care, educational, and social emotional needs. Apparently, there is interplay of health, learning, socio-emotional and family aspects in these children. Their chronic health condition significantly affects their education and school performance. It is vital then that the needs of these children are fully understood and properly identified in order to realize the appropriate special education provisions and services for them.

Children and even adolescents with chronic illness experience more academic difficulty than their healthy peers (Thies, 1999). Studies have recognized that illness alone may affect the learning of these children due to the stresses brought about by extended hospitalizations, frequent absences, separation from parents, siblings and peers, and painful medical procedures (Brown, 1999).

Some children, by virtue of acute or chronic medical problems, are unable to attend school regularly. Absence from school for any period will disrupt the educational process and should prompt the school administrator or child’s parent to request non-school based instruction. This instruction should be considered as soon as possible for a child who may be absent for a prolonged period or for a child repeatedly absent for brief periods (Taras, 2000).

Concomitant with all the health and learning challenges a CWCI face, psychosocial problems emerge significantly. All stresses generate a number of fears, anxieties and grief reactions (Arnold, 1990). Psychosocial adjustment problems including poor self-esteem, poor self-satisfaction, less ambitious deals, death anxiety, increased depressive symptoms (Greenberg et al., 1989 & Blackman, 1995), poor social skills and increased incidence of behavioral problems, particularly social isolation (Mulhern et.al, 1989; Sawyer et al., 1989 in Conglio & Blackman, 1995), school reintegration problems, and school phobia are experienced (Varni, et.al in Bessell, 2001). Study of Koocher et al. (1980) reports that anxiety and depression are strongly related to overall psychological adjustments.

The education of students with physical and health disabilities requires the coordinated effort of an educational team. This is to implement and teach the students the various physical management and self-help procedures correctly (including health care procedures). The educational team may have several members who will need to collaborate for a successful program depending on the student’s needs and type of objective being considered.

Collaboration among these three groups of people involved with the child is crucial in achieving success in terms of improving the quality of life of the chronically ill child through continuous and normalized education they deserve like that of their able-bodied peers. Such collaboration can be met if there is significant agreement between the ideal and perceived practices of the parents, teachers and health professionals as to roles they undertake and the norms they engage into as well as if the perceptions they have regarding each other meet or synchronize.

Cognizant of the value of addressing the health and educational needs of CWCI and the importance of collaboration among interdisciplinary members involved with the child, this study developed and validated a manual that aimed at helping decrease if not eliminate the negative effects of chronic health impairment mainly in the psychosocial dimension that hampers the child’s intrapersonal...
behavior (e.g. self-esteem and anxiety level) and interpersonal behavior (e.g. relationship with other people) and incidentally in the cognitive and psychomotor domains. The manual utilized therapeutic teaching as an approach to the different set of activities to develop and promote emotional healing among CWCI. Regardless of whether the child is capable of reporting back to school, required to be confined in the hospital or even just stay at home to rest or recuperate, holistic learning can still be attained through the collaborative efforts of the parents, teachers and other professionals who can do actual hands-on teaching using the manual activities as a guide. This in the end can lead to an improved quality of life of these children.

Four Models of the Study

The manual output of the study utilized four models as basis for development. These are: a) health-related quality of life model in the field of medicine / health to understand the health circumstance of CWCI in relation to many other factors, b) the psychosocial development framework of Erikson as rationale for the consideration of therapeutic teaching approach in the manual output of the study, c.) the family centered model in education, and c) the ecological model of Brofenbrenner (1979, 1995) in educational psychology to as premise for the involvement of the interdisciplinary team especially the parents in the education of CWCI.

Considering the eclectic influence of the four models mentioned, the paradigm of the study was developed which is presented as Figure 2.
Figure 2. Research Paradigm

Conformity between the IDEAL and PERCEIVED PRACTICES among IT in educating CWCI

LEGEND:
- CWCI - children with chronic illness
- T - teachers
- HP - health professionals
- L/E - learning or education
- OSS - other support systems
- HC - health condition
- DP - demographic profile
- IT - interdisciplinary team
- P - parents
- PS - psychosocial state
- Improving Quality of Life of Children with Chronic Illness (CWCI)

Optimal Educational Outcomes
The Variables in the Paradigm of the Study

The lives of Children with Chronic Illness (CWCI) involve an interplay of many factors which are related to their: a.) demographic profile, b.) health condition, c.) learning and education, d.) intrapersonal (e.g. self-esteem and anxiety) and interpersonal (e.g. relationships with parents, teachers & health professionals) psychosocial characteristics and e.) support system (e.g. family, health, education). Such factors entail certain needs that require special provisions that must be addressed for the benefit of the child.

Research has established the effects of chronic illness in the psychosocial and educational dimensions of these children, thus, developing a material that answers to these needs of CWCI in these dimensions will help optimize educational outcomes that can lead to an improved quality of life for these children.

Concomitantly, partnerships or collaboration among the members of the interdisciplinary team who are the parents, teachers and health professionals involved in the care and education of the CWCI are crucial in achieving optimal outcomes that are predictors for the child’s quality of life. Such partnerships/collaboration can be strengthened by the understanding of each member’s practices (roles and norms) in the education of CWCI. The more conformity there is between the ideal and perceived practices of the interdisciplinary team, the more favorable will the educational outcomes be for the child.

Overall, developing a manual that can be used collaboratively by the interdisciplinary team to educated and promote therapeutic healing of CWCI can help achieve optimal educational outcomes that can improve the quality of life of these children.

Research Hypotheses

Considering the element of interdisciplinary team collaboration in the education of CWCI, understanding of the practices (roles and norms) of each member of the team is important. To test whether there is significant difference among the perceptions of the parents, teachers and health professionals as to their practices (roles and norms) in the education of CWCI, the following hypotheses were tested:

\[ H_0: \text{There is no significant difference among the perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI.} \ (\mu_p = \mu_T = \mu_{HP}) \]

\[ H_1: \text{There is significant difference among the perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI where there is at least one inequality among the group.} \]
\[ (\mu_p \neq \mu_T \text{ or } \mu_p \neq \mu_{HP} \text{ or } \mu_T \neq \mu_{HP}) \]

Literature established the ideal practices in the education of these children and realizing the conformity between what is ideal and what is perceived by the parents, teachers and health professionals can aide in reiterating important contents of the manual pertaining to the roles and norms each one can have in educating CWCI. Therefore, the following hypotheses were tested if the t-value is negative:

\[ H_0: \text{There is conformity between the ideal and perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI.} \ (\mu \geq 4.5) \]
There is nonconformity between the ideal and perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI. ($\mu < 4.5$)

AND the following hypotheses if the t-value is positive:

$H_0$: There is no significant agreement between the ideal and perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI. ($\mu < 4.5$)

$H_1$: There is significant agreement between the ideal and perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI. ($\mu \geq 4.5$)

In the final phase of the study, the manual was validated by testing its effectiveness in improving the psychosocial characteristics of CWCI. The CWCI and parent respondents were divided into control and experimental groups who were both pre and post tested. In testing for differences in their scores, the following hypotheses were tested.

To test for the difference in the scores of pretest and post-test for both control and experimental groups:

$H_0$: There is no difference in the pre-test and post-test CWCI psychosocial characteristics scores for both groups of CWCI and parent respondents ($\mu_{POST-TEST} - \mu_{PRETEST} = 0$)

$H_1$: There is a difference in the pre-test and post-test CWCI psychosocial characteristics scores for both groups of CWCI and parent respondents where the mean of post test is higher than pretest ($\mu_{POST-TEST} - \mu_{PRETEST} > 0$).

To test for the difference in the scores of the control and experimental groups:

$H_0$: There is no significant difference between the psychosocial scores of the control and experimental groups. ($\mu_{POST-TEST} = \mu_{PRETEST}$)

$H_1$: There is a significant difference between the psychosocial scores of the control and experimental groups where the mean of the experimental group is higher than the control group ($\mu_{POST-TEST} > \mu_{PRETEST}$).

Definition of Terms

Cancer (CA) - is the abnormal growth of cells that can affect any organ of which leukemia and lymphomas are the most common types in children. Treatment includes chemotherapy that weakens the immune system. Late stages of which are usually fatal.

Children with chronic illness (CWCI) – In this study, it pertains to children between 3 to 9 years of age who are diagnosed with a condition that is either long term, not curable, or has residual features resulting to limitations in daily living or requires frequent hospital admissions or visits. These children are currently admitted in a hospital for at least one week in duration, or are actively engaged as outpatient clients due to their health condition.

Chronic disease – a long term condition not curable or has residual features that result in limitations in daily living requiring special assistance or adaptation in function. It lasts for 3 months or more in 1 year or requires frequent hospitalizations or doctor follow-up visits.
Health professionals – refers to the like doctors, nurses, physical therapists and occupational therapists who render related services to CWCI.

Interdisciplinary collaboration – pertains to the partnership and cooperation made by parents, teachers, and health servicing professionals in the care and education of CWCI.

Norms – pertains to the set of behaviors manifested by parents, teachers, and other professionals in terms of prioritizing responsibilities, communicating with other members of the interdisciplinary team, and committing oneself in the care and education of CWCI.

Other health impairment – conditions leading to having limited strength, vitality or alertness, including a heightened alertness to environment stimuli that results in limited alertness with respect to the educational environment, that is due to chronic or acute health problems.

Practices – pertains to roles and implemented norms of parents, teachers and health professionals in the education of CWCI.

Therapeutic Teaching – pertains to the teaching pedagogies in form: a.) music therapy, b.) bibliotherapy, c.) play therapy, d.) dance therapy, e.) creative drama, and f.) arts and crafts (Dizon, 2003) which aim to facilitate emotional healing of exceptional children like those with chronic illness through relaxation, enjoyment, direct or indirect skill-building, and planned opportunities for creativity.
Chapter 3
RESEARCH METHODOLOGY

This chapter describes the research design, locale, respondents, instrumentation and data collection procedure used in the study.

A. **Research Design**

This study is primarily descriptive and quasi-experimental in design.

B. **Research Locale**

The hospitals which served as research locale of the study were: a.) East Avenue Medical Center (EAMC) in East Avenue, Quezon City, b.) Fe Del Mundo Hospital (FDH) formerly Children’s Medical Center in Banawe, Quezon City, c.) National Children’s Hospital (NCH) in E. Rodriguez, Quezon City, d.) Philippine Children’s Medical Center (PCMC) in Quezon Avenue, Quezon City, e.) Philippine General Hospital (PGH) in Taft Avenue, Manila, and lastly f.) Philippine Orthopedic Center (POC) in Banawe, Quezon City.

C. **Population and Sampling**

The study utilized purposive sampling utilizing inclusion and exclusion criteria to screen the CWCI. A total of 84 CWCI, 84 parents of CWCI, 14 teachers and 28 health professionals served as respondents in the study.

D. **Instrumentation**

There are four research questionnaires used in the study. These are: a.) research questionnaire no.1 for the CWCI respondents; b.) research questionnaire no. 2 for the parent respondents; c.) research questionnaire no. 3 for the teacher respondents; and lastly d.) research questionnaire no. 4 for the health professional respondents.

All of the four instruments were validated by experts and were then pilot tested using test-retest method which yielded to high reliability.

E. **Data Collection**

Population screening and selection of qualified respondents was done using form A presented as Appendix F. Consent of the qualified respondents was taken. Once consent is given, Form B presented as Appendix G was used to gather the necessary contact information for follow-up purposes. Data to answer the objectives of the study were gathered by letting the respondents answer the research instruments. CWCI were guided in understanding the questions if they are not able to read yet.

During the manual implementation phase, the researcher monitored weekly through phone calls and/or hospital visits the compliance of the experimental group in delivering the activities of the manual using the monitoring sheet presented as Appendix I. The interdisciplinary team member who rendered the activity to the child was also noted.

After manual implementation, the CWCI and parent respondents of both experimental and control groups were made to answer again the statements with 4-pt measurement scale as answering option located in section F and section G respectively, of their research instruments. This is to re-evaluate the psychosocial characteristics of the CWCI after manual utilization.

For the experimental group, data from section F of their respective instruments were gathered using the same methods used in Phase 1 of the study. For the control group, section F of the
research instruments for both CWCI and parent respondents were mailed with detailed mechanics as to how to answer and mail back the post-test tools. Appendix J presents the mechanics.

F. Statistical Treatment Used

Descriptive-correlational statistics were used to treat the data gathered in the study. The weighted mean was interpreted using the scale in the succeeding table.

### TABLE 1
WEIGHTED MEAN ANALYSIS OF PERCEIVED PRACTICES (ROLES AND NORMS) OF PARENTS, TEACHERS AND HEALTH PROFESSIONALS

Analysis of Variance (ANOVA) was used to test the significant difference among the perceptions of the parents, teachers and health professional respondents was tested using. Agreement between the ideal and perceived practices was tested using One-Sample t-test. The weighted mean was used to treat the data answering specific question number 7 regarding the pre and post-test scores of CWCI and parent respondents. All statements were treated in negative state and were interpreted using the scale presented in Table 2.

In answering specific question number 8, significant difference between the pre and post test scores for each control and experimental group in the study, data gathered were treated using One-sample t-test where the test value is equal to zero (0). Since the responses were all treated as negative statements, the ideal situation is that the pretest score is greater than the posttest score. The 31 psychosocial statements were summarized into 5 variables namely: A.) Self-esteem, B.) Anxiety, C.) Relationship with Parents, D.) Relationship with Teachers and Classmates, and E.) Relationship with Health Professionals.
The results of the control and experimental groups were compared using Two-sample independent t-test. The input variables are the five mentioned in the previous paragraph (A to E) which are the differences between the pre-test and post-test scores.

Data were treated using Excel and SPSS Version 13 program operations for Windows.

G. The Manual Output

The manual developed in the study was based from the health, education, support system and most important, the psychosocial profile and needs of CWCI gathered from the first phase - preliminary data gathering, of the study duly validated by ten experts in the field of special education, pediatric health care (e.g. developmental pediatrics, pediatric internal medicine and oncology, family medicine and pediatric nursing) and rehabilitation medicine (physiatrist and physical therapist) and educational psychology, research and administration. Profile of the content validators of the manual is presented in Appendix K. The manual was originally developed and validated in English language and was then translated by a professional linguist to Filipino for the use of the experimental group of respondents of the study. The succeeding paragraphs highlight the content and significance of the manual.

The manual is divided into two major books. The first book focuses on the manual rationale which is further divided into two major chapters. The second book of the manual presents the different therapeutic teaching activities and basic academics for CWCI ages 3 to 9 years old. It is further subdivided into three sub-booklets namely: a.) Preparatory to Primary Education Program: Level 1 for ages 3 to 4 years old, b.) Preparatory to Primary Education Program: Level 2 for ages 5 to 6 years old, and c.) the Early Primary Education Program: Level 3 for ages 7 to 9 years old. The manual also explains the method to use in assessing the psychosocial and academic progress of the child as the manual is being used. It incorporated the tools with corresponding scale of measurement to check the development of the child in the process of therapeutic teaching.

H. Methodological Limitations

The researcher encountered situations that limited the methodology of the study. The application for research locale inclusion was restricted by the varied hospital research protocols, high cost research application fees and administrators who rejected the conduct of the study in their facility.

Concerning the population and samples, randomization for true experimental design was not followed due to the fast rate of patient discharge for inpatients and the highly variable outpatient physician or treatment program appointments that transpired yielding to quasi-experimental design.

During the preliminary data gathering phase, physical limitations on the part of the researcher was experienced. During manual utilization period, follow-up procedures done to monitor the delivery of manual activities to the child and filling-out of activity monitoring sheets were dependent upon honesty-based parental reports during phone call conversations and actual meetings. Relative to the post-testing of the study, a drop-out rate of 13% transpired during the last phase of data gathering.
This chapter presents the results and analyses of the responses of the four groups of respondents in the study namely the CWCI, parents, teachers, and health professionals handling CWCI.

I. A. WHAT ARE THE DEMOGRAPHIC CHARACTERISTICS OF CWCI?

Fifty-two percent of the respondents were boys and 48% were girls mostly belonging to the 7 to 9 years old (62%) age group. Eighty-seven percent (87%) have siblings mostly 1 to 2 in number (46%) and 37% of them were first born children. Fifty seven percent have both parents giving them company at home. When analyzed in terms of sole parental involvement however, it can be noted that mostly mothers (21%) accompany the CWCI. It was evident that other than the parents of CWCI, siblings (87%), grandparents (31%) and CWCI Aunts and Uncles (21%) were the top three other people accompanying CWCI at home. It can be noted that 74% of the CWCI have parents who are still married.

Findings also showed that 83% of the CWCI respondents were Roman Catholics which serve as a good foundation for coping with the challenges of the child’s health condition.
I. B. WHAT ARE THE CHARACTERISTICS OF CWCI WITH RESPECT TO THEIR HEALTH CONDITION?

Majority or 62% of the CWCI respondents have had their illness for one year already and 18 of the 84 respondents have other illnesses commonly Pneumonia. Eighty-five percent (85%) have history of previous hospitalization with 38% being hospitalized at least once or twice. Average duration of stay in the hospital is for at least 4 to 6 days (33%) to 1 to 2 weeks (25%).

Twenty-five out of 28 or 89% of the health professional respondents have CWCI patients who are undergoing treatment. Health professionals have patients receiving medications (25 of 25 health professionals), have CWCI undergoing chemotherapy (18 of 25), and undergoing infection treatment (16 of 25). There is significantly high percentage of CWCI undergoing chemotherapy (72%) and infection treatment (64%) programs.

Out of 84 CWCI respondents, 45 or 53% knew what their health condition was, 9 or 11% were not aware, while 30 or 36% were uncertain. Majority of those who were aware of their health condition were diagnosed to have Leukemia. Top three initial reactions were: a.) sad (mean=22.5 out of 84), and b.) crying (mean=14.5 out of 84). Given the initial reaction of CWCI and parents, majority of them still believe that the health condition will be immediately resolved (mean=52 out of 84).

Doctors are commonly the first source of information regarding the health condition of the CWCI followed by the mother of the CWCI. Teachers on the other hand showed their reliance on the mothers of the CWCI for information concerning the health condition of the CWCI.

Overall survey for the CWCI, parent and teacher respondents shows a mean score of 23.67 reflecting generally a little knowledge by the respondents concerning the health condition.

In terms of health impairment manifestation, majority (79%) of their CWCI patients manifested moderate weakness of the body. Furthermore, results of the study also revealed that in the school setting, teacher respondents stated that the symptoms usually occur during activities (79%) and that majority occurs sometimes (50%).

I. C. WHAT ARE THE CHARACTERISTICS OF CWCI WITH RESPECT TO THEIR LEARNING / EDUCATION?

Results show that 61% of the CWCI respondents attend a public school. Twenty-nine per cent of them belong to Grade 2, 21% Grade 1, 20% Nursery, 18% Kindergarten, and 12% Grade 3. At the time of the research, 56% of the CWCI had stopped schooling.

Sixty percent already have previous history of disruption of formal schooling. In terms of CWCI absenteeism from regular classes, majority (mean=23) of the CWCI were absent from their classes 1 to 2 times a week. The most common reason for the absences is because the CWCI is symptomatic of illness (mean=38.33).

When the perceptions of health professionals were asked regarding the health condition of the CWCI leading to school disruption, 82% of the health professionals agreed that the health condition of the child does lead to disruption.

Findings revealed that the CWCI themselves, the parent and the teacher respondents believe that the activities given in school do not stress the child. Moreover, majority of the respondents stated that English is the most common subject of difficulty and the most common specific learning difficulty is focusing.
Most common specific class performance difficulty based on direct teacher respondent observations was lack of concentration. Most of the health professional respondents meanwhile, believe that the health condition of CWCI pose a limitation to the schooling of these children. Teasing of classmates (mean=58.5) is the topmost unpleasant school experience among CWCI.

I. D. WHAT ARE THE PSYCHOSOCIAL CHARACTERISTICS OF CWCI?

An overall mean of 2.22 of the psychosocial component of the research instruments for all four respondents using the 4-point scale of measurement which implies that the indicators of psychosocial characteristics which were all statistically treated as negative statements were often experienced by the CWCI. All variables for both intrapersonal and interpersonal characteristics range between a mean score of 2.03 as lowest and 2.36 as highest.

I. D.1. Intrapersonal Psychosocial Characteristics of CWCI, Anxiety Manifestation and Self-Esteem

A significantly high number of CWCI and parent respondents replied that the relationship became more close (mean=68). Parent respondents justified the relation of the CWCI to God becoming closer after having the health condition.

It can be noted that there is inconsistency with the CWCI’s description of their relationship with God. This can be explained by the high and low emotional moments often experienced by CWCI and their parents concerning their relationship with God which leads to answers that may change overtime depending on the current level of personal issues being faced.

Results of the respondent’s self-esteem revealed an overall mean score of 2.4 which implies that they often manifest low self-esteem.

I. D.2. Interpersonal Psychosocial Characteristics of CWCI: Relationships with Family

Concerning the interpersonal psychosocial characteristics majority of the CWCI respondents became more close to their parents (mean=67). Ninety-two per cent of the parent respondents on the other hand when asked about their closeness to their CWCI given the health condition reported that they became closer. The top three reasons given by the parents for the established closeness between them and their CWCI were: a.) parents became more affectionate with the CWCI (98%), b.) parents pity their child because of the health condition (92%), and c.) parents always attend to the needs of the CWCI (91%).

Although the fact that there is good relationship between CWCI and their parents is validated, it can still be noted that parents develop a more closer relationship with their child given the health condition (92%) than CWCI developing close relationship with their parents (67%).

On the contrary, results of the study revealing parents who were uncertain if the have established closer relationship with their CWCI given the health condition reasoned that the increased moodiness and irritability of their child made them uncertain with their answers.

When asked about the relationship of the CWCI to their siblings given the health condition, results showed that majority of the parent and CWCI respondents themselves answered that their relationship became closer (mean=43) after the CWCI was diagnosed of the condition while some stated that the relationship became distant (mean=19) and others were uncertain of what to answer (mean=11). The top five reasons given by parent respondents to justify the closeness of CWCI and their siblings were: a.) they want to be with each other always, b.) the innately love each other, c.) the healthy siblings pity the CWCI, d.) they are fond with each other and e.) they do not quarrel with each other. Parents who answered that their CWCI were not close to their other child/ren given the health condition
stated that it was because a feeling of jealousy exists (14 out of 28 parents) among siblings because of the attention being given whenever the child is sick and because their CWCI seem to be more irritable and moody (9 out of 28) always wanting to be attended to which keeps his/her sibling/s distant.

Results of the 4 – point scale research instruments assess the relationship of the CWCI with their family members revealed an overall mean score of 2.48 which implies that the psychosocial indicators which were all treated as negative statements are sometimes experienced by the CWCI. Indicator statements on specific interpersonal relationship with family member resulted in mean scores ranging between 1.98 and 2.6 which are interpreted to occur as sometimes among CWCI except for items 17 and 19 which occur often.

I. D.3. Interpersonal Psychosocial Characteristics of CWCI: Relationships with Teachers and Classmates

Results of the 4-point scale research instruments to assess the relationship of the CWCI with teachers and classmates revealed an overall mean score of 2.39 implying that the psychosocial indicators which are all treated as negative statements were often experienced by the CWCI. Indicator statements on specific interpersonal relationship with teachers and classmates resulted in mean scores ranging between 2.27 and 2.61 which are all interpreted to occur often among CWCI except for item no 21 which sometimes occur. Consequently, when asked concerning the closeness of CWCI to their friends after being diagnosed of the health conditions, a collaboration of the answers of both the CWCI and parent respondents revealed that majority have a distant relationship given the health condition (mean=41). A mean score of 28 was derived from those who answered that the relationship became close and a mean score of 15 are for those who are uncertain with their answers. CWCI did not express any reason to justify their answers, however, reasons given by parents why their children have a distant relationship with friends given the condition were: a.) CWCI are avoided by friends (44%) and b.) friends of CWCI are scared that the condition is contagious (36%). Reasons given for stating that there was a closer relationship were: a.) CWCI were visited by friends (87%), b.) CWCI received letters from friends (65%), and c.) friends help the CWCI (43%). Those who were uncertain of what to answer reasoned that: a.) the CWCI and his/her friends are far from each other (50%) and b.) they do not communicate with each other, hence they are unsure (31%).

On the contrary, however, some CWCI (mean=21) still established a close relationship with their peers and teachers. This is consistent with the findings of Spinetta et al. (1998) on psychosocial relationships of children with leukemia that demonstrated these children to enjoy school as they interact with peers. Such children were also not teased or injured at a rate higher than classmates although absences can be a major deterrent to academic achievement.

I. D.4. Interpersonal Psychosocial Characteristics of CWCI: Relationships with Health Professionals

Results of the 4-point scale research instruments used to assess the relationship of CWCI with health professionals revealed an overall mean score of 2.03 implying that the psychosocial indicators which are all treated as negative statements were often experienced by the CWCI. Indicator statements on specific interpersonal relationships with health professionals resulted in mean scores ranging between 1.78 and 2.26 which are all interpreted to occur often among CWCI.

When asked about the unwanted health experiences of CWCI when hospitalized, results revealed that the top five answers given by CWCI and parents were: a.) when being injected (mean=80), b.) unable to play with friends (mean=69.5), c.) drinking too many medications (mean=62), d.) when required to stay for long at the hospital, and e.) when talking to doctors, nurses and other health professionals in the hospital.
I. E. WHAT ARE THE CHARACTERISTICS OF CWCI IN TERMS OF OTHER SUPPORT SYSTEMS?

I. E.1. Family Support System

Results revealed that 58% of the family of CWCI respondents would fall on the low income group with a combined monthly income of less than 5,000 pesos, 30% with income ranging from 5,000 to 18,000 pesos, and 12% ranging between greater than 18,000 to 32,000 pesos. Changes in family expenditures given the health condition of the child showed that 75% of the parent respondents encountered great increase in their family expenditures, 64% have increased their family debt, 38% pawned family items, 32% were almost unable to buy medications for the child, and 15% have minimal increase in expenditures. Fifty-seven per cent of CWCI families rely on the fathers as source of financial support during illness, 32% from mothers, 15% from grandparents, 8% from siblings of CWCI who are working, 7% from sponsors or private agencies, and 6% from other members of the family (e.g. aunts/uncles and cousins).

When specifically asked about the commonly encountered difficulties in taking care of their CWCI, the top three difficulties mentioned were: a.) buying of prescribed medications (69%), b.) hospital and other health expenses (58%), c.) rushing of the CWCI to the hospital (52%).

There is equal varied response among parents of CWCI in their acceptance of the CWCI health condition. Thirty-seven per cent of the parent respondents answered that they have slightly accepted their child’s condition, 34% have not accepted, and 29% have fully accepted.

Concerning parental relationships, when parents were asked about the status of their relationship with their spouses given the health crisis of their child, 66% of the parent respondents answered that they and their spouses became close, 20% became aloof or distant to each other and 14% were uncertain of their answer.

The most common reason given for being close was because parents of CWCI and their spouses help each other in facing the problem (55%). The most common reason given for being aloof / distant was because couples rarely see each other (71%), while the most common reason for uncertainty of response was because the couples are busy with work.

In terms of relationship between other family members other than the parents of CWCI given the health crisis of the child, 86% of the parent respondents replied that the family members became close, 7% became aloof or distant to each other and 7% were uncertain in their answers. The three most common reasons given for being close were because: a.) of the common desire of the family members for the CWCI to recover, b.) the family wants to make the CWCI happy and c.) the family inherently loves each other. The most common reason given for being aloof / distant was because couples rarely see each other (67%) and they quarrel because of all the problems (67%).

Results of the study revealed that 27% of parent respondents noticed no change in their behavior in terms of dealing with the CWCI. For those who noticed some changes, the top three changes most commonly observed were: a.) siblings became thoughtful with the CWCI (32%), b.) siblings became more caring with the CWCI (22%) and c.) siblings were jealous of the attention given to the CWCI.

I. E.2. Health and Educational Support System

In terms of support whenever symptomatic of illness, showed that majority of the parent and CWCI respondents stated that the mothers of CWCI are the primary persons that render personal support to the child (mean=51), followed by the father (mean=26), sibling (mean=15), helper (mean=9) and grandparent (mean=6). Even health professional respondents agree that mothers are the persons most commonly coordinating with them regarding the CWCI health needs and condition. For CWCI and
parent respondents, when they were asked if the CWCI receives instantaneous response to be treated whenever symptomatic, a significant number of the CWCI and parent respondents replied that whenever symptomatic, the child is immediately brought to the doctor or hospital (mean=50.5) while only some replied that they are unable to immediately bring the child to a doctor (mean=31) and very few were uncertain of what to answer (mean=2.5). The three most common reasons given for being able to immediately attend to the child whenever symptomatic were: a.) family members help each other, b.) they find ways to resolve the problem and c.) they loan money to address the needs of the child. The most common reason given for not being able to immediately attend to the child was because they have no money to use to bring the child to the hospital or doctor.

Concerning educational support for the CWCI, results showed that some CWCI respondents do not receive any personal support at all when they attend to their homework (mean=7.33). Some, however, answered they have and the three most common people rendering personal support to the child were: a.) mothers (mean=30.33), b.) father (mean=13.67), and c.) sibling (mean=13). Table 96 presents details of the data.

Results of the study revealed that 64% of the teacher respondents admitted that they know little about the health condition of the CWCI they handled, 29% stated that they know just enough and only 7% replied that they know much about the condition. In terms of actual knowledge, the top three were: a.) that CWCI have many activity limitations because of their health status (64%), b.) that CWCI require medication during class hours (43%) and c.) that CWCI have restrictions in exposure (36%).

Based from the findings, it can be noted that more than half of the teacher respondents of the study know a little about chronic health condition of the students they handle. The three most common sources of their knowledge about the CWCI health conditions were: a.) medical books (50%), b.) medical personnel (50%) and parents of CWCI themselves (43%).

Ninety-three percent (93%) of the health professional respondents believe that the health condition of the CWCI can pose a limitation to the child’s education and 50% of those who said so believe that it can affect these children to a moderate extent. Teacher respondents of the study, on the other hand, stated that frequent absenteeism (86%) is the most common difficulty they encounter in handling CWCI, followed by the CWCI’ inability to participate in class (43%) and that the child easily gets tired when in school (43%).

Whenever symptomatic in school, the three most common initial reactions of the teacher respondents were: a.) they give the CWCI ample rest time (100%), b.) they call for help (57%), and c.) they slowly pace the teachings with the child (43%). All of the teacher respondents render special considerations to the CWCI.

Moreover, three of the most commonly given special considerations by teachers were: a.) take home / special assignments (100%), b.) excused absences (86%) and c.) longer time in taking examinations (57%). All of the teacher respondents do not consider the special considerations they give to CWCI as additional burden to them.

Health professional respondents on the other hand perceived the same as the teachers in giving special considerations in the education of CWCI. Three of the most commonly given special considerations were: a.) excused absences (100%), b.) non-participation in strenuous activities such as those in physical education subject (89%), and c.) take home / special assignments (86%).

Teacher and health professional respondents also stated that in terms of restrictions in school, CWCI should be restricted in running races (mean=13.5), strenuous games (mean=11), cleaning the classroom (mean=6), and jogging (mean=5). Some, however believed that no restriction in activities
may be given provided that activities are done with precaution (mean=4.5). Both health professionals and teachers agree to suggest art as substitute activity for CWCI.

In terms of support from classmates, the five most commonly observed behavioral support were: a.) checks-out if CWCI feels okay (mean=65.5), b.) donates money to help (mean=27.5), c.) writes letters to CWCI (mean=25.5.), d.) reminds the CWCI to take extra caution during activities (mean=20.33), and e.) helps the CWCI in understanding the lessons (mean=14).

Considering the CWCI diagnosis, 43% of health professionals suggested home-based schooling, 29% suggested resumption to schooling in regular set-up with special education provisions, 14% suggested hospital-based schooling, and 7% suggested temporary halting of schooling and resumption with regular schooling without special education provisions.

When given option to choose special education services, results revealed the following: a.) tutorial program (mean=16.5), b.) part-time special education placement (mean=13.5), c.) home study program (mean=10) and d.) full-time special education placement (mean=4.5).

Relative to the recommendations given by professionals concerning special education services, majority of the CWCI and parent respondents attest that teachers of CWCI give remedial classes to help the child cope with unclear lectures/lessons (mean=56) although some not do so (mean=23).

Other than the remedial classes for unclear lessons, a significant number of CWCI were given special sessions for missed topics in class (mean=31.67) although some were not (mean=24.33). When asked if they believe that tutors are needed to facilitate the education of the CWCI, significant number of CWCI, parent and teacher respondents agree that it is needed (mean=42) and only a few believed that it was not needed (mean=13.33).

Results of the study revealed that there is no special teacher attending to majority of the CWCI respondents while hospitalized (mean=45) and only few have them (mean=4.5.)

For those who have special teachers, data presented showed that activities done include counting, drawing, praying, singing, coloring and basic academics.

When all of the respondents were asked if special teachers were needed to help CWCI, data showed that majority answered it as necessary (mean=39.75), few said it is not necessary (mean=3.75) while there were some who were uncertain of their answer (mean=4.5).

The top five reasons presented as to why special teachers are needed were: a.) CWCI want to continue their studies, b.) to decrease CWCI boredom, c.) for CWCI to learn, d.) CWCI wants visitors, and e.) CWCI wants other teachers.

For some who did not recognize the need for special education teachers in hospitals, the reasons given were: a.) additional expenditures for the CWCI family, b.) CWCI like the teacher in his/her own school, c.) activities can physically and mentally exhaust the CWCI and d.) studying serve as additional stress to the sick child.

When asked if they are agreeable to have parents as special teachers for CWCI, significant number of respondents agreed (mean=40) while few were not agreeable and uncertain of what to answer (mean=8).

The top five reasons for agreeing were: a.) to promote continuity in education, b.) to decrease boredom in hospital, c.) to decrease depression, d.) for the CWCI to learn, and e.) CWCI will be at ease when taught by parents.
Reasons given by the respondents for not agreeing were: a.) some parents may have no capability to teach, b.) parents are not real teachers, c.) parents do not have time, d.) parent do not know what to teach, e.) activities may be additional stress to the sick child. Reasons given by the parent respondents themselves for being uncertain of becoming special teachers for their hospitalized or housebound CWCI were: a.) they are not sure if they have the ability to teach the way teachers do, and that b.) their CWCI became easily irritable and moody which make teaching hard.

When asked if they are agreeable to have health professionals as special teachers for CWCI, findings showed that majority of the respondents agreed (mean=25.25) while some did not agree (mean=19.5) and others were uncertain of their answer (mean=7.75).

The top five reasons for agreeing were: a.) to continue learning/education of CWCI, b.) CWCI listen to health professionals more, c.) health professionals are capable to teach, d.) decrease depression of CWCI, and e.) health professionals know the needs of their CWCI patients. Reasons given by the respondents for not agreeing were: a.) CWCI fear health professionals, b.) CWCI are aloof with health professionals, c.) teaching may disturb health professionals from their work, d.) health professionals might refuse to teach.

In terms of the health professionals’ willingness to teach CWCI, when asked if they are agreeable to be special teachers of CWCI, results showed that 53% of the health professionals agreed with the proposal, 29% were uncertain and 18% refused to accept.

Forty-seven per cent of those who expressed willingness agreed to render special education for less than half an hour, 20% for half an hour to one hour, and 13% declared no time duration as long as they are off duty. Table 124 presents the data.

Recommendations given by professional respondents in order to make parent and health professionals effective special education teachers for CWCI were: a.) guiding instructions on what to teach (mean=11.5), b.) formal training / seminars / teaching units (mean=10.5), and c.) teaching modules (mean=8).

II. WHAT ARE THE SPECIAL EDUCATION NEEDS OF CWCI BASED ON THE CHARACTERISTICS MENTIONED IN SPECIFIC OBJECTIVE NUMBER ONE?

Based from the data gathered in specific objective number 1, it can be noted that majority of the CWCI, parents and teacher respondents lack knowledge concerning the chronic health condition. CWCI have a health condition that demands thorough knowledge and understanding not only on the part of the child and parents themselves but also on the part of the family, classmates and teachers of the child. The extent of awareness should be given directly by the health professional in-charge to ensure comprehensive and accurate information concerning the condition of the child. The information must encompass discussions concerning the nature, accompanying health impairment, signs and symptoms of the illness including their frequency and occurrence, the treatment program, medication requirements and its effects as well as anticipated hospitalization occurrences which can help the CWCI and the people involved with them (e.g. family, classmates/peers and teachers) be oriented with their condition and needs.

A significant number of the CWCI study in public schools and majority of them stopped schooling because of their health condition. Absenteeism is one significant factor leading to school absences which are often brought about by the symptomatic episodes of the illness. Regardless of the child’s health condition however, the CWCI themselves, the parent and teacher respondents still consider the positive effects of schooling (e.g. not notice time, enjoy learning, forgets pain etc.). Considering this matter, there is a need to develop special education programs that will address the absenteeism issue
among CWCI with special provisions for teaching / activities in school done in hospitals in order to maximize the positive effects learning and education on the child.

Learning difficulty is evident among CWCI, and teacher respondents believe that such difficulty presents moderate to high limitations in the schooling of the child. Subjects in school that were observed to be problematic were those that require focusing, computation, reading, speaking and analyzing. English, Math and Science were significantly identified as areas of difficulty and other than frequent absenteeism, class participation and easy exhaustion from activities were also observed. Along with the academic issues that lead to low grades among CWCI, they are also commonly teased and avoided by people in school. Moreover, there are a lot of reminders and restrictions that need to be followed to protect the health of the child. Considering these learning and educational needs of CWCI, collaboration among health and educational disciplines should prosper and ensure the implementation of awareness and training programs for the protection of the child’s health in school as well as development and carrying out of special and adapted activities modified to fit the learning needs of CWCI. Home and /or hospital-based educational programs should also be developed and provided by special education teachers to facilitate continuance of the child’s learning. The program should advocate strengthening the weak areas of the child in academics, affective and psychomotor domains through activities or worksheets that focus on subject areas of difficulty and emotional well-being as a whole.

Children with chronic illness face psychosocial problems brought about by the stress and issues linked with their health condition. Self-esteem is affected, anxiety levels are higher, relationships with family members, classmates and teachers and most especially health professionals are affected. The importance of faith and strong family relationships are important in helping the CWCI and his/her family deal with the stresses brought about by the condition. The unpleasant experiences of the CWCI in hospitals and during the process of treatment make them aloof towards health professionals. Anxiety and refusal to cooperate with them were commonly observed among CWCI. Relative to this fact, it is important that guidance and psychotherapy sessions are provided to the child. Activities that promote psychosocial or emotional healing should also be developed and implemented whether child is at home, in school or in the course of treatment. This will help the CWCI overcome the psychosocial issues linked with his/her health condition. Moreover, it will be helpful if the parents, teachers and especially the health professional collaborate and cooperate in the carrying-out of such psychosocial activities to promote development and increase in positive intrapersonal competence and interpersonal behavior of the CWCI.

A significant number of CWCI families earn a low monthly income that is not enough to sustain the needs of the family including the huge health and educational needs of the CWCI. A considerable increase in the regular expenditure of CWCI families is evident with support primarily coming from the father as family provider. The burden of compliance to prescribed medications, frequency of hospitalizations and related health needs are predominant set of difficulties encountered by the family in taking care of CWCI. Relative to these financial needs, a wide network of agencies, public and private, should be broadly advertised and extended to reach-out especially to less fortunate members of society with CWCI as members.

In terms of educational support system, teachers are open in giving special considerations in teaching CWCI in the form of take home assignments, longer examination time, non-strenuous activities, etc. and this is also what health professionals recommend in terms of special educational provisions for CWCI. Teasing / bullying in school by classmates of CWCI are also balanced by those who offer concern for the welfare of their classmate with chronic illness. At home, mothers of CWCI primarily offer support in attending to their school homework.

Considering the educational support system for CWCI, it is evident that teachers, classmates, most consistently the mothers, are open in rendering assistance to the child. Such openness to help will be made more effective if proper knowledge regarding the actual needs of the child based on
the nature of his/her condition is disseminated. Teaching considerations, modifications and stressing of certain issues and concerns in school activities may be done if the teachers themselves know the consequences of the child’s health conditions and other related problems that comes with it. Trainings for teachers and parents can be given to enhance teaching methodologies that can be utilized. An awareness program for the school community can be given to promote deeper understanding of the CWCI and how their condition affects their quality of life.

When CWCI are hospitalized, it is significant that there are no special education teachers that render learning activities for the child despite the acknowledgement of the benefits of teaching-learning activities in forgetting pain, decreasing boredom, etc. and the recognition of the need for CWCI teachers (e.g. tutors, special education teachers). The concept of having health professionals do hospital-based teaching activity during their free time is also a rational provision considering the shortage of special education teachers and to facilitate better rapport between the highly anxious CWCI and their health service professionals. Home-based teaching is also a practical approach to consider especially for those CWCI who are expected to recuperate at home because of the health condition. Such approach will cater to parents doing hand-on teaching to their children which are consistent with the goals of the Family Centered Model (Mahoney & Wheeden, 1997).

In the light of empowering parents and other potential teachers (e.g. health professionals) to uplift the quality of life of the CWCI through teaching, development of relevant teaching materials like teaching manuals, modules and activity guides can be helpful. Such materials are cost-effective and practical means of addressing the shortage of special education teachers, promoting continuity of the child’s education, attaining the positive benefits of learning and education in the midst of chronic health condition, decreasing anxiety levels of CWCI to health professionals, improving the relationship of parents and their CWCI and overall addressing the academic and psychosocial needs of the child.

III. WHAT DOES THE LITERATURE SAY REGARDING IDEAL PRACTICES (ROLES AND NORMS) OF MEMBERS OF THE INTERDISCIPLINARY TEAM IN THE EDUCATION OF CWCI?

Families notify the school of the student’s health management needs and diagnosis when appropriate. They notify schools as early as possible and whenever the student’s health needs change. They provide a written description of the student’s health needs at school, including authorizations for medication administration and emergency treatment, signed by the student’s health care provider. They participate in the development of a school plan to implement the student’s health needs and meet with the school team to develop a plan to accommodate the student’s needs in all school settings. They authorize appropriate exchange of information between school health program staff and the student’s personal health care providers and communicate promptly significant changes in the student’s needs or health status to appropriate school staff.

Families provide an adequate supply of student’s medication, in pharmacy-labeled containers, and other supplies to the designated school staff, and replace medications and supplies as needed. This supply should remain at school. They provide the school a means of contacting you or another responsible person at all times in case of an emergency or medical problem and educate the student to develop age-appropriate self-care skills. Likewise, they promote good general health, personal care, nutrition, and physical activity.

Family members are able to lead the care coordination team effectively and/or be active participants when they are knowledgeable about their child’s condition and their skills and strengths are supported.
Students with chronic illness on the other hand must notify an adult about concerns and needs in managing his/her symptoms or the school environment. And they should participate in the care and management of his/her health as appropriate to the developmental level.

Schools identify students with chronic conditions, and review their health records as submitted by families and health care providers. Teachers arrange a meeting to discuss health accommodations and educational aids and services that the student may need and to develop an Individualized Education Program (IEP), or other school plan, as appropriate. The participants should include the family, student (if appropriate), school health staff, IEP coordinator (as applicable), individuals trained to assist the student, and the teacher who has primary responsibility for the student. Health care provider input may be provided in person or in writing.

Educators of a CWCI provides a sound, comprehensive educational opportunity for that child in the least restrictive environment. The student’s physical needs should be planned for and modified or accommodated. However, once that is accomplished, educators should be free to be the child’s teacher, rather than feel that they must also be the child’s nurse. Educators will need the support of the school nurse and administrators to ensure freedom to go about being a teacher. With parent and student consent, educating the rest of the class about their friend’s health condition may enable everyone to go about their daily business of learning as usual. Many educators report that working with a special child is challenging and rewarding.

Teachers provide nondiscriminatory opportunities to students with disabilities. They should be knowledgeable about and ensure compliance with laws protecting the child’s rights. They should clarify the roles and obligations of specific school staff, and provide education and communication systems necessary to ensure that students’ health and educational needs are met in a safe and coordinated manner. They implement strategies that reduce disruption in the student’s school activities, including physical education, recess, offsite events, extracurricular activities, and field trips. They communicate with families regularly and as authorized with the student’s health care providers and Ensure that the student receives prescribed medications in a safe, reliable, and effective manner and has access to needed medication at all times during the school day and at school-related activities. They must be prepared to handle health needs and emergencies and to ensure that there is a staff member available who is properly trained to administer medications or other immediate care during the school day and at all school-related activities, regardless of time or location. They ensure that all staff who interacts with the student on a regular basis receives appropriate guidance and training on routine needs, precautions, and emergency actions. They provide appropriate health education to students and staff, and a safe and healthy school environment. They ensure that case management is provided as needed and ensure proper record keeping, including appropriate measures to protect confidentiality and share information. Teachers promote a supportive learning environment that views students with chronic illnesses in the same way as other students except for their health needs. Likewise, teachers promote good general health, personal care, nutrition, and physical activity.

The primary care pediatrician's role in coordination care within the medical home concept is not fixed or determined by a defined set of tasks but is a dynamic process driven by the health status and developmental progress of the child, the specific needs of the child and family, the primary care pediatrician's expertise with children with special health care needs, and the availability of other professionals to provide coordination in care.

IV. WHAT ARE THE PERCEIVED PRACTICES OF THE MEMBERS OF THE INTERDISCIPLINARY TEAM SPECIFICALLY ON ITEMS STATED IN SPECIFIC OBJECTIVE NO.3?

General description of the results concerning the perceived practices of parents, teachers and health professional respondents revealed an overall mean score of 4.33 which can be implied that in general, the respondents agree to the practices each member of the interdisciplinary team
have in the education of CWCI. Mean scores for specific sub-areas range between 3.96 and 4.65, implying that the respondents agree with the statements given which are all ideal roles and norms of the different members of the interdisciplinary team. Exception however is given to areas pertaining to norms/culture of teachers and roles of health professionals wherein the respondents strongly agree with the given statements.

Results revealed that the respondents agree to the specific roles of parents in the education of CWCI as revealed by an overall mean score of 4.42. Specific statements under this area resulted in mean scores ranged between 3.88 and 4.69. Among the statements concerning parent roles, the top five highest agreements were noted in the following: a.) parents promote overall personal care for the child, b.) parents should notify the service professionals of the health management needs of the child, c.) parents promote physical activity that can help the child, d.) parents should attend educational and support-oriented meetings for the education of the child, and e.) parents should provide information about the child and family to service professionals.
Results revealed that the respondents agree to the specific norms/culture of parents in the education of CWCI as revealed by an overall mean score of 3.96. Specific statements under this area resulted in mean scores ranging between 3.29 and 4.55. Among the statements concerning parent norms/culture, top three highest agreements were noted in the following: a.) parents communicate to other professionals rendering services to the child, b.) parents take full and great responsibility in the education of the child, and c.) parents take a lead role in the evaluation of the child’s services.

Results revealed that the respondents agree to the specific roles of teachers in the education of CWCI as revealed by an overall mean score of 4.28. Specific statements under this area resulted in mean scores ranged between 3.67 and 4.83. Among the statements concerning teacher roles, top five highest agreements were noted in the following: a.) teachers provide the necessary comprehensive education for the CWCI, b.) teachers provide general education of the CWCI, c.) teachers promote supportive learning environment for the CWCI, d.) teachers implement strategies that reduce disruption in the student’s school activities, and e.) teachers must learn to how to promote a safe and healthy environment for CWCI.

Results revealed that the respondents strongly agree with the specific norms/culture of teachers in the education of CWCI as revealed by an overall mean score of 4.58. Specific statements under this area resulted in mean scores ranging between 4.23 and 4.93. All of the statements were strongly agreed upon by the respondents except only for item number 44 concerning the norm/culture of teachers wherein they communicate with the other service providers as authorized which was interpreted as agree.

Results revealed that the respondents strongly agree with the specific roles of health professionals in the education of CWCI as revealed by an overall mean score of 4.65. Specific statements under this area resulted in mean scores ranged between 4.52 and 4.90, all of which were interpreted as strong agreement of the respondents to the statements given.

Concerning the level of involvement the parents, teachers and health professionals should have in the education of CWCI, general results revealed that respondents believe that all of these members of the interdisciplinary should be involved in the education of CWCI as implicated by an overall mean score of 4.48. The highest mean score was met by the teacher respondents (mean=4.96), followed by the parent/guardians (mean=4.79), then by the health professionals (mean=3.69) which implies that respondents believe that the greatest involvement in the education of CWCI should come from the teachers, followed by the parents and the least from the health professionals.

V. IS THERE SIGNIFICANT DIFFERENCE AMONG THE PERCEIVED PRACTICES OF EACH MEMBER OF THE INTERDISCIPLINARY TEAM HANDLING THE CWCI?

To test the null hypothesis that there is no significant difference among the perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI ($\mu_p = \mu_t = \mu_{hp}$), one way Analysis of variance (ANOVA) was done to treat the data statistically. Results revealed values at less than $\alpha 0.05$ level of significance for the roles and norms/culture of parents and
teachers and value less than $\alpha 0.10$ level of significance for the norms / culture of health professionals. Tests were not significant for areas concerning the perception of respondents about the roles of health professionals and the level of involvement of the members of the interdisciplinary team in the education of CWCI. Therefore, the null hypothesis is rejected specifically on areas A, B, C, D at $\alpha 0.05$ and F at $\alpha 0.10$ implying that there is significant difference among the perceptions of parents, teachers and health professionals as to the roles and norms/culture of parents and teachers as well as to the norms/culture of health professionals in the education of CWCI. The succeeding table presents the data.

VI. IS THERE NONCONFORMITY BETWEEN THE IDEAL AND PERCEIVED PRACTICES OF THE INTERDISCIPLINARY TEAM RESPONDENTS?

To test the first null hypothesis that there is conformity between the ideal and the perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI, \( \mu \geq 4.5 \) was used if the t-test score results to positive value. The second null hypothesis that there is no significant agreement between the ideal and the perceived practices (roles and norms) of parents, teachers and other health professionals in the education of CWCI, \( \mu < 4.5 \) was used if the t-test score results to negative value. One sample t-test was done to statistically treat the data. Results revealed values less than \( \alpha 0.05 \) level of significance for all areas with t-test scores to be negative in all areas except for area E pertaining to roles of health professionals. Therefore, the first null hypothesis is rejected specifically on areas A, B, C, D, F and G implying that there is nonconformity between the ideal and the perceived practices in the education of CWCI in areas pertaining to roles and norms/culture of parents, teachers, norms / culture of health professionals and level of involvement of each interdisciplinary member. The second null hypothesis on the other hand is rejected specifically on area E at \( \alpha 0.05 \) implying that there is significant agreement between the ideal and perceived practices (roles and norms) of the respondents as to the roles of health professionals in the education of CWCI. The succeeding table presents the data.

PHASE 3: Manual Post-testing and Validation

VII. WHAT ARE THE PRE AND THE POST-TEST SCORES OF CWCI AND PARENT RESPONDENTS’ CONTROL AND EXPERIMENTAL GROUPS REGARDING PSYCHOSOCIAL CHARACTERISTICS?

For the pre-test and the post-test psychosocial scores of the CWCI and parent control groups of the study, an overall pre-test mean score of 2.23 was noted for CWCI respondents with an overall post-test mean score of 2.19. Mean scores for the pre-test ranged between 2.05 and 2.51 while mean scores for the post-test range between 2.02 and 2.45. Scores decreased by a difference of 0.04 during the post-testing period. On the other hand, an overall pre-test mean score of 2.27 was noted for parent respondents with an overall post-test mean score of 2.26. Mean scores for the pre-test range between 1.83 and 2.45 while mean scores for the post-test range between 2.21 and 2.30. Scores decreased by a difference of 0.01 during the post-testing period. Table 5 presents the data.

For the pre-test and the post-test psychosocial scores of the CWCI and parent experimental groups of the study, an overall pre-test mean score of 2.52 was noted for CWCI respondents with an overall post-test mean score of 2.79. Mean scores for the pre-test ranged between 2.19 and 2.73 while mean scores for the post-test range between 2.69 and 2.87. Scores increased by a difference of 0.04 during the post-testing period. On the other hand, an overall pre-test mean score of 2.36 was noted for parent respondents with an overall post-test mean score of 2.77. Mean scores for the pre-test range between 2.00 and 2.52 while mean scores for the post-test range between 2.72 and 2.80. Scores increased by a difference of 0.41 during the post-testing period. Table 6 presents the data.

</tbody>
</table>

To test the null hypothesis that there is no difference in the pre-test and post-test psychosocial characteristics scores for both groups of CWCI and parent respondents \( (\mu_{\text{POST-TEST}} - \mu_{\text{PRETEST}} = 0) \), one sample t-test was used to treat the data.

For the CWCI respondents, results revealed values lower than \( \alpha = 0.05 \) level of significance in the following psychosocial areas: A - anxiety manifestation, B-self-esteem and E-relationship with health professionals all under the experimental group. Therefore, the null hypothesis is rejected for these three aforementioned areas (A, B and E) for the experimental group, thus, for these three areas there is significant difference in the pre-test and the post-test psychosocial characteristics scores for the experimental group of CWCI where the mean of post test is higher than pretest. Table 7 presents the data.

<table>
<thead>
<tr>
<th>PSYCHOSOCIAL AREAS ASSESSED BY CWCI CONTROL AND EXPERIMENTAL GROUPS</th>
<th>t-test value</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Control</td>
<td>Experimental</td>
</tr>
<tr>
<td>A Anxiety manifestation</td>

</tr>
<tr>
<td>B Self-esteem</td>
<td>0.451</td>
<td>0.044</td>
</tr>
<tr>
<td>C Relationship with Family Members</td>
<td>0.414</td>
<td>0.259</td>
</tr>
<tr>
<td>D Relationship with Teachers and Classmates</td>
<td>0.488</td>
<td>0.153</td>
</tr>
<tr>
<td>E Relationship with Health Professionals</td>
<td>0.290</td>
<td>0.000</td>
</tr>
</tbody>
</table>

For the parent respondents, results revealed values lower than \( \alpha = 0.05 \) level of significance for all areas under the experimental group and for area E (relationship with health professionals) only of the control group. Therefore, the null hypothesis is rejected in all areas for the experimental group and area E of the control group, thus, for the parent respondents there is significant difference in the pre-test and the post-test psychosocial characteristics scores for all psychosocial areas in the experimental group and area concerning the relationship of CWCI with health professionals under the control group where the mean of post test is higher than pretest. Table 8 presents the data.

<table>
<thead>
<tr>
<th>PSYCHOSOCIAL AREAS ASSESSED BY PARENT CONTROL AND EXPERIMENTAL GROUPS</th>
<th>t-test value</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>0.456</td>
<td>0.000</td>
</tr>
<tr>
<td>D Relationship with Teachers and Classmates</td>
<td>0.315</td>
<td>0.000</td>
</tr>
</tbody>
</table>
To test the null hypothesis that there is no difference between the psychosocial scores of the control and experimental groups ($\mu_{\text{post-test}} = \mu_{\text{pre-test}}$), two sample independent t-test was used to treat the data.

Results revealed values lower than $\alpha$ 0.05 level of significance in the following psychosocial areas: E – relationship with health professionals for both CWCI and parent respondents, and B – self-esteem for parent respondents only. Values lower than $\alpha$ 0.10 level of significance was also noted in the following psychosocial areas: A – anxiety manifestation for both CWCI and parent respondents and C – relationship with family members for parent respondents only. Therefore, the null hypothesis is rejected for all these aforementioned areas. Thus, we can say that there is significant difference between the psychosocial scores of the control and the experimental groups for CWCI respondents where the mean of the experimental group is higher than the control group for areas of anxiety manifestation and relationship with health professionals, and that there is significant difference between the psychosocial scores of the control and experimental groups for parent respondents where the mean of the experimental group is higher than the control group in all psychosocial areas. Table 9 presents the data.

**IX. CAN THE EDUCATIONAL NEEDS OF CWCI BE MET BY A MANUAL INTENDED FOR INTERDISCIPLINARY USE?**

Based on the results of the study that tested the effectiveness of the interdisciplinary therapeutic teaching manual by comparing pre and post test psychosocial scores, it can be noted that: a.) as answered by CWCI, there is significant difference in the pre-test and the post-test psychosocial characteristics scores for the experimental group where the post test mean is higher than the pre-test mean in areas of Anxiety, Self-esteem and Relationships with Health Professionals; b.) as answered by parent respondents, there is significant difference in the pre-test and the post-test psychosocial characteristics scores in all psychosocial areas (anxiety, self-esteem, relationship with family, relationship with classmates and teachers and relationships with health professionals) for the experimental group and area concerning the relationship of CWCI to health professionals under the control group where the post test mean is higher than the pretest mean; and c.) in comparing overall changes between the control and the experimental groups, results revealed significant difference between the psychosocial scores of the control and the experimental groups for CWCI respondents where the mean of the experimental group is higher than the control group for areas of anxiety manifestation and relationship with health professionals.
professionals, and that there is significant difference between the psychosocial scores of the control and the experimental groups for parent respondents where the mean of the experimental group is higher than the control group in all psychosocial areas.

Considering the aforementioned results, it can be concluded that the interdisciplinary therapeutic teaching manual was able to meet the educational needs of CWCI respondents of the study through therapeutic teaching methods with incidental integration of basic academic components of learning. A matrix that summarizes how the manual answered the specific needs assessed in the study is presented in Table 10.

Chapter 5
SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

This descriptive and quasi-experimental study investigated the educational needs of children with chronic illness and the practices (roles and norms) of the members of the interdisciplinary team (e.g. parents, teachers, health professionals) involved with the children in facilitating their education. The study developed and validated a manual that can be used by the members of an interdisciplinary team to ensure not only the continuity of regular education in the early primary level but also to address the therapeutic and incidentally the cognitive needs of CWCI that affect their learning and development, thus enhancing the quality of their lives. It specifically sought to answer the following questions:

CONCERNING EDUCATIONAL NEEDS

1. What are the characteristics of CWCI in terms of the following aspects:
   b. Demographic profile
   c. Health condition
   d. Learning or education
   e. Psychosocial state
      i. Intrapersonal characteristics
         1. Anxiety manifestation
         2. Self-esteem
      ii. Interpersonal characteristics
         1. Relationship with parents
         2. Relationship with teachers and classmates
         3. Relationship with health professionals
   f. Other support system
      i. Family support system
      ii. Health and Educational support system

2. What are the special educational needs of CWCI based on the characteristics mentioned in specific objective number one?

CONCERNING INTERDISCIPLINARY COLLABORATION

3. What does the literature say regarding the ideal practices of the members of the interdisciplinary team in the education of CWCI specifically on the following:
   i. Roles undertaken as member of the team
   ii. Norms in terms of:
      1. Prioritized responsibility
      2. Communication to other members of the team
      3. Level of involvement in educating the child

4. What are the perceived practices of the members of the interdisciplinary team specifically on items stated in specific objective no.3?

5. Is there an agreement between the perceived practices of each member of the interdisciplinary team handling the CWCI

6. Is there conformity between the ideal and perceived practices of the of the interdisciplinary team respondents?

CONCERNING MANUAL VALIDATION
7. What are the pre and post-test scores of CWCI and parent respondents’ control and experimental groups regarding the psychosocial characteristics of the child specifically:
   i. Intrapersonal characteristics
      1. Anxiety manifestation
      2. Self-esteem
   ii. Interpersonal characteristics
      1. Relationship with parents
      2. Relationship with teachers and classmates
      3. Relationship with health professionals

8. Is there a significant difference between the pre-test and post-test scores of CWCI and parent respondents and between control and experimental groups regarding the psychosocial characteristics of the child stipulated in specific objective no.7 after manual implementation?

9. Can the educational needs of CWCI be met by a manual intended for interdisciplinary use?

The hospitals which served as research locale of the study were: a.) East Avenue Medical Center (EAMC) in East Avenue, Quezon City, b.) Fe Del Mundo Hospital (FDH) formerly Children’s Medical Center in Banawe, Quezon City, c.) National Children’s Hospital (NCH) in E. Rodriguez, Quezon City, d.) Philippine Children’s Medical Center (PCMC) in Quezon Avenue, Quezon City, e.) Philippine General Hospital (PGH) in Taft Avenue, Manila, and lastly f.) Philippine Orthopedic Center (POC) in Banawe, Quezon City. Purposive sampling was used and the CWCI population was subjected into a set of screening criteria to be qualified. Overall, the study comprised 84 CWCI, 84 parent respondents, 14 teachers, and 28 health professionals as respondents.

Four researcher-designed, pilot-tested and expert validated questionnaires were used as instruments in the study, one for each respondent. The study was divided into three phases namely: a.) Phase 1 - Preliminary data gathering phase, where CWCI needs assessment and analysis of interdisciplinary collaboration practices were done; b.) Phase 2 – Interdisciplinary Therapeutic Teaching Manual development and expert validation phase, and lastly c.) Phase 3 – Post-testing and validation of the developed manual based on post-test psychosocial characteristic scores of the CWCI respondents. Descriptive-correlational statistics were used to treat and analyze the data.

MAJOR FINDINGS:

The study yielded the following major findings:

DEMOGRAPHICS OF CWCI

1. Male and female CWCI were nearly equally represented as respondents of the study with boys slightly greater than girls in number with more than half belonging to the 7 to 9 age groups. Nearly three-fourths of them had siblings and most were the eldest or second children in the family. Almost three-fourths were Roman Catholics.

2. More than half of the CWCI respondents had parents who were married and nearly half of them had parents accompanying them at home.

HEALTH CHARACTERISTICS

3. CWCI respondents had clinical diagnoses categorized as: a.) Cancer; b.) Musculoskeletal disease, c.) Blood diseases, d.) Kidney disease, e.) Tumor, and f.) Other special types. More than half of them were diagnosed of Cancer mostly Leukemia in type, followed by other unspecified forms of Cancer, Lymphoma, Polymosisis and Pott’s disease.
4. More than half of the CWCI respondents had their illness for one year and had had other co-existing illnesses, the most common was Pneumonia. Nearly three-fourths had a history of hospitalization, mostly 1-2 times and staying in the hospital for 4 to 6 days.

5. Nearly three-fourths of the CWCI respondents were undergoing chemotherapy treatment program. More than half of them were aware of their diagnosis which most commonly was Leukemia.

6. Most of the CWCI respondents showed no reaction or were sad upon knowing their condition. Majority of them, together with their parents believed that the illness would immediately resolve by itself.

7. Doctors were the common source of information among all respondents except for teachers who learned about the child’s condition from the parents of the CWCI. All of the respondents, except the health professionals, admitted that they knew only little about the health condition.

8. Majority of the CWCI respondents showed moderate weakness. Common signs and symptoms experienced included, but were not limited to the following: a.) tires easily, b.) loss of appetite, c.) body/joint pains, d.) weakness and e.) fever. When in school, symptoms were sometimes experienced during activities.

**LEARNING CHARACTERISTICS**

9. More than half of the CWCI respondents attended public school, had history of school disruption, and had currently stopped schooling already. Most of them stopped at the level of grade 2, grade 1 and nursery because of their physical condition and as per doctor’s advice.

10. Absenteeism from school was a common occurrence. Majority of the CWCI respondents were absent 1 to 2 times per week mostly because of their illness. They were required to stay home and rest and because of doctor’s appointments.

11. Almost all of the health professional respondents believed that the health condition of the CWCI pose limitation in the education of CWCI and lead to school disruption which was coherent with the teacher respondents’ claim that CWCI significantly experience school problems evidenced by frequent absenteeism and inability to participate in class.

12. Common school problems justifying difficulties included, but were not limited to the following: a.) physical weakness, b.) symptomatic episodes, c.) frequent absences, d.) exposure restrictions and e.) effects of medication. English, Math and Science were the most common subject areas of difficulty in school. Focusing, computation and reading were the most common specific learning difficulties that were encountered. Other most common related school experiences given the health condition included, but were not limited to the following: a.) laziness in studying, b.) low grades, c.) forgetfulness of lessons, d.) difficulty understanding lessons, e.) difficulty focusing, f.) writing difficulty, g.) teasing by peers and h.) being avoided by people.

13. Despite the health condition, majority of the CWCI, parent and teacher respondents still believed that school activities did not stress the CWCI since boredom could be suppressed as the child did not notice time and demonstrate enjoyment with the activities. Majority of the CWCI and parent respondents preferred their last attended school and their homes to continue their education.

14. Common restrictions and/or reminders given to CWCI when in school include, but were not limited to the following: a.) regular visit with the doctor for check-up, b.) drinking of prescribed
medications, c.) having enough sleep, d.) not engaging in stressful activities and e.) eating nutritious foods. The last two were the most commonly violated.

**PSYCHOSOCIAL CHARACTERISTICS**

15. Majority of the CWCI established closer relationship with God given the health condition as they were convinced that God would help them get well.

16. CWCI respondents oftentimes experienced poor intrapersonal relations as evidenced by high anxiety, low self-esteem and poor interpersonal relationship with family, teachers and classmates and health professionals revealed by the psychosocial assessment tool with 4-point scale of measurement for answers. The results of the latter, however, were inconsistent with findings about CWCI interpersonal relations with the family using direct questions answerable by dichotomous scale. Results of the questions with dichotomous level of measurement were suggestive of good interpersonal relations of the CWCI of this study and their family members while those items with 4-point level of measurement scale implies poor interpersonal relationship as evidenced by OFTEN occurrence of negative interpersonal behavior.

17. High anxiety among CWCI was most commonly evidenced by, but was not limited to the following: a.) often fearful of many things, b.) oftentimes sad, and c.) easily and often gets angry.

18. Low self-esteem among CWCI was most commonly shown by, but was not limited to the following: a.) often did not feel relaxed when left alone, b.) oftentimes did not know what they wanted and were not open to expressing it to other people, and c.) often could initiate doing tasks.

19. Majority of the CWCI respondents established closer relationship with parents and siblings given the health condition when asked directly using dichotomous (yes or no) answer. Most common reasons/evidences presented were, but not limited to the following: a.) parents became more affectionate with the child, b.) the child was pitied, c.) parents always attended to the child’s needs, d.) siblings wanted to be with the CWCI always, e.) siblings innately loved and are were of each other, and f.) siblings did not quarrel with each other given the health condition.

20. Poor interrelationship of CWCI with family members, however, using researcher-made psychosocial assessment tool with 4-point scale of measurement for answers was most commonly evidenced by, but was not limited to the following: a.) refusal to play with siblings, b.) CWCI became demanding, and c.) refusal to go out with the family for recreation.

21. Majority of the CWCI respondents became distant with friends given the health condition commonly because they were being avoided and because peers were scared they might catch the disease.

22. Poor interrelationship of CWCI with classmates and teachers were most commonly demonstrated by, but were not limited to the following: a.) refusal to play with other children, b.) feeling of not being helped by teachers, and c.) CWCI did not express themselves to teacher.

23. Poor interrelationship of CWCI with health professionals was most commonly evidenced by, but was not limited to the following: a.) refusal to stay in the hospital, b.) fearful of health professionals, and c.) CWCI did not express their sentiments or feelings to the health professional.

24. Common unwanted experiences of CWCI when hospitalized included, but were not limited to the following: a.) injections, b.) drinking too many medications, c.) inability to play with friends. d.)
requirement of lengthy stay at the hospital, and e.) talking to health professionals. Literature has shown that medical procedures CWCI undergo are frightening or painful. Hospital stays can also be frightening and lonely and because of young children's limited ability to understand their illnesses, they sometimes believe that they are being punished thus making them withdrawn or aloof with health professionals.

SUPPORT SYSTEMS OF CWCI

25. More than half of the CWCI family respondents of the study earned an income lower than PhP 5,000 monthly with fathers as primary source of financial support. Three-fourths of them experienced great increase in family expenditures with more than half experiencing increased debts given the CWCI health condition. Common difficulties encountered were, but not limited to the following: a.) buying prescribed medications, b.) hospital and other expenses, and c.) rushing in to hospitals when the CWCI is symptomatic.

26. Majority of the families of the CWCI respondents had not accepted if not slightly accepted the health condition of the child. More than half of the parent respondents established closer relationships given the health condition as they help each other face the problems aspire to make the child happy, and unite in their desire for the child to recover. It was noted that majority of CWCI siblings, were more thoughtful and caring with the CWCI although some were jealous over the attention given to the CWCI.

27. Mothers of CWCI were the major source of personal and home educational support among CWCI. Majority of the CWCI family respondents responded immediately to the child’s symptomatic episodes by immediately bringing the CWCI to nearby doctors or hospitals, mostly through the help of other family members and by loans.

28. All of the teacher respondents responded to symptomatic episodes in school by giving the CWCI rest and by calling for help. All of them gave special considerations through take home assignments, excused absences and longer examination time, nonparticipation of the CWCI in strenuous activities, and special sessions/activities for missed topics. Peer support was evidenced by frequent checking of the CWCI condition and money donations from classmates and friends.

29. Majority of the health and teacher respondents suggested art activities as substitute for learning of the CWCI. Both respondents also advocated tutorial programs, part-time special education placement, and home-based schooling if possible as educational services to support the CWCI.

30. Almost all CWCI respondents did not have special teachers when hospitalized. All of the respondents believed that special teachers are needed to attend to CWCI learning when confined in the hospital or required to stay at home. Common reasons given included, but were not limited to the following: a.) to continue studies, b.) to decrease boredom, c.) the desire to learn, d.) to have visitors and e.) the desire to have other teachers.

31. A significant majority of the respondents were agreeable to have parents as special / substitute teachers whenever the child was hospitalized or homebound. Likewise, significant majority of the respondents, except for the CWCI, were also amenable to have health professionals as special / substitute teachers when at the hospital. Fear was the most common factor why CWCI refused to have health professionals as teachers.

32. More than half of the health professionals expressed willingness to serve as special / substitute teachers at the hospital for CWCI. Most of them preferred less than an hour of teaching the CWCI, but together with the teacher respondents, they recommended the development of guides and
instructions on what and how to teach, formal training/seminars/teaching units, and teaching modules to equip them.

SPECIAL EDUCATION NEEDS OF CWCI

33. Major findings showed the need to educate families and teachers of CWCI regarding the health condition and provisions of the child as well as the need to develop special education programs that will address the absenteeism, cognitive and psychosocial needs of CWCI.

34. Results also showed the need to expand support systems to CWCI families especially those in the poverty level by expanding and advertising networks or agencies, public and private that can reach out to less privileged families with chronically ill children so as to improve their quality of life.

PRACTICES (ROLES AND NORMS) IN THE EDUCATION OF CWCI

35. Major findings showed that independently, each of the respondents agreed with the stipulated ideal roles and norms of parents, roles of teachers and norms of health professionals and strongly agreed to the norms of teachers and roles of health professionals in the education of CWCI.

36. Significant difference, however, existed in the perceptions of parents, teachers and health professionals as to the practices (roles and norms) of each member of the interdisciplinary team in the education of CWCI when compared. Significant differences were evident in their view of the parental roles and norms, teacher roles and norms, and health professional norms. Although, their concordance was apparent on their view of health professional roles and level of involvement of each interdisciplinary team member.

37. Although, there was agreement when results were treated independently, it was revealed that there is nonconformity between the ideal and the perceived practices (roles and norms) of each member of the interdisciplinary team in the education of CWCI when statistically treated except for the area concerning the roles of health professionals. The perception of the parents, teachers and health professionals regarding the practices (roles and norms) of each member of the interdisciplinary team in the education of CWCI did not conform with the ideal practice as stated in the literatures except only on the part which concerns the roles of health professionals where there is similarity.

POST-TESTING PSYCHOSOCIAL CHARACTERISTICS

38. For the control group, an overall mean difference of 0.04 was evident for the CWCI respondents with 0.01 mean differences for the parent respondents.

39. For the experimental group, an overall mean difference of 0.27 was evident for the CWCI respondents with 0.41 mean differences for the parent respondents.

40. Test of significant difference for the CWCI respondents showed that for the experimental group, there is significant difference in the pre-test and the post-test psychosocial scores in three areas namely: a.) anxiety manifestation, b.) self-esteem, and c.) relationship with health professionals. No significant difference for the control group transpired. This implies the effect of the interdisciplinary therapeutic manual intervention utilized by the experimental group of the study.
41. Test of significant difference for the parent respondents showed that there is significant difference in the pre-test and the post-test psychosocial scores in all of the five areas namely: a.) anxiety manifestation, b.) self-esteem, c.) relationship with family members, d.) relationship with teachers and classmates, and d.) relationship with health professionals. No significant difference for the control group transpired except for the area concerning relationship with health professionals.

42. Overall test of significant difference between the control group versus the experimental group revealed that for the parent respondents, there is significant difference in all psychosocial areas, and for CWCI respondents, there is significant difference in two areas namely: a.) anxiety manifestation, and b.) relationship with health professionals where the post-test mean of the experimental group is higher than the control group. This implies the effect of the interdisciplinary therapeutic manual intervention utilized by the experimental group of the study.

MANUAL VALIDATION

43. Overall, tests of significant difference during the post-testing phase revealed significant change in the psychosocial characteristics of CWCI after using the interdisciplinary therapeutic teaching manual which renders the manual effective in addressing the psychosocial needs of CWCI.
CONCLUSIONS:

Children with chronic illness are faced with multifaceted challenges brought about by their health condition and other related socioeconomic factors. They are faced with health, cognitive and psychosocial issues that affect the quality of their lives including their family.

Health and psychosocial issues intertwine to produce problems concerning school attendance, learning and cognition as well as intrapersonal and interpersonal relations of CWCI. Depressed health and emotional being of the CWCI contribute to daily activity limitations, including those in school that result eventually in pressing further psychosocial issues with the child including his/her family.

CWCI, their parents, teachers and health professionals consider education and learning of CWCI as a positive impetus for the well-being of CWCI. The positive effects of learning activities in decreasing if not eliminating boredom and forgetting pain has been considered especially for hospitalized children and those who are required to stay at home. Specially noted are those therapeutic teaching activities that improve the psychosocial characteristics of CWCI like arts therapy, play therapy, music therapy and drama / role playing.

As the needs of the CWCI fall in the realms of medical and educational practice, the need to establish good collaboration among health and educational professionals is vital. Strategies should involve methods that lead to the common goal of improving the CWCI quality of life. Special education utilizing educational, lay and often universal but scientific therapeutic teaching approaches like art, play, music and etc. can serve as the common point to share and explore in terms of providing improved and extended services.

Considering such premise, this study developed and tested the validity of an interdisciplinary therapeutic teaching manual that can be shared by all members of the interdisciplinary team from parents, teachers to health professionals in order to deliver special education services to CWCI primarily geared towards improving their psychosocial characteristics with incidental cognitive and psychomotor benefits.
RECOMMENDATIONS:

Based on the results of the study, the following recommendations are given:

ON HEALTH ISSUES AND SUPPORT SYSTEMS OF CWCI

1. Support groups for parents and children themselves should be organized among hospitals (especially tertiary level hospitals) and cancer institutes to address CWCI personally and related family concerns and help channel available resources to tap so as to address CWCI specific needs.

2. To facilitate dissemination of ample, appropriate and accurate information concerning chronic illnesses among children and their effects to the child’s life as well as impact on families, hospitals especially those specializing in pediatric care should develop protocols for information dissemination that reaches out to almost all persons involved with the child including peers and teachers in school.

3. Schools with CWCI enrollees especially those in regular school programs should develop indigenous or adapt foreign-based strategies that requires comprehensive health documentations with ample health precautions, treatment provisions and learning sequela in preparation to inclusion of CWCI so as to effectively address their needs (e.g. academic, psychosocial, physical, etc.) competently.

4. Relative to the third recommendation, a centralized knowledge awareness program should be developed with efforts coming from top level health managements (e.g. Department of Health, specialized pediatric tertiary hospitals) in support of the goal of World Health Organization to develop free and relevant health education materials to disseminate accurate information regarding health and provisions for children with chronic conditions which must reach down to the lowest level of the community.

ON EDUCATIONAL AND PSYCHOSOCIAL ISSUES OF CWCI

5. In consideration of unavoidable absenteeism and other related learning problems among CWCI, and considering that majority of these children are potentially present in public schools, educational materials and teacher training guides that cater to the academic needs of CWCI in all levels be developed for utilization and implementation of regular and special teachers handling CWCI in their classrooms. A centralized instructional materials development through the Department of Education will make these materials accessible and beneficial to schools in far flung areas of the community.

6. Realizing the lack of hospital and home-based special education programs and teachers, tertiary hospitals especially those specializing in pediatric care should establish hospital-based education programs offering bedside or special class teaching to CWCI. Such programs should also consider developing standard therapeutic teaching materials (with special emphasis on those that enrich self-esteem and eliminate anxiety), that teachers can use in delivering the activities. Hospitals should open their doors to volunteer special education teachers who are willing to implement the program. Zealous health professionals should also be given a chance to engage in such extension of services.

7. Other than the therapeutic teaching materials, hospital-based special education programs should also consider continuity of learning through the development of teaching guides that can be used by parents, caregivers, relatives and teachers of CWCI as home-based teaching modules to promote education for homebound children.

ON INTERDISCIPLINARY COLLABORATION

8. Through the leadership of top-level managements, a move to practice routine case conferences in hospitals, special pediatric facilities and educational institutions should be promoted. Such case conferences should involve the parents of CWCI, the doctor and other related health services
professionals the child requires, the regular and/or special education teacher of the CWCI, other professionals (e.g. psychologists, social workers, etc.) who may have dealings with the child, and the child himself when necessary so as to effectively plan, implement and continually evaluate multifaceted programs and strategies that improve the child’s quality of life.

9. To promote interdisciplinary collaboration through clarity and understanding of specific team member roles and norms in the care and education of CWCI, the Department of Education and Department of Health and other related organizations should identify at-risk children and families and be given informative materials. These can be in form of leaflets, brochures, etc. and must contain: a.) what each of the interdisciplinary team members can do, b.) the professionals the family can tap, c.) how each member of the team can get connected to each other in service and d.) how to tap related networks or agencies for support. To promote massive dissemination, informative resource materials should also be released through all hospitals, schools and barangays.

ON THE FUTURE OF THE DEVELOPED MANUAL

10. Since proven to address the psychosocial needs of CWCI with incidental cognitive and psychomotor needs, it is recommended that the validated interdisciplinary therapeutic teaching manual be published and disseminated to all tertiary level hospitals prioritizing those that render specialized pediatric services and all families of CWCI through non-governmental organizations to promote the positive effects of therapeutic teaching among children with chronic illness.

TO ADDRESS THE LIMITATIONS OF THIS STUDY AND FUTURE RESEARCHES

11. Since the study was limited to assessing and addressing the educational needs of CWCI belonging to the age group between 3 to 9 years old with history of schooling, it is recommended that a similar study be conducted for CWCI belonging to higher age groups and/or for those who do not have any history of schooling at all.

12. It is recommended that the developed and validated interdisciplinary manual produced in this study be tested for effectiveness to other potential subjects who were not included as respondents in this study but may also benefit from it. These include, but are not limited to the following: a.) CWCI older than 9 years of age but with academic delays that can fit with the activities of the manual, b.) CWCI who may be 3 to 9 years old but without any history of schooling, c.) other CWCI identified in the community who are homebound without connections to hospitals, d.) other exceptional children with psychosocial problems, and e.) regular children who are identified to have psychosocial problems.

13. To address other needs of CWCI other than the psychosocial (e.g. health needs, strictly cognitive needs, support system needs, family needs), a similar needs-assessment study can be conducted with the end-goal of developing relevant programs.

14. A similar study concerning the educational needs of CWCI identified in the community can be done. Likewise, the validated manual of this study can also be tested for effectiveness with community-based CWCI.

“I WILL CONTINUE O MY GOD TO DO ALL MY ACTIONS FOR THE LOVE OF YOU”
Bias, Cause, Impact, and the Will to do better
Welcome, Welcome, Welcome, Welcome!

I am:

- Allen Majors, UniServ Director
  - Illinois Education Association
  - Champaign, Illinois
Bias abounds in our society and affect us all. This session will examine various biases, explore their impact, and leave you with a course of action.
Introduction (Getting to know you!)

- First and last name
- Where you call home
- Your vocation
- Why you chose this session
Bias

What is bias?
What does bias look like?
Who is the object of bias?
What are some groups that bias impacts?
What are some common biases?
On the newsprint provided you are to write any biases, stereotypes, or prejudgments that you have heard or otherwise think that others may hold regarding the various titles provided.

*Keep in mind that these are not to be viewed as biases that you hold but that you perceive are “out there”.*
From where does bias arise and how is it perpetuated?
In your small group, relate an incident of when you were the object of bias or when you were biased toward someone else.

Tell one or two things about you that you want others to know that are outside the bias(es) others might have toward you.
What do I do to contribute to bias in my workplace or organization?
What is the impact of bias?
What happens when there is bias?
What can be done to change bias that we, others, and groups hold or even embrace?
In Summary:

Bias robs human beings of their individuality, relegates them to someone else’s pre-conceived ideas about them, and deprives them of available opportunities.
What will you do?

Record your plan on a piece of paper and take it with you.
My Plan

(A.K.A., “Things are going to change and the change will start with me!”)

Social Media as a Means of Engaging Students Within the Classroom
Dr. Tim Newman, Jennifer Pinsky-Newman

The Internet has become an integral part of society. According to the Pew Internet and American Life Project (2008), 63% of all Americans currently have high-speed Internet access at home and the figure is expected to grow to 90% by the year 2012. Statistics further indicate that more Americans are using the Internet to watch videos, visit social networking sites, blog and share photos (Universal McCann Wave 4, June 2009). Many are finding it difficult to ignore social media since over 122 million people now visit Facebook each month and Twitter grew 1551% last year (Compete.com, June 2009).

From a business perspective, it is not prudent to ignore the fact that millions of people are using these networks and tools. Not surprisingly, companies of all sizes are using social media as part of their public relations campaigns. In fact, 54% of Fortune 100 companies utilize Twitter for news updates, customer service, marketing, promotion and even employee recruitment (Mashable, August 2009). Wouldn’t it be prudent for educators to use the same networks and tools to engage students and prepare them for the future?

This presentation focuses on the many types of platforms, applications, tools and strategies associated with the constantly emerging world of social media. We will discuss how to encourage students to engage in an educated and systematic manner, how to maximize the benefits of social media without damaging one’s reputation, how to be responsible about the information broadcast over the Internet via online communities and networks and how to constructively spend time online to get internships, jobs and positive exposure. Students need to understand the world of social media, the positive and negative consequences associated with online information and the concept of personal branding and maintaining a positive online presence. We will include specific examples of how educators may embed social media into existing courses, demonstrate techniques and specific assignments designed to provide hands-on experience and share some of the best practices associated with teaching and using social media within the traditional classroom environment.
CORRELATES OF THE PERFORMANCE IN THE LICENSURE EXAMINATION FOR TEACHERS (LET) OF THE EDUCATION GRADUATES OF DE LA SALLE UNIVERSITY-DASMARIÑAS: BASES FOR IMPROVED ADMINISTRATIVE POLICIES

ABSTRACT
In the pursuit of quality education, one has to consider the roles that the teachers play. Nava (1994) looked up to the teachers as the most influential persons in the student’s life next to his parents. The would-be-teachers need to have an education and a training that would prepare them for the demanding and complex profession of teaching. Their pre-service education should equip them with the pedagogical knowledge and skills needed in the profession, After all, the teachers who facilitate the teaching-learning process come to the classroom with their personal and training background. They are the products of the curriculum, the human and physical resources of the institution where they graduated from (Nava, 1994). Republic Act No. 7836, The Philippine Teachers Professionalization Act of 1994, states that: “The State recognizes the vital role of teachers in nation building and development through a responsible and literate citizenry. Towards this end, the State shall ensure and promote quality education by proper supervision and regulation of the licensure examination and professionalization of the practice of the teaching profession.” The Act further provides that a valid certificate of registration and a valid professional license from the Professional Regulation Commission are required before any person is allowed to practice as a professional teacher in the Philippines, except as otherwise allowed under this Act.

The Teacher Education Institutions (TEIs), therefore, are challenged to produce graduates who can pass the Licensure Examination for Teachers (LET). DLSU-Dasmariñas, being a TEI, envisions to be a leading institution nationally and globally by producing graduates who perform well in government examination. Hence, this study determined the correlates of the performance in the LET of the Education graduates of De La Salle University-Dasmariñas from 1998 to 2006 as bases for improved administrative policies.

The Spearman Rank Correlation Coefficient was used to determine significant relationship between Licensure Examination for Teachers (LET) and High School Grade Point Average (GPA), performance in General Education subjects, Professional Education subjects and Major subjects. Results show that the LET takers with lower performance in High School, lower performance in General Education subjects, Professional Education subjects and Major subjects usually performed low in the LET and those who performed higher performed well in the Licensure Examination for Teachers. After the stepwise multiple regression analysis, results of
the data show that the best predictors of the LET performance were the grades in the **general education courses and the major courses**. This means that although the high school GPA and the performance in the professional education courses were considered as predictors in the LET, the LET takers who performed well in the general education courses and their major courses are more likely to perform well in the LET.

As the best predictors in LET performance, the performance in the education courses and the performance in the major courses should be strictly monitored and the retention policy of the college should be improved in consideration of these areas. The students’ potential for passing the licensure examination for teachers should be mainly based on the performance in these areas.

**Keywords:** teacher education, licensure examination, administrative policies

**Introduction**

Human beings have certain basic rights that have to be exercised to maximize their potentials. These basic rights include the right to food, clothing, shelter, and education. The first three basic rights ensure individuals that physical needs are met. The right to education allows them to develop knowledge, improve ability, and enhance productivity to meet personal wants and those of one’s family (Ramos, 1995).

To ensure that the individual’s right to education is met, the 1987 Constitution of the Philippines explicitly declares that “the State shall protect and promote the right of all citizens to quality education at all levels and shall take appropriate steps to make such education accessible to all.” In the promotion of quality education, the role of the teacher is emphasized. The teacher is considered as “the key to the effectiveness of the teaching-learning process” (RA 7784). Stressing the significant role of the teacher, Rod Paige, former secretary of US Department of Education, states that “a high quality teacher is the single most significant factor on how well students achieve” (U.S. Department of Education, 2002). Corollary to this, Hunter (2005) maintains that “the quality of the teacher has a direct impact on student achievement, regardless of the grade level and subject matter.” Further, Walsh (2001) emphasizes that “an effective teacher and, therefore a highly qualified teacher, is a critical determinant of how students learn.”

To guarantee that the teacher can truly become effective and qualified, aspirants need to undergo a four-year training in a teacher education institution (TEI), taking either Bachelor of Elementary Education (BEE) or Bachelor of Secondary Education (BSE) degree. This pre-service education should equip aspirants with the “pedagogical knowledge and skills needed in the profession” (CMO No. 11, s. 1999). This pre-service training should also “ensure that the future teachers of the system are adequately prepared for teaching in the school system of the future” (Gonzales, 2000). After graduation, one needs to take the requisite government examination to be qualified to teach. This examination is known as the Licensure Examination for Teachers (LET) which was created by virtue of Republic Act 7836 or the Philippine Teachers Professionalization Act of 1994. This is promulgated towards (a) the promotion, development and professionalization of teachers and the teaching profession, and (b) the supervision and regulation of the licensure examination for teachers. This Act further provides that a valid certificate of registration and a valid professional license from the Professional Regulation Commission (PRC) are required before any person is allowed to practice as a professional teacher in the Philippines.
Because of this, TEIs are now challenged to ensure that their graduates pass the LET. As former Commissioner Hermogenes Pobre (as cited in Legaspi, 2000) of the PRC states, “the LET is administered to determine the fullness of applicants for admission to the practice of teaching.” If applicants fail to pass the LET, it means that they are not qualified to teach. To further emphasize the importance of passing the LET as a teacher certification measure, Miles and Staple (2002) declare that “student achievement increases when they have certified teachers as instructors.”

De La Salle University-Dasmariñas is one of the teacher education institutions in Region IV-A. Its teacher education programs started in 1977 when the University was still known as General Emilio Aguinaldo College-Cavite. When the De La Salle Brothers took over in 1987, it continued offering its BEE and BSE programs. Teachers in nearby private and public elementary and secondary schools are usually graduates of the University. However, the passing of years saw the changes in the quality of graduates the College of Education (COE) produced. Records of LET results show that there are a number of COE graduates who continuously fail the LET inspite of two or three attempts. This somehow pulls down the passing percentage of the University and paints a not-so-good image of COE. The Professional Education Department of COE which is in charge of training prospective teachers is in a dilemma on how to solve this pressing problem. In order to sustain the quality of education provided by the College, it must maintain a high passing rate in the LET. This is one of the key indicators of how a TEI is judged. At this juncture, the researchers felt the need to undertake a study on the predictors of LET so that COE can revisit its administrative policies to ensure its high passing percentage in the licensure examination.

Conceptual Framework

This study is anchored on the Long-Term Higher Education Development Plan (1996-2005) of the Commission on Higher Education (CHED) which requires higher learning institutions to “increase its percentage passing level from 20 to at least 85 percent in the licensure examination.” This is a test of the quality and excellence offered by these institutions.

This is also based on Taylor, et al.’s (as cited in Ukpabi, 2008) assertion that “success in licensure examinations can be predicted by standard indicators of scholastic aptitude or a student's record of academic achievements when in school.”

In this connection, the researchers identified certain variables that can be correlated with the LET performance of the graduates of COE. Since the LET is taken after graduation, factors such as the graduates’ high school grade point average and their performance in their general education, professional education, and major courses were studied to determine if they can predict the LET performance. After the correlation was done, an improvement of the policies on student admission and retention, as well as policies on instructional procedures, need to be formulated to ensure the continuous high passing percentage of COE graduates in the LET.
The framework below is used in this study:

<table>
<thead>
<tr>
<th>High School Grade Point Average</th>

</tr>
</tbody>
</table>

**Statement of the Problem**

This study determined the predictors of the performance in the Licensure Examination for Teachers (LET) of the Education graduates of De La Salle University-Dasmariñas from 1998 to 2006 as bases for improved administrative policies.

Specifically, the following questions were answered:

1. What is the profile of the Education graduates from 1998 to 2006 in terms of:
   1.1. high school grade point average (HS GPA);
   1.2. performance in the general education courses (GEC GPA);
   1.3. performance in the professional education courses (PEC GPA); and
   1.4. performance in major courses (MC GPA)?
2. What is the performance of the Education graduates from 1998 to 2006 in the Licensure Examination for Teachers (LET)?
3. Is there a significant relationship between:
   3.1. the LET performance of these Education graduates and their high school GPA;
   3.2. the LET performance of these Education graduates and their performance in the general education courses;
   3.3. the LET performance of these Education graduates and their performance in the professional education courses; and
   3.4. the LET performance of these Education graduates and their performance in the major courses?
4. What are the best predictors of the performance in the Licensure Examination for Teachers?
5. What changes in the COE administrative policies can be proposed?

This study only focused on the LET performance of the Education graduates of COE, DLSU-D from 1998-2006 since COE has been provided by the PRC of the individual rating of its graduates on the specified years.

Correlated with the LET performance are the graduates’ high school grade point average and their GPA in the general education courses, professional education, courses and major courses. These data were taken from the Registrar’s Office and the Information Technology Center of DLSU-D. The college entrance examination results are not included in the factors correlated with
LET performance because of the unavailability of these data. The Institutional Testing and Evaluation Office (ITEO) revealed that these data were only kept for two years, after which, these were discarded.

The proposal on the improvement of the administrative policies of the COE is done after the analysis of the correlation between the said variables.

**Research Method**

This study applied the descriptive method of research. This study is specifically a correlational study which is designed to estimate the extent to which different variables are related to one another in the population of interest (Padua and Santos, 1998). Specifically, the LET performance of the Education graduates is correlated with their high school GPA and their performance in the general education courses, professional education courses, and major courses.

The subjects of the study are the 517 Education graduates of the College of Education of De La Salle University-Dasmariñas from 1998 to 2006. There are 205 BEE graduates and 312 BSE graduates. These data are taken from the records of the Alumni Relations and Placement Office and the University Registrar’s Office. The distribution of the graduates is as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>BEE</th>
<th>BSE</th>
<th>TOTAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1998</td>
<td>28</td>
<td>9</td>

This study employed **documentary analysis technique** where the following documents were used:

**COE DLSU-D LET Performance from 1998 to 2006.** This contains the individual rating of the Education graduates in three areas: general education, professional education, and major courses. This is provided by PRC to a TEI whose graduates took the licensure examination.

**High school Form 137.** This contains the high school grades of the Education graduates and is kept in the Registrar’s Office of DLSU-D.

**Transcript of records.** This contains the performance in the general education courses, performance in the professional education courses, and performance in major courses of the Education graduates which is kept in the Registrar’s Office of DLSU-D. On-line data on students’ performance in the three areas were also provided by the ITC personnel.
Summary, Conclusions, and Recommendations

The study yielded the following results:
1. The profile of the Education graduates from 1998 to 2006 in terms of high school grade point average (HS GPA) is as follows: The mean grade in high school of the students who took BEE is 83.86 and the mean grade in high school of the students who took BSE is 84.35. The mean grade for both BSE and BEE is 84.11.
In terms of performance in general education courses, the mean grade in general education courses of the students who took BEE is 2.16 and the mean grade in general education courses of the students who took BSE is 2.40. The mean grade for both the BSE and the BEE is 2.28 with a standard deviation of 0.516.
In terms of performance in professional education courses, the mean grade in professional education courses of the students who took BEE is 2.59 and the mean grade in professional education courses of the students who took BSE is 2.69. The mean grade for both BSE and BEE is 2.64 with a standard deviation of 0.476.
In terms of performance in major courses, the mean grade in major courses of the students who took BEE is 2.56 and the mean grade in major courses of the students who took BSE is 2.35. The mean grade for both BSE and BEE is 2.44 with a standard deviation of 0.580.
2. The profile of the Education graduates from 1998 to 2006 in terms of their performance in the Licensure Examination for Teachers (LET) is as follows: the mean performance of all BEE graduates from 1998 to 2006 is 73.47 with a standard deviation of 7.637 and the mean performance of all BSE graduates from 1998 to 2006 is 72.69 with a standard deviation of 7.310. Both the scores in the LET of BEE and BSE graduates yield a mean of 73.06 with a standard deviation of 7.466.
3. In terms of high school GPA, the computed Spearman rank correlation coefficient is 0.313 with a p-value (significance) of 0.000 which is significant at 5 percent level. Therefore, the null hypothesis of no significant relationship between high school GPA and the performance in LET is rejected. In terms of performance in general education courses, the computed Spearman rank correlation coefficient is 0.482 with a p-value (significance) of 0.000 which is significant at 5 percent level. Therefore, the null hypothesis of no significant relationship between the performance of the graduates in their general education courses and in the LET is rejected. In terms of performance in professional education courses, the computed Spearman rank correlation coefficient is 0.406 with a p-value (significance) of 0.000 which is significant at 5 percent level. Therefore, the null hypothesis of no significant relationship between the graduates’ performance in professional education courses and in the LET is rejected. In terms of performance in major courses, the computed Spearman rank correlation coefficient is 0.366 with a p-value (significance) of 0.000 which is significant at 5 percent level. Therefore, the null hypothesis of no significant relationship between the graduates’ performance in major courses and in the LET is rejected.
4. The best predictors of the LET performance are the performance in the general education courses and the major courses with the computed multiple r of 0.507 and adjusted r-square of 0.251.
5. The following changes in the COE administrative policies are hereby proposed:

A. On Student Admission and Retention
1. The high school GPA of prospective Education students should be at least 85 because this grade is generally accepted as an indication of an average academic achievement or ability. Also CMO # 11, s. 1999, the previous CHED memorandum pertaining to the policies and standards for teacher education programs, specifies that “teacher education candidates should have obtained a high school GPA of at least 85.” Since the findings of the study point to the fact that high school GPA can predict LET performance, there is a need to specify the GPA requirement so as to assure the passing of the Education graduates in the LET. The higher the high school GPA, the better is the possibility that the Education graduates can pass and get high scores in the LET.

Careful attention should also be given to the applicants’ grades in English, Science, Math, Social Sciences, and Filipino because these subjects are the same general education courses that the students take in college. As proven in the study, the performance in these subjects is one of the best predictors of LET performance. Likewise, these five subjects are the general education components of the LET.

2. If students have high school GPA lower than 85, they may be accepted conditionally based on their scores in the standardized entrance examination given by the University which measures their knowledge in Math, English, and Science which form part of the general education courses, and abstract reasoning, which is an important skill in test taking. They should get a stanine of 5 or higher.

An interview with these prospective students should also be done to measure their readiness to answer questions and their fluency in English, which is the medium of instruction in most of the subjects in college and the language that is used in most subjects in the LET.

3. Education students should maintain a GPA of 2.50 which is equivalent to 80.00 or higher. Close attention should also be given to the performance of these students in their general education courses and their major courses since these two are considered to be the best predictors of LET performance.

4. If students fail to maintain a semestral GPA of 2.50, they should be placed in probation for a semester with the condition that they would be able to get a higher GPA. Class advisers should closely monitor and follow up the academic activities of these students to ensure that they would be able to improve performance.

5. A semestral qualifying examination may also be instituted covering the subjects taken for the year, classified according to the components of the LET. The students should be able to get a minimum grade of 75 so as not to be placed on probation. A student who is placed on probation because of a low score in the qualifying examination should be able to get a passing rate in the next qualifying examination.

**B. On Instructional Procedures**

1. Close coordination should be done with the servicing departments who are providing teachers handling general education and major courses. Orientation meeting should be held at the beginning of each semester where topics such as motivational activities, active teaching strategies, learning styles/multiple intelligences, and alternative assessment procedures are to be discussed. These topics would ensure that the Education students would get the best from their general education and major courses, thereby allowing them to perform better in these areas which would redound later to an improved LET performance. Another meeting may be done after the preliminary examination so that the COE administrators and the servicing departments can cooperatively evaluate the initial performance of the Education students. Plans and programs
to address the difficulties these students face may be formulated like remedial classes, buddy system, peer tutoring, and the like.

2. Teachers handling professional education courses should try better and more active strategies and techniques in teaching so that their students would perform better in these subjects. Deep analysis of the students’ strengths and weaknesses may also be done through alternative assessments so as to bring out the best in these students and help them eliminate their weaknesses. Although the performance in the professional education courses is not the best predictor of LET performance, it should be noted that the knowledge and skills they learn from these subjects will help them adapt better to their teaching career. Also, professional education courses form 40% of the components of LET. A good performance in these courses would ensure a good performance in the LET.

Teachers handling the professional education courses should also emphasize the production or development of a performance-based professional portfolio which may demonstrate their readiness for initial licensure (Thibodeau, 2000). This would accentuate to the students at the very start of their teacher preparation the importance of maintaining a record of their good performance which they can later on use as part of their credentials for job application.

3. All the faculty members teaching Education students should use the multiple choice type of test which is used in the licensure examination. Variation in the difficulty of the items should be maintained, ranging from easy items to those that require situational analysis and application of learned principles and concepts. This would ensure the students’ familiarity in the type of test used in the licensure examination, thereby enabling them to get a higher score.

Conclusions

The following are the conclusions made in this study:

1. Education students belong to the average level in terms of performance in high school. The mean grade in general education courses shows that the students who took BSE and BEE show average performance in general education courses. The mean grade in professional education courses shows that the students who took BSE and BEE show average performance in professional education courses. The mean grade in major courses shows that the students who took BSE and BEE show average performance in major courses.

2. The ratings of the graduates in LET are low with a number of them getting a failing mark.

3. There is a significant relationship between the performance in LET and high school GPA, performance in general education courses, professional education courses, and major courses.

4. The best predictors of LET are the performances in general education courses and major courses.

5. Policies on admission and retention of students, as well as instructional procedures, may be changed based on the results of the study.

Recommendations

The following recommendations are hereby offered:

1. The proposed changes in the COE administrative policies should be strictly implemented as soon as possible to ensure that the quality of students taking Education and the teachers handling the Education students are raised. This will ensure a good passing percentage in the LET which would give honor to the College and the University.
2. Another study on the predictors of LET performance may be done considering other variables not included in this study.

6. Abstract.
Critical thinking and evidence-based education prepares future health care administrators to apply much needed analytical skills and evidence to solve every day management problems encountered in their work settings. Two critical thinking educational techniques are combined to empower health care management students to learn to effective and efficient means of resolving problems and conflicts. The traditional evidence-based medicine approach ¹ is combined with Delfini’s Ask, Aquire, Appraise method² to propose a new method of educating health care management students in critical thinking and problem-solving. This method is being researched in Southern Illinois University Carbondale’s Health Care Management Program during the 2010-2011 academic year.

What It Is They Do: Understanding Disciplinary Literacy

Background to the Study

Late one afternoon, following a long day of research presentations at a Las Vegas conference, a group of teacher educators took a drive out to Hoover Dam. Walking across the dam, the four colleagues paused at various points to marvel at the historical, architectural, and technological significance of the immense structure. Amy, a mathematician, marveled at the size of the 726 foot high edifice, commenting on the statistics displayed on the dam’s informational exhibits, mentally visualizing the 3.25 million cubic yards of concrete. Reading the information about construction workers who died in the during the construction, she wondered about the probability of casualty. Holly, whose academic interests are in culture and society, was drawn to the Art Deco architecture and the rich historical connections of the site. Her questions centered around the people who created the marvel beneath their feet. Who was the “everyday joe” who worked on this, she wondered. Becky, a science educator, spent most of her time studying the star chart embedded in the terrazzo floor of the monument, puzzled by how this celestial map connected to the dam. Pat, whose academic interests are in literacy and technology, asked a steady stream of questions ranging from, “Why do they call it Lake Mead?” to “Why is the water level so low?” She eagerly anticipated returning to the hotel where she could “Google” Hoover Dam and begin to answer her questions. As they drove away from the dam, the four colleagues marveled at how diverse their interests and questions had been. It was both obvious and fascinating how disciplinary interests had shaped this casual tourist experience into disparate, yet connected, learning opportunities for each of the educators.

The conversations that emerged from that trip to Hoover Dam were the beginnings of an ongoing exploration into how disciplinary viewpoints, unique to specific content areas, shape
and define the particular literacy practices enacted within each discipline. Finding out what "tools" our disciplinary colleagues across the academic fields use for acquiring knowledge—and even knowing what they would identify as necessary knowledge for teachers and teacher educators to know—was the aim of this project. We began to work with disciplinary experts to address the question of what it means to be literate in the fields of mathematics and geography, beginning our inquiry with experts who have a connection to the schools or colleges of education at their universities.

**Purpose of the Study**

Content area literacy has a long history rooted in the paradigm of applying cognitive strategies to content specific texts (Moje, 2008). Developing from Gray’s (1925) work with study skills at the beginning of 20th century and continuing through Harold Herber’s (1970s) work, the idea of teaching cognitive strategies for making sense of text dominates content area literacy textbooks. Recently, however, theory in content area literacy has begun to focus on adolescent literacy, including issues of culture, social interaction, technology, and diversity. Researchers and theorists have encouraged those involved with content area literacy instruction to adopt a disciplinary approach, which is a more complex view of literacy instruction that addresses the literacy demands specific to content areas and is based in the belief that deep knowledge of a discipline is best acquired by engaging in the literate habits valued and used by experts in that discipline (McConachie, Petrosky, & Resnick, 2009; Moje, 2008; Lee & Spratley, 2010). Through reading, writing, and thinking in ways common to the discipline, students deepen their knowledge and understanding of disciplinary content. This paradigmatic shift presents enormous challenges to those of us engaged in the preparation of teachers. What seems evident is that in order to engage in a disciplinary approach to content area literacy, we must first
know about the literacies and texts of particular subject areas. Although a few researchers have begun to describe and delineate the literacy practices of different disciplines (Donahue, 2003; Draper, 2008; Shanahan & Shanahan, 2008), the work is just beginning. The questions guiding our inquiry were: What does it mean to be literate in particular disciplines and how do we begin to shift to disciplinary literacy?

**Perspective/Theoretical Framework**

Draper, Smith, Hall, & Siebert (2005) described the disjuncture between content area instruction and literacy instruction as a “dualism,” and asserted that teachers must explicitly instruct students about how the texts in their disciplines are created and used. Draper’s (2002) work with content area colleagues yielded the understanding that some content area strategies suggested by literacy educators were contradictory to the needs of some disciplines and encouraged teachers to engage in literacy instruction that did not support learning of the discipline. Other research, however, has shown that some generic strategies have the potential for supporting readers in comprehending many different types of texts (Heller & Greenleaf, 2007; Moje, 2008). The current challenge for teacher educators is to identify which strategies have merit and which should be discarded as well as to develop our own knowledge of the roles texts and literacy play in the disciplinary subject areas of middle and secondary schools.

**Methods**

**Participants.** The participants of this study included the authors and their Arts and Sciences colleagues from two comprehensive universities. All had terminal degrees in their fields and taught both graduates and undergraduates in their respective departments. Our collaboration with these colleagues is presented here as examples of the kind of work that is
needed to develop the field of disciplinary literacy, and our work with them was framed within
the context of informing teacher preparation.

**Data collection and analysis.** Data were collected from multiple sources: interviews; textbooks developed for content area literacy courses in teacher preparation; informal discussions with teacher candidates; major academic journals and disciplinary websites, and; our lived experiences as content/disciplinary literacy instructors in teacher preparation programs. One of the authors teaches at the university in the Southwest, the other at the university in the Midwest. Both teach in middle grade education programs for candidates interested in teaching in grades 4-9, but have taught content area literacy for students in secondary programs.

Interviews were conducted in the home departments of the mathematicians and the geographer. Consisting of 10 questions, the protocol addressed the concept of literacy in the discipline and what it means to be literate. Interviews were transcribed, analyzed through open coding, and then categorized into themes, which included “major understandings of the field,” “literacy in the discipline,” and “practice of the discipline.” These major categories contain subcategories that include discussions of the texts used in the discipline, the types of strategies used to become literate in the discipline, and the types of questions addressed within the discipline.

Twelve current textbooks were selected for content analysis. The types of knowledge within the texts were divided into two major categories, “pedagogical” and “content,” which attended to “how to teach” and “what to teach” respectively. In addition, we constructed a list of the disciplines addressed within each text as well as the major themes such as addressing the standards, the concept of multiple literacies, and the types of strategies suggested.
Other types of data collected for this project included our own experiences in the university classroom with teacher candidates. As content area literacy instructors, we offer courses that address literacy across the curriculum at the undergraduate and graduate level. One of us is located at a university in a state with a reading mandate that includes a content literacy course. At the graduate level, our courses are electives, and thus, students rarely express concern about the reason for taking the course. At the undergraduate level, however, students often challenge us with questions such as “why do we have to learn about reading” if they are going to teach math, science, or social studies, art, music, or physical education. Other challenges come in the form of skepticism related to the textbook or the types of learning we believe our candidates could pursue with students in their 4-12 classrooms. Finally, we consulted disciplinary sources (e.g. websites and journals of professional organizations) for greater understanding of the disciplinary field and to verify the thinking and advice of our disciplinary colleagues.

Results/Findings

Through our work with our colleagues in mathematics and geography, we came to recognize that the discourses of our disparate fields created challenges and opportunities for further knowledge and bridge building between us. Our discussions, when juxtaposed with our experiences as content area literacy educators and the textbooks we frequently used, showed the disparities between the common knowledge of our colleagues and our experiences as instructors in secondary content area literacy courses. Often, we struggled to communicate so all participants could understand the other parties’ intents. What we garnered from our efforts with our colleagues included the distinct definitions and major questions of their fields, the
differentiation of what is considered “literacy” and literacy tools used in their areas of study, and, the particular literacy practices they enact within their disciplines.

Interviews with disciplinary experts in mathematics revealed three important strands important to mathematical thinking: patterns, models, and proofs. Literacy in mathematics requires individuals to possess number sense, the ability to understand and interpret graphs, and the ability to connect numerical representations with their graphic counterparts. In addition to these elements of fundamental literacy, mathematical literacy demands individuals to possess the logical abilities to think through and validate arguments and create proofs. Mathematical texts include databases, computer simulations, computer-based models, academic articles, lectures, and theories. Disciplinary experts in mathematics felt that mathematical language has a unique structure and syntax that is very precise. Often students in secondary schools are exposed only to mathematical textbooks, not to mathematical language. Useful literacy tools for math would include learning this precise language and grammar through reading and writing mathematical texts. Logic puzzles and simulations would be useful in promoting the kinds of logical thinking required by mathematics. Talk and discussion are critical to the development of mathematical thinking. Thus, talk in math circles, where students can make concrete what they are forming in their heads, and thinking aloud, where the formulation of their thinking takes place, are two of the most powerful literacy strategies teachers can use in mathematics classrooms.

According to the geography expert interviewed, the field of geography is actually a complex array of subdisciplines spanning the physical and social sciences. The field can be broadly described as the study of space and place. While the general public connects geography to maps, maps are actually the result of geographical study and a way of representing geographic knowledge. While having some mental sense of the world is important, that is only the beginning
of geographic literacy. The goal of geographic education should be to create cultural
consciousness and awareness. Geographic literacy requires the ability to think in terms of spatial
and temporal patterns and the ability to examine the perspectives of others. Texts in geography
include images created through remote sensing and Geographic Information Systems (GIS).
These technologies produce data displays in the forms of maps, models, and databases. Note
taking and note making are the primary literacy tools K-12 students would use for identifying
intertextual patterns as well as for the collection and organization of information in order to
make those intertextual connections. I(nquiry) Charts (Hoffman, 1992), are a form of graphic
organizer that would be useful in the collection and analysis of information from geographic
sources. Visual literacy is another crucial tool in a geographer’s world. Learning to read satellite
images and aero-photography, as well as primary photographs of locations and cultures, is
important. Grids and questioning strategies like those provided by Ogle, Klem, and McBride
(2007) prompt students to examine the purpose, source, point of view, and impact of primary
source documents and images and can lead to the kind metaphorical thinking necessary for
developing geographic content knowledge.

Implications for Reading Education

This project represents the beginnings of our efforts to identify discipline-specific
knowledge and understandings that will allow us to move beyond generalist notions of content
area literacy in which comprehension of content area text is believed to occur simply by applying
generic reading strategies and tools. We did not, however, begin with the assumption that the
strategies and tools, developed and taught through a long tradition of content area teacher
preparation, are without value. Instead, we began the quest for a paradigm of content literacy
instruction that is relevant and useful to preservice and inservice teachers as they prepare twenty-
first century students for careers and higher education. Through our work with disciplinary 
experts in the disparate fields of math and geography, we sought to identify the specific kinds of 
knowledge needed to comprehend texts and construct knowledge in those fields. While we 
sought to understand our disciplinary colleagues’ ways of reading and thinking, we also 
presented them with cognitive tools and strategies commonly taught in content area literacy 
courses, with the goal of identifying those that would be most useful and relevant to novices in 
these disciplines. Through our data analysis, three themes emerged. These themes present clear 
implications for teacher preparation and development in the field of disciplinary literacy.

First, our disciplinary experts were firmly convinced that the teaching and learning that 
occur in K-12 content area classrooms and what is published in the traditional textbooks for the 
disciplines bear little resemblance to what actually occurs in the day-to-day work conducted in 
the field. Our experiences in middle and secondary classrooms confirm that, to a large degree, 
what occurs in schools is the transmission of knowledge through lectures and talk about the 
discipline, rather than the actual “doing” of the disciplines of math and geography. All 
participants, literacy experts and content experts alike, agreed that literacy instruction in content 
area classrooms should aim to build an understanding of how knowledge is constructed within 
the discipline, rather than transmitting knowledge about the discipline (Moje, 2008).

A second theme emerged in the area of preservice teachers and how the content experts 
believed literacy educators could better prepare teacher candidates for educating future 
mathematicians and geographers. Our experts agreed that, frequently, the university students 
who aspire to teach in these fields view themselves as only teachers of the field, not content 
experts. The understanding that we drew from these initial explorations into disciplinary literacy 
was that, to be literate in a discipline, means not just accumulating knowledge about the
discipline, but also understanding the discipline’s important theoretical ideas. It means being able to understand what questions are important to the discipline and how to seek answers to those questions. It also means being able to read and write successfully within that discipline. Teachers in these fields must be literate in these ways themselves in order to apprentice their students in the ways of the discipline.

The last theme we constructed from the data was the importance of the interdisciplinary collaborations themselves. All of us began to realize the value of exploring the topic of disciplinary literacy and the potential these explorations hold for improving the opportunities adolescents may have for constructing knowledge of content and practice in the content areas. As literacy experts, we were surprised by the commonalities we found where we least expected them. Our content experts recognized and embraced some of the current knowledge base of content literacy as appropriate for supporting students as they learn to “do” the disciplines. Through this project we began to see that content literacy curriculum, rather than being irrelevant, could actually move teachers closer to “doing” rather than simply reporting or talking about the discipline they teach.

Girls vs. Boys in Mathematics:  
Test Scores Provide One Interpretation  
Girls' Narratives Suggest a Different Story  

Kathleen Stoehr & Kathy Carter  
University of Arizona  
Teaching, Language, and Sociocultural Studies

Abstract
This study seeks to provide a data based critique of the claims of gender equity in mathematics. Specifically, this paper is an analysis of the personal well-remembered events (WREs) told and recorded by women who are in the first course of their preservice teaching professional sequence. Importantly, these are women who are on the professional track to teach mathematics. Using a narrative based methodology, the writings provide another angle of the intricate pieces of equity (i.e. test results say both genders are just as capable, stories of females say otherwise). These themes center around the safe zones, struggles, embarrassment, competition, and self-fulfilling prophecies. From these stories, we see subtle illustrations of existing gender inequities in mathematics.

Purpose
The purpose of this study is to examine the equity issue in mathematics from perspectives not traditionally included in equity claims. This study offers a close up view of personal experiences that preservice candidates have encountered in their own journey as students of mathematics, especially as they learn to teach. This transition time is important to study, as preservice candidates make the switch from student to teacher. It is vital to understand how critical these stories are, as new female teachers take on the important role of mathematics teachers. What these narratives do is capture the impact of
personal experiences in mathematics to a developing professional identity through the personal well-remembered events (WREs) which require telling, analyzing, and drawing implications.

The different themes that arise in this issue of mathematics equity were examined. These themes include the safe zones in mathematics, the struggles that occur in mathematics, the feelings of embarrassment, the competition, and the self-fulfilling prophecies. These data-derived themes will be expanded and discussed in greater detail in the larger paper.

**Theoretical Framework**

Huebner ‘s (2009) study, *Encouraging Girls to Pursue Math and Science*, notes that the mathematics achievement gap between boys and girls has all but disappeared. Huebner’s research reveals that the differences in mathematics achievement between boys and girls are insignificant. Boaler’s (2008) study, *What’s Math Got to Do With It?* supports this view by claiming national statistics in mathematics show that presently, girls do very well in mathematics, achieving at equal or higher levels than boys. Huebner (2009) makes the statement that there is great optimism for girls in mathematics.

Some data suggests the equity issue in mathematics between boys and girls is solved. However, Boaler’s (2008) study reveals another important component in the equity issue in mathematics between boys and girls. Boaler’s (2008) work reminds us that we cannot underestimate the power of stereotypes that still exist suggesting that boys are stronger in mathematics than girls. These stereotypes occur in family, school, and society (Tobias, 1993). Teachers often overestimate boys’ potential in mathematics whereas they underestimate it in girls (Goodell and Parker, 2001). Gavin and Reis (2003)
argue that girls often believe they are not expected to excel in mathematics. This notion comes from some parents, teachers, and peers. This leads to a detrimental affect on girls in mathematics classes.

Huebner, (2009), Boaler, (2008), Meehan, (2007), and Tobias (1993) agree that girls’ often view themselves as having inferior mathematical abilities when compared to boys. Huebner’s (2009) longitudinal study found that from an early age, girls rate their mathematical ability lower than boys, despite there being no actual difference in achievement. This is significant, as students with more confidence in their mathematics ability are more likely to take classes that lead to careers in this field. Meehan’s (2007) work reveals that some girls still carry a script in their head that says not only are they not good in math, they shouldn’t like it as well. This results in some girls believing that math is too hard and boring and that math is a highly intellectual field to which they do not have access. It is important, therefore, to understand more fully the issue of gender inequity in mathematics and the variables that revolve around it.

**Data Sources**

The present paper is a report of findings from the first year of a five-year research initiative at a large Research I University in the Southwestern United States. The sample for the present study is 60 students enrolled in three sections of an introductory teacher education course. The students in the study were all female with both elementary and secondary teaching majors represented. The majority were students who were traditional undergraduates in their early twenties, with the rest being older female students returning to school for teacher preparation and/or degree completion.
Methods

This study involves a long-term qualitative analysis of approximately 60 narrative stories prepared by a diverse group of elementary and secondary preservice teacher education students. These students were enrolled in a course entitled “Classroom Processes and Instruction.” In these narratives, termed “well-remembered events, the preservice candidates were asked to describe and analyze a particularly salient mathematics event from their own experiences as students in K-12. This genre of personal narrative was derived from Carter’s (1993, 1994) work on well-remembered events as windows into the understandings preservice teachers have of teaching. The task consists of a 2-3 page paper organized around the following parts (1) the selection of a particularly salient mathematics event from one’s past experiences in mathematics as a K-12 student; (2) a detailed description of the event; (3) an explanation of why the mathematics event was memorable; and (4) a statement of what impact this mathematics event might have on the writer’s understanding of what it means to be a teacher. Career studies imply that teachers can often recall in considerable detail specific incidents that have been especially critical in their development (Sikes, Measor, and Woods, 1985). This suggests that having preservice candidates focus on specific well-remembered events may be useful in understanding gender equity issues in mathematics that may still exist.

The analysis of these narratives involved an iterative and sustained qualitative analysis designed to identify the basic story structures (characters, sequence, plot, pattern of action) embedded in the texts. Attention was then turned to the detailed documentation of themes in the mathematics stories (e.g. safe zones, struggles,
embarrassment, competition, and self-fulfilling prophecies) and the meanings the preservice candidates assign to these themes.

**Results**

The preliminary results of this analysis strongly suggest that in regards to mathematics, female preservice teachers did not feel like capable or confident mathematics students. When asked to recall an experience that occurred sometime during their K-12 schooling years in mathematics, the experience or the “well-remembered event” was overwhelmingly a negative one. The recalled experiences centered around themes of operating in a safe zone in mathematics (i.e. not taking chances or be willing to take chances), struggles to understand mathematical content, feelings of embarrassment, dealing with continuous competition from others (especially boys), and dealing with self-fulfilling prophecies of being unable to be successful in mathematics. The analysis at this point is in the first stages of development. A more in-depth and detailed evaluation is currently in process.

A significant number of the participants in the study wrote their well-remembered events in a manner in which the salient event came immediately to mind. The memories tended to be accompanied by strong feelings of pain, embarrassment, and/or anger. The stories seemed to be written as if they had happened only yesterday. The typical structure of the struggles to understand the mathematics content being taught or feelings of embarrassment involved incidents in which the teacher made it public that the writer was not successful in that moment of time in mathematics.

Other incidents chosen by the writers focused on the boys in the class competing to get the answers to the mathematics problems posed by the teacher the fastest as well as
competing to complete the most correct problems as quickly as possible. This also resulted in the boys receiving praise and kudos from the teacher.

Participants also wrote about incidents where they felt like there were not viewed as strong mathematics students by others (teachers, parents, other students) and therefore would never be good in mathematics. These stories focused on negative experiences in mathematics heaped on their past weak histories in mathematics.

Some participants’ stories focused on positive experiences in mathematics and attributed these experiences to having a strong mathematics teacher who believed in them or encouraged them to excel in mathematics. This encouragement was supported by extra help from the teacher, a firm belief by the teacher that the student was indeed capable of being a strong mathematics student, or a push to enroll in a higher level mathematics course than the student had initially planned on taking. These stories were accompanied by feelings of great joy and accomplishment by the students.

**Scholarly Significance of the Study**

Boaler (2008) and Huebner (2009) agree that the mathematics achievement gap between boys and girls has just about disappeared. However, the preliminary findings of this study call into question the notion that the gender equity issue in mathematics is solved. In the midst of current claims of gender equity in mathematics, this study comes along with data obtained through narrative methodology that suggest these claims should not be taken totally at face value. There is great optimism for girls in mathematics (Huebner, 2009). However, we need to pay attention to the personal themes that come directly from women who are going to be teaching. These themes (safe zones, struggles, embarrassment, competition, and self-fulfilling prophecies) question the belief that
gender equity exists in mathematics. We must continue to explore methods which voice those young women still struggling to see themselves as capable in the area of mathematics.

Tobias (1993) points to sex-role stereotypes in families, schools, and societies as a major culprit in girls viewing themselves as being less capable in mathematics. Gavin and Reis (2003) and Meehan (2007) are in agreement with this statement and add that as a result, girls themselves may believe they are not expected to excel in mathematics. More work needs to be done in this area to ascertain the affect that sex-role stereotypes continue to have in the area of girls and mathematics. The results of this preliminary study suggest that these stereotypes still exist and may possibly be surfaced through alternate modes of inquiry.

Campbell (1992) and Hanson (1992) talk about the importance of teachers not passing on to girls any negative feelings that may have about mathematics as well as taking on the responsibility to encourage capable females to excel in this area. This is a crucial point based on the preliminary results of this study.

Moving Toward a Technology Enhanced Alternative Certification Program (TEC) 
for Secondary Special Educators

This abstract describes a federally funded project that addresses the critical shortage of qualified teachers prepared to serve urban learners in secondary schools with mild/moderate disabilities. It addresses this shortage by providing a standards-based technology enhanced certification program that meets on-campus one day a week, every other week over a two-year period for on-the-job teachers. Students progress as a cohort in all of their coursework and receive financial and academic support to meet subject matter competencies in the CORE subjects they teach at the secondary level. School university personnel provide a comprehensive support system to enhance teacher retention through individualized advisement, online mentoring and collaboration, cohort participation, and on-the-job assistance. Cohorts of twelve students are recruited yearly and the project is in its fourth year of implementation. Objectives of the project include: (a) recruit a total of 48 secondary urban school interns in mild/moderate disabilities, (b) prepare highly qualified secondary special educators, and (c) enhance teacher retention through a support system that includes cohort participation, mentoring, and ongoing classroom assistance. Preliminary results from the first, second, third, and fourth cohort are described, as well as lessons learned working with faculty in moving traditional classes to a flexible online format.

Need for the Project

Personnel shortages in the field of special education are well documented with a chronic and severe shortage in every geographic region of the nation (National Clearinghouse for Professions in Special Education, 2003). Many school districts report
difficulty finding sufficient numbers of qualified teachers, particularly in urban areas (Graziano, 2005), and the shortages of special educators are increasing. Moreover, employment of special education teachers is expected to increase faster than the average for all occupations through 2014, given teacher attrition and retirement (U.S. Department of Labor, Occupational Outlook Handbook, 2006).

California employs more special education teachers than any other state and is one of four states with the highest percentage of special education teachers in the field who are not fully certified (24%) (U.S. Department of Education, 2003). The shortage of qualified special education teachers is consistently identified as the highest personnel needs in California. Personnel shortages are particularly acute in large urban and high-poverty areas where teachers are twice as likely (20% vs. 11%) as others to be hired with emergency certification and leave their jobs at much higher rates than those who are fully certified (Zumwalt & Craig, 2005). In Los Angeles County, serving half of the 500 schools considered high-poverty, one out of 5 teachers are underqualified. As noted by the Center for the Future of Teaching and Learning (Christopher et al., 2003), the highest poverty schools have so many unprepared teachers as to make schools dysfunctional.

While California State University, Northridge’s intern program has been very successful in contributing to the need for qualified special education teachers, there are gaps and weaknesses in services. First, with NCLB legislation, all teachers, including special educators, are required to demonstrate subject matter competence in each of the academic subject areas they teach. This project facilitates the preparation of subject matter competent secondary special educators through financial and academic support in secondary subject matter and pedagogical content knowledge.
Second, CSUN’s intern program is designed as a two-year program with interns earning a K-12 Education Specialist Preliminary Credential. However, given the demands of working full-time while attending school, many CSUN interns request an extension to their 2-year intern credential, completing the program in 2 ½ to 3 years. To promote efforts in completing the program on time, the program is designed to improve support and course accessibility. A cohort of secondary interns progress through the program together, completing a sequence of technology-enhanced coursework that minimizes campus visits while providing an online environment that promotes mentoring and collaboration.

Preliminary Results of the Program: Cohorts 1, 2 & 3

Recruitment of secondary interns in mild/moderate disabilities.

The project has admitted 37 of the 48 interns targeted for this program, 12 in year 1, 11 in year 2, 10 in year 3, and 4 in year 4. All participants teach secondary students with mild/moderate disabilities. About half of the interns recruited teach in the Los Angeles Unified District (46%); others teach in Santa Clarita/Antelope Valley School Districts (22%) or in non-public schools (32%). Of the 37 interns recruited, 35% are from diverse backgrounds; 19% are Hispanic, 8% African American, and 8% from other minority groups. Other demographic data indicates that the cohort is diverse in gender (43% male) and age. The majority are 35-44 (34%) or 25-34 (32%); 19% are 45 or older and 15% are under 24. Each cohort has surpassed the GPA admission requirement of 2.75, with the undergraduate GPA of most interns 3.0 or above. All have received a 2 or higher on the interview rating scale. Of the 37 interns recruited for the program, 8 have withdrawn. Most withdrawals took place in Cohort 1 where 50% (6 of the 12 interns) withdrew.
Cohort 2 has completed the program and only 1 of the 11 interns has withdrawn (91%).

Cohort 3, with 10 interns recruited, is halfway through the program and has 2 withdrawal. Cohort 4, with 4 interns recruited, is in its first semester of coursework.

Interns remaining in the program are progressing through the program as expected. The six graduates in Cohort 1, all met the subject matter requirement in an appropriate secondary core area (four in Language Arts, two in History). In Cohort II 6 out of 10 met subject matter requirement in a secondary area (two in Language Arts, three in History, one in Science).

**Prepare highly qualified secondary special educators.**

A major emphasis in this project is to facilitate the development of technology-enhanced courses. Professional development sessions are offered each semester to faculty and individual support is provided as needed. Over the course of the three years TEC faculty have met together eight times, and are increasingly using online components in their classroom. As a result, all TEC faculty have offered completely online or hybrid courses. Professional development sessions included faculty learning about various ways of structuring communication in the online environment and (synchronous chat rooms, break-out rooms in a web conferencing environment, and asynchronous threaded discussions) and sharing their teaching experiences in the technology enhanced courses. Another session included faculty learning about setting up a Second Life environment as an instructional tool and faculty shared ways in which they conduct assessment in the online environment. Most recently, sessions in the past year included a workshop on using Moodle, a new Learning Management System for the university, use of an electronic teaching portfolio, use of a Smart Board, and also use of
online modules developed through the IRIS Center. All TEC courses are implemented completely or partially online.

At the end of each semester in year 1, the first TEC Cohort completed a program evaluation that asked questions on program satisfaction and content related to the specific project emphasis and classroom and program support/supervision. Ratings were strong, ranging from 4.0 to 5.0 on a 5-point scale (1 = not helpful to 5 = very helpful) and included an overall program rating (4.75, first semester and 4.80, 2nd semester) and program content related to the specific project emphasis (teaching in diverse urban secondary schools, serving English learners, and developing inclusive practices, range from 4.0-4.80). All 16 TEC participants have met performance criteria; cohort 1 has completed four semesters as expected and earned a mean GPA in TEC courses of 3.79; cohort 2 has completed four semesters with a mean GPA of 3.46. All TEC participants have met required competencies on their teaching evaluations and portfolios.

**Enhance teacher retention.**

On the survey described above, ratings of TEC Cohort 1 were strong regarding classroom support and supervision (range 4.5-5.0); and program advisement and support by the cohort (4.67-5.0).

**Increased proficiency in the use of technology tools.**

On a survey administered at the beginning of the program and after the 1st year, cohorts use of technology tools improved over time. Results on a rating of 1-no experience to 5-proficient include: (a) level of technology skills: Pre 2.5, Midpt 3.7, (b) use of WebCT: Pre 2.7, Midpt 4, (c) access and download course content: Pre 3.1, Midpt 4, (d) use of
Running Head: TECHNOLOGY ENHANCED

webconferencing: Pre 1, Midpt 3.1, (e) blogging/threaded discussions: Pre 2.2, Midpt 3.2, (f) real-time chat: Pre 2.2, Midpt 3.5, and (g) online quizzes: Pre 2.2, Midpt 3.7.

Comments from cohorts about the program.

Strengths of the program noted by the cohorts include: lots of collaboration and use of technology, work with cohorts in different classes, flexibility and personal attention, scheduling advantages, improved proficiency with technology, accessibility to technology, collaboration with professors to improve technological skills, flexibility of cohort supervisor, and when professors are willing to collaborate and use the technology the classes are far more beneficial and comprehensive. Weaknesses of the program noted by the cohorts include: not all teachers are equally proficient in all aspects of technology and not a clearly defined pace of the required classes.
Using Reflective Writing to Reveal Students’ Self-Awareness of Learning in Mathematics

Kelli M. Slaten
University of North Carolina Wilmington
Department of Mathematics and Statistics
601 S. College Rd.
Wilmington, NC 28403
slatenk@uncw.edu

Abstract: As part of an ongoing study concerning the use of writing in the mathematics classroom, this presentation focuses on students’ written reflections and self-awareness of their own learning. Specifically, undergraduate mathematics majors enrolled in a course on the historical development of mathematics are required to write an expository research paper on the historical development of a particular mathematical concept. A component of the writing assignment requires students to write a reflection on what they learned about mathematics based on their experiences with writing an expository paper. This type of assignment is not typically included in the majority of mathematics courses which tend to focus on teaching formalized mathematics, such as algorithmic procedures and proof writing. The process of writing encourages students to reflect on content and promotes cognitive growth. Furthermore, this type of reflective writing benefits both student and instructor. Students construct personal meaning through reflection and instructors gain insight into the cognitive connections students made during the writing process.

**Introduction**

It was coming up to the fifth season of the Inclusive Practice seminars in the teacher preparation program at the University of Calgary when the infrastructure supporting the course collapsed, leaving only the two of us, out of about twenty instructors, to teach over 350 students in this component of their final semester. Since its inception, one of the hallmarks of the Master of Teaching Bachelor of Education program has been its small class size. With the advent of severe budget cuts, along with a major overhaul of administration, however, two of the key components of the program – the field experience seminars in the first year and this Inclusive Practice seminar – were relegated in 2009-2010 to a large class lecture approach. This reflection, then, is the story of the transition of a core component of our teacher education program as we shifted from an inquiry dialogic pedagogy in small groups of 20 to two sections for the 350+ students in a large lecture format. Because we were instructors of this component since its beginning, our task was the dismantling of what had been a highly successful course in its original conceptualization and reconstituting it into an essentially whole new course.

We will begin this paper with a brief introduction of our professional backgrounds. Following this, we will provide an overview of the current teacher preparation program and a description of the Inclusive Practice course including our history with its beginning development. Subsequently, we will share the story of our lived experience as a part of the course from its inception, and our experience during the tumultuous transition to a large lecture format. The latter includes excerpts of our journal reflections and past and present student feedback. We conclude with what we learned and with how we managed to find meaning and develop pedagogical relationships in the face of our loss of “the way things were.”

_Nancy_

My background includes nursing, public health nursing, social work, and educational psychology. Teaching at the university level has been involved across these
disciplines. The last twenty two years teaching in the Faculty of Education at the University of Calgary has afforded me opportunities to teach in Early Childhood Education, Teacher Preparation, and Counselling Psychology. Responding to children and families with special psychological and educational needs has been integral to these different aspects of teaching and learning and to my private counselling practice. I have studied avidly in the fields of human development across the life-span, relationship processes, and mind/body/spirit integration, including ways to apply my learning to teaching and counselling.

Bev

Prior to arriving at the University of Calgary as a doctoral student and instructor, I worked for seventeen years with the public education system in Calgary, first with preschool children, then Division I and II students (grades one to six). My educational background includes a Bachelor of Arts degree in psychology, a Bachelor of Education degree focusing on children with exceptionalities, and an Early Childhood Diploma. My doctoral research focused primarily on ecological mindedness and my current interest lies within the realm of neuroscience. For the past six years I have been an instructor in the Division of Teacher Preparation at the University of Calgary and have recently begun a position in the Faculty of Health and Community Studies at Mount Royal University in Calgary.

Overview of the Master of Teaching Program

The Master of Teaching (MT) program was initially developed in 1998 with a pilot program of 100 students as a way to make a transition from a four year Bachelor of Education program to a two year “after degree” program. Following the first year, the program eventually admitted about 450 students a year in order to fulfill a mandate to graduate 400 teachers. In this program, students interested in Secondary Education enter the program with a specialization in one or more subject areas – English/humanities, French, Math, Fine Arts (Art, Drama, Music), Social Studies, Physical Education, Science (Biology, Chemistry, Physics), while students choosing Elementary Education, including Early Childhood Education, are admitted with either a specialization or a more generalist academic preparation. A French program also accommodates a cohort of students. Recently, a middle school cohort and a rural school cohort have been added to students’ options.

The program’s philosophy is one of emphasizing that theory and practice are always intertwined; it is one of holding a belief about the teacher as: knowledgeable, thoughtful and deeply caring about the responsibilities of this vocation. To become a teacher requires strong preparation in subject matter knowledge, development of pedagogical skills, and acquiring the ability to make good judgements in practice. (B.Ed. Master of Teaching Program, 2009-2010, p. 2)

To the end of the latter – practical wisdom – developing a reflective practice is promoted in all components of the program; in the small group format this is regularly reinforced through dialogic reflections and sharing personal experiences.
In order to fulfill the intent of the philosophy, the program has been organized around three key themes of teaching and learning: “inquiry-based, field-oriented, and learner-focused” (B.Ed. Master of Teaching Program, 2009-2010, p. 2, bold in original). Ideas behind these themes include the following:

To become learner-focused means that it is critical to develop understanding of the life-worlds of students...(and) that it is essential to begin to explore one’s self as a learner. Practical wisdom is also dependent on strong forms of inquiry. Learning to teach is not just accumulating received knowledge, but is instead formed through inquiry – learning activities in the program are inquiry-based. To be field oriented means that learning about teaching happens in real educational situations. (B.Ed. Master of Teaching Program, 2009-2010, p. 2, bold in original)

Three types of courses make up the bulk of the program and address these themes: field experiences with seminars (homogenous groupings), case tutorials (homogenous as well as heterogeneous groupings with both elementary and secondary foci), and professional seminars (heterogeneous groupings). Additionally, large lectures once a week in three of the semesters have introduced “big ideas” and/or information that have been designed to stimulate conversations in the other three main components. In the final semester, students are also provided with an optional course that captures their special interests.

Collaboration among students and instructors is a hallmark of the program in all four semesters. To support this approach, the form of assessment of students’ work utilized is a narrative on, an in-depth description of their assignments and class participation, which includes suggestions for ways to strengthen their inquiries. Through this approach to appraisal, competition among the student body is negligent. Adjusting to a credit/no-credit system creates disequilibrium at the beginning; later in the program this system is embraced by most. Besides moving away for competition, the rationale for this practice is that collaboration mirrors the reality of the teaching world.

Central to the program is the understanding that identity – the ‘who’ of our teaching selves – is predicated on beliefs and values, along with personal awareness of our history, our assumptions, our understandings of others, and the meaning of our life experiences. Focus on identity, then, is a part of all components of the program, and is particularly emphasized in the professional seminars in the first and final semesters. With inquiry as the pedagogical approach to learning and teaching, case tutorials introduce this process through a case study approach for examining the key issues of teaching, learning, and curriculum. Field opportunities enrich this inquiry by providing students with lived experiences in the worlds of schooling. “Big questions” have guided all learning and teaching in this program; this of course includes questions of diversity with all its faces – differences in learning and physical abilities, in ethnicity, in family background, in sexual orientation, in religion, in educational background. As a result of this diversity, conversations and avenues for inquiry in all components of the program are rich with a myriad of world views and understandings. It is this variety of lenses for viewing learning and teaching that has fostered the ongoing expansion and deepening of students’ – and instructors’ – consciousness through the years.

At the heart of inquiry is the primary pedagogical relationship, which includes teacher, student, and curriculum – a living relationship, one that is always changing; for example, our students can become our teachers at any given moment, if we are open to learning from them....We call this relationship primary because we make...
this claim: *The quality of knowing and learning is dependent upon the quality of this relationship.* Developing trustworthy knowledge and authentic learning means developing trustworthy, authentic relationships between teachers, students and curriculum. (B.Ed. Master of Teaching Program, 2009-2010, p. 7, italics in original)

It was this pedagogical relationship that was fractured in the Inclusive Practice component of the program when we were required to abandon our small group seminars and move to the large lecture format.

*Inclusive Practice*

From the beginning of the Master of Teaching program, issues relative to inclusive practices in education were generally integrated in all courses, albeit quite haphazardly, primarily dependent on student and instructor interest. For example, one way exceptionalities were addressed was in the first professional seminar course when a large number of students engaged in an independent inquiry on a topic of choice focused on diversity of physical, emotional, intellectual and social abilities and explored ways of including all children in their classrooms. Another was through a case inquiry on diversity in the first case tutorial course. Because content and processes addressing diversity were inconsistent across the program however, and because the government body overseeing curriculum had mandated that teacher preparation programs have a specific course on inclusive education, in 2005 Dr. Joan Jeary, a professor with an extensive background in the field, was assigned the task of creating a course which would be especially designed to address issues of exceptionalities within an expansive view of diversity. This inclusive view is one of “recognizing that learning differences occur on a continuum and so should the instructional response” (B.Ed. Master of Teaching Program, 2010, p. 1).

Whatever the needs of the student inclusive classrooms require teachers to be able to work collaboratively with others in assessing the learning of students and then to plan and respond instructionally, in a way that addresses the unique and individual needs of the student. (B.Ed Master of Teaching Program, 2010, p. 2)

With the understanding that students enter classrooms with a wide variety of life experiences, and with a range of strengths and abilities, teachers need “to create a safe and supportive learning community in which all students belong and have equal status as members” (B.Ed. Master of Teaching Program, 2010, p. 2). Keeping this in mind, one of the key tasks of a course on inclusive practices was deemed to be the provision of a safe learning community for pre-service teachers to inquire about exceptionalities, explore beliefs and values, and reflect on how their understanding and attitudes might impact on their pedagogical relationships with diverse learners. Following the model of the MT program in general, the course was thereby conceived by the overall program planning committee as a case seminar – one that would allow for small groups of 20 or less to inquire deeply into issues surrounding inclusive classrooms and the complexities of students’ exceptional needs.

Given this general direction, a small group of faculty selected as seminar instructors joined Joan to collaborate on the development of a course. We were two of these collaborators and, with our fellow colleagues, met frequently through the summer
and fall of 2005 to develop the course to be launched in the winter semester of 2006. In congruence with the inclusive theme, our planning group under Joan’s tutelage quickly created a synergistic planning body.

Our planning began with brainstorming ideas around what we considered essential content areas. Common to other case tutorials in our program are Casebooks; these books contain a number of cases designed to provoke in-depth and wide-ranging inquiry on key curricular themes. For Inclusive Practice, we focused on the following core topics: overview to exceptionality; risk, vulnerability, and resilience; creating safe, supportive, and inclusive learning environments; high incidence learning disabilities; low incidence disabilities; inclusive classrooms for gifted and talented learners; curriculum considerations; and collaboration: partnerships for inclusive practice. Through the various cases, students were exposed to specific emotional, physical, intellectual, and behavioural differences influencing students’ learning and development.

Once we had settled on these main areas, each of our group of about eight collaborators went to work, either creating case narratives, finding quotes and preambles to introduce each one, developing guiding questions for inquiry to follow each case, and/or researching articles to include to initiate students’ inquiries. Narratives were either stories mirroring collaborators’ experiences or short published stories that highlighted significant issues.

Through the first four years of Inclusive Practice, cases were explored by leadership groups of four or five taking responsibility for designing and facilitating sessions to engage participants in active inquiry. As stated to the students on our course outline (each instructor developed his/her own course outline, so there were variations):

This might include experiential activities, “paper and pencil” reflective activities, small group discussions on questions, film clips, etc. While you may present key points as a part of your role, this is not to be a “STAND and DELIVER” opportunity. Rather, it is a chance for you to engage colleagues in an active inquiry process. (Course Outline, 2009, p. 4)

The focus, in other words, was “on exploring issues and ideas, for ‘living with the questions,’ and becoming increasingly aware of the multiple perspectives that can promote a deeper understanding of the complexities involved in inclusive practices” (Course Outline, p. 2). Such facilitation required students to do in-depth research relative to the case at hand; for example, interviewing teachers, doing library research, reviewing media, etc. Following the student-led inquiries, instructor or guest presentations, films, or additional class activities also provided inspiration for our dialogues.

Assignments for the seminars varied among instructors; we chose to have students write responses to the cases, an initial one to capture their “on-the-spot” thoughts, feelings, beliefs about the case narrative, drawing from their life experiences and posing questions raised by the story. Responses following inquiries were housed in case inquiry book, along with articles or newspaper clippings relative to the cases. In the last couple of years, as a way to honour students’ learning differences, this book was conceived as a “Sketch Book” for representing their learning via mind maps, poetry, prose, music titles, artwork, or journal writing as alternatives to academic writing. In the fourth year, we also developed a film assignment; in this reflection students were asked to discuss their learning about the exceptionality featured in the film and any changes in understanding
that occurred as a result of their viewing. Among frequently selected films were “I Am Sam” and “Rain Man.”

While we tried to maintain the essence of this course as it was initially developed when we began planning for the new lecture format for 2010, the heart of our work was deeply wounded when we had to eliminate student-led inquiries and small group dialogues. These dialogues constituted a great loss for us, as we, like Bache (2008) know that dialogue “evokes contact with that ‘something greater’ that lives in the midst of people, that connects them with each other and with the topic, ‘something that comes into being only when people gather in groups’” (p. 120).

The story of our lived experience follows. In this we portray both the joys and challenges involved in the birth and growth of a course and the subsequent myriad dilemmas we faced through the transition from a seminar to a lecture format.

Lived Experience

Hope is that thing with feathers that perches in the soul and sings the tune without the words and never stops...at all.

- Emily Dickinson

In the Beginning: Creation, Initial Implementation, and Hope in its First Inception

As we reflected upon the gifts and the diversity of conflicting voices, we came to identify a certain form of ‘energy’ which we eventually framed as hope. Within this we recognised a pulsating flow of energy that arose from within the individual, rippling outward and connecting our group in a common purpose. This sustained, infused, and informed all of our discussions and guided us throughout the planning, writing, editing, and course seminar participation. This energy had its origins within the strong leadership of Joan Jeary. She was able to engender a sense of purpose that centred not only on the work but was founded on relational principles. Her remarkable ability to blend playful humour with the seriousness of the work was exemplified during our first meeting in which she began with an “icebreaker” starting with her own hilarious experience of how she met her life partner. The stories that followed and flowed from the rest of the group contributed to an initial development of trust. This became a fertile ground and a future wellspring for the honest, open communication necessary for the inevitable intensity that would be called forth when such work grow from agreeing to disagree. We quickly learned that the disagreements in our collaboration efforts were not a deterrent but added to the richness and excitement involved in developing a course from the ground up. With the entertaining of a variety of ideas, perspectives, and experiences, conflicting values and beliefs became typical attendants to our conversations. Meetings were not the only avenue for thought and discussion; numerous phone calls, conversations, and independent research continued to carry our thinking forward beyond and between group connections. This typified our full investment in this venture and our enthusiasm about having been invited to participate. The type of leadership demonstrated by Joan Jeary and the life force of the group that was liberated as a result were wholly congruent with the intent of the teacher preparation program and the kind of leadership we hoped to live in our
upcoming Inclusive Practice seminars. Our own learning community evolved into a prototype of that which we envisaged nurturing in our classes. This again parallels the intent of the Master of Teaching program – the hope throughout was centred on students taking responsibility and ownership for their learning and for the very process of understanding not only with their minds but their hearts as well. The leadership we aspired to inspire within our student teachers as they led inquiries was that which we hoped would appear within their own classrooms.

Because this was a personal journey for each of us, we will separately share our unique experiences of our beginnings as instructors of the course. What follows in this section are our individual reflections along with a summary of student feedback.

**Nancy**

After having arrived home from the 5th International Education Conference in Hawaii at 2 a.m., I was not only jet-lagged but seriously sleep deprived as I launched the first class of Inclusive Practice in the winter of 2006. Perhaps the lack of slumber numbed my beginning anxiety somewhat about actually implementing what had only been a plan before this January morning, but I do recall a whole host of complex thoughts and emotions as I entered the crowded, cluttered classroom I’d been assigned: shakiness as I gazed at 20 sets of eyes expectantly examining me; excitement with embarking on the learning journey; uncertainty about my competence; and overall feelings of fragility as a teacher. At this point in time I had been teaching university students for almost thirty years, but because of the depth of my investment in this particular course and a sense of ownership of the curriculum, I felt more vulnerable than I had since I first stepped into a classroom.

Students generally enter fourth semester with a great deal of resentment/regret about having to return to the student role after finishing their three month practicum and these particular students were no exception. I began by welcoming their voices rather than jumping into the curriculum. They kept their complaints about returning to the student role to a low roar, and after venting for some time, engaged in the work at hand. Because of this beginning diatribe from the class, I was determined to be responsive to the group will about how to proceed with our inquiries. They voted unanimously to do individual inquiries on the topics and engage in collaborative group work only when they came into the class. This effectively shot down my plan to form leadership groups for the cases, but building classroom communities is always at the top of my list, and this year my welcoming of student voices to that end overshadowed any agenda I had. I left the first day feeling elated that the students had openly entered into dialogue and filled with trepidation about whether or not my hopes for in-depth inquiries through the semester would be fulfilled.

By the time we returned to class – there was a week’s hiatus because of a career fair – my fears were allayed when the students arrived wholly prepared from their independent research. The ensuing dialogues were profound. From week to week, however, the level of interaction varied considerably, and while the students agreed to take leadership of discussions in the class, this often didn’t manifest and I ultimately was mostly responsible for facilitating the inquiries and coming up with ideas to catalyze discussions. What did continue through the semester was the introduction of significant
research that students uncovered between classes. I wrote notes like “serious class about serious topics today,” “not much energy in dialogues,” “disgruntled by fourth semester work today,” “more dialogue on cases and enthusiastic about role plays,” “great class today!” “super involved in professor’s talk on gifted students,” “film well-received today,” “last class today was great; they thanked me for my flexibility.” The pattern of highs and lows seemed to vary according to how much I organized and led the inquiries; I left the class grateful that they had learned so much from the class experiences and their assignments and that they had appreciated the flexibility, but undecided about whether I would let the next class “off the hook” about leading inquiries. Something was definitely missing for me without exposure to the valuable input from the kind of inventiveness students brought to their leadership of case explorations that I had grown so used to in other tutorials.

Students’ feedback on narrative evaluations of the class did not reflect that for them anything was missing! I found it fascinating to read that they had loved the independent research, the far-ranging dialogues, the flexibility in being able to take their inquiries in whatever direction best met their learning needs, and that they found their overall learning in case exceptionally meaningful. They clearly communicated that they felt free because of the “no-group” format. Most important in the students’ feedback was that the Casebook of readings we had developed was especially facilitative of their learning. Through this experience, students noted that they felt like professionals rather than students. For this particular class, full collaboration worked. While it was a couple of months before I received these evaluations, the comments clearly buoyed my hopes about instructing the course again when I returned from my sabbatical leave. However, through my retrospective analysis, I realized I would need to further reflect on my future teaching approach. What I knew, without a doubt, was that the nature of the relationships that I had forged with the students and the kind of collaboration they had developed with each other were uppermost in their positive appraisal of their overall learning experience.

*Bev*

Although my experience is not recorded in the same way as Nancy’s (I kept no journals or written comments), there are moments in time that are indelibly etched in my mind and ineradicably imprinted in my body. As I retrace the nervous tightening in my stomach, the joyful bounce in my footstep, the distinct lingering images of students – their voices, their experiences, their writing – I experience an upwelling of associated feelings. In broadly describing my experience, then, I draw from recollections resurfacing as sensory memories, snippets of seminar conversations, and revisits to my detailed weekly plans and ‘notes to self,’ all of which were imbued with a combination of thoughts and feelings: anticipation, passion, trust, hope – hope, of course, being the most prominent. Above all, I hoped that the students would engage and connect deeply with the topics, dilemmas, issues, that they would respond with the same enthusiasm I felt, both as a former teacher/colleague and presently as their university instructor, that they would be happy to sit together for one last semester, to pause, explore ideas, reflect, and deeply listen to one another’s experiences. Admittedly, I am at risk and must bear the burden of memory rearranging itself into something more palatable or in some cases, more dramatic – for exaggeration inclined towards the gloomy is sometimes as much,
perhaps more, compelling than conjuring a healthy, healing dose of happy beginnings and happy endings – but the words that follow are my closest recollections of what I would describe as my truth.

Much of what Nancy outlined above in terms of vulnerability, uncertainty, hope, and trepidation speaks to my experience as well. I was part of the team who developed the course, I was not yet very far removed from my own school teaching experience, and I maintained vivid images of the children looking back at me from their desks with what I interpret(ed) as the same mixture of hope, excitement, and fear that I commenced and completed my days, entering and exiting a classroom. As an instructor of university students, I bore the responsibility of setting in motion meaningful, provocative, and ‘real’ experiences, and, never having taught fourth semester students before, I was entering uncharted territory in more ways than one. Although it does not exist in written form, I have a clear memory of my first experience, my first class, my first time teaching Inclusive Practice. I remember the classroom, how crowded it seemed, how daunting was the task before me, and how relieved I was to see two former students amongst the group. As they, with their varied backgrounds and experience, sat [undoubtedly] wondering, so did I: what were their expectations, what were they feeling, and how would I, how could I, possibly guide this mixed group of early childhood, elementary, and secondary preservice teachers towards deepening their understandings of exceptionalities? How was I to engage them in the stickiness of the language of exceptionalities when I was still wrangling with the difficulties around the ‘typical’ language of the teaching profession – classroom management, authority, learning ‘style’, and perhaps the worst of all – “normality”? Finding ‘common ground’ within uncharted territory is a daunting task indeed. I did know unequivocally, however, that no matter what the age level, no matter what the subject area, no matter how many or how few people may be part of the group, the single most important thing to set in motion is a sense of being part of a team. We may not always agree with one another, we may not develop lasting friendships, and we may not come from the same knowledge basis, but we could – and needed to – understand that we were all in this together.

Unlike Nancy, I did not provide any choices regarding the structure and format of the course. It really had not occurred to me to do so. I created a sign-up list for weekly group-led inquiry sessions, they chose topics of interest from the Casebook, and fortunately, it “worked.” It worked, in fact, far better than I could have anticipated. They shared their stories and their experiences, they discussed, they grappled with dilemmas – some from personal experiences as children and youth, some from current events – and that is where I came to understand where true meaning rests. They needed to develop ‘knowledge’ around the various forms of exceptionalities, to be certain. There is a legitimate and unquestionable anxiety that circulates within this tentative space of knowing/not knowing; in a few short months they would be facing the realities and ‘practicalities’ of teaching. I fully understood their perspective, I had enough experience – “real”, “practical”, and “imaginative” – to know that while knowledge does provide one with some sense of security, however tentative, preliminary, and in many cases, outright false that might be – knowledge is only one small part of a much more complex equation: enter the students, the children and youth, along with their families, their history, their hopes and expectations, and the “real” takes on a different hue. Reality is not knowledge; reality is the everyday comings and goings, the unpredictable, the provisional, and this is
where understanding finds its home. However, at this point in time, it could only be their interpretations and imaginings of what those realities might entail and what we needed to front our time together on was trust. Trust in the process, trust in one another, trust in me.

It became readily evident that students in their 4th semester of the Master of Teaching Program were ‘done.’ They carried – and often articulated – an air of having had ‘enough practical’ experience in the classroom, enough university courses, and certainly enough reflecting on their experiences. Amidst this low rumbling discourse/discord, however, there were many who were not only prepared but were actually looking forward to one final semester before stampeding ahead into their much anticipated teaching careers.

Once the class warmed up to one another, once trust was developed, once those critical experiences were shared, heard, and respected, once they participated in their own and their peers’ group led seminars, we did become a team, just as I had experienced with children and other post secondary students. Not everyone would walk away best friends, not everyone would maintain contact with one another, not everyone agreed on everything, but for that brief moment in time, those 13-odd weeks together sharing, wondering, worrying, speculating, developing confidence, an exquisite aura came to rest upon us. That this was, in the end, a success was confirmed by the course evaluations. There is no denying that not everyone got everything they needed (or perhaps what they thought they needed) but the overall tone was positive and promising. It was more than enough to continue.

Middles: Hope as a Course of Action

Throughout the first two years of the Inclusive Practice course, ongoing meetings and professional development workshops were held for collegial conversations and sharing. All instructors were invited to these and while not all instructors were available for all meeting times, the cross-fertilisation of instructors’ varied experiences with their classes informed, enriched, and aided in the further evolution of the course. During this period, Joan Jeary continued to provide leadership and insights into the various issues and dilemmas associated with both course content and pedagogical relationships.

Feeling buoyed with energy and enthusiasm, we discussed with Joan the possibility of preparing a conference talk because we felt that the dynamic interplay amongst and between colleagues and students could provide a rich ground for others. This culminated in a presentation by the three of us at the Canadian Society for Studies in Education in Saskatoon, Saskatchewan, 2007. Due to a somewhat unexpected change in Joan’s teaching assignment, she moved out of her role in the Department of Teacher Preparation, leaving a gap in the coordination and ongoing development of the course. At this point, we voluntarily filled the gap and subsequently shared the responsibility of course coordination. Based on feedback from students and colleagues, we made the decision to revise and edit some of the course reading package.

Nancy’s Experience

By the time I began teaching in the third year of the course in what was my second time of being one of the instructors, I had spent a great deal of time reviewing my
first experience and listening to the other instructors about what they had learned; by and large, organizing the course around case leadership groups for inquiries earned a “thumbs up” from everyone. I decided to return to this “tried and true” way of facilitating case tutorials. While there was no resistance to joining leadership groups in this class once we had experienced some initial group building activities, I later faced a major, never before experienced, barrier to our collaboratively organizing a democratic learning community: three students who filled the air-waves with cynicism in spite of the clear guiding principles for our conversations we had devised. This hogging of air-time with negativity was a “thorn” throughout the semester, and neither the students in leadership roles in the inquiries nor I was able to temper the antagonistic input that erupted, seemingly unprovoked, from time to time. My efforts at including their voices in an instructive way inevitably fell flat. Fortunately, there were good things too: inquiries were extremely well-developed so I knew I had chosen wisely by re-introducing leadership groups. Students over the years have consistently introduced novel ways of addressing cases. This means that by the conclusion of a course, we have all been exposed to seven or eight new lesson plans with numerous kinds of exercises and resources that we can draw from for future teaching. This was what I had been missing in the first go around with the course. Another plus with the course related to joining forces with Bev and her students for parts of three classes through the semester: two for the viewing of informative and provocative films and two for guests with specialized information on identifying exceptionalities. On these occasions, discussions became very active due to the introduction of new voices. Only occasionally through the run of the course did I write in my journal at the end of the day, “great class!” and it was at those times that it was evident our relational principles were being enacted.

Evaluations at the end of this semester reflected students’ understanding that the class dynamics often impacted our large group dialogues in a negative manner. In site of this, they also noted enjoying the way small group interactions generated meaningful discourse and a feeling of collaboration. Additionally, they appreciated the opportunity to take a personal approach to the inquiries and to explore topics which sparked their interest. While the few students who held on tenaciously to their critical appraisals of both the content and process of the course and the teacher preparation program as a whole coloured my own evaluation of the course, because the vast majority of students demonstrated through their work in-depth changes in their knowledge, skills, and attitudes, I finished the season with a sense that overall we had done our best.

Entering the same classroom as the previous year when the 2009 session began, I couldn’t help but feel uneasiness as I surveyed the faces in the room. How would these students re-enter the world of their studies after their semester of teaching. Appraisal of student mood in the fourth semester is always a critical first task; I have learned this from teaching many courses in this semester over the years. This season, aside from a couple of disengaged students, who in dialogue with me acknowledged their belief that inclusive practices in education were irrelevant to their disciplines of art and music, the rest of the class members were wholly immersed in their learning. By the second week students were eagerly sharing poignant stories from their life and teaching experiences. Week after week my journal entries spoke of fruitful inquiry sessions. I felt that for the most part the cloud from last year had lifted; both large and small group discussions and exercises were lively. I learned a great deal from the student led inquiries and from
reviewing their responses to cases and collections of resources housed in their sketchbooks.

Highlights of the students’ learning mentioned in course evaluations were the Sketch Books and a film interpretation assignment – both new this year. Representing their learning in the sketch book unleashed their creativity, and interpreting the film of their choice provided a novel opportunity for applying their learning. Most significantly, they also reported valuing the safe space created in our class for open sharing. In contrast to the class of 2008, this group expressed thoughts and feelings unabashedly as they listened to each others’ narratives and engaged in inquiry. The camaraderie engendered through these dialogues and via our activities led to a meaningful learning community. On the downside, students were well aware of the pall that sometimes entered the room when the few students “disappeared” mentally from our arena. Enough energy was generated by the majority, fortunately, to override the silence of these few.

In all three of the years I instructed a section of our seminar course, there was no doubt in my mind that the small groups, collaborative relationships, and personal relationships with one another and me as the instructor were the keys to fostering rich learning experiences, especially in terms of shifts in awareness and attitudes. Every year, one of the themes that stood out on evaluations was the importance to the students of the prompt and detailed feedback I provided them on all of their work, definitely one of the many plusses about our commitment to small class size in the program.

Bev’s Experience

Once again, my experience mirrors Nancy’s. Instructor collegiality, collaboration, and commitment alleviated the agonies, heightened the hurrahs, and deepened our dedication to the students, the Inclusive Practice course, and the Master of Teaching program. Although not directly uttered, it was clear that the students were finding a similar sort of sustenance through collaborating with one another. While I – or rather we – escaped the extreme voices that shook and sometimes overtook Nancy’s 2008 experience, I do not fool myself into believing that there were not those who were bound by an invisible shroud of restlessness. They were not overtly rude, they did not refuse to participate, they did not skip class, yet there was an almost palpable sense that some, perhaps many, were more focused on the future than the present – than ‘being’ present – they were struggling with settling into this one final pause before becoming salaried professionals. While this restlessness was expressed vociferously, distinctly, and succinctly in Nancy’s class, it was not in mine; however, it was present, just as it had been in our very first experience with the course. My preemptive ‘pep talks’ consisted of reminding them that teaching is a long, long time, that they do not need to be in a hurry, that the children and youth will wait for them, and perhaps my favourite piece of didactic ‘wisdom’, that never again would they be in this position – teachers collaborate, teachers attend all manner of professional development activities, teachers develop relationships with students, families, colleagues, paraprofessionals, therapists, psychologists, etc. – but never would an event like this come again. This would be their final coming-together, their final moment to gather and share ideas, experiences, and questions within this form and format ever again.
I learned a great deal about fourth semester students and how to negotiate the tricky terrain of ‘doneness’, I understood, I felt their anticipation, their fears, their hopes, their slide between feeling absolutely confident to absolutely lacking in confidence, I came to know their respective learning trajectories, I witnessed eyes moistened from laughter, eyes moistened by sadness in hearing of others’ experiences, when viewing films, video clips, or upon hearing true life stories. Sometimes we sat in silence, sometimes we were unable to hear one another above the cacophony of voices volleying for air time, but I am, as is Nancy, absolutely convinced that it was – and is – relationship, fostered by and encased within the safety and trust that can be developed that makes or breaks a course, a semester, a significant moment in time. This depends in large degree on the way it is set in motion by instructors. There is great potential for intimacy within small groups, but someone needs to guide this responsibly and appropriately. The importance of this was iterated, reiterated, affirmed, and reaffirmed within course evaluations. Despite their obvious eager anticipation to move forward into their teaching careers, comment after comment reflected and underscored their gratitude for one another and their awareness that a seminar affords a unique and valuable opportunity to expand not only one’s knowledge but one’s understanding.

Although my experience teaching the course grew year by year, the experience was itself always new. It could not, of course, be otherwise. Founded on collaboration and support, the joys and the dilemmas, the hopes and the dreams that students brought with them had distinct similarities but each new class, each new group had its own distinct vitality, energy, and way of being. It could not, of course, be otherwise.

Endings: Hope Springs Eternal

As mentioned in the introduction, we were placed in charge of dismantling what had been a unique component of our program; we were “the quick response team.” Initially it was very difficult to become wholehearted in our planning when we were destroying that which we had created over the previous four years, especially since we knew this would be a ‘one-shot-deal.’ one of us would be leaving the university after the course was over, and the other was going on sabbatical leave. However, armed with our previous experience, lesson plans, the course reading package, connections with experts in various fields of inclusive practice, and a wealth of supplemental resources including online documentaries, we forged ahead. Two months before the course was to begin, we reviewed all of these materials and began organising a series of lectures and a course outline. With over 350 students, we knew that we had to devise original assessment methods. In a credit/non credit program, this proved very challenging; however, we arrived at what we thought would be reasonable expectations. Each of our meetings left us feeling energised as we surprisingly came up with exciting ideas. Our excitement was also due to the fact that we wholly enjoyed our working partnership. This aspect was not surprising since we had always enjoyed our collaboration, but what did take us by surprise was our enthusiasm about the course we were developing since we were and continue to be committed to the inquiry approach to learning and teaching which involves a relational pedagogy. The question remained for us, “How were we to maintain the integrity of the Master of Teaching program and be open to relating meaningfully to these students despite the barriers that loomed ahead?” We were, nevertheless, hopeful and
determined that we could construct a relevant curriculum which would embrace meaningful student engagement.

Our vision of a worthwhile curriculum included a variety of learning opportunities and forms of appraisal. As in previous renditions of the course, our Coursebook of readings formed the core of the curriculum and we designed learning experiences pertinent to the topics encased within; blank pages for student note taking were included. Students were placed in online discussion groups (Blackboard) of ten, and from these, representatives from one group per week presented summaries of their responses to the week’s topic. A brief research paper on a specific learning difference was also posted on their Blackboard site so that each student would have access to a concise summary of practical information and ideas for the classroom relative to ten different exceptionalities. We also set aside time for “open mike” commentaries wherein students were invited to share reflections following class exercises. Lectures were supplemented with in class exercises, films, video clips, and presentations by professional guests from the community. Students submitted a mid semester self assessment outlining their perceptions of their learning to this point and at the end of the term, they wrote a final self assessment and a short film interpretation in which the protagonist portrayed a person living with an exceptionality.

At the end of the process, we were very excited about our role in developing and participating in something different.

Expectations and the Unexpected

What follows in this section is a summary of some of our post course thoughts, reactions, and responses. We will begin with a few words from each of us as we reflect on our initial thoughts and feelings as we headed towards the winter semester of 2010.

Nancy

I resisted teaching this lecture course which was instituted as a sacrificial lamb of the budget cuts. At first, Bev was assigned to teach one of two sections. She kept pester me to teach the second section. I resisted, resisted, and resisted but I kept getting ideas about how Bev could do the course. One fall morning in particular, I was on a roll with ideas, until finally in the shower a flash came to me that we should team-teach the course. I called Bev even before saying anything to my husband and told her “the decision” (I think it was the universe’s decision!). Bev was delighted and said she had suggested this before. Either I don’t remember this or it was part of my denial. But ultimately, it made sense because we would be on the same page whereas another instructor might approach the course from a perspective of pathology and we were adamant that Inclusive Practice needed to be founded on a strength based and inclusive philosophy. From the point of saying “yes” I began to be energized.

Bev

Although I was offered the ‘choice’ to teach this course as a lecture series, in reality, it was not a choice. Trying to remain optimistic (which I have since reframed as
blithe naïveté), I attempted to imagine how this course might look and what it might entail. Being immersed in teaching four courses at the time of these initial discussions around the transformation of Inclusive Practice, I had little time to think seriously about a new one. Fortunately, I had a solid friend and colleague who phoned me on a regular basis with one new idea after another. The energy and synergy that erupted as a result of these quick conversations gradually developed its own ‘life force’ and outside of and beyond my constant “pestering” Nancy, a partnership began to take shape.

Excerpts from the Trenches

After the many hours of planning – which invariably included raucous laughter – we headed to our first session buoyed with optimism and eager anticipation. The ten minute walk through the corridors seemed to take only moments, and when we encountered the Dean on our travels, we confidently exclaimed to him that the course was going to be fantastic!

Enter auditorium with 200 students looking down at us…

We looked up at them with innocence, hope, and a great deal of nervousness. The latter escalated when the technicians did not arrive with the media necessary for the day. To make matters worse, we noticed that the room was only slightly warmer than our Calgary winter temperature. Finally the technicians arrived but we were 20 minutes late beginning. Much of the remainder was a blur as we ran through the expectations for the course and showed a film portraying the lived experiences of students with diagnosed learning differences. The film was well received, we were able to follow our lesson plan, and we felt great. Then Bev spoke to a former student who offered some feedback, essentially stating that students were not going to be happy sitting for three hours on hard plastic chairs, they were not going to participate, and they were not going to continue coming to the class. Our bubble of innocence had burst: we left the lecture theatre deflated, exhausted, and disappointed on both our behalf and on behalf of the students. The walk that took moments to arrive at the lecture theatre lasted an eternity as we dragged our way back to the Education Tower.

The following day, a welling sense of defeat was intensified. During a hunt for a lost piece of work, Nancy heard a voice murmuring to her from behind the recycle bin as she was hunched over rifling through the papers. “So it’s come to this, has it?” joked a colleague. Laughingly, she replied, “Do you know what Bev and I are doing?” He quickly affirmed that he was indeed aware, having been informed by students in his own class and that they were not happy because they knew they were not going to receive the meaningful feedback that had become a defining feature of the Master of Teaching Program. Nancy’s laughter came to an abrupt halt.

New decision: We will provide written feedback on their assignments

Initially, we had thought we would only monitor whether or not students had completed their work because we could not comprehend how we would be able to
provide feedback. Since we knew that they were at the end of their BEd degree, we assumed they would be eager and willing to undertake the work for the sake of deepening their own learning. As this turned out not to be the case, we set about brainstorming some ideas about how we might manage marking assignments for this course. Fortunately, we had not articulated our original plan to the students.

Gradually we released our unrealistically high hopes that all students would see the potential for learning in this new format in the same way that we had come to imagine it. The student’s feedback/prophecy on the first day of class began to unfold. Attendance dropped, students walked out part way through classes, laptops became a barrier rather than a support for learning, it was evident that cellphone text messaging was occurring, and only a portion of the students seemed fully invested in the course. Very few students engaged in large group discussions, which could in some part be attributed to intimidation: a number came forward and confided in us their fears around sharing in such a large forum. We could understand their hesitance and were grateful to hear that this was the primary reason for their seeming lack of engagement but we (and they!) missed the depth of conversations we had grown accustomed to during our seminars.

As instructors, we eventually began to wholly enjoy our sessions. This was partly due to the daily support we received from numerous students through their validating participation and feedback; partly due to the fact that former instructors of the course were parachuted in to help with assessing assignments; partly due to the enthusiasm of the guest speakers who shared stories of their lived experience in the field; and partly because we knew the students were hearing a consistent message from us and our speakers: get to know children and youth as whole beings and address their differences from a strengths-based perspective.

After class debriefs: All that and a bag of chips

Our joy in the teaching of this course increased exponentially once we began a ritual of heading for the cafeteria after the class where we shared many things: our interpretations, anxieties, hopes for next time, gratitude for rolling with the highs and lows together, new learnings, and what became a weekly bag of chips. Inevitably, we defaulted to humour – the healing balm for what we perceived were less than resounding successes. Significantly, what turned out to be some of our best successes were the unplanned, unpredictable, and serendipitous events (e.g., a guest would have to change a date and this would ultimately work out better in our sequence).

Also at this time we shared what we heard from various students about what they were thinking about the class. Since both of us had a number of students in this class that we knew from other classes, we had a few informants with feedback. Occasionally we heard superlative comments; one former student exclaimed after class one day that she loved this class. Sometimes we would hear that students were saying that the previous week’s class was good, and other times we would hear that students were posting ‘reflections’ on Blackboard because they were forced to, not because they were interested or invested in the discussions. In one case, a student came forward and directly informed us that the assignments we designed were meaningless and paternalistic. Another student, a single male custodial parent, let us know he was quite disturbed that all the poverty stories of that day were about women. This was a somewhat jarring moment but at the
same time it sharpened our awareness of our own blinders about issues of inclusivity. Another jolt was felt when a couple emails arrived from students who took us to task for not sufficiently preparing them for videos of a “sensitive” nature (specifically, death and anorexia). We had never experienced this in our previous seminar classes and we were completely caught off guard. This was a graphic reminder that in these large classes, we did not know these students.

This discussion would not be complete without some mention of our numerous encounters with technological glitches. Most prominent in our minds is the day we fought a defining battle with technology. A classic case of two warring forces unfolded before our very eyes. Despite the best efforts of our onsite technology trouble shooter running up and down the stairs from the projection room to the console below, pushing buttons, making phone calls, dashing out of the room, we finally admitted defeat. Technology won and we ended the class. Before we were able to exit the room, however, a few people stayed to chat, one of whom informed Bev that this class was just not working. To save the day, three other students, wholly positive about the class, invited us to join them for tea. This helped to counterbalance the ongoing battle with technology and student negativity.

What really lifted our spirits in a more sustaining way was learning what and how the students were learning – and that they were, in fact, learning. Reading the first self-assessments at mid-term helped us to let go of much of our angst about the course, and reviewing students’ final work and their course evaluations validated our efforts in making this a valuable learning experience in the final term of teacher preparation – all of our work had not been in vain.

_Student Voices: We wish we had seminars AND we did learn a great deal!_

A major theme from this written feedback captured the overwhelming sentiment that students missed the seminar format they had enjoyed in all previous courses when they had felt free to inquire together and share personal stories from their experiences. In spite of this loss, all but a handful wrote about how much the course had aided them in changing attitudes and gaining confidence by having really understood an inclusive way of approaching their teaching, along with having a “tool-kit” of ideas for practices to take into the classroom. Especially significant, most expressed a knowing that they would never look at children again solely in terms of behaviours.

This latter was articulated as their biggest change; they were now committed to looking beyond students’ behaviours to focus on understanding what messages they were conveying through their words and actions, and to becoming curious about what children have experienced and are experiencing in their classrooms and in their lives. In other words, their focus was becoming more holistic, especially in terms of students’ emotional well-being. In this regard, there was a deepened awareness of the need for a safe, caring climate for student learning.

Another huge shift for many was one of expanding their understanding of what inclusion means, including now seeing inclusion as an ethical, moral social justice issue. In this regard, the course was eye-opening. In several papers, students shared stories of truly transformative experiences vis-à-vis the course, and over and over, students reported “seeing differently.” What seemed to precipitate changes in perspective were
inspirational stories of guest speakers and serious engagement in the Blackboard discussions. In terms of the latter, unlike hearing different opinions in face-to-face dialogues, reading multiple viewpoints seemed to strike more chords for them, allowing them to examine novel ways of looking at issues and considering them in leisure. Because these students, by the nature of their vocation, are very sensitive about hurting the feelings of classmates they come to know well in the seminars, they are often hesitant to express their ideas fully in the classroom or have their own emotional reactions when colleagues differ with them. Some reported that the anonymity of Blackboard helped them to keep their own thoughts and feelings in abeyance long enough to ponder another’s ideas. Their own views became less fixed as they opened themselves to the influence of diverse perspectives.

A number of students wrote that the course was re-igniting their spark, their passion for teaching. Particularly significant for them as they moved toward embarking on their careers was an awakening to the reality that “they are not alone;” they now “knew” that help would be there, from collaborations with colleagues and from vast stores of resources. They truly appreciated the concrete, practical information provided through the Casebook readings, our lectures, guests, the media, and their peers. In short, they believed their understanding of inclusive practices had been deepened, broadened, and validated, helping them feel prepared to confidently enter their own classrooms in the fall.

Comments on the students’ mid-term assessments were clearly echoed on their final assessments and the evaluation. On some points, there was special emphasis; for example, there were superlative comments by most about how much they valued the Casebook of readings, a book many intended to keep with them as an important resource. This was supported by the fact that only 18 students failed to retrieve their book. Reiterated on the evaluations were references to their changing attitudes, their increased confidence, and their delight in having received “tons of information!” While this was heartening, it was repeated over and over in many different ways on the final evaluation that these students had deep regrets about what they believed they missed by having this course in a lecture format. Given our limitations in this format, we had tried in many ways to emulate learning experiences from our past renditions of the course and one of these ways was with our assignments. The ones rated most highly were the independent inquiry into learning differences, the self assessments (reflections), and the film interpretation.

We were both surprised and moved by the way students put their hearts and souls into this final film project, seemingly delighting in the chance to apply their theoretical learning to the story of a protagonist living with an exceptionality. Popular selections for film interpretation included familiar titles of the previous year - “I Am Sam” and “Rain Man” – as well as “Good Will Hunting,” “Finding Forrester,” and “Mean Girls.” We had featured guests present on gifted/talented students and on bullying, which accounted for the interest in the latter three. Students’ interest in inquiring further into learning differences led to choosing “Forrest Gump” and “What’s Eating Gilbert Grape.” Among the most inspiring papers were those about films calling us to see into children’s hearts to understand their unique gifts within their perceived differences: “Simon Birch,” “Like Stars on Earth,” and “How to Train your Dragon.”
Final Reflections and Griefwork

*What I hear I forget*
*When I see I remember*
*When I do, I understand*

- Ancient Chinese Saying

In the transformative learning literature, it is understood that learning is “an active process. Learning is not simply an outcome, but occurs as individuals engage in experiences that cause them to change what or how they do or think, and/or develop dispositions that might lead them toward changes in their doing and thinking” (Merriam & Caffarella, 1999 cited in Bagleria, 2008, p. 590).

We have our reports from almost all of our students about their learning process and outcomes, particularly in terms of their changing attitudes and understanding about inclusion, and we also have our own experience of having dialogued with students in an ad hoc way before and after class, along with engaging with them in bits and pieces in class. Additionally, we have our observations from reviewing Blackboard entries. Much of our awareness about student experience and learning outcomes, however, was at arm’s length, unlike previous years where we were deeply immersed in the learning with students, moment to moment. When we listened to students’ comments, read their papers, and reviewed the online discussions, we were glad to know they were indeed gaining insights and understandings. What we missed, however, were the kind of relationships in which we inquired together. Outcomes appear not to have suffered, at least not for those who were fully engaged. For those who attended minimally, who did not complete the evaluation, and for those who verbally said that this was “not working,” we have no idea of outcome. Perhaps this was little different than in other years where students found their own unique ways to distance themselves from learning. What we do know, is that the process in this new format was less than satisfying for us, and only as fulfilling as it was for five key reasons: one was that we were grateful that we both knew a fair number of these students from other classes (and these were the students who participated wholeheartedly); another was that we did learn that there were meaningful experiences happening for the students; another was our own enjoyment in learning from the students who shared their experiences and from experts in the field; another important one was that we had help from our teaching assistants who faithfully reviewed Blackboard; and finally, we truly valued our relationship with each other as we lived through this “heroine’s journey;” we learned the true meaning of partnership.

The following reflections bring this last theme to life:

*Email Conversations*

Bev:

*Have you integrated the whole “lecture experience?”* For me it still seems to be settling...Every once in a while a thought unexpectedly erupts: students talking, students walking, trudging the link between buildings, student faces, student comments, moments of pure hilarity, dragging 200 books back and forth, back and forth, back and forth...Yeah. What a thing, eh? I feel entirely privileged that I got to do that with you.
Nancy:
My sentiments exactly! The only thing I might add is that I’m no longer dreaming these images nightly. I feel like I lived and breathed this course and now I’m just catching my breath. I chuckle whenever I reread in my journal our repartee on one of those “hauling the carts of Coursebooks days” as they spilled all over the Social Science building hallway:
Nancy: “Whose idea was this?”
Bev: “Yours!” (Hysterical laughter and a long pause until we got to the office) ”Well it was a good idea because they were engaged with them. If we hadn’t had the assignment for them to keep ongoing notes in it, they wouldn’t have been.”
Nancy: “How true! In all the years we’ve done this course, this is the year that this book has not only been read, but has been the focus of their inquiry. Living this course was a surreal moment in time, one that will forever be emblazoned in my memory as an exhilarating highlight of my teaching career!

On this journey, both of us knew we were doing all we could, walking each week into the unknown and learning from each new hurdle encountered, trying to bring to the students the best of what we had done before minus the close relationships, relationships where we had learned what students were thinking and feeling vis-à-vis the curriculum and our connections. The truth is: that was the best of what we’d had and we couldn’t do that anymore. This was our grief work all semester. In our hearts and minds, we know that student-teacher relationships are key to learning, and we had to hope that the majority of the students with whom we did not have personal connections found this key through their own connections with one another in the class and on Blackboard, and that, because of their learning through this program, would discover it with their own future students.

Contradictions

Amongst the “surprises” we experienced along the way were a number of contradictions. A few of these are sketched out below.

Inclusion/Exclusion

>Welcome to our Inclusive Practice lecture – and just to clarify, your experience of ‘inclusive practice’ will not be fully inclusive.”

More than once we uttered – or heard from students – some variation of the above. The irony was lost on no one. There is no fault to be laid; this is a statement of fact: a course encased within a lecture theatre has an inherently hierarchical, top-down (literally and figuratively), expert-novice aura surrounding and shrouding even the best intentions. Even so, inclusion is more than intent; it requires action or rather enaction: an invitation must be advanced and a response subsequently elicited. A lecture arrives with particular parameters and restrictions. In the case of our Inclusive Practice lecture series, these erupted as contradictions. Hovering above our attempts to breathe life into a
potentially static endeavour was an inaudible, invisible yet ever present form of exclusion softly echoing throughout the lecture theatre. Because it is our belief that it is the students and instructors together who make the teaching, all voices were invited into conversations. At the same time, however, their voices were silenced: silenced by the numerous impositions and limitations that suppressed the dynamism and organicity of true inclusion: the size of the class, the size of the room, the configuration of the desks (all facing forward, toward the “experts”). The parameters that held us together also pulled us apart. We were determined that everyone would have an opportunity for expression, but comfort level was another matter.

Comfort/Discomfort

“Please sit back in your moulded plastic chairs for the next three hours and be prepared to participate in meaningful conversations with the people around you. You might also want to keep your jacket on.”

We worked very hard at creating a “comfortable” classroom atmosphere wherein everyone felt safe to share their experiences, their wonderings, their dilemmas: this was the very essence of our beliefs around teaching and learning. Given the conditions, however, physical and psychological comfort seemed to be on a frequent collision course with the freedom for expression and freedom to learn. At the front of the lecture theatre were fire doors; on the other side of the fire doors was the outdoors. Cold air seeped through the cracks and even on what we considered warm days, the classroom was infused with a chill. This chill was also palpable when we issued our guidelines about conversations.

Quiet/Disquiet; Hearing/Not Hearing

“Please continue this conversation with the people around you, bearing in mind that this is a very large room and in order to hear one another, you will need to speak quietly. We will also be asking for a summary of your discussion so speak up: there are approximately two hundred students listening to what you have to say. Please also remember that every week, two or three of you will be presenting a summary of your Blackboard discussions to the large group. And don’t be shy.”

While not everyone in the class was too shy to speak when it came to sharing conversations with the large group, it is safe to say that most were too shy to speak up. What seemed to happen was the same few students, week after week, plucked up enough courage to formulate a response. Once in awhile, this created a ripple effect. Other students entered the discussion, and we, as instructors, were able to expand on the topic at hand, which circled back to spark a new thread of discussion.

One of the difficulties of sustaining this large group sharing had to do with our “travelling microphone.” On the one hand it was very helpful in amplifying voices, but on the other hand, if students at opposite ends of the lecture wanted to respond to one another, it was awkward making our way across the theatre with microphone in hand. Additionally, on a number of occasions, the battery in the microphone – one of our most relied upon tools – died; the very thing that made it possible to speak, to hear, to listen, that which allowed silence to be broken, became the silencer.
Too Much Time/Not Enough Time

“Three hours! How can we possibly fill three hours? On the other hand, how can we provide enough time to hear from each discussion group about each dilemma? And how are we going to ever provide meaningful feedback?”

The issue of time arose repeatedly in all its manifestations: three long months to teach the course, three long hours of teaching twice a week, three long months to prepare for the course, and what seemed like three long miles to walk between buildings. This was contradicted by the seemingly brief moment that we would have to work with these students and through the course, knowing that in a matter of weeks after the end of the term they would be facing classrooms and would need to understand and apply their knowledge to create inclusivity. Many decisions about what would be most meaningful to their current learning experience and their future teaching practice consumed our time before, between, during, and after our classes. An important turning point in our own learning as instructors occurred when it became completely evident that many students were not returning to class after the break. We realised we had to let go of some of our ‘best laid plans’ as well as the idea that we needed to provide three full hours of content and classroom experience. We had to learn to live with the contradiction between the need to fill the three hours they were paying for and the obvious restlessness and disengagement if we tried to stretch the class out for the whole time.

One of our greatest obstacles in terms of time lay in our knowledge of the importance of providing worthwhile feedback but we also knew how much time it would take to read and subsequently write meaningful comments on 350+ reflective self assessments. This was brought somewhat into balance by two elements: the first involved one of our teaching assistants who volunteered to assume responsibility for one third of the papers and the second came in the form of expressions of gratitude from the students.

Learning

While we never let go of our belief that small classes equal quality because of the centrality of the pedagogical relationship in learning, we did ascend our own steep learning curve through the semester in recognizing there were some up-sides to a large lecture format: we were able to convey to over 350 students the underlying strengths-based paradigm of the inclusive practice curriculum; the content of the curriculum that was addressed and emphasized was consistent (impossible in 20 sections); because there were so many voices in the large class format, unformed opinions were questioned freely by peers; and finally, all students heard the same reframing messages about students and their behaviours from guests committed to enhancing children’s lives: “exceptional does not mean abnormal,” “students are ‘stuck’ rather than ‘bad’ or ‘stupid,’” “behaviour is communication.” Especially heart-warming for us was knowing that, without the lectures, not all students would have had the opportunity to become inspired by the heroic story of Marc Ross, a doctoral student who, at age 17, had become quadriplegic due to a diving accident. His journey through the remainder of high school and subsequent university education involved many compassionate teachers, true models for inclusive practice teachers.
It was class experiences like this throughout the course that meant that even through our moments of most existential doubt in the value of our work, we never lost hope. Every day, as we left the coffee shop, it was “pick ourselves up, dust ourselves off, and start all over again…” On the inside cover of one of the early handbooks for our program there is a quote by Silver Birch to guide our students in their vocation: “We always say at the end of your earthly term, if you have helped one soul to find itself, then your existence has been worthwhile.” It is our sincere hope that we helped at least one soul.

The Development of a Teacher Observation Instrument for PBL Classroom Instruction

Linda M. Stearns, Jim Morgan, Mary Margaret Capraro, & Robert M. Capraro

Texas A & M University
Abstract

Teaching is a complex activity that requires making ongoing multiple decisions and sporadic, responsive actions all while performing preplanned prescribed tasks. Evidence of certain aspects of teaching can be best assessed with a well-designed observation instrument. This instrument was designed to assess the enactment of the essential elements of implementing a Science, Technology, Engineering, and Mathematics (STEM) Project-Based Learning (PBL) activity in classrooms. The steps leading up to the instrument development and follow-up suggestions are offered to those who are engaging in STEM professional development including districts, schools, academies, service centers, and university partners.
The Development of a Teacher Observation Instrument for PBL Classroom Instruction

A renewed federal and state focus on Science, Technology, Engineering, and Mathematics (STEM) education has resulted in the prolific growth of programs and professional developments (PDs) focused on STEM. However, little research investigating the effectiveness of these programs and professional developments have been conducted. While many agree that STEM education is important because it affects the field of education, it also affects the United States’ competiveness in global markets across various fields, including economics (Committee on Prospering in the Global Economy of the 21st Century: An Agenda for American Science and Technology, National Academy of Sciences, National Academy of Engineering, Institute of Medicine, 2007; Marshall, 2010; Pfeiffer, Overstreet, & Park, 2010). A heightened awareness of STEM education in the general public has occurred due to media reports of what is called the STEM pipeline problem, which is a decrease in the number of students pursuing careers in STEM fields (Sanders, 2009).

The No Child Left Behind Act (2001) has addressed the growing concern over the STEM pipeline problem by advocating for greater attention to science and mathematics education. K-12 STEM education provides a foundation for STEM careers but can also funnel students into post-secondary STEM majors (National Governors Association [NGA], 2008). In fact, STEM education in all schools and post-secondary institutions should be involved and play an important role in helping schools build infrastructure and improving articulation between K-12 schools and universities (NGA).

In a recent study, Bhattacharjee (2009) found that a lack of incentive for pursuing STEM careers was the cause for decreasing numbers seeking STEM degrees,
contradicting the previously held notion that it was due to inadequate K-12 STEM preparation. Even though the number of high-school STEM education credits students earned increased steadily from 1990 to 2005, just taking more courses was not the solution. Given a statistically significant increase in the number of STEM courses high school students completed, there was a decline in the number of students graduating college with STEM related degrees (Laird, Alt, & Wu, 2009).

Because increasing the number of STEM courses taken in high school has been shown to be insufficient, improvement in the quality and integration of STEM education should be the focus of national attention. Marshall (2010) advocated for improvement in the quality of the STEM courses. An effective STEM curriculum should nurture students’ problem solving and inventive thinking. Additionally, it should focus learning on creative exploration, projects, problem solving, and innovation, not fact memorization that predominates practice in many schools (Marshall). When a school’s curriculum is focused on research and inquiry-based learning projects in STEM classrooms, those projects foster complete student understanding by encouraging students to make connections between the content taught in various classes (Pfeiffer et al., 2010).

Therefore, incremental improvements might be gained by guiding teachers to better implementation of STEM education because a better understanding of STEM will lead more students to STEM careers.

**Importance of STEM Professional Development**

Professional development (PD) is considered essential for educators to keep up with current reforms. Teachers cannot just be shown a new idea or practice but need experimentation and a culture of learning to fully implement a new practice or idea
(Franke, Carpenter, Levi, & Fennema, 2001). Professional development was shown to be effective over the course of three years when interspersed with classroom observations that tracked the targeted instructional behaviors (VanTassel-Baska et al., 2008). Therefore, a prolonged and sustained professional development model should include estimates of assimilation of new ideas introduced through professional development into classroom teaching practices.

Sustained PD can be accomplished through the development of professional learning communities. One common way is the idea of lesson study, which permits teachers to refine their lessons to infuse quality (Stigler & Hiebert, 1999). However, this process has not been enculturated into American teaching due to many identified policy and organizational constraints (Lewis, 2002). Professional learning communities (PLC) have been shown to achieve similar results and to be self-sustaining and resilient. The model resembles lesson study in that collaborative groups of teachers work together to refine a skill or lesson learned through PD (Buysse, Sparkman, & Wesley, 2003). The primary mission of the PLC is to provide teachers with the time to fully engage in a professional task and to reflect and plan the implementation (Krause, Culbertson, Oehrtman, & Carlson, 2008). The PLC can support the STEM field, boost diversity of the STEM curriculum, and increase the level of implementation school-wide (Liddicoat, 2008). Research has shown that PLCs work to create a positive community of collaboration with common goals of advancing the STEM pipeline (Krause et al.). PLCs combined with classroom observations of teaching enactments can help to ensure full implementation of an innovation.
**Observation of Teachers**

In order to improve the quality of STEM education classes designed to encourage conceptual development (i.e. Project Based Learning [PBL]), teachers need feedback and support. “There is considerable evidence from different studies suggesting that how teachers behave in the classroom, the instructional approaches they employ, significantly affect the degree to which students learn” (Van Tassell-Baska, Quek & Feng, 2007, p. 85). Observations can be either peer or professional in nature, but the observer needs to provide feedback to the educator so he or she may evaluate and adjust their teaching to benefit the students (Patrick, 2009).

Without classroom observation check points, teachers’ assimilation of PD ideas can be assessed; however, feedback and continuous improvement may be compromised (VanTassell-Baska et al., 2008). Ineffective teachers can depress student achievement in mathematics by as much as 54% regardless of students’ abilities (Sanders & Rivers, 1996). Therefore, to ensure that translation of any PD into classroom practice, assessment must be present in some form during actual teaching activities. When carefully designed to align with the PD, classroom observation instruments can be an effective tool for providing feedback about assimilation of PD teaching strategies.

An effective way to evaluate teaching behaviors is with the use of a specifically designed observational instrument (Guskey, 2002; O’Malley et al., 2003; Simon & Boyer, 1969). The observation tool can yield a descriptive account of targeted performances. This can be achieved with a conceptual rubric that contains a numeric range of descriptors for each predetermined objective. Observational data can also be structured with a frequency-counting system, or coding system (Taylor-Powell & Steele,
This observational tool can serve to monitor the progress toward increasing a desirable trait or diminishing an undesirable behavior based on some theoretical framework. The information gained through the observation tool can also be used for teacher reflection and to customize subsequent professional development.

Effective observations require a certain amount of training and often can still have a degree of subjectivity, however, the information gathered through observations has a high degree of face validity (Volpe, DiPerna, Hintze, & Shapiro, 2005). This is not to say that no validity threats are present. For example, the following threats have been identified within behavioral observations: (a) poorly defined behavior categories, (b) low inter-observer reliability, (c) observee reactivity, (d) situational specificity of target behaviors, (e) inappropriate code selection, and (f) observer bias. These threats can be minimized with observer training and instrument validity testing (Merrell, 1999).

Using external observers to describe and evaluate teaching practices can provide a teacher with a better sense of their classroom instruction (Hlebowitsh, 2005). A team of observers should be well trained to identify factors that are fundamentally important to a school’s academic success. In addition, the observers should understand how the school’s goals and initiatives, past and current PDs, and the content covered in courses are aligned. Evaluators may use an observation tool that can be designed in as many ways as there are teaching methods (Dinkelman, 2003; Felder & Silverman, 1988), however, clearly defined goals should be made explicit and communicated with the teachers prior to any observations.

Teacher observation instruments can provide the classroom educator with a wealth of supportive feedback. But without on-going, connected, professional
development effective change may not occur (Van Tassel-Baska et al., 2007). A study of teacher evaluation practices found that few teachers had substantial change in their teaching effectiveness after an evaluation process without follow-up professional development (Kimball, 2002).

**Follow-up Professional Development**

After the observation process, an iterative planning and implementation phase should be undertaken for designing future professional development. The observations should be aggregated across teachers (analysis) with attention to commonalities in both strengths and weaknesses. Information should then be provided back to the teachers during conferences (discussions) and the information should be used as a basis for planning subsequent PDs (needs assessment).

**Analyses:** While an individual observation can be the basis for individual feedback and estimating a single teacher’s growth toward some school or district identified target set of skills, it should not function as a basis for determining school or district wide professional development. Personal PD needs can be addressed through the PLC. However, the power of aggregated observation analyses is in their usefulness in designing and developing future PD on a broad scale. Aggregated information based on observations provides the opportunities to build on systemic strengths while addressing systemic weaknesses. This also provides a structure for the PLCs to sustain the innovation and to provide gradual assimilation of the new PD. A carefully prepared analysis allows all stakeholders to examine the information and to build ownership of the pedagogical behaviors and to recognize the need for change in some of those pedagogical choices (Corcoran, 1995).
Discussion: It is important to encourage discussion of the aggregated analyses among stakeholders because without this discussion teachers would not have a clear understanding of their degree of assimilation of new ideas or how their lesson may appear to students (Franke et al., 2008). One important aspect of the discussion phase is in differentiating between systemic and idiosyncratic strengths and weaknesses or teacher reflection on their teacher (Franke et al.). Without these discussions, teachers would not know which topics their colleagues could help them with or what would best be done in large-scale sustained PD. Idiosyncratic weaknesses and strengths can be paired and addressed through peer interaction within the PLC. Systemic weaknesses can form the basis for subsequent PD needs.

Needs Assessment: Once teachers and administrators reach a shared understanding they can begin to prioritize which needs should be addressed first and how to best plan for future PD. Follow-up PD for the selected needs should be addressed by the original PD provider, the district/school should develop a scope and sequence, and in concert with the PD provider, allocate (5 or more days) PD days in which all teachers should be available to attend (Corcoran, 1995).

Theoretical Framework

Based on the previously presented ideas, a carefully designed observation instrument is essential to inform on-going and sustained PD. In fact, many researchers have identified issues with traditional PD (Desimone, Porter etc.) and the missing link in both the literature and in practice is the use of classroom observations and an instrument to guide that observation. The manuscript describes the development of one such instrument and its situation in a model sustained PD program.
STEM PBL Classroom Observation Instrument

Found in the appendix is a copy of a classroom observation instrument that has been created by a team of professors and graduate students from A STEM Center at a large southwestern public university. This instrument was specifically created to evaluate observable teaching and learning objectives when teachers use PBLs in their classrooms. Teachers who were evaluated with this instrument participated in sustained PD (10 full days) focusing on PBL. The PD has focused on each of the measured objectives. Both the observers and the teachers were trained on the design components and purposes of the instrument.

The instrument contains twenty-seven items organized by six objectives. The objectives include: (a) PBL structure, (b) PBL Facilitation, (c) Student Participation, (d) Resources, (e) Assessment, and (f) Classroom Learning Environment. The number of indicators under each objective varies. Each item can be evaluated on a scale ranging from 1 (no evidence) to 5 (strong evidence). The observer must justify every score assigned to each item. Occasionally, an item will not apply to what is taught during a particular observation. This may happen if the observer is only present for part of a PBL, however, well-documented lesson plans can provide insights and further details. The observer may still choose to indicate that a particular behavior was not applicable or not observed during the class period.

Use of Instrument and Aggregating Observation Data

It is important for observers and those observed to understand that this scale is not intended to be used as a grading tool, but rather to indicate progress toward an ideal. Therefore, while it may be tempting to use the scale as a ratio, caution should be used. A
low score on the instrument is an indicator of need for continued PD either on a systemic level or by peers in a PLC but should never be used as part of any teacher’s formal evaluation process. For the scale to function well the observers should be well trained, have a solid understanding of what ideal is, what it means to not see a particular item on the scale, and dependably be able to rate particular events similarly with peer observers. Inter-rater reliability is only achieved by multiple observers observing the same teaching event and then discussing their ratings and their justifications.

In the identification of systemic issues it is important to aggregate across observations and observers, campus boundaries, and subject areas; within each of the six objectives. The data can be aggregated using mode in cases when either low inter-rater reliability is present or when instrument training was not provided. However, in the presence of adequate inter-rater reliability and substantial training the scale can be used to compute means and standard deviations. In either case, larger numbers indicate greater progress toward the ideal goal and lower numbers indicate greater opportunity for systemic PD.

**Summary**

An observation instrument, designed to assess the enactment of the essential elements of implementing a STEM PBL activity in classrooms, has been presented. Included in the discussions are:

- The steps leading up to the instrument development, and
- follow-up suggestions for those who are engaging in STEM professional development including districts, schools, academies, service centers, and university partners.
It is hoped that this instrument will be useful in assessing the effect of the ongoing decisions; sporadic, responsive actions; as well as the preplanned prescribed tasks associated with teaching. Such evidence of teaching is well correlated with improved student learning (Darling-Hammond, Wei, Andree, Richardson, & Orphonos, 2009).

To what extent was the following present? Please mark the box that best displays your response on a scale of 5 to 1. 5= to a great extent, 1 = no evidence.

(5) (4) (3) (2) (1)

Justification __________________________________________________ ___

I. PBL Structure

1. The PBL has a well defined outcome.
2. The PBL contains rigorous subject area content.
3. The PBL lends itself to multiple, creative and unique tasks in which students can demonstrate a continuum of knowledge and understanding.
4. The PBL covers subject/grade level TEKS.
5. The tasks or the overall PBL will likely to lead to higher order thinking.
6. The PBL is not a stand-alone lesson.
7. The PBL is interdisciplinary.
8. The students worked in organized small groups.

II. PBL Facilitation

9. The teacher clearly stated goals and tasks.
10. The teacher facilitated the students to remain on-task.
11. The teacher asked effective open-ended questions.
12. The teacher worked with members of all small groups.
13. The teacher achieved objectives they identified.

III. Student Participation

14. The students were actively engaged.
15. The students could explain tasks and solution strategies.
16. The students could explain the goal(s).
IV. Resources
    17. The appropriate resources were used.
    18. The resources were readily available and in working order.
    19. The students were proficient in using the resources (i.e. calculators, test books, computers).
    20. The materials were familiar to the students.

V. Assessment
    21. The assessment(s) was/were continuous and varied.
    22. The evidence of holistic assessments existed (e.g. rubrics for participation/engagement, early stages of the PBL, or group work).
    23. The students could explain the expectations.
    24. The students understood what they needed to do and how it was evaluated on the rubric.

VI. Classroom Learning Environment
    25. The students were aware of teacher expectations and the purpose for learning content and methods.
    26. The teacher identified and engaged students around their prior knowledge.
    27. The teacher identified and engaged the students around their cultural contexts?

Other comments or observations

Observer         Date
Abstract:
The term ‘tone-deaf’ is commonly applied to poor pitch singing (Pfordresher & Brown, 2007). Research into tone deafness suggests that while only around 4% of the population actually have the condition congenital amusia, around 17% of Western adults consider themselves to be tone deaf (Wise, Sloboda & Peretz, 2007). The acquisition of musical competence is related to many personal, social, and environmental factors. Music educators have noted that this phenomenon of ‘tone-deafness’ often co-exists in Western societies with the concept of being ‘unmusical’ (Small, 1998). Ethnomusicologists maintain that everyone has the potential to be musical (Blacking, 1973; Campbell, 1998) yet often this potential is trained out of them (Small, 1998) due to the tendency in Western society to categorize a small group of individuals as ‘musical’ while the majority are declared ‘unmusical’ (Blacking, 1973; Kingsbury, 1988). Research amongst early childhood teachers in New Zealand has drawn attention to the high level of low self-belief in many teachers’ musicality and that a number self-identify as ‘tone-deaf’ (Willberg, 2001; Bodkin, 2003). Lack of confidence in singing, in particular, has been shown to have a prevailing influence on an overall negative musical self-perception (Bodkin, 1999).

This paper reports on a research project involving early childhood teachers in the Otago and Southland regions who self-identify as tone deaf. The study utilises two interventions: musical coaching (based around singing) and positive feedback derived from methods of Positive Psychology (Duckworth, Steen, & Seligman, 2005). This paper presents the preliminary findings of the research.
Dancing With the Students
Keeping up with the beat of classroom standards

ABSTRACT

Dancing With the Students: Keeping up with the beat of classroom standards

Dancing is an art form used as expression or social interaction in a spiritual or performance setting. We can dance with people, for people, or about people. We dance when we are happy, sad, or trying to excuse ourselves from a sticky situation. Friedrich Nietzsche once said dancing is a major component of education. It does not matter if it is with our words, ideas, feet, or preferred writing utensil. The art of the dance can be performed best when one not only understands the technique, but also improvises when the song changes.

Today’s college student has a changing face and cannot properly be defined under one complete category. A diverse student population brings all ages and backgrounds into the classroom environment. Those students encounter a vast increase in technological innovations as well as conflicting schedules, obligations, and an apathetic job market. Research has shown the changing face of today’s student to be more self centered and rude than in years past. There is a feeling of entitlement. Narcissistic students are now becoming classroom distractions unable to focus and spending less time studying outside of class.

In a follow up study to a 2009 qualitative survey of faculty members regarding classroom standards, a quantitative survey of students from three different Midwestern universities was given during the spring and fall semesters of 2010. Respondents were asked their opinions on standards, the value of education, and course evaluations. Student responses indicated education has varying degrees of importance, diversity is
not of relevant importance, and course evaluations are flawed to the point that many felt they were a way of getting even with the instructor.

Today’s field of education has become a dance. Unfortunately there is no step by step diagram to practice and follow. The best dance partners are confident and expressive. They develop chemistry and compatibility through proper use of communication. They are creative in trying new things and patient, even when their partner steps on their toes.
The Cultural and Linguistic Divide:
Japanese EFL Learners’ Conversation Practice with Native Speaker

Introduction

“What’s your favorite movie?”

“Armageddon.”

Armageddon. Japan welcomed the 1998 blockbuster out of Hollywood with success in box office sales and a high rate of DVD rentals, even more than 10 years after its release. The action-romance movie was an especially popular answer as a favorite with college students, yet does a space-age thriller about a potential end of the world story-line warrant a “favorite” film? In this characteristic conversation between a native speaking English teacher (NS) and a Japanese student of English (NNS), the would attempt to solicit detail, by asking, “why?” To which a student would respond, “I like Bruce Willis.” As a result, the conversation would soon fall flat, commencing the cultural divide between the American teacher and the Japanese student. Certainly
the students are capable of deeper analysis, and can contribute to a conversation by introducing a more critically acclaimed, art-house, or at least a controversial or literary based movie. On the other hand, was the student giving “Armageddon” as an answer because it is easy to for a Japanese learner of English to pronounce? Was the student simply confident that the instructor would be familiar with a Bruce Willis movie, and thus the conversation would flow?

The above “conversation” is a common non-linguistic misunderstanding that leads the NS to conclude that the students might be shallow. It was not until a handful of years ago that one of the teachers who experienced “Armageddon” as a common response was introduced to a more thought provoking answer.

“What’s your favorite movie?”

“Hula Girl.”

“What’s it about?” The student stalled.

However, the student’s hesitation was not unwelcome. Rather, it invited class participation to help the classmate introduce the complex story line of the Japanese award-winning movie, the protagonist’s struggle, familiar conflicts, as well as the once doomed fate of a mining village set in the time when Japan’s energy resource was changing from coal to oil. The NNS were active, working together to explain the movie to the NS instructor, who was interested in the story line, the students’ linguistic efforts to describe a movie in English, and finally, the choice of a non-action, non-Hollywood title as a “favorite” movie.

The background of the miscommunication in the above scenario turned out to be a cultural misunderstanding. Through this English Conversation Practice study, which highlights EFL students’ reactions to their personal speaking performance with a NS, the researchers would learn that many misunderstandings are due to cultural assumptions. In this case, the students most likely presumed that an American action
movie was a “safe” choice, familiar to the American teacher; whereas the NS found the introduction of the dramatic Japanese film to lead to more stimulation, natural conversation, due to its complex cultural implications and student generated participation.

**English Conversation Practice**

Learners of English in a limited EFL (= English as a foreign language) environment akin to Japan tend to lack the necessary opportunities to exercise their English skills with native speakers. For such EFL learners, face-to-face English conversation practice with a native instructor should provide a valuable chance to articulate their thoughts within the natural context of English. With native-speaking (NS) and non-native speakers of English (NNS) interactions, learners of English can attain helpful support from experts in the field of language education in improving their linguistic proficiency.

Previous research has demonstrated a strong link between interaction and second language (L2) acquisition (Ellis 2008; Philp and Tognini 2009; Mackey and Goo 2007). We adhere to Philip and Tognini’s definition of interaction as, “the use of language for communicative purposes, with a primary focus on meaning rather than accuracy” (p. 246). In this study, we created a conversation practice situation in which Japanese university EFL students are provided with ample opportunities to interact in English with a native English-speaking teacher. Interaction is beneficial to L2 learners in facilitating learning because it provides L2 input, and also learners have the chance to speak the language (L2 output). Both input and output are key components in attaining L2 proficiency.

When a teacher is engaged in an interactive situation with students, the teacher takes on a crucial role in either facilitating or interfering with communication in
English. Walsh (2002) suggests that several verbal behaviors on the teacher’s side increase L2 learners’ participation in interaction, such as provision of wait time for response, instructive scaffolding by suggesting key words to use, and repeating a portion of the learner’s utterance. The conversation practice session for this study was set with the objective of providing the opportunity for the students to speak for communication in English, therefore, the teacher attempted to facilitate the student talk, using these techniques.

It should be noted that the interaction between a native speaker and a non-native speaker inevitably produces communication breakdown or miscommunication. Varonis and Gass (1985) demonstrated that the lack of shared worldviews, or cultural assumptions, combined with a linguistic deficit of NNS, may lead to miscommunication. There is ample research on how L2 learners misunderstand or miscommunicate L2 exchanges, especially through conversation analysis techniques. However, most of the studies are based solely on the researchers’ interpretations based on transcriptions of actual L2 utterances and do not examine non-native speakers’ perspectives of what caused the miscommunication. What the researchers discovered during this specific exercise centered on the cultural assumptions, as will be described later in more detail.

This study examined an English conversation practice session with two Japanese university students and a native-speaking teacher. Conducted in what the researchers set out to be a welcoming and non-threatening environment, the session aimed to give low-intermediate EFL learners a chance to converse in English for communication. We attempted to investigate the learners’ perspectives of what made the NNS-NS English conversation run smoothly for them and/or what obstacles they faced. The questions addressed were: What were the Japanese EFL learners’ reactions to the English conversation practice? And how did they perceive their own linguistic
This paper followed the calls from Firth and Wagner (1997) and van Lier (2000) to enhance social and contextual orientations to second language acquisition (SLA), by taking into account the emic view of the learners themselves. Firth and Wagner criticized SLA research that regards the foreign language speaker simply as a “deficient communicator struggling to overcome an underdeveloped L2 competence” (p. 295).

The data for this study came from the transcriptions and audio/video recordings of the session as well as the interviews of the two learners of English. What is unique about this study is that, in addition to the analysis of the transcriptions, we the researchers conducted post-hoc interviews with the aim of exploring the Japanese EFL learners’ perspectives based on their personal experiences. We checked and confirmed with the learners where miscommunication and incompetent use of the language seemed to occur, and will provide insight into how these “mistakes” were triggered by factors other than limited English proficiency.

Method

Participants and Setting

This study was conducted at a small university of approximately 1300 students with a concentration in undergraduate law, located in Saitama prefecture. The majority of the students are male (90-92%) and a significant amount (30%) are members of varsity sports clubs. Students’ English proficiency in general is classified as between beginner to low-intermediate levels.

The participants in this study include a native English-speaking teacher, Kathryn, and two Japanese students, Akira and Hiroshi (pseudonyms). Kathryn, the second author of this article, was an American full-time faculty member. She was a
French teacher in the United States, and came to Japan to teach English 16 years prior to this study. Kathryn earned a graduate degree in Japanese studies and thus was quite competent in Japanese, both in speaking and reading, but never spoke Japanese in front of students. Although she was capable of comprehending Japanese EFL students’ self-talk expressed in their native language, she persisted in interacting exclusively in English with the students. However, her knowledge of the students’ native utterances was advantageous in keeping a smooth flow of conversation when speaking with the low proficient students.

Although not a participant in this study, the positionality of the two researchers needs to be mentioned here. Kathryn and Minami, the first author of this article, have been colleagues for the past 9 years. Minami, a female Japanese, also teaches English full-time at the university. Although the two Japanese student volunteers were in the same elective English class that Minami taught for one semester, they did not know each other on a personal level. The English proficiency levels of the students were high beginner or low intermediate level. The two students were selected for this research project out of the “researchers’ convenience” (Hatch 2002, p. 99). They were moderately motivated, and of cooperative nature, commonly seen active about campus with other members of university athletic groups.

Akira was a third-year male student and member of the varsity soccer team, and took one of Minami’s English reading classes for two years, one compulsory English class, and the other, an elective English reading class. He was an avid fan of the American TV program series LOST, and especially liked reading English books based on its themes. He was now seeking employment upon graduation, while also working part-time in the evenings at an area convenience store.

The other student, Hiroshi, was a first-year male student. Even though he already had two compulsory English classes per week and had to take a full load of
required law and teacher training courses, he was taking an additional elective English class which one of the researchers taught. Hiroshi was relatively skilled in English reading, and had a greater working vocabulary in English than the majority of his classmates.

Neither of the Japanese students had experienced living in an English-speaking country or traveling outside of Japan, and their only contact with a native English speaker was with one of the two foreign instructors (one full-time, one part-time) at the university. They both took one class with a native English speaking teacher per week, in a classroom setting with 20-30 fellow students. The class was mostly devoted to oral English communication practice with other students, in pairs or in groups.

Because we chose the setting for this research project to be on the university campus where we, the researchers, are employed full-time, we did not face problems negotiating access. As for ethical concerns, the students were willing to cooperate, and openhandedly agreed to participate in the project for research purposes, on the condition that their names remain anonymous.

The English conversation session was conducted in the office of the American female English teacher, Kathryn. The students were present for approximately 40 minutes which included setting up and “warming up” to make them feel at ease, whereas the actual session took place for around 25 minutes of that time block. The setting of the English conversation session is shown below: Kathryn sat at the large table face-to-face across from the two Japanese university students, Akira and Hiroshi.
**English Conversation Practice Session**

The American teacher provided the students with a sheet of paper, containing a list of questions with some illustrations, modified from an ESL textbook. The two students and the teacher had the question sheet in front of them on the table. The questions used in the session mostly centered on likes and pastimes, for example: 1. What kind of sports do you like? Who are your favorite players? 2. What are your favorite TV programs? 3. What’s your favorite kind of music? Who’s your favorite singer? 4. What types of sports did you play or watch when you were a child? 5. What are some of your favorite hobbies? 6. What movies have you seen recently? Who’s your favorite movie actor? Actress? Why? 7. What kinds of ethnic foods have you eaten? Which have you liked?

The NS teacher, Kathryn, asked one question from the list to Hiroshi, then Hiroshi would ask the same question to Akira, and finally Akira would ask Kathryn. All the three participants asked the questions in turn and in a circle. Note that Hiroshi and Akira did not know each other well, and were two years apart at the university. Akira spoke in English directly to Hiroshi only once in the 25-minute session, saying that he also liked Hiroshi’s favorite movie, *The Last Samurai*. In response to Akira’s comment, Hiroshi smiled, acknowledging his reaction with a nod, but did not respond verbally.

Kathryn’s main objective was to provide the students with the opportunity to communicate in English. She explained that:

I selected short, conversational themes set up in an interview style questionnaire. I thought that this would put the students at ease since (1) the topics (although they had not seen the handout in advance) were familiar as they are often covered in every level of ESL classes, and (2) they had the "crutch" of holding a reference in front of them. Initially I didn't know if the students would know each other, so I wanted to create a comfortable setting in order to promote communication.
Kathryn did not give error correction and instead focused on what the two students were saying or trying to say. She encouraged the students by providing them with possible response choices whenever they seemed to get “stuck” during the session (McCormick & Donato 2000; Walsh 2002).

**Data Collection and Analysis**

Data were collected through the following four methods:

1. Video/audio recordings and transcriptions of the English conversation session
2. Email exchanges in the students’ L1, Japanese, between one of the researchers and the students
3. Semi-structured interviews of the two students, conducted in their L1
4. The American instructor’s written reaction after the session

During the English conversation practice, the other researcher did not stay in the office in the interest of avoiding observer’s effects, and out of consideration of the positionality as the students’ classroom teacher. Conversely, she set up video and audio recorders and excused herself from the room. The video was placed behind Kathryn, and the two students did not even glimpse at the camera during the session. Both of them reported later that the presence of the video did not interfere with their conversation session, nor did they feel nervous about being video recorded.

Following the interview session, the audio recording was first transcribed word by word. In addition, Email exchanges using cell phones were used to gain short reactions from the students immediately after the English conversation session. Also, we asked about their own impressions on their performance. Next, interviews were separately conducted with each of the two Japanese EFL learners, in Japanese, by one of the researchers, Minami. The aim of the interviews after the English conversation session was three-fold.
1) To ask the student’s reaction to the session. What was beneficial for him or not? What did he find difficult? What was his general impression?
2) To check my initial interpretation of what went wrong or what went well in the conversation. Did the student really (mis)understand when I thought he did? Is there any miscommunication between the native English teacher and the Japanese student?
3) What was good about the English conversation session? Is there anything that might have helped them to communicate better in English?

As the Japanese interviewer and the American instructor work for the same university, we agreed that the principle of the mini English conversation session would be to explore an angle that could contribute to the small group or individualized English support program at the university (using the English faculty’s office hours for advisement or tutorial sessions for students in need), as well as for the screening session to select students to participate in a two-week ESL and home stay program in Canada. We explained to the students that the English conversation practice session contained these objectives in addition to research purposes.

The kind of interview we conducted was a “formal” or “semistructured” interview (Hatch, p. 94). The interviewer had prepared the following list of questions, which was placed in front of her throughout the interview.

a) What is your previous experience speaking English? English conversation practice or experience speaking with native English speakers?
b) What did you find difficult or troublesome, in general or specifically?
c) What did you find beneficial or good about the learning experience?
d) Do you have any requests, if any, about the session?
e) If you could “prepare” for the session, what would you do?
f) Were there any misunderstandings or what was not clear to you during the conversation session?
g) Did you say anything that you did not intend to say? Or do you think you could have said differently?

Minami asked the first couple of questions in this order and the other questions were posed when and where she deemed appropriate. In fact, she asked several questions more than once. For questions f) and g), the interviewer watched the video.
recording of the session with the students individually, stopping to re-play where necessary in order to check the learner’s understanding or misunderstandings among the participants. Minami also had the session transcription on hand at the interview.

As Kvale and Brinkmann (2009) stated, “power asymmetry” (p.33) was evident in the interviews. The positionality of the interviewer for this study as one of their English teachers had some influence on the interview, although Minami did not participate in the English conversation in focus. For that reason, Kathryn did not take part in the interviews. For the first interview with Akira, Minami asked him directly about what she thought to be problematic, such as a miscommunication or a failure to respond to a question. This kind of probing could easily lead to giving “judgmental responses” (King & Horrocks, 2010, p.52). Therefore, at the second interview with Hiroshi, the researcher tried not to solicit direct questions when reviewing the video recording. Instead, she took an inductive approach and asked him to point out what he thought was not going well, and what he would have wanted to add or change during the session, within his capabilities.

The interviews revealed that some of our initial interpretations of miscommunication were not supported. We, the two researchers, interpreted the students’ inappropriate responses mostly as the manifestation of their limited English proficiency, but we discovered that the students had other reasons and justifications, which will be discussed later. We then went back to the transcriptions and watched the video recording, searching for indications, such as gestures and gazes, which could possibly demonstrate why the students were unable to respond fluently.

Although the focus of the present study was on the emic perspectives of the EFL learners and not on the NS teacher, Kathryn was asked to write a short reaction to the session, to get a general depiction of how the session went from the NS teacher’s point of view. Her response was quite positive.
Findings and Discussions

Flow of Conversation: On the Surface

On the surface, the English conversation practice went quite smoothly, without any embarrassing incidents, in which the participants got tongue-tied or felt unable to continue the flow of the conversation. The two Japanese students made minor mistakes, and had a short self-talk in their L1 while searching for the correct word, but were able to express themselves in English. Their English was mostly “broken” English, replying in words or short phrases. However, Kathryn helped them in the flow of conversation by providing possible answers when they seemed unable to respond quickly or when they appeared puzzled. The students responded well to Kathryn and even initiated a question. Finally, all of the participants sincerely appeared to enjoy the practice.

Immediately following the English conversation practice session, Kathryn provided the other researcher quite positively via a written response. Effective communication in English was achieved from the NS teacher’s perspective.

The sessions went better than I anticipated. I did not foresee problems, but I was pleased that there were no "frozen" gaps where a student stopped and was desperate, or showed desire for, a translation. The Japanese students were able to make use of the small group and hit on some Q&A that interested them, and perform well. I was pleasantly surprised about the session. The Japanese students did not seem to mind or notice the taping/filming. I wondered if they are just so programmed to being in different learning or testing environments, and generally disciplined in general and thus were able to ignore the AV "action." (Emphasis added by the researchers.)

Although the conversation practice mostly utilized the set questions, there were some moments in which it seemed to flow into natural, spontaneous conversation. In the following extract, Kathryn, the NS teacher (T), continued to ask Akira (A) additional “tag on” questions, as a follow-up to the set question, “What kind of food do you like?” Numbers in the parenthesis indicate minutes and seconds into the conversation practice session.
T: How about the school cafeteria? Do you like the ramen in school cafeteria?
A: School cafeteria’s ramen is not good.
T: Not good? So when you eat at the cafeteria, what do you eat?
A: In school cafeteria, I don't eat.
T: No? So what do you do for lunch? What do you eat for lunch?
A: My apartment.
T: OK, do you live close? Where do you…? Do you live close to the school? Far or near?
A: Near.
T: OK.
A: Hanasaki.
T: So you come to class and go home for lunch (A: Yes.) and you return to school?
A: Yes.
(17:35-18:14)

The two Japanese students asked the set questions on the handout in turn, and additional questions soliciting more detail were mostly posed by Kathryn, as shown in the above extract. However, there were a few student-generated questions as well. Specifically, Akira initiated a question after he asked the set question about ethnic food.

A: What kinds of ethnic food have you eaten?
T: OK, ethnic food. I like Thai, Indian, spicy, spicy foods, so Thai soups and Indian curries. <<Bell>>
A: Do you like Japanese food?
T: Yes, I like sushi, of course, and soba. And in the winter, I like nabe.
(19:23-20:07)

In the next extract, Akira responded to Kathryn’s answer.
A: Who are your favorite players, ah...basketball?
T: Basketball. I like LeBron James.
A: Ah, Ca..Cavaliers.
T: I’m from Ohio State. And the Cavaliers are in Cleveland, Ohio.
A: Ah.
T: So it's my home state. All right. Very good.
(2:53-3:18)

When Minami, the other researcher, asked the two Japanese EFL learners through emails about their reactions to the English practice session immediately
following, they were positive as well. The students also provided additional feedback regarding nervousness or clumsiness speaking in English. Akira wrote:

It was fun so I felt the session finished instantly. But **I really had trouble** because normally I don’t have chance to speak English. I was able to understand what the teacher said, but **I could not express myself well and talk smoothly.** Also, I read aloud the questions on the handout, so questions became **unnatural.** I responded in **words or phrases only,** so I want to be able to reply in complete sentences. I hope I can learn to speak everyday conversation naturally. (Translated from original Japanese.)

Hiroshi was more concerned with his inability to speak fluently and accurately. He wrote:

When trying to speak, **grammar points and phrases** that I know normally did not come to my mind so it was difficult. The environment and time length were just right and I did not see any major problems. (Translated from original Japanese.)

Hiroshi was aware that he was making basic grammatical mistakes. In one of the researchers’ classes, when he wrote in English, Hiroshi did not confuse “don’t” with “doesn’t” as in the following segment. Kathryn (T) asked if a childhood friend of Hiroshi (H) still played baseball now.

T: Does your friend still play baseball now?
H: My friend is...my friend is, **don’t** play baseball now.

Hiroshi corrected himself, replacing the “be” verb with “do” but made the subject-verb agreement error, which he normally did not miss in written English. This is an instance of what Corder (1967) called “mistakes,” as opposed to “errors” that arise as a result of lack of L2 competence. Another error that Hiroshi made more than once was the use of “I’m” where “my” was appropriate.

T: And who's your favorite...who are your favorite baseball players?
H: I'm favorite player…Ichiro.

(1:25 - 1:33)
T: OK. All right. That's interesting. Very good. Very good. So let’s see... what about... ehm... where are we... your favorite TV actor or actress?
H: I'm favorite actor is Watanabe Ken.
(5:33 - 5:53)

Except for the two instances cited above, Hiroshi used “my” correctly as in the following extract.

T: How about food? What kind of food do you like?
H: Ah... I... My favorite food is Hamburg.
(15:27 - 15:40)

Hiroshi watched the video recordings of the session later during the interview but did not notice that he was making such a mistake. He was probably thinking he correctly pronounced “my,” and not, “I’m.”

The two Japanese students spoke mostly in English, except for an automatic response in Japanese, “hai” in place of English, “yes” and in another instance during word searches. At the start of the English conversation practice session, Akira replied to Kathryn’s directions on how the session will be carried out by saying, “hai.”

T: So what we're going to do is to have a short, casual conversation. (A: Em...) So I will ask you a question and then please ask him the same question. And he'll ask me. So we'll have a conversation in circle.
A: Hai.
T: OK?
A: Yes.
(0:46 - 1:10)

Akira realized that he instantly responded in Japanese, and for the next question he said “yes.” In the next extract, Akira immediately noticed his mistake, and corrects himself on the spot. Akira’s laugh indicates his realization of the L1 use.

T: So did you say movies? What movie do you like that you’ve seen recently?
A: My favorite movie is... Grand Torino.
T: Oh, I saw Grand Torino. The movie about... Was that... er... Clint Eastwood?
A: Hai, yes (laugh).
T: And Grand Torino was his car that he liked so much. That was a good story.
(14:45 - 15:21)
L1 as well as L2 speakers utilize the verbal techniques to signal word searches in adult face-to-face interactions in order to gain time for self-repair and also to seek assistance from a conversational partner. The most frequently used format is the *wh*-questions such as, “*What is it?*” and, “*nandakke?*” (Hayashi 2003). Kathryn once said, “*where are we?*” as cited in one of the extracts above, and the two students used such Japanese expressions like, “*sodana*” and, “*nandakkena.*” In the next extract Hiroshi looked at his handout for the next question to ask.

T: So please ask.
H: *Dokodakke?* What...your favorite kind of music?
A: I like Japanese hip hop.
(8:02 - 8:17)

Akira also expressed in his L1 during word searches.

Z: OK. What season of *Lost* are you watching now?
A: Ah...Five, five.
Z: Season five, OK. And which character do you like?
A: Ah...(sodana)...Harry.
(5:12 - 5:33)

Akira explained to one of the researchers later at his interview that he somehow did not come up with the name of his favorite character “Sawyer” because he was nervous.

A: To be honest, my favorite character is Sawyer, but I was nervous and the name did not come to my mind, so the first name that popped up in my head…
M: Oh, so you were lucky, you weren’t asked why you liked the character.
A: Ha, ha, ha (laugh). Somehow, my mind went blank.
(Translated from original Japanese)

In general, the 25-minute English conversation practice session between the NS teacher and two Japanese EFL students went well. As discussed above, some noticeable incidents on the learners’ side were:

1. students’ mistakes (= performance errors)
2. student-initiated questions/responses
3. students’ use of L1 in automatic responses
4. students’ use of L1 during word searches
The students were able to correct their mistakes and L1 use in automatic responses during the 25-minute session. As the session continued, it is quite probable that the students were able to reduce their nervousness and therefore decrease their mistakes and L1 use. The amount of student-initiated questions is expected to increase as they become more comfortable in the session. The question remains whether students’ L1 use during word searches can be decreased, and whether it is something that can be avoided entirely.

In the next section, we will report the findings based on the interviews with the two students revealing their perspectives of why some interactions seemed not to go smoothly. The students indicated that their inability to express themselves in English sometimes resulted not from limited L2 proficiency, rather from other cultural and social concerns or attitudes that they held toward the native English-speaking teacher.

**Sources of Miscommunication: Below the Surface**

The conversation everyday topics were selected so that the students should be familiar with them (sports, foods, hobbies, and movies). These topics are typically considered “easy” as everyone is expected to have something to say regarding his own likes. Furthermore, they are quite commonly utilized in the English classroom. However, interviews with the students revealed that the Japanese students’ concern about the NS teacher’s potential unfamiliarity regarding their cultural references seemed to interfere with communication.

**NNS’ Concerns regarding NS’ Cultural Knowledge**

The two Japanese students were concerned about how much the American teacher knew about Japanese pop culture. In the following extract, Akira explicitly
expresses his apprehension by saying, “Maybe you don’t know.” He was hesitant to
tell what he thought Kathryn did not know. At the post interview, Akira said that, “This
question, gave me the most trouble (kono shitsumon ga ichiban komattandesuyone),”
because his favorite singers were somewhat obscure. He was also not sure if the other
student was familiar with his favorite hip hop groups, and thus was pleasantly
surprised to learn that Hiroshi knew of one of them.

T: So what’s your favorite hip hop group?
A: *Maybe you don’t know.* Eh...Group?
T: Or singer.
A: For example, Yoshida, Hanyu, Yass.
T: (To Hiroshi) Do you know those names?
H: I know Hanyu.
A: Ah.
T: OK.
(8:17 - 8:58)

Their reluctance can be considered quite natural in that the Japanese students did not
have much awareness of American cultural icons either. The knowledge gap pertaining
to each other’s cultures was evident in the next extract as well.

A: What’s your favorite kind of music?
T: Um, I like popular music. I also like...for example, some country music. And
do you know Kelly Clarkson or Carrie Underwood? Maybe not. Or Pink?
A: *I don’t know.*
T: No? They’re all American female artists. Let’s see, but I like many kinds of
music. All right. OK.
(8:58 - 9:24)

Although such gaps are unavoidable and thus they are something that both the NS and
the NNS need to tackle during the conversation, the two Japanese students sometimes
chose not to give “true and honest” responses due to such anxiety.

Both Akira and Hiroshi confessed in their interviews that they intentionally
chose Hollywood movies and actors when they were asked about their favorites. They
preferred responses that Kathryn might be familiar with, assuming that she was
unacquainted with Japanese movie titles. The particular question in the next segment was directed from Hiroshi to Akira:

H: What...Who's your favorite TV actor?
A: I like Tom Cruise. (T: Mmm...) (To Hiroshi) I like Last Samurai too.
(6:09 - 6:28)

Likewise, Hiroshi replied during the English conversation practice that the movie he most recently watched was Wanted. He said later that he loved Japanese movies but had not seen any American movies for quite a while. His hesitance is evident in the frequent use (twice) of L1 in the next extract: “Nandakkena (What was it)?” and “Nandaro (What is it)?”

T: So what movie have you seen recently?
H: Em..(nandakkena...) I...my best movie is Wanted.
T: Wanted. Is that...? Who is in that movie?
H: Angelina Jolie.
T: OK, I’ve heard of that. I heard it was very good... I didn’t see it.
H: Eh?
T: I did not see Wanted, but I heard that it was very good.
H: Yes.
T: What's the story?
H: Ah...(nandaro?)...spy.
T: A spy story?
H: Spy story. Ah... Spy, spy. (laugh)
T: All right, that’s great, good answer, so you like watching movies, that's great.
(13:36 - 14:29)

It is interesting to note that the difficulty that Hiroshi had in explaining the details of story did not necessarily come from his limited English proficiency or lack of English speaking fluency. The movie plot is in fact quite complicated and set in an extraordinary, unbelievable secret society of killers. Hiroshi searched for words and voiced the Japanese wh-question “nandaro,” probably in order to give himself extra time to think, finally coming up with the word “spy.” He tried to explain the details but gave up quickly with a laugh. This is an instance where an easy conversational topic can be extremely demanding. Both the NNSs and the NSs can get hit roadblocks, but
because the interlocutor here is a non-native English speaker, the failure to respond can easily be seen due to the lack of English proficiency (Firth & Wagner, 1996).

**Situational Factors that Interfered with the L2 Conversation Flow**

The instance mentioned above about the difficulty in explaining the move plot is caused by situational factors. “Situational factors” refers to factors related to the situation a speaker is in, excluding individual factors such as L2 proficiency/competence and language-related issues.

In the following extract, Akira’s body language is described in parentheses and in italics. He could not reply to the question immediately. He looked away, apparently in thought. Akira’s mouth dropped wide as if caught in a surprise when asked a specific question regarding his favorite player’s team:

H: What kind of sports, do you me... do you like?
A: I like soccer.
H: Who are your favorite players?
A: My favorite player is...Shunsuke Nakamura.
T: **What team does Nakamura play for?**
A: …*(Akira opens his mouth wide, grins, looks above thinking, and then looks down)*
T: What team? *(Akira looks up at T, with his right hand on his chin)*
T: Er..Japan? *(Akira nods)*
T: National team?
A: Yes.
T: Oh yes? OK. Very good. So please ask me.
(2:14 - 2:31)

As indicated by the changes in Akira’s gesturers, he did not respond for some seconds. Noticing that he was struggling to answer the question, Kathryn offered support and started to provide possible answer choices. Our initial interpretation of this segment was that Akira did not understand the question, probably because he did not have enough English listening ability.

However, in the interview with Akira, we found that he comprehended the
question correctly. Akira told the interviewer that the reason that he was having trouble answering was because Nakamura had just left his former team in Europe and was currently in transit while weighing his options before signing on to his next team. There was a great deal of speculation regarding where he was going to play next, whether in Japan or overseas, and his new team name had yet to be released. Instead of responding, “I don’t know,” Akira was trying to think of ways to explain the complicated circumstances to Kathryn, resulting in a delayed response. Nakamura was on the Japan national team but that was not what Akira wanted to say. He had wanted to name a different, specific team.

In the next segment, Hiroshi answered to the question, “How often do you eat hamburgers at Mos Burger?” by simply saying, “Often.” Our initial interpretation (and Kathryn’s instant reaction as well) was that he did not know how to express frequency, even with Kathryn’s other-repairs such as “everyday” and “twice a week.”

H: Ah... I... My favorite food is hamburg.
T: Hamburger? Really?
H: Yes.
T: So where is the best place to buy a hamburger?
H: Ah... Mos Burger.
T: Mos Burger, really? (laugh) And eh, what kind of burger?
H: Ah... (pause) Mos Burger.
T: Mos Burger? So just a regular burger?
H: Regular.
T: And how often do you eat hamburgers at Mos Burger?
H: Oh, yeah.
T: So how often? Everyday? Or twice a week?
H: Ah… Often.
T: Often…often. And can you cook?
(15:37 - 16:31)

At the interview, Hiroshi watched the video recording and said, “To reply to ‘How often’ with ‘Often’ is really strange, isn’t it? (How often ni often te kotaerunotte hen desuyone)” When he was asked this question, he realized that he had not been to the hamburger shop for quite some time. He was hesitant to tell Kathryn honestly
because his answer would appear to contradict his previous remarks about his favorite food and burger shop. In this segment, Hiroshi could have explained that he liked the fast food restaurant, Mos Burger, yet had not been there lately. Because he did not, he looked as if he did not comprehend such a basic question in English. Of course, his limited English proficiency was into play here, but that response gave Kathryn the impression that he was more incompetent in English than he actually may have been.

Due to the fact that the students in this study were considered to be at the beginner or low-intermediate level, it could be assumed that student performance error would be due to the linguistic deficit of the NNS, as previously mentioned. However, inappropriate cultural assumptions proved to be the stronger force guiding the participants’ hesitation to respond quickly or seemingly naturally. For example, when asked about their favorite food, a fundamental topic often introduced in the beginning stage of an English language program in Japanese schools, students can quickly answer, “pizza.” Yet when the NS attempts to expand, soliciting more details in the conversation with one of the students, “Oh, really? What kind of topping do you like?” To which the student appears to draw a blank. Throughout this study, the researchers learned that the NNS tended to believe that they should cater their answers to please the NS, in this case an American. Most likely, the student in the above scenario does not prefer pizza and thus was taken aback when casually asked to name a topping. The conversation stalled as the student failed to have the next “fib” prepared, and perhaps he was also distracted by his true answer, wondering if “ramen noodles” would have been a “correct” answer, that is, if the NS would have understood or appreciated his true answer.

What follows is another instance in which Hiroshi looked less capable in communicating in English than he in fact was.
H: Mm...I favorite music is Utada Hikaru.
T: So that’s...er...she is a female singer, right?
H: Female.
T: Pop singer?
H: Female pop singer.
T: Is she a solo singer, or is she in a group?
H: Solo.
T: OK. What is her most famous song?
H: Eh...nanda...?
T: Or popular song?
H: Eh...All love. (laugh)
T: OK. All right
T: I've heard of her name, but I don't know her music.
H: Ah... Unto… Pardon?
T: No, I’ve heard...I know her name.
H: Ah.
T: So I’ve heard of her name.
(7:05 – 7:59)

This was the only segment in which either student explicitly expressed his incomprehension (not by gestures, or by a puzzled look, for example), so it was particularly noticeable. The other student, Akira, interpreted Hiroshi’s actions: “Probably Hiroshi thought that Kathryn asked a different question (nanka shitsumon dato omottanjaikana?).” We did not ask Hiroshi intentionally but he himself pointed his clumsiness in the moment. Hiroshi said he thought he did not understand her so asked, “Pardon?” He was disappointed by her response because he realized he had understood her utterance in this case without a problem. Nothing new was in her “re-posing” the question for him. He even regretted having asked her because this interrupted the flow of conversation, adding that, “I shouldn’t have asked this (kikanakya yokatta) but, rather, I should have let the conversation continue its flow (hanashi tsuzukereba yokatta).”

Conclusion

The English conversation practice session that was arranged at a university in Saitama, Japan, involved one American female teacher and two male university
students. The students did not know each other well on a personal level, but with the aid of a handout listing questions concerning sports, foods, and movies, the three participants were able to ask and respond to questions in English in turn. As a result, they successfully generated a natural conversational flow. Although the students’ responses were predominantly in phrases or words rather than in complete sentences, they rarely hesitated due to the instructional scaffolding provided by the NS teacher. Students’ mistakes (performance errors), L1 use when searching for words, and L1 use in automatic responses, such as “hai” instead of “yes,” were observed. Fortunately, the frequency of these negative instances decreased as the student progressed in the session. Additionally, there were even examples of student-initiated questions detected in this relatively short 25-minute conversation session.

Further qualitative analysis of the English conversation practice session was conducted with the post-hoc interviews with the aim of gaining the emic perspectives of the two EFL learners. It was revealed that the researchers’ initial interpretation of the students’ inability to express themselves in English was not supported in some cases. For example, we tended to take the failure in communication as the manifestation of limited L2 proficiency. There were various instances in which the interactional talk between the NS and the NNS students were also affected by situational factors, as well as the NNS students’ concerns for the NS teacher’s understanding of Japanese cultural references. To cite a specific example, both of the Japanese students indicated that their favorite movie was an American Hollywood movie, assuming that the American teacher would not be familiar with popular Japanese movie titles. Their responses, based on their perceptions of the NS teacher’s cultural competence of their culture, sometimes made expanding the discussion more challenging. Therefore, some instances in which the students seemed unable to express themselves were not necessarily caused by their limited English proficiency. Being
low-intermediate EFL learners, with not much previous experience of speaking with NS, the students sometime looked more puzzled and unable to speak or understand English than they actually were. We also found that outwardly easy topics such as explaining a movie plot can be extremely complex.

This study examined an arranged conversational setting involving NS-NNS interaction, which the American and Japanese researchers created. This was not a classroom situation, where students are provided with regular opportunities to interact with each other. Although the locale of this study was not a “typical” classroom or a full 90 minute class length, the content paralleled a typical first session of an English class. English speaking class activities on the first meeting often involve NS-NNS or expert-novice interactions and speaking on topics, such as likes and hobbies, as seen in this study.

As Firth and Wagner (1997) critiqued the study of Varonis and Gass (1985), when miscommunication between the NS and the NNS is caused by the NNS, it is often interpreted as a result of the NNS’ limited linguistic proficiency. In line with socio-cultural views of language learning and language learners, it is hoped that this study sheds light into the difficulties L2 learners could have during NS-NNS interactions, including the reality that situational and cultural factors come into play as well.

Abstract

The Texas A&M University (TAMU) Department of Teaching, Learning and Culture has forged a partnership with an Italian middle school in Castiglion Fiorentino, Italy, the home of TAMU’s long-established Santa Chiara Study Center. Following a review of literature addressing the importance of authentic cross-cultural experiences for preservice teachers, the authors provide a narrative of the background of their study abroad program and a description of the day-to-day reality of the partnership. They then discuss implications for the future—viewed from the perspectives of the TAMU participants and their Italian counterparts—and conclude with results from research questions presented in their 2010 “Work in Progress” paper and explored in their 2010 spring semester program.
Exploring Implications, Observations, and Conclusions of a Cross-Cultural Partnership between Preservice English as a Second Language (ESL) Teachers and an Italian Middle School

Angene H. Wilson (1982) begins her discussion of cross-cultural experiential learning for teachers by quoting James Boswell’s 1765 words: “Nine months in this delicious country (Italy) have done more for me than all the sage lessons which books, or men formed by books, could have taught me” (p. 184). After completing our second semester living in Castiglion Fiorentino, Italy and working with the local middle school in this ancient and exquisite Tuscan hill town, we fully concur with Boswell. In fact, the lessons our Texas A&M University preservice teachers and we, their supervising professors, have learned during our months in Italy have spawned questions and yielded exciting results as we endeavor to understand and analyze the significant depth of our cultural immersion and to plan for the continuation of our partnership with the Dante Alighieri Scuola Media and, indeed, with the entire community of Castiglion Fiorentino since we have interacted with community officials, school children, parents of school children, and the many other local citizens who have opened their school and their hearts to us. Although different word choice from James Boswell’s 1765 observations (as quoted in Wilson, 1982), an excerpt from one of our 2010 preservice teacher’s journals seems to express a similar devotion to Italy and, at the same time, express her and our passion for continuing our journey:

As I sit on a mountainside reflecting over the last two months of my life, I can’t help but have a joyful, thankful heart. My emergence into this lifestyle has been incredible and indescribable.
Cross-Cultural Partnership

I have lived in the society, traveled the lands, and worked side by side in Italy to come full circle with the conclusion of great success. I have fallen in love with this country, its people, and its culture to where my return is definite!!

Unlike our earlier paper, which was presented as a “work in progress,” we are presenting a summary of significant observations resulting from our 2010 research questions and both looking back on our progress to date and looking forward with anticipation. Indeed, we believe that our international, cross-cultural experience with our Italian counterparts—which began with powerful implications concerning the potential of such a partnership for all the stakeholders—has continued to develop and mature into a structure that can be sustainable and mutually beneficial for current and future preservice teachers at our university and Italian English Language Learners (ELLs) in Castiglion Fiorentino for years to come. Although the current economic pressures on both our university and our students present challenges, we are confident that our program has the demonstrated value and continuing potential to remain an integral and ongoing part of the our department’s global initiative for our undergraduate, preservice teachers and to play an equally integral and ongoing role in the lives of the students and faculty at Dante Scuola Media.

Following a review of literature addressing the importance of authentic cross-cultural experiences for preservice teachers—in fact the initial and underlying rationale for our Castiglion Fiorentino experience—we provide a narrative of the background of our program and a description of the day-to-day reality of the partnership between ourselves and our Italian middle school partners. We then discuss significant implications from our
2010 spring semester program, within the context of their application to our pre and post research questions and other observations by our students, our Italian counterparts, and ourselves.

II. Importance of Authentic Cross-Cultural Experiences for Preservice Teachers

In developing the rationale for any study abroad experience, the planners must examine the goals and expectations for all who will be involved in or affected by the program and determine if the potential rewards of the proposed international interchange are worth the resources, both human and financial, that are required to create a meaningful program. Certainly, research backs up the premise that a global perspective is needed in today’s world and that, in increasingly diverse American classrooms, such a perspective is particularly important in teachers (Bruce, Podemski, & Anderson, 1991; Faulconer, 2003; Pence and Macgillivray, 2008; Willard-Holt, 2001). Yet, the cultural dissonance between children in our schools and their teachers is disturbing, as noted by Tracy Faulconer (2003), who quotes research by Christine Sleeter in 2001 indicating that, while increasing numbers of teachers have students with limited English proficiency in their classrooms, fewer than twenty-five percent have training working with them. Faulconer goes on to state:

No one is more aware of this gap than those of us who teach in pre-service education programs. Despite our ever-increasing efforts to provide a multicultural perspective in all of our courses and a variety of sensitizing activities in our programs, many pre-service teachers remain completely inexperienced in authentic, personal connections with groups outside their own milieu. (p.3)
In discussing the need to develop global perspectives in the United States, Jan L. Tucker and Peter J. Cistone (1991) call teacher education the “beachhead” in the campaign (p.3). Citing extensive research concerning how teacher perceptions and expectations can negatively impact children in the classroom, Faulconer (2003) insists:

Change in these perceptions should be the goal of every teacher education institution. Designing curricula, immersion experiences, and methods that effectively require pre-service teachers to confront their own biases and to truly see into another culture is paramount to preparing teachers who will honestly and effectively create equitable learning environments for all children.” (p.3)

Colleen Willard-Holt (2001), in writing of her international program for preservice teachers in Mexico, explores research involving global education and provides a suggested list of goals for educating preservice teachers from a global perspective. The qualities that preservice teachers meeting the goals would hopefully possess include cross-cultural knowledge (including knowledge about cultures other than their own), motivation to teach from a global perspective, the ability to perceive and value cultural diversity, confidence and skill in communicating, a sense of ease in other cultural groups, the ability to view peoples of other cultures without the distortions of stereotype, and the perspective of seeing themselves as part of a professional community with peers around the world (p.505-506).

Of course, meeting the goals that Willard-Holt (2001) presents is not accomplished without effort; initial ventures into another culture present challenges and surprises that must be addressed in an immediate sense and then learned from in a
forward-thinking manner. Gary Barkhuizen and Anne Feryok (2006) stress the importance of preparing preservice teachers for an international program well before they arrive—preparation that goes “well beyond the usual advice about clothing, medications, and travel documents” (p. 131). They forthrightly state conclusions and identify implications of their six-week international experience in Auckland, New Zealand with 15 pre-service English second language teachers from Hong Kong. The authors note the necessity for future international experience planners to accept that not everyone will be satisfied with the planned program and to understand the importance of teamwork and transparency at both the macro and micro levels. On the micro level, Barkhuizen and Feryok (2006) note the value they found in investing authority in a classroom teacher at the host institution and in creating honest and open communication with their participating students. They acknowledge that, in a short but intense program, responsiveness is crucial, and needed changes must be made quickly.

Despite the challenges, research supports the premise that authentic international field experiences can help preservice teachers meet the goals we, as university teacher-trainers, have for them (Bruce, Podemski, & Anderson, 1991; Faulconer, 2003; Pence and Macgillivray, 2008; Willard-Holt, 2001; Wilson, 1982). By working in schools serving different cultural communities, interacting with colleagues from different cultures and nationalities, and integrating themselves into a different culture, in-depth learning can be achieved that cannot be replicated in campus classrooms (Bruce, Podemski, & Anderson, 1991). In writing of their field experience in Rome, Italy with preservice teachers from James Madison University, Holly M. Pence and Ian K. Macgillivray (2008) report that “the active engagement and self-reflection required of the field experience
challenged their [students’] preconceptions of culturally different others, how schools and classrooms should be structured, their personal and professional beliefs, and, ultimately, helped them grow as individuals and future teachers” (p.14).

Pence and Macgillivray (2008) also stress the importance of providing preservice teachers the opportunity to interact with the community outside of the classroom, citing Stachowski and Mahan’s 1998 research on the importance of synergy between teachers and their communities. In fact, Stachowski and Mahan’s 1998 article cites research findings that “most students entering teacher education programs are from non-minority backgrounds, possess a narrow cultural worldview, and have limited exposure to cultural diversity” (p.155). The authors chronicle their experiences with cultural immersion student teaching projects on American Indian Reservations and overseas at national schools in England, Wales, Scotland, the Republic of Ireland, India, Australia, and New Zealand (Stachowski & Mahan, 1998). In their programs on reservations and overseas, members of the community, as well as educators and supervisors in the host schools, are vital contributors to the learning process, and student teachers, in addition to their classroom experiences, perform at least one service learning project in the local community as a means of leaving the school environment and venturing into the broader community (Stachowski & Mahan, 1998, p.159). Having to adapt to new cultures in foreign schools and observing foreign children in their own educational systems can challenge and break down prejudices that preservice teachers might have of culturally different others (Faulconer, 2003; Pence and Macgillivray, 2008). Further, “stepping outside of one’s comfort zone and reflecting on one’s reactions can help preservice
teachers become more flexible and reflective practitioners” (Pence and Macgillivray, 2008, p.16).

The nature of study abroad programs and their impact on preservice teachers vary from program to program, and it appears clear that study abroad experiences, even as short as one week (Willard-Holt, 2001), can change and motivate preservice teachers. Barkhuizen and Feryok (2006), however, point out that just being in another country does not create an international experience and caution against the tendency for student teachers to limit many of their activities to their own group members, in their case “leaving little in-depth engagement with ‘real’ New Zealanders” (p.132). In fact, the authors state that this tendency was “the greatest shortcoming of the programme, and one that has continued to be the most difficult to address in subsequent programmes” (Barkhuizen and Feryok, 2006, p. 132). The authors further suggest that innovative ways of providing more intercultural and interlingual contact should be found for a successful international experience, including social activities with members of the community and professional meetings with host-country educators.

The rewards of a successful international program for educators or future educators are significant. Jan M. Robertson and Charles F. Webber (2000), in examining the results of their cross-cultural travel study exchange between Canadian and New Zealand graduate students in educational leadership state “… the breaking of boundaries between theory and practice, between university professors and students, between two nations, and between self and others, can foster the development of critically inquiring leaders who may not only have more questions than answers, but, more importantly, know that there are still more questions to ask” (p. 329). Wilson (1982) notes that an
intense immersion experience, in which the student moves from the level of “dabbler” to “participant,” is the most exciting and rewarding and ends her article, “Cross-Cultural Experiential Learning for Teachers,” with the words, “No one should make the claim of being educated until he or she has learned to live in harmony with people who are different” (p.191). With this, we will move on to the program we, in the Department of Teaching, Learning and Culture at Texas A&M University, have developed in our quest to, in Wilson’s words, become educated.

III. Background

To begin, any discussion of the background of our program must refer to the title and authorship of this paper. Our program is a true partnership between ourselves and our Italian colleagues, Dr. Maria Giovanna Fabianelli and Professor Silena Faralli, who have been involved with the program from its conception and remain integral to its success in the future. In fact, this partnership began in the summer of 2007 through the leadership of Paolo Barucchieri, Director of the Santa Chiara Study Center in Castiglion Fiorentino, Italy, and his assistant, Sharon Jones, both of whom have been involved with Texas A&M University’s (TAMU) sponsorship of Castiglion Fiorentino’s Santa Chiara Study Center since its inception in 1988. The Center, housed as it is in an ancient and beautiful structure dating back, in some sections, to the 1400s, has provided a home away from home to study-abroad students from TAMU and other universities across the country for the past twenty years.

Although the Community of Castiglion Fiorentino and the Santa Chiara Study Center have a longstanding and valued relationship, the program that we have developed with Dante Scuola Media is the first time that university students with coursework and
training in working with English Language Learners have entered into a formal, established partnership with a local public school. Our program with Dante began when the administrators at Santa Chiara introduced us to Silena Faralli, the English language teacher and Professional Development Coordinator at the local “Dante Alighieri” Scuola Media (middle school) and arranged for our Summer 2007 study-abroad group of sixteen preservice teachers to visit Professor Faralli’s English classes at Dante. Although the visit was initially intended to be a one-day event, occurring on the first day of the last regular week of school, we immediately saw the potential of the cultural interchange between her Italian middle school students and our university preservice teachers. As we put them in small conversational groups, we noted the resulting motivation in Silena’s students to use their English skills to communicate with our enthusiastic, young, “different” university students and the corresponding interest in our university students to get to know these young Italian students. The impact on our students was even greater as they realized the challenges of coping in a community where they did not speak the primary language--as they, too, struggled to say even the most basic words in Italian, they began to identify and empathize with the Italian middle school children as they attempted to speak English.

After expanding our one-day Summer 2007 visit to Dante Scuola Media to five days and moving from our initial simple conversations to language arts lessons involving readers’ theatres (based on folktales) and dramatic presentations (based on the Italian students’ recent visit to an English production of Pygmalion), we, as well as the faculty and staff at Santa Chiara and Dante Scuola Media, were able to see the potential of a partnership between preservice teachers who were training in working with English
Language Learners (ELLs) and Italian English as a Foreign Language Learners (EFLs). We could all also see that such a program could not be fully realized in a summer program; thus, we were invited to return to Castiglion Fiorentino for the spring semester of 2008 for a semester-long program.

Luckily, we found that we had strong support and enthusiasm from our department and college, as well as from the study abroad office and university as a whole, as evidenced by our university’s Vision 2020, which states, among other things:

“To position our students to live and compete in a global society, Texas A&M University must produce graduates who are not only academically prepared, but who have the capacity to understand other cultures and to live and work outside their own cultural framework.”

A crucial additional sponsor of our program was the Texas A&M University’s European Union Center of Excellence (EUCE), one of eleven such centers across the US that are funded by the European Union. In addition to a wide range of interests within the EUCE, a strong K-12 Educational Initiative exists with the purpose of nurturing relationships between schools in EU countries and American schools. Since the prospect of recruiting preservice teachers--as well as planning and implementing the university curriculum and planned field experience with only a few months lead time--was daunting, we were delighted when the EUCE provided grant funds for us to bring Dante’s principal, Dr Maria Giovanna Fabianelli and Professor Faralli to the TAMU campus in October of 2007 to meet with the preservice teachers who had applied for the program and to address the details of our field activities in the Italian middle school.
On campus at TAMU during the fall semester, we tried to lay the groundwork for the spring semester’s program. We determined that we would combine university coursework with the students’ field experiences, in order to allow our preservice teachers to remain on-track with their degree plans. Their work with the Italian middle school was scheduled for the mornings while their more theoretical university coursework at Santa Chiara was planned for the afternoons. Wednesdays were reserved for fieldtrips that the students would take in conjunction with the larger group of study abroad students at Santa Chiara (including architecture, art, and general studies students from TAMU and other universities). In addition to ESL, Multicultural Studies, and Language Arts courses that the students took from us, they also took one course on Italian Art and Culture from the Santa Chiara Director, Professor Barucchieri.

As we forged together a group of fourteen preservice teachers, most of whom were in their first or second years of university, and made plans to begin the first of what we hoped would become a longstanding program, we realized that we were embarking on an exciting, important, innovative, and somewhat intimidating project—and that the stakes for success or failure were high.

IV. Spring 2008 Program Description

We were welcomed with open arms by the Community of Castiglion Fiorentino from the first day. In fact, this first day was marked with a beautiful reception at Dante Scuola Media, attended by the Mayor, Vice-Mayor for Education, the local print journalism reporter, representatives from two television stations, and other town dignitaries. Our department head and associate dean, as well as representatives from the faculty and staff at Santa Chiara, joined in showing their support. As the leaders of the
TAMU group, we experienced for the first (but not the last) time how inarticulate and foolish it was possible to feel when we stumbled over Italian words with a microphone to our mouths (usually saying something profound like, “Me.....happy.....here”). Fortunately, we also found—from this first day—how forgiving and understanding the people of Castiglion Fiorentino were and how ready they were to help us learn Italian as they improved their English. Humor, flexibility, patience, tolerance, and friendship soon became the guidewords by which we all lived during our intense, often exhausting, but always exhilarating semester with Dante. The actual structure of the program that emerged is best described in terms of the regular school days at Dante, the university coursework at Santa Chiara, the extracurricular activities with Dante, and the external relationships with the citizens of Castiglion Fiorentino.

Dante Scuola Media has approximately 350 students in Levels I, II, and III (or grades six, seven, and eight) who are studying English, and we were asked to work with all of these students, since the administrators felt strongly that all Dante students should be given the same opportunities. We were also asked to provide adequate supervision to our preservice teachers in the Dante classrooms, so we divided students into teaching teams of two-to-three students with at least one of us as a faculty observer. We were at Dante every morning, Monday through Thursday, after which students returned to Santa Chiara for lunch and afternoon coursework. On days when activities at the Santa Chiara Study Center or fieldtrips precluded our preservice teachers from teaching scheduled classes at Dante, one of us presented the lessons. Because our students were taking English as a Second Language (ESL) coursework, appropriate weekly lessons for the three levels of students were planned, developed, and assessed in those classes and then
taught in the Dante classrooms. The subject matter was developed in collaboration with
the Italian English teachers who suggested specific language emphasis (such as working
with present tense or irregular verbs) and content emphasis (such as American customs,
US geography, etc.). Since a number of our students had laptops, they often brought their
computers to the school and showed PowerPoint presentations on their subjects and
downloaded illustrative clips and/or music for English songs.

In the afternoons, our students would attend classes at the Santa Chiara Study
Center, including a course on Italian Art and Culture taught by Professor Barucchieri,
voluntary Conversational Italian classes, ESL, multicultural education, and multicultural
English language arts. The English language arts coursework included, among other
pieces of European-based children’s and adolescent literature, the study of Carlo
Collodi’s *Pinocchio*, and this beloved Tuscan classic became the basis for the
development of a bilingual readers’ theatre and performance of *Pinocchio* for the entire
community of Castiglion Fiorentino. As with so many of our activities this first semester,
many of our classroom activities at Dante and our related coursework at Santa Chiara
evolved as we became more familiar with the Dante students and found teachable
moments to increase English language learning while building cultural bridges.

The evolution of our ESL lessons and related university coursework expanded to
include various extracurricular activities, some that were planned from the beginning and
some that developed as the need and/or interest arose. One planned program, supported
by the grant we received from the European Union Center, was the development of a pen-
apal club between Level I (sixth grade) students at Dante and fifth and sixth graders at a
private middle school in Brenham, Texas, a town approximately the same size as
Castiglion Fiorentino. We were delighted with the enthusiasm of the Italian children as they crafted detailed English letters to their Texan pen-pals, resplendent with colorful self-portraits and other delightful artwork that we found were more the rule than the exception with these artistic students. During the course of the semester, we succeeded in having two rounds of letters to and from Texas, and we concluded the year with the creation of DVDs of the Italian and Texan children introducing themselves in person to their pen-pals and exchanging (if they chose to do so) home addresses, so they could continue their correspondence over the summer and into the future. Another planned activity involved regular after-school, one-on-one tutoring sessions between our preservice teachers and students at Dante who were preparing to take formal Trinity English Examinations at the end of the school year.

Spontaneous extracurricular activities that evolved into two of our most successful cross-cultural activities were the weekly English classes that we taught to Italian teachers and administrators at Dante and the Pinocchio production discussed above. The adult English classes developed into a rich and enjoyable cultural exchange between educators, and as the Italian teachers learned a little English and we learned a little Italian, we also discovered how alike we were and how much we liked each other—in other words, we became colleagues and friends. The Pinocchio production, resulting from Professor Faralli’s suggestion that it might be nice to have “a little play,” was performed in the beautiful and historic Castiglion Fiorentino theatre and truly became a community project involving children, parents, town officials, local entertainers, and many of the other American students and faculty at Santa Chiara. By the time we took
our final bows at the play and boarded our plane to return to Texas, we felt that we were leaving a part of ourselves behind.

V. Program Perspectives of Our Italian Partners

We found the implications of our first-full semester to be profound. Many of the lessons learned and advice given by the authors of the cited references in this article rang true and were gratifying to read, both in terms of sharing the realization of the urgent need for a broadening global view in today’s university students, particularly preservice teachers, and in facing the fact that a true cultural immersion will not be without its challenges. That said, we found the rewards to be well worth the effort and looked forward to establishing a program that could grow and develop in the years ahead. In fact, the later portion of this paper, which draws conclusions and establishes firm footing for the future, could not have been accomplished without a careful analysis of the first full semester’s successes and challenges. Of course, for a partnership to be successful, it must be beneficial to stakeholders on both sides, and we are only one-half of the equation. For this reason, no description of the beginning semester of our program is complete without the crucial and vital observations and perspectives of our Italian counterparts, Dr. Maria Giovanna Fabianelli and Professor Silena Faralli, and the added reinforcement by Castiglion Fiorentino Vice-Mayor for Education, Dr. Edoardo Lucci.

Excerpts from Perspectives of Dante Principal, Dr. Maria Giovanna Fabianelli (translated by Silena Faralli)

The experience enabled the two partner institutions to interact in a formative cultural exchange. The American students proposed various teaching units which totally involved all the middle school students, who were strongly motivated to use effective
communicative strategies. Therefore, Scuola Media students became aware of the importance of learning a foreign language to get in touch with people who use a different linguistic code. Moreover the contact of two different cultures and lifestyles not only enriched the students’ cultural background, but also the Istituto Comprensivo faculty who, after the project, expressed the unanimous wish to be involved in similar programs in the years ahead.

The experience required quite a long time for research and lesson planning, but the activities which were proposed created a positive atmosphere in class and, keeping attention levels high, fostered varied learning styles. The numerous activities were also carried out by the TAMU professors and the school English teachers in perfect synergy. The *Pinocchio* theatre production constituted a strong catalytic factor which allowed students to become masters of their learning, in a lively environment. On the whole the TAMU-Dante cultural exchange stimulated creativity and facilitated educational action through scrupulous graded planning of the activities. Besides, constant supervision by TAMU professors allowed regular feedback, analysis and adjustment of the process which was being put into practice. The best we can wish for is that cooperation between TAMU and Istituto Comprensivo “Dante Alighieri” will continue in the future and that the cross-cultural exchange program will become a privileged means in the teaching-learning process of a foreign language, fostering the dialogue between different cultures and people.
Excerpts from Perspective of English Language Coordinator and Professor Silena Faralli

When my principal, Dr Maria Giovanna Fabianelli, and I were welcomed at College Station for a planning workshop sponsored by the E.U.C.E., late in October 2007, we soon found out that large schools in the metropolitan Houston area or small town schools such as “Dante Alighieri” Comprehensive, all have similar problems to solve and challenges to meet - intercultural issues due to immigration, second language teaching, integration of multiple perspectives, and professional competence in teaching in an international environment. Therefore our school, whose seat is at a walking distance from Santa Chiara Study Center, could become a suitable a place where student teachers, supported by their professors, would start an innovative program and action research activities which required not only motivation, enthusiasm, and devotion to the project but also adaptability to a different culture and a certain spirit of sacrifice.

During their time in Castiglion Fiorentino, the student teachers, who demonstrated to be not only professional but also hard working, were able to design very well structured lessons, implementing them with suitable teaching aids that they regularly constructed and using multimedia materials.

They also showed skills in managing class life, creating a positive learning environment, where all school children, including the weaker ones, were totally involved in numerous activities. Moreover, bringing a characteristic Texan flavor to school life, the beautiful young mother tongue teachers were able to raise enthusiasm in the middle school students.
Besides class work, extracurricular projects were also carried out in the afternoon. The “Pinocchio Play,” based on a typical Tuscan story, was particularly important not only for offering middle school students the chance of taking part in fun educational activities, but also because the bilingual script intermingled both Italian and American cultural aspects (Walt Disney songs, Italian music, etc.), which made socialization and integration easier, involving not only students but also students’ parents and the population of Castiglion Fiorentino.

The preservice teachers also spent long afternoons to help me and my colleagues prepare 60 second and third year students who had to take a graded exam in spoken English with Trinity College of London, a qualified British Examination Board. The very positive results of the exam taken by the students in May, demonstrated that conversation and oral practice with mother tongue speakers had been a powerful procedure for reinforcing communication skills.

First year students were also involved in a Pen Pal Club with fifth and sixth graders of a private middle school in Brenham, Texas. The Italian students were successfully encouraged to use their English for real communicative purposes exchanging information and sharing feelings with their age group American correspondents. The result of the experience showed that friendship relations between people from different cultures are a powerful incentive to develop mutual understanding and consolidate linguistic competence.

My role as one of the coordinators was very rewarding in that I had to communicate (and often translate and interpret from one language to the other) to TAMU professors and their students, the school principal Dr. Maria Giovanna Fabianelli,
the Director of Santa Chiara Study Center, Professor Paolo Barrucchieri, his Assistant Director, Mrs. Sharon Jones, the Vice Mayor, Dr. Edoardo Lucci, and my colleagues whose precious cooperation was essential to the fulfillment of the project.

Living a semester full of activities, social life, field trips and participation in local events was also a very rewarding experience which contributed to enriching my professional and human background, and at the same time, having so many people working for one big project was also a strong message to Italian middle school students who felt “immersed” in the American culture and exposed to real English speech.

**Excerpts from Letter from Castiglion Fiorentino Vice Mayor, Dr. Edoardo Lucci to Dr. Fabianelli (translated by Professor Faralli)**

The experience we had in 2008, together with the Principal of Dante Alighieri Comprehensive school, Dr. Maria Giovanna Fabianelli and Texas A&M. University professors and their students, represented a meaningful moment for those who care for the younger generations’ future.

The chance to learn a second language, especially English, is a unique opportunity for our students which is going to be decisive when they start approaching the world of work. The presence of Texas A & M students in our community, due to an agreement with Dante Alighieri Comprehensive School, made this difficult but exhilarating project possible. Dr. Silena Faralli’s devotion to the program also represented another fundamental link for a perfect integration between American student teachers and Italian middle school learners.

The Local Administration and the Town Council for Public Education supported some activities caring for the necessary logistics which they needed. It was possibly a
small contribution, compared to the hard class work, but it is important to know that we are present and fully share your common project.

VI. Summer 2009 and Spring 2010 Program Descriptions

As expressed so eloquently by our Italian counterparts, the first full-semester of the TLAC-Santa Chiara-Dante Partnership was life-changing for us and for our students, and we came away with the passionate conviction that we had a unique and valuable program that we needed to nurture in the years ahead. However, our first semester was not without its growing pains, and we tried to learn lessons and make plans for the ongoing partnership that would address the parts of the program that needed addressing. Clearly, despite our attempts to prepare in advance for the semester, we simply did not fully know what to expect when we first arrived at the doors of Dante Scuola Media, and we had to be flexible and adaptive, something that does not always come naturally to many of today’s university students who are used to having detailed course syllabi and schedules and don’t particularly like surprises. We also realized that we were trying to do it all, expecting our students to be well-prepared teachers at Dante, responsible university students in the afternoons at Santa Chiara, and fun-loving undergraduates “experiencing” Italy with their study abroad counterparts in the larger Santa Chiara program (who did not have to be up at 8:00 “looking and acting like teachers”).

Ironically, as we tried to reduce the pressure on our students by staggering their hours at Dante and allowing days off to go on field trips with the larger Santa Chiara group, we somewhat diluted the value of the cultural immersion for them and enriched it for ourselves. We, on the other hand, because of our commitment to supervise every
class that any of our students were in and because of our need to cover class days on our
own when our students were away on field trips and other activities, were at the school
every day for most of the school day and many after-school afternoons for Trinity
tutoring sessions and English classes for the Dante teachers—and we loved it!

Based on our realization that frequent and extended immersion was necessary
for the most meaningful cultural exchange and that our students still needed to have time
for travel and fun with their peers at the Santa Chiara Study Center, we redesigned the
full-semester program for the spring semester of 2010, incorporating extensive pre-
departure preparatory work on campus in Texas in order to allow for total dedication to
cultural immersion through fieldwork in the Italian school after our arrival in Italy.

During the Summer of 2009, we piloted our new structure in a five week summer
program that involved 17 of our university preservice teachers teaching English lessons at
Dante Scuola Media during the last two weeks of school, followed by a three-week
summer enrichment camp for interested Italian students that included continuation of the
Pen-Pal Club and the development of a bilingual readers’ theatre production using High
School Musical as the focus (since during our 2008 program we had learned of the Italian
students’ fascination with the musical and wanted to do something fun for the summer
camp). By doing essentially all of our planning on campus before our departure,
complete with our students actually presenting their individual lessons, we were able to
immerse ourselves in the field experiences with the Italian students and limit our
scholarly coursework to regular written reflections on what was actually happening with
the partnership. Excerpts from our students’ journals can show the success of the
program better than we can:
• “Every place you go has a treasure to find.”

• “This experience makes me realize the importance of making English Language Learners comfortable in our classrooms.”

• “This has been beyond AMAZING! I will be a different teacher now. You have changed my life by creating this program!”

• “After being an ILL (Italian Language Learner) for five weeks, I can fully sympathize with my students. It is hard to learn a language!”

• “Now I can see why modeling is so important in the classroom. If children see the action done, they are more likely to understand, especially if they are English Language Learners.”

• “This experience is absolutely worth it because I feel like I have officially learned what it takes to not only teach ELLs, but to understand what it feels like to be the actual learner.”

• “I learned the most valuable lesson because I came to realize how it feels to not know a language, as well as becoming aware of how to treat and be patient and understanding with my future ELLs.”

• “I came here with the mentality that I was going to drastically change and enhance these children’s lives, but really they have done that to mine.”

• “The Italian children were learning from me as I was learning from them.”

• “This trip has shown me how ELLs and EFL students are still typical, everyday children. Often, I believe we try to categorize our students, which sometimes can lead to their failure. I now feel better prepared on how to incorporate instruction for my ELLs into my everyday classroom
activities. I know that I need to speak clearly, speak slowly, and use hand
gestures and lots of visual aids.”

• “…an experience I will never forget; it will be carried in my heart on a
daily basis and will forever influence my teaching!”

Our 2010 spring semester program, because more coursework was required than
in the summer pilot program, required us to accelerate completion of contact hours for
courses that had to be completed before our departure, while also conducting extensive
preparatory English as a Second/Foreign Language (ESL/EFL) coursework developing
and practicing lessons that were to be taught in the Italian classrooms. This was
accomplished by online coursework, coupled with all-day workshops on campus in Texas
during the months of January, February and part of March (eliminating the need for our
students to pay for on-campus housing and thus reducing costs). Then, beginning in mid-
March and continuing until mid-May, we traveled to Italy, where all of our students spent
the entire school day, Monday through Thursday, at Dante Scuola Media. In effect, they
put their theoretical preparatory coursework to practical use when they got to Italy; at
Dante, they taught lessons they had already prepared, assisted with lessons their peers
had prepared, observed Italian classes in other subjects (where they learned what it felt
like to be a language learner in math, physical education, art, etc. classes), tutored after-
school sessions with Italian students preparing to take their Trinity English Examinations,
and organized rehearsals for the highly successful spring 2010 bilingual readers’ theatre
and musical production of *Tom Sawyer* (this production, as our earlier ones have been,
was presented to the community in the historic and beautiful town theatre and included
skits, songs, dances, and a readers’ theatre with our preservice teachers speaking Italian
and the Italian children speaking English). Their coursework in Italy was limited to their extensive fieldwork at Dante, with the exception of written journal reflections reporting on their experiences in the Italian classrooms and the implications of these experiences on their teaching philosophies and practices for the future. Our students were still able to take group trips to Rome, Florence, Arezzo, and Cortona at the beginning and end of their program; they had most evenings free, and they had most Fridays, Saturdays, and Sundays for their individual travel plans. However, Monday through Thursday, they were, first and foremost, “teachers” at Dante. We were gratified to see this restructuring result in what we believe was the best of both worlds for our preservice teachers, and our Italian counterparts were pleased to see the concentrated immersion at Dante result in the same or more actual time with the Italian students. We hope a selection of comments from our 2010 student journals conveys the overwhelming satisfaction with our new structure:

- Before coming on this trip, I can honestly admit that the thought of teaching an Italian middle school class terrified me…I am so much more confident in my teaching methods and techniques after my time at Dante; learning teaching methods and adaptations in the lessons being taught are such valuable skills that I would never have been able to experience if I wasn’t part of this unique program. The time spent in the classroom and many hours with the students in Tom Sawyer play practice have fueled my excitement and motivation to work with my own students in the future.
• I will never forget my students at Dante, the precious relationships built, and in the long run, the students were the ones teaching me valuable lessons.

• I will be an ambassador for this program because it changed my perspective, life style, and heart forever.

• I have gained so much confidence in the classroom and feel so comfortable teaching lessons now…I can only hope they’ve learned half of what I’ve learned from them.

• I could not have asked for a better introduction into teaching…This teaching experience was also my first ELL teaching opportunity…I would not be able to tell you how attached I would be to the students at the beginning of the trip; after all of the hours of teaching, observing, tutoring, and Tom Sawyer, it makes sense. Being able to plan and teach lessons has been really great for me; I have learned so much about classroom management and different teaching styles as well.

• I have learned so much about myself, teaching, students, other cultures, and relationships. Looking back, I am so proud of myself and everyone else on this trip and how far we have all come…I have truly learned to appreciate our culture and now know how important it is to be experienced in different cultures…my time in Italy has been the best time of my life and the best experience a future teacher could ever have!

• Living in Italia for seven weeks has completely changed my heart. I have a newfound respect for people from other countries. I can still remember
our arrival in Rome and how terrifying it was for me to try and speak to Italians…I feel like now my experience would be so different because I am relaxed and feel comfortable around the people. My outlook on people who speak different languages has changed so much. Before this trip I had no desire to learn another language, but now I am eager to return and spend time conversing in a second language…I now know that I can and will be passionate towards children in American schools that come from other countries. Being the minority for a short period of time myself, I can sympathize with and understand my students.

- My time in the classroom, at Trinity tutoring, and at Tom Sawyer revealed to me how important it is for a teacher to possess confidence, joy, patience, perseverance, and as cheesy as it sounds, love. There were times that I said or did something incorrectly, but it was imperative for me to press on. Truthfully, I believe the students taught me more than I taught them.

- I have learned so many things about becoming a better teacher. I learned to articulate and project your voice and to always use hand motions or visuals. Each student has a different need, and it’s important to catch onto these needs for the beginning so that, as time progresses, you know how to let those children gain their fullest potential of learning.

- I am so thankful that we had the opportunity to sit in and observe some of the Italian classes. Although I was unable to understand the majority of the lessons, I learned so much about being an ESL student in a class.
Because I now understand the difficulty of what it is like to be in those students’ position, I will be able to better identify with any of my future ESL students.

- Through the last two months in Italy, I’ve gained not only 17 best friends, but one more including a girl with a new appreciation for history, art, beauty, and life itself, and thankfully, that girl is me…First and foremost, the experiences I’ve had at Dante have taught me not only patience but work ethic as well.

- The things I have seen, though many and beautiful, do not compare to what I have felt and learned.

Conclusions, Pre and Post Research Questions and Responses, and Plans for the Future

Thus, with the support of our university and the Santa Chiara Study Center in Castiglion Fiorentino, we have completed our second full semester of this vibrant, dynamic partnership between our university preschool teachers and the students, teachers, parents, and administrators of Dante Scuola Media. Based on our students’ comments, our own observations, and input from our Dante counterparts, we feel that the program was immensely successful and incredibly important. Truly, when looking back at the earlier mentioned goals for educating preservice teachers from a global perspective (Willard-Holt, 2001), we believe we can confidently look at our participating students and answer each quality with a resounding “yes.” Further, we believe that the changes we have made in the program since 2007 have improved it without depriving it of its heart, depth, and vision.
On a more quantifiable basis, last spring’s Trinity Exam results indicated that, out of 62 examinations, only one student didn’t pass, the majority with As and Bs. Although our Italian counterpart, Silena Faralli, confirms that it is not unusual to have this sort of passing rate from those students who choose to work afterschool to take the proficiency exam, she notes that the number of students who take the Trinity classes has increased and, she believes, will continue to increase whenever our students are involved. She goes on to state the impact of our preservice teachers’ involvement in more intangible but equally significant ways:

…because of the one-to-one interpersonal relationship they [Dante students] had with their Texas tutors, who were incredibly patient and understanding, I believe that our middle school students will never forget how important it is to be able to interact and communicate with people who speak a different language and belong to a different culture—it is a way to discover themselves and become better people, besides the fact that they are offered the chance to improve their English…but my overall estimate is that the main difference is the change of their perspective, in the different approach they have to the language and culture, in other words, in the way they see “English”—not just an “empty” school subject, but a world to discover, a way to learn interesting things, make friends and have fun…
Cross-Cultural Partnership

We quantified our preservice teachers’ perceptions by using the following instructions and research questions on a pre and post experience basis:

Texas institutions of higher education face many challenges in preparing pre-service teachers to teach linguistically and culturally-diverse students. An opportunity to live and teach internationally is one possible response to this dilemma. Please respond to the following questions:

- Do you consider it important to be interculturally experienced? Why?
- What skills do you consider as important to possess when teaching in a multicultural environment?
- How can you improve these competencies? (include examples of your own experience if applicable)
- Do you think it is important to understand the cultures of people from other countries that are living in your home country?
- What role do you think language plays in intercultural competence?
- Do you feel competent to teach children who are not fluent in English?

In the following segment of our paper, we will address the results of each of our research questions by providing a summary statement of the overall responses from our students and then follow with an example of a pre and post quote that exemplified our findings:

- **Do you consider it important to be interculturally experienced?**
  
  Why?

  All but one of our students indicated their belief that it was important to be interculturally experienced in both their pre and post answers; most
Cross-Cultural Partnership

addressed the fact that, as teachers in ever-increasing multicultural classrooms, they needed to gain experience in working with children from other cultures. The main difference between the pre and post responses had to do with the somewhat theoretical, third person approach in the pre-departure responses to the emphatic and personal answers in the post-experience responses. The following are the pre and post responses from the single student who did not initially consider experience essential:

**Pre-departure response:**

I think it is important to be interculturally aware, but not necessarily experienced. Not everyone has the opportunity to become experienced in different cultures. It is definitely a bonus to be able to physically experience the cultures, but not necessarily important. Researching and learning about the other cultures is important because it helps us to understand the world around us. Experiencing the cultures is taking it a step up and adding to the important part, learning and understanding the different cultures.

**Post-experience response:**

I consider it to be extremely important to be interculturally experienced. After this study abroad experience, I have realized how much of an impact experiencing another culture has had on my life. I have learned so much about my culture from the culture of the Italians. It’s strange to think you can
learn so much about your culture from another culture. This experience has broadened my view of the world and opened my eyes to new things.

- **What skills do you consider as important to possess when teaching in a multicultural environment?**

For all of our students, the repeated words in both the pre and post surveys were *patience and understanding*. The main difference in word choice and, especially, emphasis in the post-experience responses was the need for flexibility and for the teacher to adapt her teaching methods to the particular needs of different children--although patience, understanding, a sense of humor, and other qualities were still noted. The following pre and post responses from one of our students exemplify the importance placed on the teacher’s ability to adapt:

**Pre-departure response:**

First and foremost, I think that patience is required for a teacher to work with students of different cultures. As teachers in the US, we are used to teaching our own specific way and to fluent English speaking students. Teaching in a multicultural environment will require both patience and much adaptation in order for the students to succeed. I also think we need to be very understanding and put ourselves in the student’s shoes. I think it is important for teachers to get to know all of their students, especially those of different
cultures, in order to best educate them.

**Post-experience response:**

Adaptation would definitely be on the top of my list. I have learned that different cultures run in different ways, and we have to be quick to adapt to the best learning style for those specific students. I have also learned that patience and flexibility are necessary skills to possess when teaching in a multicultural environment. Because we were not teaching native English speakers, there was a language barrier that could often cause frustration. But if I constantly reminded myself to have patience and put myself in the student’s shoes, I would always communicate more effectively.

- **How can you improve these competencies? (include examples of your own experience if applicable)**

Most of our students did not have experience in working with students in a multicultural environment, and those that did seemed to have only observed diverse classes or worked as volunteers in various settings. Although in the pre-departure comments, they expressed, in theory, the importance of having empathy and the need to gain experience, the post-experience responses were more personal and specific, with an emphasis on experience, as displayed in this example:

**Pre-departure Response:**

I have actually never had the privilege of working in a
multicultural classroom, although I have observed one before, but I would imagine that these skills take much practice and experience to improve them. I think that following the example of a teacher who has worked in a multicultural classroom would be a wonderful experience and open you up to other teaching techniques.

Post-experience Response:

Experience, experience, experience! I think that by getting as much time as possible in the classroom, the skills to work in a multicultural classroom will improve. I had very little experience in a multicultural classroom before coming on this trip, so I felt pretty clueless before going into the classroom. But after writing lesson plans for the students and being in the classroom, I have gained so much knowledge and have improved many of those skills. Also, after having the opportunity to observe many Italian classes, I have been able to see the classroom from an ESL (or EFL) student’s point of view. As a future educator, it is SO important to be able to relate to each of our students. By experiencing a classroom where a foreign language is being spoken, we will be able to better understand how some of our students will feel.

- Do you think it is important to understand the cultures of people from other countries that are living in your home country?
Most of our pre-service teachers recognized the importance of understanding the cultures of immigrants living in the U.S. but defined their answers by recognizing the importance of knowing the cultures of their future students rather than the cultures of all immigrants. In the pre-departure responses, three pre-service teachers questioned or dismissed the importance of understanding the cultures of immigrants and expressed that, in their views, the immigrants should embrace the culture of their adopted home, “Part of me at times wishes these people from other countries would focus on learning our culture and language.” The post experience responses demonstrated a personal appreciation of the Italians who acknowledged and valued a culture different from their own. All post experience responses of the pre-service teachers expressed a desire to understand the cultures of people living in the United States as demonstrated in the following example.

**Pre-departure Response:**

I do think it is important to understand, but not to the extent that I’m sure I will when I am finally teaching, especially if it’s in a Texas classroom. I think the better we understand how all our students live and where they are coming from, the better we will be able to adjust our teaching styles to meet their individual needs.

**Post-experience Response:**

I believe that it is one of the most important things to understand.
While being in Italy, it has been so nice to meet people who are attempting to speak English back to me, or are patient with my Italian, and it is so pleasant to hear when people here speak about Texas, or what they know about the U.S. It makes me so proud when the students talk about different areas they know about America, and I like to talk to them as well about Europe! I think it is so comforting to have them understand where I come from, and I definitely want to make sure that I understand different cultures of people visiting or living in the US so that they feel the same comfort that I do.

- **What role do you think language plays in intercultural competence?**

Prior to the Italian experience, all of the pre-service teachers expressed that, in their opinions, language played the most important role in intercultural competence. Five of the students also shared in their pre-departure responses that gestures, body language, and drawing assisted with communication when people do not share the same language. Following the experience, all but three of the pre-service teachers shared the view that language, while important, was simply one component in intercultural competence as expressed in the following example.

**Pre-departure Response:**

I think language plays a crucial part in intercultural competence. Whether spoken or written, people have to communicate somehow. Yes people can draw pictures or point to things without using
language, but nothing compares to the direct relationship when language is the form of communication.

**Post-experience Response:**

Now that my teaching and study abroad experiences is coming to an end, I think that language plays a much smaller role in intercultural competence that I originally thought before I left Texas. While I feel like I picked up A LOT of Italian vocabulary and I could definitely continue on to become fluent one day, learning Italian wasn’t completely necessary. Hand gestures, pictures, body language all played much larger roles than I anticipated. We are all humans working toward the same main goals in life, and we all have the same basic everyday needs at around the same times each day, so communicating effectively was much easier than I expected it to be.

- **Do you feel competent to teach children who are not fluent in English?**

Prior to the Italian experience, five pre-service teachers felt component to teach English language learners while most of the students felt overwhelmed and lacking in competence to teach children who are learning English as a foreign language. Following the intense teaching experience in which the pre-service teachers taught English four days a week to Italian middle grade students, all of the future teachers felt competent and skilled in teaching English and recognized the value of this competence for their future teaching positions. The following is one
example but expresses the views of most of the pre-service teachers who participated in the Italian study abroad.

**Pre-departure Response:**

Not yet, but I am confident that I will one day be good at it! The more I learn about teaching ESL, the more I realize that it is exactly what I want to do with my life. I’m hoping that studying abroad will give me the experience I need to feel competent, or at least closer to competency.

**Post-experience Response:**

I feel extremely competent to teach children who are not fluent in English after this study abroad experience. I was fearful before I came about the language barrier, and the students just staring at me. This was not the case, and even if it was, I adapted to it and it would end up working out. The Italian children are so accepting of us and are eager to learn. I think these traits of the Italian students helped to make me feel more comfortable with teaching students who are not fluent in English. I have loved teaching the Italians, and it is a good experience for me since I will be ESL certified when I graduate.
Cross-Cultural Partnership

With the crucial support of our university in tough economic times, our hope is to continue our program on an every-other-spring basis so that all of our students and all of the Dante students will have the opportunity to participate in the program during their university and middle school years, respectively. Clearly, our program is becoming a well-loved tradition with our preservice teachers, as seldom a day goes by without our current students asking us when we will be going back to Castiglion Fiorentino or our “alumni” students telling us how much the experience has helped them in their student teaching experiences and has impacted their lives. In Castiglion Fiorentino, after four years of working in Dante, we believe the same evidence of a meaningful, significant partnership is true and conclude our discussion of our program and our hopes for the future with more words from our eloquent and passionate counterpart, Silena Faralli:

You and your students have become almost a “tradition” in our school; therefore, when students think of you and your lessons, they think you are a part of their world, not a world across the ocean! And that is quite an important point, especially for teenagers who always have to refer what they student to their experiences, in order to learn.

LEAVING A STUDENT BEHIND: THE CASE STUDY OF SAM AND A SPECIAL EDUCATION TEACHER LEADER WHO FULLY EDUCATES STUDENTS WITH DISABILITIES.

by

Dr. Vaughn L. Bicehouse

vlb31@pitt.edu

33 Abbott Road

Bradford, PA 16701

Submitted as an abstract

Presentation to the Hawaii International Conference on Education

School of Education Instructor
University of Pittsburgh-Bradford

October 17, 2010
Defining the Problem

The dual pressure of providing a general education curriculum that best accommodates the needs of special education students while also meeting the ever-increasing demands of state testing has placed special educators in a quandary. There are ethical and legal challenges that come with attempting to both accommodate disabilities while pushing students to perform in high-stakes testing environments. The result is extraordinary pressure on teachers and students alike. As a special education teacher, education professor, special education supervisor, and parent of a child with special needs, I will present a session that addresses the need for effective special education teachers in the era of high stakes testing and data driven decision making. Both this abstract and the session draws attention to the need for effective teachers who are leaders in the field of special education as well as also school systems that are committed to the collaboration between teachers, parents, and school personnel so that no child with disabilities gets left behind.

The cornerstone of special education is to provide specialized instruction to meet the unique needs of each child with a disability. Special educators are expected to utilize individualized referenced decision-making and continually plan and adjust curriculum and strategies to educate and motivate their students. In the age of high stakes testing where intensive interventions are expected to help all students in general education classrooms, one has
to speculate about the ability of general education teachers and school systems to evaluate student progress using procedures that are fair, meaningful, and address the varied needs of today’s diverse student populations. Indeed, are the students that need the help getting the necessary help that they need, and is there the potential for students with disabilities to be left behind? The answer to this question will determine whether or not general and special educators are collaborating and sharing responsibility for successfully educating these students.

Special education teachers are on the front lines of implementing a standards-driven system for their students while maintaining the core practices of individualization, intensive instruction, and the teaching of explicit skills for students with disabilities. The session will also share the findings of a case study that shows that without due diligence it is possible for a student with a disability to fall through the cracks of the public school system in the Commonwealth of Pennsylvania.

Structure of Session

A Brief History of the Evolution of Special Education in Public Schools

IDEA, Accountability Requirements

Achievement Testing & Students with Disabilities

The Case of Leaving a Student Behind—with Questions to Ponder Including:

1. How did Sam progress from 2nd to 9th grade without special education support?
2. What happened to Sam’s early records?
3. What happened to the regularly scheduled re-evaluations that should have taken place for Sam in kindergarten, first grade, or second grade?
4. Why didn’t Sam’s mother press for an IEP in grades 2-8?

5. Where was the collaboration between the family, general education teachers, special education teachers, administrators, guidance counselors, paraprofessionals, and related service personnel to effectively meet Sam’s needs?

6. What happened to Sam?

*Future Implications from this study*

Laying the foundation

As special education law approaches its thirty-fifth anniversary in the United States, the Individual’s with Disabilities Education Act (IDEA) continues to guarantee students with disabilities the right to a free appropriate public education to take place in what the Act defines as the “least restrictive environment” (Ward, Montague, & Linton, 2003). Today’s educational system is working to provide the maximum level of inclusion appropriate for students with disabilities, while also managing the pressure created by an educational climate that has placed increasing emphasis on high stakes testing and evidence-based practice as mandated by No Child Left Behind. Striking the balance between “least restrictive environment” (LRE) and strategizing to attain the highest possible scores on standardized tests has left special educators in a quandary, as they feel torn between the spirit of IDEA and the expectations imposed by NCLB (Hardman & Dawson, 2008).

The mantra of “leave no child behind” is a pledge rather than a reality in today’s public schools. Plainly, research is needed to directly support or refute the supposition within national educational policy that a standards-based education system will improve results for students with
disabilities. Nevertheless, the current system requires both effective teachers and supportive school systems that collaborate to deliver educational services that indeed leave no child behind.
REFERENCES

Abstract

This presentation examines native-English speaking instructors’ narrative accounts of both professional identity and tertiary classrooms in Japan. What do so-called native teachers say about teaching in the Japanese tertiary system and how do they rationalize their career trajectories? What do they perceive to be the rewards and challenges of working in Japanese universities and how do they characterize both the students they teach and the institutions they work at? Finally, do native teachers adapt their pedagogy in response to perceptions of socio-cultural differences between Japanese classrooms and classrooms in their countries of origin?

Kiernan (2010) has recently argued that although narrative as a methodological approach has extensively been employed in studies of language learners, it has, to date, remained surprisingly underutilized in research on teachers. This paper draws from Kiernan’s pioneering work in its use of qualitative semi-structured interviews with native English-speaking instructors working in Japanese universities. It frames these narratives within wider discourses about the English language, ‘foreignness’, and ‘native-speakers’, because, the meanings associated with language and language teaching are cultural constructs that, as Seargeant (2009, p. 2) has argued, are specific to the society in which that language is operational rather to the language itself.

Preparation for Effective English-Medium Subject Matter Instruction within Japanese-Curriculum Institutions: Lessons from Bilingual Education

Abstract

Pressure is increasing more than ever on the Japanese university system to provide a greater supply of graduates who are capable of functioning proficiently in an English-speaking professional and/or academic environment. In response to these pressures brought about by the globalization of higher education, many Japanese institutions have increased the number of academic subject matter courses offered using English as the language of instruction. The government has recently attempted to encourage these efforts by providing funding over a five year period for more than two-dozen universities to begin offering full degree programs conducted completely in English. As the specific curriculum design of these programs has been left to the discretion of the funded institutions, this will likely result in a variety of designs, of which some may prove to be effective and some perhaps not. Traditionally, Japanese institutions have tended to simply create exclusive programs for foreign students, and perhaps some returnee Japanese students. This approach provides virtually no support for Japanese students of lesser English proficiency who might have the desire to participate, and therefore effectively provides for very little interaction between the program's students and the institution's 'mainstream' Japanese students studying in Japanese. This lack of interaction benefits neither group. Institutions that have the desire to create a more inclusive program will have to have mechanisms in place to support students (Japanese and non-Japanese alike) whose academic English proficiency is not fully developed enough to benefit from English-medium instruction. The purpose of this paper is to look to the very large body of research in bilingual education in English speaking countries and identify pedagogical approaches that can be applied to the English-medium subject matter taught in a foreign language environment. The paper will review several thoroughly researched concepts in the field of English as a second language (such as scaffolding, sheltering, and comprehensible input) that can contribute to making English-medium subject matter instruction in Japanese universities more effective, more efficient, and perhaps most importantly, more inclusive for Japanese students.

Paul J. Kroutter, Jr., Oklahoma State University
Martha Ringgold, Tulsa Technology Center
Floyd B. Ausburn, Oklahoma State University

Abstract

With a national shortage of qualified nurses, successful career training programs for this occupation are critical to the nation’s well-being. High levels of conceptual, procedural, and language complexity of many nursing skills make mastery difficult, especially for non-native speakers of English. The classic instructional design model Dale’s Cone of Experience suggests that learning activities that are “concrete” or closest to actual real-world experience are most successful for many learners, particularly when information is complex and/or new to them. Simulation technology is intended to replicate real-world experience with a high degree of fidelity, thus removing learning barriers caused by more abstract instructional methods. This study is an application of Dale’s theory of instructional “concreteness.” Using a time-series experiment research design, the study describes the positive effects of simulation technology in the form of a “smart manikin” on the learning performance and confidence of adult native and non-native speakers of American English in an occupational LPN training program in a large urban technology center.

Introduction and Conceptualization

Recent literature has documented a shortage of nurses throughout the United States that is having negative effects on hospital quality, patient care, and American society (Aiken, 2002; Aiken, Clarke, Sloane, Sochalski, & Silber, 2002; DHHS, 2000; Sammons, 2009). This shortage is complicated by (a) recent estimates that 77 million Baby Boomers plan to retire in the next 10 to 15 years, placing a heavy strain on an American health care system already struggling under a severe shortage of trained nurses, and (b) the fact that the current nursing workforce is aging and new nurses are not replacing those who are retiring or leaving the profession (Sammons, 2009).

The significant shortage of trained nurses and its negative effects on the health and well-being of the nation’s aging population draws attention to the importance of programs intended to prepare professional nursing personnel for the health care industry. Given the current and predicted shortages of qualified nurses, training programs cannot afford to lose students unnecessarily and must consider all available instructional methods and technologies to maximize numbers of successful graduates. One group of technologies that has a record of success in health occupations training and is currently expanding in available options and applications is simulation.

Simulation technologies are generally considered to be imitations of a process, environment, or item in which certain critical elements, aspects, or characteristics of reality are
represented or replicated. Hunt and Waller (1999) explained that a true simulation, as opposed to a mere representation, is defined by preservation of important visual and operational/functional aspects of the reality being modeled. They asserted that when this preservation of key aspects of reality is maintained in a simulation, that simulation has “fidelity,” or a high degree of replication of the real world.

Simulations have historically been used successfully in a wide variety of applications. Beginning with the introduction of the famous Link Flight Trainer in 1929 and extending to currently-emerging high-tech hands-on “smart” apparatuses and computer-based virtual reality simulations, the goal of simulation technology is to facilitate development of specific skills or to improve performance. Simulation has been particularly important in environments that are complex, difficult, or dangerous in the physical world. Most simulators in the current occupational and professional training market are in the category of interactive or “human in the loop,” defined as physical or computer simulators that include human operators (Bronaugh, n.d.; Sollenberger, Willems, Della Rocco, Koros, & Truitt, 2005).

High-tech interactive “human-in-the-loop” simulators have already had considerable success in professional training in the medical field. One example reported in the research is the highly successful computer-based virtual reality (VR) trainer MIST-VR (Minimally Invasive Surgical Training) for improving laparoscopic surgical skills (Ahlberg, Enochsson, Gallagher, Hedman, Hogman, & McClusky, 2007; Harb, Adams, Dominguez, Smith, & Randall, 2005; McClusky, Gallagher, Ritter, Lederman, Van Sickle, Baghai, & Smith, 2004; Seymour, Gallagher, Rorr, O’Brien, Bansal, & Anderson, 2002). Another successful VR training simulator is Emory University School of Medicine’s Vascular Interventional System Trainer (VIST) that has demonstrated significant improvements in carotid angiography skills (Patel, Gallagher, Nicholson, & Cates, 2005).

In addition to computer-generated virtual reality simulations, medical training is also currently using many “smart haptic devices.” These devices use touch as well as visual feedback to develop and improve such skills as laparoscopy; injection and venipuncture; suturing; respiration and airway procedures; fracture diagnosis and treatment; and arthroscopy (c.f. surgical simulators at www.simulation.com).

One of the newest hands-on “human-in-the-loop” simulation trends in medical training is the “simulated patient” approach. At the Shelden Clinical Simulation Center of the University of Missouri, this training takes the form of the Standardized/Simulated Patient (SP), in which trainee medical workers interact with a real person carefully coached to simulate an actual patient so accurately that the simulation cannot be detected by a skilled healthcare provider (University of Missouri School of Medicine, 2010). While this real-life simulation has been successful, it is extremely time-intensive to create. The more popular technology-based alternative is currently the “smart manikin,” a computer-augmented “virtual patient” that simulates a human patient with various characteristics, injuries, and ailments. One of the first virtual human trainers was designed at Emory University Hospital to train physicians in carotid stenting procedures. This simulator provided early evidence of the efficacy of virtual patient technology and led its developers to conclude this type of simulator training could reduce cardiology surgical errors and resulting patient deaths (Emory University Hospital Heart Center,
Despite its high costs, smart manikin technology is now beginning to appear in nursing curricula in career and technical education (CTE) programs. However, empirical evaluations of this technology are not yet found in CTE research literature. At Tulsa Technology Center (TTC) in Tulsa, Oklahoma, state-of-the-art new teaching facilities include advanced laboratories and smart manikin simulators. Adult students in the TTC Licensed Practical Nursing (LPN) program that has this new technology include both native English speakers and a significant number of English as a Second Language (ESL) students. The LPN faculty and the school’s administration have collected for these students both demographic and performance data obtained in the naturalistic classroom setting. To apply these data to an assessment of the effects of smart manikin simulators on their ESL and non-ESL students, the Tulsa Technology Center teaching faculty partnered with researchers of the Occupational Education Virtual Reality (VR) Research Team at Oklahoma State University (OSU). The results are presented in this paper. The study is conceptualized as an empirical trial of a high-fidelity simulator as defined above by Hunt and Waller (1999) in a naturalistic instructional setting. Specifically, the paper presents a time-series experimental study of the efficacy of smart manikin technology as a realistic hands-on instructional strategy in a CTE practical nursing course and its comparative effects on the performance of ESL and non-ESL students.

Theoretical Framework

The theoretical underpinning for this study is provided by the iconic instructional design theory Dale’s Cone of Experience. Based in Piagetian psychology, Dale’s Cone posits that more concrete experiences and media are truer representations of reality and can facilitate learning, particularly when the represented reality is complex, unfamiliar to learners, or presents opportunities for confusion when more abstract representations are used (Dale, 1954). According to Dale’s Cone, direct real-world experience is the most concrete learning medium, followed by simulated reality, while the most abstract media are spoken and printed verbal communications. Smart manikin simulators represent realistic learning experiences with a high level of concreteness on Dale’s media taxonomy. The hands-on and concrete nature of these virtual patients suggests they may have not only strong appeal to many CTE students, but also the ability to assist students – particularly ESL students – in medical programs where abstract instruction in spoken and printed English could be problematic in learning complex and unfamiliar content. From this theoretical perspective, it was hypothesized that the use of virtual patient simulators would improve learner performance in the LPN program, and that this improvement would be particularly evident in ESL students who might encounter greater difficulty with the more abstract medium of verbal instruction in English.

Purpose and Research Questions

The purpose of this study was (a) to describe, using data collected in the naturalistic setting of classroom instruction, the effects on the performance of adult students in a CTE LPN program of using a virtual patient “smart manikin” simulator, and (b) to compare these effects for ESL and non-ESL students.
The study addressed the following research questions:

1. What effects are observed on learning performance and perceptions when a smart manikin patient simulator is introduced in a CTE LPN course?

2. What pattern of learning performance effects are observed over time before and after introduction of the simulator?

3. Are there differences in the learning performance and perceptions of the simulator between ESL and non-ESL students?

Methodology

Research Design

This study was descriptive and *ex post facto* in design. Quantitative learner test data were collected by Tulsa Technology Center (TTC) faculty as part of their student assessment process in the LPN program. Additional supporting quantitative and qualitative data were collected through a short questionnaire administered to the study participants and an interview with the TTC LPN simulation lab coordinator. Both the learner data collection and the instructional procedures with the “smart” virtual patient simulator were done in the naturalistic context of the LPN program’s normal classroom instruction. Because of the naturalistic context of the data-gathering and experimental instructional process, typical experimental pre/post testing, assignment of subjects to treatment groups, and manipulation of instructional procedures between groups were not possible. Therefore a time-series experimental design was adopted for the study and data analysis. According to Campbell and Stanley (1963), “The essence of the time-series design is the presence of a periodic measurement process on some group … and the introduction of an experimental change into this time series of measurements, the results of which are indicated by a discontinuity in the measurements recorded in the time series” (p. 37). This describes well the procedure used by the TTC faculty in collecting their learning performance data. Multiple sets of performance score data were collected for the LPN students as a single class group both before and after introduction of the manikin simulator, presenting a rationale for treating these data as a time-series experiment.

Subjects

A population of 20 subjects participated in this study. This population comprised one whole class intake within the Tulsa Technology Center’s LPN program. Of the 20 participants, 18 were female and two were male. This gender distribution was consistent with the typical female/male ratio for the LPN program at TTC and is reflective of the highly gendered nature of this occupation. The age range of the participants was from 20 to over 40, with nine aged 20-30, four aged 31-40, and seven over age 40.

Participants were also divided into two groups based on whether they were native speakers of American English. These two groups were designated English as Second Language
(ESL) students and non-ESL students. The non-ESL group consisted of 10 females, while the ESL group consisted of eight females and two males. Of the 10 ESL subjects, six were from African countries, two were from Eastern European countries, one came from East Asia, and one was from the Caribbean.

**Instructional Treatment Intervention**

The 3G SimMan patient simulator manikin was used as the instructional treatment intervention in this study. It provided the study’s LPN students/participants with realistic, practical hands-on learning scenarios to practice various medical procedures.

The 3G “smart” manikin made by Laerdal is a high-tech computer-integrated simulator that realistically replicates a full range of physiological conditions of a human patient. Founded in 1940 in Norway, Laerdal Medical AS today produces a comprehensive line of medical “smart” simulators (Laerdal, 2010a). The 3G system, with a price tag of over $70,000, is one of its latest and most advanced computer-integrated training simulations. A complete description of the 3G manikin, its associated computer equipment, teaching scenarios and materials, and an interactive online demonstration are available at the Laerdal website (Laerdal, 2010b). The 3G manikin and part of its integrated computer system are shown in Figure 1.

![Laerdal 3G Man smart manikin patient simulator and its integrated computer interface.](image)

**Instrumentation and Data Gathering Tools**

The data for this study were gathered from four instruments:

1. The Health Education Systems, Inc. (HESI) standardized Admission Assessment Examination,
2. Content-specific teacher-made tests developed by TTC faculty to assess progress of their LPN students,
3. A teacher-developed questionnaire to determine student perceptions of their experiences with the 3G Man patient simulator, and
4. A qualitative interview with the TTC LPN simulation lab coordinator to document her perceptions of the 3G patient simulator experience.

_HESI Admission Assessment Examination_. The HESI Admission Assessment Examination is a commercially-available standardized test used by the Tulsa Technology Center to assess students for admission into their LPN program. This admission test battery is part of the HESI suite of exams that include tests for entrance, content testing, and exit evaluation in the nursing professions. The HESI exams are standardized and computerized, rapidly increasing in use in schools of nursing, and well respected for their validity and reliability (Morrison, Adamson, Nibert, and Hsia, 2008). The HESI Admission Assessment Examination consists of nine academic exams, as well as a personality profile and learning style assessment. The academic exams were used to assess the entering LPN students’ knowledge in the three general areas of English language, math, and science.

The English battery included four tests: Reading, Grammar, Vocabulary, and English Comprehension. The Science battery included four tests: Biology, Chemistry, Anatomy/Physiology, and Science Comprehension. The Math section was a single test. Individual scores were obtained for each student for each exam and the nine scores were combined to provide a HESI cumulative total score for each student.

In addition to the knowledge assessment tests, the HESI also used concepts related to introversion and extroversion to classify each student’s personality profile as either Calm, Creative, People-Oriented, or Leader. This exam also assessed the preferred learning style of each student as Visual, Auditory, Kinesthetic or Cognitive. It also classified each student’s information processing preference as Analytical or Global.

_Teacher-developed content tests_. Several content-specific course tests were developed by TTC LPN faculty to assess the students’ learning of the information presented in classes. Several content-specific tests were administered before and after the smart manikin treatment intervention to assess student learning at several points prior to and after being exposed to the SimMan 3G patient simulator manikin.

_Teacher-developed student questionnaire_. This short questionnaire was developed by TTC LPN faculty to obtain student feedback regarding their perceptions of their interactions with the SimMan 3G patient simulator.

_Qualitative interview with TTC LPN simulation lab coordinator_. This interview was designed to document the coordinator’s personal perceptions and conclusions regarding her students’ experiences with, and reactions to, the 3G simulator. It was conducted by a member of the OSU VR research team.
Procedures

The collection of student data and the instructional application of the 3G smart patient simulator were done entirely by the Tulsa Technology Center (TTC) LPN program faculty as part of their routine instructional process, and in the regular classroom environment of the LPN program. This phase of the study was completed before the TTC faculty partnered with the VR research team at Oklahoma State University (OSU). Once the TTC faculty entered a research partnership with the OSU team, the OSU researchers obtained written permission to join the study from the Superintendent of the Tulsa Technology Center, the Director of the TTC Health Sciences Center, the instructors involved in the LPN simulation lab, and the OSU Institutional Review Board. Before data analysis was undertaken, student participants received consent information from the LPN lab instructors. All 20 students in this program agreed to have their data included in this study.

The first data collected for the 20 student participants came from the administration of the HESI Admission Assessment Examination, which was used to establish initial baseline performance marks. This test battery of nine scores plus a cumulative score was called HESI 1 scores for this study.

After reviewing the HESI 1 scores, the TTC LPN faculty formulated teaching plans based on the needs of the students as identified by the HESI assessment. The students were also identified as non-ESL or ESL, based on whether or not they were native speakers of American English.

During the next few weeks, the LPN students were administered four teacher-developed tests covering specific units of course content. These were called pre-intervention scores for this study. Based on these scores and personal observations, the TTC teaching staff realized that the ESL students were struggling and had considerably lower learning performance than the non-ESL students. At that time, the instructors re-assessed their available student data. They reviewed the HESI 1 data and observed that all but two of the students’ preferred learning style was identified as kinesthetic or hands-on. They also observed that most of the students (n = 12, or 60%) had been identified as having a global cognitive processing style, while the remaining (n = 8, or 40%) were identified as analytic in their cognitive style.

In an interview with a member of the OSU VR research team, the TTC simulation lab coordinator explained:

… we noticed that…the ESL students were testing out to be kinesthetic learners…and none of them proved to be cognitive learners…so they were not getting the concept that they were reading so…there seemed to be a learning gap. They had to read English and when I visited with them, they would say, ‘Well, you know, we don’t know some of these words’ and then they were trying to figure out in their own language what it was saying, but…they couldn’t bridge the gap to get to understand the actual process…., so there was a learning problem.
Based on their analysis, the TTC instructors altered the way they presented the LPN program. They began to supplement lectures and written materials with more concrete hands-on practice to reinforce information and help students connect with abstract medical terminology and concepts. Specifically, the instructors introduced both the ESL and non-ESL students to the SimMan 3G manikin patient simulator and allowed them to work on the manikin in small groups, with ESL students working with only other ESL students. In the words of the TCC simulation lab coordinator:

…since we determined…[the ESLs] were all kinesthetic learners, we pulled them aside separately and we started using our new high fidelity manikin… and we tied in the concepts that they were having difficulty grasping and we allowed them to see it and experience it through him…. They were only with other ESL students… over a two-week period.

Instructors used the new manikin simulator to help demonstrate concepts and procedures the students were having difficulty grasping. Students were able to see and experience the difficult concepts in a highly realistic and concrete manner through the patient simulator. The manikin provided all the students with a hands-on, safe learning environment to try out various complex procedures without dangerous consequences for errors.

After the implementation of the 3G patient simulator manikin in the instructional process, the TTC LPN instructors collected additional student data in the form of a series of eight more teacher-made unit content tests (called post-intervention scores for this study) and a brief student questionnaire to document the students’ perceptions of their interactions with the simulator. Then, they administered the HESI test battery a second time (called HESI 2 scores in this study), and finally one more teacher-made content test (post-HESI 2 score) to complete the time-series.

After completing all these pre- and post-intervention data collections and instructional processes, the TTC LPN faculty partnered with members of the OSU virtual reality research team to complete the study. All data were given to the OSU team for analysis. Additionally, a member of the OSU team conducted a qualitative interview with the TTC simulation lab coordinator to document her perceptions of the students’ experience with the 3G patient simulator manikin.

Data Analysis

Quantitative data in the form of student test scores and multiple-choice responses on the teacher-made student questionnaire were entered into an Excel spreadsheet and then uploaded into the SPSS statistical program for analysis with descriptive statistics and time-series charting. Qualitative data obtained from the open-ended questions on the student questionnaire and the interview with the TTC simulation lab coordinator were analyzed using content analysis techniques.
Findings

Effects on Learning Performance and Perceptions When 3G Smart Manikin Patient Simulator Was Introduced

In this time-series experimental design, learner performance effects of the 3G simulator were examined based on three pre- and post-intervention data sources: (1) quantitative descriptive test data for students on HESI 1 (pre-intervention), HESI 2 tests (post-intervention), and pre/post-intervention teacher-made content tests, (2) qualitative comments from the interview with the TTC simulation lab coordinator, and (3) input from the short questionnaire administered to the LPN students.

Findings from descriptive test data. Descriptive data for the students’ test scores on HESI1, HESI 2, and all teacher-made content unit tests are shown in Table 1.

The data in Table 1 indicate that introduction of the SimMan 3G patient simulator manikin produced changes in students’ score patterns on both the HESI tests and the teacher-made content tests. Prior to the use of 3G, the ESL students scored generally lower on HESI 1. Their mean scores were lower than the non-ESLs on all HESI 1 tests except Math; their scores were more variable on 8 of the 9 HESI measures; and they generally had lower minimum scores, often considerably lower than the non-ESLs. This pattern was also observed on the four pre-intervention content test scores. On all four of these tests, the ESLs performed worse than the non-ESLs, demonstrating lower mean scores, lower minimum scores, lower maximum scores, and in no case scored the highest observed score in the population.

After introduction of the simulator, several performance effects are observable. ESL students’ test scores were raised to levels very similar to those of the non-ESL students. On the eight post-intervention teacher-made content scores, scores were raised for both ESLs and non-ESLs, but the greater gains were made by the ESLs. Further, the ESL/non-ESL means and standard deviations were much more similar on the post-intervention tests, and four of the eight
highest scores were made by the ESL group. On the HESI 2 tests, post-intervention scores were also generally higher for both ESLs and Non-ESLs, and the means and standard deviations were more similar for the two groups. On the post-HESI 2 content test, the means, minimum scores, and maximum scores were very similar for the ESLs and non-ESLs.

**Qualitative interview comments.** Additional information on the effects of the 3G simulator relating to the confidence of the ESL students came from the interview with the TTC simulation lab coordinator. She asserted that:

>[When using the 3G] the ESL students did not feel embarrassed to ask questions or to converse with each other in their own language.…. What we saw was that they grasped it. It was like a light bulb came on and finally the dots were all connected and the things that they were struggling terribly to understand cognitively were now clear.

The lab coordinator further explained that the TTC LPN teaching faculty were concerned that when they reviewed the HESI 1 scores of their ESL students, they felt that, “… unless we intervened in some manner … they would not be successful in this program, nor would they be successful on taking the … Board [examinations].” The lab coordinator reported that the faculty were very pleased to find that after the introduction of the 3G patient simulator, the test scores of the ESL students came up and met those of the non-ESLs and “… in some cases … surpassed them.” The score increase of the ESLs was dramatic and sudden with introduction of the simulator. Faculty were also pleased that after the 3G instructional intervention, both groups of students performed better on HESI 2 than they had on HESI 1.

**Student perceptions on questionnaire.** Information on the nature of the learning assistance the students felt they received from the 3G patient simulator came from their responses to the question on the questionnaire they completed for the TTC faculty that asked them to “List ways 3G was beneficial.” Their responses included:

- Lung sounds are real and easily identifiable in clinical.
- Bowel sounds are realistic and easily identifiable in clinical.
- Realistic pupil dilation, pulses, heartbeat, etc.
- Hearing the heart/lung sounds, assessment practice
- It has been extremely beneficial to be able to hear the sounds/feel the pulses before adding the difficulties of the field. It is a confidence builder.
- If I make a mistake I can learn from it without punishment.
- Hands on experience, real sounds, scenarios
- He responds like a real person. We get to hear the different heart ... and lung sounds.
- It gives me a true experience of a real situation - with real person.
- It made it seem more real.

These comments appear to support Dale’s theory (1954) that learning benefits accrue from experiences that are concrete, realistic, and replicate reality as closely as possible. These are basic and defining characteristics of simulation technology.
Pattern of Learning Performance Effects over Time before and after Introduction with the 3G Patient Simulator

To examine further the pre- and post-intervention effects of the 3G simulator over time, a time-series chart was developed. Mean scores for all student tests from pre-intervention HESI 1, pre-intervention content tests, post-intervention content tests, post-intervention HESI 2, and the post-HESI 2 content test were entered in the order in which they occurred chronologically into a time-series chart. Separate trend lines were drawn for ESL and non-ESL students. The resulting time-series chart is shown in Figure 2.

The time-series chart shows graphically the pattern of test scores for both ESL and non-ESL students before and after introduction of the simulator. The time-series illustrates several post-intervention trends for both ESLs and non-ESLs: (a) generally improved performance in both HESI scores and course content test scores, (b) greater consistency of performance, and (c) greater similarity of performance between the groups. The greatest positive effects of the simulator were demonstrated by the ESL students. These trends remained consistent over time after introduction of the simulator and showed no signs of reversal as the study progressed, suggesting they may represent permanent changes in learning attitudes and performance.
Differences in the Learning Performance and Perceptions of the Patient Simulator between ESL and Non-ESL Students

As shown in the quantitative test descriptive data and the time-series data, the general pattern observed in this study was that introduction of the 3G simulator resulted in improved and more consistent performance for both the ESL and non-ESL students. However, the greater gains were attained by the ESL group.

In her interview, the TTC simulator lab coordinator concurred, stating that in her perception, the 3G “…was very beneficial to our non-ESL students… but we were not finding it to be as dramatically impacting as it was on the ESL students.”

Additional data from the questionnaire administered to the ESL and non-ESL students by their teachers showed that both groups perceived the simulator as beneficial. Asked if they felt the 3G was beneficial in their beginning lab experiences, 15 of the 20 LPN students strongly agreed and 4 agreed. Asked if they felt the combined use of the simulator plus the written word enhanced their learning, 12 strongly agreed and 8 agreed. All 20 students said they felt they would have benefitted from more simulator experience.

In addition to learning performance outcomes, qualitative data from the lab coordinator’s interview indicated the ESL students also experienced strong affective outcomes from the patient simulator. For example, one way the simulator impacted the ESLs was improving their confidence. According to the lab coordinator, …when we first started bringing [the ESL students] into the lab…they were very uncertain of themselves and they would be standoffish… and they would not participate [but] now they are equally as confident as the non-ESLs.” She further pointed out that “…the impact of their increased confidence has now carried over to the actual clinical site where … the clinical instructors are also seeing no difference [between the ESL and non-ESL students].”

Several comments from the lab coordinator pointed to the intense emotional response of the ESL students to their simulator experience and their almost anthropomorphic feelings for the virtual patient. The coordinator affirmed:

… the feedback [about the patient simulator] that we received from all our students was very positive. However the ESLs definitely embraced ‘him’ even more and they would use phrases like ‘He’s a God send.’ You know, …they stopped referring to it as a mankin and it became ‘he.’ He has helped us learn. And so in their minds, he is a virtual patient and he is the one that helped them learn, not me, not any other instructor, but HE did.

The coordinator also recounted the emotional reaction of the ESL students to their learning success with the simulator and her own resulting sense of satisfaction:

It was very rewarding, but it was also very humbling because there … was a time when each one of them thought that they were going to not be successful and we were in the lab with 3G and all of a sudden they said, ‘We’ve got it’ and they all
broke out into a dance and they were dancing in the lab. … it was because they … accomplished a goal. They… passed a hurdle and they got it and it was from that day – I remember the instant – that the light bulb came on and they figured out, you know what, we can do this, we’ve got it – and they did, they do have it.

Conclusions, Discussion, and Recommendations

Triangulation of the findings of this study suggest several conclusions, implications, and recommendations. The results indicate that “smart” patient simulators can be effective in helping licensed practical nursing students, particularly those whose first language is not American English. Students struggling with the complex concepts and vocabulary of nursing programs may be aided by the concrete, hands-on nature of the patient simulator. Findings of this study show the simulator had both cognitive and affective effects on the LPN students and that both effects may have contributed to improved learning performance.

This conclusion has implications at several levels. At theoretical level, it supports the basic premise of Dale’s (1954) iconic instructional design theory that more realistic and concrete learning experiences benefit learning. Realism and “fidelity,” or accurate representation of the real world (Hunt & Waller, 1999), are definitional characteristics of simulations. This study acknowledged these characteristics. It allows the placement of new-generation patient simulation technology near the base of Dane’s Cone of Experience along with actual real-world experience and supports this technology as a “realistic” learning experience.

At the instructional methodology level, this study justifies the expense of “smart manikin” simulators and encourages their inclusion in nursing education programs. Computer-integrated smart manikin systems such as the Laerdal 3G Man have both substantial price tags (e.g. approximately $70,700 at TTC) and rather steep learning curves – both of which could discourage their use in nursing training. The TTC simulator lab coordinator in this study pointed out that they were using their 3G only “very scantily” to teach basic skills until they “were struggling, trying to figure out how to help our ESLs.” This study suggests that fully integrating simulator technology into the nursing teaching process may be a very effective learning performance enhancer that justifies its costs and efforts.

This study also has implications at the level of CTE nursing training programs, particularly for ESL students. The TTC simulation lab coordinator discussed the impacts on their LPN program if capable ESL students were lost. In addition to ethical concerns for attracting and retaining ESL students, faculty in many CTE programs are worried about program retention rates, professional certification rates, accreditation, and return-on-investment. The TTC coordinator affirmed this concern, stating that “if we can’t find a way to make our ESL student successful, then our…drop-out rate will be very high and, ultimately, if they should make it through the program, our Board passage rate will be very low, which can affect our accreditation….“ The coordinator further pointed out that they were planning to use the HESI admission tests as a tool to select who would be able to enter their LPN program. She stated that this process would have excluded all 10 of the ESL students in this study from even starting their program, yet they were able to succeed when the patient simulator was used for instruction. In difficult economic times when many programs must compete for students, new instructional
technologies that might help all capable students to successfully enter and complete CTE programs merit full investigation.

At occupational or industry level, a similar argument can be made. The nursing shortage documented at the beginning of this paper (Aiken, 2002; Aiken, Clarke, Sloane, Sochalski, & Silber, 2002; DHHS, 2000; Sammons, 2009) and its negative effects on health care are a significant concern to an aging American population. Nursing programs cannot afford to lose to attrition potentially successful personnel for the health care industry if this nursing shortage is to be addressed. If simulator technology can contribute to retention and course completion of trainee nurses, it should be fully investigated through studies similar to this one in various populations and settings. If this new technology continues to demonstrate positive learning effects and ability to retain nursing students and certify them into a health care system troubled by diminishing staff resources, they may justify their relatively high costs and help CTE to fulfill its primary role of workforce development.

‘REAL’ DATA IN THE INTRODUCTORY BUSINESS STATISTICS COURSE: USING CARBON EMISSIONS DATA TO ‘HEAT UP’ DESCRIPTIVE STATISTICS

Robert Brooks
Department of Econometrics and Business Statistics
Monash University
PO Box 197, Caulfield East VIC 3145, Australia
Email: Robert.brooks@buseco.monash.edu.au

ABSTRACT

This paper explores using a carbon emissions dataset to enliven an introductory business statistics assignment with real data. The carbon emissions data have all of the desirable characteristics of real data in that a choice needs to be made as to which measure to use, and further the data have some desirable complex properties such as skewness and the presence of outliers. In addition, the complexities in the data allow elements of research and public policy complexities to also be introduced.
Prime the Pipeline Project: Innovative Instruction through Scientific Villages

“Today, mathematics education faces 2 major challenges: raising the floor by expanding achievement for all, and lifting the ceiling of achievement to better prepare future leaders in mathematics, as well as science, engineering and technology” (AERA, 2006).

“If America is to sustain its international competitiveness, its national security, and quality of life for its citizens, then it must move quickly to achieve significant improvements of all students in mathematics and science.” (Business-Higher Education Forum, 2005).

These two quotes underscore the call to address national concerns regarding rigorous mathematics content, achievement for all students and professional development. Significant deficiencies in American K-12 mathematics education have been brought to light in many prominent reports e.g., A Nation at Risk (1983), Shaping the Future (George 1996), TIMSS (1998), the Glenn Commission (2000), and PISA (2003). It is worth noting that these reports span over twenty years but the issues they address remain unresolved. The consensus of these reports is that over one-third of the instructors who teach secondary school mathematics in the United States do not have a major or minor in mathematics, mathematics education,
nor in related disciplines. (Ingersoll 2007). Further those teaching middle school core areas, such as math are typically certified in elementary education hold generic multiple subjects certificates.

Student poor performance in middle school mathematics has been cited as a national problem. Cities across the nation are reporting failure rates in Algebra I in the range of 35% to 45%. In several districts, Algebra I has been cited as the major cause for school dropout. Some studies claim that students’ difficulties stem from a lack of preparation for algebra in the earlier grades. Other studies claim that students’ difficulties with math begin in grade 4 and that their interests in the study of math also begin to wane at that time. It is not clear which comes first, decline in achievement or loss of interest. Both conditions set the stage for math failure.

The need for more experts and innovators in the fields of science, technology, engineering, and mathematics in the United States has become a paramount for the success of the nation (National Science Board, 2008; Lewin & Couto, 2006; U.S. Department of Labor, 2008). While the need for more experts in STEM fields is increasing dramatically, the number of students who are pursuing college degrees in these fields is decreasing (NAEP, 2007; National Science Board, 2008; National Academies of Sciences, 2006, National Science Board, 2006). Factors that may be influencing this decrease may be: 1) lack of alignments between high school and college programs and skills needed for the workplace 2) students’ poor performance in high school mathematics and science (OECD, 2007); 3) students’ lack of knowledge of STEM careers 4) teachers under-prepared to engage high school students in the study of mathematics and science, and the use of technology
in investigating ways that mirror the types of projects and problems faced by the workforce (National Science Board, 2006).

Typically curriculum, particularly in the STEM disciplines (science, technology, mathematics, engineering and mathematics) has been siloized through the critical school years. These global imperative disciplines rarely connect to the content and intersections of the other disciplines.

Researchers have suggested the early introduction of complex mathematics to begin to address these needed exploration opportunities. Xin (2008) reported that introducing symbolic representation and algebraic thinking in earlier grades might facilitate a smoother transition from elementary to higher-level mathematics learning and improved middle school mathematics performance for students with learning disabilities.

Mathematics educators do agree that: (1) To enhance learning, students need more time on task; (2) Long-term projects that engage students in “hands-on” explorations and collaborations, and applications of mathematics to the solution of problems in other content areas, lead to deeper and longer-lasting understanding of concepts and skills; (3) Students can do more if challenged and expectations for their performance are higher; and (4) Focusing instruction in the lower grades on the development of key mathematical ideas that prepare students for the study of higher level mathematics, will result in greater success with the more advanced courses and concepts.

The Prime the Pipeline Project (P3) goal is to transcend traditional and stagnant borders between the critical elements of pedagogy and learning by creating and
evaluating new teaching and learning spaces. The P3 project developed Scientific Villages that provide a confluence of the STEM areas problems-based learning. The Villages are co-lead by university faculty and bench scientists from corporations and industry. The village participants include high school sophomores and high school STEM teachers who were side-by-side learners. An undergraduate student majoring in the STEM field served as a mentor. The villages are, in essence, multigenerational, multiethnic, multidisciplinary, and multiprofessional. The goals that have been met through the Villages include 1) increase student interest and success with the study of STEM in high school; 2) Increase student awareness of STEM careers, university preparation programs and their own talents as related to these fields; and 3) update teachers’ content in their own and related fields.

Each village focused on critical global issues such as strategic planning for wind turbines, cellular network communication, international clean room development, and 3-D visualization for architectural design. A follow-along research model has assessed longitudinal achievement and persistence of participants in STEM fields as well as teacher efficacy.

Organisation for Economic Co-operation and Development (2003). Programme for International Student Assessment. OECD.

In this paper, I examine the growing body of education-abroad literature on experiential/service learning programs available to North American students. Experiential/service learning programs entail short-term volunteer opportunities for youth. While some experiential/service learning programs take place within North America, there is a growing desire to travel internationally and to combine this travel experience with a volunteer placement for academic credit. In the United States, these programs are often referred to as service learning, while in Canada the terminology of experiential learning is frequently employed. In reviewing the available literature on experiential/service learning in international contexts, there is a widely held view that these programs have a positive impact on youth. Such programs are believed to offer enriching learning, personal growth and career opportunities for young North Americans. For my research I carried out interviews with 100 young Canadians who traveled abroad for experiential/service learning programs in developing countries. In this paper, I highlight the specific benefits of these educational programs as identified by Canadian youth between the ages of 18 and 30. In particular, I examine how overseas learning experiences have impacted their career goals and plans.
Undergraduate Student Perceptions of Affiliate Organization Contributions to What They Learn about Leadership While Serving as Officers in Professionally Oriented Clubs

Author: Mitchell Friedman

Abstract

This poster presentation will present a current study exploring undergraduate student perceptions of the contributions of a relationship with an organization outside the university to their experiences as leaders in a professionally oriented club. It focuses on student leaders of a Public Relations Student Society of America (PRSSA) chapter at a public state university in Northern California and its Public Relations Society of America (PRSA) affiliate.
Cases from the Field:
Preventing Litigation in the Trenches

Doris L. Wilson, Ed.D.
Deborah E. Stine, Ph.D.

California State University, San Bernardino

Paper presented at and Published in the Proceedings of the 9th Annual, 2011, Hawaii International Conference on Education, Honolulu, Hawaii, January 4 – 7, 2011. Authors can be contacted at dwilson@csusb.edu or CSU San Bernardino, 5500 University Parkway, San Bernardino, CA 92407-2393.
Cases from the Field:
Preventing Litigation in the Trenches

From the backdrop of case law, up to and including recent cases before the Supreme Court, narratives are presented from the field of an individual school district, describing particulars in the life of a superintendent/district in the area of religious controversy in the public schools and tactics utilized to avoid litigation. Samples of described events include a ‘little preacher’ on campus (8 year old, third grade student), volunteers (from churches) providing ‘guidance’ during recess breaks, removal of particular texts from the school (based on family values/morals), prayer in numerous locations on campus and the notorious ‘December Dilemmas’ that are posed to school districts throughout the nation.

Prevailing board policy and/or school policy dictates are impeccably scrutinized by the Courts when examining the factual basis of the cases presented. The Courts do not try to interfere with the administrative decisions of the schools, unless they are in conflict (in the case of religious controversy) with the 1st Amendment/Establishment Clause/Free Exercise Clause of the Constitution. Perception is important – what do children/those outside of the schools perceive? Do they perceive that favoritism of religion/practice is occurring? Do they perceive that the schools, by condoning the actions are endorsing religion (or a particular religion in the schools?) These questions and case precedent guide the decision making of the Courts. Leaders need to be informed of precedents in guiding their decision processes.

The Constitutional guidelines

1. **First Amendment:** Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press, or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

2. **Establishment Clause:** Prohibits the government from passing laws that aid a religion or show preference of one religion over another.

3. **Free Exercise Clause:** Prohibits the government from interfering with individual religious freedoms.

Rulings of cases have reflected multiple standards:

1. **Lemon Test:** 1971 – Lemon v. Kurzman – Three-prong test that stated that a governmental action or policy must:
   a. Have a secular purpose
   b. Neither advance nor inhibit religion
   c. Not cause excessive entanglement between government and religion.

For many years, if any one action failed any one of these three prongs it did not pass the constitutional test through the courts.
2. **Endorsement Test:** Have a purpose or effect of endorsing or disapproving religion.  
   (Example: Agostini v. Felton, 1997 – Payment of Title I Teachers)

3. **Coercion Test:** Place direct or indirect government coercion on individuals to profess a faith. (Examples: Ward v. Santa Fe Independent School District, 2004 – court maintained that the policy encouraged prayer on school property and at school-sponsored events and Dobrich v. Walls, 2005 – parents claimed they suffered retaliation after they sought to change a board policy regarding prayer as part of graduation ceremonies, board meetings, and other school activities).

Also Examined by the Courts

**Intent of School District Policies:** Courts began to look to the intent of school district policies and for any patterns that include prayer/devotionals in the schools.

**With Regard to Board Policies:** The courts are now looking towards principles of both neutrality and non-coercion.

**Case Study I**

Prayer at the flagpole: students, generally high school, gather around the flagpole at front of school prior to first period, hold hands and pray. This began with National Prayer Day, in 2006 on the fourth Wednesday in September. “See you at the pole” is an annual meeting for public prayer, generally organized by conservative Protestant public school students. In addition to the students who are actively engaged in the circle of prayer, others will 'look on' including parents who are dropping off students in front parking lot. The gathering became a concern when faculty/staff joined the students and prayed with them or led the prayers. Solution includes: at the beginning of each new school year, prior to first prayer, faculty/staff are informed of their rights re. religious activity at school. Specifically, we do not pray with the students, nor participate in this activity during school day. This is a student-initiated prayer, to be led by students to ensure that there is not a nexus of public school's endorsement of the activity. In addition, the administration determined that the ‘Amen’ needed to be stated in advance of the first school bell of the day.

**Court Decisions**

**Prayer/Restriction on Speech:** Restrictions on speech are also permissible in a limited open forum as long as they are related to the educational mission of the school.

*Board of Education of Westside Community Schools v. Mergens, 495 U.S. 226, 110 S. Ct. 2356 (1990)*

Supreme Court upheld Equal Access Act that most high school students could understand that a religious club was not an endorsement of religion by the schools. Students have a right to organize their own groups in public schools, whether these groups be religious, political, or philosophical. (Here it is important that teachers are not perceived to be leading prayer or leading the meeting)
If school has a limited open forum – the Supreme Court decided that a Christian Club could not be denied facilities.

**Higher Education (more recent)**

On June 28, 2010, the United States Supreme Court rendered its long-awaited decision in Christian Legal Society v. Martinez, concluding that the Hastings Law School, a public California institution, did not violate a student group’s constitutional rights when it denied the Christian Legal Society (CLS) official recognition because it discriminated on the basis of religion. (CLS sought to exclude potential members who did not share their religious beliefs, particularly with regard to pre-marital sexual activity and homosexuality.)

**Prayer at School Events and Graduation**

Public prayer before a sporting event was disallowed. Outlawed was a situation in which the state affirmatively sponsored the particular religious practice of prayer. The court felt that allowing students to include invocations did not remove school sponsorship and ruled that the school district’s policy permitting student-led, student-initiated prayer at football games violated the Establishment Clause.

Ruled that public school graduation ceremonies involving prayer cannot be in harmony with the First Amendments Command for neutrality.

U.S. Supreme Court remanded case to the Fifth Circuit which ruled and allowed student-initiated, student led prayer at the graduation ceremonies in Texas (this was in the school board policy).

No Child Left Behind (2002)
Requires schools that receive federal funds to certify that they have no policies that either deny or prevent participation in constitutionally protected prayer in the schools.

Ruling stated that prayer by teachers is not permissible during school hours – teachers cannot be perceived to be leading prayer.
Case Study II

Bible openly displayed on teacher's desk: Bible is consistently open on teacher's desk during instructional time. Principal has not observed the teacher reading silently nor reading aloud to students. The teacher is not instructing a class that would include Bible as literature or comparative religion. Does the mere display of a religious text/Bible promote a specific religion or any religion? Solution: in this case this was the least of the principal's worries about this teacher so principal dealt with issues that lead to "not recommending for rehire", rather than those of a religious nature – it could make a difference if the teacher was tenured.

Court Decisions

While this is not the best judgment, if the teacher is not proselytizing (and the action is not against specific board/school policies), this most probably could not be called to question, as the teacher has a right to have a ‘book’ open on her desk.

State enforced Bible reading and prayer in the public schools are unconstitutional.
(This case did not mandate any reading)

State statute requiring posting of copy of Ten Commandments in walls of each public classroom is violative of Establishment Clause.
(This case did not involve statute, only teacher’s decision)

*Roberts v. Madigan, 921 F. 2d. 1047, (10th Cir. 1990).*

Teacher had an open Bible on desk (and chose to read from it during silent reading) and on bookshelves (during open house). Ruling – for teacher. There was no indication that any statement of any kind was being made to the students, and the Court felt that the teacher had a right to read the Bible.
(The opposition stated – ‘It is unrealistic to think that bright energetic students are oblivious to what their teacher reads.’)

Minimally Related

*Cooper v. Eugene School District No. 4J, 301 Or. 358, 723 P. 2d, 298 (1986).*

Tenured teachers can have certificate revoked for violating state statute prohibiting the wearing of religious garb in school.
Case Study III

Removal of Webster’s Collegiate Dictionary from library: Parent of middle school student demanded this book be removed from middle school library as it included two definitions of oral sex and she thought this information was not age appropriate. This is not a clean religious issue except that 'family values/morals' come into the conversations which draw out the fundamentalists, i.e. Four Square Church. Solution: rely on Board Policy that spells out the process for reviewing a demand to remove. While the committee is reviewing the parent’s demand, we continued to have the book on the reference shelf in the library; cannot be checked out.

Court Decisions

“A local school board may not remove books from school libraries simply because it dislikes the ideas contained in the books.”

School Board restriction of access to Harry Potter violates the Constitution.

Virgil v. School Board of Columbia City, Florida, 862 F. 2d 1517 (11th Cir. 1989).
School Board’s removal of works by Aristophanes and Chaucer from Curriculum is reasonably related to legitimate pedagogical concerns. (Note: here it is the school board, not the parent who made the action)

Mozert v. Hawkins County Board of Education, 827 F. 2d 1058 (6th Cir. 1987).
Requirement that students study basic reader series does not violate the Free Exercise Clause.

Parent does not have a fundamental right to mandate school curriculum.

Case Study IV

"Little Preacher", an eight year old, third grade student, began to bring religious tracts from his church and distribute them to classmates during recess/lunchtime. He also urged them to attend church and accept God as their personal savior so they would have eternal life, quoting John 3:16. He was assertive and annoyed/alarmed students. Parents began to complain that their children were bringing home religious literature. The principal’s first step was to contact the boy's parents re. concerns. Parents were insistent that son had the right and religious obligation to continue to do the Lord's work at school. Solution: student could hand out literature to students who willingly accepted the pamphlet, but this was limited to before and after school. Fortunately, after a few weeks, his interest waned.
Court Decisions

Students do not leave their rights at ‘the school house gate’ and the material/incident needs to materially or substantially disrupt the school operation or infringe on the rights of others.

*Child Evangelism v. Montgomery County Public Schools*, 373 F. 3d 589 (4th Cir. 2004).

“We note that our holding accords with that of most other courts which have held that a public elementary school does not violate the Establishment Clause by similar distributions of flyers from private/religious organizations.” (However, the case above does not have the school distributing the flyers, so the issue in question would be if it is the perception of the students/parents that the school is endorsing it – by allowing the boy to distribute) Therefore, the decision of the school to allow literature to be handed out at a place of their choosing, outside of school time was the correct one.

and

“If defendants manipulated the facially neutral party so as to give preferential access to religious literature or certain religious literature, then an Establishment Clause violation might be declared.” (Here there were two teachers present at the flagpole at the beginning of the day – the Court of Appeals asked for reconsideration as they were not leading, but only present.)

The issue here is one of ‘infringing on the rights of others’ more than anything – as the case states “he was assertive and annoyed/alarmed students”.

Case Study V

Volunteers on campus: in our community we have a mega church that attracts many young families and teens. The attraction includes "Friday Night Out", teens gather at the church for music, games, food and religious instruction. Young adults who work at the church volunteer to assist at middle schools i.e. noon supervisors, playground supervisors. While supervising at lunch or PE, they invite students to the activities at the church and give them flyers to take home and inform parents of the activity. It progressed to the Friday Night Out event becoming a competition between schools, and the school with the most students present would be acknowledged and given a trophy to take to school on Monday. Solution: Board Policy re. volunteers on campus was amended. Each volunteer must now read/sign an agreement re. the role of a volunteer and the “Don't List” which includes a discussion of religion.

Here, the decision to amend the school board policy was an important one as it could be perceived that the decision was ENDORSING a religious viewpoint. As with the case above, the administrator can choose WHERE AND WHEN flyers are distributed.
Case Study VI

The December Dilemmas: term used for the quandaries and anxieties in December when dealing with religious and non-religious holidays in public schools. Prime examples include Christmas trees in district and school's offices, concerts and programs that are dominated by religious music and symbols, i.e. Nativity scene, miracle of Hanukkah, menorah. Solution: refer to the recommendations of Charles Haynes and Oliver Thomas and enlist the support of clergy and parents when writing your district's policies. These are dilemmas that escalate quickly and appear to be insensitive to both the Christians and non-Christian communities. The "plastic reindeer test" that is predominance of non-religious symbols, driedels, and Frosty the Snowman can be offensive to those who want Christmas in public schools to be Christian in message. The line must be that our role is not to observe a religious holiday or honor one religion over another. We can display symbols for a limited time and discuss in context of the holiday.

Court Decisions

This is a case regarding the celebration of public holidays, which has cultural significance and often religious significance as well. The Court upheld the inclusion of a nativity scene in a holiday display that also included other non-Christian symbols.

Supreme Court indicated, in 1984, that there was not an issue with religious significance, but this was a court divided.

Supreme Court ruled that a nativity scene in the county courthouse violated the Establishment Clause because it had the effect of endorsing religion.

The issue of the proper role of religion in the public schools continues to be the subject of great controversy. School officials, board members, parents and students grapple with these complex questions every day. Decision makers must address many competing demands, consistently looking to balance the dual constitutional mandates of separation of church and state and the right to freely exercise religion. Decision makers must include in their thinking the needs and rights of both the religious and the non-religious.

The role of religion in public schools does not have to be divisive. Boards of Education must adopt clear policies and administrative regulations regarding religion in the public schools that meet the letter and intent of the First Amendment. Parents, students, clergy and staff should become involved in the process of discussing these policies with the common goal to ensure that the vision of religious liberty upon which this nation was founded is preserved. All leaders – as an imperative – need to continue to be informed.

Abstract

In this proceedings paper, I report on an ongoing research project, focusing on data collection and analysis frameworks, to design and implement an effective approach to teaching interlanguage pragmatics in an EFL context. The pedagogy is organized through strategic interaction (SI) (Di Pietro, 1987), and is mediated by use of model conversations, online wiki space, and digital video technologies. Participants at a Japanese university engaged in an SI routine within the context of learning politeness strategies for a Business English course. Transcripts from spoken performance are compared longitudinally with data from pre and posttest written discourse completion tasks. A functional perspective on language use (Luria, 1992; Ahmed, 1994; Frawley and Lantolf, 1985; Frawley, 1987) provides insight into shifts in learner development from object and other regulation, towards more independent and creative language use, defined as self-regulation, as the participants engage with the teaching/learning cycle.

Key words: Mediation; Strategic Interaction; Pragmatics; Technology; Sociocultural; Wiki
Introduction

Teaching English in a Japanese university context has constraints that have been well documented. Cultural concerns have been cited to explain low learner motivation (Yashima, 2002), classroom anxiety, and general lack of confidence in communicating (Kitano, 2001). Building a classroom curriculum that accounts for these issues is challenging. In this paper, I describe one possible approach to solving these issues, strategic interaction (SI), and highlight a procedure that is in the process of being developed at two university programs in Japan. The nature of SI, as detailed below, mean that it is ideally suited to dealing with pragmatic issues in the classroom, an area of particular concern for business communication, that has been described as a difficult area to teach. Specifically, I am interested here in detailing the research design and data analysis aspect of this ongoing teaching/research program, which is important to establish the learning outcomes and overall efficacy of this approach.

Teaching Pragmatics

Pragmatics is usefully defined by Kasper and Rose (2001) as “the study of communicative action in its sociocultural context” (p.2) which places linguistic choice in a particular social context with specific interpersonal meanings governing those choices. The importance of interlanguage pragmatics in language education was underlined by its explicit inclusion in influential models of communicative competence (Canale and Swain, 1980; Bachman, 1990). Though pragmatic awareness and deployment of pragmatically sensitive language has been deemed an important element of what it means
to communicate effectively, questions have arisen about how, and indeed, if, pragmatics can be effectively taught and learnt in a classroom setting (Kasper and Rose, 2001). This concern is of course particularly salient in an EFL context where learners may have limited exposure to native speakers of the target language. As Kondo (2008) helpfully reminds us, simply providing learners with scripts and examples of use related to particular situations, and asking them to memorize them, is hardly likely to produce a functional pragmatic understanding.

Much work in teaching pragmatics has focused on understanding and production of speech acts (Cohen, 1996), including refusals, apologies, requests, and complaining (Rose and Kasper, 2001). Generally, the approach taken has been a cognitive one where developing pragmatic competence is seen as an individual mental process (Soler and Martinez-Flor, 2008). In this research, we take a sociocultural perspective in which development of pragmatic competence is essentially a social undertaking involving the gradual internalization and control over socially constructed forms of mediation. As Lantolf and Thorne (2005) explain: “…schooling is the fundamental site where conceptual knowledge is brought into conscious awareness and appropriated as a means of enhancing our self-regulatory capacity” (p.148).
Strategic Interaction 2.0

Our work in two university contexts in Japan (see deHaan et al, 2012) draws upon the teaching and research paradigm outlined by Di Pietro (1987). In short, the basic notion of SI revolves around the dramatic tension of completing a scenario in which each participant plays a different and often conflicting role. Dramatic tension arises through the uncertainty of the role that each participant is playing, as well as the exact nature of the situation that emerges much like the unfolding interactions of everyday life. The suggested routine of activity to enact a scenario, as detailed in the original text (p. 2), is as follows:

Pre-class Preparation:
In this initial stage, a scenario is selected and role cards created for each of the participants. These cards outline the basic premise of the interaction and suggest a goal and desired outcome for that learner.
Phase 1: (Rehearsal)
In rehearsal, students form groups and prepare “agendas” to fulfil the requirements that have been suggested for their roles in the scenario. The instructor guides the learners wherever necessary.
Phase 2: (Performance)
Students perform their roles while the remainder of the class observe.
Phase 3: (Debriefing)
Teacher leads the entire class in a discussion of the student performance.

To fully appreciate the proposal made by Di Pietro (1987), it is necessary to reflect upon his understanding of language. Firstly, Di Pietro was concerned with placing the learner and learner identity at the heart of second language learning and teaching. As Lantolf (1993) explains: “Di Pietro’s fundamental concern is with how language serves to construct a self and with helping learners develop that linguistically configured self in a second language “ (p.221). It is this feature of his approach that makes it particularly
suitable for the teaching of pragmatics, where linguistic choice is so clearly related to personal and interpersonal factors, as mentioned above. Di Pietro (1987) considered the following three dimensions to language as important to consider when designing second language instruction:

1. Information exchange (focus on grammatical orientation)
2. Transaction (negotiation and expression of speaker intentions)
3. Interaction (how language works to portray roles and speaker identities)

Di Pietro (1987) suggested that in many communicatively oriented language classrooms, where “authentic” communication is the stated purpose of the classroom activity, in reality learners exchange linguistic tokens according to rigid criteria. While these exchanges may illicit production of target forms, because they are removed from the reality of life outside of the classroom, the tokens are not animated by genuine speaker intention. There is therefore, no real communicative act, or sense of self, at stake. As described above it is this self and the interpersonal aspects of communication that make SI particularly attractive in a Business English context where intercultural communication is key. This personal engagement was felt by Di Pietro to be crucial for language development.

Developments in classroom technology and their widespread availability in many educational settings means that we are able to adapt Di Pietro’s (1987) pedagogy to fit our own purposes and provide our learners with staged and efficacious learning affordances (van Lier, 2008). As detailed in de Haan et al (2012), we employ digital video technology and an online wiki to create a cycle of interaction and activity,
specifically designed to provide learners with preparation, performance, instruction related to performance, and further performance (see Figure 1). A particular feature of this cycle is the learner transcription and reflection phase in which the learners own language becomes an artifact to mediate awareness and development. Using learner language in this way has been shown to be beneficial to language development (Swain and Lapkin, 2008).

Figure 1.

*Performance and Data Collection Routine*

The 2.0 version of SI then follows the following sequence. In the teaching situation detailed in this paper, the teaching goal is firstly the grammatical structures (e.g. modal plus main verb) related to the speech acts of request and refusal in a business context.
How and why different kinds of apology and refusal may be meaningfully and appropriately deployed then becomes central.

1. Discussion of business meeting setting and related speech acts. How might Japan and the US off cultural differences?
2. Study model conversation of a business meeting that features intercultural communication and target speech acts.
3. In groups, learners are given one of two roles to play in a business meeting.
4. After preparation and focus on key vocabulary and the details of their task, the learners are randomly assigned a partner from the different group to come together and perform the SI.
5. Performance is recorded and uploaded into the class wiki. The pair then review their own performance and transcribe it. The transcription is placed below the video on the wiki page.
6. The instructor reviews the performance with the learners and answers questions and offers guidance for improvement wherever appropriate.
7. The second performance takes place. This involves a slight change to the scenario to maintain the dramatic tension and may also involve switching the pairings at the discretion of the instructor.
8. Second performance is recorded and placed in the class wiki. Learners comment and reflect on the changes. An instructor led, full-class debriefing may also take place.

Data Collection and Analysis

In order to better understand the impact of the pedagogical design outlined above, we have implemented a pre- and posttest data collection procedure using written discourse completion tasks (WDCT), following Cohen (1996). This type of assessment has been widely used in speech act research, including apologies, refusals and requests (e.g. Cohen et al, 1986; Kondo, 2008), and these written tasks have been found to be a reliable and consistent means of assessing pragmatic ability (Rose, 1994; Brown, 2008). The instrument was designed to test appropriate response on a range of functions across
the different aspects of pragmatic communication, as outlined by Levinson (1983); and is based upon previous research in testing pragmatic ability (Hudson et al, 1995).

</table>

+- I, P and D = +- Imposition, Power, Distance

*Power*: is the relative difference between the listener and speaker due to rank, professional status, etc.

*Distance*: is the social distance between the listener and speaker due to familiarity or shared solidarity due to group membership.

*Imposition*: is the degree of imposition imposed by the speech act within the cultural context based on expenditure or obligation.

This scheme then guided the creation of the test items, written with a business context in mind, so that a broad spectrum of pragmatic understanding and use could be assessed.

The items were written and then the contextual information was translated into Japanese so that there would be no misunderstanding about the details of the situation. This created 16 items in total and in both pre and posttest, the respondents were given 2 minutes to read the item and give their response to each one. An example item with assessment rubric was as follows:
**Item 1 (+I+P+D) - Apology for late project**

You are in a meeting with a manager from Head Office. He has set you a deadline to complete an important advertising project. However, you have not yet completed the project and you will need one more week to finish. Request more time from your manager:

**Manager: So I wanted the work on the advertising to be finished by today.**

**You:**

<table>

<td></td>
<td></td>
<td>Completely appropriate</td>
</tr>
</tbody>
</table>

The data from both pre and posttest, given just before and just after the SI procedure, was rated according to appropriateness, and the two performances compared. This data is used then to trace and assess the impact of the teaching cycle. For each study participant, it is possible to compare the written and spoken data longitudinally and for this purpose, an analysis protocol was designed (Table 2). Taking a functional view of language (Luria, 1982; Ahmed, 1994) we are interested in changes in regulation from object, through other and towards self-regulation. As Ahmed (1994) explains:

“The task of the researcher is to discover if the speech of the interlocuters shows evidence of object regulation, other regulation or self regulation. This is achieved through careful analysis of the relationship between task factors and specific linguistic forms manifested in the speech of the interlocuters” (p. 160)

At the outset, we expect to find the participants relying upon external means found in the learning ecology, such as the model dialogue, the instructor, and/or their peers, to
complete the communicative tasks. Evidence revealed in microgenetic analysis (see Lantolf and Thorne, 2005) of learner discourse will reveal shifts in operation towards increasing self-reliance and control over the meaning making resources of the language.

The protocol for analysis provides insight into development across the semester, as performance changes over time can be seen in different stages of mediation.

**Conclusion**

The teaching of intercultural pragmatics is an important aspect of Business English, due to the importance of cross-cultural interaction. Strategic Interaction, enhanced through application of digital technology, has the potential to provide learners with powerful and effective learning affordances. In a Japanese context, where there may be several constraining factors such as large class size and shyness, involving learners in a cycle of activity where they interact and reflect on their own language performances may prove beneficial (Oda, 1993). As well as improving motivation and having the
Hawaii International Conference on Education – Proceedings, 2011, Johnson

learners become active participants in their own classrooms, SI provides experience with the real world drama and tension of daily interaction. In order to assess the effectiveness of this approach, however, it is also important to collect and analyze performance data in a meaningful and appropriate way. By comparing data from written discourse completion tasks with transcripts of learner performance and correction, within the context of the mediational means provided through instruction, we hope to gain further insight into the impact of our pedagogical design.

**Introduction:**

In the past, education was merely to transmit knowledge from an individual or an entity, i.e. the teacher or the school, to a general population of receivers, the students. No longer is this definition sufficient for the modern society. Education must encompass much more than just knowledge. It must instill other aspects of life such as character, value and leadership in the students.\[^1\] These intangible aspects require more than just the classroom experience.

With the turn of the millennium well behind us already, we are indeed venturing into the information era. Technologies are matured enough that every aspect of our daily lives relies, to some extent, on the computer and the computer network.\[^2\] Education is no different. In fact, higher-level education has been on the forefront of information technology and much of the knowledge we know originates from universities and institutes.\[^3\] With the help of the Internet and Intranet, people are able to share their experience and point of view on platforms and chatrooms that incubate ideas and policies. Open Forum is exactly such platform in which people can publicly and anonymously post thoughts and comments to certain subjects that are being discussed by members of the forum.

On the secondary-level education, however, information technology is still mostly limited to classroom lecturing and teacher research. There are very few school-sponsored open forums encouraging students to express their opinions like most universities have. Students usually have to go to commercial websites to create and organize such forums. Should middle schools take over these...
forums then? Should schools allocate resources to monitor and administer them? What will be the benefit of such forums in terms of pedagogy, learning, information sharing and policy making? What will be the pitfalls and drawbacks if these forums are not properly managed? How do schools take advantage of this new trend by making learning more efficient through the use of open forum? How can schools optimize communication by encouraging ideas and views from both students and teachers in these forums? These are answers that schools would like to have answers to before they can proceed to embrace this new wave of learning method.

This research aims to investigate the application of the open forum technology in the education realm and how it can help schools to adapt to this new phenomenon.

**Proposed benefits of open forums:**

a) *An environment of open atmosphere:* Open forums create an environment of open atmosphere in the schools. They show that the schools care about what the students think and are willing to hear what the students have to say about regulations and policies. Commercial websites do offer such forums to students from different schools but their target is usually limited. It is not hard to notice that only a few specific users frequently visit these forums. Thus, the opinions expressed there are usually very narrow and subjective. If schools offer their own forums, they can promote them to their students and encourage students to take part in them. With more students participating, the views gathered will be more objective and representative.
b) **Collect constructive suggestions from students:** Students need to learn how to express themselves. It is not an easy task. Natural instincts do not necessarily include the ability to clearly put into words what is in one's mind. It takes practice. Most of the time, it also takes courage. That is why not every student is willing to speak out in class. The open forums provide a very convenient platform for students to practice how to effectively organize their thoughts and let everyone know what they actually feel and think. They can raise questions; they can answer other people's questions; they can agree with some people's opinion but they can definitely disagree with some others. It will not be an overnight job though. However, through constant questioning and answering and constructive arguing, they will be more comfortable expressing their views. They will find that when they go to universities, it will not be so difficult for them to quickly adapt to the new openness of college life.

c) **Feedbacks on school policies and activities:** School policies are not necessarily always correct, especially new policies. However, policy makers do not always see from the students’ angle. Sometimes it is because they are not willing, but most of the time it is because they are not able to. Students usually do not express negative feelings to school policies in front of their teachers. Sometimes these negative feelings are legitimate. Students are not always wrong. The open forums can let them air their feelings and suggestions. These suggestions may turn into constructive modifications to school policies. Also, there are many school activities and events throughout the school year. Students may not tell teachers face-to-face what they think about these events but they will most likely say
their words in the forums. Schools can then collect these feedbacks and make improvements to subsequent activities and events.

d) **A platform to acquire information for students:** Most schools have websites and they usually make announcements on the school websites. However, these announcements are usually important notifications and target all students in the school. However, students have many small questions about school affairs and they cannot find all the answers on the school website. Alternatively, they can ask their questions in the forums. As one may observe, questions in forums are always answered, usually with the right information. Some people out there always have the right information and they are usually eager to answer. Thus, it reduces the chance for students to miss out on a meeting or to be late on an activity or to forget about a test date, etc.

e) **Sub-forums: English/Science/Math etc:** There are many extra-curriculum clubs in a school, English Club, Math Club, Science Club, etc. They meet regularly and conduct workshops or seminars from time to time. They may or may not otherwise see or communicate with each other. A sub-forum for each of these clubs may help bond them together better. Someone from the English Club may post a digest on a novel he just read. A Math Club student may show an alternative answer to a very hard question. A Dance Club member may post a video clip of her dancing a move that she invented. Over time, if this culture of open forum is propagated throughout the schools, it will greatly enhance the performance of these special interest clubs.
Potential pitfalls:

a) *Postings can turn into hostile attacks:* As with any other societies, freedom to express opinions usually comes with disparity in opinions. This disparity is healthy and is the very essence of open forums. However, if left unchecked, the difference in views may turn into extremities. Very often, posts in the forum may turn into hostile attacks on posters. Since the posters are all students, they may not be matured enough to control what they have to say. Many users will attack on other users' suggestions. They might degrade other people's character. They might even use vulgar on other users.

b) *Teachers will feel ‘insecure’:* Occasionally, students will use the forum to discuss about their teachers. Sometimes the discussion may be about their discontent towards certain teachers. As a result, teachers may feel 'insecure' due to this vulnerability of potentially being attacked by students. One may view this vulnerability as incentives for teachers to constantly improve themselves. Others may view this insecurity as interference with teachers' regular duties and may cause teachers to work under constant fear. Whichever stand one may take, schools should take extreme precaution to maintain a positive atmosphere in these forums to encourage constructive inputs from students rather than just trash talk.

c) *School policies will meet ‘resistance’:* Just as with teachers, students may also dislike school policies. School policies usually appear to be on the
opposite side of students' preferences. Therefore, it is easy for students to generate resonance in the forums if they oppose certain school policies. Thus, every time a school tries to insert a new regulation or modify an old rule, it might meet some resistance from the students.

**Implication at various dimensions of the open forum in schools:**

The effect of adapting the open forum in schools may go well beyond academic. It is going to change the sociological relationships between students and teachers, teachers and management, students and students, and even students and management. The power struggle between each party in the school will take a new form. The very anonymity of the open forum will expose everything in front of everybody. Teachers can no longer afford to ignore student demands. Management can no longer afford to ignore teacher demands. Everything is up for praise or scrutiny. Everybody is linked together by an invisible, yet more powerful bond. Management hierarchy will be enhanced or shaken depending on the generation and distribution of information over the network.

The open forum will also have an impact on the traditional curriculum development. Curriculum theory describes itself as in four domains: the content, the product, the process and the praxis. Schools typically follow the content or the product approach. However, the content and product approaches usually neglect the learning experience of the students. Curriculum is rigidly set out by school management and usually has little room for evolvement. The process approach of curriculum theory suggests that curriculum be dynamic and
adaptive.\[5\] Through the learning experience of the students, schools should improve and shape their curriculum to reflect the needs of the students as well. The open forum is exactly the vehicle for schools and students to exchange this vital information on the optimization of their curriculum.

**Conclusion:**

Open forums are platforms for people to share views and express opinions. When they are applied to middle schools, one must weight the advantages and disadvantages of such forums. These forums promote freedom of speech, generate constructive suggestions, collect feedbacks on policies, provide information for students and create space for special interest clubs. On the other hand, they may turn into hotbeds for battleground; arouse insecurity in teachers and raise resistance to rules and regulations. Schools need to exercise extreme caution and utilize considerable resources to maintain these forums. When operated effectively, open forums can be a great tool to enhance student quality and school reputation. However, if managed poorly and incorrectly, open forums can also be the source of unrest and dissatisfaction.

First Year Teachers’ Experiences Directing the Work of Educational Assistants in the Classroom

Rosemary Vogt, University of Manitoba

Abstract: Educational Assistants (EA’s) are persons hired by school divisions to provide support for classroom teachers, or students with special needs. It is often noted that the supervision of EA’s falls on the shoulders of classroom teachers who are relatively unprepared for supervising and directing the work of another adult in the classroom. Additionally, many teachers are uncertain about the fundamental roles and responsibilities of EA’s. The current study helps to fill some gaps in the literature regarding first year teacher preparedness to direct the work of a paraprofessional in the classroom. Better understanding of the issue can lead to improving pre-service teacher education as well as provide a rational for on-going in-service teacher training.

Educational assistants (EA’s, paraeducators, paraprofessionals) are persons hired by school divisions to provide support for classroom teachers, or students with special needs. “A paraprofessional may be assigned as an assistant to the whole class or to help support a subset of students that have learning, personal care, or behavioral needs” (Causton-Theoharis et al., 2007). It is often noted that the supervision of educational assistants falls on the shoulders of classroom teachers who are relatively unprepared for supervising and directing the work of another adult in the classroom. Additionally, many teachers are uncertain about the fundamental roles and responsibilities of educational assistants and may have questions about how best to direct the work of paraprofessionals (Causton-Theoharis et al., 2007). The literature draws attention to training requirements and initiatives for educational assistants (Carroll, 2001, Riggs, 2001, Cobb, 2007, Christie, 2002), yet little attention has been paid in the research to the competencies required by first year teachers to supervise and direct the work of educational assistants (Morgan et al, 1998).

In her thesis, Jennifer Ramsey (2007) examines the relationship between an educational assistant and a classroom teacher and how that relationship impacts student success. She agrees that many teachers are unprepared to direct the work of another adult in the classroom and the majority of her research derived from interviews and classroom data focuses on paraeducator preparedness. The four themes that emerged from her data were;

1) The importance of shared beliefs about working together;
2) A responsive student centered practice, although together, yet in distinct roles;
3) A supportive working environment, and

4) An inclusive school culture.

Ramsey’s findings support the importance of creating and maintaining effective working relationships between educational assistants and classroom teachers. Yet, more research is needed about first year teacher’s preparedness and experiences directing the work of an educational assistant in the classroom.

A study by Marie Tejero Hughes, and Diana Martinez Valle-Riestra (2008) investigates the perceptions of paraprofessionals working with young children who have disabilities as well as teacher’s perceptions of the roles and responsibilities and level of preparedness of paraprofessionals. Identifying that many professional development opportunities were available to both teachers and paraprofessionals in the survey group, the degree of support was particularly valuable to teachers because:

Few teacher preparation programs at institutions of higher education in the USA offer segments or courses that equip teachers to manage another adult’s activities or design experiences or opportunities for teachers to have hands-on experience with paraprofessionals prior to program completion. Thus, most teachers are not adequately prepared to work with the paraprofessional in the class. (Tejero Hughes & Martinez Valle-Riestra, 2008)

In order for teacher and paraprofessional teams to better meet the individual needs of students with disabilities, “teachers need to be provided with preparation on how to consult and supervise another adult in the classroom” (Tejero Hughes & Martinez Valle-Riestra, 2008).

John Rosales (2002) examines teacher and paraprofessional partnerships in “What’s the Secret Behind Successful Teacher-Para Relationships”. From data he collected through interviews with three experienced paraeducators on what makes the relationship between the teacher and the paraeducator click, Rosales identifies mutual respect, teamwork and common goals. Not knowing the role of the paraeducator was identified as the most common error made by new teachers regarding the supervision of paraeducators. Paraeducators commented, “They sometimes think para’s are there for clerical purposes – copying, correcting papers – instead of working directly with students as support” (Rosales, 2002). Rosales’ (2002) work is one-sided and biased stemming entirely from paraeducator interviews. The teachers’ voice about their experiences directing the work of paraeducators has been overlooked entirely.

The current study helps to fill in some of the gaps in the literature regarding first year teacher preparedness to direct the work of a paraprofessional in the classroom. Better understanding of the issue can lead to improving pre-service teacher education as well as provide a rational for on-
going in-service teacher training. As leaders in an educational team, it is essential that classroom teachers are adequately prepared to direct the work of paraprofessionals in the classroom. That they have a clear understanding of what is expected of them in directing a paraprofessional, as well as awareness and understanding of paraeducator roles and responsibilities. Whereas, most of the previous studies have examined preparing and managing paraprofessionals (Trautman, 2004) and creating effective teacher paraprofessional teams (Devlin, 2009), there has been little focus, if any on teacher preparedness to direct the work of a paraeducator in the classroom.

The present study investigates the perceptions of three first year teachers who direct the work of paraeducators in their classroom using the following overarching research questions:

1) In what capacity do you currently work with an educational assistant?
2) What are your experiences with directing the work of educational assistants?
3) How did your university education prepare you for directing the work of educational assistants?
4) What questions do you have about directing the work of educational assistants?
5) Does your school have a document which addresses the roles and responsibilities of educational assistants?
6) Do you know if Manitoba Education and training has a document that addresses the roles and responsibilities of educational assistants?

Method

Design

This study employed a descriptive, qualitative design. Data were collected through face-to-face interviews between March and April 2010 with participants from a sample of schools from a school division where administrators had granted permission for exploring first year teacher’s experiences directing the work of an educational assistant in the classroom.

Recruitment and Selection of Participants

Participants for the study were recruited with the assistance of a school board administrator from the school board that granted permission to conduct the study with teachers from within the school division. All three participants were caucasian females in their first year of teaching having graduated from university with the appropriate qualifications required for their position.
Settings

The three classroom teachers that participated in this study work in rural community settings. They span grade levels from Kindergarten to Grade 9. All participants were graduates from a university in the same province.

Procedure

The school district provided the names of first year teachers who worked with educational assistants. One of the participants was recruited through word of mouth. The teachers were initially contacted through email and telephone during which time the purpose and procedure of the study was explained and a mutually agreed upon location for the interview was determined.

Findings

Current Capacity Working with an Educational Assistant

First year classroom teachers reported various capacities in which they currently work with an educational assistant in the classroom.

Participant #1 stated:

I have an EA that comes in for part of the morning. I will have her help me out with starting the day, generally with the morning tasks. She/he will help me with either going through some agenda’s or check homework. Then, if we do something like math, I have him/her working with a group of students or sometimes one on one with just one student either helping them catch up on something or giving them the one on one help that they may need that I can’t possibly give at that time. In the afternoon I have a different EA and she/he helps me with jobs that need to be done. During the last hour of the day we generally have guided reading and she/he will help keep the class quiet, or help out again with a small group of students to get some writing down, talk through something they have read and just kind of keep the classroom management under control while I’m busy doing something else.

Participant #2 stated:

I have two funded children in my classroom so I have an EA that’s with me until 1:45 and then another one comes in from 1:45 until the end of the day. So I have two EA’s in my classroom all day long. I shouldn’t say that both of them are with me all day long. I have an EA in the classroom all day long. You know this is my first year. I haven’t worked with EA’s before. During my student teaching I worked with one EA, and that was for only half the day, and then the classroom teacher was directing the EA. So now, in my first year of teaching, I don’t have this experience working with EA’s, and it’s been a learning curve for me. I’ve been working with the resource teacher to figure it out. I
feel so young, and the EA’s are a lot older than I am. I’ve had to step up and say, “O.K., I am the teacher” and I just need to gain confidence in talking to an older adult.

Participant #3 stated:

I don’t have an EA that’s assigned to me personally, but I have them come in with particular groups of students [junior high]. So this term, I have probably worked with three different EA’s and last term I also worked with three. I find it really difficult. I’m not really sure what is o.k to ask and what isn’t o.k to ask and I’m not sure what their primary responsibilities are. When they come with one student, I know that their primary responsibility is that one student, but when they’re assigned to a class, I find it hard to figure out what’s o.k. to ask them to do. I know that the ones that come in with specific students, like if they’re attached to a student, they’re responsibility is that student and sort of helping them get through, so I’m not too worried about them.

Participant responses indicate that classroom teachers work with educational assistants in various capacities in the classroom. They may assist with:

- Starting out the day
- Morning tasks
- Homework and agenda checks
- Provide one on one assistance to struggling students while the teacher is engaged elsewhere in the classroom
- Assist with classroom management, and
- Assist with reading comprehension, discussion and writing.

An emerging theme indicates that all of the teachers work with two or more educational assistants through the course of the day. Two teachers stated that they had not worked with EA’s prior to their first year of teaching. One teacher stated they did not bring any experience to directing the work of an EA as they had only worked with an EA once before during their student practicum and that EA had only been present for half of the day, and then the cooperating teacher was directing the work of the EA. One teacher identified the learning process as a “learning curve”, involving collaboration with the resource teacher, feeling young compared to older EA’S and the need to develop confidence. Another respondent identified not being sure what’s o.k and what is not o.k to ask the EA to do.

**Personal Experiences Directing the Work of an Educational Assistant**

When asked about personal experiences directing the work of educational assistants, participants replied as follows:

Participant #1:
What I do is if there is something that they can quickly help me with right away, then I’ll direct them to that, sometimes it’s photocopying something quickly, or if I know a student is struggling, then they can go to that student. I have a bin in the classroom of just kind of odd jobs that if there is nothing to do, they can go to that bin and just help me out that way. At the end of the day during our guided reading time, I talk to him/her about something new that I want him/her to do. Sometimes he/she takes one student specifically and helps them, either guiding through something they have just read, or helping them write down something. Students really appreciate just having him/her around to talk through what they have read.

Participant #2:
