The National Council of Teachers of Mathematics (NCTM, 1989, 1991, 2000) emphasizes teaching Mathematics aimed at understanding and applications. Exercises aimed at the capacity to explore, conjecture and reason logically, as well as use a variety of mathematical models effectively to solve non-routine problems. The idea of developing Mathematics this way is based on the reasoning that this discipline is more than a set of concepts and skills to be dominated, it includes methods of investigation and reasoning, means of communication and notions of context. But for this fact to occur in the classroom, the teacher needs to be capable of using a variety of practices in the classroom that contemplate such needs.

Good teaching practices in Mathematics contribute to learning being able to keep up with scientific and technological progress. Teaching this discipline cannot be limited to reproductions or labeling and identifying things, it needs to be aimed at production; in other words, the student must know how to solve problem situations present in his day to
day life, to apply Mathematics to their social context, and not only in situations presented in the classroom, since Mathematics is one of the strongest factors of social progress, due to its absolute universal dominance over all other disciplines, even the native language.

However, in classroom practice, what we see are practices contrary to teaching which enables the student to build his mathematical thinking. Most students do not use Mathematics from the classroom in real life, they learn how to do mathematics exercises, but they do not learn why or what to do them for; that is, they cannot see where to apply Mathematics in real contexts (Zaslavsky, 1994; Whitney, 1987).

This can be related to the resistance and/or the difficulty of many students in learning Mathematics, since it is being worked on in a very decontextualized way, disconnected from thought, from action and from understanding; in other words, mathematical content is approached in an instructional way, and mainly, algebraic. This denomination is used in a pejorative sense, to designate that which is complicated, attributing meaningless memorizations and repetitions to Mathematics, and not to the algebraist mathematician himself.

Algebraist teachers, according to teacher José Ferraz de Campos, waste time “[…] by proposing and cramming the students with abstract, uninteresting and fastidious difficulties, instead of searching within the endless wealth of facts and circumstances from ordinary life, the necessary data for organizing useful problems.” (apud Tahan, 1961, p. 62).

Perhaps this algebraist influence is due to teacher education itself, which often falls short of the necessary minimum. Whether it is easier to be algebraist with the students, instead of thinking with them, discussing and/or providing them with discussion and/or understanding, since, providing an opportunity for understanding requires courage and mainly a holistic command of the discipline, which is sometimes difficult for a teacher
from this area, and certainly much more difficult for those with only a general education and those prepared to teach in the initial grades.

There is also a certain discrepancy between what is understood as a teacher of Mathematics and a mathematician. There is, according to Fiorentini and Lorenzato (2006), a relative difference between the two: the mathematician is directed towards Mathematics in itself, while the teacher/educator mathematician conceives it as a means, a tool for student development, trying to promote education through Mathematics.

One attributes the algebraist nature of the students to the algebraist teacher; that is, he is not a Math teacher and not a mathematician, seeing that the latter aims to produce new knowledge and mathematical tools that enable the development of the Science, while the former has his teaching practices focused on the student. If this teacher is not a mathematician and not a teacher of Mathematics, what is left for him to be is an algebraist.

According to Fragoso (2001), routine is parallel to algebraism. The algebraist practice is a symptom of routine, provided by improvisation, that is, there is no class preparation. Even if one has broad experience (or repetition), planning is still necessary, in order to avoid the lack of variety and to make the classes more dynamic. But, for this, it is necessary to have a teacher who craves for improvement, who is concerned with the evolution of knowledge, who has a quality education and uses it in his teaching practice. According to the National Curricular Parameters, “part of the problems referring to teaching Mathematics is related to the teaching education process, with respect to initial education as well as to continuing education.” (Brasil, 1997, p. 24).

Through the whole attributed to the Math teacher, one can say that it is not interesting for him to know ‘a lot of Math’; what matters, is knowing how to teach it well, since, in the teaching and learning process, he is a guide, an advisor, the one who
organizes and creates learning conditions which are able to spark the interest of the
student and encourage him to act, to think mathematically and to learn. However,
knowing how to teach Math is not an easy task; this requires constant study. This enables
the Math teacher to better combine theory and practice, to diversify his teaching
strategies (good teaching practices), to discuss and share experiences or knowledge, in
other words, to improve his methodology.

Martinez and Cervone (2008) claim that research has proven that an improvement
in the results of student learning is directly connected to improvements in teaching
practices. Stein (2001) argues that better teaching practices in Math include activities
centered on important mathematical ideas, the use of multiple representations of concepts
as well as of the procedures involved, which can be solved through innumerous
strategies.

Some authors present the dissemination of good teaching practices, such as aspects
relevant to quality higher education (Chickering and Gamson, 1987). Carrol and
McConchie (1998) analyze the advancement of the quality of Higher Education based on
the conception of learning organization; in other words, learning at this level of teaching
needs to be connected to good practices, since they contribute to a quality university
education, as well as to the quality of the teaching institution.

It is thus necessary to have a quality university education, which enables the future
teacher to develop good teaching practices, that is, an education that enables the
construction of a methodology capable of improving the teaching and learning process of
Mathematics, through multiple teaching strategies, and not simply with the use of “spit
and chalk”.
THE TEACHER OF MATHEMATICS: good practices permeating his work

Every teacher, inevitably, adopts a pedagogical perspective; that is, they use teaching and learning theories, since pedagogy is nothing more than the teacher’s practice, in which he is constantly exposed to situations that only he can solve, without recipes or models, but within his capacities and limitations. In this sense, the condition that there is no such thing as work without technique extends to the issue that there is no teaching and learning process without pedagogy. This means that pedagogy is aimed at all of the aspects that can influence this process, seeing that the content to be taught requires necessary transformations and adaptations in order to be understood by the group that is being ‘taught’, making the management of the subject matter a pedagogical challenge. To overcome this challenge, the teacher needs to have total command of the content, which facilitates and enables the development of unique techniques and/or those adapted to the situation, in other words, the good use of a set of good classroom practices.

One cannot say that a methodology or practice is better than another, but that a set of them can contribute to the better learning of Mathematics. The conception of good teaching practices, especially in teaching Mathematics is pointed out as a good path that provides different forms of teaching, hence different forms of learning. This is essential to the teaching and learning process, since this way each teacher is unique, the students are as well, and the different forms, practices, or paths used for learning enable the contemplation of different learning styles, that is, they increase the chances of a greater number of students learning better.

There certainly is not one teaching practice better than another, which is why the use of a varied set of them can provide a better teaching and learning process. This
refers to a methodological practice aimed at understanding and not memorization, to applicability and not to repetition, in connection to reality and not dissociated from it, since diversity broadens the possibilities of learning. If this practice is used and developed for teaching Mathematics, this discipline can become easy, feasible and interesting for the student, since he begins to understand it and apply it to his daily life.

The methodological suggestions or diversity of teaching strategies are formed by a vast spectrum of practices, which can be adapted, improved or rejected by the teacher, depending on the situation where they are given applicability. Within this set of practices, the use of analogies and metaphors is mentioned; problem-solving; mathematical modeling; the formation of study groups and monitoring; classroom research; the use of para-educational as well as educational books; practicing Mathematics in teaching workshops; the use of mathematical games; interdisciplinarity; transversal topics; the use of new technologies and other situations that contribute to non-routines in the classroom.

However, a list of diversified activities and/or practices can become valid only when enriched by the creativity and dynamism of the teacher, but this follows from a quality teacher education, from a continuous process of continued education.

FINAL CONSIDERATIONS

When the teacher builds his practice over the years, transforming his knowledge into an identity and know-how, he is investing in his own teaching methodology, providing quality teaching, hence a good learning process. When the teacher thinks about his work in a critical and reflective manner, reinforcing his ideas and consolidating them with relevant theories, he is being a true teacher, since he is
pursuing ways to improve his work, that is, to improve the teaching and learning process.

Observe that teacher education does not take place in a decontextualized manner or from one day to the next, it happens, it is built and rebuilt in time and with time. It is never ready and complete, it is under constant development. But, for this, the teacher needs to be present and be different over time and not just go through the motions.

Teacher education, with an emphasis in this article on teachers of Mathematics, brings attention to an education aimed at the capacity to use different teaching and learning strategies, that is, the relevance in adjusting the guidelines of good practices. They can provide a continuous improvement in the quality of learning, increasing, this way, the academic success of the students and answering the scientific and technological demands of the 21st century.

COLLABORATION AMONG THE TEACHER EDUCATION INSTITUTIONS: 
THE PAFTE-CAVITE EXPERIENCE

Olivia M. Legaspi, EdD
Vice Chancellor for Academics and Research
De La Salle University-Dasmarinas, Dasmariñas City, Cavite, Philippines 4115
omlegaspi@dlsud.edu.ph

Abstract

The Philippine Association for Teacher Education (PAFTE) is a network of caring and competent teacher educators engaged in continuing education, innovations, and scholarly works (PAFTE, 2008). When the dean of the College of Education of De La Salle University-Dasmarinas (DLSU-D) became the auditor of PAFTE Region IV-A Chapter in 2003, she, together with two other DLSU-D faculty, organized the provincial chapter. This was a response to the challenge posed by the Commission on Higher Education (CHED) IV-A Director to share the university’s expertise with the other teacher education institutions (TEIs) in Cavite.

Through documentary analysis and key informant interview, this paper presents the historical growth of the association from 2004 to 2010 focusing on its role in providing its member schools with standardized policies in teacher education and sponsoring training programs for teachers and students that aimed to equip them with the necessary competencies, making them more competitive yet retaining their individual personalities. Specifically, the paper discusses (a) the specific programs sponsored by the association, (b) the benefits received by the member schools, (c) the issues and concerns that threatened the sustainability of the association, and (d) the recommendations for possible areas that can be strengthened.

Keywords: collaboration, teacher education, school partnership

Introduction

Collaboration is defined simply in the Webster’s Dictionary as the act of working together. This term is used synonymously with teamwork, partnership, alliance, networking, and cooperation. This is oftentimes used not only in the industry but also among the government and nongovernmental units, as well as in the schools. Collaboration among schools has been a common by-word. In the Philippines, schools are challenged to engage in collaborative or networking activities to develop linkages for faculty and student exchange programs; to share best practices in teaching and learning and/or school management and supervision; to provide opportunities for joint training programs; to do cooperative researches; to provide venues for a short visit; or to exchange books, journals, teaching materials, scientific papers, research reports, and other academic information. These are generally the contents of the Memorandum of Agreement (MOA) or Memorandum of Understanding (MOU) entered into by the two schools collaborating with one another.
Slater (2004) mentioned that “the ability to work collaboratively with others is becoming an essential component of contemporary school reform”. She further stated that “as school systems in many countries have restructured their organizational features and activities, the need to develop a more collaborative approach has been a part of the direction”.

In conjunction, Inger (1993) and Garmston and Wellman (1999) discussed the need for a meaningful teacher collaboration. They asserted that “teacher collaboration produces significant benefits like improving student learning”. Likewise, “collaboration and collective learning are considered as part of the characteristics and requirements in forming professional learning communities,” according to DuFour and Eaker (1998) and Hord (1997). On the other hand, the National Staff Development Council (2010), as well as Riel and Fulton (2001), highlighted the role of technology in collaborative professional learning where they will be “able to share ideas, strategies, and tools with one another through interactive ways”. All these point to the importance of “collaboration or the formation of partnerships amongst schools” which is a trend that is noted in society today (Slater, 2004).

The formation of partnerships among schools is not a new concept among Philippine educational institutions. The Mendiola consortium, which is based in Manila and was founded in 1974, has been a learning community for more than three decades. It derives meaning and success from the fruitful collaboration of the member schools’ involvement in the areas of research, faculty development, student development, and community service (Mora, 2009). The South Manila Inter-Institutional Consortium, which was also founded in 1974, is another example of a successful partnership that primarily aims to foster collaboration among member-institutions by maximizing resources through joint course offerings, restructuring of curricula, exchange of information and faculty for academic excellence, and sharing of facilities (Banaga, 2009).

The formation of partnerships among schools does not only happen through these samples of school consortia. Partnerships among educational institutions also happen when professional organizations whose leaders are academicians extend the membership to institutions and not only to individuals. This is the case of the Philippine Association for Teacher Education or PAFTE.

**Statement of the Problem**

This study presented the historical growth of the Philippine Association for Teacher Education (PAFTE) - Cavite Chapter since its inception in 2004, focusing on its role in maintaining strategic alliance among the TEIs in the province.

Specifically, the following questions were answered in this study:

1. What programs were sponsored by the association for the Education students, for the Education teachers, and for the cooperating teachers and principals?
2. What benefits were received by the Education students, the Education teachers, and the cooperating teachers and principals?
3. What issues and concerns threatened the sustainability of the association? and
4. What other areas can the association strengthen to improve its services to its members?
Methodology

This study is a qualitative research that specifically used the documentary analysis and key informant interview techniques in gathering the data needed to answer the specific problems of the study. The documents that were studied and analyzed were the following: PAFTE-Cavite minutes of the meetings, letters, resolutions, attendance reports, and evaluation forms, as well as the issues of DLSU-D Newsette and DepEd endorsements. For the key informant interview, there were six officers who were interviewed regarding the benefits gained by the TEI students and faculty on PAFTE-Cavite activities, problems encountered in terms of these activities, and the areas to improve on and their recommendations for such improvement. The officers interviewed were the active members of PAFTE-Cavite Chapter. Aside from these officers, the secretary of the former dean of the College of Education (COE), DLSU-D was also interviewed since she was the key person who has contacts with all the member schools.

Findings and Discussion

PAFTE is a network of caring and competent teacher educators and is a prime mover for quality teacher education. It is a learning community of teacher leaders engaged in continuing education, innovations and scholarly works. It is an advocate of the teaching profession and a prime mover for national development (PAFTE, 2008).

PAFTE as an organization has the following objectives:

1. To promote and maintain unity, professionalism, and excellence among teacher educators, TEIs, and professional teachers;
2. To raise and maintain standards of teacher education and enhance the nobility of the teaching profession through effective leadership and enlightened fellowship;
3. To stimulate, support, and undertake researches, and other scholarly works and innovation that will contribute to the improvement of teacher education;
4. To disseminate new knowledge, information, and materials through publications, seminars, workshops, lectures, conferences, and other forms of continuing professional education activities; and
5. To serve as partner of the Philippine Government in promoting national development through preservice and in-service teacher education.

Membership in the PAFTE is through the regional PAFTE organization. The PAFTE is present in all the 17 regions (Regions 1, 2, 3, 4A, 4B, 5, 6, 7, 8, 9, 10, 11, 12, 13, NCR, CAR and ARMM) of the Philippines. Each region has a complete set of officers and adopts the national PAFTE constitution. Any member should belong to the regional chapter.

At the DLSU-D, the faculty members and administrators of the College of Education (COE) are all members of PAFTE Region IV-A, the university being part of the CALABARZON area. On 24-25 July 2003 during the PAFTE’s 8th Annual Regional Convention, the dean of the COE was elected auditor of the PAFTE Region IV-A while two other COE faculty members were, likewise, elected as members of the Board of Directors (published in Newsette 2003).
In the courtesy call made by the PAFTE Region IV-A officers to the Commission on Higher Education (CHED) Region IV-A Director, Dr. Isabel Inlayo, on 16 June 2004, she discussed the importance of provincial clustering among schools. This concept was in line with CHED’s thrust of monitoring higher education in the country’s different regions. She recommended that areas for improvement in curricular offerings, identified through self-assessment, be met through the sharing of both material and human resources by schools within the same province (published in Newsette, 2004).

Responding to the challenge posed by the CHED Region IV-A Director, the COE dean called for a meeting of the deans and/or heads of TEIs in Cavite on 27 August 2004. Aside from DLSU-D, this was attended by 11 other TEIs as follows: University of Perpetual Help of Rizal-Molino, Colegio de Salitran, Immaculada Concepcion Colleges, Rogationist College, Imus Institute, Southern Philippines Institute of Science and Technology, Philippine Cambridge School, Emilio Aguinaldo College, Cavite State University-Indang, St. Jude College, and Eulogio “Amang” Rodriguez Institute of Science and Technology-GMA. The presiding officer explained that the meeting was called for to organize a PAFTE provincial chapter, which was in line with the thrusts of CHED IV-A and PAFTE, and to pave the way for the sharing of resources among the Cavite TEIs, thereby further improving the quality of education offered in the said institutions. The said meeting also resulted in the discussion of the following items: involvement of student teachers, seminar-workshop for the faculty and administrators of the TEIs, as well as for the cooperating teachers and principals, memorandum of agreement for the Student Teaching Program, Observation and Participation/Community Immersion, and review center for Licensure Examination for Teachers (LET) in Cavite (reflected in the 27 August 2004 minutes of meeting).

In the preceding meetings called, the membership of the association expanded to include these other schools: Philippine Christian University, Western Colleges, St. Francis of Assisi College, University of Perpetual Help of Rizal-GMA, Cavite State University-Rosario, Cavite State University-Naic, St. Joseph College, Polytechnic University of the Philippines-Maragondon, and Olivarez College, increasing the provincial membership to 21 schools. This was the start of the collaboration of teacher educators in Cavite which resulted in the sponsorship of 11 activities from year 2005 to 2010.

Table 1 reflects the 11 activities that were sponsored by PAFTE-Cavite since its inception in 2004. Five of these activities were specifically for the fourth year Education students aimed to further hone their skills in teaching and managing classroom situations. Three were allotted for the cooperating teachers and principals who helped the TEIs in developing the needed teaching competencies of the future teachers. Two were intended for the faculty members as they were helped in improving their assessment skills and their ability to prepare appropriate syllabi. One was intended for the graduates of these TEIs so that they would be ready to take and pass the board examination. This activity, however, in spite of the good number of attendees as reflected in the attendance sheet, was not repeated. There was also no record on how they performed in the board exam, which could have been the best evaluation for the success of the activity.

It can also be gleaned from the table that the topics for the activities sponsored by the association were relevant to the needs of the participants. However, the number of activities sponsored for
Each year was not equal and there was a year, 2008, when no activity was done. This was commented on by one of the officers of the association when he was interviewed.

Further perusal of the documents revealed that aside from the activities listed, PAFTE-Cavite also paved the way for the Cavite TEIs to be members of the National Council of Education Deans (NCED) and to attend the workshop it sponsored on the “New CHED Teacher Education Curriculum” held on 27 September 2006. The workshop provided details to current course descriptions and formulated selected course syllabi in the undergraduate areas of specialization of science, mathematics, language, social studies, and special education.

Through the key informant interview, it was pointed out that one major accomplishment of the association was the endorsement of the Department of Education, Cavite Province on the standardization of policies for the Student Teaching Program. This was made possible through a meeting attended by the deans of the Cavite TEIs, the Assistant Schools Division Superintendent and one Division Supervisor from the Department of Education, Cavite Province on 2 September 2005. They agreed on the amount and distribution of the practicum fee paid by the student-teachers. A sample of the MOA for the Student Teaching Program was also drafted. This means that cooperating schools will no longer compare the practices of two or three TEIs who sent their student-teachers for immersion.

Aside from the list of PAFTE activities, the benefits received by the participants were also identified. From the interview conducted with the PAFTE-Cavite officers, it was revealed that the activities sponsored by the association were beneficial to the participants, both students and faculty. Specifically, they enumerated the following as the benefits derived from these activities:

1. PAFTE activities provide opportunities for faculty and students to grow professionally. The various activities keep the faculty members and students abreast with the latest development in the field of education, provide networking and linkages for both faculty and students, provide opportunity for exchange and adoption of best practices done in other member institutions and serve as the clearing house for coordinating CHED policies with DepEd for better implementation of CHED memoranda regarding teacher education.

2. The faculty members and students were provided updates on the latest issues about the latest trends in education. They were also given the chance to know the latest programs of DepEd and CHED. They were able to meet people who were also in the field of education. Students and faculty got to meet their counterparts from the different teacher education institutions in the province. They were given the opportunity to exchange notes with their counterparts from the different educational institutions as well.

3. The activities of PAFTE-Cavite have brought new life to prospective teachers. Definitely, they have learned a lot not only to renew their commitment to teaching but they also gave different colors to those who are shifting to teaching even if they are not education graduates.

4. Students gained more knowledge regarding new teaching strategies and met new friends from the other TEIs. The faculty members learned new technologies and methodologies from the seminars given by PAFTE-Cavite.

5. Students are more aware of the new trends and new thrusts of the College of Education. They become well-informed after attending the seminar. The faculty members learned different methods and new styles.

6. Students were updated and they learned new information. The faculty members learned new things after they attended the seminar.
In spite of these benefits, the officers were also asked about the issues and concerns that threatened the sustainability of the association. Four of them said that they experienced no problem with the association and its activities. One mentioned about the problem on venue not being able to accommodate all the student-participants. Another one said that there was a time when there were very few attendees, hence, there was an excess in food and hand-outs. The problems mentioned were all due to poor communication among the organizers and the participating schools.

Perusal of the documents also revealed that one of the concerns faced by the association was the irregular attendance of half of its members. From the 21 member schools, usually only 10 were represented in the meetings called. This probably caused the problem in the attendance of the participants since not all were present to disseminate properly the information discussed in the meeting.

When asked about the other areas that the association can strengthen to improve its services to its members, the interviewees gave the following recommendations:

1. PAFTE should continue to provide more activities to upgrade the quality of teacher education in the province and to increase the passing rate of the different member institutions. In this line, it is recommended to involve all TEI representatives in planning annual activities and create various committees to work on the above undertaking;

2. There is a need to have a long preparation, specifying the duties of the officers; and

3. Junior PAFTE membership should be continued.

The recommendations focused on the provision of more activities. This implies the need of the member TEIs for a training program for both their faculty members and students. In relation, to make these activities more successful, there is a need to plan out carefully the activities and to ensure that each officer performs the tasks assigned to him/her. The last recommendation is worthy to consider since the creation of Junior PAFTE, composed of fourth year Education students, paved the way for better camaraderie among the students. Their leadership skills were also honed since they were allowed to work together in some of their activities.

Taking all these things into consideration, the officers were asked if the PAFTE activities are worth continuing. The resounding answer was “Definitely YES, PAFTE-Cavite activities are worth continuing because they serve as an avenue for updating the TEIs in the province of the changes and development in education. Likewise, PAFTE-Cavite serves as a very good partner in preparing the future teachers in facing the challenges of the profession”.

Summary

The study showed the growth of PAFTE-Cavite. The various activities sponsored by the provincial chapter have impacted on the training not only of the Education students but also of the Education faculty and the cooperating teachers and principals. They gained new knowledge as they learned updates on the latest developments in the field and they collaborated with each
other. This collaboration resulted in a strong partnership among the member schools and produced harmonious working relationships among the faculty and the students. Problems met were very minimal and were easily solved. The association shows a strong leadership but needs more open communication and more support and cooperation from the members. There is a need for the provision of more activities and the revival of the Junior PAFTE membership. All in all, PAFTE-Cavite was able to perform its role as a provider of standardized policies in teacher education in the province and as a sponsor of training programs for teachers and students that equipped them with the necessary competencies, making them more competitive yet retaining their individual personalities.

EMERSION ON DEVELOPMENT ORIENTATION OF CAVITE
PROVINCE PNP: IMPLICATION TO POLICE ENHANCEMENT PROGRAM

Dausan, Alrien Francisco

afdausan@mail.dasma.dlsu.edu.ph

De La Salle University -Dasmariñas

ABSTRACT

This study was conducted to analyze the emersion on development orientation of the Cavite Province PNP and its implications for police enhancement program. The survey instrument used was the Modified Development Value Orientation for Law Enforcers, which was anchored on International Studies. This value orientation was composed of the following: commitment to innovation, action propensity, concern for economic development, and concern for economic equality, concern for public participation, local commitment, conflict avoidance, and selflessness.

The 213 respondents were subjected to the Modified Development Value Orientation of Law Enforcers. The survey instruments used in this study were subjected to dry run validity in the selected Police Stations in the Province of Batangas. The data gathered in the final revision of the survey questionnaires were used to answer the sub-problems of the study.

Based on the results of the study, the strengths and weaknesses of the men-in-uniform will serve as re-training to enhance police orientation in order to address the needs and demands of the community; to serve as inputs in the formulation of the new policies and other related decisions of the PNP, for the revitalization of the police career, education and training and for the improvement of the police efficiency and effectiveness.

Introduction
Development is a multidimensional process involving major changes in social structures, popular attitudes, and national institutions, as well as the acceleration of economic growth, the reduction of inequality, and the eradication of poverty.

There are three basic components of core values that should serve as conceptual basis and practical guideline for understanding the inner meaning of development. These core values – sustenance, self-esteem, and freedom – represent common goals sought by all individuals and societies. They relate to fundamental human needs that find their expression in almost all societies and cultures at all times (Todaro, 1997).

Mahatma Gandhi is considered as the forefather of development. His thought on development was focused on development “from below.” The People Power is an example of the development from below which was meaningful and a significant event in the lives of the Filipinos. The dramatic radical change of the country was felt not only here but also in the entire world.

For development to take place, development orientation is necessary. Development orientation is grounded on the concept of development. This is a set of values for development as spelled out by the International Studies of Values in Politics. As such, it was originally used to measure the degree of commitment of peace officers. It also measured the agreement and disagreement of people on their development values.

The thrusts of New Public Administration include: an emphasis on the values that animate both the discipline and its practitioners, a dissatisfaction with bureaucracy and thus a search for alternative delivery systems; and a
discovery that policies and programs need direct attention, not just through the staff functions. Thus, the content areas for this variety are studies on public service values and ethics and accountability, alternative delivery systems, and public policy and programs administration (Cariño, 2002: 8).

On public service values, two papers were published in 2002. They predated the American new PA by almost a decade, suggesting that the Philippine concern on this issue has not been triggered by any colonial mentality. Bureaucratic self-discipline was the focus of the third paper published in 1973. In the same year, a set of values collectively called “development orientation” was conceptualized and public groups of public servants, notably career executives and school administrators as to their degree of development – orientedness. This was a research theme consciously made to serve the goals of development administration with its concern for commitment to change and growth (Cariño, 2002: 9).

In the foregoing statement, what is needed is a commitment to development. This commitment must be reflected in the expansion of the role of the police workforce as social agents of change.

**Background of the Study**

Widespread abuses and corruption are offshoots of police involvement in partisan politics. This paved the way for Republic Act 4864 which was otherwise known as the *Police Act of 1966: The Police Reformation and Professionalization Act*. To carry out its objectives at undertaking reforms in police performance at national level, the National Police Commission (NAPOLCOM) was created under the Office of the President. Despite its merits, the Act still failed obviously because of the “tayo-tayo” system. This
Act was short-lived as the Martial Law regime militarized the police.

Section 12, Article XV of the 1973 Constitution called for the establishment of an Integrated National Police (INP). Under Presidential Decree No. 765, the INP was established and composed of the Philippine Constabulary as nucleus and the INP as component under the Department of National Defense (DND). The PC remained and continued as a major branch of service of the Armed Forces of the Philippines (AFP). The power and functions of NAPOLCOM were transferred to the INP. The PC-INP then became a useful tool for intimidation and repression of the citizenry by the Marcos martial rule.

Learning its lesson, the Aquino Administration saw to it through its 1987 Constitution that the “State shall establish and maintain one police force, which shall be national in scope and civilian in character, to be administered and controlled by a National Police Commission.” Implementation of this mandate was effected by R.A. 6975 also known as “The Act Establishing the Philippine National Police under a Re-organized Department of the Interior and Local Government, and for Other Purposes”, which laid down the restructuring of the police organization. Coming into force on January 2, 1991, the PC was dissolved and thus, ceased to be the nucleus and organic component of the police organization. The Philippine National Police (PNP) was born.

Now, after nine years, the members of the Senate claimed that the civilian character of the PNP is not actually present or at least has not materialized in full. The widespread hysteria over the upsurge of organized crime in the nation and the scandals that plague the PNP organization pushed
the upper chamber to pass a PNP Reform Law. The senate bill version included a section on the “civilianization” of the PNP organization, thereby abolishing the rank classification of the PNP under R.A. 6975.

The final version is a consolidation of Senate Bill 2215 and House Bill 10089 which was signed into law on February 25, 1998 and was later known as R.A. 8551 or the “New Police Act of 1998: An Act Providing for the Reform and Re-Organization of the PNP and for Other Purposes”. The titles and rank classifications under R.A. 6975 were retained, however the educational qualifications for PNP members were advanced. This law is aimed at professionalizing the police service even more with the advent of higher education as a pre-requisite for admission in the police force. Field grade police commissioned officers are not spared the new requirement through the inclusion of post-graduate education as necessity to become a Chief of Police (COP).

Between the law and law enforcement always stands the policemen. Officers are entrusted with vast powers and they possess wide latitude of discretion to exercise these powers. The policemen must wear many professional hats to perform their roles with skill and success, including those of information processor, community organizer, crime analyst, counselor, street-corner politician, arresting officer, religious preacher, schoolteacher, liaison officer and arbiter. Any of these roles taken individually would require a high degree of education; collectively, they point out necessity for an educated police organization.

It must be frankly admitted that there exists a universal strong prejudice against the police. When strenuous efforts are being made in a police agency
to build up respect for the police and their morale, it is rather ungracious to
dwell on the efficiency of the police. But an understanding of the situation
with reference to crime makes it necessary to state the situation as it generally
prevails, and this means criticisms. The following are of the most common
criticisms, to wit:

- Some of the policemen are not educationally qualified and
  therefore, cannot cope successfully with criminals.
- The policemen are lack of training, and if ever trained, there were
  no sufficient equipment and other teaching aids used in the training.
- The Policemen are receiving less attractive salary as compared to
  other government employees, and therefore, highly qualified and
  competent people are not attracted to law enforcement profession.
- Police service is the last recourse of job hunters who failed to gain
  employment in their field of profession according to their
  educational qualification, thereby making the police service as
  dumping ground for lame duck job hunters, who in the first place
  have no interest in joining the police service, but for the sake of
  employment, they are now members of the PNP.
- The general criticism of the police is that, it is both inefficient and
  ineffective.

The criticisms seemed to boil down to the level and quality of education
of the police. This is a sad reality for the rank and file policemen. Over the
years, the police career education and training has always been considered
one of the rational and fundamental cornerstones for improving police
efficiency and effectiveness. Yet, the idea of continuing professional
education and training for police officers has evoked an awesome amount of emotional argumentation and debate. The controversies usually stretch from the mundane to the sophisticated, centering on the issue such as the benefits of higher learning, its implications on policing, its validity as a legitimate occupational necessity for police, the most type of educational and training experience for them and the quality of such programs available for the police.

Expanding the raison d’etre for police career education and training is a must in order to achieve professionalism. The need for communicative skills and the ability to express oneself capable are dimensions required of present day policemen. Even the most basic level of police communication task, which is report writing and the indispensable skills obtained through career education and training can really add significant dimension.

It must be recognized that the overall educational level of the public is likewise increasing. This poses a subtle, albeit grim obligation for the police. To succeed, they must be provided with the mental psychological tools, which are at least proportionate, if not superior to those of the general population whom they supposedly render public safety service.

A lot of queries delve today on the impact of education on the professionalism of the PNP. Will education really have any bearing or could it effect any change at all in the police services? How will a highly educated police force like the PNP cope with the present developments in crime, the community and globalization? Will the PNP just retreat into the fortitude and contentment of its past to cope with present realities or adapt to the present and future trends?

It is along these points that the researcher felt the need to look into the
emersion on the development orientation of Cavite Province PNP.

Statement of the Problem

This study aimed to explore and analyze the emersion on the development orientations of Cavite Province PNP and its implication to police enhancement program.

Specifically, it attempted to answer the following questions:

1. What is the level of development orientations of the Police Commissioned Officers (PCOs) as regards to the following:
   
   1.1 commitment to innovation,
   1.2 action propensity,
   1.3 concern for economic development,
   1.4 concern for economic equality,
   1.5 concern for public participation,
   1.6 local commitment,
   1.7 conflict avoidance, and
   1.8 selflessness?

2. To what extent is the level of development orientations of the Police Non-Commissioned Officers (PNCOs) as to the following:

   2.1 commitment to innovation,
   2.2 action propensity,
   2.3 concern for economic development,
   2.4 concern for economic equality,
   2.5 concern for public participation,
   2.6 local commitment,
   2.7 conflict avoidance, and
2.8 selflessness?

3. Is there a significant difference in the level of development orientation between the PCOs and PNCOs in the eight (8) development orientation values commitments as law enforcers?

4. How are the demographic profiles of the law enforcers related to the eight (8) development orientation value commitments of the law enforcers? Is there a significant relationship, if any?

5. From the findings, what implications maybe drawn for the police enhancement program?

SCOPE AND COVERAGE:

This study focused on the emersion on development orientation of the Cavite Province PNP and its implications to police enhancement program. The respondents of the study were chosen from seventeen (17) Police Stations in the Province of Cavite. There were 27 Police Commissioned Officers (PCO) or 12.67 percent while 186 Police Non-Commissioned Officers (PNCO or 87.33 percent with a total of 213 respondents.

The 213 respondents were subjected to the Modified Development Value Orientation of Law Enforcers, which was anchored from the International Studies of Value Orientation.

METHODOLOGY:

In this study, the descriptive-normative survey with the questionnaire and documentary analysis technique was used as the research method with the Province of Cavite as the research setting. The data were analyzed through the use of the following statistical tools: percentage, weighted mean, z-test and chi-square.
Findings

From the data collected and the sub-problems formulated, the following are the findings:

1. The PCO respondents indicated that they have high level of development in the commitment to innovation; concern for public participation; local commitment; conflict avoidance and selflessness. These were supported by the obtained overall means of 3.62; 3.52; 3.57; 3.58 and 4.01.

On the other hand, they also revealed that there levels of development orientation were only moderately high in action propensity, concern for economic development and concern for economic equality. These findings were supported by the obtained overall means of 3.32, 3.28 and 3.26.

2. The PNCO respondents have similar development levels were they revealed that they have high orientations in commitment to innovation; commitment to local concern; conflict avoidance; and selflessness. These findings were evidenced in the obtained overall means of 3.63; 3.66; 3.57 and 3.93.

On the other hand, the PNCOs indicated that action propensity, concern for economic development, concern for economic equality, and concern for public participation were moderately high as supported by the obtained overall means of 3.32; 3.30; 3.27 and 3.44.

3. The PCOs and PNCOs significantly differ in their development orientation as to the concern for public participation. This finding was supported by the obtained Z-value of 2.071, which is much higher than the tabular value of 1.97 at .05 significant level. The hypothesis is
therefore rejected.

It is also noted that no significant differences were found between the PCOs and PNCOs level of development orientation in the areas of commitment to innovation; action propensity, concern for economic development; concern for economic equality; local commitment; conflict avoidance and selflessness. These findings were evidenced by the obtained Z-values of .035; .673; 1.460; 1.520; 1.058; .844 and 1.108 which were much lower than the tabular value of 1.97 at .05 significant level. The hypothesis is therefore accepted.

4. The PCOs and PNCOs indicated that educational attainment and length of service in the PNP are significantly associated with the eight (8) development orientation since the obtained chi-square values of 48.623 and 111.074 were much higher than the tabular value of 41.337 with 28 degrees of freedom at .05 significant level. The hypothesis is therefore rejected.

On the otherhand, no significant relationship existed between the eight (8)-development orientation value commitment and the gender, civil status, age bracket and the type of HEIs, the criminology course taken. The obtained chi-square values were much lower than the tabular value at .05 significant level. The hypothesis is therefore accepted.

5. These are implication that maybe drawn from this study such as: revitalize RA 8551 which aimed at professionalizing the police service; organize and conduct more continuing staff development programs; implement the immersion as an approach to criminology education for future policemen; strengthen the career development orientation programs and
likewise consider the recruitment and promotion of more female PCOs to promote the gender development in the Philippine National Police.

Conclusions

From the findings of the study, the following are hereby concluded:

1. The Police Commissioned Officers and the Police Non-Commissioned Officers who are assigned in the different Police Stations in the Province of Cavite are willing to sacrifice for others and to divest one’s own interest for the peace and order in the community. They are also committed to innovate changes in the PNP by creating new ideas or solutions to community peace and order problems.

2. The Police Commissioned Officers and the Police Non-Commissioned Officers in the Province of Cavite strongly believe on risk-taking as important component to effectively and efficiently deliver peace and order services to their constituents in the community through innovations, challenges and changes in the Philippine National Police.

3. There are strong indications that the Police Commissioned Officers and the Police Non-Commissioned Officers have the tendency to effect internal and external changes in the organization of the PNP for better service in accordance with the needs and demands of the community.

4. The Police Commissioned Officers and the Police Non-Commissioned Officers have developed high sense of volunteerism and is willing to share their expertise, experiences and education to others in the community without expecting any reward.

5. There are significant implications that may be derived from this study such as the identification on the strength and weaknesses of the men-
in-uniform which will serve for the re-training to enhance police orientation; may serve as inputs in the formulation of policies and other related decisions of the PNP; revitalization of the police career, education and training that has always been considered one of the fundamental cornerstones for improving police efficiency and effectiveness.

**Recommendations**

From the conclusions drawn in the study the following recommendations are hereby forwarded:

1. Since there are strong manifestations that the Police Commissioned Officers and the Police Non-Commissioned Officers have developed high commitment to police work, there is a need to capitalize on these to strengthen the good qualities through continuing career development programs with appropriate budgetary allocations from the agency concerned to fully implement the programs.

2. There is a need to adhere to the development career doctrine in the entire PNP organization since the police is the most important factor in development which in the process he becomes more self-reliant and at the same time interdependent on one another.

3. Since the police officers have not fully internalize the conflict avoidance which is akin to “pakikisama”, they should be made aware that this value may not contribute to the effective and efficient delivery of peace and order services in the community. This may be done through re-training of the policemen on a periodic basis.

4. There is a need to take cognizance on the implications drawn
from this study. Doing so will make the PNP leadership aware that re-training and immersion program will contribute to the quality service among peace officers in the community.

5. It is recommended that the results of this study be disseminated to all concerned agencies for their information and guidance as regards to the development orientation value commitments of the police work.

6. It is further recommended that similar studies be undertaken particularly on the interpersonal values, personal and values and police work values in order to fully understand the PNP as an organization.
Introduction

A nation needs a protector from any threats, the lives of its people should be preserved, and their rights and beliefs should be protected. Nowadays, terrorism and coercion from the so-called “outside forces” are much unbridled. These outside forces are the different groups of criminals who have their own way of earning the negative way of living and threatening the security of the nation. Crimes committed by these groups of people are one of the main problems of the Philippines and other nations in the world. As a response to these problems, the law enforcement agencies developed different plans and programs to address these needs with the help of the community through its continuous cooperation. The PNP has developed different programs and activities in Police Community Relations and has implemented to persuade support from the community.

Pace (1991) states that understanding the over-all crime prevention, crime suppression, and the limitations of the criminal justice system are needed to understand the complexity of community relation. Relating the purpose of community relations to the contemporary culture and crime is necessary to glimpse the need for improved community relations. Furthermore, he defines community relations as “The total effort of the criminal justice to become a part of the community” (p.5). These factors that contribute to the community relation as a whole are human interaction, human relation, community crime prevention, community interaction and public relations. Citizen, components of the criminal justice system and different institutions especially the
school, should support and cooperate with each other to confront crime.

Community partnerships should begin particularly in school, which is composed of groups of people like students, teachers, staff and administrators within its area of learning. These groups of people play a vital role in establishing partnerships between schools and the police. Both should play on the same team and police visibility is a positive pointer that they are giving guarantee that the schools are safe and conducive to learning.

Presidential Decree 603 states that the child is the most important asset of the nation. Every effort should be exerted to promote his welfare and enhance opportunities for a useful life. The molding of the character of the child starts at home and other institutions like the school, church, the guild, and the community in general should assist the home and the state in the endeavor to prepare the child for the responsibilities of adulthood.

Different sectors and institutions especially the schools are important in helping the country to build a strong foundation and solidity of the future of the children. Furthermore, provincial and national government officials shall see to it that school children and students are provided with adequate school rooms and facilities. Such officials should also see to it that the school environment is free from hazards to the health and safety of the students (Art. 45 PD 603). In the matter of safety and security situation, children’s education can be affected by crime and violence inside and outside of the school. To prevent this obstacle, the school should realize the value of maintaining good community relations, especially with the law enforcement agencies.

According to Pace (2007), mutual trust, cooperation and support of the community and the criminal justice agents are considered as a complex process. The justification of developing good community relations can be best understood from the programs and activities developed and implemented by the community and the police. The police should gain the confidence of the members of the community for them to be able to work hand-on-hand to battle the threats in the society. Support, cooperation and coordination from the different sectors especially the government, school officials and others is necessary in order to solve the problems.

O’Brien (as cited in the work of McCamey, et al., 2003, p.197) pointed out the
nature of police community relations, He states that:

*The central position of the police in the community critically affects all sections of society. The multiple duties of the police at all times and in all areas of the community dictate that they must influence the daily life of each citizen…*

*Unfortunately in recent times, there has been a rupture of mutual trust between the police and some segments of the community.*

In the same light, McCamey, et al. (2003) mention that the encounters between the police and other citizens can become problematic depending on the number of factors which include the impressions of both the police and the community that are brought to the encounter. Encounter settings (private or public, familiar or unfamiliar), number and types of participants involved, the degree of control exercised by the participants, and what actually happens during the encounter are some contributory factors that make the encounter of the police and the citizens to become problematic. Moreover, police community relations are composed of two components, the human relation and public relation. Reiss (as cited in the work of McCamey, et al., 2003, p.201) believes that “It is possible to exaggerate the difficulties involved in police encounters with other citizens. Most encounters are civil, characterized by some degree of mutual concern, understanding, and respect”. The efforts on behalf of the police to develop and present favorable image consists the public relation component.

In addition, Miller and Hess (2002) reveal that police should actively engage the community in problem solving to develop the community partnerships. Community partnerships and problem solving are the two core components of community policing. Sir Robert Peel (as cited in the work of Miller & Hess, 2002, p.481) believes that in modern policing, community support and participation is important to the police work for them to be effective. He further states:

*To maintain at all times a relationship with the public that gives reality to the historic tradition that the police are the public and the public are the police; the police being the only members of the public that are paid to give full-time attention to the duties that are incumbent on every citizen in the interest of the common welfare and existence.*

Public opinion of the police is shaped by a variety of factors. Police misconduct
can severely damage the image and integrity of a police department (Hickman, et al., 2004).

Police Community Relation is a concept and philosophy of the police designed to have a good and true relationship between the police and the community. These two important components of the society should work together to control, prevent crime, and eliminate threats in the security of everyone. Police becomes a part and member of the community by having an actual interface with society. Having a high crime rate and crime volume affects not only the safety of the members of the community but as well as the economic growth of a country and the future of our children.

The researchers aimed to measure the extent of implementation and effectiveness of Police Community Relations in District II of Cavite to identify its effectiveness in gaining the rapport, support and cooperation of the community in the fight against criminality.

**Statement of the Problem**

The study determined the implementation and effectiveness of the Police Community Relation Programs in District II of the Province of Cavite.

Specifically, it sought to answer the following questions:

1. What is the extent of the occurrence of the following offenses in the calendar year 2007:
   2.1 index crimes; and
   2.2 non-index crimes?
2. What is the extent of the implementation of the Police Community Relations (PCR) in District II of the Province of Cavite as regards the following areas:
   3.1 Building citizens-police partnership;
   3.2 Police adequate response to complaints in the community;
   3.3 Decentralization of police decision making; and
   3.4 Restructuring of police training and education?
3. What are the implications of the result of the study for crime prevention and control programs of the PNP in District II of Cavite?
Scope and Delimitation

The study covered District II of the province of Cavite. It is composed of one city and six municipalities. These are Trece Martires City and the municipalities of Imus, Dasmariñas, Carmona, General Trias, Tanza and General Mariano Alvarez.

The respondents were the police officers both commissioned and non-commissioned, and the citizen of each city and municipality. The research study was delimited only to answer the general and specific problems through the survey instrument to accentuate the following:

1. Assessment of the Police Community Relation Programs implemented in the selected municipalities and city.
2. Documentary analysis of crime rate and crime volume, the occurrence of criminal behaviour and offenses in crime statistics.
3. Assessment of the effectiveness of the extent of implementation of Police Community Relation Programs.

Methodology

In this study, the descriptive method of research was employed to assess and measure the implementation and effectiveness of Police Community Relations in District II of Cavite, consisting Trece Martires City and the municipalities of Imus, Dasmariñas, Carmona, General Trias, Tanza and General Mariano Alvarez.

The respondents of the study were the community members (students, teachers, barangay and Sangguniang Kabataan officials, professionals and other residents), and police officers, both commissioned and non-commissioned. Four hundred community members and 96 police officers with a total of 496 respondents participated in the study.

The study gathered the data from Trece Martinez City and the municipalities in District II of Cavite. The crime statistics, crime rate and crime volume were obtained from the respective police stations of the six municipalities. The data were analyzed and interpreted. The researchers wrote a letter to the respective Chief of Police of each police station and to the Barangay Chairmen to seek permission to conduct the study in order to obtain the necessary information. Survey questionnaires were used to measure the extent of implementation of Police Community Relation with regard to crime prevention and control. Percentage and weighted mean were the statistical instruments
used to analyze and interpret the data. Percentage was computed to obtain the relationship of the demographic profiles of each respondent with the total population. On the other hand, weighted mean was computed for the extent of implementation of Police Community Relation.

Findings

1. There are two classes of crime, the non-index crimes and the index crimes. Non-index crimes are crimes which are punishable by Special Laws while index crimes are those crime and offenses which are under the Revised Penal Code (RPC) or Criminal Law. Examples of index crime are robbery, arson, theft, murder, homicide, physical injury and others which can be seen in the RPC. On the other hand, non-index crimes are punishable under Special Laws such as car napping, estafa, illegal possession of dangerous drugs, illegal possession of firearm/ammunition and deadly weapons and the likes which is the punishment crime is provided by the Special Laws (www.pnp.gov.ph).

The crime statistics record of year 2006 and 2007 showed that there is an increase in crime volume in District II of Cavite from 754 in 2006 and 785 in 2007. There is a high occurrence of crime (index and non-index) in the area of District II in year 2007 compared last 2006. On the other hand, there is a decrease in crime volume in the whole Province of Cavite, composing of the three districts, which is 1,836 in 2006 decreased to 1,676 in 2007. The police and the community must coordinate and support each other to eradicate crime in their area of responsibility and it can be done through a good PCR (Police Community Relations).

According to Cavite PPO the recorded crime volume of 1,676 in 2007 was broken down to 987 index crimes and 689 non-index crimes as compared to 1,836 in
2006 with 1134 index crimes and 702 non-index crimes. There was a decreased of 160 crime incidents or 8.71%. Index crimes consist of crimes against persons and property. From the 987 index crimes, theft has the highest with 228 incidents.

The average monthly crime rate was pegged at 6.24 as compared to 6.32 in 2006 or 1.28% decrease. The index crime rate of 2007 is 3.68 as compared to 3.91 in 2006. The non-index crime rate of 2007 is 2.57 as compared to 2.42 in 2006.

The index crime solution efficiency of Cavite PPO for 2007 is 81.66% as compared to 83.95% in 2006, and there was a decrease of 2.73% and non-index crime solution efficiency for 2007 is 96.23% and 97.15% in 2006 or a decrease of 0.95%. The overall crime solution efficiency of Cavite PPO is 87.66% in 2007 as compared to 89.00% in 2006 or a decrease of 1.51%. The decrease of the crime solution efficiency was brought about by the 207 unsolved crime incidents reported.

In general, Cavite PPO is exerting all the efforts to maintain the peace and order situation within the Province of Cavite. Anti-criminality programs are set in place by the Chiefs of Police to reduce the crime incidents in their AOR (area of responsibility). Monthly COMSTAT conference is being held for the purpose of determining the crime prone areas of a certain locality and for the Chief of Police to be guided on where to deploy his personnel on certain days and hours. (Cavite PPO Crime Analysis for 2007)

| **Q 3.** The PNP is giving the community a knowledge and information pertaining the new laws, rules and ordinances. | 3.4450 | Often Implemented |
| **Q 4.** The PNP conducts programs to build and enhance the good relationship of the police and the community. | 3.4975 | Often Implemented |
| **Q 5.** The PNP helps in resolving problems in every barangay or community. | 3.58 | Often Implemented |
| **Q 6.** The PNP is active in coordinating with the citizens and officials of barangay to know the problems/concerns in the Community | 3.6500 | Often Implemented |
| **TOTAL** | **3.4778** | Often Implemented |

This implies that police community relation on building citizens-police partnership is observed by the community-respondents as often implemented. The respondents are aware of the extent implementation of Police Community Relation, therefore PCR officers are responsible enough in implementing their projects and activities by building a strong citizens-police partnerships.
TABLE 3

Frequency Distribution of Community-Respondents on the Extent Implementation of Police Community Relation (PCR)

POLICE ADEQUATE RESPONSE TO COMPLAINTS IN THE COMMUNITY

<table>
<thead>
<tr>
<th>Extent of the Implementation of PCR</th>
<th>MEAN</th>
<th>INTERPRETATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q 7. The PNP entertain the comments, opinions and suggestions of the community pertaining to the ways on eradicating or fight the criminalities.</td>
<td>3.60</td>
<td>Often Implemented</td>
</tr>
<tr>
<td>Q 8. The PNP responds and give solutions in the problems and concerns of the citizens.</td>
<td>3.61</td>
<td>Often Implemented</td>
</tr>
<tr>
<td>Q 9. The PNP serves the community very well, by providing quality service.</td>
<td>3.63</td>
<td>Often Implemented</td>
</tr>
<tr>
<td>Q 10. The PNP help the citizens in settling and resolving the Problems in the barangay or community.</td>
<td>3.8250</td>
<td>Often Implemented</td>
</tr>
<tr>
<td>TOTAL</td>
<td>3.663</td>
<td>Often Implemented</td>
</tr>
</tbody>
</table>

This implies that Police Community officers communicate with the community by regular meeting and implementing projects towards harmonious relationships and maintenance of peace and order in District II of the Province of Cavite.
### TABLE 4

**Frequency Distribution of Police-Respondents on the BUILDING CITIZENS-POLICE PARTNERSHIP**

<table>
<thead>
<tr>
<th>Extent of the Implementation of PCR</th>
<th>MEAN</th>
<th>INTERPRETATION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Q 1.</strong> Police communicate the philosophy and concepts of PCR through open forum, personal and news media or citizen’s meetings.</td>
<td>4.6250</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 2.</strong> Police discuss with the citizens what are the PNP plans and programs for a specific time and date.</td>
<td>4.4167</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 3.</strong> Police officers involved the elected barangay and local officials in the formulation and implementation of PCR programs and activities.</td>
<td>4.4687</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 4.</strong> At all organizational levels police participate in two-way communication with citizens and community leaders.</td>
<td>4.5000</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 5.</strong> All police personnel commit themselves for the implementation and success of PCR.</td>
<td>4.4479</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 10.</strong> Police Community Relation Officer socialize or interact with the community to gather information for the planning of PCR programs.</td>
<td>4.5417</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 12.</strong> Police officers coordinate with the other agencies with regards to PCR activities.</td>
<td>4.5833</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>TOTAL</strong></td>
<td><strong>4.5119</strong></td>
<td><strong>Fully Implemented</strong></td>
</tr>
</tbody>
</table>

It can be gleaned from the table that the overall perception of the police-respondents as regards this PCR on building citizens-police partnership is fully-
implemented and supported by the mean of 4.5119. It is important to note that the perception of the police-respondents is contrary to the perception of the community-respondents. The former perceived this aspect as fully implemented while the latter is only often implemented.

**TABLE 5**

**Frequency Distribution of Police-Respondents on the**

**POLICE ADEQUATE RESPONSE TO COMPLAINTS IN THE COMMUNITY**

<tr>
<td><strong>Q 9.</strong> Police identifies the needs in the implementation of PCR plans and programs.</td>
<td>4.4896</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 11.</strong> Police Community Relation Officer use the available data and information as basis for the formulation of PRC plans and programs.</td>
<td>4.4792</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 13.</strong> Chief of Police decides on what plans and programs for PCR should be implemented in his area of concerned.</td>
<td>4.3438</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td><strong>Q 16.</strong> Chief of police identify the problems in PCR to come up the solution for the enhancement of the organizational policy and training of the officer.</td>
<td>4.4167</td>
<td>Fully Implemented</td>
</tr>
</tbody>
</table>
Q 17. Police officers are required by the chief of police to undergo a series of seminars or schooling that will help in the improvement of all aspects of PCR.

Q 18. Chief of Police assigned police officers who are experienced in dealing with the community.

Q 19. Police officers welcome the comments, opinion, and suggestions of the community and use it as basis for the formulation of organizational policies, methods and procedures.

| TOTAL | 4.4458 | Fully Implemented |

This suggests that the police are closely coordinating with the community, and the programs and activities are based on the needs of their area of responsibility. Also the voice of the community is being heard and considered in the formulation of a valuable scheme towards a peaceful community.

**TABLE 7**

Frequency Distribution of Police-Respondents on the RESTRUCTURING OF POLICE TRAINING AND EDUCATION

<table>
<thead>
<tr>
<th>Extent of the Implementation of PCR</th>
<th>MEAN</th>
<th>INTERPRETATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q 14. The police and the community officials meet or attend seminars to come up PCR programs suited to the needs of the community.</td>
<td>4.5104</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td>Q 15. Police officers are given seminar to enhance their inter-personal and intra-personal relationships.</td>
<td>4.4687</td>
<td>Fully Implemented</td>
</tr>
<tr>
<td>TOTAL</td>
<td>4.4896</td>
<td>Fully Implemented</td>
</tr>
</tbody>
</table>
As a whole, the mean 4.4896 interpreted as fully implemented suggests that police officers undergo a continuous education and training to provide a better service for the community.

3. The implementation of the Police Community Relation (PCR) in District II of the Province of Cavite as observed by the residents, policemen are closely coordinating with the community especially with the barangay officials. The police are exerting their efforts towards the attainment peace and order in the province which were proven by the report given by the Provincial police headquarters which indicate the increase of crime solved. Also the findings of the study suggest that a stronger Police Community Relation with a committed policeman, a cooperative residents and a supportive government will form a long-term solution to prevent and control crimes. Also partnership between the police and the community will be a great help in the public safety.

Moreover, the findings of the study revealed that the extent implementation of Police Community Relation (PCR) plays a very important role in preserving and maintaining peace and order in the community. A better partnership and open communication between the law enforcement agencies and community can eradicate and prevent the occurrence of crime. The reality of lack of man power of the PNP can be solved and can be sustained by tapping the barangay officials and the citizens to work hand-on-hand to fight the criminality. Police and citizens are both two important components of the society/community, with regard to ensuring the safety and peace in the community, the former and the latter are both responsible for this matter. The PNP is providing programs and activities to fight the criminality, and they reach out for the
help of the community through the Police Community Relation Activities. On the part of the community, they are encouraged by the PNP to report all the crime incidents and suspicious activities in their area for the PNP to do necessary actions. And on the other hand, the community wanted to be understood and heard by the PNP. To bridge the gap between the police and community PCR (Police Community Relation Program) is designed for the benefit of both groups.

**Conclusion**

Based on the findings of the study, the following conclusions were drawn:

1. Through the extent implementation of PCR in the District II of the Province of Cavite more crimes were solved. Public servants do their best to prevent and control crime by balancing their rapport to the community

2. The Police Community Relation programs and activities are fully implemented in District II of the province of Cavite through the effort given by the police and community. With this relationship a more peaceful and well-order community is being observed. The policemen are responding to the needs of the community vis-à-vis both have a goal of building a peaceful nation.

3. Full implementation of the Police Community relation has a major role in the improvement of the crime prevention and control as the responsibility of the Cavite police and the community.

**Recommendations**

Based on the findings and conclusions, the following recommendations are made:

1. There is a need to strengthen the values of family ties of the community and love of country, people and faith in GOD.
2. The church should be a tool in awakening the citizens in taking good care of each other, and becoming concerned of the welfare of the community.

3. Barangay officials should follow the policies courteously, and implement them faithfully. This will be realized by continuing the education provided by the local government with PNP doctrines and the department as in-charge.

4. PNP with the coordination of the community should formulate strategic solutions or options that can directly eliminate or eradicate and prevent the number of crimes or socially related problems.

5. School or universities should help organizing a forum as an instrument for the information drive regarding the intensification of the police community relation, and to increase the consciousness of the people regarding criminality.

6. As part of curriculum, a comprehensive and improve program for the youth to engage, learn opportunities and to create a strong sense of community among leaders, parents and students. In addition, Public Safety courses should be given at least 6 units of this endeavor.

Cell Phone in Classroom: A Literature Review

Tenzin Yeshi

Steven Dale Aagard

University of Wyoming
Abstract

Cell phone is the fastest growing technology among the young generation or the net citizens. However, cell phones are considered more as a distraction in the classroom teaching than a means to support student’s learning. Cell phones can be noisy and distracting. But they can also be an aid to learning (Docksai, 2009). The paper will examine past five-year literature on cell phone use in the classroom.

Purpose of study

Cell phones are powerful little handheld computers (Eifler, 2009). Cell phones are getting smarter with better features, increasing hardware and software supports, low monthly connection charges, and growing applications for mobile education. Lindquist et al. (2007) posited that cell phone features such as SMS and MMS are robust, simple, affordable, and familiar to students. Within an educational setting, using cell phones as an interactive tool requires minimal technical and financial support: the majority of the students possess the needed hardware and software (Divitini et al., 2002) and communication occurs via existing cell phone networks (Markett et al., 2006). Several educators have studied cell phone in the classroom and have provided favorable opinion for its use (Trotter, 2009; Milrad & Spikol, 2007; Markett et al., 2006). This led us to ponder whether cell phone use in the classroom is just a distraction or a smart tool for learning and teaching.

The questions we asked as we tried to find answers are: why cell phones are still not considered for classroom teaching? Why cell phones are not favorably accepted as other technologies such as computer? Are cell phones only a distraction to students’ learning? Will the use of cell phones in the classroom effects students’ learning? These questions seem to emerge
quite often among many educators and learners alike. The purpose of the study is to explore the 
literature concerning cell phone use in the classroom for learning and teaching.

The supports for cell phone use are more widespread in the existing literature. For 
instance, Scornavacca, Huff, and Marshall (2009) posited that the rapid proliferation of cellular 
phones has presented an opportunity to develop new interactive classroom systems, which have 
the potential to enhance students’ learning experience. And for Eifler (2009), after experiencing 
the effective use of cell phone in the classroom, he started to appreciate the possibilities cell 
phone could bring into the classroom learning. In his words, “I now propose that there are 
pedagogically defensible alternatives to silencing cell phones in our classroom” (p. 3).

There are many proper uses of cell phones such as enhancing class projects, test reviews, 
and instructor communication and feedback (Docksai, 2009). In a study with a large classroom 
of more than 100 college students, Scornavacca, Huff, and Marshall (2009) found that cell phone 
use in the classroom provided a very positive experience to the instructor that helped to increase 
the quality and quantity of student feedback during the class. Studies have used SMS (short 
messaging service) and MMS (multimedia messaging service) for student’s interactivity in the 
classroom via polling and feedback (Lindquist et al., 2007; Markett et al., 2006; Cobb et al., 
2010), and beyond the classroom for after-class discussion (Markett et al., 2006). SMS and MMS 
are found to encourage shy, non-participatory or self-conscious students, increase learner-content 
interaction, promotes classroom accountability, and encourages student interaction (Markett et 
al., 2006).

However, Wei and Leung (1999), Campbell (2004), and Campbell and Russo (2003) 
found classrooms to be the least acceptable place for cell phone use. David Strom, the general
counsel for the American Federation of Teachers (AFT) said, “cell phone is disturbing to the educational process” (as cited in Honawar, 2008, p. 29). Moreover, with the advent of cell phone cameras, there are more concerns for cyber bullying and cheating. Many educators ban the use of cell phones in their classrooms considering it as a distraction to the learning process and compromising examinations (Braguglia, 2008). Katz (2005) found that younger educators seem to accept cell phone communication technologies more easily than their older counterparts. Not surprisingly, in a national survey on cell phones in American high school, Obringer and Coffey (2007) found that 82% of parents were supportive of the school’s overall cell phone policy. These may be the reasons why cell phones are not favorably accepted as other technologies for classroom teaching and learning. Are educators not joining the students to help use their preferred mode of communication? Or are there more reasons for not adopting cell phones in the classroom? From our review of literature thus far, we found majority of the studies supported the use of cell phone in the classroom despite some prevailing limitations such as small screen, text abbreviations, privacy, cheating, ringing, and bullying, among others.

Analysis of literature

Due to the rapid growth of Web 2.0 technologies, it is difficult for many Web developers to survive long on the Internet. From our literature review, we found few of the applications and tools used in the study were no longer in business or operations. Because of the fast changing nature of technologies, we narrowed down our search of literature to the last five years. We will analyze the key findings and incorporate them into our paper presentation.
Future Implications

Cell phones can be a major distraction to learning when students use them improperly. The experience of Scornavacca, Huff, and Marshall (2009) with the use of cell phones in the college classroom showed that positive results can be achieved by encouraging students to bring their mobile phones out in the open and to use them to contribute to the class, and to their own learning – that is, by joining them instead of trying to beat them.

Elizabeth Hartnell-Young stressed, “we hope that, in the future, mobile phone use will be as natural as using any other technology in school”. Will Elizabeth hope materialize? There are several positive indicators such as, increasing calls against the ban of cell phone use in the classroom, growing number of research on cell phone use, increasing capabilities of smart phones, and the declining monthly connection charges for cell phone use. Moreover, as of 2008, Braguglia found in his survey of College of Business students that 45% of the students spend four or more hours daily on their cell phones, which gives a clear indication that students spend most of their daily time on cell phone as compared to other educational tools.

We agree with the suggestion of Markett et al. (2006) on more research on cell phone use in the classroom. Cell phone features like SMS and MMS are an area of further exploration in education such as, in-class discussions, two-way interactions, language learning vocabulary and study support, and learning support, among others.

School Reform: Why it Doesn’t Work

Robert Vos, Ed.D., Associate Professor
College of Education, ZEB 215A
Florida International University
Miami, FL 33199
Robert.Vos@fiu.edu

Presentation Abstract:

In Why is it so hard to get good schools (2003) Larry Cuban states that “…administrators and policymakers, seeking improvement in students’ performance, view teachers, paradoxically, as both the problem and the solution to school defects.” Especially in the past twenty years teachers have been blamed for many of the ills that schools face. But why blame only teachers? What about the legislators that underfund education; the parents that don’t seem to care; the students who are not engaged; the school building administrators that don’t supervise; the school districts that appear to care more about test scores than student learning; the business and industry leaders that are only concerned about employability skills? Aren’t we all to blame?

Drawing on the literature and his own experience in Miami, Florida the author will describe why the major national, state and local school reform efforts fail. Billions of dollars and many years of effort have been expended and yet our national high school graduation rates are still less than 70% with some individual states reporting less than 60%. At its peak in 1969 the graduation rate was 77%, yet by 2007 it had dropped below 70%. Graduation rates of minorities in urban areas are even worse. In Florida, for example, the graduation rate of African American males was 37% in 2008 while in Miami Dade County the figure is 27%! With the plethora of national and state programs since the 1960’s why have we not yet seen more positive results? The author will provide examples and reasons for the failures and considerations for practice and policy.
Title: Confessions from the Chalkface: Māori teachers reflect upon their experiences in six monocultural New Zealand schools.

Author: Toni Torepe

E-mail address: toni.torepe@canterbury.ac.nz

Abstract:

This presentation outlines some key findings from a Masters thesis (Torepe, 2010), which examines the lived experiences of Māori teachers who recently completed and graduated with a Graduate diploma in Immersion and Bilingual Teaching and Learning from the University of Canterbury College of Education’s Hōaka Pounamu programme.

This research will explore how these indigenous graduates transition back into teaching, particularly mainstream primary schools. It will discuss the challenges they face as they attempt to incorporate kaupapa Māori (Māori knowledge that validates a Māori world view) into their teaching praxis, whilst working within English medium teaching environments reflecting the prevailing Eurocentric ethos of their schools. This presentation will also consider the strategies that they used to negotiate these challenges.
Title: The use of indigenous metaphor as pseudonyms for indigenous research participants in a Masters thesis project

Author: Toni Torepe

E-mail address: toni.torepe@canterbury.ac.nz

Abstract:

This presentation outlines a methodological issue related to the identification and use of culturally and contextually appropriate pseudonyms for research related to indigenous participants and communities. This will draw on a research project that formed the basis of a Masters thesis (Torepe, 2010). It will illustrate how this process was negotiated during the design and development of this thesis, guided by the principles of kaupapa Māori methodology (sourced from Māori philosophies), situated in Te Waipounamu (South Island) of New Zealand. Pounamu, New Zealand’s highly prized greenstone is a culturally valuable and spiritually significant taonga (treasure) to the indigenous peoples of Aotearoa, New Zealand. It has been used to affirm status, authority plus for adornment and peace-making purposes. This presentation will accordingly discuss why types of pounamu were used as pseudonyms for different participants and how pounamu is used as a simile to describe the participants (teacher educators) within the context of the New Zealand schooling system.

Introduction

A computer is a machine that performs a specified sequence of operations as per the set of instructions (known as programs) given on a set of data (input) to generate desired information (output). Being a machine, it will not perform independently or creatively. It will do only, what it is instructed to do, in specific terms. It is based on a complex technology, but works on a simple Input – Process – Output principle (National Informatics Centre, Training Division, New Delhi retrieved from http://training.nic.in/courseware/PDF%20Files/ComputerBasics.pdf).

Over the past few years, computers have become a vastly popular household item. The luxury of emailing messages as opposed to charging up the phone bill is more appealing. Checking news, weather, and sports via the Internet is a convenience that many are taking advantage of. Computers are in use almost everywhere, whether we
go to reserve a plane ticket or to a bank or a grocery. This is because it is faster and helps us complete our work without mistakes/errors.

Children's lives are also getting influenced by technology – and this is just the beginning. Computers and Internet are here to stay and software titles targeting young children continue to increase. So parents too have realized the need to help their children develop strong computer skills.

Children are learning to read and write with computer games instead of homemade flash cards. They are reading their bedtime stories online instead of in bed with their parents. Many parents are buying computer learning games instead of board games and pop-up books.

One benefit of the computer age is that children are growing up computer literate and will have that as a huge advantage. Computer literacy is becoming a huge job qualification and feeling comfortable with one will put them a step ahead.

However, slowly, some traditions are being broken and the computer is becoming a child’s learning tool, reducing the child’s interaction with peers his / her age. Computer use also has its dangers. When children log on to the computer their innocence is noticeable. Children are an easy target for adults who pose to be other children with similar interests. Criminal offenders often chat online with children and then make plans to meet them or slowly filter information about them.

But overall, children can benefit from computers if they are used wisely. Parents that supervise their children when they are on the computer can ensure that everything is happening safely. Moreover, children need to be taught proper computer use through
formal computer education. The computer is a vital tool used by man in every field of life. It is projected to be increasingly more valuable in the times ahead. Hence, one important educational goal is to prepare students for a world in which the computer will continue to play a significant role.

In the Philippines, the Department of Education has recognized the significance of teaching and integrating computer subjects as early as in the elementary level. According to the directives of the Department of Education in the 2002 Basic Education Curriculum: “Information and Communication Technology (ICT) shall be used in every learning area, wherever hardware and software are available” (2002 BEC Executive Summary 6th Draft March 6, 2002).

ICT is introduced at the elementary level as part of the subject “Edukasyong Pantahanan at Pangkabuhayan” or EPP which is in turn covered under the subject Makabayan. However, computer education is only a part of EPP and not yet mandated by DepEd to be a separate subject. Also, the minimum learning competencies prescribed by DepEd for Computer Education are only for Grades 4, 5, and 6. This may be due to following reasons which were identified as key problem areas for implementing ICT in basic education during a Consultative Workshop for Developing Performance Indicators for ICT in Education held in the Philippines in August 2002: (1) teachers’ fear of the technology; (2) school principals’ closed mindset to and non-appreciation of ICT in education; (3) constraints of the annual Education Budget; (4) maintenance of ICT resources and lack of technical staff; (5) sustainability; and (6) limited availability of education software and courseware.
This study sought to assess the current status of computer education in private elementary schools in Angeles City as there is still a dearth of knowledge on this area and elementary school administrators and teachers, as well as pupils and their parents may benefit from the results of this particular endeavor.

**Conceptual Framework**

Computers offer substantial benefits to young children and their development, and to families as a whole. At the right age, a computer is a wonderful thing that every child deserves to have. Accordingly, if a family can afford a computer without sacrificing other important, traditional childhood experiences, then this environment should contain a computer set-up that can be accessed as easily as books and other playthings and integrated in the family's day-to-day activities in a natural way.

The actual benefit of a computer to a child depends primarily on: the quality of parental involvement, the quality of educational software that the child is using, following developmentally appropriate practices in the way the child uses the computer, achieving a balanced role for the computer in the child's life as one important element in the mix of quality learning and play opportunities, and proper computer education.

With proper computer education, parental guidance, quality software, and their own love of discovery and learning, young children can work wonders with computers & the internet. They can also gain and reap the benefits of computer literacy for the rest of their technology-filled lives.
This study was interested in assessing the current status of computer education in private elementary schools in Angeles City so as to make appropriate recommendations, particularly on the computer education curriculum. To do this, it was necessary to identify the variables that are relevant to the provision of computer education. These variables could either enable effective and efficient computer education or serve as barriers depending on their current state. These variables include curricular factors, namely the inclusion of Computer Education as a separate subject, time allotted for the subject per session, number of sessions per week, course objectives / desired learning competencies, and course contents. The study also assessed instructional factors, namely educational qualifications of teacher(s) handling the subject, methods of teaching used, instructional materials used including textbooks, hardware and software, and the presence of technical support. Data on these aforesaid variables as well as data on problems encountered in the subject that are perceived by Computer Education teachers laid the foundation for the drafting of curricular developments for Computer Education in the elementary level.

Two foundational works on curriculum development are by Ralph Tyler (1949) and the other by Jerome Bruner (1960). They provide the foundation for even the most current thinking in curriculum development. Jerome Bruner’s book, *The Process of Education* devotes a chapter on the importance of “structure”. The theme of structure refers to the importance of presenting the basic structures of the disciplines as the focal points of curricula. Basic structures consist of essential concepts, such as “supply and demand” in economics or “conflict” in history or “energy” in physics, and the relationships among them. Such concepts, when understood, enable students to
understand many of the phenomena in that discipline and similar phenomena that may be encountered elsewhere. As Bruner wrote, “Learning should not only take us somewhere; it should allow us later to go further more easily…The more fundamental or basic is the idea, the greater will be its breadth of applicability to new problems”. Bruner advocated that these fundamental ideas, once identified, should be constantly revisited and reexamined so that understanding deepens over time. This notion of revisiting and reexamining fundamental ideas over time is what has become known as a “spiral curriculum.” As time goes by, students return again and again to the basic concepts, building on them, making them more complex, and understanding them more fully.

A decade before the book that Jerome Bruner wrote, Ralph Tyler (1949) published his classic text on curriculum development. It was organized around four questions: (1) What educational purposes should the school seek to attain? (2) How can learning experiences that are likely to be useful in attaining these objectives be selected? (3) How can learning experiences be organized for effective instruction? (4) How can the effectiveness of learning experiences be evaluated? This book called for the application of four corresponding principles in the development of any curriculum: defining goals, establishing corresponding learning experiences, organizing learning experiences to have a cumulative effect, and evaluating outcomes. Tyler’s principles were the accepted approach to curriculum development for almost 30 years, and they guide the essential questions of curriculum development today, though they now are applied to newer ideas and considerations that extend or reinterpret his principles.
Probably the biggest objection to Tyler’s approach, and the cause of its demise in the 1970’s, was its perceived mechanistic orientation to curriculum. As the theory was implemented in the 1950’s and 60’s, behavioral objectives provided the underpinning of its design, and the success or failure of the curriculum was based on pre-defined changes in student behavior. The assumption was that student outcomes – at least those that matter – could and should be measured. The result was that in order to measure the behaviors, tasks were broken down into smaller and smaller parts, resulting in tasks that lost their authenticity or meaningfulness. Tyler was a product of his time, and his ideas were written and interpreted in light of current educational perspective, which was behavioral in nature. His theory of curriculum development was simple, logical, and rational, but it fell out of favor as educators began to view learning experiences more holistically and assess outcomes that are not so easily measured. In response to the curriculum approach advocated by Tyler, often called the *product approach*, came what is known as the *process approach*. This approach is most associated with the work of Lawrence Stenhouse (1974), who advocated principles for selecting content, developing teaching strategies, sequencing learning experiences, and assessing student strengths and weaknesses with an emphasis on empiricism. A process curriculum was designed to be not an outline to be followed but a proposal to be tested. Gone were the behavioral objectives and tight hierarchical learning tasks.

The process approach to curriculum development was extended after Stenhouse originally laid it out, morphing into the *praxis approach*, which added the element of commitment to curriculum development. This approach advocates a shared idea of the common good and the goal of informed and committed action to the model of curriculum
development. Even more recently there has been an emphasis on the context of curriculum and the notion of curriculum as a social process in which personal interactions within the learning environment take on considerable significance. Last, it should be mentioned that developmental theorists continue to have a strong influence on how curriculum should be structured. Wildman (2007), for example, advocates curriculum built around what is known about development and the Vygotskian concept of scaffolding, or what Wildman calls “assisted performance.”

An article by Knight (2001) provides a convincing argument for the superiority of a process approach to curriculum development in higher education by outlining the problems with an “outcomes-led rational approach” to curriculum planning. Knight’s major point, however, is not to advocate one approach over another, but to stress the necessity of coherence in a curriculum. He returns to Jerome Bruner’s concept of the spiral curriculum, saying “Bruner depicted good curriculum as a spiral of repeated engagements to improve and deepen skills, concepts, attitudes and values, and extend their reach. The spiral curriculum has coherence, progression and, I claim, value”. Contending that it is possible to provide coherence and progression in a process curriculum as well as in a product curriculum, he writes, “a good curriculum would plan for learning to take place through communities of practice in which group work and peer evaluation are normal, interpersonal contact is common and networks of engagement are extensive”.

Other curriculum writers, particularly those from the UK, have gone beyond thinking of curriculum as product or process or the more recent extensions of those
theories. Barnett, Parry, and Coate (2001) propose a model of curriculum that involves three domains: knowledge, action, and self. The knowledge component is comprised of discipline-specific subject matter; the action component includes the necessary skills of the discipline; and the self component includes identifying oneself with the competencies of the discipline. The authors give an example of a history major. For him or her, the knowledge domain would be the history specialty area, the action domain would include skills such as critical writing; the self domain would include a view of self as critical evaluator. They contend that the way the three domains are weighted and integrated differs depending on the subject matter and that curriculum development should take those different integration patterns into account.

Jan Parker (2003) argues for a “transformational curriculum.” Suggesting that the Barnett, et al. model be expanded and concentrate on the interaction of the three domains, Parker says that students should design their own interacting aspects of knowledge, action, and self. Such a curriculum “would engage the student’s love of knowledge, and use that to re-inspire the teacher’s, would develop a mature critical self, which was nevertheless sophisticatedly appreciative, would incorporate the Barnett value of dealing with supercomplex paradigms and value systems while understanding how and why to invest oneself”. This approach to curriculum centers on metacognition and self-direction, and as the author says, transformation.

The curriculum approaches outlined above are theoretical but for practical, simple approaches to curriculum development, works by Dee Fink, Grant Wiggins, and Jay McTighe are useful.
Fink (2007) writes about designing significant learning experiences in college courses using a process called integrated course design (ICD). His model includes the familiar triad of learning goals, teaching and learning activities and feedback/assessment. Learning goals identify what we want students to learn, learning activities identify how students will learn what it is we want them to learn, and the feedback/assessment identifies how we will know students have achieved the intended goals. Fink emphasizes, however, that these components are all influenced by “situational factors,” such as course context, professional expectations, and the nature of the subject, the students, and the teacher. He presents a taxonomy of significant learning that outlines six kinds of learning to consider when designing a course. The taxonomy, unlike Bloom's well-known cognitive taxonomy, is interactive rather than hierarchical. The identified kinds of learning include foundational knowledge, application, integration, human dimension, caring, and learning how to learn. Fink's book (2003) explores each aspect of the taxonomy and includes feedback from professors who have used this approach to curriculum design and have found it helpful.

Currently, one of the most influential books on curriculum development is Wiggins and McTighe’s (1998, 2005) *Understanding by Design*. The authors call their approach “backward design” and, sure enough, they cite Ralph Tyler's (1949) model as providing the logic behind their “new” idea. However, the backwards design model avoids the mechanistic predisposition of behaviorism and offers a major advantage by featuring the latest thinking in assessment. The principles put forth by the authors are relevant to curricula at any level. Wiggins and McTighe say their design is backward because it starts with the end, the desired results, first and then works backward to a
curriculum based on acceptable evidence of learning. The stages in the backward design process are (1) Identify desired results; (2) Determine acceptable evidence and (3) Plan learning experiences and instruction. In stage 1, consideration is given to what students should know, understand, and be able to do, and here is where it becomes clear that the orientation to curriculum design is more constructivist than behaviorist. The authors suggest a framework for establishing curriculum content by considering three levels of knowledge: that which is worth being familiar with, that which is important to know and do, and that which represents an “enduring” understanding. Third level knowledge, enduring understandings, refers to essential principles of disciplinary and/or interdisciplinary thought. Here, as you might expect, they reference Bruner (1960), reiterating his idea that these essential concepts and principles are what should anchor the curriculum, whether it be a unit of study, a course, or a major field comprised of a number of courses. The authors offer four criteria for determining essential understandings: (1) To what extent does the idea, topic, or process represent a “big idea” having enduring value beyond the classroom? (2) To what extent does the idea, topic, or process reside at the heart of the discipline? (3) To what extent does the idea, topic, or process require uncoverage? (4) To what extent does the idea, topic, or process offer potential for engaging students? (Wiggins & McTighe, 1998, 10-11)

Stage 2 asks how we will know if students have achieved the desired understandings and skills. At this point, thought is given to what assessment evidence will document that the desired learning has taken place. The authors advocate considering a wide range of evidence and assessment methods ranging from informal checks for understanding to complex performance tasks and projects. It is this stage
that is probably the most “backward” for instructors. There is a strong tendency not to think about assessment until toward the end of a topic or unit or course. Considering assessment as evidence of learning, and considering it before teaching, puts assessment not only in a new place, but in a new light. It is not until stage 3 that the learning experiences (instructional strategies) are planned. Since acceptable evidence has already been considered, the learning experiences are designed to enable students to produce the desired results. Teaching is viewed as a means to an end, not an end in itself. Wiggins and McTighe suggest asking the following questions during this stage: (1) What enabling knowledge and skills will students need to perform effectively and achieve desired results? (2) What activities will equip students with the needed knowledge and skills? (3) What will need to be taught and coached, and how should it best be taught, in light of performance goals? (4) What materials and resources are best suited to accomplish these goals? (5) Is the overall design and effective? (Wiggins & McTighe, 1998, 13)

In this study, the researcher was guided by the foregoing principles in curriculum development in coming up with proposed computer education curricula for the various grade levels in the elementary school.

The research paradigm is presented in Figure 1.
Figure 1. Research Paradigm
Statement of the Problem

This study generally aimed to describe the current status of Computer Education among private elementary schools in Angeles City and to propose curricular enhancements based on the findings.

Specifically, the study sought to answer the following research questions:

1. What is the current status of Computer Education among different grade levels in private elementary schools in Angeles City in terms of:

1.1. Curricular factors

1.1.1. Inclusion of Computer Education as a separate subject
1.1.2. Time allotted for the subject per session
1.1.3. Number of sessions per week
1.1.4. Course objectives / Desired learning competencies
1.1.5. Course contents

1.2. Instructional factors

1.2.1. Qualifications of teacher(s) handling the subject
1.2.2. Methods of teaching used
1.2.3. Instructional materials used

1.2.3.1. Textbooks
1.2.3.2. Hardware
1.2.3.3. Software

1.2.4. Technical support
2. What problems, as perceived by Computer Education teachers, are commonly encountered in the subject?

3. What curricular developments may be proposed for Computer Education per grade level based on the findings of the study?

**Significance of the Study**

Evaluating the status of Computer Education among private elementary schools in Angeles City will basically serve as bases for drafting recommendations, particularly on possible curricular developments for computer education in the grade school level.

Results of the study may benefit:

**The Department of Education** as this study may provide a picture of the present scenario of computer education in the grade school level which they can use to draft and implement department orders / policies for more efficient and effective computer education programs.

**The private elementary schools** as they would have an idea on how to improve their offering of computer education. Furthermore, this study serves as a challenge to the said elementary schools to improve computer education - to update, upgrade and even develop their interests in computer education.

This study would also benefit **private elementary school teachers** as they would be guided on how to handle the computer education subject, particularly, in terms of course contents and objectives.
This study would ultimately benefit the **private elementary school pupils**, (and perhaps even those from the public schools given the appropriate provisions for hardware, software and peopleware) as they would be educated towards more effective and more efficient performance with the aid of computers since the computer is considered the brain, the eyes and the ears or the future.

Lastly, this study would be useful to **future researchers** who would want to further investigate the various aspects of computer education for elementary school pupils.

**Scope and Delimitation of the Study**

This study attempted to determine the status of Computer Education among private elementary schools in Angeles City as of Academic Year 2009-2010. Computer education in all grade levels was assessed based on identified curricular factors, namely inclusion of Computer Education as a separate subject, time allotted for the subject per session, number of sessions per week, course objectives / desired learning competencies, and course contents as well as instructional factors namely, educational qualifications of teacher(s) handling the subject, methods of teaching used, instructional materials used, including textbooks, hardware and software, and technical support. Based on the findings of the study, curricular developments were proposed for Computer Education per grade level.

The respondents were computer education teachers in private elementary schools in Angeles City as of Academic Year 2009-2010. Data obtained on the
curricular and instructional factors were factual information, supported by pertinent documents such as the syllabus/course outline, subject schedules, etc and by ocular inspection of private elementary schools in Angeles City. Perception-based data were also obtained, but only in terms of perceived problems in the teaching of Computer Education.

As mentioned, this study focus only on private elementary schools for purposes of uniformity and applicability of recommendations. Computer education in public elementary schools may be regarded as another possible topic for scientific investigation.

**Definition of Terms**

For clarity of use, the following terms are hereby defined in this section:

Computer – This refers to an electronic device, operating under the control of instructions stored in its own memory that can accept data, process the data according to specific rules, procedure results, and store the results for future use (Shelly, Gary B., et.al, *Discovering Computers*. Boston MA 02210: Thomson Course Technology, 2005)

Computer Education – This refers to the subject designed to introduce Information and Communication Technology at the elementary level. It is presently mandated by the Department of Education to be offered under the
subject “Edukasyong Pantahanan at Pangkabuhayan” or EPP which is in turn covered under the subject Makabayan.

Curricular developments – In this study, this refers to possible improvements in the Computer Education subject in terms of time allotment / number of session, course objectives / desired learning competencies, and course contents.

Curricular factors – In this study, this refers to the Inclusion of Computer Education as a separate subject; the time allotted for the subject per session, the number of sessions per week, the course objectives / desired learning competencies, and the course contents.

Grade Level – This refers to the various levels in the elementary school, that is, from Grades 1 to 6.

Hardware – This refers to all physical parts of the computer.

Information and Communication Technology – This is an umbrella term that includes any communication device or application, encompassing: radio, television, cellular phones, computer and network hardware and software, satellite systems and so on, as well as the various services and applications associated with them.

Instructional factors – In this study, this refers to the educational qualifications of teacher(s) handling Computer Education; methods of teaching used, instructional materials used including textbooks, hardware and software.
components; as well as the technical support available for the Computer
Education subject.

Instructional materials – These refer to materials used in teaching Computer Education
including textbooks, hardware devices as well as software

Methods of teaching – This refers to techniques / strategies used by teachers in
handling the Computer Education subject

Qualifications – This refers to the college and post-college degrees of the teachers of
Computer Education subjects in the private elementary schools; their
length of teaching experience in the subject and other related trainings

Software – This refers to a set of programs or electronic instructions that make the
hardware perform a particular set of tasks in a particular order.

Technical support – This refers to services provided by computer / laboratory
technicians

Textbooks – These refer to the regular reference materials prescribed to students for
use in the Computer Education subject
CHAPTER 2

REVIEW OF RELATED LITERATURE AND STUDIES

This chapter presents various literature and studies about computer education, which provide ideas and relevant background information related to the present study.

RELATED LITERATURE

FOREIGN LITERATURE

History of the Computer

The "First Generation" of computers started in the very late 1930's. These computers were grotesquely slow, colossal in size, created much heat, used hundreds of kilowatts of power, and were about as reliable as a used up match. As time went on, these computers evolved from using vacuum tubes to transistors. Transistors mark the beginning of the "Second Generation" of computers in 1947. Unfortunately, the 2nd Generation did not advance as much as most people hoped, but eventually, the "Third Generation" was brought about by the invention of integrated circuits in 1958. Integrated circuits replaced transistors, and many computer languages came out in this time. Many more computer companies were born during this time, and eventually this led to personal computers for everyday use. Microprocessors introduced the beginning of the "Fourth Generation" and a time where computers were in almost every house (Kazeki, 2009).
Overview of a Computer System

The following overview of the computer system, classification of computers, and computing environments were based on the courseware on Computer Basics by the National Informatics Centre, Training Division, New Delhi (retrieved from http://training.nic.in/courseware/PDF%20%20Files/ComputerBasics.pdf).

Every computer system has two main units: (i) Hardware and (ii) Software. All physical parts of the computer (or everything that we can touch) are known as Hardware. Software gives intelligence to the computer. For example in a television the wires, switches etc. are the hardware while the programs, watched on TV, is the software. Although the hardware of a computer is capable of performing marvelous tasks, it can't actually accomplish any of them without the vital instructions that software provides.

A. Hardware

Hardware refers to the physical units of a computer, which includes electronic and electrical circuitry, components and devices. Regardless of its shape, size or capabilities, every computer that people use directly has same general design:

Computer Hardware = Processing Unit + Secondary Storage Devices + Peripheral Devices

i. Processing Unit

The complex procedure that transforms raw input data into useful information for output is called processing. To perform this transformation, the computer uses central
processing unit. The processor is the "brain" of the computer, the part that interprets and carries out instructions.

ii. Secondary Storage Devices

The CPU, however, does not have sufficient storage space for the entire program as well as for the data being manipulated by those programs. Therefore, the control unit stores the data and instructions received from input devices into primary memory called random access memory (RAM). Unlike human memory, which can store information indefinitely, RAM holds information only while the computer is ON. When the computer is turned off or reset, the information disappears unless it has been saved on a storage device. Hence RAM is often referred to as volatile or temporary memory.

Some of the data and instructions remain permanently stored into memory, which cannot be changed. This memory is called read-only memory (ROM). A computer needs ROM, mainly, so that it knows what to do when the power is first turned on. Among other things, ROM contains a set of start-up instructions that check to see whether the rest of memory is functioning properly, look for hardware devices, and look for an operating system. Since this memory never gets lost, it is sometimes referred to as permanent or non-volatile memory.

The performance of a computer very much depends upon the data transfer rate between CPU registers and memory. The computer is costlier if data transfer rate is faster. Therefore, to increase the transfer rate, economically, a cache memory (pronounced as CASH) is introduced in the computer that acts as a buffer between
primary memory and CPU registers. In the present day computers, cache can be either a section of main memory or an independent high-speed storage device.

Floppy diskettes, hard disk, and optical disks come under the category of external storage devices or ancillary storage devices. These devices are very sensitive to environmental conditions (humidity and temperature) as well as to external magnetic fields and need to be stored carefully.

Floppy disks are magnetic storage media, using flat circular platter. Information on a floppy disk is recorded in the magnetized states of particles of iron oxides evenly placed upon concentric circles known as tracks. On the other hand, hard disk is a non-removable enclosed magnetic disk included in most PCs. A hard disk holds much more information than a floppy disk and is used to store relatively large amounts of data. The physical size and storage capabilities of a hard disk vary.

The need for ever greater storage capacities has driven hardware manufacturers to use optical storage technology as the main alternative to magnetic storage. Optical storage techniques make use of the pinpoint precision possible with laser beams.

The most-popular optical storage medium is compact disk, read-only memory (CD-ROM). CD-ROM uses the same technology that is used in music CDs. One cannot write data to a CD-ROM but can always read it. The huge amounts of data, such as dictionaries, encyclopedias, medical, legal or other professional reference libraries etc., that normally would not change, is available on CDs nowadays. A single CD can hold up to 650 MB of data. Larger CDs can store up to 20GB.
Due to tremendous capacities of CDs, writable optical devices have been developed. This has resulted in the write once, read many (WORM) drive. As with the CD, once data has been written onto a WORM disk, it cannot be altered. For example, many banks use WORM disks to store a record of each day's transactions.

Compact Disk – Record able (CD-R) is similar to CD-ROM and can be produced by anyone who has a CD-Writer. Data can be recorded only once in a CD-R to produce an audio CD or CD-ROM.

Digital Versatile Disk or Digital Video Disc, is a type of CD-ROM that holds a minimum of 4.7 GB enough for a full length movie. The DVD specification supports disks with capacities from 4.7 GB to 17 GB and access rate of 600 Kbps to 1.3 Mbps (Mega Bits Per second).

A CD-Writer is a peripheral device that can record data on a CD-R disk.

iii. Peripheral Devices

Peripheral devices are devices connected to the computer externally. If a peripheral device is disconnected, the computer will still be able to work; only functions performed by this peripheral device will not be available. Mainly there are following types of peripheral devices: Input Devices, Output Devices, and Other Peripherals.

Input devices accept data and instructions from the user. Following are the examples of various input devices, which are connected to the computer to provide input. There are many input devices. Some important input devices are as follows: keyboard, mouse, joystick, and light pen. Other input devices are the optical scanner
such as the bar-code reader and optical character recognition (OCR) device; touch panel displays and pads which are now being offered as alternatives to keyboard input wherein input can be given through the computer screen, that is, users touch electronic buttons displayed on the screen or they may use light pen; the microphone which takes voice as input, and a track ball which is a pointing device, basically, a mouse lying on its back that is stationary so it does not require much space to use it and can be placed on any type of surface so they are popular pointing devices for portable computers.

Output devices return processed data that is information, back to the user. Some of the commonly used output devices are: monitor (visual display unit), printers, and speakers.

Out of all the output devices, monitor is perhaps the most important, because it is the output device that people interact with most intensively. Two basic types of monitors are used with microcomputers, which are as follows: Cathode Ray Tube (CRT) which is the first is the typical monitor that you see on a desktop computer; it looks a lot like a television screen, and works the same way; and Liquid Crystal Displays (LCD), a flat panel monitor.

On the other hand, after a document is created on the computer, it can be sent to a printer for a hard copy (printout). Some printers offer special features such as coloured and large page formats. Some of the most commonly used printers are: laser printer, dot matrix printer, ink jet printer and line printer.

Lastly, speakers are output device, which allow you to listen to voice like music, even conversation with people.
Other Peripherals include the floppy disk drive which is a device that reads and writes data to and from floppy disks and the hard disk drive, which includes the hard disk, the motor that spins the platters, and a number of read/write heads. Generally, one cannot remove the hard disk from its drive; the two terms are used interchangeably to mean the whole unit, both disk and drive. However, some manufacturers make removable hard disks that plug into a separate drive unit.

A modem is another peripheral device that enables your computer to receive/send data from/to remote places. Also, in the present day computer systems, FAX machines can be attached with a computer to send and receive documents created in the computer to distant places, bringing computers and communication together.

B. Software

Computer needs instructions to tell it what to do, how to do and when to do. Thus the electronic instructions well defined and well organized, that people write to tell the hardware what to do to get desired results, are called programs. Software refers to a set of programs that makes the hardware perform a particular set of tasks in a particular order. Software can be classified mainly in two categories as follows:

i. System software which is responsible for the running of the computer and management of computer resources. Operating System (OS) falls under this category. An operating system is system software that provides an interface for a user to communicate with the computer, manages hardware devices (disk drives, a keyboard, a monitor, and so on), manages and maintains disk
file systems, and supports application programs. Some of the popular operating systems are, DOS, Unix, UNIXWARE, Windows, OS/2 Warp, Windows NT, Windows 2000, Windows XP and LINUX etc. Although OS developers try to provide all the features users need to use and maintain their systems, inevitably, they do not meet everyone's expectations. This has led to another type of system software called **utilities**. These are programs that bridge the gap between the functionality of an OS and the needs of users. Utility programs are a broad category of software. They range from programs that can organize or compress the files on a disk to programs that provide a menu interface to a command-line OS. For example, Norton Utilities, Antivirus software, Network resources management etc.

ii. Application Software that include General Purpose Software for creation of files of various types and Computer languages for designing customized applications. General Purpose Application Software are user-friendly software to help the user write letters, analyze numbers, sort files, draw pictures and even play games. It is a group of programs that provide general-purpose tools to solve specific problems. Some of the application software are Word Processing software like: WordStar, WordPerfect, MS-Word; Data Analysis (Spreadsheets) like Lotus 1-2-3, SCO Professional, MS-Excel; Data Management software like DBase IV, Fox plus, FoxPro, MS-Access, Lotus Approach, Oracle, DB2, SQL Server; Desk Top Publishing software like Ventura, PageMaker, CorelDraw, Press Works etc.; Graphics Tool software like Adobe Photoshop, Paint Shop Pro; Presentation software like Microsoft
PowerPoint, Presentation Graphics; Internet Browsers like Microsoft Internet Explorer and Netscape Navigator. On the other hand, some of the popular high-level computer languages, that can be used to develop application software are, C, C++, Visual Basic, Visual C++, JAVA, and Smalltalk etc.

**Classification of Computers**

According to the purpose, computers can be divided into the following categories: Digital Computers, Analog Computers, and Hybrid Computers.

In a digital computer, the system works with digits. In other words, a digital computer is a counting device. All the expressions are coded into binary digits (0 and 1) inside the computers and it manipulates them at a very fast speed. The digital computer circuits are designed and fabricated by the manufactures and are quite complicated ones. A digital computer manipulates data according to the instructions (program) given to it in one of the computer languages. The instructions and data are fed to the computer in the form of discrete electrical signals. Most computers are digital. Unlike a digital computer, an analog computer works by measuring voltages and currents rather than by the process of counting.

An analog computer works on supply of continuous electrical signals and displays output continuously. The accuracy of these machines is quite low although they are faster in speed as compared to digital computers. The word "computer" is a synonym of a digital computer.
Lastly, Hybrid Computer is one, which combines best features of analog and digital computers. These machines are generally used for scientific applications and in industrial control processes.

According to size, computers can be divided into following categories: Supercomputers, mainframe computers, minicomputers, and personal computers.

A supercomputer is the most powerful computer available at a given time. These machines are built to process huge amounts of information and to do so very quickly. For example, scientists build models of complex processes and simulate the processes on a supercomputer.

On the other hand, the largest type of computer in common use is the mainframe. They are designed to handle tremendous amounts of input, output, and storage. For example, consider the airlines reservation system. One can get his/her air ticket booked at one of the various reservation counters, each of which has many employees working at computer terminals. A terminal is a special kind of computer that does not have its own CPU or storage; it is just an I/O device that acts as a window into another computer located somewhere else. The terminals are connected to a database residing in and controlled by a mainframe computer that can handle the input and output needs of all the terminals connected to it. A typical mainframe computer is characterized by vast amounts of memory with many hard disks in several gigabytes range, one or more tape drives, several line printers, a separate computer room, a false floor (for under-floor cabling) and tight security.
Still on the other hand, the best way to describe a minicomputer is that its capabilities lie somewhere between those of mainframes and those of personal computers. Like mainframes, minicomputers can handle a great deal of input and output than personal computers can. Minicomputers are relatively inexpensive and ideal for academic institutions and small business houses.

Finally, the terms personal computers and microcomputers are interchangeable and generally refer to the small computers that are commonly found in offices, classrooms and homes. Personal computers or PCs come in all shapes and sizes, although most models reside on desktops, others stand on the floor, and some are even portable. A desktop model is the most common style of PC and it is small enough to fit on a desk but a little too big to carry around with you. Among the portable computers, a notebook computer approximates the shape of an 8½ -by 11-inch notebook and can easily fit inside a briefcase. Laptops are the slightly larger predecessors of notebook computers. Notebooks and laptops are fully functional microcomputers and are used by those people who need the power of a full computer wherever they go. Personal digital assistants (PDAs) are the smallest of portable computers. No larger than a chequebook, PDAs are also called palmtops. They are much less powerful than notebook or desktop models and are generally used for displaying important telephone numbers and addresses or keeping track of dates and agendas. Many can be connected to larger computers to exchange data.

With the fast changing technology, present day computers have increasing capabilities. But of course, computers have limitations such as thinking limitations, computer crimes, computer virus, mismatch between technological advancements and
their implementation, standards enforcement problems, machine dependency problems, risk of equipment failure and equipment downtime and recovery.

**Computing Environments**

Computing environments can be single user (the complete PC family belongs to this category; at a time only one person can work on the computer); multi user (many users can simultaneously work on the computer and share its resources); and networked environment (networks are groups of computers and peripherals connected together to share data and information). Classification of networks include Local area network (LAN) which covers a small geographic area such as one office or a building; Wide area network (WAN): covers a large geographic area such as several cities or even countries; and Metropolitan area network (MAN): covers an area larger than LANs, but smaller than WANs; these networks are designed for a town or a city.

The advantages of networking include resource sharing (one computer in a network can access data and resources of another computer in the same network; the physical location of any computer has no effect on network's resource sharing property); reliability (one can store multiple copies of files and data on multiple nodes, so even if one computer goes off the data wouldn't be lost); cost effectiveness (we can use large number of small computers than small number of large computers; this helps in improving cost/performance ratio) and communication media (networks act as a strong communication media between distant placed employees of an organization).
Advantages of Computers Among Children

Computers help children to be in control of their experience, to set their own pace, and to select the level of challenge with which they feel comfortable.

Computers help children to use all of their senses to extract information. Computers fascinate kids and can draw their full attention, which often results in a deeper focus and concentration.

Computers enable children to learn through creating, just as they gain hands-on knowledge and understanding when they build forts, make up stories, and paint, increase their skills.

As they master computers, children build positive attitudes toward technology that will pay dividends for the rest of their lives.

Good educational software also enables children to develop and practice a broad range skills. It can help them learn, for example, about letters, numbers, shapes, colors, and rhythm. Good software can also help children develop their understanding of cause and effect, higher order problem solving, procedural thinking, and creative expression. Today, the wide range of multimedia available for kids is really amazing.

By using a computer children develop self-confidence and self-esteem as they master computer skills and use the computer to make things happen. This also gives them a reason to smile.
In the classroom setting or in the home when their friends or parents are available, children often prefer working with one or two partners over working alone, which leads to the development of social skills.

Computers have also proven extremely beneficial to kids with certain speech, audio, and motor limitations. Kids with special needs can use alternative input and output devices (assistive technologies) to interact with computers and do things that they normally could not accomplish independently. They benefit especially from having access to an on-demand, patient tutor that allows them to work at their own pace. What they achieve through using a computer enhances their self-esteem and provides them with a greater sense of control and engagement with the world. The internet provides them with the best of knowledge for their treatments and they can be in touch with doctors or friends through the internet. Also, the internet can later help them earn their means of livelihood.

**Disadvantages of Computers Among Children**

Computers are very engaging and can exercise a strong "holding power" on children as well as adults. They really seem to mesmerize children. Since we do not yet understand the impact of this power, we need to monitor the amount of time a child spends before a computer.

If the software is not age-appropriate, children are likely to become frustrated and associate a computer with failure.
Kids with access to software that is not age appropriate may be exposed to such negative influences as violence, strong language, and over-stimulation from fast-action graphics.

Frequent and prolonged computer sessions may pose physical health risks for children. The most frequently cited are visual strain, harmful effects of radiation, and posture and skeletal problems. In the case of normal usage and normal operating conditions, however, research has shown that computer monitors are safe and do not compromise the health of our eyes and that computer monitors emit little or no harmful radiation. What does seem to pose a hazard is the strain placed on a child’s posture and skeletal structure if he / she consistently uses a computer set-up designed for an adult.

**Advantages vs Disadvantages of Computers Among Children**

Overall, the benefits seem to outweigh the drawbacks. And, the fact is, actively involved parents can control most of the drawbacks. This puts even greater responsibility on parents to be vigilant and conservative in their judgment about their children's computer usage. A regular and constant watch is very necessary, especially regarding the internet. For Surfing the Internet, parental involvement & control is also a must. Because the Internet holds no barriers since it is a World Wide Web, parents could install parental control tools to prevent children from going to undesirable sites.

Given the important benefits of computers and parental ability to control many of their drawbacks, computers have a positive, useful role to play in the development of young children. However, this role must be carefully circumscribed, as computers can
be misused and cannot provide all of the kinds of experiences that are critical to a young child’s development.

Computers supplement and do not replace highly valued childhood activities and materials, such as art, blocks, sand, water, books, exploration with writing materials, and dramatic play.” In other words, the computer is an enrichment tool for enhancing readiness skills, problem-solving, and creative expression. It adds another dimension to concrete exploration and expression, like playing with sand, puzzles and crayons.

The good news is that most parents, teachers, and kids in particular seem to know this intuitively. Young children flit between blocks, dress-up, drawing, books, the computer, and other favorite activities according to their spontaneous interest..

**Computer Education for Children**

Years ago, computer literacy was defined in terms of specific knowledge of computer technology and terminology. Today, it is regarded more as a continuum of awareness, skills, experience, and attitudes based on the age and capabilities of the individual child - an awareness of what the computer can do – that it is a tool for learning and finding out about things, and for expressing and creating things; an awareness of ideas and behavior that are a part of the computer culture, such as knowledge of safe behavior on the Internet; basic operational skills learned by immersion in a variety of software programs; a body of successful experiences that over time develop within a child an intuitive feel for dealing with new things that he
encounters in a computer environment such as how to navigate a new program and how to "trouble-shoot" when something isn't working; and an attitude of discovery, mastery, purposefulness, and pleasure in using computers.

Children develop computer literacy by observing others at the computer and by diving in and actively exploring different software programs. As with learning to read, each child will progress at the rate appropriate to that child. By and large, children are curious and pick up fast. There are lots of computer classes which especially cater to young children.

**Stages of Computer Education for Children**

Rather than predicating an optimal age when to start computer education, it is best to allow the child to take the lead. As in the case of reading and writing, her own readiness should drive when she starts using a computer and at what pace she develops her computer skills. Since most children seem to "catch up" whenever they start using a computer, parents needn't worry that their child will fall behind on computer skills if she doesn't demonstrate an interest at an early age.

On way of looking at stages in computer education for children is described in this section:

**Exposure and observation:** A child's relationship with the computer typically begins with the child watching a sibling, parent or classmate busy at the computer. She
eventually crawls up on Daddy's lap, and through the so-called "Daddy Interface" has her first computer experiences, passive in nature.

**Active participation:** The child quickly moves from observer to active participant, grabbing at the mouse, banging on the keyboard, and pointing at things that excite her on the screen. The parent, however, still operates the software.

**Taking control:** Eventually, the child learns how to control a mouse or trackball and subsequently how to control what is happening on the computer screen. Using her newfound "point and click" and "click and drag" skills, she can now actively explore a software program.

**The computer is my tool:** With greater control, the child begins to see the computer more as her tool – something she can use to make and find things. Increasingly, she approaches the computer with a goal, for example to find dinosaurs or or click on something colorful or moving.

**Mastering skills:** As she plays with different software programs, a child develops a general sense of how to navigate through simple environments, how to start and quit an activity, and how to operate specific programs. Although she may still rely on a parent or sibling for many functions, she is rapidly mastering an impressive skill set.

**Independence:** Most children with consistent access to a computer over the period of a couple years are eventually able to power up the machine, start up a pre-loaded application either from the hard disk or a CD-ROM, quit an application, operate the printer and scanner, access the Internet from the desktop, and even send an email.
Another way of looking at stages in computer education for children is described as follows:

**Babies and Young Children: Passive Observers:** At this age, kids are able to sit on a parent's lap and watch the activity on a computer screen. They have the curiosity, attention span to track and enjoy the media experience. This relatively passive computer experience with the parents, however, is not very different from being read to or watching a TV program, with the parent making the effort to connect the child with the media.

**Three-Year-Olds: Ready, Set, Go:** A few essential skills are required for directly controlling a computer software program. Children must first have adequate fine motor skills and hand-eye coordination to operate a mouse or track ball. Second, they must possess the cognitive skills of causality and vertical/horizontal transfer in order to understand that what they are doing with the keyboard or mouse is making things happen on the computer screen. They also need to possess the related skill of knowing what is up, down, right and left, so that they can control which direction they want the cursor to move on the computer screen.

Typically, these capabilities are present in the three to three-and-a-half-year-old. This is when becoming proficient with a mouse is a quasi-effortless, rapidly acquired skill. Although many two's are able to control a mouse, for most younger children, it is a struggle and it is better to simply wait until they are ready rather than build up frustration and negative feelings toward the computer.
With basic mouse skills, three-year-olds can explore and experiment with cause and effect in simple environments like interactive stories and play rooms. They can also dabble with basic draw and paint programs and enjoy sing alongs, finding games and other activities that are simple to control.

**Preschoolers and Kindergartners: Computer Explorers:** As children move through pre-school into kindergarten, their insatiable curiosity, growing attention span, increasing memory, and developing cognitive skills make for an increasingly richer, more independent experience. They can stay with an activity longer, remember more about where things are and how to get where they want to go in a program, and they can enjoy a broader range of content and activities. They move from simple cause and effect experiences to acquiring readiness and problem-solving skills through structured activities, creating illustrated stories and multimedia pictures with graphics programs, and even using visual reference programs like Microsoft Encarta to answer their many "why's?" At this stage, four and five year olds become computer "explorers", never tiring of finding more things to do with a program and the computer.

**First and Second Graders: Computer Competency:** As children enter elementary school, their computer experience continues to broaden with their emerging reading and writing skills. Programs that require or revolve around some reading come within their reach, and they can supplement their learning in school with subject-specific software programs, from the three "Rs" to science and geography. Their more sophisticated logic and problem-solving skills enable them to enjoy puzzles, strategy games and building and simulation programs. Their ability to follow longer multi-step procedures allows
them to use more sophisticated creativity programs to make slide shows, theater productions, paper doll designs, even animations. The text-heavy Internet starts to become more comprehensible, and as their sense of the world broadens, email and correspondence with children from far away places becomes more comprehensible and exciting. Their facility with the printer and other input and output devices gives them control over a wide range of creative "productions."

**Teachers and Computer Education**

Despite global calls over the past decade for more technologically savvy teachers, efforts by teacher education programs to ensure technology competence among graduates can best be described as isolated, often uncoordinated, and in some cases, dysfunctional (Bober, 2003; Harland, 2001, Learning Point Associates, 2004). While some colleges of education are doing a commendable job of preparing classroom teachers to use technology to facilitate student learning in specific content areas (Francis-Pelton, Farragher, & Riecken, 2000; Whitworth & Berson, 2003); others are doing very little; and the majority are situated between the two extremes (Mehlinger & Powers, 2002).

Galligan (1997) emphasizes the role of individual teachers in implementation of computers and how teachers can affect the educational appropriateness of the technology: It is their [teachers'] choices of how, when, where, why and by whom computers are used that determine whether or not the "technological pull is educationally beneficial" (p. 1).
The versatility in the ways computers can be employed for instructional purposes is varied, sometimes within the context of the software itself. "Effective teachers" (p. 2) states Galligan are teachers who make effective choices "about why they are facilitating any particular computer-based learning experience" (p. 3). Becker (cited in Galligan, 1997) provides a number of variables that complicate the pedagogy of implementing the computer in instruction: although computer availability is important, the most important factors determining whether teachers use computers effectively are planning time and teacher attitudes, style and background (p. 3).

Drury (1995) states that changes surrounding pedagogy are necessary if teachers are to be successful in implementing technology to support learning. He states that the "lack of sound pedagogical basis for integration of technology within the school has led to a narrow and unimaginative usage" (p. 3). He argues that teachers and schools focus the use of computers on classes such as "computer studies" (p. 3) rather than in other subject areas and thus "most study is of the technology rather than with the technology" (p. 3). He contends that this practice has the "effect of marginalizing" (p. 1) computers in education. Drury predicts a change in pedagogy and teacher role: The emphasis in our classrooms will shift increasingly from the product of learning to the process of learning and good teachers will be regarded as those who instill in students the skills required to navigate successfully through an information rich world (p. 1).

Galligan expresses a similar view about teacher roles and the pedagogy of computer technology: The outcomes of computer use at the classroom level are shaped by the theoretical framework and beliefs of individual teachers; the range of their
pedagogical repertoire; and their sensitivity and responsiveness to the structure, potential and limitations of particular software programs (p. 4).

Teacher attitudes toward computer technology may be a significant factor in the implementation of computers in education. Griswold (1984), Stevens (1984) and Stephenson and deLandsheere (1985) cited in Madden (1989) express a concern that computer literate individuals will "reap greater benefits than their counterparts who lack that knowledge" (p. 16). Their concern is that the development of computer literate individuals is dependent on computer literate teachers who have "in general demonstrated a resistance to learning about computers" (p. 16).

Lidtke (cited in Madden, 1989) attribute the reluctance of teachers to embrace computer technology to a number of factors that include: anxiety from dealing with equipment, a sense of loss of control over the teaching situation, hardware and software availability, lack of technical support, time and effort for training, remaining current in the field, and appropriately implementing the technology in the classroom.

LOCAL LITERATURE

Offering of Computer Education as a Separate Subject

According to Ms. Marivic Abcede of the Department of Education the Philippines’ policies on the use of ICT in education state that technology must be studied first as a separate subject, then applied in other learning areas as a tool for learning how to learn. The application of computer skills to the other learning areas is a curriculum policy that
systems from the principle that teaching-learning must not be textbook-driven, and educational processes should take advantage of technological developments, including the application of ICT in teaching and learning, where appropriate. An education modernization program should equip schools with facilities, equipment, materials and skills and introduce new learning and delivery systems necessary to capitalize on recent technological developments.

**Qualifications of Computer Education Teachers**

Since year 2000, it has been the policy of the DepEd to give preference to the hiring of teachers who are computer literate; most teacher-training institutions offer computer education as a required course. Usually, public schools send a few teachers to computer literacy training, who would then pass on the training of peer teachers. Private schools usually hire ICT service providers to give training to their teachers. There has been some private sector support for teacher training. Intel and Microsoft have a current program called Intel Teach to the Future program which targets to teach 1,000 teachers on the condition that each teacher would train 20 others. Other training programs for teachers are funded by other private organizations.
RELATED STUDIES

FOREIGN STUDIES

Teachers and Computer Education

One of the earlier studies on teachers and computers which was done by Lidtke (1979) is cited and summarized by Madden (1989): Results indicated that while teachers did not feel that their own jobs were threatened by computers, they still saw them as dehumanizing, isolating, prone to error and possibly as a violation of the right to privacy. Similar results were reported by Tetenbaum and Mulkeen (1984) (p. 13). A more recent study by Newhouse (1995) found that some teachers do not believe that computers have "a useful educational objective" (p. 5) and that they are "nonessential and supplemental to their teaching and classrooms" (p. 4).

Dupagne and Krendal (cited in Morton, 1996) completed a review of literature on teacher attitudes towards computers. They are able to identify "twenty aspects related to teachers perceptions of computers, the impact of computer use and the impact of personal and learning environment characteristics affecting a teacher's intention to use computers as teaching learning strategies" (p. 5).

Drury (1995), in his reference to a study of the Canadian Ministry of Education and its attempt to implement IT in schools in Ontario, finds that: Canadian ministry officials estimate that only 20 percent of the teaching cohort are at least "moderately committed computer users" and even this 20 per cent may not be in favor of a dilution of the traditional curriculum model - "software integrates the curriculum. It can work
against a subject approach." However research indicated that the main factor leading to a high level of IT-usage was a school-wide consensus on the importance of IT use for students and the amount of teacher-teacher collaboration (p. 2).

Kazlauskas and Koop (1995), in their examination of the barriers to the implementation of computers, observe: A critical factor that all staff needed to recognize and understand that integrating computers into classroom practice is a complex innovation which requires change to the whole school's practices and culture, to the curriculum, and in teacher's attitudes and classroom practice. Such change is achieved incrementally over a long period of time (p. 2).

Understanding the factors related to the prediction of preservice teachers' perceptions of their technological competence remains unclear although much has been written about the need for modeling by instructors (Albee, 2003; Francis-Pelton et al.; Strudler & Wetzel, 1999) and for preservice teachers to apply technology in their teaching (Brush, 1998; Dexter & Riedel, 2003; Russell, Bebell, O'Dwyer, & O'Connor, 2003). While preservice teachers are provided with courses on computer literacy and offered examples of computer software packages, it is only recently that they are required to apply computer technology in their courses. In addition, they are rarely afforded faculty role models who demonstrate computer technology in the classroom (Albee), or cooperating teacher role models during student teaching (Dexter & Riedel), although modeling computer technology in the classroom may result in stronger beliefs about the value of technology for teaching (Russell et al). Wheatley (2003) stated "Observing highly influential models, learners think Oh, if s/he could do it (or learn to do it), I can do it (or can learn to do it)".
In support of this, Dexter and Riedel (2003) found that modeling predicted student teacher use of technology and that support from staff members at the student teaching site was the most common source of support.

In another study, Motamedi and Fleming (2003) examined the role of the training environment in the acquisition of preservice teachers' technological skills. The three training environments studied included practicum, student teaching, and the university where preservice teachers were enrolled. In this study, it was found that while university instructors were most likely to use technology, university instructor use was unrelated to preservice teachers' perceptions of their computer technology skills. However, when cooperating and practicum teachers used computer technology, preservice teachers' perception of their skills were greater than those preservice teachers who reported no computer technology use by their cooperating and practicing teachers. This supports the findings of Higgins and Russell (2003) who found that modeling by other classroom teachers had the most influence on technology use in new teacher classrooms.

A study by Morton (1996) draws some important conclusions surrounding teachers' personal familiarity with computers and how lack of personal familiarity and experience may act as a barrier: the acquisition of computer expertise and skills is generally left to teacher initiative high levels of anxiety in using computers is experienced by teachers wanting to use computers and have few role models to follow teachers view the use of computers as promoting learning in students teachers are aware that increasing the frequency of computer use will lead to changes in pedagogy teachers are critical of lack of computer resources to implement change administrators
have created a major barrier to implementation because they are focused on learning about the computer instead of using the computer for learning (p.1).

Van Lengen (cited in Morton, 1996) finds that for the most part all teachers are willing to implement the computer but "the problem was that many [teachers] were either infrequent users or they didn't know how to use them"(p. 8). Compounding this problem is the need for infrequent teacher users to have structured opportunities to develop and practice computer skills. In addition is the startling revelation that "those that do not know how to use them [computers] have successfully avoided the many basic staff development activities that have run over the years" (p. 8).

Appropriate role models are required for infrequent users to implement and manage computers. Morton (1996) presents a complicating factor to the role model situation: ...the situation is that those role models exist, are generally based on computing studies teachers using computers in laboratory situations...and the more subtle obstacle of computing being the domain of mathematics / computer studies [teachers] inhibits the spread of computers across the curriculum (p. 5).

Newhouse (1995) identifies teachers' lack of computer literacy as being an obstacle to their using computers in classrooms. Newhouse draws a conclusion about the number of years of experience with computers teachers have and the impact it makes on the implementation process: ...most teachers need two or three additional years of experience using computers to become significant users of computers in classrooms...teachers need up to five years solid experience in using computers to become proficient at integrating them [computers] in the curriculum (p. 5).
Newhouse’s findings are shared by Roszell (1995): The most commonly identified factor, in the literature affecting IT use by teachers, was their level of knowledge and skill in using computers. This factor was identified by Zammit (1991), Ely (1990), Pelgrum and Plomp (1991) and Brummelhuis (1991) (p. 151).

Seidman (1996) has conducted a study into issues surrounding teacher training and its relationship with the successful implementation of computers. Along with the statistical analysis, Seidman finds that the handwritten comments by teacher respondents "overwhelmingly expressed a need for teacher training on basic computer skills" (p. 145). Seidman also states that teacher training should not be limited to teachers who teach computing. Seidman refers to an international trend on the part of educators to train all teachers on the use of computers: This need for teacher training is explained by the fact that most of the presently hired teachers received little or no training in their formal education. It could also be a reflection of the need to update teachers' knowledge in the world of fast moving technology of communication. Training all teachers on the educational use of computers gains special importance when considering integrating the computer into regular curriculum. Teachers need to know how to use computers first before they can integrate [them] (p. 145).

Seidman states that subject matter teachers are reluctant to consider the implementation of computers in teaching: The relatively cautious position of the SM [subject matter] teachers is perhaps due first to their limited experience with software and hardware, and second to the uneasiness about changing their habits and techniques as some of them expressed in their written comments (p. 147).
Mintz (1997) echoes Seidmen's view that teachers are unprepared to use computers in their classrooms and they "lack support and educational guidance" (p. 3). Mintz points to professional development and training as a solution to successful implementation: "...the next crucial step [in successful computer implementation] is the professional development for teacher that will provide them with materials, strategies and new understanding to meet the learning goals (p. 4).

The Office of Technology Assessment Report (cited in Geisert and Futrell, 1995) was written for the U. S. Congress to provide federal policy-makers an information base for making long-term decisions about computers in education. The OTA Report states that technologies have the potential to enrich the teaching and learning process but only under certain related conditions: adequate teacher training in the skills needed to operate the technology a clear vision and understanding among educators of state-of-the-art development and applications support for experimentation and innovation time for learning and practice (p. 256). The OTA report lists adequate teacher training as one of the recommendations in the report: Provide adequate teacher training. Teachers will need continuing in-service programs as technology changes, as more effective uses of technology are developed, and as research provides a better understanding of how children learn. (p. 257). The teacher is central to the implementation of computers in the classroom. Adequate teacher training is necessary it that is occur. Essential to teacher training is drawing a link between pedagogy and technology (Solomon, 1995; Bennett, 1996; Holzberg, 1997; McKenzie, 1994).
Availability of Hardware for Computer Education

Ginsberg and McCormack (1998) conducted a survey of 1163 teachers to discern what barriers teachers encounter in using computers. The responses to their survey indicated that issues surrounding computer hardware were the most serious barriers affecting implementation: Regarding hardware, teachers in both highly and less effective schools reported "serious" to "very serious" concern with "too few computers" and "too few printers." Teachers in less effective schools also reported concerns about "computers being too limited" (p. 2).

Middleton, Flores and Knaupp (1997) view the hardware factor as an accessibility barrier. They contend that computer labs are an effective strategy for reducing the student-to-computer ratio in schools. However, the competition between teachers for blocks of time in the computer lab may result in some teachers giving up on scheduling time in the computer lab and thereby ceasing to implement computers in instruction. They also contend that the accessibility to computer hardware may also be dictated by the subject being taught. In some instances, the physical location of computers and the students needing access to them will act as a barrier to teachers implementing the technology: The most important issue, according to Middleton et al, involves limitations of computer labs and issues of scheduling computer time. Middleton et al argue that computers need to be situated in classrooms where they can be easily accessed by students and used in a meaningful and pragmatic way.

The barrier of poor or limited accessibility prevents true integration of the computer in the instructional process: When large numbers of computers are in a room
separate from classrooms, many students get hands-on experience occasionally, but no one gets to use the computer in a truly authentic way—that is, the way a scientist or mathematician might use it to solve a difficult, time consuming problem. In order to be true tools for learning, computers need to be on hand when the need arises, not next week when the lab is open (p. 2).

**Software Issues and Computer Education**

The computer is a tool and the software tells the computer what to do. Accordingly, the value of the computer for a child is as good as the experience provided by the software. Having access to a library of high-quality age appropriate titles spanning the product categories relevant to kids (e.g. creativity, storybooks, and reference) is essential for enjoying the full benefits of a computer.

Newhouse's (1997, p.2) evaluation of computer-saturated learning environments in part considers issues concerning teachers' implementation strategies for computers in the classroom. One factor that is identified by teacher respondents in Newhouse's study is the lack of availability and access to software that is subject content appropriate. This factor is perceived by teachers as being a serious barrier that has a negative effect on their using computers in their classrooms. Lockhart et al (cited in Mann, 1997) names the application of appropriate software and hardware to curricular specific computing, the process of "articulation"(p.30). Primary to the implementation of the software is its assessment in terms of its use and appropriateness in the context of specific learning outcomes. Part of this articulation process is having curricular software
and manuals catalogued and accessible for easy use by teachers (Mann, p.3). Ginsberg & McCormack (1998) list a number of teacher issues and potential barriers to implementation that are software resource related: matching courseware to curriculum evaluation, quality control acquisition, setting priorities security, placement appropriate use (p.253). Similar software issues that act as barriers to successful implementation can be found in Ginsberg & McCormack (1997) and Morton (1994).

**Problems in the Use of Computers in Education**

Roszell's (1995) studied one urban school district in Saskatchewan to determine the degree teachers and administrators used Information Technology [IT] to support the goals of education and to identify the factors affecting the level of IT usage. Roszell surveyed urban district teachers and school-based administrators to estimate their level of IT use, the effectiveness of the IT they employed, and the degree to which various organizational and personal characteristics affected the amount of IT they used.

To summarize, the most important factors, identified by Roszell in the study, shown to have an effect on the implementation and use of IT in schools are: access to computers; availability of software; self-motivation; confidence and skill; the amount of time available for software review and teacher preparation; priority of computer use in the school; availability of hardware; attitudes of administrators; and teacher education and training (p. 54).
From the list of ten factors which he saw as having the greatest impact on IT use, Roszell identified five factors: the availability of time for teachers to prepare to use computers in instruction; the availability of high quality software; the availability of hardware; personal knowledge about computers; and administrative support (p. 58). Though Roszell did not include it in his list of recurring factors, he identified "pedagogical factors" (p. 171) as those requiring further investigation and research. Roszell stated that the research would benefit software developers and persons responsible for implementing technology into school curricula. The integration of computer technology has tremendous potential to effect changes in traditional education in terms of pedagogy.

Individual teacher initiative accounts for much of the implementation of computer technology in schools. Lack of support by administrators is identified as a significant barrier toward implementation of computers in classrooms (Morton 1997; Brand 1998). Arzt, (1991) and Lockard et al (cited in Mann, 1997) argue that successful implementation of computers can only occur if administrators offer teachers support and leadership. Persky (cited in Brand, 1998) states that in addition to administrators developing a philosophy to guide the implementation of computer technology, they can support the technological professional development of teachers by: establishing flexible schedules so teachers can practice what they have learned (or to continue their learning); encouraging and facilitating team teaching and peer coaching allowing teachers to visit each other's classrooms to observe computer technology integration; and scheduling regular meetings among teachers using technology to plan and evaluate instruction (p.13).
LOCAL STUDIES

Dizon (2001) made a study on the assessment of the current status of computer education in the private elementary schools in the Division of Pampanga and Angeles City. The study focused on perceptions on computer education. Based on her findings, she found out that most students find satisfaction in learning the lessons and these are further reflected in their positive attitudes about the subject. Students also appreciate computer education subjects. This means that they value the practical application of having knowledge in their life. Furthermore, student like computer subjects as part of their curriculum in order to keep themselves updated regarding recent technology in their community and country as whole.
 CHAPTER 3

RESEARCH DESIGN AND PROCEDURES

This chapter presents the research design and procedures, which the researcher applied in the conduct of the study. It includes the research method, research locale, population and respondents of the study, research instruments, data analysis techniques and research procedures.

RESEARCH METHOD

The descriptive method of educational research was employed in this study with questionnaires and secondary data as the major sources of data for analysis. This was done to provide data and information on the status of computer education in private elementary schools in Angeles City.

From another vantage point, this research may also be looked at as employing both qualitative and quantitative methods of research based on the nature of data collected and the type of data analysis performed.

RESEARCH LOCALE

This study was conducted in ten (10) private elementary schools in Angeles City during Academic Year 2009-2010.
POPULATION AND RESPONDENTS OF THE STUDY

The target population of this study consists of administrators and computer education teachers from private elementary schools in Angeles City.

Ten consenting private elementary schools in Angeles City were included in the study. All the administrators and computer education teachers from the consenting schools were included as respondents of the study.

The number of respondents per school are as follows:

RESEARCH INSTRUMENTS

The major instrument for gathering the desired data of this study was the questionnaire. Specifically, two sets of questionnaires were prepared – one for school administrators and one for computer education teachers from private elementary schools in Angeles City.

Some responses in the questionnaire were verified and validated with the data and information emanating from the respondents in unstructured interviews that were conducted. The interviews were informal in the sense that the respondents were just made to supplement or confirm results from the questionnaire.

DATA ANALYSIS

Qualitative as well as quantitative data analysis techniques were utilized in this study.

Qualitative data analysis techniques, particularly thematic organization, was used for the textual information collected on the course objectives / desired learning competencies and course contents in Computer Education.

On the other hand, quantitative data analysis techniques, namely, frequency and percent distribution were used for analyzing the inclusion of computer education as a separate subject, time allotted for the subject per session, number of sessions per week, educational qualifications of teacher(s) handling the subject, methods of teaching used, instructional materials used, technical support, and problems commonly encountered in the subject.
Descriptive statistics such as mean, standard deviation, minimum and maximum values were also obtained for the following variables: time allotted for the subject per session, number of sessions per week, number if trainings / seminars related to Computer Education, length of experience in teaching Computer Education, and Computer Education teacher-pupil ratio.

Mean ranks were also computed for the data on the problems met in Computer Education.

RESEARCH PROCEDURE

After securing the necessary permission to undertake the study from the AUF Graduate School and her Dissertation Adviser, the researcher visited the individual schools and distributed the questionnaire personally and requested the respondents to return the same. The respondents were assured of the confidentiality of their responses and assured that their responses would be used solely for the purposes of this research. After data collection, the researcher encoded the data gathered into a spreadsheet application (Microsoft Excel) and then applied the data analysis techniques mentioned in the preceding section.

CHAPTER 4

PRESENTATION, ANALYSIS AND INTERPRETATION OF DATA

This chapter presents the data gathered by the researcher in order to answer the research problems. The sequence of presentation is aligned with the order of the research questions as presented in Chapter 1.
Current Status of Computer Education among Different Grade Levels in Private Elementary Schools in Angeles City

The current status of computer education among different grade levels in private elementary schools was assessed based on curricular and instructional factors.

CURRICULAR FACTORS

Curricular factors, which are discussed in this portion of the manuscript, covers the inclusion of computer education as a separate subject, the time allotted for the subject per session, the number of sessions per week, the course objectives / desired learning competencies and the course contents.

Inclusion of Computer Education as a Separate Subject

All the 10 private elementary schools included in this study offer a subject for computer education. As shown in Figure 2. for 6 out of these 10 schools, the computer subject is integrated under the subject Makabayan. On the other hand, for 4 out of the 10 schools, the computer subject is an entirely separate subject.
As mentioned previously in this paper, Information and Communication Technology (ICT) is introduced in the elementary level as part of the subject “Edukasyong Pantahanan at Pangkabuhayan” or EPP which is in turn covered under the subject Makabayan. However, computer education is only a part of EPP and not yet mandated by DepEd to be a separate subject.

The computer subject is simply called “Computer” in 7 out of the 10 schools. The other 3 schools dub the subject as “Basic Computer,” “Computer Education,” and “Computer Studies,” respectively.
Figure 3 presents the number of schools with a computer subject per grade level. As seen in the graph, not all schools have a computer subject in the primary level (grades 1 to 3) while all 10 schools have a computer subject in the intermediate level (grades 4 to 6). Two schools do not have a computer subject for Grade 1, one (1) school does not have a computer subject for Grade 2 and one (1) does not have a computer subject for Grade 3. This may be because the minimum learning competencies prescribed by DepEd for Computer Education are only for Grades 4, 5, and 6, hence there are schools which do not include it among the subjects of grades 1 to 3 pupils.

![Figure 3](image_url)

**Figure 3**

**Number of Schools with Computer Subject Per Grade Level**

Among the schools with Computer Education subjects, the number of students and sections handled and number of computer teachers were obtained. Mean number of sections and students handled by each computer subject teacher per grade level were then computed along with other summary measures and these are presented in Tables 2 and 3.
As seen in Table 2, there is approximately 1 section or class to be handled per computer teacher for grades 1 to 2 while there are approximately 2 sections or classes to be handled per computer teacher for grades 3 to 6. Moreover, it can be seen from the table that there are teachers who handle up to 3 computer classes for Grades 1 to 3. On the other hand, there are teachers who handle up to 8 computer classes for Grades 4 and 5 and up to 7 classes for grade 6.

</table>
Congruent with the preceding results presented, for grades 4 to 6, the mean number of students handled by each computer teacher is about twice the values obtained for grades 1 to 3. The average number of students handled in the computer subject for grades 1 and 2 are only 32 and 31, respectively. For Grade 3, there is a slightly higher mean number of students handled, which is 39. This indicates that there are generally more students per computer teacher for the intermediate level.

Also, there are bigger standard deviations for the number of students per computer teacher for the intermediate level (102, 106 and 93 for grades 4, 5, and 6, respectively). This indicates that the individual number of students handled by each computer teacher in the intermediate level in the schools included in this study are generally far from the mean. The mean is affected by the extreme data as low as only 16, 13, and 14 students handled to as high as 335, 345, and 304 students handled for grades 4, 5, and 6, respectively.

</table>
Data were also obtained on the number of grade levels handled by each computer teacher. Table 4 presents summary statistics on this variable.

As seen in the table, only one-fourth of the teacher-respondents (25%) handle only 1 grade level. The rest (75%) handle 2 or more grade levels. Looking at the actual frequencies, it can be seen that the most number of teacher-respondents (43.8%) indicated handling 6 grade levels.

Table 4
Summary Statistics on Number of Grade Levels Handled by Each Computer Teacher
To date, there is still no DepEd order to provide guidelines on the student:teacher ratio for computer subjects just like there is no clear guideline yet on the offering of the computer education subject in the primary grades. Therefore, these findings may serve as baseline data for drafting the aforesaid guidelines which are very much needed in order to regulate the teaching of Computer Education in the elementary school level. This is necessary considering that the computer subject entails laboratory work where hands-on activities and exercises are the bases for assessing performance. Such activities entail much more time to assess as compared to usual quizzes or tests.

### Time Allotted for the Subject per Session and Number of Sessions Per Week

Table 5 presents the time allotted for the computer subject per session and the number of sessions per week in the various schools surveyed by the researcher. The number of sessions per week for the computer subject for all grade levels range from 1 to 5. In other words, the computer subject is taken up as seldom as once a week to as often as everyday. In terms of amount of time allocated to the computer subject per session, the sessions for Grades 1 to 3 last from 30 minutes to 60 minutes. Overall, the total number
of minutes allotted to the computer subject per week for Grades 1 to 3 range from 40 minutes to 180 minutes.

On the other hand, the sessions for Grades 4 to 6 last from 30 minutes to 100 minutes (1 hour and 40 minutes). Overall, the total number of minutes allotted to the computer subject per week for Grades 4 to 6 range from 40 minutes to 200 minutes.

Since there is no fixed number of hours specified for Computer Education, the private elementary schools have the liberty to assign the time allocation for the subject as they deem appropriate. The primary consideration should be that the time allotted would be sufficient to achieve the minimum learning competencies in the subject. These learning competencies are discussed in the succeeding section.

</table>
Course Objectives / Desired Learning Competencies

In the Philippine Elementary Learning Competencies for Makabayan under the Basic Education Curriculum, minimum learning competencies for the Computer Education subject are specified only for Grades 4 to 6 (Appendix __ ). However, in most of the schools surveyed, computer education is offered from grades 1 to 6. The course objectives or desired learning competencies for the computer education subject in the various schools included in this study are presented as follows per grade level:

GRADE LEVEL:                   GRADE ONE

SUBJECT DESCRIPTION:

Computer education for grade one deals with the historical background of the computer as well as the safety rules when using the computer. It covers the basic functions of the operating system and the Microsoft Windows. It also includes keyboarding, word processing and Microsoft Paint.

GENERAL OBJECTIVES:

At the end of the course, pupils will learn:

- about the impact of Information Technology in their lives as creative, critical, and conscientious learners;
- how to determine which processes, tools, and techniques to use, and when to use them;
how to use and apply a variety of information and communication technologies in
effective, efficient, and ethical way;

learn to identify parts of the computer
use proper technology in the classroom
learn how to use and control the mouse
learn how to utilize the backspace, delete and return keys
learn how to open and close appropriate software
learn early keyboarding skills

GRADE LEVEL:  GRADE TWO

SUBJECT DESCRIPTION:

Computer education for grade two deals with the parts of the computer, what it
can do, its proper care, and how it works. It also covers the basic applications of
computer networks to give the pupils in depth knowledge of how the internet works. The
subject is also designed to develop the pupil's artistic skills in designing using the two
important software: Microsoft Word and Microsoft Paint.

GENERAL OBJECTIVES:

At the end of the course, the pupil is able to:

- describe the computer as an information tool
- show how to take care of the computer system
- tell the difference between MS Windows and windows
- define Word Processing and tell what it can do
identify the different tools in the MS Paint toolbox

GRADE LEVEL: GRADE THREE

SUBJECT DESCRIPTION:

Computer education for grade three deals with the fundamental concepts of Information Technology, MS Word, MS Excel, graphics and simple programming.

GENERAL OBJECTIVES:

At the end of the course, the pupil is able to:

- explain what is a Operating System
- explain how to rename, copy, move and delete a folder
- describe the advantages of representing data in the tabular format
- describe MS Excel
- List the application of Graphics software
- Describe MS Paint and its features

GRADE LEVEL: GRADE FOUR

SUBJECT DESCRIPTION:

Computer education for grade four teaches the pupils how to create near-typeset-quality copy of a printed materials using Desktop Publishing. The subject also includes adding graphics to text to produce nice looking flyers, bookmarks, brochures, newsletters, posters, greeting cards, invitations, and many others.
GENERAL OBJECTIVES:

At the end of the course, the pupil is able to:

- identify the different uses of computers in different environment
- identify the significance of creating documents using MS Word than using pencil and paper
- create flyers, bookmarks, brochures, newsletters, posters, greeting cards, invitations, and many others
- familiarize with the different slide layouts
- create a presentation from a Word document and vice versa

GRADE LEVEL: GRADE FIVE

SUBJECT DESCRIPTION:

Computer education for grade five starts with an overview of the Word Processing, Internet, and the manipulation of graphics. It then proceeds to creating basic Web site using Web page development tools. With this the pupils will be prepared in the fundamentals of internet as well as the MS Office FrontPage.

GENERAL OBJECTIVES:

At the end of the course, the pupil is able to:

- explain what an Internet is and can do
- distinguish the difference between Internet and World Wide Web
- use the standard toolbar of the Internet Explorer
identify the system requirements prior to creating Web pages

differentiate the concept of uploading and downloading

create a presentable Web page in MS Office FrontPage

GRADE LEVEL: GRADE SIX

SUBJECT DESCRIPTION:
Computer education for grade six deals with the basics of using electronic spreadsheet program called Microsoft Excel that will do computations on data and presents these data in a table. The subject also provides with a unique opportunity to think, express ideas, and learn the fundamental process of problem solving. It enable the pupils to create programs like designing a calculator, creating songs, or making a picture move (animation) using the computer language QBASIC.

GENERAL OBJECTIVES:
At the end of the course, the pupil is able to:

manifest knowledge on the great men in the field of computing, describe their inventions, and discuss the great help their machines have done to society

discover the different ways to navigate around the worksheet and workbook

name the different categories of programming language

identify the stages in program development process

save, run and load a simple QBASIC program

create and run programs that solve various problems

Course Contents
The schools surveyed in this study also vary in terms of course content in the computer education subject for grades 1 to 6. The course contents for the computer education subject in the various schools included in this study are presented as follows per grade level:

GRADE LEVEL: GRADE ONE
FIRST QUARTER: History of Computer
SECOND QUARTER: Introduction to Windows
THIRD QUARTER: Keyboarding and Word Processing
FOURTH QUARTER: Creative Drawing

GRADE LEVEL: GRADE TWO
FIRST QUARTER: Knowing Your Computer
SECOND QUARTER: Windows and the Internet
THIRD QUARTER: Keyboarding and Word Processing
FOURTH QUARTER: Graphics and Creative Drawing

GRADE LEVEL: GRADE THREE
FIRST QUARTER: Introduction to Windows Basics
SECOND QUARTER: Exploring Windows Desktop
THIRD QUARTER: Introduction to MS Word 2007
FOURTH QUARTER: Introduction to Excel 2007

GRADE LEVEL: GRADE FOUR
FIRST QUARTER: The Computer System
SECOND QUARTER: Word Processing with MS Word
THIRD QUARTER: Desktop Publishing with MS Publisher
FOURTH QUARTER: Creating Presentations Using MS PowerPoint

GRADE LEVEL: GRADE FIVE
FIRST QUARTER: The Computer: Then and Now
SECOND QUARTER: The Internet and the World Wide Web
THIRD QUARTER: Web Design Using HTML
FOURTH QUARTER: Designing Web Pages Using MS Office Front Page

GRADE LEVEL: GRADE SIX
FIRST QUARTER: The Computer System: How It Works
SECOND QUARTER: Creating Spreadsheets with MS Excel
THIRD QUARTER: Introduction to Programming
FOURTH QUARTER: QBasic Programming
INSTRUCTIONAL FACTORS

Instructional factors, which are discussed in this portion of the manuscript, covers the qualifications of teacher(s) handling the subject, methods of teaching used, instructional materials used including textbooks, hardware, and software, and technical support.

Qualifications of Computer Teachers

Table 6 shows the educational qualifications of computer subject teachers in private elementary schools in Angeles City.

As seen in the table, most of the computer subject teachers are graduates of either Bachelor of Secondary Education (43.8%) or Bachelor of Elementary Education (25.0%). These teachers mostly majored in English, Filipino or Math although there were 2 out of the 7 BSE graduates who majored in Computer Education. The other 25% of the teachers are graduates of computer related courses, namely BS Computer Science and BS Information Technology.

Several of the computer education teachers (37.5%) did not yet pursue a master’s degree but the same number (37.5%) have earned units in a master’s degree program, specifically Master of Arts in Education, Master of Arts in Special Education or Master in Business Administration.

One-fourth of the teachers (25%) have actually completed their master’s degree particularly Master of Arts in Education, Master of Arts in Teaching and Master of Science in Mathematics. Among the graduates of the master’s degree programs, only one computer education teacher has pursued doctorate education in Educational Management.
Based on these data, it can be said that majority of the computer education teachers lack the formal academic preparation for teaching computer education. The computer education teachers are mostly graduates of education courses but did not specialize in computer education. This may be because teacher education institutions or schools offering graduate programs do not yet offer computer education majors or because the teachers do not want to specialize just in computer education but also in other fields.

</table>
The lack of formal academic preparation of the computer subject teachers may not be an issue or a problem for as long as the teachers seek other forms of training for handling the computer education subject. Figure 4 shows the distribution of computer education teachers according to attendance to trainings / seminars related to computer education. Eleven (11) or 69% of the teachers do attend professional development activities to enhance their knowledge and skills for teaching computer education. However, 5 teachers (31%) have not attended such activities for the past three years. Therefore, school administrators have to devote more attention to faculty development efforts for these teachers in order to ensure that they are able to teach the computer education subject competently.
Further scrutiny of which computer subject teachers have not attended faculty development activities related to teaching computer education subjects showed that 3 out of the 5 teachers who have not attended faculty development activities related to teaching computer education are computer science or computer education majors. Hence, their superiors may have deemed it unnecessary for them to attend such activities. However, 2 teachers were non-computer majors and have not attended the needed trainings related to teaching computer education subjects.

For those who attended faculty development activities related to teaching computer education subjects, the number of trainings attended are presented in Table 7. Number of trainings attended by each teacher for the last three years range from 1 to 6.

</tbody>
</table>

On the other hand, Table 8 presents data on the number of years that the teacher-respondents have been teaching computer education. One-fourth of the teachers have been handling computer education for only 1 year. There are two teachers who have been teaching computer education for 10 years and 13 years, respectively. The mean number of years of teaching the subject is 4.4 years, still indicative of a relatively short teaching experience as far as computer education is concerned.

Table 8

</tbody>
</table>
Overall, data on the teacher qualifications show that the computer education teachers in private elementary schools in Angeles City mostly strive to develop competencies for teaching the subject in the absence of the appropriate degree for computer education. However, efforts still have to be improved in terms of faculty development to ensure that the computer teachers are able to handle the subject effectively.

### Methods of Teaching Used

Table 9 presents data on the methods of teaching used in computer education by the teacher-respondents.
As seen in the table, almost all of the teachers indicated the hands-on method for teaching the computer subject. This involves making pupils implement the lessons learned in lectures in actual computer units. Lectures are another method mentioned by 56.3% of the respondents.

Some teachers (31.3%) also use the collaborative method while others (31.3%) use the discovery method.

Instructional Materials

Instructional materials needed for teaching computer education include textbooks, hardware and software components. Data on these are presented in this part of this chapter.

Textbooks
Reference or text books are important tools in the teaching-learning process for computer education. They serve as the main material that will guide the pupils as they go through the lessons in computer education.

For Grades 1 to 3 in the private elementary schools in Angeles City, the textbooks used are Computer Literacy, IT Learning Series, and The Amazing World of Computers. Publishers of the said books are the Phoenix and the Rex Publishing Company. The books were published in 2002, 2004 and 2006.

For Grades 4 to 6 in the private elementary schools in Angeles City, the textbooks used are Computer @ Work, Computer Literacy, Computing for Life, IT Learning Series, and The Amazing World of Computers. Publishers of the said books are the FNB Educational Inc., Jemma Inc., Neo Asia Publishing, Phoenix and Rex Publishing Company. The books were published in 2002, 2004, 2006 and 2008.

Although the years of publication are fairly recent, it is important that books be kept up to date with the most recent advancements in computer technology because technology changes very fast. Some contents may no longer be applicable these days such as the use of floppy drives which have been replaced by flash disks. Software versions also change rather frequently. Hence the textbooks to be used have to be breast with the developments in both hardware and software technology.

**Hardware**

All 10 schools hold computer education classes in a computer laboratory. The computer to student ratio in the said schools is 1 is to 1 except for one school where there is only one computer for every two pupils.
Given this information, it can be surmised that the private elementary schools included in this study have the physical facilities necessary to support the teaching-learning process in computer education.

**Software**

Table 10 presents the software available and taught to private elementary school pupils in Angeles City. Software are a set of programs or electronic instructions that make the hardware perform a particular set of tasks in a particular order.

For Grade 1, pupils are taught MS Word, MS Paint and Internet Explorer. The same are taught to Grade 2 pupils with the addition of MS Excel. For Grade 3, the same software as those taught in Grade 2 are taught along with MS Access and MS Powerpoint.

Grades 4, 5, and 6 pupils are taught MS Word, MS Excel, MS Access, MS PowerPoint, MS Publisher, MS Paint and Internet Explorer. Grade 6 pupils are also taught Movie Maker.

**Table 10**

Technical Support

Figure 5 presents data on technical support available when teaching Computer Education classes (presence of a computer technician(s) who assist in computer education classes).

As seen in the graph, eight out of the 10 schools included in this study have a computer technician(s) who assist in computer education classes. The technical support staff help in ensuring that functional hardware and software are available for the teaching-learning process in Computer Education.

Figure 5
Availability of Technical Support in the Private Elementary Schools
PROBLEMS PERCEIVED BY COMPUTER EDUCATION TEACHERS TO BE COMMONLY ENCOUNTERED IN THE COMPUTER SUBJECT

During a Consultative Workshop for Developing Performance Indicators for ICT in Education held in the Philippines in August 2002, the following key problem areas for implementing ICT in basic education were identified: (1) teachers’ fear of the technology; (2) school principals’ closed mindset to and non-appreciation of ICT in education; (3) constraints of the annual Education Budget; (4) maintenance of ICT resources and lack of technical staff; (5) sustainability; and (6) limited availability of education software and courseware.

In the case of the schools included in the study, the problems encountered are mostly in terms of the available computer units being outdated in terms of processing capability. This obtained a mean rank of 2.88. This is also related to computers malfunctioning or being defective which was pointed out as the second top problem (mean rank = 3.22). Some students intentionally destroying the computer facilities and not having an adequate number of functional computer units are the 3rd and 4th top problems. Although the problem “there is not enough time allotted for the Computer subject” obtained a mean rank of 2.45, only 5 teachers chose this as a problem so it had the lowest overall rank among the given problems.

PROPOSED CURRICULAR DEVELOPMENTS FOR COMPUTER EDUCATION PER GRADE LEVEL

Since there is no DepEd order that outlines the contents and objectives for the computer, the researcher proposes the following course contents and objectives for Computer Education per grade level. These are referred to as curricular developments or enhancements because as shown in the earlier parts of this chapter, the private elementary schools have their own course contents and objectives. The following are intended to provide a comprehensive and logical series of contents and objectives for the offering of computer education from grades 1 to 6.

GRADE ONE

Subject Title: COMPUTER 1

Time Allotment: 1 hour a week

First Quarter: Your Friendly Computer

The Story of Computers
Computers in Different Places

Parts of a Computer

How a Computer Works

Components of a Computer System

How to Operate a Computer

Caring for Your Computer

General Objectives:

At the end of the first quarter the pupils are expected to:

1. describe how a computer helps you and tell the things that a computer can and cannot do;

2. tell how computing devices have developed and name the different inventors of computing devices;

3. identify the different places where computers are used and tell how computers are used in these places;

4. name the different parts of a computer at the same time describe the function of each part of the computer and group the different computer parts according to their uses;

5. explain how a computer works and tell the steps in information processing;

6. name the different components of a computer system and compare a hardware and a software;

7. switch the computer on and off, insert a floppy disk and a compact disk in their respective compartments properly and use the mouse properly; and
8. share ways of caring for your computer and explain the importance of caring for your computer and your diskette.

Second Quarter: Operating System and MS Windows

Windows Desktop
Parts of a Window
Working with Windows
Introduction to the Internet
What the Internet Offers
Getting Connected to the Internet
Opening the Internet Explorer

General Objectives:

At the end of the second quarter the pupils are expected to:

1. define an operating system and describe MS Windows as an operating system;
2. name and describe the different parts of a Windows desktop;
3. name the parts of a window and describe the function of each part of the window;
4. open and close a window and change the size of a window;
5. describe the Internet and tell why the Internet is called the information superhighway;
6. describe the things that you can do on the Internet and list topics that you would like to look for on the Internet;
7. name the different things needed to get connected to the Internet and describe each of the equipment and programs needed to get Internet access; and
8. open and describe the Internet Explorer window.

Third Grading: Parts of the Keyboard

Proper Keyboarding Posture

Locating Letters, Numbers, and Symbols on the Keyboard

Word Pad and the Home Row Keys

Proper Finger Placement

Using the Space Bar, Enter, Backspace, and Delete Keys

Using the Shift and the Caps Lock Keys

Typing Words and Sentences

General Objectives:

At the end of the third quarter the pupils are expected to:

1. name the different parts of the keyboard and describe the function of each part;

2. show correct keyboarding posture and finger placement;

3. identify and locate the different letters, numbers, and punctuation marks on the keyboard;

4. open the Word Pad program;

5. use the left and right hands correctly to locate and type letters;

6. use the space bar, enter, backspace, and delete keys;

7. type using the home row keys; and

8. type words and sentences.

Fourth Grading: Getting Started with MS Paint
The Toolbox

Drawing Straight and Curved Lines

Drawing Different Shapes

Freehand Drawing

Using the Color Box

Adding Text

Saving and Printing a Picture

General Objectives:

At the end of the fourth quarter the pupils are expected to:

1. open and name the different parts of the MS Paint window;

2. name and describe the functions of each tool in the toolbox;

3. draw vertical, circles, rectangles, polygons and curved lines of different
   thicknesses;

4. create different freehand drawings using the pencil tool and eraser tool;

5. fill a drawing area with appropriate color using brush, fill with color, and airbrush
   tools;

6. type words inside the text frame using different fonts, sizes, colors, and styles;

   and

7. save, preview, and print drawings.

GRADE TWO

Subject Title: COMPUTER 2

Time Allotment: 1 hour a week
First Quarter: The Amazing Computer

Computer Around Us

History of Computers

Input Devices

Output Devices

Central Processing Unit

Storage Devices

General Objectives:

At the end of the first quarter the pupils are expected to:

1. describe and enumerate the things it can and cannot do;
2. identify and describe the places where computers are used;
3. explain how computing devices have changed through the years;
4. explain and describe the information processing cycle;
5. identify and explain the different input devices;
6. describe the different output devices and compare a hard copy and a soft copy;
7. compare a RAM and a ROM; and
8. determine the capacity of storage devices.

Second Quarter: Exploring Windows

Windows Start Menu

Opening, Closing, Moving, and Resizing a Window

Using Menus and Dialog Boxes

Using the Search or Find Command
The Internet

Opening the Internet Explorer

Moving Through Web Pages

General Objectives:

At the end of the second quarter the pupils are expected to:

1. enumerate the parts of a window;
2. identify some of the programs under the Accessories menu;
3. change the size of a window;
4. describe a dialog box;
5. explain the use of the Search command;
6. identify some of the features of the Internet;
7. demonstrate the different toolbars in an Internet Explorer window; and
8. move through different web pages using the address box, hyperlinks, and back and forward buttons.

Third Grading: Parts of the Keyboard

Proper Keyboarding

Home Row Keys

Keyboarding Drills

Word Processing

Getting Started with MS Word

Creating a Document

Saving, Opening, Closing, and Printing a Document
General Objectives:

At the end of the third quarter the pupils are expected to:

1. identify the different characters on the keyboard;
2. demonstrate proper keyboarding position and finger placement;
3. practice typing using the home row keys;
4. type using correct finger position;
5. explain the advantages of using a word processor;
6. name the different parts of MS Word window;
7. create and change the format of a document; and
8. open, close, save, preview and print a document.

Fourth Grading: Graphics and MS Paint

Drawing Lines and Curves
Drawing Different Shapes
Freehand Drawing
Adding Color
The Brush and Airbrush Tools
Using the Cutout Tools
Adding Text

General Objectives:

At the end of the fourth quarter the pupils are expected to:

1. define graphics and identify the different MS Paint tools;
2. draw lines and curves;
3. draw different shapes using the shape tools and save your drawing;
4. use the magnify tool to zoom in on a part of a drawing;
5. choose appropriate colors for your drawing;
6. use the brush and airbrush tools;
7. describe a cutout; and
8. add text and format text to MS Paint.

GRADE THREE

Subject Title: COMPUTER 3
Time Allotment: 1 hour a week

First Quarter: Computers in a Changing World
Applications of Computers
History of Computers
Hardware
Software
Information Processing Cycle
The Binary System
Safety and Security

General Objectives:

At the end of the first quarter the pupils are expected to:
1. explain how computers affect people’s daily lives;
2. list places where you can see people using computers;
3. name the earliest computing devices and their inventors;
4. name the different computer hardware;
5. describe the different available software;
6. enumerate the steps in an information processing cycle;
7. convert simple words using the binary system; and
8. describe ways on how to protect data.

Second Quarter: The MS Word Windows

Creating a New Document
Editing Typing Mistakes
Cut, Copy, and Paste
Changing Font Type, Style, and Size
Bulleted and Numbered Lists
Indenting and Aligning Text
Using the Spell Checker

General Objectives:

At the end of the second quarter the pupils are expected to:

1. describe the functions of a word processor;
2. open, close, and save a document;
3. use the delete and backspace keys to edit typing mistakes;
4. select text and cut, copy, and paste text;
5. insert symbols and special characters into a document;
6. add bullets or numbers to an existing text;
7. use different text alignment; and
8. use the spell checker to correct misspelled words.

Third Grading: Parts of the Keyboard
Accessing the Internet
Browsing the Web
Searching the Internet
Barrowing Searches
Creating Electronic Bookmarks
Copying Web Text and Images
Using an Electronic Encyclopedia
Using Electronic Resources Properly

General Objectives:

At the end of the third quarter the pupils are expected to:

1. discuss the functions of the different toolbars of Internet Explorer;
2. move around the web using the address bar, hyperlinks, and navigation buttons;
3. use search engines to locate information;
4. use AND and OR to narrow searches;
5. explain the importance of using bookmarks;
6. copy web text and images;
7. cite electronic sources properly; and
8. discuss the importance of using the Internet Properly.
Fourth Grading: Inserting Shapes and Word Art
Searching and Inserting Graphics
Moving and Resizing Graphics
Copying and Pasting Graphics
Rotating, Aligning, and Stacking Graphics
Modifying Graphics
Listening to Audio
Watching Video

General Objectives:

At the end of the fourth quarter the pupils are expected to:

1. add colors and fill effects to shapes and other objects;
2. insert graphics into a document;
3. move clip arts in a designated part of a document;
4. copy and paste clip arts;
5. stack clip arts to create different effects;
6. ungroup and regroup clip arts;
7. use the different commands of Windows Media Player; and
8. access the different commands of a Windows Media Player.

GRADE FOUR

Subject Title: COMPUTER 4

Time Allotment: 1 hour and 40 minutes a week

40 mins. Lecture
1 hr. Laboratory

First Quarter: The Amazing Computer
How It All Started
Computers Inside and Out
Bits and Bytes
Computer Programs
Windows Basics
Taking Care of Your Computer
Computers and Your Health

General Objectives:

At the end of the first quarter the pupils are expected to:

1. explain the capabilities and limitations of computers;
2. describe how computers developed through the years;
3. name the different parts of a computer;
4. compare a bit from a byte;
5. give examples of programs and the specific tasks they perform;
6. identify the different parts of a window;
7. discuss ways of taking care of computer; and
8. list health hazards related to computer use.

Second Quarter: The Internet
Using Search Engines
Advanced Searching Techniques

Searching for Multimedia on the Web

Web Sites for Kids

Evaluating Web Pages

Copying Not Allowed

That’s Private

General Objectives:

At the end of the second quarter the pupils are expected to:

1. discuss how the Internet started;
2. explain how search engines work;
3. use keywords in searching for information on the web;
4. search for multimedia files on the Internet;
5. explore web sites for kids;
6. evaluate selected web pages;
7. define the term copyright; and
8. classify private and personal information.

Third Grading: Creating a Document

Formatting Text

Spacing, Aligning, and Indenting Paragraph

Using Bullets and Tabs

Drawing and Inserting Objects

Creating Columns and Tables
Margins, Headers, Footers, and Page Breaks

Using the Spellchecker and the Thesaurus

General Objectives:

At the end of the third quarter the pupils are expected to:

1. describe what word processing can do;
2. compare a serif and a sans-serif font;
3. set the line spacing of a document;
4. create bulleted and numbered lists;
5. format an object;
6. resize the columns of a table;
7. change the margins of a document; and
8. use the thesaurus tool to look for synonyms.

Fourth Grading: Introduction to Desktop Publishing

Exploring MS Publisher

Creating a One-Page Publishing

Working with Frames

Making Changes in Your Publication

The Building Blocks of Design

Effective Page Design and Layout

Putting the Finishing Touches

General Objectives:

At the end of the fourth quarter the pupils are expected to:
1. define desktop publishing;
2. identify the parts of the MS publisher window;
3. save and print a publication;
4. select a frame and modify its contents;
5. format text in a publication;
6. describe the meanings associated with the different elements of design;
7. enumerate the steps in designing a publication; and
8. proofread a document using proofreader's marks.

GRADE FIVE

Subject Title: COMPUTER 5

Time Allotment: 1 hour and 40 minutes a week

40 mins. Lecture

1 hr. Laboratory

First Quarter: A World of Computers

Computers Then, Today, and Beyond

The World Wide Web

Information Please

Exploring Web Sites

You be the Judge

Viruses, Worms, and Trojan Horses

Computers and Your Health

General Objectives:
At the end of the first quarter the pupils are expected to:

1. describe how computers are used in different places;
2. trace the development of computers through the years;
3. explain how to navigate the web;
4. use advanced searching techniques to look for information online;
5. classify web sites;
6. use these guidelines in evaluating web pages;
7. enumerate ways of preventing viruses from infecting computer; and
8. describe the symptoms of computer-related health risks.

Second Quarter: Computers and Communications Technology

E-mail Basics
Sending an E-mail
Junk Mails
Mailing Lists
Let’s Chat
Mind Your Manners
Online Safety and Security

General Objectives:

At the end of the second quarter the pupils are expected to:

1. identify the different ways by which people communicate in cyberspace;
2. create an e-mail account;
3. compose and send an e-mail;
4. explain ways to avoid spam;
5. subscribe to a mailing list;
6. enumerate the dos and the don’ts in writing e-mails;
7. discuss ways on how to deal with online; and
8. explain ways on how to stay safe online.

Third Grading: Introduction to Spreadsheet

Creating a Worksheet
Filling and Sorting Data
Formatting Worksheets
Using Formulas
Using Functions
Creating Graphs
Previewing and Printing a Worksheet

General Objectives:

At the end of the third quarter the pupils are expected to:

1. describe the different uses of spreadsheets;
2. enter data into a worksheet;
3. perform basic and complex sorting;
4. format cells using the formatting tools;
5. describe the order of operations in a formula;
6. solve mathematical problems using functions;
7. create a graph to visually display a set of data; and
8. change the page setup of a worksheet.

Fourth Grading:

General Objectives:

At the end of the fourth quarter the pupils are expected to:

1. explain what a database is;
2. describe the different types of data and field properties;
3. add, edit, and delete data in a table;
4. sort data alphanumerically;
5. explain what a query is for;
6. create a form;
7. add records to a form; and
8. describe the function of a report.

GRADE SIX

Subject Title: COMPUTER 6

Time Allotment: 1 hour and 40 minutes a week

40 mins. Lecture
1 hr. Laboratory

First Quarter: Living with Computers
The Evolution of Computers
Communications and Networks
Exploring Cyberspace

Searching the Net

Netiquettes for Netizens

Computer Security Risks

Computers and Your Health

General Objectives:

At the end of the first quarter the pupils are expected to:

1. describe several ways computers play an important role in modern life;

2. identify the different people who made significant contributions to the development of modern-day computers;

3. cite examples of communication devices;

4. access web pages using different navigation tools;

5. evaluate materials on the web;

6. discuss some netiquettes;

7. describe the different computer security risks; and

8. identify the different computer-related health risks.

Second Quarter: Introduction to Multimedia

Text and Typography

Graphics

Sound and Music

Animations and Video Technology

Virtual Reality
Downloading Multimedia Files

Videoconferencing Technology

General Objectives:

At the end of the second quarter the pupils are expected to:

1. define the terms multimedia and interactive media;
2. use different typefaces to convey a message;
3. save images from the web;
4. discuss how sound data is manipulated by a sound-editing software;
5. search the web for free animations;
6. explain the practical uses of VR;
7. download multimedia files from the internet; and
8. conduct a videoconference with another person at a remote site.

Third Grading: Getting Started with MS PowerPoint

Creating a Basic Presentation

Adding Objects to Slides

Enhancing a Presentation

Working with Graphics

Fine Tuning a Presentation

Effective Slide Design

On with the Show

General Objectives:

At the end of the third quarter the pupils are expected to:
1. identify the parts of an MS PowerPoint window;

2. add text to a placeholder;

3. add AutoShapes, WordArts, and media clips to a slide;

4. animate objects in a slide;

5. change the brightness and contrast of a picture;

6. rearrange the slides in a presentation;

7. evaluate a slide presentation; and

8. discuss the ways of effective presentation.

Fourth Grading: Planning Your Web Site

MS FrontPage Basic

Formatting Web Pages

Adding Images

Creating Links

Creating Tables

Creating Frames

Basic Web Designing Principles

General Objectives:

At the end of the fourth quarter the pupils are expected to:

1. create a sketch of the structure of web site;

2. identify the different parts of the MS FrontPage window;

3. change the background color of a web page;

4. add images to a web page
5. create, format, add text to a table;

6. create, resize, add an existing web page to a frame;

7. explain the different web design principles; and

8. follow the design principles in designing a web page.
CHAPTER 5
SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

This chapter presents the major parts of this research in brief.

This study sought to assess the current status of computer education in private elementary schools in Angeles City as there is still a dearth of knowledge on this area and elementary school administrators and teachers, as well as pupils and their parents may benefit from the results of this particular endeavor.

Specifically, the study sought to answer the following research questions:

4. What is the current status of Computer Education among different grade levels in private elementary schools in Angeles City in terms of:

4.1. Curricular factors

4.1.1. Inclusion of Computer Education as a separate subject

4.1.2. Time allotted for the subject per session

4.1.3. Number of sessions per week

4.1.4. Course objectives / Desired learning competencies

4.1.5. Course contents
4.2. Instructional factors

4.2.1. Qualifications of teacher(s) handling the subject

4.2.2. Methods of teaching used

4.2.3. Instructional materials used

4.2.3.1. Textbooks

4.2.3.2. Hardware

4.2.3.3. Software

4.2.4. Technical support

5. What problems, as perceived by Computer Education teachers, are commonly encountered in the subject?

6. What curricular developments may be proposed for Computer Education per grade level based on the findings of the study?

The descriptive method of educational research was employed in this study with questionnaires and secondary data as the major sources of data for analysis. From another vantage point, this research may also be looked at as employing both qualitative and quantitative methods of research based on the nature of data collected and the type of data analysis performed.
Ten consenting private elementary schools in Angeles City were included in the study. Administrators and computer education teachers from the consenting schools were included as respondents of the study.

The major instrument for gathering the desired data of this study was the questionnaire. Specifically, two sets of questionnaires were prepared – one for school administrators and one for computer education teachers from private elementary schools in Angeles City.

Qualitative as well as quantitative data analysis techniques were utilized in this study.

Qualitative data analysis techniques, particularly thematic organization, was used for the textual information collected on the course objectives / desired learning competencies and course contents in Computer Education.

On the other hand, quantitative data analysis techniques, namely, frequency and percent distribution were used for analyzing the inclusion of computer education as a separate subject, time allotted for the subject per session, number of sessions per week, educational qualifications of teacher(s) handling the subject, methods of teaching used, instructional materials used, technical support, and problems commonly encountered in the subject.

Descriptive statistics such as mean, standard deviation, minimum and maximum values were also obtained for the following variables: time allotted for the subject per session, number of sessions per week, number if trainings / seminars related to Computer Education, length of experience in teaching Computer Education, and Computer Education teacher-pupil ratio.
Mean ranks were also computed for the data on the problems met in Computer Education.

After securing the necessary permission to undertake the study from the AUF Graduate School and her Dissertation Adviser, the researcher visited the individual schools and distributed the questionnaire personally and requested the respondents to return the same. The respondents were assured of the confidentiality of their responses and assured that their responses would be used solely for the purposes of this research. After data collection, the researcher encoded the data gathered into a spreadsheet application (Microsoft Excel) and then applied the data analysis techniques mentioned in the preceding section.

MAJOR FINDINGS

The succeeding portion enumerates the major findings of this study:

1. Current Status of Computer Education among Different Grade Levels in Private Elementary Schools in Angeles City in terms of Curricular Factors

   a. Inclusion of Computer Education as a Separate Subject

      i. All the 10 private elementary schools included in this study offer a subject for computer education.

      ii. For 6 out of these 10 schools, the computer subject is integrated under the subject Makabayan. On the other hand, for 4 out of the 10 schools, the computer subject is an entirely separate subject.
iii. The computer subject is simply called “Computer” in 7 out of the 10 schools. The other 3 schools dub the subject as “Basic Computer,” “Computer Education,” and “Computer Studies,” respectively.

iv. Not all schools have a computer subject in the primary level (grades 1 to 3) while all 10 schools have a computer subject in the intermediate level (grades 4 to 6). Two schools do not have a computer subject for Grade 1, one (1) school does not have a computer subject for Grade 2 and one (1) does not have a computer subject for Grade 3.

v. There is approximately 1 section or class to be handled per computer teacher for grades 1 to 2 while there are approximately 2 sections or classes to be handled per computer teacher for grades 3 to 6.

vi. There are teachers who handle up to 3 computer classes for Grades 1 to 3. On the other hand, there are teachers who handle up to 8 computer classes for Grades 4 and 5 and up to 7 classes for grade 6.

vii. For grades 4 to 6, the mean number of students handled by each computer teacher is about twice the values obtained for grades 1 to 3. The average number of students handled in the computer subject for grades 1 and 2 are only 32 and 31, respectively. For
Grade 3, there is a slightly higher mean number of students handled, which is 39.

viii. Only one-fourth of the teacher-respondents (25%) handle only 1 grade level. The rest (75%) handle 2 or more grade levels. The most number of teacher-respondents (43.8%) indicated handling 6 grade levels.

b. **Time Allotted for the Subject per Session and Number of Sessions Per Week**

i. The number of sessions per week for the computer subject for all grade levels range from 1 to 5.

ii. In terms of amount of time allocated to the computer subject per session, the sessions for Grades 1 to 3 last from 30 minutes to 60 minutes. Overall, the total number of minutes allotted to the computer subject per week for Grades 1 to 3 range from 40 minutes to 180 minutes.

iii. The sessions for Grades 4 to 6 last from 30 minutes to 100 minutes (1 hour and 40 minutes). Overall, the total number of minutes allotted to the computer subject per week for Grades 4 to 6 range from 40 minutes to 200 minutes.

c. **Course Objectives / Desired Learning Competencies**
The course objectives or desired learning competencies for the computer education subject in the various schools included in this study are presented as follows per grade level:

i. For Grade 1

At the end of the course, pupils will learn:

- about the impact of Information Technology in their lives as creative, critical, and conscientious learners;
- how to determine which processes, tools, and techniques to use, and when to use them;
- how to use and apply a variety of information and communication technologies in effective, efficient, and ethical way;
- learn to identify parts of the computer
- use proper technology in the classroom
- learn how to use and control the mouse
- learn how to utilize the backspace, delete and return keys
- learn how to open and close appropriate software
- learn early keyboarding skills

ii. For Grade 2

At the end of the course, the pupil is able to:

- describe the computer as an information tool
- show how to take care of the computer system
- tell the difference between MS Windows and windows
- define Word Processing and tell what it can do
- identify the different tools in the MS Paint toolbox

iii. For Grade 3

At the end of the course, the pupil is able to:

- explain what is a Operating System
- explain how to rename, copy, move and delete a folder
- describe the advantages of representing data in the tabular format
- describe MS Excel
- List the application of Graphics software
- Describe MS Paint and its features

iv. For Grade 4

At the end of the course, the pupil is able to:

- identify the different uses of computers in different environment
- identify the significance of creating documents using MS Word than using pencil and paper
- create flyers, bookmarks, brochures, newsletters, posters, greeting cards, invitations, and many others
- familiarize with the different slide layouts
- create a presentation from a Word document and vice versa
v. For Grade 5

At the end of the course, the pupil is able to:

- explain what an Internet is and can do
- distinguish the difference between Internet and World Wide Web
- use the standard toolbar of the Internet Explorer
- identify the system requirements prior to creating Web pages
- differentiate the concept of uploading and downloading
- create a presentable Web page in MS Office FrontPage

vi. For Grade 6

At the end of the course, the pupil is able to:

- manifest knowledge on the great men in the field of computing, describe their inventions, and discuss the great help their machines have done to society
- discover the different ways to navigate around the worksheet and workbook
- name the different categories of programming language
- identify the stages in program development process
- save, run and load a simple QBasic program
- create and run programs that solve various problems
d. **Course Contents**

The course contents for the computer education subject in the various schools included in this study are presented as follows per grade level:

i. **GRADE LEVEL:** GRADE ONE

   **FIRST QUARTER:** History of Computer
   
   **SECOND QUARTER:** Introduction to Windows
   
   **THIRD QUARTER:** Keyboarding and Word Processing
   
   **FOURTH QUARTER:** Creative Drawing

ii. **GRADE LEVEL:** GRADE TWO

   **FIRST QUARTER:** Knowing Your Computer
   
   **SECOND QUARTER:** Windows and the Internet
   
   **THIRD QUARTER:** Keyboarding and Word Processing
   
   **FOURTH QUARTER:** Graphics and Creative Drawing

iii. **GRADE LEVEL:** GRADE THREE

   **FIRST QUARTER:** Introduction to Windows Basics
   
   **SECOND QUARTER:** Exploring Windows Desktop
   
   **THIRD QUARTER:** Introduction to MS Word 2007
   
   **FOURTH QUARTER:** Introduction to Excel 2007
iv. GRADE LEVEL: GRADE FOUR

FIRST QUARTER: The Computer System
SECOND QUARTER: Word Processing with MS Word
THIRD QUARTER: Desktop Publishing with MS Publisher
FOURTH QUARTER: Creating Presentations Using MS PowerPoint

v. GRADE LEVEL: GRADE FIVE

FIRST QUARTER: The Computer: Then and Now
SECOND QUARTER: The Internet and the World Wide Web
THIRD QUARTER: Web Design Using HTML
FOURTH QUARTER: Designing Web Pages Using MS Office

vi. GRADE LEVEL: GRADE SIX

FIRST QUARTER: The Computer System: How It Works
SECOND QUARTER: Creating Spreadsheets with MS Excel
THIRD QUARTER: Introduction to Programming
FOURTH QUARTER: QBASIC Programming
2. Current Status of Computer Education among Different Grade Levels in Private Elementary Schools in Angeles City in terms of Instructional Factors

a. Qualifications of Computer Teachers

i. Most of the computer subject teachers are graduates of either Bachelor of Secondary Education (43.8%) or Bachelor of Elementary Education (25.0%). These teachers mostly majored in English, Filipino or Math although there were 2 out of the 7 BSE graduates who majored in Computer Education.

ii. The other 25% of the teachers are graduates of computer related courses, namely BS Computer Science and BS Information Technology.

iii. Several of the computer education teachers (37.5%) did not yet pursue a master’s degree but the same number (37.5%) have earned units in a master's degree program, specifically Master of Arts in Education, Master of Arts in Special Education or Master in Business Administration.

iv. One-fourth of the teachers (25%) have actually completed their master's degree particularly Master of Arts in Education, Master of Arts in Teaching and Master of Science in Mathematics. Among the graduates of the master’s degree programs, only one computer
education teacher has pursued doctorate education in Educational Management.

v. Eleven (11) or 69% of the teachers do attend professional development activities to enhance their knowledge and skills for teaching computer education. However, 5 teachers (31%) have not attended such activities for the past three years.

vi. Three (3) out of the 5 teachers who have not attended faculty development activities related to teaching computer education are computer science or computer education majors. However, 2 teachers were non-computer majors and have not attended the needed trainings related to teaching computer education subjects.

vii. Number of trainings attended by each teacher for the last three years range from 1 to 6.

viii. One-fourth of the teachers have been handling computer education for only 1 year. There are two teachers who have been teaching computer education for 10 years and 13 years, respectively. The mean number of years of teaching the subject is 4.4 years, still indicative of a relatively short teaching experience as far as computer education is concerned.

b. **Methods of Teaching Used**
i. Almost all of the teachers indicated the hands-on method for teaching the computer subject. This involves making pupils implement the lessons learned in lectures in actual computer units.

ii. Lectures are another method mentioned by 56.3% of the respondents.

iii. Some teachers (31.3%) also use the collaborative method while others (31.3%) use the discovery method.

c. Instructional Materials

i. For Grades 1 to 3 in the private elementary schools in Angeles City, the textbooks used are Computer Literacy, IT Learning Series, and The Amazing World of Computers. Publishers of the said books are the Phoenix and the Rex Publishing Company. The books were published in 2002, 2004 and 2006.

ii. For Grades 4 to 6 in the private elementary schools in Angeles City, the textbooks used are Computer @ Work, Computer Literacy, Computing for Life, IT Learning Series, and The Amazing World of Computers. Publishers of the said books are the FNB Educational Inc., Jemma Inc., Neo Asia Publishing, Phoenix and Rex Publishing Company. The books were published in 2002, 2004, 2006 and 2008.
iii. All 10 schools hold computer education classes in a computer laboratory.

iv. The computer to student ratio in the said schools is 1 is to 1 except for one school where there is only one computer for every two pupils.

v. For Grade 1, pupils are taught MS Word, MS Paint and Internet Explorer. The same are taught to Grade 2 pupils with the addition of MS Excel. For Grade 3, the same software as those taught in Grade 2 are taught along with MS Access and MS Powerpoint.

vi. Grades 4, 5, and 6 pupils are taught MS Word, MS Excel, MS Access, MS PowerPoint, MS Publisher, MS Paint and Internet Explorer. Grade 6 pupils are also taught Movie Maker.

vii. Eight out of the 10 schools included in this study have a computer technician(s) who assist in computer education classes.

3. Problems Perceived By Computer Education Teachers To Be Commonly Encountered In The Computer Subject

   a. In the case of the schools included in the study, the problems encountered are mostly in terms of the available computer units being outdated in terms of processing capability. This obtained a mean rank of 2.88.
b. This is also related to computers malfunctioning or being defective which was pointed out as the second top problem (mean rank = 3.22).

c. Some students intentionally destroying the computer facilities and not having an adequate number of functional computer units are the 3rd and 4th top problems.

d. Although the problem “there is not enough time allotted for the Computer subject” obtained a mean rank of 2.45, only 5 teachers chose this as a problem so it had the lowest overall rank among the given problems.

4. Proposed Curricular Developments For Computer Education Per Grade Level

a. Since there is no DepEd order that outlines the contents and objectives for the computer, the researcher proposes course contents and objectives for Computer Education per grade level. These are referred to as curricular developments or enhancements because as shown in the earlier parts of this chapter, the private elementary schools have their own course contents and objectives. The proposed curricular developments are intended to provide a comprehensive and logical series of contents and objectives for the offering of computer education from grades 1 to 6.

CONCLUSIONS
Based on the highlights of the findings of the study presented in the previous section, the researcher reached the following conclusions:

1. Private elementary schools in Angeles City recognize the value of computer education as they included the computer subject in their curriculum as early as Grade 1.

2. The number of sections and students handled by computer teachers in the primary level is generally acceptable whereas the number of sections and students handled by computer teachers in the intermediate level is approximately twice that in the primary level.

3. The computer subject is taken up as seldom as once a week to as often as everyday in sessions last from 30 minutes to 60 minutes for Grades 1 to 3 and sessions lasting from 30 minutes to 100 minutes (1 hour and 40 minutes).

4. Majority of the computer education teachers lack the formal academic preparation for teaching computer education. The computer education teachers are mostly graduates of education courses but did not specialize in computer education.

5. The computer education teachers in private elementary schools in Angeles City mostly strive to develop competencies for teaching the subject in the absence of the appropriate degree for computer education through attendance to trainings / seminars related to teaching computer education.

6. The computer education teachers have relatively short teaching experience as far as computer education is concerned.
7. Teaching methods used in computer education are mostly hands-on activities and lecture method.

8. Different textbooks are being used by private elementary schools in Angeles City for the computer education subject. The years of publication of the said books are fairly recent but some still contain information which are already obsolete given the very fast pace of technological developments.

9. Private elementary schools included in this study have adequate physical facilities necessary to support the teaching-learning process in computer education. However, these computer facilities, like any other equipment, are subject to wear and tear.

10. Pupils in the Private elementary schools are taught Microsoft Office applications. Primary level pupils are taught MS Word, MS Paint, Internet Explorer, MS Excel, and MS PowerPoint while intermediate level pupils are taught the same software with the addition of MS Access, Publisher and Movie Maker.

11. Technical support staffs are present in most schools to help ensure that functional hardware and software are available for the teaching-learning process in Computer Education.

12. Private elementary schools included in the study have problems mostly with the available computer units being outdated in terms of processing capability, or computers malfunctioning or being defective, some students intentionally destroying the computer facilities and not having an adequate number of
functional computer units. For some schools, the time allotted for the computer subject is deemed to be too short.

13. In the absence of guidelines from the Department of Education for minimum learning competencies for computer education for Grades 1 to 3, curricular developments are needed to provide a comprehensive and logical series of contents and objectives for the offering of computer education from grades 1 to 6.

RECOMMENDATIONS

In view of the foregoing conclusions, the researcher came up with the following recommendations:

1. DepEd may consider formulating guidelines for the:

   a. Minimum learning competencies for computer education for Grades 1 to 3

   b. Appropriate student : teacher ratio for computer subjects

   c. Appropriate number of hours for Computer Education

2. Private elementary school administrators have to devote more attention to faculty development efforts given the relatively short teaching stint of the computer education teachers and their non-alignment to computer education.
3. Private elementary school administrators also have to devise ways on how to be able to address the problem on outdating and defectiveness of computer units.

4. Teacher education institutions and schools offering graduate education programs may consider offering computer education majors.

5. Prospects for future studies include:
   a. Gauging the computer skills of elementary school pupils and correlating these with the kind of curriculum their school adopted
   b. Evaluating the implementation of the proposed curricular developments
TITLE: DON’T CALL IT “MERIT PAY”: THE POLITICS OF IMPLEMENTING A STATEWIDE PERFORMANCE-BASED PAY STRUCTURE FOR EDUCATORS AND ADMINISTRATORS

Lauren C. McDonald, Georgia College & State University

Abstract:

This research investigates and identifies the major points of contention for the implementation of a performance-based pay structure for educators and administrators in the context of the statewide implementation scenario introduced in Georgia by Senate Bill 386 during the 2010 Legislative Session of the Georgia General Assembly. A multi-faceted analysis of the legislative tracking elements of the debate innovatively serve as research methodology for identifying and answering those questions that proved critical to the success or failure of implementation of reform via the legislative process. Whereas a great deal of research has been conducted on the potential efficacy of various performance-based pay systems, this analysis seeks to frame that data and debate within the context of an actual, and necessarily political, attempt at statewide implementation.

A unique feature of this research is its insider vantage point from within the legislative debate as it played out in Georgia during the 2010 session. Analysis of Georgia’s performance pay debate, when viewed from the perspective of both policy makers and education interest groups, demonstrates that very often the success of education reform hinges not merely on the presence of scholarly research, but on politics and persuasion. Accordingly, implications of this analysis include providing practical insight for future policymakers who may take up the construction and implementation of performance-based pay structures for educators and administrators. This analysis is also useful as an illustration of the politics of education reform on the state level and illuminates ways in which reform may be more effectively addressed at the legislative level.

Introduction

On the 2nd day of 2010 legislative session, Governor Perdue announced in his speech at the Georgia Chamber of Commerce’s annual “Eggs and Issues” breakfast that he would propose legislation to “create a merit pay program that will identify and reward teachers who increase student achievement.” The merit pay proposal was part of a three-piece set of education reform legislation that also included a principal incentive pay bonus and an incentive program to address Georgia’s need for math and science teachers. Perdue went on to say:

"It has long been one of the chief fallacies of government to focus on inputs, usually on how much you’re spending, instead of outputs – on
performance and achievement. I know this business crowd understands the importance of being accountable for results. That’s the culture change we’ve tried to make in state government, focusing our investment on generating measurable outcomes.

This research seeks to evaluate which groups opposed and/or supported the legislation and to identify the major points of contention. Major voices in the debate included support from the Governor’s Office, certain legislators and some individual educators and superintendents. Major opposition came from both individual teachers and larger professional educator organizations—Georgia Association of Educators (GAE) and the Professional Association of Georgia Educators (PAGE).

The proposed solution: Performance-Based Pay for Educators and Administrators

Based on the recommendations of Georgia’s Race to the Top Great Teachers working group, Senate Bill 386 would have required that some measure of student achievement account for 50 percent of Georgia educators and administrators’ effectiveness evaluations and that those evaluations be utilized for the purpose of salary increases. In December 2009, Georgia’s Race to the Top Task Force executed a survey of Georgia’s educators, via The Parthenon Group, to evaluate teachers’ views on effectiveness evaluations. Based on the input of the over 20,000 teachers and school leaders who responded, the Governor’s Office concludes that 80% said they would like to be evaluated on classroom observation and the degree to which they have helped students learn (Parthenon Group).

The resulting legislation states:

No later than July 1, 2011, the State Board of Education shall establish a state-wide common evaluation instrument that takes student achievement into account when assessing teachers, assistant principals, and principals. Such instrument shall be used to determine the Teacher Effectiveness Measure (TEM) for teachers and the Leader Effectiveness Measure (LEM) for assistant principals and principals. Fifty percent of the calculation for the TEM and the LEM shall be based on student achievement, as defined by the State Board of Education. The remaining 50 percent of the calculation shall be based on one or more factors as determined by the State Board of Education.

The idea of compensating educators based on some sort of measure of teacher effectiveness isn’t really new—neither are failed attempts at education reform. As one Georgia educator put it: “If education in Georgia were a football team, it would lose every game because it keeps changing its offense.” This educator and high school football coach was expressing a common sentiment from Georgia’s. Frequently over the past few decades, education in the United States has been the subject of large federal and state reform movements and experiments, of which educators have often found themselves to be the guinea pigs of right along with students.
A brief history of recent education reform in Georgia includes efforts to unite the state’s elementary, secondary and post-secondary education facets through the P-16 initiative. Some Georgia counties have also participated in the KEYS program, which also seeks to build a more comprehensive way to track and improve student achievement. Today, the program can be credited with the compilation of a P-16 database to track individual student achievement from pre-school to college (Venezia et.al).

The role of teacher performance in student achievement

A fundamental assumption behind the argument for performance pay in education is that there is a significant, positive link between teacher performance and student achievement. Research by Gordon, Kane, and Staiger in support of this link is cited by the Governor’s Office of Student Achievement as a major influence in the development of Georgia’s proposal via The Hamilton Project recommendations. A report by the Hamilton Project summarized this research, stating that “[t]eachers have a substantial impact on student performance. After a single year, students assigned to the best quarter of teachers ended up about 10 percentile points ahead of students assigned to the worst quarter of teachers” (Hamilton Project 2006).

Currently, the state of Georgia follows a common salary schedule for educators—increases in salary are given based on years of experience and for attaining advanced degrees. The research basis used to develop SB 386 rejects the assumption that earning an advanced degree or time in the classroom significantly and consistently increases teacher effectiveness and leads to higher student achievement. If these qualifications are not sufficiently accurate measures of teacher effectiveness, then proponents of adapting the current salary schedule have to provide a better way of measuring teaching quality. As a result, advocates of performance pay found themselves arguing the potential efficacy of longitudinal student data systems as required by SB 386.

Observations and implications

This research ultimately seeks to evaluate why SB 386 was unsuccessful and to identify which arguments were more successful than others during the debate.

3 major factors in the failure of Senate Bill 386

1. The Budget

One large factor seemed to be the budget, as the state faced a $4.2 billion revenue shortfall for the fiscal year 2010. This gap represented a 26.2% revenue shortfall and big budget cuts to keep Georgia within its constitutionally required zero-based budget structure. While legislators deliberated over unpopular reductions to close the gap between the projected and actual revenue numbers, it was hard to separate the ominous “budget” from the discussion of any other legislative attempt. Educators were understandably concerned that the proposed change to the salary schedule was a covert attempt to cut education funding at their expense. According to the Governor’s office,
implementing SB 386 was not projected to decrease teacher salaries overall. Still, lawmakers were unable to convince educators that SB 386 was not a tool to fill the budget hole. But it was difficult to make that claim while simultaneously conveying the severity of the revenue situation in order to explain why huge budget cuts were required across departments.

2. The Election

A second significant factor was that 2010 is an even-numbered year—which in Georgia means the entire legislature was up for re-election in November 2010. Opposition from groups such as GAE and PAGE did not go unnoticed by legislators, presumably more so by incumbents with opposition in the November election. However, some lawmakers disagreed that push back from educators was the primary reason the legislation failed. It should be noted that a majority of Georgia’s incumbent legislators faced no primary or general election opposition in 2010—55.6 percent running unopposed in the general election and 79.3 percent having no primary challenger (Pallay 2010).

3. Lack of Communication Between Legislators and Educators

The debate continually illuminated the frustrations that teachers have with the government meddling in education. This skepticism was evident when even attempts to set up framework for evaluation were treated as suspect.

Successful Selling Points:

Amid the opposition, there were some selling points that were better received by educators. For instance, SB 386’s requirement that administrators also be paid based on student achievement seemed to hold merit with educators as a means of increased accountability. More than one educator indicated that there was sometimes at least the perception that a principal could or would make classroom assignments based on his or her personal like or dislike of a particular teacher. Some might dismiss this claim as attributable to a hierarchal issue or a problem of “teachers vs. administrators.” However, the results of the Educator Survey demonstrate that educators were more concerned with accountability than shifting power away from administrators. 63 percent of respondents agreed that “[h]igh performing principals should have more autonomy over hiring and firing staff” (Parthenon Group).

Generally, the debate also revealed that:

- Educators were more willing to engage in the discussion of performance pay so long as the discourse was non-binding, i.e. via study committee
- Educators supported performance-based bonuses to supplement standard pay schedule—but wanted assurance that the money would be budgeted for future years
- Educators were more willing to consider if a performance-based pay structure could replace other required testing and increase local school autonomy

Abstract for Presentation 1463

Reading to Compute: Integrating Literacy and Literacy Skills into the Middle Grades Mathematics Classroom.

At all levels of formal schooling, mathematics and literacy are the two most tested areas of the curriculum. Often students and teachers view these two areas as polar opposites and are rarely grouped together in a strand. Communicating the incorporation of literacy skills and activities into formal middle grades mathematics courses serves to strengthen the connections necessary for student success in both disciplines.

Mathematics teachers realize how students’ interest and attitudes affect their success in both reading and mathematics classes. Using young adolescent trade books as the source for integrating literacy and mathematics provides the opportunity for success in both disciplines through connections to real life experiences and the increase of students’ ability to communicate.
PREDICTORS OF ACADEMIC SUCCESS FOR CONDITIONALLY ADMITTED FIRST-TIME FRESHMEN AT A FOUR-YEAR PUBLIC UNIVERSITY

by

ROBERT S. HORNBERGER

MAY 2010
Heck (2004) stated, “Policy analysis is an important, but problematic, window on the educational world because it may illuminate or obscure what it views” (p. 318). A student’s potential entrance to a four-year university is initially affected by an admission policy. However, often the policy, and resultant process, lacks an integral correlation with significant predictors of academic success and retention. Policy is instead set by political agendas and at decision levels that expand beyond the university. While formal procedures are therefore created at the university level and higher, informal practices become unclear and inconsistent to the practitioners (Fowler, 2009). Kretchmar (2006) suggested an inconsistency within these informal practices and lack of reliability in the process. Therefore, practitioners do not have dependable and credible processes to follow. Reliant processes are dependent upon solid policy, established through authentic leadership.

Various arenas understand policy and its related concepts differently. Fowler (2009) recognized at least seven different interpretations of the term policy. Within the context of policy are several key themes, including process (Hannah, 1997), politics (Morgan, 2006), power (Bryson & Crosby, 1992), and evaluation (Cook, 2002). Each of these characteristics significantly affects college and universities in regard to setting admission policies. For instance, some influence over admission policy is from the governing state, while other pressures come from both internal and external university constituents. Additionally, policies within universities are established to help achieve enrollment and retention goals set by the institution (Kretchmar, 2006). And a by-product of admission policies being influenced by these many factors is the event of a student not meeting the criteria and consideration of conditional admittance.
Additionally, college retention and academic success are topics of broad discussion throughout the American landscape (Carey, 2005; Heldman, 2008; Lederman, 2009). Over the past 50 decades, public funding for education has dramatically decreased, while competition for students has increased (Spillane, Reiser, & Reimer, 2002). Therefore, universities seek to retain students for economic purposes while also striving to produce healthy environments for learning. Because of the strong emphasis on college retention, colleges and universities seek to find reliable indicators collected at the time of application that will predict student academic success and retention.

While studying various predictors of academic success and retention, colleges and universities recognized the existence of a shared responsibility between the student and the institution in attaining this goal. While students provided their acquired characteristics developed prior to college, universities also affected a student’s likelihood of succeeding by contributing an environment conducive to learning (Astin, 1993; Tinto, 1994). To fully understand the magnitude of this matter, analyses of both individual and organizational learning, a student’s reacculturation to a new learning community, and the associated risk factors have also been conducted (Bruffee, 1999; DeBerard, Spielmans, & Julka, 2004; Nonaka, 1994).

Within the literature review of this study, three components were carefully examined. First, policy was reviewed, from a broad to narrow perspective, including the influences of politics and power, and ramifications in regard to educational policy. Second, retention and student academic success were evaluated according to three key theories, Astin’s (1993) Input-Environment-Output Model, Scholssbert, Waters, and Goodman’s (1995), study of Transition Theory, and Tinto’s (1993) Theory of Student Departure, and five studies about predictors of college retention and student academic success. These examples appropriately connect the
subjects of university admission policies, and college retention and student academic success. Third, a review of student risk factors, organizational learning, Nonaka’s (1994) theoretical framework of organizational knowledge creation, and Bruffee’s (1999) explanation of reacculturation, was provided, allowing for a deeper study of inputs and environmental factors related to the analysis. These three combined frameworks create a synergistic lens from which to view the study in its entirety.

Leadership was viewed through the lenses of politics and power. As Bolman and Deal (2003) noted, leaders in organizations need coalitions to build support and cooperation from others. This is accomplished through cultivated relationships. Herington, Scott, and Johnson in their study of firm-employee relationship strength noted that “firms need to establish ‘strong positive relationships’ with employees” and “the strengthening of relationships with internal constituents as being critical to a firm’s success” (Herington, Scott, & Johnson, 2005, p. 261). Moreover, Alderson and Alderson McDonnell (1994) asserted that a strong organization can be found when it is comprised of healthy, satisfying relationships between all levels of employees.

Furthermore, political cultures are comprised of constituents with political motives that energize particular behaviors within organizations. Frictions between individual and organizational concerns present a consideration for individuals to function politically. Inherent in this is the desire and need for power among individuals within organizations. In addition to the structural phenomenon of power, political systems also include personalities and incentives behind both individual and organizational actions (Shafritz & Ott, 2001).

Bolman and Deal (2003) asserted that power is the most valuable resource within organizations. Morgan (2006) supported this claim by stating that, “power is the medium through which conflicts of interest are ultimately resolved” (p. 170). The fact that behavioral dynamics of
individuals within organizations are derived through political motivations and power is an inevitable by-product.

Within the context of this study, the following research questions were addressed:

1. What academic admission factors of conditionally admitted students best predict first year academic success?

2. Are there differences between groups of conditionally admitted students based on demographic factors in their first year academic success and college retention?

3. Based on the student demographic factors that most significantly differentiate first year academic success, what academic admission factors of conditionally admitted students best predict first year academic success?

4. For conditionally admitted students, are there differences in first year academic success between students who are and are not retained from the first to the second year?

This quantitative study examined a sample of 249 conditionally admitted first-time freshman at a four year public university to answer four research questions pertaining to the potential prediction of academic success and college retention for conditional admits. The single-stage, convenience sample (Creswell, 2003) included students admitted during the three semesters of fall 2006, fall 2007, and fall 2008. Variables related to student demographic, academic admission, first year academic success, and college admission factors were included in the study.

The findings of the study revealed that an emphasis on core curriculum classes taken during high school, especially the senior year, and the core curriculum coursework GPA should be emphasized by policymakers as determinants for admission exceptions. The results also highlighted the ACT English sub score for the full sample, and the high school GPA for the male
sub group, as significant predictors of academic success and college retention. Other factors analyzed in the study, including the type of high school, whether a student earned college credit prior to college, whether a student participated in high school athletics, whether a student was an athlete at the college of study, ethnicity and race, whether the student received an application for admission fee waiver, and the type of conditional admit, did not qualify as significant predictors in the final statistical model.

In addition to the study’s focus on predictors of academic success and college retention, further study should also examine those factors that contain low correlations with academic success and college retention, allowing for possible implications regarding identified risk factors and recommendations for improvements to the services and support provided to students.

Paper prepared for the 2011 Annual Hawaii International Conference on Education,
Kindergarten Entrance Age and Gender: Short and Long-term Literacy Effects

Educators, parents, and policy-makers have for decades wrestled with identifying appropriate kindergarten entry age for children. Since the 1970s many school boards in Canada and the United States have debated the merits of raising and of lowering “cut-off” dates for children to enter kindergarten. Over a 25 year period starting in the early 1970s, De Cos (1997) found increasing numbers of school jurisdictions across the United States had raised the minimum entry age to kindergarten by three months or more (i.e., implementing a September 1st birthday cut-off date for admission rather than a December 1st cut-off date). Even in school jurisdictions where kindergarten entry age remains low relative to other provinces or states, parents are often encouraged by teachers or school administrators to “hold back” (i.e., “red-shirting” as described by Graue & DiPerna, 2000) their children to provide them with opportunities to gain additional experience and maturity.

The question of “what is the best age for entry to kindergarten?” has many responses. These are primarily dependent on the theoretical perspective taken with respect to child development and growth and what is considered to be the purpose of kindergarten (i.e., behaviourist/environmentalist – e.g., Bandura, Skinner; constructivist – e.g., Montessori, Piaget, Vygotsky; or maturationalist – e.g., Gesell). Given the variety of orientations, it is not surprising that a variety of studies (e.g., positive effects as a result of delaying entry: Datar, 2006; negative or no effects as a result of delaying entry: Lincove & Painter, 2006) conducted over the last decade have not found agreement over the effects of entry age to kindergarten.

Research Question

The present research will serve to add evidence to the debate over the academic effects of early and late entry age to kindergarten. Specifically, the authors address the question: What are the short and long term literacy effects of entry age to kindergarten.

Review of the Literature

Much of the literature suggests that there exist age and gender differences in children’s cognitive and behavioral school outcomes in kindergarten. Where there are gender differences with academic achievement, girls are more likely to attain higher performance scores in literacy (Below et al., 2010; Naglieri & Rojahn, 2001; Naour, 2001; Witelson, 1976). In a study performed by Below et al. (2010), from kindergarten to grade five, children were tested on four out of six early reading skills: phonemic awareness, phonics, orthography, and fluency. The findings revealed that female students tended to score significantly higher than their male peers on the four skills. However, when the students were re-evaluated on three out of the four kindergarten measures in the first grade, there were no longer any significant differences between the girls and boys. Overall, Below et al. (2010) conclude that there do exist “male deficits in early reading skill development . . . [but] these differences are small, temporary, and surmountable” (p. 254). Since the girls in this study scored a substantial amount higher than the boys, it provides evidence confirming girls’ possession of stronger literacy skills upon school entry. However, Below et al. (2010) observed that their “results failed to support findings that these [gender] differences grow larger as students’ progress through school” (p. 251). Since this study assumes a cross-sectional approach, Below et al. (2010) note that limitations do exist.
Instead, a longitudinal approach should be taken; this would minimize the effects of pertinent disregarded factors which influence a child’s reading performance, such as the implementation of different curricula in each classroom.

Gender discrepancies are also evident in children’s overall experiences of kindergarten upon entry. According to Fantuzzo et al. (2005), boys were identified as being more at risk for developing or suffering from “poor social knowledge outcomes” (p. 579). The research confirmed that children who were both younger of age and male were most at risk for developing poor work habits in the classroom. In their research, Fantuzzo et al. (2005) also discovered that a child’s gender combines with other influential factors, such as ethnicity, age, familial socio-economic status, and maternal education, to collectively affect a child’s performance in Language Arts at the start of kindergarten. Although gender does exhibit influential outcomes on a child’s performance on literacy assessments, it is critical to consider the complex interaction of other factors which also affect a child’s literacy performance.

Early et al. (2010) conducted a study which investigated how pre-kindergarten students spend their time in class. Their conclusions reveal that male students spent less time than girls in language/literacy, art, and fine motor activities while the female students spend less time than boys in science, social studies, and gross motor activities. Within the classroom, Early et al. (2010) discovered that teachers did not usually encourage different activities or use different kinds of instruction for girls and boys, but children tended to choose gender-stereotyped activities when they had free-time for classroom activities, and depending on what activities these children decided to spend their free-time doing, it could facilitate the development of foundational skills. Ruble et al. (2006) explain that boys and girls demonstrate different interests and behavioral preferences at early stages in their development. Boys tend to partake in play consisting of gross motor, blocks, sports, and action figures, while girls’ play is characterized by activities which gear towards fine motor skills development (e.g. drawing) and verbal skills development. Early et al. (2010) note that this could result in boys being less experienced for school readiness due to the specific skills they develop from the activities they are involved with, which do not encourage the same amount of cognitive development as the activities of girls’ play.

There has been debate as to whether retaining children for one year before kindergarten entry will provide them with opportunities to grow and develop, thus increasing the likelihood that children will develop foundational skills such as literacy. Current research presents conflicting evidence regarding whether delaying kindergarten entry truly benefits young children.

The results from a collection of studies demonstrate the advantageous effects of delaying a child from entering school by at least one year. Some researchers have discovered a correlation between enrollment age and academic performance during kindergarten, where the older children who were delayed entry had higher scores on academic performance evaluations (Baer, 1958; Bickel, Zigmond, & Strayhorn, 1991; DiPasquale, Moule, & Flewelling, 1980; Green & Simmons, 1962; Lin et al., 2009; Robinson, 1986; Shepard & Smith, 1986; Warder, 1999). However, this academic advantage which the older children possess diminishes with the progression of time (Baer, 1958; Bickel, Zigmond, & Strayhorn, 1991; Lin et al., 2009; Shepard & Smith, 1986; Stipek & Byler, 2001). Lin et al. (2009) explained that as older students progress through elementary school, “their academic gains gradually become smaller than the
younger groups” (p. 52) and the researchers suggest that younger groups of students may even outperform their older counterparts in the future. A possible explanation for the benefits of kindergarten delay rest in the “gift of time,” where children who delay a year before school enrollment are given opportunities to mature and prepare for the start of their educational careers (DiPasquale, Moule, & Flewelling, 1980; Robinson, 1986; Warder, 1999). In a longitudinal study conducted by Stipek and Byler (2001), the effects of age upon kindergarten entry on “children’s academic achievement, social skills, academic engagement, relationship with teachers, and self ratings of academic skills” (p. 175) were investigated. Children were categorized into three cohorts: the oldest consisting of children who turned six by December 31 of the year they entered kindergarten; the intermediate including children who turned five by May 31, prior to entering kindergarten; and the youngest group consisting of children who turned five after May 31 and before they entered kindergarten or in the fall after they have entered kindergarten. Results determined that the oldest cohort of children had higher literacy scores than the youngest cohort, but this disparity between literacy test scores disappeared by the third grade. Stipek and Byler (2001) also discovered that when children were matched for age, and not grade level, results concluded that “children who entered a year younger . . . were achieving at a significantly higher level in math . . . but not in literacy . . . than children who entered school a year older” (p. 184). Therefore, when discussing the likelihood of academic achievements in correlation with increasing age, it is essential to investigate what academic subject is being examined.

Academic curricula for kindergarten is becoming more demanding and challenging, thus more American states and school districts are increasing the age for kindergarten entry (Meisels, 1992). By raising the average entrance age, the goal is to increase test scores, since there is the assumption that older children outperform their younger classmates on academic performance tests (Meisels, 1992). Lin et al. (2009) support this argument by stating that the trend of delaying kindergarten entrance has contributed to substantial changes in the kindergarten curriculum. According to Lin et al. (2009), “with more children entering kindergarten with higher cognitive readiness, teachers must increase curriculum expectations to meet their needs” (p. 46). This poses problems for children who are already academically and developmentally disadvantaged, since curriculum alterations are exacerbating the gap between their achievement levels and the expectations that the kindergarten curriculum has of students.

Although some research unveils that there are benefits to delaying kindergarten entry on academic achievement, Graue (1993) argues that the social effects of delayed kindergarten entry do not present any advantages for children. In fact, children who have been “red-shirted” often worry about failing or being held back, and thus, they develop poor attitudes toward school. In a study performed to observe the effects of multiple factors on academic success, Hirst (1970) concluded that age was less of an influential factor in predicting a child’s academic success than gender and socioeconomic status. DeMeis and Stearns (1992) even argue that younger kindergarteners are able to outperform their older classmates. In their collection of studies, DeMeis and Stearns (1992) discovered that children who entered school at a younger age did not have more academic or social challenges, like many researchers had concluded. In fact, DeMeis and Stearns (1992) found that some of these younger students in their studies were even qualified for gifted education programs based on kindergarten teachers’ assessments. Therefore, DeMeis and Stearns (1992) do not suggest academic red-shirting as a
solution for giving a child time to mature and develop before kindergarten entry, especially since “present results indicate that a sizable population of the youngest entrants not only succeed but also excel” (p. 27) in classroom settings. The belief that academic red-shirting provides developmental benefits for children has caused kindergarten entry to be postponed for many students. Whether the delay of kindergarten entry truly does produce developmental benefits is still ambiguous. Even though there are contradictory research results determining whether there is an optimal age for school entry and whether this affects a child’s academic achievement and skill development, it is critical to note that “regardless the enrollment age, all children [gain a] significant amount of knowledge over time” (Lin et al., 2009, p. 51).

Context
Corter and Park (1993) found agreement among teachers, principals, consultants, and parents regarding what constituted exemplary kindergarten practice; they noted six principles exhibited in exemplary programs:

1. underpinning the kindergarten program of studies should be a play-based child-centred philosophy;
2. the focus of the program should be on the whole child;
3. the child should be placed in the social context;
4. parents and administrators should recognize and support the teacher;
5. all interest groups should work towards structured and balanced programs; and
6. schools and society in general should provide support for kindergarten.

These principles are often evident in kindergarten programs offered by a large variety of school jurisdictions. The province of Alberta is similar in this respect. In fact the Alberta Children and Youth Initiative (ACYI) highlights the importance of ensuring “that Alberta’s children and youth are well cared for, safe, successful at learning, and healthy” (Alberta Education, 2007a, p. 1). From a philosophical perspective, the Alberta recommended program of study for kindergarten is based on the premise that the program will meet the needs of every child in attendance, regardless of age (Alberta Education, 2005). Again, this is not unique.

A critical difference does, however, exist between this Alberta context, and the data collected in it, and those contexts often drawn on by researchers in other settings which makes this paper particularly interesting and insightful; the Province of Alberta admits children of younger age to kindergarten than virtually all other jurisdictions in North America. In this province all children whose fifth birthdays fall before March 1st are eligible to attend kindergarten the previous September. This means that a large proportion of children are actually as much as three months younger than what is normally seen in most North American jurisdictions having December 1st cut-off dates and six months younger than those jurisdictions having September 1st cut-off dates. Thus an excellent opportunity exists to examine the relationship between particularly young kindergarten entry age and literacy effects.

Method
In the 2000/01 school year, the 2001/02 school year, and then again in the 2002/03 school year, 15 schools, predominantly situated in low SES communities were identified by
Edmonton Public Schools to offer full-day kindergarten programming to their students. Additionally, a comparison group of schools offering half-day kindergarten were also identified for the three school years. Schools offering half-day kindergarten programming were chosen randomly and asked to volunteer by the school jurisdiction to form the comparison group. In total, for the 2000/01 cohort, 20 schools participated in the study, for the 2001/02 year there were 19 participant schools, while the 2002/03 cohort drew on kindergarten classes in 17 schools (some schools had more than one kindergarten class). Total original numbers of students in cohorts 1, 2, and 3 were 554, 532, and 554 respectively. The current data set includes data through to grade six for all students, boys and girls, whose birthdays occurred prior to September 1 of their kindergarten year (n = 602, average age = 240.6 days on September 1, s.d. = 82.9) or after December 1 of their kindergarten year (n = 84, average age = 1798.3 days on September 1, s.d. = 17.2).

These children’s progress (except those who have moved out of the jurisdiction and are no longer part of the study) has been tracked every year since they first entered kindergarten using a variety of literacy test instruments including Clay’s Observation Survey (Letter Recognition and Western Concepts About Print) administered at the beginning of the kindergarten year and again at the end of the kindergarten year and the Alberta Language Arts Provincial Achievement Tests (PAT) administered in grades three and six. Data from the Clay’s Observation Survey Letter Recognition and Western Concepts About Print were standardized (i.e., mean of “0.0” and standard deviation of “1.0”) and combined in equal weights to create aggregate pre-test and post-test literacy variables for the analyses. Using two-way ANOVAs to explore group differences, including interaction effects, the authors examined the relationships between kindergarten entry age, gender and literacy achievement at each point of data collection.

Findings

The literacy effects of kindergarten entry age and gender differences, including interaction effects were analyzed. A two-way ANOVA was conducted at each point of data collection. Findings are reported below.

**Pre-test kindergarten literacy comparisons.** The results presented below suggest that age of entry to kindergarten is significantly related to initial kindergarten literacy achievement (i.e., as measured in October of the school year after a September start date) level literacy skills with older children demonstrating greater abilities in understanding Western concepts of print and identification of letters (see tables 1 and 2). However, no differences in literacy levels at the beginning of the kindergarten year were found to exist between girls and boys. Similarly, no interaction effects were found to exist between age and gender in the data collected at the beginning of the kindergarten year from the children.
Table 1
Pre-test kindergarten literacy descriptive statistics (equally weighted composite of standardized Letter Recognition and standardized Western Concepts About Print variables).

**Post-test kindergarten literacy comparisons.** By the end of the kindergarten year, the gap between the younger children and the older children narrowed enough that no significant difference in literacy ability was found to exist between older and younger children (see tables 3 and 4). Again, as was the case with the kindergarten entry literacy data, there was no significant difference between boys and girls at the end of the school year, nor was there an interaction effect between age and gender.

Summary. As described above, significant literacy differences found in the entry to kindergarten data examined by age grouping disappeared by the end of the kindergarten year and remained absent in grades three and six. This trend is best seen in figure 1 in which all of the data have been standardized (mean of 0.0 and s.d. of 1.0) for comparison purposes. At all data collection points, girls performed similarly to boys. While this finding partially supports Below’s et al. (2010) finding that younger students enter kindergarten with fewer literacy skills,
evidence from the present study contradicted their finding that younger girls entered kindergarten with greater literacy skills.¹

Figure 1
Comparisons of standardized literacy data at the beginning of kindergarten, the end of kindergarten, grade three, and grade six.

Discussion and Conclusions
Our analysis supports Below’s et al. (2010) observation that their “results failed to support findings that these [gender] differences grow larger as students’ progress through school” (p. 251); in fact, we were unable to find significant gender differences in any of our four literacy measure points from kindergarten through to the end of grade six. This study contradicts Fantuzzo’s research which confirmed that children who were both younger of age and male were most at risk; even when age gender interactions were considered. Given the common belief held by many educators that girls out-perform boys with respect to literacy, particularly during the early years of schooling, this finding was very surprising. It is possible that teachers addressed this issue by providing more support to boys in order to bolster their

¹ As part of data analysis for other related work, also found no significant differences on age and gender comparisons using two-way ANOVA conducted on grade 3 mathematics, grade 6 mathematics, grade 6 science, and grade 6 social studies PAT data.
literacy levels to match those of girls; this does make sense in the light of the fact that the jurisdiction provides additional supports through schools to children falling behind in their literacy achievement.

Wading in on the retention debate, given the results of this study, it makes very little sense to hold back children who do not have special needs requiring additional educational supports. By the end of the kindergarten year we found no significant differences in measures of literacy between groups of children whose average ages differed by more than eight months. The younger children continued to keep any literacy gap closed right through to the end of grade six. The present study specifically contradicts the earlier findings of Baer (1958), Bickel, Zigmond, & Strayhorn (1991), DiPasquale, Moule, and Flewelling (1980), Green and Simmons (1962), Lin et al. (2009), Robinson (1986), Shepard and Smith (1986), and Warder (1999).

Meisels’ (1992) and Lin’s et al. (2009) assertion that as more children are held back to enter kindergarten a full year older the “academic curricula for kindergarten is becoming more demanding and challenging” (Meisels, 1992) and how policy makers are taking this up must be questioned. An argument put forward by Meisels (1992) for holding children back is that older, more mature children will outperform their younger classmates on academic performance tests. Lin et al. (2009) add that these older, more cognitively ready children must have increased curriculum expectations to meet their needs. This is particularly puzzling and clearly not playing out in the Alberta context generally since Alberta not only has one of the youngest entrance ages to kindergarten in North America (and has for decades), it also has among the very highest performance of its children on various international measures of literacy and numeracy achievement. For example, on the 2006 Progress in the International Reading Literacy Study (PIRLS), Alberta’s grade four students scored third highest in the world with very little difference in the performance among the top five participants (Russia, Hong Kong-China, Alberta, Singapore and British Columbia). Alberta students excelled in reading for literacy and in the higher level of comprehension processes such as interpreting, integrating and evaluation. (Alberta Education, 2007b)

It is noteworthy that the other Canadian province mentioned in the list of top five achievers on the 2006 PIRLS was British Columbia which requires its children to be a minimum of five years of age by December 31st of the academic year in which the child begins kindergarten, only two months older than Alberta’s cutoff date for admission. Other international measures such as the 2007 Trends in International Mathematics and Science Study (TIMSS) and the 2006 Programme for International Student Assessment (PISA) show similarly high international performance for Alberta students. For example, Alberta students aged 15 years of age placed 4th in the world in reading, 2nd in science, and 6th in mathematics in the 2006 PISA (Alberta Education, 2007c).

Given these international indicators and the findings of this study, policy makers must question the belief that raising average school entrance age will, in fact, lead to increased test scores on tests of academic performance in upper elementary school as well as junior high school. Educators and parents must also consider carefully their decisions to hold back children and they must question the true benefits to those children. It appears that DeMeis and Stearns’ (1992) view that “a sizable population of the youngest entrants not only succeed but also excel” (p. 27) in school is also supported in the present study. Of course, this, and the other recommendations made in this paper, only hold true if downward curriculum creep is
prevented. Learning objectives in early learning settings *must* be developmentally appropriate and in line with the six principles of exemplary kindergarten programs as outlined by Corter and Park (1993). An examination of the recommended kindergarten program of study in Alberta reveals consistency with these principles.

Distance Education of Public Schools Principals:  
The ICeXCELS Experience in Bicol, Philippines

Rebecca Rosario O. Bercasio*  
Helen M. Llenaresas**

The advances of technology have paved the way to a non-traditional mode of education. In the Philippines, the South East Asian Ministers of Education Organization Regional Center for Educational Innovation and Technology (SEAMEO-INNOTECH) offers a short course to school heads, potential school heads or teachers of the Department of Education (DepEd) through a non-traditional or flexible course delivery mode as a response to their needs for continuing education amidst geographical, time and even occupational barriers. This flexible learning course is called Instructional and Curricular Excellence in School Leadership and Management or ICeXCELS. An innovation in the continuing education of public schools principals, the course aims to address the need to develop and strengthen the school head’s role as an instructional leader in promoting the quality of teaching and learning in his school. This paper intends to document the experiences of an e-learning community, that is, a class in DepEd ICeXCELS from the Bicol Region, Philippines. This action research particularly aims to describe the experiences of the DepEd principals as online learners and the on-line tutor including their problems and coping mechanisms, and propose solutions to these problems.

*Dr. Rebecca Rosario O. Bercasio is a Professor II of Bicol University, Legazpi City, Philippines. She is one of the two ICeXCELS Online Tutors from Bicol University.
**Dr. Helen M. Llenaresas is a Professor VI of Bicol University, Legazpi City Philippines. She is currently the Vice President for Academic Affairs.
Factors Influencing the Attitudes of University Faculty toward Research

Normaliza C. Ramirez, Ed.D.
University of the East
normsramirez@yahoo.com

The study determined the factors influencing the attitudes of University of the East (UE) college faculty toward research. A researcher-developed instrument was used to collect data from 203 regular faculty members across all colleges in Manila and Caloocan campuses of UE. The results indicated that the respondents considered need for competence as the most important research motive; and time as the greatest barrier to faculty research engagement. While faculty members held favorable general attitudes toward and personal interest in research, they were ambivalent towards the value of research training, and the value of research in enhancing their function of instruction. The hypothesis is partially upheld since only some factors considered in this study significantly influence the research attitudes. A mixture of extrinsic and intrinsic reward strategies is recommended to promote faculty participation in the university’s research function.

Introduction

Higher education institutions are the primary source of research-generated knowledge in many academic fields for achieving economic progress and social well-being. However, Sanyal and Varghese (2007) found out that research is not yet an integral part of the responsibilities of universities in the developing world. This finding has also been observed in the Philippines. Bernardo and Sarmiento (1997) investigated whether the various researches give attention to the four goals of the Commission on Higher Education (CHED): (1) quality and excellence, (2) relevance and responsiveness, (3) access and equity, and (4) efficiency and effectiveness. They discovered that there were very few researches which dealt with these goals. Other local studies (Deza, 1999; de Jesus, 2000; Fetalver, 2002; de Guzman, et al., 2006) also indicated that research productivity level in the higher educational institutions was low in terms of both quantity and quality. The launching of the National Higher Education Research Agenda (NHERA) in 1998 provided the policies, priorities, procedures and guidelines on the research environment required to promote, and support research in Philippine colleges and universities.

In the University of the East (UE), its president, Dr. Ester Albano-Garcia, acknowledged the value of research as one of the trifocal functions of the university together with teaching and community extension. She also emphasized that the research experiences of the faculty members make their teaching more vibrant. Dr. Olivia C. Caolli, director of UE Office of Research Coordination (UE-ORC), pointed out that the office has since school year 2005-2006, facilitated several seminar workshops to help faculty members develop and strengthen their capability to conduct research projects and publish the results of their research. Academic Circular No. 1 Series of 2004 (as amended August 8, 2006) stipulates the attractive incentives for doing research. However, only a few faculty members have actively participated in the university’s research program.

It is in the light of the foregoing data that this study was undertaken. It aimed to provide a deeper understanding of the college faculty members’ attitudes toward the challenge of research work by investigating the (1) faculty respondents’ personal, teaching and research profile; (2) factors which motivate and hinder faculty research engagement; (3) faculty attitudes toward research; and (4) relationships among them.

Theoretical Framework

This study assumes that faculty attitudes toward research may be inferred from their cognitive, affective and behavioral inclination responses indicating positive, negative or undecided evaluations of research as an important academic responsibility. Such attitudes are influenced by personal and environmental factors. This view agrees with Herzberg’s
theory which considers the two factors that affect people’s relation to their work: intrinsic and extrinsic. Intrinsic factors in this study pertain to personal characteristics such as need for autonomy and competence; research skills; research productivity and experience; educational attainment and teaching rank.

The theory of planned behavior predicts that the college faculty members with higher degrees of perceived behavioral control tend to have both stronger intentions to engage in research and more likelihood to perform their research roles in appropriate conditions. Expectancy-value theories also propose that workers are inclined to do a task when they are certain that they can execute the task. This idea is also maintained by the self-determination theory which explains that the more autonomous the faculty members in engaging in research the more positive are the outcomes which, consequently, influence them to have positive attitudes toward research.

It is clear based on the above mentioned theories that intrinsic factors such as self-perception of one’s ability to successfully perform research are related with positive research attitudes.

Highlighting the person-environment dialectic, organismic theories support the assumption of this study that the research attitudes of the faculty are affected by external factors such as institutional research policies and reward structure, opportunities for research training, working conditions, and time for research. In this dialectic, there is a two-way relationship: (1) the person acts on the environment out of an intrinsic motivation to search for and influence changes in it, (2) the environment pushes the person to adjust and accommodate to it. This results to a consistently-changing synthesis in which the person’s needs are satisfied by the environment, and which generates in the person new types of motivation (Reeve, 2005).

Organismic theories provide the present study with a framework on how to explain why faculty members need environmental resources such as facilities and rewards to actualize their latent research capabilities. Thus, nurturing an environment conducive for research is necessary to motivate academic personnel to do research.  

Relerated Literature

Research Attitudes

According to de Jesus (2000), research is a highly demanding undertaking whose excellent execution relies not only on cognitive and psychomotor abilities but also on attitudes. Hence, the present study focuses on the attitudes of faculty members toward research.

Tang and Chamberlain (1997) investigated differences between administration and faculty members on six distinctive factors of attitudes toward research and teaching: (1) research orientation, (2) teaching orientation, (3) rewards influence research, (4) rewards influence teaching, (5) personal interest, and (6) mission of the university. They found out that administrators tend to think that research and teaching are mutually interdependent and that both research and teaching is the mission of their university. On the other hand, faculty members are less likely to agree with the mission of their institution that both teaching and research are essential parts of their work in the university. They believe that teaching is pleasurable, that research interferes with teaching, and that they should be required to do either teaching or research, but not both. Based on these differences, administrators and faculty members may develop different behavioral patterns in an educational institution. It is postulated that administrators may persist to expect professors to be more productive in terms of research, while carrying many teaching loads. Thus, it is concluded that university professors should spend more time in research and publication than to instructional activities so that they will be regarded positively by administrators when they are aiming for tenure and promotions.

In the Philippine higher education institutions, faculty members value research not only for knowledge sake, but also the importance of research for reform and development, and as an instrument of producing ideas for improving education in colleges and universities. For instance, Banaag (1994) indicated that the faculty members in a state college in Indang Cavite value research positively. De Jesus (2000) also found out that attitude wise, the faculty members are in general, have positive consideration about research.

Salazar-Clemena and Almonte-Acosta (2007) indicated the characteristics of a research culture that would improve research productivity in Philippine Higher Education
Institutions. These are: “time, strong belief in research endeavor, faculty involvement, positive group climate, working conditions and organizational communication, decentralized research policy, research funding, and clear institutional policies about research benefits and incentives.” Furthermore, their faculty respondents who are actively engaged in research disclosed that their productivity was enhanced by the graduate training program they had attended.

**Relationship between Demographic Characteristics and Research Attitudes**

The research attitudes of purposively selected college teachers in the University of Santo Tomas were investigated by Catalan (1997) through correlation and comparative analyses. The study disclosed that educational attainment, college affiliation, nature of employment, academic rank, sex, age, status of employment, and length of service, in this order of importance, were significantly correlated with the teachers’ research attitudes. Additionally, civil status and teaching load were not associated with the teachers’ attitudes. The comparative analysis result suggests that: (1) the positive research attitudes of the teachers with higher levels of education and teaching rank are marked by their perception that doing research is a rewarding activity; feeling that research contributes to school policy decisions; and predisposition to recognize the value of competent researchers, and to support the school’s encouragement for teachers’ research engagement; (2) the lack of the following: motivation, adaptation resources, and awareness of the benefits that can be derived from research, appear to be the reasons why engaging in research is a less-preferred activity among faculty members who are older and have lower educational level attained and teaching rank; and (3) the discomfort experienced by faculty members who are younger, who have not completed their graduate studies and who have not earned higher academic ranks may be caused by their anticipation of difficulties in meeting the demands of research, doubts about one’s research competence, and unwillingness to give up their leisure time.

**Relationship between Contextual Variables and Research Attitudes**

The study made by de Guzman et al. (2006) sought to ascertain the research psychographic characteristics of a select group of nurse professoriate in a comprehensive university in the Philippines. Results of the quantitative and qualitative analyses of this study revealed that the overall attitudes of the nurse professoriate are favorable. Though the respondents hold a strong positive interest in research, issues such as research incompetence and time constraints prevent them from being involved in research undertakings. Through the use of multiple correlation and regression analyses, the results indicate that teaching status, research know-how, educational attainment, and civil status greatly influence the nurse professoriate’s positive research psychographics. The results further revealed that the respondents’ training and exposure to research and attitudes toward research engagement, benefits and payoffs, research utilization and availability and overall attitudes toward research are negatively correlated.

**Relationship between Research Attitudes and Research Productivity**

The study made by de Jesus (2000) reveals that positive attitudes toward research do not necessarily lead to a higher level of research productivity. To a certain extent, the relationship between research attitude and productivity, either assessed in terms of output or publication, appears to be negative. For instance, faculty members with “highly positive” regard for research have fewer research outputs as well as published research works, compared with those holding “moderately positive” research attitudes.

In summary, the findings reviewed thus far indicate that the important correlates of research attitudes are gender, age, civil status, and highest educational attainment, teaching status, teaching rank, length of teaching service, research training and research productivity. Aside from these aforementioned variables, this study considers other factors that may somehow influence research attitudes. These are teaching assignment, research interests, and length of professional research experience, awareness of the university policy on faculty research, research motivating factors and research hindering factors.
Methodology

The study used the descriptive survey technique. It was conducted during the first semester of school year 2009-2010. The respondents were 203 regular faculty members of UE.

The instrument used for gathering data is a researcher-made questionnaire composed of four parts: Faculty Profile; Research Motivating Factors Inventory (RMFI); Research Hindering Factors Inventory (RHFI); and Research Attitude Scale for Teachers (RAS-T). The research instrument has been pilot tested to establish its validity and reliability.

In describing the respondents' personal profile, teaching profile, and research profile, descriptive statistics such as the computation of frequency distribution, percentages, mean and standard deviation are employed. The weighted mean are computed to determine the level of importance of the motivating factors, the extent of the hindering factors, and the degree of the favorability of the attitudes of the respondents toward research. Inferential statistics such as correlation analysis and regression analysis are used to ascertain how the respondents' profile and other factors, singly and collectively influence their attitudes toward research.

Findings

It can be described that in UE, female faculty (52.2%) slightly exceeds the number of the male faculty (47.8%). As to their age, the majority (39.4%) belongs to the age bracket of 40-49 years. One hundred forty (69%) of the faculty are married. Eighty-two (40.4%) of the respondents have doctorate units. Majority (40.9%) are presently at the associate professor level teaching on a full-time basis (94.6%) and handle four or more subject preparations and stayed in the teaching profession for 11-20 years (52.7%).

In regard to the respondents research characteristics, Table 2 indicates that eighty-one (39.9%) have only one research field of interest which is the field of education (32.5%). Majority (62.1%) has one to five years of research experience and participated in not more than five research trainings (75.4%) during the past five years. One hundred sixty-five (81.3%) are aware of the university policy on faculty research. In terms of their research-related productivity, more than half (53.7%) are slightly productive as determined by the total score computed from the points affixed to each research output they indicated in the survey questionnaire.

Among the extrinsic factors, affiliation has the highest mean value of 3.76 while status and social recognition has the lowest mean value of 3.38. Looking at the intrinsic factors, the data disclose that competence is regarded the most important motive with a mean value of 4.13 while autonomy is the least important motive with a mean value of 3.83. On the whole, all the motivating factors are regarded as “very important” except for status and social recognition, which is perceived as “moderately important” by the respondents.

The data further reveal that intrinsic factors (M=3.99) tend to motivate the teachers to engage in research more than the extrinsic factors (M=3.58). In other words, the faculty members in the respondent institution may be more likely to engage in research because of the satisfaction, autonomy and competence the activity provides more than the benefits that are separate from the research work itself such as extrinsic rewards and incentives, affiliation, and status and social recognition.

In sum, both the extrinsic and the intrinsic factors are perceived to be “very important” research motives. It may be inferred that faculty members can simultaneously hold strong extrinsic and intrinsic motivations in relation to research. This supposition is in accord with the Amabile, et al. (1994) conclusion that one type of motivation does not necessarily undermine the other. Thus, it is clear that both types of motivation play an important role in faculty research activities.

The respondents consistently view all the hindering factors as “moderate barriers” to pursue one’s research activities. Interestingly, it appears that the institutional barriers (M=3.10) exert a greater hindering influence on the faculty members’ research endeavors compared with the personal barriers (M=3.05). It can be assumed that if the faculty members perceive that the institutional barriers hinder them more than the personal barriers, they may use this as an excuse for them not to be very active in research. In addition, they may blame it more to the institution why they are not becoming productive in terms of their research outputs.
Table 1 presents the summary of the average means for the research attitudes. Based on the results, the respondents hold ambivalent overall attitudes (M=3.40) toward research. This is because, although they have positive beliefs about research, and are disposed to act favorably to do research, they have ambivalent feelings about their general attitudes, the value they give to research training, and the value they attached to research in enhancing their function of instruction. These results also reveal that their research attitudes are more of a general attitudes toward and personal interest in research rather than attitudes toward the value of research training. It is not also seen as an attitude toward research as a prime mover to enhancing instruction. The actual scenario should be research for the value of research because it is only in the academe where new knowledge of man can be rooted upon. Faculty research attitudes therefore should be positively directed towards their research interests including the enhancement of research competence through appropriate training, and most importantly the contribution of research to their teaching function.

Table 2 presents the summary of the significant results of the correlation analyses. In regard to the correlation between highest educational attainment and value attached to research in enhancing the function of instruction ($X^2=30.78 \ p=.014<.05$), statistical analysis reveal that faculty members with higher levels of educational attainment are less ambivalent toward the value of research in enhancing their teaching function. This finding is supported by the research made by Catalan (1997) which concluded that faculty members with higher educational attainment seem to have a definite research orientation. The highest educational attainment also has a significant influence on the overall research attitudes ($X^2=27.33 \ p=.001<.01$) meaning that those faculty members with higher educational attainment tend to
have more favorable attitudes toward research. Catalan (1997) also pointed out that the favorable attitudes of the faculty members with higher educational attainment seem to indicate that they have a “greater confidence in their ability to read with ease journal articles, better comprehension of the language that statistics conveys, and an ability to translate meaningfully elicited information.”

Among the teaching profile indicators, only teaching rank is found to have significant correlations with the value faculty members attached to research in enhancing their function of instruction ($X^2 = 22.12 \ p = .036<.05$), and overall research attitudes ($X^2 = 20.20 \ p = .0036<.01$). These results reveal that the faculty members who are more ambivalent toward the value of research in enhancing their teaching function are the instructors. This finding is consistent with Catalan’s study which disclosed that faculty members with higher academic rank believed that including relevant research findings in classroom discussions enhance teaching. It also appears that, as faculty members move to a higher teaching rank, they become less ambivalent in their overall attitude toward research, and hold more favorable overall research attitudes. This finding is also supported by Catalan’s conclusion that faculty members with higher academic rank regard research as a rewarding activity and exhibit more inclination to support the school’s “prodding” for faculty members to engage in research.

The awareness of the university policy on faculty research ($X^2= 13.13 \ p = .004<.01$) and research-related productivity ($X^2= 24.39 \ p = .018<.05$) are significantly correlated with the general attitudes toward and personal interest in research. These results indicate that, the faculty members who are aware of Academic circular No.1 series of 2004 (As Amended August 8, 2006) have more favorable general attitudes toward and personal interest in research than those who are unaware of the said policy. It may be that, as faculty members become aware of the university research policy, to some degree, they become encouraged to conduct research. Indeed, according to UE president Garcia, the research policies adopted by the university since 2004 have begun to bear fruit. “There are now faculty members who have been able to publish their research in national and international refereed journals” (UE Research Bulletin, 2008).

Statistical results indicate that the faculty members who have higher levels of research-related productivity hold more favorable general attitudes toward and personal interest in research. Perhaps they become more active producers of research because their positive beliefs about research are somehow validated by their research experiences.

Surprisingly, the results indicated that the value faculty members give to research training and research profile variables are relatively independent. It appears that the research characteristics of the faculty respondents have nothing to do with the value they give to research training.

There are three research profile variables which significantly influence the respondents’ attitudes toward the value they attach to enhance their teaching function: (1) awareness of the university policy on faculty research ($X^2= 12.87 \ p = .012<.05$), (2) research-related productivity ($X^2= 29.06 \ p = .024<.05$), and (3) length of professional research experience ($X^2= 32.65 \ p = .037<.05$). These results indicate that, the faculty members who are not aware of Academic Circular No. 1 series of 2004 (As Amended August 8, 2006) are more ambivalent on the value they attach to research in enhancing their function of instruction. It appears that the recognition of the importance of research in teaching may depend on the information about research policies of the university. Statistical results also indicate that, the faculty members who have lower levels of research-related productivity are more ambivalent toward the value they attach to research in enhancing their function of instruction. It may be that, as faculty members become uninvolved with research activities, they become less certain about the value of research in their classroom teaching. On the other hand, those who are active producers of research may be undertaking research that is so closely linked to the subjects they are teaching, that is why their research work enhance and reinforce their teaching function. In the study of Fairweather (1997), he concluded that when the faculty member is confronted with a substantial classroom teaching assignment and the desire to publish, the deciding factor may be his own attitude and beliefs about the importance of research or teaching.

Statistical results also reveal that, the faculty members who have less number of years of professional research experience are more ambivalent toward the value of research in enhancing their function of instruction. It may be that, as faculty members spend fewer years in doing research, they may lack knowledge of the value of research in the teaching profession.
The results show that the research profile variables which have significant correlations with the value the teachers attach to research in enhancing their function of instruction are the same variables which have significant correlations with the overall research attitudes of the faculty respondents.

Correlations between extrinsic and intrinsic research motives and the research attitudes are all significant. Apparently, the need for affiliation is the strongest extrinsic motivation for faculty research engagement. It may be that their desire to be associated with expert researchers facilitates positive evaluation of research and interest to pursue such scholarly activity. Perhaps they perceive that being with distinguished researchers can provide them with adequate research exposure and eventually they can also become competent researcher. According to Salazar-Clemena and Almonte-Acosta (2007), opportunities for novice faculty to work together with expert researcher are essential for faculty involvement in research activities.

In terms of enjoyment/research satisfaction, it appears that, as faculty members seek more pleasure in doing every aspect of the research work, they become more interested to conduct research. This finding is supported by the expectancy-value theories which assume that the individual will choose to do a task that arouses the greatest feeling of pleasure (Franken, 2007). The data also reveal that autonomy has a significant influence on the general attitudes toward and personal interest in research. This finding conforms to Lindholm’s (2004) conclusion that the intrinsic interests in research of the faculty are associated with the strong need for autonomy.

All types of personal barriers are negatively correlated with the respondents' general attitudes toward and personal interest in research. It could be, therefore, that faculty members who are less preoccupied with family responsibilities and leisure/recreational activities are more likely to have favorable general attitudes toward and personal interest in research. Perhaps they become more focused on their roles in the university if they think less about personal concerns. Moreover, it could be inferred that as faculty members expect less about how time consuming research is and the difficulties they can experience in doing research, they are more likely to hold positive general attitudes toward and personal interest in research.

In regard to self-assessment of research competency, it appears that, as faculty members assess more about their research knowledge and skills, they are less likely to have favorable general attitudes toward and personal interest in research. Perhaps they are less confident about their research capabilities. As noted, the respondents of this study have attended only a maximum of 5 research seminars and workshops in the past 5 years, and have 5 years and below professional research experience. These factors may have contributed to their doubts about their research competency.

The aforementioned findings support the research by de Guzman et al. (2006) in which they found that though the faculty respondents have expressed a strong positive interest in research, issues such as lack of research capability and being preoccupied with other priorities hinder them from doing research activities.

As might be expected, the value given to research training is influenced by research culture which is defined as an institutional barrier pertaining to limited opportunities for research training. This means that if the faculty members strongly believe that the university provides limited opportunities for research training, seminars and workshops they tend to be more ambivalent as to the value of research training.

The significant results of the regression analyses are summarized in Table 3. These results clearly indicate that the faculty research attitudes and attitude indicators are much affected by research profile variables and intrinsic research motivating factors. Moreover, the other explanatory variables for some indicators of research attitudes include highest educational attainment, gender, teaching rank, and research culture.

**Summary of Findings**

1. In general, the college faculty members are concurrently extrinsically and intrinsically motivated to engage in research. However, personal and institutional factors hinder them to pursue research activities to a moderate extent.

2. The college faculty members have favorable general attitudes toward and personal interest in research. However, when it comes to the value they give to research training and the value they attach to research in enhancing their function of instruction, their attitudes are described to be ambivalent. In addition, although these faculty members hold positive beliefs about research and are inclined to engage in research-related activities, they have ambivalent feelings about research. Thus, their overall attitudes toward research are found to be ambivalent.

3. Based on a descending number of significant correlations, the independent variables namely: intrinsic research motives (enjoyment/research satisfaction, competence, autonomy) (4), extrinsic research motives (extrinsic rewards and incentives, affiliation, status and social recognition) (4), research-related productivity (3), awareness of the university policy on faculty research (R²=.046), length of professional research experience (R²=.031), and intrinsic factors-grouped (R²=.297) are the most significant predictors of research attitude.
policy on faculty research (3), length of professional research experience (2), highest educational attainment (2), teaching rank (2), preoccupations (2), self-assessment of research competency (1), expectations of research demands (1), and research culture (1) are the factors on which the college faculty members’ research attitudes depend. In addition, the predictors of faculty research attitudes are: research-related productivity (3), highest educational attainment (3), teaching rank (3), length of professional research experience (3), field of education (as a research interest) (3), awareness of the university policy on faculty research (3), intrinsic motivating factors (grouped) (2), gender (2), competence (1), autonomy (1), law (as a research field of interest) (1), language (as a research field of interest) (1) and research culture (1), in this order, based on a descending of significant proportions of the variances in their research attitudes that can be explained.

Conclusions
The significant findings of this study affirm that the attitudes of college faculty members toward research are influenced by both personal and environmental factors. As predicted by the theories guiding this study, favorable attitudes are associated with factors affecting one’s ability to successfully perform research and unfavorable environmental conditions affect one’s attitude to be ambivalent towards participating in research training as well as in recognizing the value of research in their teaching activities.

The hypothesis is partially upheld since only some factors considered in this study significantly influence the research attitudes.

ABSTRACT

Personal investment theory has three key components: facilitating conditions, sense of self, and achievement goals. The relationships of these components were explored with the end of clarifying their interface as they affect Filipino adolescent students’ achievement from public and private schools. Model 1 (serial model) and model 2 (parallel model) were proposed and tested through path analysis. The fit indices indicated that the data from 1,694 Filipino adolescent students (public schools, \( n = 823 \); private schools, \( n = 871 \)) fitted model 2 considerably well. The better fitting model (parallel model) captures the independent effects of external factor (facilitating conditions) and internal factor (sense of self) in influencing students’ achievement via their achievement goals. As captured by parallel model, results indicated that, in comparison with public school students, better facilitating conditions were provided to private school students which influenced the endorsement of achievement goals leading to their achievement. Further, higher level of sense of self of private school students influenced their achievement goals leading to their achievement. Discussions focused on the confluence of human agencies: social agency and personal agency in influencing the personal investment of the public and private school expected to impact students’ academic achievement.
Active Learning of Multiple Culture by Wide Rolled Ehon with Multiple 3D View Points

Abstract. People can learn a lot from success stories and expand his / her ability. We propose an active learning of multi-culture by wide rolled ehon with multiple view points. The rolled ehon gives a vivid description of people and the town in old days. A wide display consists of several screens can show a panorama of scene and a long rolled ehon at the same time over human eye angle 68 degrees. Multiple views and multi-angle 3D images allow users to easily understand the structure and inner meaning of the target. Q&A interaction based on multiple views enables deeper understanding. We also discuss effectiveness of active learning and human characteristics based on these functions.

1 Introduction

A success story indicates major reasons for the great success with some parts of direct background. It also includes both lots of wonderful human activities and unpleasant stories. Even a success feels threat in an unfamiliar environment at the start point and usually takes some mistakes. Success stories indicate useful guidelines for a new success in future. Looking back upon both how the success has developed in a wonderful environments and its tough contexts in drastic change in global economy and political strategies by advanced nations enables us not only to enjoy a tour but also to develop new industry. The success stories by both immigrants and aborigines are also good teachers since they have directly developed industry and built infrastructure in the society. Some of them also became leaders of the society.

It is not easy for people to learn such a success story in multiple cultures although it includes valuable guidelines and great power for many purposes such as healing, symbiosis with nature, and developing new tourism. Different generation has different focuses and finds different meaning for a target based on his/her background and relation with it. Different fascinating story is often popular in each generation. Time flies, now Japan should learn the multiple cultures in order to accept immigrants in the super-aged society although Japanese had emigrated from Japan to Hawaii and Brazil etc.

People can learn a lot from such success stories and expand his / her ability in different environments. Easy and natural start of learning success stories is very impor-
tant for the beginners. We propose an active learning [2, 3] of multi-culture by wide rolled ehon with multiple view points. A rolled ehon gives a vivid description of people and the town in an old day (See Fig.1) [1]. A wide display consists of several screens [9] which can show a panorama of scene and a long rolled ehon at the same time over human eye angle 68 degrees. Multiple views and multi-angle 3D images allow users to easily understand the structure and inner meaning of the target. Q&A interaction based on multiple views enables deeper understanding. We also discuss effectiveness of active learning based on these functions.

2 Opportunity and Ability for learning

People usually get useful information from surroundings without intention. People have both strength and weakness in a field and feel some threat in the field. They encounter some chances for the success although they can not notice their weak points and have lots of problems. A person that has an interesting in a target can easily notice the chance and become happy. Therefore a person with strength usually notices more opportunities than that with weakness (See Fig. 2).

<table>
<thead>
<tr>
<th>Strength</th>
<th>Weakness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threat</td>
<td></td>
</tr>
<tr>
<td>Opportunity</td>
<td>A little opportunity</td>
</tr>
</tbody>
</table>

Fig. 2 Opportunity for a person with strength and weakness

Easy start for getting such opportunities is very important for a good discovery. A user naturally tries to discover some clues in given views based on his/her preferences. The clue in the entrance view plays an important role in order to choose the target and good access routes to some success. Therefore the entrance should prepare good clues both in a general view and in a variety of key views for the user.

Different generation has different sense of values and focuses in every country. The sense and the focus also change according to user’s life style and experiences. The user often has a bias for either an object or a field since he/she already knows about a part of them based on a relationship between them and him/her. The entrance should make the user be aware of the bias and show a variety of ideas for the bias.

Rapid and fun review of all success stories allows a person to discover a good focus. He/she should find and understand both the will for a success and messages from the success (See Fig. 3).
Active learning mainly consists of three phases (a) Warming up phase, (b) Learning phase, and (c) Refreshment phase. We think that stages of (1) Easy start, (2) Rapid & fun review, and (3) Find focus belong to (a) Warming up phase.

The user refreshes him/her after a cycle of active learning and comes back to the warming up phase. The warming up phase also plays a roll of restart of learning for a new discovery and improvement for the other successes in a spiral (See Fig. 4).

### 3 Active Learning of Multi-culture by Wide Rolled-ehon Display with Multiple 3D View Points

To find a good focus single-handed and to think of the target from his/her point of view are very important in active learning. Human enjoys mainly nine activities for functions of brain such as (a) recognition, (b) imagination, (c) perception/disillusion, (d) studying, (e) creation, (f) emotions, (g) reflection/introspection, (h) decision making, and (i) command for an action. Assists of these activities in the four stages for a success are important for active learning. We propose “wide rolled ehon type system with multiple screens” as a teaching tool in order to show not only general view but also vivid description of people and activities in a large canvas together. The digital large ehon can simultaneously show general historical views of several countries and the show relationships between the countries. The digital ehon easily shows a panoramic image of scene with an atmosphere in a target space. It also shows detailed explanations in front of user’s face for easy reading although it is very difficult for a user to read explanations in a long rolled ehon on either a desk or a floor. A story that has been handed down from generation to generation can be described in the wide ehon.

The digital information in a wide ehon can also show related information next to the target information and show the relationship between them. The wide display consists of multiple screens covers all the field of human vision in $68^\circ$ eye angle and show lots of vigorous autonomous activities in a wide area like those in a wide view in ICA in Boston [6].
The first target of the wide display is 620 meter rolled ehon of Japanese immigration in Hawaii that consists of 34 volumes of rolled ehons. The average length of them is about 20 meters. A user of four wide screens can review the whole information of a long ehon in real size by seven repetitions of sliding real size images in the wide display. Zooming function is also available for a quicker review.

The display can show not only the image in a focus but also relationships between multiple images. It is very important to show the reality by a set of 3D images from different angles and how to utilize a target object. The image shows a context with the surroundings. The user can automatically change the views of the target according to the direction of his/her face by face recognition functions. People with young mind can enjoy views from different angles and fan images. The angles are now six directions: front, upper front, right hand side, upper right hand side, left hand side and upper left hand side are available.

The user can enjoy rapid and fun review in his/her pace corresponding to his/her preferences. He/she can make mind models in the review by a simulation in his/her brain based on the observation.

The user can also find an interesting focus in some information media that give him/her a message in a success story. We suppose that there are sixteen kinds of information media that describe daily life and festivals etc. (1) photo, (2) rolled ehon, (3) newspaper, (4) a book (poetry and message), (5) video, (6) song and music, (7) physical object (lunch plate, lunch box, foods (chocolate, fruits, sea food), house, trunk, clothes and shoes), (8) dance, (9) sports (marathon, surfing), (10) festival (Aloha-festival, the hula, Bon-dance, Okinawan-festival), (11) Web-library (12) bridal, (13) transport (boat, train), (14) power spot and healing, (15) infrastructure and (16) teaching materials. The users can share the focus and think about the opinion by checking deeper knowledge and experiences in these information media (See Fig.5).

Users have their position and many kinds of relation with given information. For example five positions (a) to (d) can be found for the long ehon of immigration in Hawaii (a) immigrants in Hawaii, (b) employer of immigrants, (c) Returned immigrants, (c) descendants of returned immigrants, and (d) the other travelers. The value of Hawaii is different for people in different generation since customers of tourism in Hawaii has been changed from rich white people to the general public since the 1920s. Different generation in Japan has different views in Hawaii. Therefore lots kinds of focuses should be prepared as an entrance of success stories for such a variety of people. We think that a large canvas and simple slide operation system is suitable for showing a variety of focuses.

(1) Easy start (2) Rapid & fun review (3) Find focus (4) Find and understand

Fig. 5 An image of activities for understanding a will and messages from a success.
Question and Answer (Q&A) function shows the users the deeper knowledge with fun stories. Official approval of Kanji and Eco is very popular like a game in Japan. That of Aloha might be popular in Japan in near future.

The user can also enjoy experience with teaching materials in virtual world. For example he/she can know the structure of a work cloth and put it on him/her in the virtual world. He/she can also put the clothes in chronological order and check the improved parts according to the functions. The user can also understand a series of actions and important skills in the virtual experiences.

The user can find and understand wills and messages from the success based on study in the virtual experiences. Some of the users can create a useful idea and extend his/her creativity. He/she can also notice the effective success strategies done in a certain long time period for the great success.

4 A prototype of rolled ehon system

A prototype of rolled ehon system consists of mainly two sub-systems. One sub-system is a rolled ehon sub-system that has a large and long canvas with simple slide operation (See Fig. 6 - Fig. 9) and Q&A interaction. A user could read explanations in front of his/her face (See Fig. 7) and zoom out in order to effectively review wider contents (See Fig. 8). He/she could also easily access related information for the target besides it (See Fig. 9). A user could reorganize the relationships and meanings among important information in his/her brain with both the flow of scenes and relationships between the target and related information.

The user could watch history of improving work clothes with several images of work clothes in a wide display at the same time. He/she could easily notice and compare the
improved parts without sliding the images in the display (See Fig. 10) [4, 5, 10, 11].

The other subsystem automatically shows 3D information from six angles in order to easily understand the structure and roles of a target (See Fig. 11 and Fig. 12)

### Experimental Results.

We propose and built a basic teaching tool: a wide ehon system for active learning of success stories. We are making digital ehon media of 34 volumes long ehon. The total amount of length is about 620 meters and each volume is 20 meters. The 20 meter ehon could be easily reviewed and read in front of user’s face by simple operations of slide and zoom. We could confirm that a user could easily arrange lots of interesting scene and related objects on a wide display at the same time. This allowed the user to find a vivid daily life of challengers and to make a variety of imagination based on the related information. Typical four types of learning are (1) to (3). (1) Great success.
A user admire some ancestor as a great success in a foreign country and his/her brave, (2) Deep understanding by a physical tool. The user carefully used a lunch box that is made in Japan. A Japanese product is a long life one, (3) Good ides. People improved the work clothes step by step, and (4) People who learned a variety of trades had been building the city and its infrastructure like Roman water way. A user admires the flexibility and believed similar potential in him/her.

Relationship between Japanese lunch box and the invention of mixed plate enable the user to assume several stories about collaboration between people come from different countries.

A user could easily find the topics based on his/her preferences and could also learn deep knowledge in the wide ehon type system. Teaching materials are also digitalized by a simplified 3D image. The structure of a target and its roles could be automatically changed using face recognition from six angles. People with young mind were bubbling with expectation of something fresh in the target in a different angle and the way of using tools. A variety of people in different positions could understand not only the structure of target and deep knowledge but also make a variety of image of the usage and new evolving from the future point of views.

### Discussion

The person in different generation has a different interesting as an entrance for learning success stories. We found that how to make a link between a receiver and a sender in a different generation was very important since their entrances were different each other. We should find a kind of common interesting and a connection between them. We suppose that a direct connection might be in popular objects like ice cream and bridal.

Indirect connections between them via some basic object; health or some power in Nature; spirit might be useful in order to share the message from senders. We should also find a shared consciousness like PUFFY’s song “Nagisa ni matsuwaru etcetera” for Bon-dance that rouses every person in all generations to Bon-dance. Healing power in a power spot might be another shared consciousness [7] (See Fig. 2).

We should also find collective unconsciousness [8] for a natural phenomenon such as symbiosis with nature and ecology “Mottainai” as an entrance of the connection.

We should weave the many kinds of such links for mutual deep understanding and new collaboration between the users of the digital wide ehon system.

We expect that our system becomes a tool for active learning of transmission of multiple cultures since user easily utilized a variety of information both in rich multiple cultures and in wonderful nature with power of the spirit.

</tbody>
</table>

Fig. 12 Common interesting and a connection by Shared Evolved Knowledge and Collective unconscious
6 Conclusions

We propose a wide ehon media with multiple viewpoints for active learning of success stories in multiple cultures. We confirmed the wide ehon media allows user to easily start learning by simple slide operation etc. We also confirmed that a wide display consists of four screens can show not only multiple culture in a long rolled ehon at the same time on a display over eye angle 68 degrees but also the transition of improvement of an objects like work clothes without stress for the comparison. Users also could easily understand deeper information of structure and embedded meaning of the target by simplified 3D images from six different angles. Q&A interaction anchored a deeper understanding at a user’s favorite point in a long ehon. We also discussed the connection between minds in different generations for effective active learning of success stories. We found that the wide digital ehon became an easy entrance of such mind connection.

A comparison of the mathematics textbooks in different educational systems

Chen, J.C. & Yang, D.C.
National Chiayi University, Taiwan

Abstract

This study is to compare mathematics textbooks in elementary school from Taiwan, Singapore and the United States to develop a clear picture of how similar or different they are in content and emphasis. The selection of “Taiwan and Singapore” for this study is based on the high performance of the TIMSS assessments and they have a centralized educational system. Meanwhile, the U.S.A. is selected because the research in math education related to math curriculum plays a key role and there is no national curriculum. Also, there are many different mathematics textbooks available in the U.S. market, including many standards-based and traditional textbooks.

Content analysis will be used for this study. The general strategy for the analysis is to use the “topic tracing” method and the “strand” of mathematics content. The following information will be compiled from the selected mathematics textbooks:
(1). What topics are provided and the grade(s) where each topic is intended to students.
(2). The composition and structure of each textbook
(3). The cognitive level of each topic based on the Survey of the Enacted Curriculum in literature. Furthermore, we examine the overall treatment of content in terms of how the textbooks are organized. We also check the coherence of content and the depth of mathematical understanding required to master the exercises and other dimensions such as technology involved.

Results of this study indicate that textbooks in Asian countries typically have more focused topics and fewer lessons. In addition, their organizations are generally consistent with mathematics curriculum frameworks and math teachers often cover all materials presented in each textbook during class session. In contrast to the U.S. textbooks that often pose real-world and less routine problems, but some topics may be skipped in the classroom.

Abstract
The UMD (University of Minnesota Duluth)-Ewha (Ewha Womans University) Teaching Exchange Program is a four-week visit to Korea. This program is designed to give the UMD pre-service teachers the opportunity to understand Korean Education and interact with Korean students and culture. The pre-and post-surveys with the UMD pre-service teachers indicate that
this program is helpful and meaningful for them to improve their world-view and teaching skills for future global classrooms.

I. Introduction
   A. Program Goals
       This program is to provide an opportunity for the pre-service teachers to understand the Korean education systems and increase their confidence, as well as develop appropriate instructional skills, strategies, and attitudes for teaching in globalized classrooms. The students participated in extensive field experiences in Korean schools, learned and applied recommended methods for instruction based on learning from this program, and reflected upon their personal development and theories from the field experiences.

   B. Program Background
       America faces an urgent challenge of preparing our children to compete in a global economy. President Barack Obama is committed to meeting this challenge with the leadership and judgment that has been sorely lacking for the last eight years. His vision for a 21st century education begins to carry out educational reform. Especially, when he called for reform of public education, Obama cited Korea as an example saying, “If they can do that in South Korea, we can do it right here in the United States of America.” (The White House, 2009)

       Korea is an educationally meaningful country. Korea is one of the fastest developing countries and the second highest scoring nation in the world in math and science on the TIMMS (Third International Math and Science Study) (TIMSS 2007).

       Also, Obama emphasized in his speech, "We need to make sure our students have the teacher they need to be successful”(The White House, 2009). That means
states and school districts taking steps to improve teachers’ quality and their professionalism.

In preparing global society, it is critical for pre-service teachers to pose meaningful multicultural preparation. The meaningful multicultural preparation can be made from direct meaningful interaction with different cultures for proper multicultural understanding (Cannella & Reiff, 1994; Fereshteh, 1995; Gay, 1993; Russo & Talbert-Johnson, 1997). Meaningful interaction entails sufficient exposure to other types of students, so that pre-service teachers gain an understanding that there are cultural differences and commonalities between themselves and other students in terms of general worldviews, how lives are lived and families are disciplined and organized. Having this knowledge of others can surely facilitate communication between teachers and students of other cultures, which might lead to healthy relationships, student satisfaction, and positive learning climates for both teachers and students.

In this regard, UMD initiated the UMD-Ewha Teaching Exchange Program. Through the program, UMD pre-service teachers visited Korea and experienced the Korean Education systems and their culture. In this program, the pre-service teachers were paired with Ewha pre-service teachers and worked on projects together. The projects were for teaching in their Korean schools. They also taught the Korean students as a team, sharing their teaching methods and culture, and developing teaching ideas.

C. Program Process

The process of this program includes the following:
a. Proposal: The proposal of the UMD-Ewha Teaching Exchange Program was first made for the global teacher preparation.

b. Fund: After the proposal was submitted, this program was funded by donors. The fund supported students financially and research studies for this program.

c. Courses: Two Education courses were open at UMD: Educ 4993 Teaching in Korea (2 credits) and Educ 5995 Special Topic (1 credit). Ewha also offered a course FST 4243 International Perspectives on Teaching Practice. The Ewha course was transferred to UMD credits. So, after this program, the UMD pre-service teachers had 6 credits.

d. Advertisement for recruiting students: Once the courses were approved, the program was advertised through the UMD website and Duluth News Tribune:

http://www.d.umn.edu/unirel/homepage/09/studentstokorea.html

http://m.duluthnewstribune.com/article.cfm?id=125173&tag=Faces

Also, the program coordinator visited each classroom and presented information about this program to the pre-service teachers. Besides, a website for the program was developed on: http://www.d.umn.edu/~jiyoon/project/UMD-EwhaWeb2/index.html

e. Orientations: The UMD pre-service teachers applied for this program through the UMD International Office. The pre-service teachers participated in two orientations to receive an overview of the program and to check program requirements before the program starts.

f. Pre-and Post Online Surveys: The modified Science Teaching Efficacy Belief Instrument-Preservice (STEBI-B) (Enochs & Riggs, 1990) and the Intercultural
Development Inventory (IDI, Hammer & Bennett, 1998, 2002) were used to assess the outcomes of the pre-service teachers through the UMD-Ewha Teaching Exchange Program in two components: teacher self-efficacy and worldview perspectives. Pre-and Post-tests of STEBI-B and IDI were taken by the pre-service teachers before and after UMD pre-service teachers experienced teaching in Korea.

g. Review Workshops: After the UMD pre-service teachers came back to UMD, they presented their learning from this program at the Freshmen Orientation Workshop, Alworth International Brown Bag, Education department meeting, and classes. Through the presentations, the UMD students and faculty discussed the importance of the program and shared their ideas for future teacher education programs.

III. Members of the Program

A. Universities:
   a. College of Education and Human Service Professions, University of Minnesota at Duluth
   b. Curriculum and Instruction Institute, School of Education, Ewha Womans University, Seoul Korea

B. Students
   a. Eight UMD pre-service teachers
   b. Nine Ewha Womans University Pre-service teachers

C. Participant Schools
   a. Ewha Elementary School
b. Ewha Middle School

c. Ewha High School

d. Myounghoon Elementary School

e. MyoungGee High School

IV. Program Schedule

This is the four-week program. In the first week, the UMD pre-service teachers took a course at Ewha Womans University to learn about Korean Education systems based on subject areas (science, math, English, Social studies, Korean, Educational Technology, and elementary education) working with Ewha pre-service teachers. In the second week, they visited schools and met Korean students and faculty. In the third week, they taught Korean students at Ewha Elementary school (1-6 graders) with their partners of Ewha pre-service teachers, experiencing Korean education and sharing teaching methods. In the fourth week, the UMD and the Ewha pre-service teachers came back to Ewha campus and presented together what they learned from the teaching practicum and the program. In weekend, they had field experiences to learn about Korean culture (see Table 1).

Table 1. Schedule for the UMD-Ewha Teaching Exchange Program
V. Program Assessment

Each of the UMD pre-service teachers participated in two separate pre- and post-tests surveys, Teaching Self-Efficacy Test and IDI, before and after their teaching experiences in Korea. Also, the UMD pre-service teachers had online interviews with the Program Coordinator to give feedback about the program.

A. Self-Efficacy Test

The Science Teaching Efficacy Belief Instrument-Preservice (STEBI-B) (Enochs & Riggs, 1990) is a one-page, 23-item instrument. Preservice teachers indicated whether they either agree or disagree with statements by choosing from a 5-point Likert scale, ranging from strongly agree to strongly disagree. Their responses totaled over the 23 items provided a measure of their self-efficacy beliefs. The STEBI-B was modified based on the majors of the UMD pre-service teachers for this program.

The modified Science Teaching Efficacy Belief Instrument-Preservice (STEBI-B) measures the pre-service teacher self-efficacy. The Table 2 shows the comparison of the mean values of the pre-and the post-tests of the UMD pre-service teachers. The post-test shows the higher mean value than the pre-test.

<table>
<thead>
<tr>
<th></th>
<th>Mean Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-Test</td>
<td>86.2</td>
</tr>
<tr>
<td>Post-Test</td>
<td>90.0</td>
</tr>
</tbody>
</table>

Table 2. Comparison of the Means of the Pre-and the Post-Tests

The comparison of the mean value of each question of the teaching self-efficacy test is shown in Table 3. Most of the post-test question had a higher mean value than the
pre-test. But the Questions 6 and 13 of the post-test had comparatively lower values than the pre-test:

Question 6. I will not be very effective in monitoring student activities in class.

Question 13. Increased effort in teaching your subject produces little change in some students' achievement.

Regarding these questions, the results indicate that the UMD pre-service teachers are not confident in communicating with their Korean students and making themselves fully understood. This may be related to the short school practicum period. The UMD pre-service teachers were placed in Ewha Elementary School and taught their students for one week. It might be too short for them to converse fully with the Korean students.

Table 3. The Comparison of Mean value of each question of the teaching self-efficacy test

B. IDI Survey

The Intercultural Development Inventory (IDI) is a 50-item, paper and pencil (or online) instrument which measures five of the six major stages of the Developmental
Model of Intercultural Sensitivity (DMIS) as well as a separate factor identified as Encapsulated Marginality (EM) (Hammer & Bennett, 1998; 2001). The IDI takes 15-20 minutes to complete and has been well established as a tool for teaching and training purposes (Hammer, in press; Paige, Jacobs-Cassuto & Yershova, 2003).

The Developmental Model of Intercultural Sensitivity (DMIS, Bennett, 1986; 1993; 2004) looks at “orientations toward cultural difference” as a progressive and developmental process. The DMIS includes three ethnocentric orientations (Denial, Defense, and Minimization), which identify individuals whose own culture is central to their understanding of reality, and three ethnorelative orientations (Acceptance, Adaptation, Integration), where one’s culture is experienced in the context of other cultures (Bennett, 1986; 1993; 2004). The model’s focus is not on culture specific information, but rather on the development of a broader and more complex worldview when approaching difference. Using grounded and constructivist theory, the DMIS is based on the premise that “as one’s experience of cultural difference becomes more complex and sophisticated, one’s potential competence in intercultural relations increases” (Bennett, 1986, p.423).

Seven of the 8 students completed the pre-IDI, while 6 out of 8 completed the post. Of these, 5 matched pre/post IDI scores were available for statistical analysis. Table 3 (below) indicates the mean pre/post scores for the 5 matched pairs of data. While the overall developmental score (DS) and subscale score changes were not statistically significant, an overall positive change score trend is seen in five of the seven IDI subscale categories.
While the students left and returned in the early stages of Minimization (a focus on similarities over differences), the IDI is a developmental model such that change is incremental and lifelong. The small but positive changes that are indicated reveal growth critical to the goals of this program. Students returned home: 1) more interested in and less defensive around the concept of “other.” 2) They identified a greater ability to comprehend and accommodate to complex cultural difference. 3) They reported an increased cultural self-awareness, and 4) a more accurate perception of their intercultural abilities.

A larger sample size and/or longer field experience might yield stronger positive results and add statistical significance to these findings (see Table 4).

Table 4. Results of Pre- and Pro-IDI (All scores are converted profile scores. Plus change score represent the direction of growth)

C. Interview

Through the conversations over the online interview with the pre-service teachers, the UMD pre-service teachers expressed the benefits and the problems of the program, found the solutions to the problems, and discussed their future teaching. The interview questions and their answers are following:

1. What was good during this program?
   a. The Kind and enthusiastic Ewha pre-service teachers, Ewha University faculty, and Ewha elementary faculty.
   b. Beautiful and convenient Ewha University campus and Korean schools
   c. Program organization
   d. Accommodations
e. Foods and culture

2. What needed to be improved?
   a. Longer student teaching
   b. Early student recruiting
   c. More information about the schedule
   d. More Funds

3. What solutions to the problems will be?
   a. More communication among Ewha and UMD faculty and students
   b. More advertisement about the program
   c. Modification in the program schedule – better balancing student private and group times

4. How will you use your learning from this program for your future teaching?
   a. Integrating globalized view into teaching
   b. Teaching with confidence
   c. Balancing American and Korean education system

D. Overall

The UMD-Ewha Teaching Exchange Program appeared to be beneficial to the UMD pre-service teachers in improving their teaching confidence and worldview. By experiencing the Korean education systems and culture, the UMD pre-service teachers found their best ways of how they can provide a better education for their future students. This program also furthered their understanding of the pedagogy of change in study abroad, and added specific and valuable insights into teacher preparation for diverse students.

For intercultural effectiveness of this program, much more needs to be done than send pre-service teachers to programs outside of the United States. It requires more work with the reflective process and intercultural understandings of the global teaching experiences. An increased focus on both the similarities and differences of the educational systems via
specific intercultural educational objectives will facilitate movement of students from a Minimization (ethnocentric) to a more ethnorelative worldview perspective.

Recommendations for adding intercultural education (a systematic effort to foster intercultural learning through curriculum design to the pedagogy) of this program would likely change the results of pre/post IDI assessment next time. In addition, the next pre-service teachers will have longer teaching periods for better communicating with their Korean students and making themselves fully understood. For advertising this program and training the pre-service teachers, it is encouraged to start early recruiting pre-service teachers.

VI. Future

The president of Indiana University, Michael McRobbie, who was visiting Korea for an international alumni conference and reunion stated that globalization can be made not only by calling international students into American universities, but also by sending American students to foreign universities (Choi, 2009). By having the students experience the world, the American students can understand multi-culture and multi-thoughts. McRobbie even plans that, from year 2011, no Indiana university students can graduate without foreign experiences (for example, language skills or foreign university course credits).

The UMD-Ewha Teaching Exchange Program supports this global idea. To prepare our pre-service teachers for future global classroom, it is necessary for them to experience the world and integrate their world-views and culture into their teaching. With dramatically expanding economies and the world's premier systems of higher education, Korea is providing significant educational and research opportunities for students and faculty (Indiana, 2009). By establishing the relationship between UMD and Ewha in Korea, the
UMD pre-service teachers will have more chances to exchange and learn educational skills and methods.

To continue the UMD-Ewha Teaching Exchange Program, Ewha and UMD must keep sending their pre-service teachers and expand their knowledge by exchanging teaching methods and philosophy. Also, the program needs to have not only a short-term but also a longer-term to exchange their ideas and compare the impact of the program, which develops the longer relationship between two universities.

References

Abstract:

Poetry can push students to delve into language more than vocabulary lists or grammar quizzes if the instructor is dedicated to verse in his classroom. This statement is even more appropriate for beginning Spanish language classes. Imagine students interacting with poems from Neruda, García Lorca, Guillén, Vallejo, Bécquer, or any poet (great or small) from the Spanish-speaking world. Now, imagine these students as writers of poetry in their developing second language. Both reading and writing poetry contribute to language learners’ abilities for creative capacity and spontaneity. The purpose of this paper is to give examples of successes among students where their poetic creativity has contributed to their desire to speak Spanish and to broaden their understanding of the cultures related to the language. On a larger scale, this paper strives to persuade Spanish language instructors from elementary schools to universities to use poetry as a tool to help students to create with the language from their first experiences with it. That poetic creativity will remain with them far longer than any fill-in-the-blank activity or verb chart.
As Pablo Neruda considered his audience when he wrote his three books of Odes (*Odas elementales*, *Nuevas odas elementales*, and *Tercer libro de odas*), he probably did not think about beginning Spanish students in the United States. By the same token, many Spanish instructors would not consider the *odas* as the ideal pedagogical tool for beginning language learners. My goal in this paper is to show that poetry in beginning Spanish courses is indispensable. Through examples from my own experience in the classroom I look to demonstrate how students have been successful communicators in Spanish through poetic creativity even at the most basic levels. On a larger scale, I hope to sway Spanish language instructors toward poetry as a positive language acquisition methodology for their beginning students.

In one of the first classes that I taught at the University level, I decided to put my knowledge and interest in poetry to use so that I could instill in my students my excitement for Spanish-language poetry. My desire was to demonstrate that poetry and creativity in the new language were closely linked. Three weeks into the course, we read Pablo Neruda’s “Oda al maíz” since the chapter in the textbook focused on food. I first performed a short excerpt of the poem:

Oda al maíz

América, de un grano de maíz te elevaste hasta llenar de tierras espaciosas el espumoso océano. Fue un grano de maíz tu geografía. El grano adelantó una lanza verde, la lanza verde se cubrió de oro y engalanó la altura del Perú con su pámpano amarillo […] (Neruda 312)

After my initial performance, I assigned students to work with a partner where they took turns and presented the rest of the poem to each other (they switched from one stanza to the next). Because this reading became a performance of Neruda’s “Oda al maíz,” the usage of dictionaries and constant questions of “¿Cómo se
dice?” occurred much less than in other classes. As the students focused on the reading and presentation of the poem, they did not necessarily believe that it was a comprehension activity (or so they thought). Students sat a little higher to perform the poem; the recitations improved pronunciation almost immediately. After the reading, instead of turning to talk of free verse, rhyme scheme, or the like, we talked of how the poem sounded on their lips.

The in-class activity did not focus on the mechanics of poetry or the mechanics of language, but the sound and visual aspects of poetry. Students recited something beautiful, creative, and even more importantly for them, correct. In other words, it seemed as though some of the pressure to be correct or have a correct answer from a student’s past academic training diminished through this activity. Granted, these beginning students did not understand every word of the poem. In fact, a couple of students mentioned that “they didn’t get poetry in English anyway” so why not give it a shot in Spanish? I saw that because some students looked at poetry as incomprehensible or unintelligible in their native language they could justify the fact that they did not comprehend every word in Spanish. So, because the students knew that poets always challenge linguistic and formal barriers, my goal was to help them see that could do the same in Spanish. If students could only feel comfortable enough to take some risks in the language without fear of making a mistake like poets do, then they could overcome one of the biggest challenges of language learning and second language acquisition.

After the recitations, we talked of other food possibilities that would make great odes. Then for their homework assignment, students chose other foods and they headed home to create their own ode for the next day. I told them “¡la creatividad es importante!” and I mentioned that the next day they also would vote on the most creative poem. I thought that if the assignment required creativity as the only stipulation, students might create more freely.

When they returned to class the next day, they sat in groups and recited their poems to their peers. Performance once again dominated the room; this time however, the students had produced the poetry themselves and they now had a vested interest in the final production. Many used language, grammar, and vocabulary from the very chapter that we were studying plus other items they had studied before. Some had
searched for the exact word in the dictionary at home in order to give their poem the touch that they were looking for. Others wanted more advanced grammar options to exemplify time and place for the poem. After the initial sharing of each of their poems, each group voted on the most creative. Then the winner from each group shared with the entire class. Later, the whole class voted on the most creative poem.

Although each poem was not perfect grammatically, most produced a reaction from the students in the class. We then compared the topics from their food choices with other odes that Neruda had written about food. The passion that students exhibited when they produced poetry in another language gave them power to manipulate the syntax, vocabulary, grammar just like Pablo Neruda and they may not have realized it.

Up to this point I have shared a successful poetic activity that I have used on various occasions in a second semester Spanish course. Despite my initial apprehension to use poetry in first semester courses at the University level, I also have noticed that students can produce language that in many cases goes beyond the brief introduction that they have had to Spanish. Recently, I introduced Neruda’s “Casa de las odas” from Nuevas odas elementales (1955) and I told the students that in the poem the poet describes his perfect house. For homework, I asked for a poem about the students’ perfect casa and I reminded them that la creatividad was what mattered most. I informed the students that they would vote on the best poem and the person who wrote the best poem as voted by the class would receive the coveted Moss Prize (Premio Moss). There was no word limit or specific rule except for one: “creativity is important!” Here is one of the student’s poems (used with his permission) and my translation where I try to relay the same grammar and vocabulary that the author used:
Un poema sobre mi casa perfecta
Ruoyu Jin

Tengo una casa perfecta
La casa es pequeña
Pero tiene una sala
En la sala hay una chica
La chica es encantada

Tengo una casa perfecta
La casa es linda
La casa tiene una terraza
En la terraza está mi amiga
Mi amiga es guapa

Tengo una casa perfecta
La casa tiene una cocina
En la cocina es mi novia
Mi novia cocina comida
La comida para la cena

Tengo una casa perfecta
Mi casa es la casa de mi esposa
La casa tiene una lavandería
En la lavandería hay una lavadora
Con lavadora mi mujer lava la ropa

Tengo una casa perfecta
Es la casa pequeña, pero linda.
Tiene una sala, una terraza, una cocina, y una lavandería.
En la casa hay una chica, una amiga, mi novia, y mi esposa.
En la casa la chica, mi novia, y mi esposa son la misma persona.

A poem about my perfect house
Ruoyo Jin

I have a perfect house
The house is small
But it has a living room
In the living room there is a girl
The girl is enchanted [delighted]

I have a perfect house
The house is pretty
The house has a terrace
On the terrace is my [female] friend
My [female] friend is beautiful

I have a perfect house
The house has a kitchen
In the kitchen is my girlfriend
My girlfriend cooks food
The food for dinner

I have a perfect house
My house is my wife’s house
The house has a washroom
In the washroom there is a washing machine
With washing machine my wife washes the clothes

I have a perfect house
It is a small house, but pretty.
It has a living room, a terrace, a kitchen, and a washroom.
In the house there is a girl, a [female] friend, my girlfriend, and my wife.
In the house the girl, my [female] friend, my girlfriend, and my wife are the same person.

The students, especially the women in the class became indignant after the first two stanzas, while many of the men in the classroom were ready to cheer. The third stanza then began to cause a division of the sexes: gender roles began to shine through and the women booed after the stanza while the men laughed. Then the fourth stanza then solidified that division. Finally, when the author read the last line of the poem, that division in class ended when the women clapped and the men patted the poet on the back.

You will notice that the language of the poem is simple. The listeners in the beginning course could understand the poem after only a brief three-week introduction to the Spanish language. The poem utilizes the vocabulary from the first chapters of the book (we had already spoken about family and social relationships) and the grammar principles from those chapters (we had previously discussed physical characteristics, we had practiced using “hay,” and we had introduced the new “stem-changing” verb “tener”).

More importantly, the poem is creative. During the first stanzas of the poem, I wondered how I would calm the waters after the poem, but the author saved me and recovered by himself in the last line.

“Un poema sobre mi casa perfecta” is an example of how students can use the small amount of language that they possess in order to create and use the language to express themselves. That expression is key for their quest to communicate in a second language. I have seen that poetry in these classrooms also contributes to level the playing field between those students who learn language quickly or who have had previous experience with it with those who do not learn quickly or have not had the same experiences. The question of creativity is what has provided a platform toward a balance between more advanced students and
those who are self conscious about their skills. In fact, I have noticed that on in the majority of my courses those who already have a more advanced level in the class are not the students who win the vote for the most creative poem. Although many of the advanced poems are excellent with extravagant language and grammar beyond the realms of the course, many of their peers look to reward the poems that they feel like they understand more. In other words, students who have more experience create on their level and write for an audience that is more advanced while the winners of the vote speak to their peers at the same level. The activity then provides possibilities for most of the students to progress in the language according to their skill and ability while creating something that they can be proud of.

Now, I have also noted that in some cases, the assignment to write poetry is positive for some students until they realize that they have to share with others. In other words, when they read poems written by the famous poets of the Spanish-speaking world they are willing to perform, but when they have to share their own work, that willingness disappears. However, these students still produce great written results despite their reluctance to read their work out loud or despite the fact that they may not want to be stigmatized as a “good poet” (heaven forbid) or associated with any negative connotation that mainstream society might use against poetry. In a couple of cases, some students have offered to read the poems of those who feel ashamed or worried about their abilities and build up the self-esteem of the student who wrote the poem although he/she did not perform it in class.

Up to this point in this paper I have focused on two ways that I have been successful in beginning language courses with poetry. Now I will look at how I can incorporate poetry more in my language courses. Recently I have been preparing a way to incorporate poetry to communicatively tackle the everlasting grammatical dilemma of the preterit vs. the imperfect. Bécquer’s Rima XLI gives both and explains the how of the differences in twelve lines:

XLI

Tú eras el huracán, y yo la alta
Torre que desafía su poder.
¡Tenías que estrellarte o abatirme!...
¡No pudo ser!

Tú eras el Océano y yo la enhiesta
Roca que firme aguarda su vaivén:
¡Tenías que romperte o que arrancarme!...
¡No pudo ser!

Hermosa tú, yo altivo; acostumbrados
Una a arrollar, el otro a no ceder;
La senda estrecha, inevitable el choque…
¡No pudo ser! (Bécquer 27)

Here we have the imperfect imbedded into the background of each stanza and the preterit to bring a close to each of those stanzas. The students can see the differences and can follow a similar pattern of imperfect for previous background information and preterit to bring closure. My idea is to have students use this poem as a pattern to creatively describe a situation in their past as they follow the model given them in this poem. This poem presents the comparison between the imperfect and the preterit so I would not use it to introduce the material; but I will look to see if it can strengthen the principles that the students have learned.

To conclude, the purpose of this paper was to give examples of successes among beginning students where their poetic creativity contributed to their desire to speak Spanish and to broaden their understanding of the cultures related to the language. Through the examples above, I hope to have shown the value of poetry for communication in a second language. I have seen that reading and writing of poetry allows students to use their creative ability. I hope to have been able to persuade you as Spanish language instructors to use poetry as a tool to help students to create with the language. I am convinced that poetic creativity will give them more confidence in their language ability than any fill-in-the-blank activity or verb chart.

Use of Computer Technology for Instruction in California Public Schools

Abstract

This study examined the use of computer technology by students in public school. The uses of technology were divided between programmatic instruction and uses that built the students’ computer literacy. Interviews and observations were conducted in 15 public schools representing a mix of elementary and secondary schools, serving different socioeconomic groups. It was found that computers across all schools were mostly used for programmatic instruction. More uses of building computer literacy were found in schools serving higher income students and in secondary schools. Such patterns are seen as likely to increase, rather than decrease the digital divide between low and high income students.

It is considered a truism that every educated person today should be literate in the use of computers. Almost everyone accepts that computers are an integral part of much of what we do in our daily lives, from shopping and planning travel arrangements to social networking and entertainment. Jobs for mathematics, the sciences, and even the arts usually require creative and skilled use of computer applications. Many claim that the use of the internet galvanized the recent presidential election campaign of Barack Obama, at least in part. Educational policy groups argue that without advanced training in technology, the United States will fall behind other nations in global competitiveness (International Society for Technology in Education, 2007; U.S. Department of Education, nd.). This study looks at what our schools are doing to prepare students for this technological world.

As computers have become a common part of life outside of school, we also see a parallel increase in their presence in schools. In the early 1980s computers were just entering homes and schools. By 2005 over 95% of schools had internet access1 According to the U.S. Department of Education, in 2003 83% of students were using computers in school, a jump from the 60% reported ten year earlier2. With such a huge shift over such a short time, one might ask what impact this has had on our educational system and on our students.

In considering what such a shift might mean for education, educational theorists interested in the topic have tended to predict one of two types of changes. One group has focused on the ability of the computer to empower students. The other group has focused on the power of the computer to effectively and efficiently deliver instruction.

Those of the first camp have claimed that computer technology would or should transform schools and education as we know it, bringing on new ways of teaching and learning
that were not possible in the past (Coppola, 2004; Dede, 2004; Papert, 1982). In particular, these theorists argued that computers made the traditional role of teachers as lecturers—the sage on the stage—obsolete. Computers give students access to almost any information anywhere in the world, replete with multimedia sources. Simulations allow students to engage in complex problem solving. Powerful programs put tools for creativity at students’ fingertips.

Constructivist, learner-centered teaching is based, in part, on being able to do real world authentic activities (Berger, 2003). Computer technology can bring the larger world into the classroom, and with Web 2.0 and Web 3.0 applications, students can share their ideas and creations with the larger world outside of the classroom in an interactive manner. With the use of such computers, teachers can and should now play more the role of guide, coach and facilitator. Some even argue that having computer technology in the classroom would inevitably lead to this revolutionary outcome (Cuban, 2001).

Another view has been that computers would or should transform schools, not by changing our basic paradigm of learning and instruction, but as a more effective and efficient way to deliver instruction, or at least as a strong supplemental aspect to the curriculum (Cruthirds & Hanna, 1997). The idea of using technology for programmatic instruction goes back at least to the 1960s. According this view, the promise of programmatic instruction is now possible with the powerful computers of today. Computers can now be programmed to assess the individual learner, and tailor the instructional pace and problem presented to that student. No longer will each teacher need to be the expert in instructional techniques, since it will be programmed into the computer. Once we have identified the steps, any skill can be taught most efficiently and effectively this way. While this approach could significantly alter the teachers role as deliverer of instruction or information, it does not substantially alter the role of the student.

As of yet, there is not much evidence of either of these becoming realities. There are lots of individual examples of teachers using computers in creative ways that do speak to the claim of a more constructivist paradigm (see for example Coppolla, 2004). On the other hand, these appear to be the exceptions that prove the rule (Cuban, 2001). While there is some evidence that many schools are using computers in ways that match the programmatic instructional idea—that is for teaching basic skills, there is of yet little evidence that it has improved learning beyond small scale examples (Cuban, 1993, 2006; Dynarski, 2007; Halverson & Smith, 2009).
Another issue that has concerned many in terms of technology use is the digital divide. Not surprisingly, those with more money and resources, and those of higher socio-economic-status, are more likely to have computers at home, and use them more powerfully (Snyder, Dillow, & Hoffman, 2007). Potentially public schools could be the place where those with fewer resources could get that access. However, often resources at schools mirror the resources of those in the community. Therefore schools, rather than leveling the playing field for disadvantaged students, may exacerbate those differences (Gorski, 2007; Kozol, 1991).

This study examined 15 public schools to examine what direction computer use has taken in terms of either building the students’ computer literacy or as tools of delivering content. Further, we examined whether the schools in the this study demonstrated equity across socio-economic groups or whether they reflected the digital divide found outside of schools. Our research examined how these 15 schools in the greater Monterey Bay Area made use of computer technology for instructional purposes. We answered these questions through observing the use of technology in schools, and interviewing teachers in these schools. We have attempted to answer the following questions through our investigation:

- For what purposes do the students use the computer technology at the schools?
- In regards to the above question, what differences do we see among schools? Do socio-economic factors correlate with those differences? Is the age level of students a factor?

**Framework for Classifying Computer Use**

For the purposes of this research we divided computer use by students in two basic categories, aligning to some degree with the two basic directions outlined in the section above. Halverson and Smith (2009) used the phrases "technologies for learners and technologies for learning [italics in original]" (p.6). The first category is where students are using computers in ways that are likely to build their computer literacy skills. As a definition of computer literacy, we borrowed the framework developed by the International Society for Technology Standards (ISTE, 2007). In this framework for computer literacy, the ISTE developed six areas or types of uses that comprise full computer literacy: Creativity and Innovation; Communication and Collaboration; Research and Information Fluency; Critical Thinking, Problem Solving and Decision Making; Digital Citizenship; and Technology Operations and Concepts. These uses are more closely aligned with those that advocate for computers being used to transform education
into a more student centered approach.

The other category we referred to as Computer Aided Instruction (CAI). This mapped more closely with the programmatic instruction vision of computers in education. In these cases computers are used for skill building and directly teaching content. Examples of this type of use would be programs designed to reinforce or build reading skills, or practice math problems. We also included in this category programs that were used to track student progress or assess students. Accelerated Reader is such a program, where the computer is mostly used as a tool to assess the students’ reading skill level, and track what they are reading.

Methods

In order to study this question of student computer use, we employed a qualitative design utilizing ethnographic methods. Interviews and observations took place in 15 schools over a tri-county area in the central coast region of California. Eight were elementary schools, four serving largely low-income students, and the other four serving more middle to high-income students. Three were middle schools, split between one serving low-income students and two serving middle to high-income students. Four were high school, two serving low-, and two serving mid-to high-income students. The schools were selected based on a convenience sample. These were the schools at which the research team worked. While not a random sample, these schools do offer a fairly representative sample of public schools in terms of grade levels served of the different socio-economic levels of the student bodies, allowing for a reasonable comparison.

The research team consisted of students enrolled in a Masters of Education course on Qualitative Research Methods, with the course instructor acting as lead investigator and author of this paper. These students were also working teachers and educators. To gather this information each member of the research team conducted an observation and interview at one school site, usually the one at which they worked. Each member of the team engaged in an approximately 45 minute observation of technology being used by students for instruction
purposes at one of the school sites, looking specifically at which of the categories the use met, and if it met ISTE standards, which of those it met. Each member of the team interviewed a key person at the school site to ask questions about how they saw technology being used by the students in the school, and their perceptions of the effectiveness of this use, again specifically probing to see the ways computers were being used for each of these purposes.

Findings

This study did find that computers were used differently based on the socio-economic make up of the student body, and based on the grade level of students served. There did not appear to be any consistent factor related to quantity or quality of hardware available to students. However, schools serving predominantly middle- and high-income students were more likely to have well-trained computer technicians and teachers to help make the computers more useful. Schools that served low-income students mostly used computers for computer-aided instruction and as an assessment tool. Schools serving middle- and high-income students were more likely to spend some time using computers in ways that build computer literacy skills. However, in none of the cases did the schools meet the ISTE standard at more than a minimal level. It was also found that high school students were more likely to use computers in ways that built their computer literacy skills than elementary students.

Uses for computer-aided instruction (CAI) highly outnumbered uses that might build computer literacy. The most common use of computers overall was the Accelerated Reading program, with the large majority of schools studied using this program. Other skill building programs, such as Reader Rabbit in primary grades, and Excel Math were common in elementary schools. In the middle schools studied, some skill building programs still continued to be used. By high school such uses appeared to be uncommon. Commonly, computers were used for word processing and internet searches for research papers.

Schools Serving Low-SES v Schools Serving High SES Students

The data suggest that at least for the elementary students, schools serving low-income students use the computers mostly for CAI, due to pressures of the standardized testing. Most of these schools are Program Improvement schools under the No Child Left Behind Act. As such, boosting standardized test scores is the top priority. Such schools are then likely to use the
computers as a tool to boost these test scores, and therefore use programs that are promoted and
designed specifically for that purpose. “They use it for intervention software,” typifies the uses
we saw. Explanations for such uses were “ELD students … need help with reading and phonics,
comprehension, some of that kind of stuff.” The behaviorist philosophy of such program use is
explained by this quote, “What I find the main benefit, for at least the programs we use, is that
there is immediate response, positive and negative, as in if you get the wrong answer…
immediate response and a lot of positive reinforcement when they do well on the computer.”
There were some instances of using computers for creative purposes in schools serving low-
income students. One elementary teacher had received a grant that allowed her to buy digital
cameras. Three teachers mentioned students being able to use drawing programs. Many of the
schools mentioned students using the web for research, or doing so with the students.

Elementary schools serving middle- and high-income students, not being under those
same pressures to raise test scores, may feel the freedom to use computers in more creative ways.
Still, several of the schools did use their computers for Accelerated Reading. There were also
several references to their use for reading and math skill programs. Some, not many, more
creative uses were found in such schools. One school mentioned how as early as kindergarten the
students are using the computers for projects. At another school the interviewee mentioned how
they integrated computers into whatever they are studying. On the more creative side, one school
mentioned the use of CAD programs, building virtual worlds and editing films.

The differences between the schools serving low and high income students were still
there at the high school level, but these differences were less dramatic. Again research was a
common use. Explicit teaching of the use of computers seemed slightly more likely in the
schools serving low-income students (as was the case in 2 of the 3 schools serving lower-income
students). In one of these schools it computer technology appeared consist mainly of taking the
technology class geared toward teaching the Microsoft Office Suite programs. In that school it
appeared that technology was used most creatively by the art students, research being the only
other use mentioned. One of the high schools serving higher-income students only mentioned
technology literacy type uses in regards to having a business technology class focused on
Microsoft Office suite programs. The others mentioned a variety of creative uses, often initiated
by the students themselves, such as music, simulations, photo imaging, and graphic design. In
one of these schools the teacher mentioned that often the students were ahead of her in terms of knowing how to use these programs.

We couldn’t distinguish any differences in student to computer ratio, quality of computers or amount of use based on grade level or socioeconomic status from our limited data. However, schools serving lower-income students appeared to be less likely to have highly trained or certified teachers to run the computer labs, and more likely to have untrained classroom aides or other uncertified personnel in these positions. This quote from one technology person at a high schools serving low-income students illustrates this. “My job description is making sure that network and the equipment are running and the administrative reports are filled out and improving instruction using technology. Unfortunately, the improving instruction part is not done.” On the other hand, at a k-8 school serving high-income students the interviewee described the technology support this way, “I think that’s been a huge change in the curriculum, just having a passionate, highly skilled teacher in charge of the computer lab.” Most schools felt they could use more and better technology support regardless of the age level or socio-economic group being served.

As has been found by other researchers, low-income students often have instruction that is geared to low-level basic skills, while middle- and high-income students are more likely to receive instruction that asks them to think creatively and critically (Finn, 1999). This was particularly apparent at the elementary level, and to a smaller degree at the middle/high school level. The types of computer use we found mirror those previous findings of overall content instruction. However, while it was clear that the schools serving middle- to high-income students did have more opportunities to use them for building computer literacy, both groups were often using them for skill building, assessment and programmatic instruction.

**Elementary v Middle/High School Student Use**

In regards to elementary versus high school student use, the findings suggest that more high school students were already likely to have basic computer literacy skills, allowing teachers to assign more creative projects without having to spend much time teaching how to use the technology itself, especially among middle- and high-income student bodies.

Virtually all of the elementary schools reported using the computers for some sort of CAI. As mentioned before, the reading assessment program Accelerated Reader was most often
cited. Next most often reported were reading programs designed for intervention or practicing skills, mostly for the early grades. One school mentioned using a program specifically designed for English language learners. Math skill programs were also frequently mentioned.

Both of the middle schools serving low-income students mentioned some use of computers for CAI, though one of those sites mentioned that such use “had mixed success.” Outside of Accelerated Reader, we did not hear much about such use at the high school level.

All of the elementary schools mentioned some use of the computers in ways that met at least one of the ISTE standards. In terms of the younger grades, five mentioned teaching keyboarding; six mentioned using Kidpix or other drawing programs. Four mentioned using computers for research, as in browser searches, mostly referring to upper grades. However, using it for research was usually in the context of availability of the individual student. It did not appear that the students were actually instructed in how to do so in any organized fashion. Several also mentioned using the computers for word processing. In one of the schools serving low-income students, the only creative use mentioned was by the teacher who had the grant to buy digital cameras.

In regards to the high schools, two schools (one serving low and one serving high SES students) mentioned having a specific technology class focusing on business type applications such as those in the Microsoft Office suite. Most of the schools mentioned having the students doing research, though in only two of the cases did the interviewees make it clear that students were getting guidance on how to do so. In one of the schools serving low-income students it did appear that students were using the computers in ways that built literacy, from music to writing to research to creating presentations, and allowed for creative uses. One of the other schools serving lower-income students mentioned the art students using a drawing and illustration programs. Two of the schools serving high-income students mentioned a wide variety of creative uses that the students put them to. However, in both cases is sounded as if often the students knew more than the teacher about these uses. The teacher created opportunities for the students to use those technology skills, rather than actually instructing the students in such uses.

**Digital Citizenship**

We found only two example of explicitly teaching digital citizenship. All but one school handled the issue through district or school filters and monitoring students. Some mentioned that
it was a problem, and that the more technologically capable students could often find ways around the filters. Rather than teaching digital citizenship, most schools attempted to police it. In some cases this actually may have led to teaching the reverse, as it seems to have encouraged some students to become adept hackers through the allure of the forbidden.

**Discussion**

The findings from this study must, of course, be taken as only tentative, given both the sample size and the limited basis of the data. Mostly the finding appear to confirm past studies on the issue of the digital divide. That is, low-income students are less likely to be using computers in powerful ways that build their computer literacy than high-income students. While all students were often using them for computer aided instruction and assessment, high-income students had somewhat more opportunities to use them in creative ways. There appear to be two main factors for this at the elementary level. One is the focus on test preparation which centers on rote skills in literacy and mathematics for schools that are program improvement schools under NCLB. All of the schools serving the low-income students were such schools. A second factor was that such schools were less likely to have high quality technology support or technology teachers. Without ongoing technical support, it can be hard to rely on the technology. Without highly trained personnel, the classroom teachers may not be up to the task of knowing how to use the computers in creative integrated ways, or the technology may often be inoperable.

At the elementary level, it was clear that teachers did want to give students opportunities to use computers in creative powerful ways. However time and technical resources limited their chances to do so. There were attempts to get students to know how to keyboard, and at least play with the computers to draw and write, and for upper graders do some basic web searches.

We saw a dropping off of computer aided instruction use for the high school students, and more of a focus on actually using them as tools for productivity, learning and creativity. Again there was slightly more opportunity for this, especially on the creative side for the higher-income students. How much was due to what is expected of students is hard to know. Some educational theories suggest that schools for high-income students are geared to prepare them to be creative and critical, while those serving low-income students train them to be productive workers (Finn, 1999). This research could be seen as somewhat supporting such a theory, though not strongly. The fact that many high-income students came to school knowing how to use
powerful programs for creative purposes probably made it easier for the teachers at these schools to integrate such uses into their assignments. They were also more likely to be able to assume that the students could work on these projects at home, and not have to rely on access to school computers.

**Implications**

This study suggests that if we want to create equity for students from all backgrounds we need to rethink what opportunities we provide for low-income students to use computers in ways that prepare them to be able to use them in as powerful ways as their more well-to-do peers.

Given that high SES students tend to have more opportunities and access to powerful technology at home, and that high SES students also have more opportunities to use computers in ways that build computer literacy, current school practices are likely to exacerbate rather than mediate the digital divide between low and high SES students.

To change such practices a serious reconsideration of what it would take to really bridge the gap needs to be undertaken. Such an examination is unlikely at most schools serving low-income students, given the pressures on district administrators, principals, teachers on down to students, to raise short-term standardized test scores. With such pressures almost everything else becomes at best secondary, if considered at all. Such pressures are only increasing under the current Federal policies.

It would also take an enormous input of resources. The real cost of having enough up-to-date computers, the software to use them well, the personnel to keep them running, and the professional development so that teachers would know how to use them effectively certainly does not exist in these times of economic crisis and education budgets cut to the bone. However, by most estimates, even in the best of times few schools could afford the real costs that such a commitment would take, especially over the long haul (Armstrong & Casement, 2000; Dede, 2004). It would take massive sate and possibly Federal reallocation and reprioritization of resources to make such a change feasible.

These are real difficulties that all of us who are committed to equity face. Those of us who do work with low-income students are therefore forced to think of creative ways to overcome these difficulties. While it is true that all students need to learn to read and do basic arithmetic, it is not true that for some students this should be done at the expense of learning
other things, including to be powerful users of technology. The brains of poor kids do not learn and function differently than those of rich children. Therefore, they do not need to be taught in fundamentally different ways. Without being prepared with equal technological skills, this lack will be just one more division and barrier when these students leave school, leaving them less prepared not just for the world of work, but the world of social empowerment, and access to information to improve their lives and make informed decisions.

Even without a change in resources, it is possible to use those limited resources differently. As the data showed, the difference in resources in the schools between types of schools was minimal. The real differences was in how they were used. These differences underscored an implicit or hidden curriculum (Giroux, 1988). The use of computers as programmatic instruction treats students as passive recipients of knowledge and instruction whose job is to input the correct answer. The uses that the ISTE standards promote ask students to be active participants in their own learning, using computers as a tool to create and convey knowledge. When these uses are promoted differently, for different types of students (which may coincide with the non-computer based instruction they are receiving), students come to view learning and the purpose of school in fundamentally different ways.

The argument for the need for this different instruction is, as mentioned earlier, the need to raise test scores. However, many schools have been effective using constructivist approaches to learning effectively with low- and high income students alike (see for example (Bensman, 2000; Berger, 2003). When students are asked to, and helped to use their minds, they not only do better on standardized tests of knowledge in the short term, but develop the abilities necessary to succeed in many arenas, in and out of school.

Authentic Tolerance: Between Forbearance and Acceptance

Abstract
Promoting tolerance is seen as a key weapon in battling prejudice in diversity and multicultural training but its meaning has been modified recently. The classical definition of tolerance meant that others are entitled to their opinions and have the right to express them and that even though one may disagree with them, one can live in peace with such differences. In recent years, however, tolerance has come to mean that all ideas and practices must be accepted and affirmed and where appreciation of differences is the ultimate virtue. Such a neo-classical definition has alienated many who value equality and justice and limits the effectiveness of diversity initiatives that teach the promotion of tolerance. The authors offer authentic tolerance as an alternative, incorporating respect and civility toward others, not necessarily approval of their ideas and practices. All persons are equal, but all beliefs and conduct are not equal.
Bill Watterson created a well-known comic strip called *Calvin and Hobbes* about the raucous antics of a 6-year-old boy, Calvin, and his real-only-to-him stuffed tiger companion, Hobbes. In the comic strip listed above the six-year-old hero gives a lame defense of not doing the right thing and denies that moral value has any meaning for philosophically sophisticated people like him. Hobbes, Calvin’s sarcastic, cynical alter ego, however, has some doubts about Calvin’s notion of tolerance.

This paper, like Hobbes, also expresses some concerns about tolerance and addresses this controversial concept and its part in diversity training. If tolerance is defined, as it often is, as “the ability to accept the values and beliefs of others,” (Lickona, 2002, p. 1) it poses a dilemma: How can individuals be asked to accept all people’s values and practices when they may believe that some of those ideas and behaviors are wrong? How, for example, can one ask supporters on opposite sides of the abortion and homosexuality debates to accept the validity of each other’s perspectives? Such contradictory views cannot both be correct.

We address the controversial topic of tolerance by starting with a brief history of tolerance. Then we discuss tolerance in diversity training efforts and explore both traditional...
(classical) and new (neo-classical) definitions of tolerance. In the next section, we review the concept of intolerance and then offer a discussion on the value of dialogue. Finally, we conclude with a summary that emphasizes respect and dignity of persons rather than required acceptance and endorsement of their beliefs and conduct.

Some History

Although the concept of tolerance has been esteemed (Locke, 1689/1983; Mill, 1859/1985; Voltaire, 1763/1994) its value has not always been appreciated. For example, early Western religious scholars St. Augustine and St. Thomas Aquinas viewed tolerance as a vice that can corrupt society and harm innocent people (Colesante & Biggs, 1999). Likewise, a value system that enjoyed near universal support in America for a number of years indicated that a good person was “trustworthy, loyal, helpful, friendly, courteous, kind, obedient, cheerful, thrifty, brave, clean, and reverent” (Boy Scouts of America, n. d.)—but not tolerant. Believing in and practicing the Boy Scout values, even if a person was not a Scout or a male, was highly correlated with being a citizen of excellent character and integrity.

Tolerance is said to be “indispensable for any decent society—or at least for societies encompassing deeply divergent ways of life” (Oberdiek, 2001, p. 23) characteristic of many Western cultures. Highly homogenous societies may be able to dispense with tolerance or greatly reduce its centrality but most of the world cannot. Tolerance has been recognized today as an especially important characteristic in pluralist, multicultural communities seeking to be free of oppression, violence, indignities, and discrimination (Mandela & Robinson, 2001).

Tolerance has been considered essential and a highly desirable quality in U.S. society (Hallemeier, 2006), and one of the few non-controversial values today (Kreeft, 2007). Many people insist that in a world burdened by injustice, inequality, unfairness, prejudice, and related
bigotry that the best solution to address these evils is to demonstrate a greater degree of tolerance (Outcome Document of the Durban Review Conference, 2009). Within the last generation tolerance has risen to the apex of America’s public moral philosophy and today it is believed that a good, moral person is tolerant (Tolerance.org, n. d.) and that such tolerance is a virtue essential for democracy and civilized life. Indeed, its absence is at the root of much evil: hate crimes, religious and political persecution, and terrorism (Lickona, 2002).

There is even a museum dedicated to tolerance in Los Angeles (Museum of Tolerance, 2006) and New York has a Tolerance Center (n. d.). It is a powerful selling point for any theory or practice that can claim it. Nowhere is this more evident than in the prominence given tolerance in education and training programs addressing issues of multiculturalism, inclusion, and diversity (Vogt, 1997).

*Diversity training*

Diversity training has become so important that it is a common curriculum now incorporated in nearly every major collegiate and graduate business program (Lansing & Cruser, 2009). This interest has also prompted a proliferation of training programs in industry since training is one of the most visible and potentially viable features of many diversity programs. For instance, an industry report on training in the U.S., prepared by the widely circulated practitioner-oriented *Training* magazine, indicated that 72 per cent of the responding companies offered some form of diversity training (Galvin, 2003) while the Society for Human Resource Management found that 67 per cent of U.S. organizations had multicultural training initiatives (Esen, 2005).

A key component of such programs involves promoting and advocating *tolerance* (Clements & Jones 2008; Wildermuth & Gray, 2005) and participants are frequently told to
recognize and acknowledge differences and to be open to them. Trainees are urged to value, endorse, affirm, and celebrate differences and are advised to appreciate, respect, and accept diverging opinions, practices, and ways of life and to create a climate of *tolerance*.

When “diversity training in the workplace” and “tolerance” were entered in the Google web browser some 182,000 hits were registered illustrating that tolerance is a key component of inclusion and multicultural training (Diversity Training in the Workplace, 2009). Additionally, *Teaching Tolerance Magazine* showcases innovative tolerance initiatives across the country (*Teaching Tolerance Magazine*, n. d.). In higher education, we are told, diversity training should emphasize “tolerance ... and respect for differences in appearance, values and attitudes, perspectives, assumptions, and conduct” (Benjamin, 1996, p. 155). Tolerance is also a key principle of one of the most successful forms of psychotherapy—Rational Emotive Behavior Therapy—which promotes an attitude of tolerance and views intolerance of others as a serious disruptive force in today’s multicultural global society (Ellis, 2004). From a slightly different perspective, The Unlearning Intolerance Seminar Series initiated by the Department of Public Information of the United Nations in 2004 (United Nations Department of Public Information Education Outreach, 2008) aims to examine different manifestations of intolerance and explore ways in which education and civil society can help overcome them. As its name suggests, the “Unlearning Intolerance” series offers opportunities to discuss how intolerance, wherever it exists and for whatever reason, can be “unlearned” through education, inclusion, and example. In sum, there seems to be a vast tolerance industry associated with diversity training.

*Meanings of Tolerance*

The idea of tolerance has seemingly undergone a change in definition over the years from the obligation not to tolerate the immoral, to the requirement of accepting the legitimacy of the
morally different; from tolerance as enduring the odious to tolerance as nearly blank-check acceptance of a myriad of differences (Weissberg, 2008). This is consistent with Apel’s (1997) proposal to distinguish the more traditional concept of tolerance, or, in his terminology, “negative tolerance,” from the newer concept of “positive tolerance” (p. 199). He maintained that negative tolerance with its emphasis on obligations to refrain from interfering with other people’s traditions or opinions was not enough within a pluralistic, multicultural society and that we have a moral responsibility to “support people in their pursuit of their ideals of life” (Apel, 1997, p. 204). To avoid such clearly prejudicial wording, the terms “classical” and “neo-classical” tolerance are used here.

*Classical definition of tolerance*

Classic tolerance derives from the term’s Latin roots—*tolerare* or *tolerantia*—the first the verb meaning to endure, the second the noun denoting forbearance (Weissberg, 2008). Simply put, this definition means “putting up with” something one finds objectionable and an ability to live with pain (assumed to be distasteful) reflects this understanding. In other words, something repugnant is allowed to exist without significant action on the part of those offended. It involves recognition that a civil society must include a willingness to bear with people whose ideas and practices are not merely different, but believed to be wrong.

The classical definition of tolerance incorporated the idea that everyone was entitled to their own opinion and that people were to recognize and respect others’ beliefs, practices, etc., without necessarily agreeing, sympathizing, or sharing in them, and to bear with someone or something not especially liked. In this view individuals accept the right of others to hold differing opinions (have different practices, and be different than themselves)—while not accepting their behavior as right for themselves or society. There is an element of grudging
forbearance in the classical definition of tolerance (Fallacy of Positive Tolerance, n. d.).

Oberdiek (2001) views tolerance as best captured by the slogans of “Live and let live,” “You go your way, I’ll go mine,” or “To each his own” (pp. 29-30).

Classic tolerance simply means the ability to hold on to one’s convictions while accepting the right of others to hold on to theirs. Tolerance is not indifference or acquiescence, but recognition of difference. Tolerance has nothing to do with accepting another person’s belief, only his or her right to have that belief. It is similar to Voltaire’s famous words: “I detest what you write, but I would give my life to make it possible for you to continue to write” (Guterman, 1963, p. 143). Thus, classical tolerance differentiates between what a person thinks or does, and the person himself or herself.

**Neo-classical definition of tolerance**

Today, some reject the classical definition of tolerance because it does not go far enough—it is a half measure (Oberdiek, 2001). What is needed, these critics say, is to move beyond tolerance as classically understood toward a positive appreciation of and an unqualified agreement with differences: a shift from forbearance to acceptance. Therefore, more recent understandings of tolerance suggest that individuals should fully welcome and unambiguously endorse alternative ways of feeling, thinking, and acting—though it is not their own or one that is considered for adoption (Oberdiek, 2001). The neo-classical definition of tolerance asks citizens to be open-minded and empathetic toward a virtually endless parade of differences; it asks them to work sympathetically to build institutional and cultural arrangements that will accommodate different ways of life. Interestingly, it appears that the graciousness implied in the appreciate differences brand of tolerance is selective with only those residing on the political spectrum’s left side deserving acceptance and celebration. For example, while gays and civil rights groups are
generally applauded, there is commonly silence when it comes to evangelical Christians or the military. Such a one-sided interpretation of neo-classical tolerance often engenders the very divisiveness it is supposed to eliminate.

Rather than a begrudging endurance implied in the classical definition of tolerance, the “appreciate differences” brand of tolerance (i.e., neo-classical tolerance) includes a duty to approve and embrace diverse beliefs, customs, and behaviors (McDowell & Hostetler, 1998; Odell, n. d.; Weissberg, 2008)—accepting the odious despite the odium. It has been largely redefined by those seeking to broaden what it means to endure, while diminishing that which is defined as offensive and distasteful in the hope of achieving legitimacy for those perceived as unfairly marginalized, stigmatized, under-appreciated, or otherwise disdained. Neo-classical tolerance is said to simply reflect a natural evolutionary process. Using homosexuality as an example, society has advanced from killing homosexuals to criminalizing homosexuality to treating it as a psychological disorder to just accepting it as a repugnant condition to embracing it as perfectly normal.

The neo-classical interpretation of tolerance requires affirming the rightness of the nonconventional and nontraditional; bearing the objectionable has been blithely replaced by “venerat[ing] the objectionable” (Weissberg, 2008, p. 126). Mistaking toleration for affirmation was made in the UN’s decision to declare 1995, “The Year of Tolerance.” In the UN’s declaration, tolerance was defined as “respect, acceptance and appreciation of the rich diversity of our world’s cultures, our forms of expression and ways of being human….It involves the rejection of dogmatism and absolutism …” (United Nations Educational, Scientific and Cultural Organization [UNESCO], 1995).
Neo-classical tolerance is immediately suspicious of the idea that something may be offensive, and in the event it is, rejects the idea that one is free to express such distaste. To evaluate something as questionable or wrong and publicly say so is considered intolerant and insensitive. No idea or behavior can be opposed, regardless of how gracious, without inviting the charge of being hateful, offensive, or some other harsh accusation.

Neo-classical tolerance goes beyond respecting a person’s right to think and behave differently, and demands that practically every nontraditional value claim and personal practice be made morally legitimate. The neo-classical definition of tolerance suggests “…that every individual’s beliefs, values, lifestyle, and perceptions of truth claims are equal” (Helmbock, 1996, p. 2). Thus, not only does everyone have an equal right to his or her beliefs, but all beliefs are equal. All values are equal. All lifestyles are equal. All truth claims are equal (McDowell & Hostetler, 1998). In a world where all values are inherently equal and a proclaimed hierarchy only reflects power, not demonstrable worth, why, for example, should one embrace capitalism over socialism or Islam in favor of Judaism? Why hold attachments to anything since nothing is better than anything else? In a world where such deeply rooted practices are perceived as “arbitrary” any choice is no better than any alternative, and thus easily interchangeable. Such a world is one of indifference where nothing is worth defending rather than one of equality.

Intolerance

In the lexicon of today’s tolerance pedagogues, respecting an individual means accepting and approving their ideals (beliefs, behaviors, and practices). To argue otherwise is to invite charges that one is engaging in “mean-spirited, right-wing polemic endorsing hatefulness” (Weissberg, 2008, p. xi). Indeed, one of the worst things that can be said of a person today is that he or she is intolerant. Calling someone intolerant helps demonize a particular, social, ethnic,
cultural, or religious group, and faulting their worldview as the most basic, primary cause of their perceived prejudice. There is a litany of words and phrases that, like bullets from a machine gun, are shot in rapid fire reflexively to attack the character and motivations of others using slander, intimidation, and pejorative personal statements: bigoted, dictatorial, narrow-minded, and inflexible. Indeed, those who have firmly-held beliefs are considered legalistic individuals with non-negotiable doctrinal convictions, deserving, in some cases, to be terminated from their job.

At least that is what AT&T representatives seemed to have thought when they fired Albert Buonanno after he refused to agree to portions of the company’s employee handbook that he believed violated his religious beliefs. All employees were required to sign a written acknowledgment that they had received AT&T’s new employee handbook and sign a “Certificate of Understanding.” The certificate contained a statement that the employee signing it “agreed with and accepted” all of the terms and provisions of the handbook, including its policies and rules. The handbook contained a provision that “each person at AT&T Broadband is charged with the responsibility to fully recognize, respect and value the differences among all of us,” including “sexual orientation.” However, Mr. Buonanno’s strongly held religious beliefs regarding the homosexual lifestyle prevented him from condoning or approving the practice of homosexuality. Buonanno shared his concerns with his immediate supervisor and informed him that he had no problem declaring he would not discriminate against or harass people who were different from him, including homosexuals, but he could not sign the statement, because it contradicted his sincerely held religious beliefs. Mr. Buonanno indicated, “As a Christian, I love and appreciate all people regardless of their lifestyle. But I cannot value homosexuality and any different religious beliefs” (Henle & Holger, 2004, p. 155). He declined to sign the document and was immediately terminated. Mr. Buonanno then sued AT&T and was awarded $146, 260 in
damages (see *Buonanno v. AT&T Broadband LLC*, 2004). Employers, it appears, may not force employees to adopt beliefs that may be inconsistent with employees’ religious beliefs and that “Employees shouldn’t be forced to forswear their religious values in the name of tolerance” (Hudson, 2004, p. 1C).

Even in institutions committed to academic freedom and diversity of viewpoints just raising questions about such dogma can be problematic, as Harvard University President Lawrence Summers discovered when he mused in 2006 at a closed-door economics conference that innate differences between men and women might explain in part why more men than women reach the top echelons in math and science (Mansfield, 2006). He was denounced for even surfacing such a question (not an assertion of belief) and was quickly given a no confidence vote by his faculty resulting in his speedy resignation.

*Authentic tolerance: On the value of charity, respect, and dignity in dialogue*

Authentic tolerance, somewhere between the classical and neo-classical parameters, involves treating people with whom we differ, not with appreciation, acceptance, or endorsement but with civility, dignity, and respect even as we recognize that some conflict and tension is inevitable (see Figure 1). Individuals, we feel, should be shown basic respect as human beings even if they hold beliefs that others may not respect. Like Ury (1999), we believe “tolerance is ... showing respect for the essential humanity in every person” (p. 127). People do not lose their dignity because they believe implausible, even offensive, things.

----------------------------------------

Insert Figure 1 about here

----------------------------------------
We argue for charity toward others with whom we disagree—a charity that includes respect for others and the approval of others as a basic object of moral concern. Charity permits conflict and criticism of others’ beliefs and practices, but it limits the ways in which this conflict can be pursued based on respect for the person. For criticism to be charitable, it cannot be blind, based on stereotypes, or debasing opposing viewpoints, but rather requires knowledge and basic concern for the identity and voice of others. Such charity, however, also introduces risk to one’s convictions since dialogue involves an openness to others (Fowers & Davidov, 2006) which, in turn, requires the willingness to allow others to call one’s own deepest beliefs and commitments into question as points of view are compared and questioned. There is nothing wrong with being convinced, in our own minds, that we are right about something. Nor is there anything wrong with promoting or vigorously debating those beliefs. But, there is a great amount wrong with condemning, insulting, or oppressing others who in good faith do not agree with the conclusions that we have freely and honestly reached in our own minds, because the conclusions that they have freely and honestly reached in their own minds just might be right. If individuals are conditioned to be persuaded by sloganeering rather than by rational discourse, they are prepared to be taken in by any smooth talker and to lose their freedoms at the hands of charismatic tyrants.

Briefly, classical tolerance involves forbearance of others and their ideas while neo-classical tolerance preaches appreciation and acceptance of others’ ideas, behavior, and beliefs. Both of these can be considered variants of inauthentic tolerance. Authentic tolerance, on the other hand, involves respect and dignity of individuals without necessarily agreeing with or accepting their practices or values. Key components include dialogue and openness to others.

The richest form of dialogue is not merely an exchange of information, but a process in which the participants actively question their own perspectives and include the other as a partner
in their cultural self-exploration and learning (Richardson, 2003). Dialogue involves self-exploration as much as learning about the other, the articulation of one’s own previously implicit values and assumptions as much as learning what is valued by the other. This kind of exchange can lead to a greater self-understanding as well as a thoughtful consideration of another’s perspective. It can also help one recognize and begin to address inconsistencies, tensions, and blind spots in one’s heritage. This kind of dialogue can be a productive way to question the values and standards of one’s cultural community in light of another viewpoint. At its best, dialogue is challenging and enriching, and it results in greater clarity about and often alterations in one’s own worldview. Such dialogue introduces profound possibilities for self-examination and transformation in ways that members of diverse groups understand: what is good for them, what is praiseworthy, and how to bring that goodness into being. Such a procedure may provide a partial antidote to higher levels of incivility seen in our national culture today (Cortina, 2008).

Of course, some may feel that there are certain beliefs or practices that are so unacceptable that they are unwilling to enter a dialogue with those who keep them. Even so, the temptation to reflexively categorize alien customs and practices as contemptuous or immoral must be resisted. Such a judgment may reflect the limits of our own horizon, rather than the truth of someone else’s point of view. Steven Covey (1989), in his highly successful text, *The 7 Habits of Highly Effective People*, referred to a similar concept when he suggested, “seek first to understand, then to be understood” (p. 235). This habit is similar to empathy and is intended to improve communication by suggesting that individuals listen with the intent to understand the others’ perspective; not listening solely with the intent to reply.

Authentic tolerance, emphasizing respect and charity, is the simple etiquette of public life and can be seen as an antidote to a U.S. culture increasingly characterized by rude and uncivil
behavior (Cortina, 2008). Authentic tolerance allows differing views to have an equal right to exist, not necessarily an equal share in truth. These are different issues. Indeed, the view that all values are equal and immune from criticism is intolerant of the view that moral judgments can be made. The great value of authentic tolerance is that in no way does it excuse individuals from resolving conflicting claims to truth. Is it intolerant to claim that the sun is the center of our solar system because others might think that it is the earth? Are scholars considered intolerant when they believe one hypothesis to be true and another false?

Individuals can be authentically tolerant without accepting another person’s beliefs. Tolerance has nothing to do with endorsing another person’s belief, only his or her right to have that belief. Individuals should be inclusive of people but should not be required to personally incorporate others’ beliefs and behaviors. We should listen to and learn from all, but we are not obligated to be in agreement with everyone. It is a disservice to all when it is believed that tolerance, respect, charity, and dignity imply never saying or doing anything that might upset someone. Indeed, Barrow (2005) goes so far as to say that those who protest that they are being offended by our interpretation is indicted as “one of the supreme self-serving acts. Taking offence, when it means treating one’s personal hurt as grounds for punitive response, involves a refusal to show tolerance, to allow freedom or to play fair—for why should you be allowed to say what you want, when others are denied that right by you” (Barrow, 2005, p. 273)?

**Authentic tolerance in other cultures**

It is worth noting that the conceptualization of authentic tolerance presented here is supported by Eastern and African thinking. Asian societies, particularly countries like China, Japan, and South Korea, stress building harmonious interpersonal relationships through avoidance of conflict and compliance with social norms. This is based on the teachings of
Confucius for whom tolerance implies harmony without conformity (Jiang, 2006). Hence, a true Confucianist or Confucianism-inspired person would graciously show tolerance for differences in beliefs and values for the sake of harmony based on benevolence and love (Lo, 2006), but not necessarily feel obligated to accept and endorse such beliefs and values. Similarly, woven into the fabric of African society is the concept of *ubuntu* which represents a collection of values for treating others with harmony, respect, sensitivity, dignity, and collective unity simply because of a person’s humanness (Kani, 2006). The *ubuntu* value system provides a framework of how people should treat others and values a collective respect for everyone in the system.

An imperative delineated from the above is that it is important to treat others as family, i.e., with kindness, compassion, and humility. Indeed, Mangalisco (2001) noted that “Treat[ing] others with dignity and respect ... is a cardinal point of *ubuntu*. Everything hinges on this canon, including an emphasis on humility, harmony, and valuing diversity” (p. 32).

These African- and Asian-based principles are clearly consistent with authentic tolerance, which is what is strongly argued for and advocated here. As such, there are important implications of authentic tolerance for cross-cultural managerial practice. Managers in charge of multinational firms with operations in African or Asian countries would be well-advised to take heed of the proposed concept of authentic tolerance and develop their corporate diversity and multicultural programs accordingly.

*Key points of authentic tolerance*

We support the idea of a truly pluralistic society where differing views have an equal and legal right to exist but not a society where ideologically driven interest groups require all to accept their worldviews, where disagreement is misconstrued as bigotry, stupidity, and hatred, and where tolerance simply means forced acceptance. We are reminded of the words of noted
English philosopher William Rowe who said: “… those who are most eloquent in demanding freedom for their own views and practices are the first to deny freedom of thought or action to their neighbours” (1930).

We hold a vision of a world that features cultural sensitivity, mutual understanding and affirmation, inclusion, social justice; and the reduction and elimination of prejudice, inequality, discrimination, and oppression—without forced acceptance and agreement associated with the neo-classical definition of tolerance, and without the endurance and forbearance incorporated in the classical meaning of tolerance. We agree with Dubos (1981) that social evolution proceeds most rapidly when different cultures and groups “… come into close contact with each other and thus can exchange information and goods, even though each retains its originality,” (p. 116) and would expand his words by advocating approaching others with respect, dignity, and charity due them as human beings. In an intolerant world, rational dialogue gives way to argument by insult. It is easier to hurl an insult—“you intolerant bigot”—than to confront the idea and either refute it or be changed by it. Tolerance today—what is here called neo-classical tolerance—has become intolerance. When thoughtful principled arguments can be refuted by insults or speculation about hidden motives, rational discourse breaks down.

Authentic tolerance recognizes the rights of other humans to both have and express their opinion. If individuals can learn to respect the rights of all human beings to have and express their understanding of reality, whether they agree with them or not, then everyone will be one step closer to living in a truly charitable world. Tolerance of persons, what might be called “civility,” can be equated with the word “respect.” People can respect those who hold different beliefs by treating them courteously and allowing their views a place in community discourse.
Persons may strongly disagree with their ideas and vigorously contend against them in the public square, but still display respect for individuals despite their differences.

Take the case of Carrie Prejean who, as a contestant in the 2009 Miss USA Beauty Pageant, was asked her views on gay marriage by openly gay pageant judge Perez Hilton. When she replied that she believed that marriage should be between a man and a woman, Mr. Hilton called Ms. Prejean “the B word” on his popular blog and said he would have liked to call her something stronger (Hilton, 2009). Other gay activists took a more measured and civil approach. For example, Rich Tafel (2009) of the gay advocacy group the Log Cabin Republicans said:

“I think it was a perfectly acceptable question. And though I completely disagree with her, I think her response was perfectly fine, too. Calling this woman an unprintable name, as Perez Hilton did, is indefensible. All of us have a belief system, whether it is informed by our faith or a secular world view. The freedom to share those even unpopular positions is what makes this nation great. In my hundreds of debates for gay rights with Christian conservatives, I was often subject to mean and personal attacks and at times was concerned for my safety. As the tide turns in favor of gay equality, what a sad victory it will be if we become the new bullies. The crime here is not that people have opinions we disagree with. The crime is treating those who disagree with us with the same incivility that they treated us to.”

An additional example involved President Barack Obama who spoke of another ideological tension when he delivered the commencement address at Notre Dame University in the spring of 2009 amid much public controversy and protest demonstrations. Some “pro-life” persons thought that the president should not be invited to speak at a Catholic university because his “pro-choice” position on abortion is inconsistent with Church doctrine, and many objected to the university awarding him an honorary degree. The President devoted a section of his address to the protests—not on the merits of one abortion position over another, but rather on public discourse; i.e., on how Americans should engage in public debate on issues with which they
fundamentally disagree. Mr. Obama observed that while opposing views would and should be presented with passion and conviction, they could be done “without reducing those with differing views to caricature (Obama, 2009).” Then he suggested a model: “Open hearts. Open minds. Fair-minded words (Obama, 2009)” in the context of “... friendship, civility, hospitality and especially love” (Obama, 2009). These words are remarkably consistent with our concept of authentic tolerance offered here.

Conclusion

Researchers are increasingly questioning the rhetoric of neo-classical tolerance which seemingly demands acceptance of beliefs and behavior contrary to one’s own in the interest of valuing differences (Lickona, 2002; McDowell & Hostetler, 1998). If diversity training and awareness programs designed to promote social understanding (inclusion, affirmation, and harmony) in a pluralistic world are to continue to do the good work of confronting and eliminating unlawful and immoral discrimination and prejudice, then a key tool in such programs, teaching tolerance emphasizing approval of, agreement with, and endorsement of all beliefs and behaviors, must receive a more considered evaluation.

Authentic tolerance as incorporating dignity and respect for individuals without necessarily sharing in or accepting others’ viewpoints and conduct must supplant the classical and neo-classical views. Individuals can be authentically tolerant without the requirement to internalize others’ thinking or convictions. Inclusiveness should not demand that differences be denied. Authentic tolerance employs respect and civility for persons since every person has inherent value, but does not require adopting another person’s belief, only his or her right to have that belief. It strongly encourages us to explore the terrain between forbearance and acceptance, exploring possibilities of mutual understanding and accommodation along the way.
Within our notion of authentic tolerance respect is accorded the person; whether his or her actions or viewpoints should be tolerated is an entirely different issue. Tolerance of persons must also be distinguished from tolerance of ideas. Tolerance of persons requires that each person’s views get a courteous hearing—not that all views have equal worth, merit, or truth. Rejecting another’s ideas should not be equated with disrespect for the person. The opinion that no person’s ideas are any better or truer than another’s is irrational and absurd. It would be inappropriate to tolerate such things as racism, sexism, or hate speech. This view is consistent with renowned psychotherapist Albert Ellis’ (2004) concept of unconditional other-acceptance which declares that one is not required to “… tolerate the antisocial and sabotaging actions of other people…. But you always accept them, their personhood, and you never damn their total selves. You tolerate their humanity while disagreeing with some of their actions” (Ellis, 2004, p. 212, italics in original).

Those attending diversity workshops where tolerance is encouraged should respectfully engage trainers regarding their definition of tolerance and to question interpretations that imply that participants endure and suffer others’ differences (classical definition) or that trainees should appreciate others’ differences and accept everything (neo-classical definition). We agree with Bennett (2001) that “Properly understood, tolerance means treating people with respect and without malice; it does not require us to dissolve social norms or to weaken our commitment to ancient and honorable beliefs” (p. 138). Such an understanding of tolerance, what is here called authentic tolerance, can enhance diversity training program effectiveness and can be a valuable approach to addressing inclusion in organizations and institutions. Tolerating or respecting people, however, must never be confused with accepting all their ideas and practices.

A Microgenetic Analysis of Learning Strategies Adoption in Group Discussions of Problem Based Learning

Abstract

With increased attention on problem based learning and widely adoption of group discussion in implementing problem based learning in science education, this paper provides evidence of the applicability of microgenetic methodology in analyzing group discussion of problem based learning. Using microgenetic method, while four students planned, implemented and finished a science poster presentation in three group discussions, the study provides the real-time generation and report of the specific development and changes of frequencies of six learning strategies adoption within group as well as the individual differences in the use of the various strategies. This study suggests that microgenetic methodology provides an effective way to describe and understand in depth that group discussion of problem based learning is an active and continuous process involving ever-changing choices of students' strategies adoption. With focusing on the process, the researcher can trace the student’s cognitive development of a certain domain within a period of time. Therefore, in future studies, researchers may apply microgenetic methodology to analyze students’ other strategies, skills, and knowledge in group discussion of problem based learning, and compare students’ different problem solving processes in different domains or under different circumstances, thereby generate a more comprehensive understanding of students’ learning.
Introduction

One goal of science education is to improve critical thinking, logical responding and to develop problem solving abilities of the students (Lavole 1993). Therefore, problem based learning is a commonly used strategy in science education. Mayer & Wittrock (1996) explained that solving a problem means to find or create new solutions for the problem or to apply the new rules to be learned. The problem could be a physical science problem such as a one dealing with motion or a social science problem as one concerning environmental issues. Studies in science education have explored the relationship between the development of students’ thinking and problem-solving skills in science. For example Davies (2008) found that children’s problem solving skills were enhanced when they understood the relevance of their learning, felt capable of completing the task, and could relate it to something else that they had done. Sormunen (2008) pointed out that pupils’ modest problem solving abilities in open-ended inquiry process were due to inability to integrate and apply their existing strategies, skills, and knowledge. Chang & Weng (2002) found a significant mean difference in students’ skills of observation, data interpretation, and hypothesis formulation between higher-level and lower-level problem solvers.

With the increased dissatisfaction towards traditional teacher-instructed approach, researchers have begun to focus on the importance of group discussions in implementing problem based learning. Student group discussion is critical for a student to learn to propose, explain the logical nature of, and defend one’s ideas of the problem. Cazden (1998) found that skills such as problem-solving, critical thinking and scientific reasoning are intimately linked to group interaction and discussion. In other words, the interaction that occurs when student discussion is fostered around authentic tasks positively influences student problem solving and
critical thinking skills. This intimate link between discussion and problem solving skills was recently supported empirically by Webb & Treagust (2006). Their study found a clear and statistically significant improvement in problem-solving and reasoning of pupils who participated in classroom discussions. Other scholars have also proposed a critical relationship between discourse and problem solving skills. Schwartz, Mennin, & Webb (2001) argued that problem based learning in science education refers to students engaged in active learning through small, collaborative groups to develop content knowledge and a range of skills, such as self-directed learning, problem-solving, and communication skills.

Among many different strategies used in group discussion of problem based learning, students tend to choose between different learning strategies and this can vary significantly across individuals. (Siegler & Jenkins, 1989; Luwel, Siegler, & Verschaffel, 2008; Kuhn et al., 1995; Schauble, 1996). Building on a series of studies, Nisbet and Shucksmith (1986) proposed six strategies that students use during group negotiations, a) asking questions, b) planning, c) monitoring, d) revising, e) checking, and f) self-assessing. Asking questions are characterized as the emergence of a new topic with a question or a statement. Planning strategies are characterized as one initial attempt to deal with the new topic, such as providing an example or a suggestion directly to the topic mentioned. It was the initial response to the question, and most of Planning strategies in these discussions were used to clarify the question or narrow down the topic. Monitoring strategies are further attempts to deal with the current topic on the basis of Planning strategies. Checking are strategies as a direct opinion, question, or evaluation to the current plan. Revising strategies are used to revise or redraft, recalculate the initial plan to make it clearer or easier to understand. Self-assessing strategies include assessments of plans and performances of the participants across the topics; for example, making conclusion
or evaluation to the current situation in the discussion. While many studies have been conducted on group discussions, few have focused on discussions during extended problem based tasks.

The purpose of this paper is to report on the use of microgenetic method as an approach to study group problem based learning. The microgenetic method has proved to be applicable in many domains in science education. For example Luwel, Siegler, & Verschaffel (2008) used microgenetic method to find that experiences influenced the students’ strategies adoption in problem-solving process. Karmiloff-Smith (1992) did a comprehensive microgenetic analysis on the child’s cognitive development in the domain of mathematics. Kuhn, Schauble, & Garcia-Mila (1992) also used microgenetic method to find students’ scientific reasoning strategies developed across different domains. Few studies, however, have used microgenetic method in studying group discussions of problem based learning.

Often, problem based learning is assessed by determining students’ understandings before and after the problem (Sormunen, 2008; DiList, Eulberg, Lanese, & Padovan, 2006; Chang & Weng, 2002). Such methodology can only compare the results at two ends of a problem solving process, and fail to have an access to the specific details of changes happened during the process (Adolph, Robinson, Young, & Gill-Alvarez, 2008; Demetriou & Raftopoulos, 2004; Kuhn, et al., 1995; Miller & Coyle, 1999). Considering this methodological tendency of problem based research and building on the intimate connection between group discussion and problem-solving abilities, this paper provides an example of using microgenetic method to study the specific stages of developments in group discussion of problem based learning. It emphasizes the different periods of change as students work through an extended (two week) student-directed problem solving task.
Current Study

This paper provides evidence of the applicability of microgenetic methodology in analyzing group discussion of problem based learning. Unlike traditional methods, microgenetic methodology provides a good way to describe and understand in depth that group discussion of problem based learning is actually an active and continuous process involving constant changes of adoptions of different strategies, skills and knowledge. In this study, the author focuses on microgenetic analysis of six learning strategies (Nisbet & Shucksmith, 1986) students used in three group discussions to understand their problem based learning process.

Using microgenetic method, while four students planned, implemented and finished a science poster presentation in three group discussions, the study provides the real-time generation and report of the specific development and changes of frequencies of six learning strategies adoptions within group as well as the individual differences in the use of the various strategies.

Participants were students attending a summer institute for accelerated middle school students. Twelve groups of four students proposed and explored authentic problems related to the theme Go Green. The students were asked to research their question, develop knowledge claims based on evidence, construct a scientific poster, and conduct a poster presentation to peers and community members. From these twelve groups, one was randomly selected for audio recording and subsequent analysis. The problem for these four students to work together was to determine how disposed computers are affecting our environment. Three audio
recordings were collected throughout the nine days of group project work totaling approximately six hours of audio.

Results

With the microgenetic analysis of the frequencies of six learning strategies students adopted during their group discussions, the author finds that each learning strategy represents an important factor in group discussions.

*Asking Questions* strategy represented the level of group members’ understandings towards the task, and the changes in these three group discussions showed the process of developing similar levels of each individual’s understandings of the current task. The analysis indicated that it took a good deal of time for all group members to clearly establish the nature of the task.

The nature of *Planning* and *Monitoring* strategies suggested the two strategies are closely connected with an individual’s ability and specialty in the discussion topic. When a student was good at or interested in certain topics, he/she would adopt more *Planning* and *Monitoring* strategies than the other students. Considering that these students were exploring an area of study in which they all had a similar understanding, the *Planning* and *Monitoring* strategies contributions were comparatively stable across the three discussions.

*Checking* strategy was closely related to the topics in the group discussions, and the changes throughout these three discussions showed the changes of the topic ranges in their
discussions. It was adopted to make clear what other students said and provide possible alternatives of current perspectives.

According to the nature of Revising strategy, it was built on the basis of Planning and Monitoring strategies, and it represented the harmony among group members, and it took time for the students to set up the harmony among these four students during their discussions.

The changes of Self-assessing strategy during these three group discussions showed that the adoption of this strategy included a thorough consideration of the understanding of the task, the ability or interest of the topic, the level of satisfaction towards current discussion, and the evaluation of the other group member.

The author defines an efficient group discussion as characterized by group members sharing similar strategies to develop ideas and generated useful results, and developing further with Monitoring strategy when the discussion direction had set. This pattern suggests that efficient group work takes time to develop.

Implications for Research and Practice

With increased attention on problem based learning and widely adoption of group discussion in implementing problem based learning in science education, microgenetic methodology brings researchers’ focus on the essential element in problem based learning – the process itself. With microgenetic methodology, the researchers can trace the student’s cognitive development of a certain domain within a period of time.
This study suggests that microgenetic methodology provides an effective way to describe and understand in depth that group discussion of problem based learning is an active and continuous process involving ever-changing choices of students' strategies adoption. Besides learning strategies, students tend to use many different strategies, skills, and knowledge during their group discussion of problem based learning. For example Kuhn (et al., 1995) found students’ adoption of knowledge acquisition strategies during their learning process. Therefore, in future studies, researchers may apply microgenetic methodology to analyze students’ other strategies, skills, and knowledge in group discussion of problem based learning, and compare students’ different problem solving processes in different domains or under different circumstances, thereby generate a more comprehensive understanding of students’ learning.

This study also suggests that in daily science education practice, microgenetic analysis of problem based learning provides researchers and educators a vivid real-time description and report of students’ detailed development during their problem solving process. Therefore, researchers and educators develop a clear understanding of the specific steps the students underwent during their problem solving process. Using such information, researchers and educators can redesign and subsequently implement a more suitable and efficient problem based learning task.

Parent Perceptions of their Child’s Social Competence, Social Skills, and Self-Concept in Relation to a Two-Day Surf Camp Curriculum for Students with Autism Spectrum Disorder

Abstract: Surfing is an emerging alternative therapy that may result in positive outcomes on the psychosocial domains for individuals with Autism Spectrum Disorder (ASD). The purpose of this presentation is to present the results of a study conducted to identify parent perceptions on the benefits and outcomes achieved by their children as a result of a two-day surf camp curriculum. Parents were provided the questionnaire 2-weeks prior to surf camp, immediately after the completion of surf camp, and then again 2-weeks following surf camp. Parents responded to 23 likert questions in the categories of social competence, social skills, and self-concept as it relates to their child’s participation in the surf camp. In addition to these questions, three additional short answer open ended questions were provided to determine participant impact perceptions of the surf camp. Results of the parent perception survey indicate statistically significant changes in the social skill category of empathy, as well as two of the five SURF Camp Social Skills curriculum activities performed at surf camp.
Changing Teacher Beliefs about the Reading/Literacy Process

The purpose of this research study is to determine if participation in literacy training changes teachers’ beliefs and practice related to the reading/literacy process. Prior to participating in California State University Fullerton’s Reading Institute for Academic Preparation (RIAP), teacher-participants were given a survey to assess current beliefs and practices regarding literacy. Following 60 hours of Institute professional development, via RIAP, secondary teacher-participants completed a post-institute survey. Participants also completed a project examining their classroom practice and a self-analysis.

RIAP is an Institute for teachers interested in teaching content through literacy. It has been developed by the CSU Chancellor’s Office and blends classroom practice with the latest research in literacy. The intent of this study is to determine whether or not teachers experience changes in understanding the reading/literacy process based on their participation in RIAP and exposure to current research. Furthermore, we investigate whether changes in beliefs/understanding impact classroom practice.

RIAP sessions focus on specific topics in literacy, including academic reading, writing, vocabulary instruction, disciplinary literacy, illustrated journaling, comprehension building techniques and assessment. Intensive training sessions are lead by CSUF faculty and guest presenters from other CSU’s. Our research examines paradigm shifts in teachers’ thinking and practice related to the reading/literacy process following 60 hours of research based trainings provided during the course of a year. In addition,
we also look at what specific literacy topics and research covered during the Institute appear to have the most significant impact as reported by participants.

Results from the survey, sample classroom studies and self-studies will be presented during our session. An article based upon the research is in progress.
A Comparison Of Learning Cultures

In Different Size And Types Of High Schools

A COMPARISON OF LEARNING CULTURES

IN DIFFERENT SIZE AND TYPES OF HIGH SCHOOLS

Paula D. Brown

Dr. Cynthia MacGregor, Dissertation Supervisor

ABSTRACT

The purpose of this study was to compare relevant data and information about leadership and learning cultures in different size high schools (small and large) and types of high schools (alternative schools, professional learning communities, small learning communities, and non-learning communities). Research was conducted using a quantitative design with a qualitative element. Quantitative data were gathered using a researcher-created survey, the Brown Learning Culture Assessment. These four themes (shared and supportive leadership, collective learning and application, collaborative culture, and shared values and vision) represent the dependent variables of this research study and the basis for the structure of the Brown Learning Culture Assessment. The independent variables are different size schools (small schools and large schools) and the dependent variables are different types of schools (alternative schools, professional learning communities, small learning communities, and non-learning communities).

High school teachers from small schools, large schools, small learning communities, alternative schools and professional learning communities were used in the population sample. Small schools and large schools were evenly represented. Missouri State High School Athletic Association (MSHSAA) guidelines for school size were used to distinguish categories of schools. Four large schools were represented by 5A and 6A schools and four small schools were represented by 1A and 2A schools. Certified educators completed the survey.

Four research questions were asked in this study. The first one asked, Does school size (large vs. small) make a difference in perceptions of shared and supportive leadership, collaborative culture, collective learning and application, and shared values and vision? Four independent sample t-tests for uncorrelated means were used to calculate the data. The second research
question asked, Does school type (small learning communities, alternative schools, and professional learning communities) make a difference in perceptions of shared and supportive leadership, collaborative culture, collective learning and application, and shared value and vision? Four one way analyses of variances (ANOVA) were calculated using one per subscale. The third research question asked, Do professional learning communities/small learning communities make a difference in perceptions of shared and supportive leadership, collaborative culture, collective learning and application, and shared value and vision? Four independent sample t-tests for uncorrelated means were used to calculate the data. The last research question asked, How do school leaders describe the leadership styles and cultures used within the different high school settings? Two open-ended questions were analyzed and coded for common reoccurring themes.

Independent sample t-tests were conducted in order to analyze the means of school size factors (small and large) and also learning structures (PLC/SLCs and Non-PLC/SLCs). According to responses from teachers statistically significant differences existed between the factor small school size compared to shared and supportive leadership and collaborative culture. Statistically significant differences also existed between the factor PLC/SLCs compared to shared and supportive leadership, collaborative culture, and collective learning and application.

A one-way ANOVA was ran to compare the means of subscales shared and supportive leadership, collaborative culture, collective learning and application, and shared values and vision. Alternative schools and professional learning communities reported significantly higher scores on three of the four subscales (shared and supportive leadership, collaborative culture and shared values and vision). Non-learning communities had consistently lower scores on all four subscales (shared and supportive leadership, collaborative culture, collective learning and application, and shared values and vision). Alternative schools were consistently highest across all subscales, with professional learning communities reported second, followed by small learning communities and non-learning communities. These statistical findings were supported with qualitative responses. However, there were divergent angry voices reported from large school and non-learning communities.

Conclusions made from research question one (Size – Small vs. Large) suggested that small schools experience higher levels of Shared and
Supportive Leadership and Collaborative Culture. Large and small schools both experience similar levels of Collective Learning and Application and Shared Values and Vision.

Research question two (Types – Alternative Schools, Professional Learning Communities, Small Learning Communities and Non-Learning Communities) concluded that alternative schools experience higher levels of Shared and Supportive Leadership, Collaborative Culture, and Shared Values and Vision. Professional learning communities experience higher levels of Shared and Supportive Leadership, Collaborative Culture, and Shared Values and Vision. Non-learning communities have lower levels of Shared and Supportive Leadership, Collaborative Culture, Collective Learning and Application, and Shared Values and Vision. There was also a consistency in the order of learning culture qualities. Alternative schools were the had the highest amount, professional learning communities were always second, small learning communities were always third and non-learning communities always had the least learning culture qualities.

The third research question (PLC/SLC vs. Non – PLC/SLC) concluded the PLC/SLC’s experience higher levels of Shared and Supportive Leadership, Collaborative Culture, and Collective Learning and Application than Non-PLC/SLC’s. PLC/SLC’s and Non-PLC/SLC’s experience similar levels of Shared Values and Vision.

Research question four’s (“Teacher Voices”) qualitative findings supported the quantitative results from the indentified subscale themes: Shared and Supportive Leadership, Collaborative Culture, Collective Learning and Application, and Shared Values and Vision. However, two new themes were identified: Open communication and Divergent Angry Voices. Open communication with administrators was valued by teachers in all size and types of high schools. Divergent angry voices were found in large high schools and Non-PLC/SLC’s.

Five implications for practice were suggested based upon the literature and data. First, principals reflect upon their leadership style, and recognize the value of shared leadership and a collaborative culture. Secondly, practice open communication skills with and among staff. Third, be aware of the importance of small class sizes and working with students in smaller learning environments. Fourth, be knowledgeable of what defines a
true learning community with components such as shared and supportive leadership, collaborative culture, collective learning and application, and shared values and vision. Fifth, be cognizant of divergent angry voices of staff members who may fear changes or feel left out of shared decision-making processes.

Recommendations were made from analyzing the data. School administrators in large schools and non-PLC/SLCs may consider plans to restructure high schools into true learning communities that are divided into smaller units. Principals may also consider using open communication while implementing change. Shared leadership with an open collaborative culture is suggested to be practiced and implemented so principals and staff can work together collaboratively to build ownership in their learning cultures.
Is it possible to impact the attitudes of pre-service general education teachers about the inclusion of students with disabilities?

Abstract

The study examined the attitudes of pre-service general education teachers about the inclusion of students with mild to moderate disabilities. Participants in the study completed the Teacher Attitudes Toward Inclusion Scale (TATIS) at the beginning and of a semester long introductory course on disabilities. The findings of the study found significant differences on the three dimensions of the pre-service general education teachers’ attitudes as measured by the TATIS. The course is providing the pre-service teachers with information about students with disabilities. This knowledge may be alleviating misconceptions about students with disabilities and improving the pre-service teachers’ foundational skills regarding disabilities.
Can we influence pre-service general education teachers’ attitudes about inclusion?

Current educational practices require general education teachers to be effective instructors for all students (i.e., No Child Left Behind, 2001; Individuals with Disabilities Education Improvement Act, 2004). Legislation alone cannot guarantee the successful inclusion of students with disabilities in general education classrooms (Coulter, 2007; Peters, Johnstone & Ferguson, 2005; Ross-Hill, 2009). Teachers are one of the most important components for successful inclusion (Ross-Hill, 2009; Van Laarhoven, et. al., 2007). The route to become an effective teacher has many parts. Pre-service teachers will gain skills in teacher preparation courses, field experience, student teaching, and later through on the job experience and professional development. The education provided to pre-service teachers will shape the future of inclusive services for students with disabilities.

Many individuals and opportunities will influence the attitudes of pre-service teachers – such influences may include personal experiences in K-12 education, personal knowledge of disabilities and/or individuals with disabilities, and the teacher preparation program. Teacher preparation programs can be very influential. Coursework focused on disability issues and the philosophy of inclusion held by university instructors can impact beginning teachers attitudes toward students with disabilities included in general education. The increasing number of students with disabilities in general education classes requires that preparation at the pre-service level provide opportunities and methodologies for beginning teachers (Henning & Mitchell, 2002). Preparation that includes coursework and opportunities to develop relationships with individuals with disabilities has been found to assist in creating positive attitudes toward students with disabilities (Forlin, 2010; Sharma, Forlin & Loreman, 2008). Pre-service teachers need to
feel comfortable interacting with students with disabilities in order to fully embrace inclusion. It is critical that concerns and doubts that pre-service teachers have be addressed before they go out into their own classrooms (Moran, 2007; Hastings, & Oakford, 2003).

Teachers need an overall acceptance and willingness to instruct a variety of diverse students including students with disabilities (Mintz, 2007). When teachers have positive attitudes toward students with disabilities they are more readily able to adapt and change the ways they teach to meet the needs a variety of student learning needs (Sharma, Forlin, & Loreman (2008). Lower grade levels and less significant disabilities have typically been areas in which pre-service and in-service level teachers are more positive about the inclusion of students with disabilities (Campbell, Gilmore & Cuskelly, 2003; Ross-Hill, 2009). Hasting & Oakford (2003) They found that pre-service teachers rated students with behavioral and emotional disabilities as having a more negative impact on other students, teachers as well as the general school and classroom environments. They also contended that teachers’ attitudes were more negative regarding students with behavioral or emotional disabilities rather than students with intellectual disabilities. These skill areas need to be addressed during the pre-service period.

Sapon-Shevin (1996) states that full inclusion draws attention to the challenges that already exist in the schools. These difficulties are even more apparent when trying to include students with significant behavioral and emotional challenges. The system needs to change in order to support all children. Unfortunately more recent legislation NCLB (2001) has actually encouraged the system to standardize more and to remove some of the flexibility needed by students with disabilities to be successful in an inclusive environment.

Silverman (2007) found that there are three factors necessary for teachers in order to have positive attitudes toward inclusion. First teachers must believe that students with disabilities can
achieve their very best and can learn. Secondly, all teachers have to have a strong sense of self-efficacy for teaching students with disabilities. Teachers with a high self-efficacy are more effective at differentiating instruction, and finally general and special education teachers need to see each other as equals. Beginning teachers typically lack the knowledge and beliefs for positive attitudes about inclusion. Negative attitudes may be due feeling inadequately prepared. It may also relate back the beginning teacher’s own K-12 experiences. These areas also need to be addressed at the pre-service level.

Becoming an effective teacher requires desire to be good for all students, including students with disabilities. The time spent in a teacher preparation program is the time to influence attitudes and to instill the belief that all children can learn (Weiner, 2003). This study sought to determine the impact an introductory course on disabilities had on masters level teacher preparation students.

Method

This research was conducted through a pre and post survey given to pre-service general education teachers at the beginning and end of a survey course on students with disabilities (ED 564: Education of the Exceptional Student). The Teacher Attitudes Toward Inclusion Scale (TATIS) was administered pre and post with pre-service teachers enrolled in the introductory course (Cullen, Gregory, & Noto, 2010).

The TATIS is grouped into three factors: teacher perceptions of students with mild to moderate disabilities, beliefs about the efficacy of inclusion, and perceptions of general educators regarding professional roles and functions. Cullen, Gregory and Noto (2010) established the validity of the TATIS through principal component analysis and the reliability coefficients generated using Cronbach’s alpha measure of internal consistency. The TATIS demonstrated strong content validity and factor loadings, and the overall correlation coefficient of 0.821 exceeded the value of 0.8 for
acceptable internal reliability. The TATIS instrument was a revision of the APTAIS developed by Cullen and Noto in 2007.

Data were collected from 2006 to 2009 in ED 564. Pre and post data were collected from students in a pre-service teacher preparation class on inclusion of students with mild to moderate disabilities into general education classrooms for 80% or more of the school day. Only classes with professors who coordinated syllabi and activities were included in the analyses. The TATIS was employed for both pre and post data collection. Participation in the survey was optional as was providing an identifier for matching pre and post responses. Responses without matching pre and posttest scores were excluded. Additionally, demographic information was collected to investigate whether there were variations in the amount of change in the pre and posttest for different groups.

The data were analyzed with Statistics Package for the Social Sciences Version 16.0 to analyze whether there was a significant difference in the pre and post test scores of respondents. This repeated measure design causes each respondent to be their own control (pre-test) and thereby reduces the variability as compared to a randomly selected sample, minimizing the estimated standard error and increasing the likelihood that differences in the means will permit valuable conclusions to be drawn.

Data were initially collected from all five professors teaching ED 564, 485 records. Seventy-four records were eliminated because they were collected in courses taught by adjunct professors. This limited the invited sample to only those students who were taught by a full-time faculty member. The full time staff met periodically to align classroom practices and content. To improve the response rate, the TATIS was administered in class, but completion of the TATIS and providing an identifier were voluntary. The lack of complete responses, missing identifiers and the mid-semester add or drop of the ED 564 class meant that 53 of the remaining surveys could not be used. The return rate over the three years was 87.1%, 179 pairs of records that were used as the data
generating sample. A paired samples $t$ test was run on the pre and post course data. The mean value for both the pre and post course responses was calculated and compared to look for a significant change at the $p \leq .05$ level. It should be noted that items relating to the beliefs about the efficacy of inclusion (items 7-10) are reverse scored on the TATIS and therefore have been manipulated in these analyses to keep the sign consistent.

**Results**

The demographic results from this sample were dissimilar to other pre-service teacher studies. While other studies (Haberman, 2004; Penny & Bolton, 2009) had samples that were over 80% female, the current sample was 64% female and 35% male. The data were also well distributed regarding the type of communities in which the subjects participated in field experiences or worked, and the amount of perceived experience with students with mild to moderate disabilities (Table 1). The tested sample consisted of mainly pre-service and novice teachers with 82% of the respondents indicating that they had 0-3 years of teaching experience.

When the pre and post-test results were compared there were significant differences in the mean score for every item on the TATIS (Table 2) and for the three factor scores (Table 3). Howard and Dailey (1979) warn that self-reported measures are subject to a response-shift bias, that the ED 564 course will change the respondents point of view and therefore their pre-test response and their post-test response will not share a common standard of measurement.
Howard and Dailey found that this may result in under reporting effects and that the response-bias shift leads to conservative estimates of assessments of effectiveness.

Even subject to possible response-shift bias, every factor score and individual item demonstrated a significant change between the pre-test and the post-test response.

When evaluating the individual item responses, the items with the lower levels of significance (7, p=.008; 8, p=.016; 9, p=.043, 10, p=.015) were the reverse scored items. These items also exhibited higher standard deviation in the post-test scores. Items 7-10 measured the respondents’ beliefs about the efficacy of inclusion (factor 2). When aggregated, the change in scores for items 7-10 was significant at the most stringent level tested. Compared to factors 1 and 3, that were also significant at the p=.001 level, the calculated t was lower for factor 2 (3.705) than it was for the other two factors (1, t=8.859; 3, 5.255). To be significant at the p=.001 level, the calculated t value had to be higher than 3.138.

Discussion

The study was designed to investigate the impact of an introductory disability course had on masters level teacher preparation students. Specifically, the study sought to determine if the pre-service general education teachers attitudes about the inclusion of students with mild to moderate disabilities in general education classes could be changed over a semester long course on disabilities.

The course, ED 564, was found to have a significant impact on the three dimensions of pre-service general education teachers’ attitudes as measured by the TATIS. It was anticipated that the introductory course focusing on an overview of various disabilities would have an impact on the pre-service general education teachers’ perceptions about students with mild to moderate disabilities. The course may be alleviating misconceptions about individuals with disabilities and increasing the pre-service teachers’ knowledge about various disabilities.
Knowledge and understanding can be very influential in reducing negative perceptions about students with disabilities.

The philosophical foundation of the course is rooted in the belief that students with disabilities have a right to an inclusive education. Despite this there is still the potential for the pre-service teachers to become more concerned about inclusion as they gain information about various disabilities and the types of supports necessary to successfully educate students with disabilities in inclusive settings. The confidence of the instructor with regards to successful inclusive practices and the instructor’s ability to transmit a foundational level of skills and knowledge to the students may be reflected in the pre-service general education teachers’ beliefs in the efficacy of inclusion. Transmitting that inclusion is “expected” based on legal mandates is important for understanding that an inclusive education is a right of all students but it does not assist beginning teachers when then are faced with the daily reality of inclusion. A legal mandate will not guarantee a willing participant in the inclusion process; a personal philosophy accompanied by knowledge and skills is need for successful inclusion. The positive attitude with regard to inclusion modeled by the instructors appears to have impacted the pre-service general education teachers’ beliefs about the efficacy of inclusion.

The course does provide some very basic knowledge and skills with regards to roles and responsibilities of the general education teacher in the inclusion of students with disabilities in general education classes. However, the expectations for general education teachers in public school classrooms is extensive with regards to including students with disabilities and the one semester course does not allow for more than a cursory introduction to the knowledge and skills needed for successful inclusion. Despite this very basic introduction the pre-service general
education teachers were confident in their beginning abilities to include students with mild to moderate disabilities into their classrooms.

**Future Research**

Recommendations for future research include the use of the TATIS to measure the attitudes of pre-service teachers enrolled in courses that focus on methodology for including students with disabilities in a variety of academic areas. The use of the instrument as a pre test before beginning the Master’s program in general education and a posttest after the completion of student teaching would provide a more comprehensive analysis of the impact of the entire program on the inclusion of students with disabilities. Additionally, to evaluate the level of expected response-shift bias, future research should include pre/then/post measures. Using the TATIS as part of a follow up conducted with graduates several years after they complete the program could also do longitudinal data collection.

Finally, the results of the TATIS, as currently constructed, demonstrate higher standard deviations on the factor that is entirely reverse scored. A revised TATIS instrument, with multiple reverse scored items within each factor should be developed to test whether the higher standard deviations are due to the instrument design or the participant responses.

Abstract
In this study, the potentials of applied technology of e-Learning system to the assistance of Japanese-language teachers are outlined. For this purpose, we conduct an online tryout as a comprehensive information space for expansive learning which includes analysis of activities, and issues of the next step are shaped in this interim report. First, we perceived that communication in cyberspace had specific potentials to enable various forms of data exchange, and allowed new forms of information communication among unacquainted users and beyond geographical location. The next, we discussed about restrictions of expansive learning in Thailand with regard to their relevance for accessing new area of information and improvement of the present teaching curriculum. Finally, we concluded that the method of an intervention to minimize users’ pressure needed to be developed in order them to lead exploratory expansive learning.

1. Introduction
Contribution of Japan has lately drawn considerable attention by the world. Accordingly, Japanese-language education is expanding in many countries. At this moment, Japanese-language learners have increased 13 times during 1979 and 2009, and it reached about 3.7 million students around 133 countries (Japan Foundation, 2010a). More than half of learners (56.6%) are learning in Asian region, and Thailand occupies about 79 thousand learners and is ranked 7th in the world.
In Thailand, average number of Japanese-language teachers is 3.39/school (world average: 4.25), and
The data of Table 1 was calculated from the results of the Japanese-language proficiency test in 2009. It shows that learners’ proficiency of Thailand is still substandard and 20.86 point minus on level 1 in comparison with the world. Actually, Thailand is ranked as 5th on a total number of learners in higher education and 4th on a total number of examinees of the test, however this data implies further effort would be required to improve educational quality.

According to the reported problems by Japan Foundation (2010a), teachers recognized the following difficulties as major problems of Japanese-language lessons,
1) Lack of lesson materials (51.7%)
2) Lack of instructional materials and information of instructional method (42.5%)
3) Insufficient facility (39.9%)
4) Lack of number of teachers (37.1%)
5) Lack of information of Japanese culture (37.0%)
These problems are involved organizational and budgetary insufficiencies in the front, however, it is important that many problems, such as 1), 2), 5), involve a shortage to access lesson information as well. This desirable information includes records of lesson experiences, principles of instructional design and socio cultural information in Japan. Unfortunately, shown substandard in the Japanese-language proficiency test relates with competencies of local Japanese-language teachers as well.

In Table 1, requiring number of Kanji characters and relative compatible grade in Japanese school education for each level are optioned. In association with Kanji number, Komiyama (2005) surveyed requiring Kanji number by fields of documentations. Public news papers use about 4,500 Kanji characters, and dictionaries, published books, magazines, and classic documents use about 8,500 Kanji characters. Therefore, even a teacher with level 1 is not enough to read socially distributed Japanese-documents, moreover it is quite difficult for local teachers to read academic or educational Japanese-documents. This is the fatal difference between Japanese-language education field and English-language education field where even local teachers can read and understand professional documents.

Recent expansion of cyberspace enables to access rich information through Internet, but it is quite difficult for local Japanese-language teachers to make use of online data under above situation.

As existing measures, face to face trainings and workshops are usually recognized as chances to improve lesson quality at the present moment, but these events are frequently managed by external organization, such as Japan Foundation, and it has been difficult to offer equally chances across the country.

It must be introduced valid communication chances for improvement over existing restrictions around the small sized Japanese-language environment. Then, authors developed online communication project in a Web Site of Ministry of Education Thailand, and promoted to enhance interests to access contemporary information.
Thus, this study focused on local Thai Japanese-language teachers and operating possible online assistances to reveal Japanese society and educational information by providing interventions by professionals (see Figure 1). And, monitoring of online activities was done to investigate their changes based on the expansive learning theory.

![Figure 1: Online Project to Support Japanese-Language Teachers](image)

2. Design of Online Communication Service

2.1. Programs for Online Communication
To make nationwide scalability and offering impartial services to even teachers work in local area, we developed programs for online communication with CGI. Our developed programs were customized to have the following functions.
1) messageboard
2) allow upload various modes of data, and display
3) archive & retrieval

As an especially developed feature of our program, there is a strong database and a retrieval function in the back side of communication board. By selecting a button on the messageboard, the system leads a user to the menu of an archive database. Here, a user can search a recorded asset with a Boolean operator option (see Figure 2 below).

![Figure 2: Archive and Search Function](image)

In addition, a program for gathering online feedback with questionnaire and interviews functions is developed (see Figure 3). This program enables to gather users’ self-initiated opinions when they intend to post opinions into online sheets. Eventually, gathered data are automatically summarized and draw graphs and tables.
2.2. Online Service System Design

All our developed programs were installed into a server located in Japan. Simultaneously, a content management function of e-Learning located in Thailand is used for online service provision. Thailand Cyber University (TCU) Project (http://www.thaicyberu.go.th/), a Ministrial project under Commission on Higher Education (higher education bureau), provides e-Learning (http://lms.thaicyberu.go.th/) by an originally developed Learning Management System (LMS). Target of the e-Learning is nationwide, and covers comprehensive education fields from school education to higher education and in-service teachers’ training. Affiliating universities of the project have developed over 550 courses. So far, this project has registered more than 4,000 teachers and about 100,000 students. In this e-Learning system, our Online Communication Service (OCS) is listed as one of online courses. But once a user enters our virtual classroom, each communicative service appears as a list item of the course content. (see Figure 4).

To avoid mis-accesses of users of other courses, we pronounced our OCS in a front page of the TCU site (see Figure 5). Because the OCS is not for instructing Japanese-language, notification of OCS to distinguish from variety of online instructions is an indispensible measure.
2.3. Developed Services
For promoting online communication, authors developed following four initial services (see a pane sample in Figure 6).
1) Voice recording service: a user posts a document and an expert edits a document based on the requested Japanese-language proficiency level, records voice or video digitally, and returns as an attached file.
4) Q&A: Free Style Q&A

Figure 6: A Pane of Contemporary Information

In our international joint study, we connected servers that are located in two countries, and developed the OCS (summarized system configuration is shown in Figure 7).

Figure 7: Overall View of OCS
This setting has led the following benefits.
1) Easy to notify to over 4,000 teachers already exist in the e-learning.
2) Potential of nationwide coverage via academic Network infrastructure
3) Rich auto-management functions by LMS where authentication, learner activity record and content management are automatically monitored by the system.
4) Cover all level of school teachers in Thailand.
5) Shopping mall advantage is expected among over 550 existing courses.
6) All users are already familiar to the way how to use LMS, and then we just prepare minimum operation guide to access our OCS.

4. Implementation

Tryout of OCS was implemented and we had monitored initial activities of the following period and introduced our analysis into this interim report.
Period: From October 12, 2009 to July 20, 2010
Total users in this period: 190
Contributors of Online Interviews and Questionnaire: 25

5. Findings

5.1. Visiting Times
The calculated mean visiting times and standard deviation of users from the access data are 5.34 (3.99) times, respectively.

![Figure 8: Number of Learners / Attendance Times](image)

5.2. Access Time

<table>
<thead>
<tr>
<th>Service</th>
<th>Mean Learning Duration (SD)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voice recording service</td>
<td>17:34 (5:03)</td>
</tr>
<tr>
<td>Contemporary Information</td>
<td>22:15 (16:45)</td>
</tr>
<tr>
<td>Learning Materials</td>
<td>26:13 (11:24)</td>
</tr>
<tr>
<td>Q&amp;A</td>
<td>17:47 (13:38)</td>
</tr>
</tbody>
</table>

Means of learning duration to use each service are calculated and shown in Table 2. Voice recording service shows the shortest mean, but smallest in standard deviation. This would be the most users accessed not only text but also streaming data that stored in this service most. The means for all four groups were not significantly different at the alpha =.05 level of one-way ANOVA.
6. Implications of Study

The results described below are based on online interviews and questionnaire data, and the comments for a course made at LMS function. Gathered qualitative data are investigated by the step of expansive learning. Engestrom (1987) developed the theory of expansive learning based on preceding theoretical studies (e.g. Bateson, 1972, Bakhtin, 1981). In this theory, transformations of job activities and learning activities in learners’ life, learners must learn new forms of activity which are not yet there. Learners are literary learned as they are being created. Eventually, Engestrom (2001a) summarized the process to consolidate the new practice as the style of cycle (see Figure 9). The cycle is composed by the following six steps (Engestrom, 2001b).

1) The first action is that of questioning, criticizing or rejecting some aspects of the accepted practice and existing wisdom.
2) The second action is that of analyzing the situation. Analysis involves mental, discursive or practical transformation of the situation in order to find out causes or explanatory mechanisms. Analysis evokes “why?” questions and explanatory principles. One type of analysis is historical-genetic; it seeks to explain the situation by tracing its origins and evolution. Another type of analysis is actual-empirical; it seeks to explain the situation by constructing a picture of its inner systemic relations.
3) The third action is that of modeling the newly found explanatory relationship in some publicly observable and transmittable medium. This means constructing an explicit, simplified model of the new idea that explains and offers a solution to the problematic situation.
4) The fourth action is that of examining the model, running, operating and experimenting on it in order to fully grasp its dynamics, potentials and limitations.
5) The fifth action is that of implementing the model by means of practical applications, enrichments, and conceptual extensions.
6) The sixth and seventh actions are those of reflecting on and evaluating the process and consolidating its outcomes into a new stable form of practice.

![Figure 9: Process of Expansive Learning and Observed Strategies against the Contradictions](image)

6.1. Expansive Learning

From our gathered data, unfortunately, we could not confirm any overt activity of a user to incorporate information into their job improvement.

Engestrom and Sannino (2010) postulated that the process of expansive learning was understood as construction and resolution of successively evolving contradictions. They also mentioned that this cycle was not a universal formula of phases or stages.

Then, we tried to investigate online records to know more detailed users activities. First, the most accesses were seen (48.3%) in the service of learning materials where 65 professionally developed learning materials were available to download as well as information and links of convenient Web sites available. Actually, expansive learning is manifested primarily as changes in the object of the collective activity that was
also seen in our case. However, unfortunately, in spite of active accesses to our services, users’ reply were quite limited and counted as only 5.2 percent of accesses.

We could imagine that downloadable materials are limited, so users would have some other requests and ideas to a next product. However, they have been silent. Psychosocial situation of users need to be considered. This active download and passive silence are also seen in the voice recording service (see Table 2).

We can postulate that it should declare a substitute path for Thai shown as a yellow box in Figure 9 in order to explain this passive attitude. Preceding study mentioned that ‘provision of the clear path to follow for learning’ is familiar and comfortable approach of Thai people (Gorman & Dorner, 2006). Individualism and avoidance of criticism that were analyzed Thai national character explained observed passive attitude, and preferring low-context communication and material possessions would explain active data acquisition in silence (Prpic & Kanjanapanyakom, 2004).

6.2. Activity System as unit of Analysis

Table 3: Matrix for the Analysis of Expansive Learning

<table>
<thead>
<tr>
<th>Activity system as unit of analysis</th>
<th>Multi-voicedness</th>
<th>Historicity</th>
<th>Contradictions</th>
<th>Expansive cycle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who are learning?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Why do they learn?</td>
<td>Importance of subculture is increased</td>
<td>Increased difference between curricula and actual communication</td>
<td>Contradictions of curricula, use in job but never use in life.</td>
<td></td>
</tr>
<tr>
<td>What do they learn?</td>
<td>Expansive interests: online knotworking through contemporary information</td>
<td>Sub-culture</td>
<td>Contemporary weight of cultural events are varied</td>
<td>Struggle between words in a textbook and words in online</td>
</tr>
<tr>
<td>How do they learn?</td>
<td>Accessing pages of information, need assistance</td>
<td>Sensitive about trend information</td>
<td></td>
<td>Online search standard, get successful sample materials of sub-culture</td>
</tr>
</tbody>
</table>

Engestrom (2001a) proposed following four central questions to examine the change of learning.
1) Who are the subjects of learning, how are they defined and located?
2) Why do they learn, what makes them make the efforts?
3) What do they learn, what are the contents and outcomes of learning?
4) How do they learn, what are the key actions or processes of learning?

Then, we summarized results of our interviews and a questionnaire, and extracted points were summarized in Table 3.

Only 23.3% of users have first or second exam level of Japanese-language, and it can find that they need strong assistances to access cultural information of Japanese-sites. About learning content, 21.9% of users selected communication method, and 9.4% selected culture and 22.9% selected sub-cultural events. Internet is widely used (24.1%) as method of learning more than learning from Japanese native teachers (7.4%). Communication in learning is quite limited. Almost half of users (52.3%) prefer to learn alone without any consultation from others. Only 12.4% of users have a person to discuss about Japanese-language.

To our surprise, 28.0% of users stated that they cannot learn alone, and took a contrary position to their isolationism.

Summarizing gathered data, we could conclude that users are under double bind situation at this moment. They showed extensive interests and active information gathering. However, it needs to intervene more to enhance their active attendances into communication in new area of society.

7. Acknowledgements
This report was conducted under the research project, Grant-in aid for scientific research (C) of JSPS, project number 21520525.
We deeply appreciate technical assistances to develop the online communication service in this study from Mr. Subhasatra Siengdang and Ms. Rassamee Jirathamthanakul of Commission on Higher Education, Thailand.

Abstract: This paper discusses the uses of Apple's Podcasting system as a tool to integrate into teaching and learning, comparing with another competitive tool, Camtasia Relay. The Podcasting system is used to not only deliver online classes but also supervise student teachers in Education and student clinicians in Communication Sciences and Disorders (CSD). Besides, the Podcast system helps students to develop their own portfolio, providing opportunities to review and assess their performance. In delivering on-line classes, the Podcasting system increases students’ understanding by replaying class lectures and thus, getting actively involved in the class. The surveys results with students are presented to support the idea that the Podcasting system is an essential learning tool for students and educators alike.

Introduction

Countless universities, colleges and K-12 classes worldwide are using the Podcasting technology to deliver recorded lectures, news and information to students. As a result the Podcasting system has emerged as an accessible and affordable means of communicating ideas and knowledge to the world with students getting more engaged and interested in class discussions, field research and independent projects that utilize the Podcasting systems.
Podcasts are digital audio files (e.g. MP3 files) that can be played on any portable media player or computer (Foster & Havemann, 2008). Once generated, podcasts can be disseminated online through personal websites or podcast directories. Podcasting, the name for this process, is an amalgamation of "broadcasting" and the acronym "POD". POD stands for "Portable on Demand", and was first used to name Apple Computer's widely successful portable media player, the iPod. Now, usage of the terms "podcast" and “podcasting” can refer to the distribution of any downloadable digital file.

The podcasting system uses Apple’s Podcast Producer, which is a video capture, processing, and publishing system that is shown in Figure 1 (Yoon, Mizuko, & Kim, 2010). Creating and publishing podcasts of lectures, training, or other audio and video projects are automatically processed with the PodCast Capture program on the Mac Computer. The Podcast Library lets the program’s server store podcasts and delivers them to viewers through specific program protocols. ITunes or a web browser like Safari can access the content from the Podcast Library. Once the content is downloaded, it can be viewed on the desktop or devices including iPhone, iPod and Apple TV. The Apple Podcasting system simplifies all the process of capturing, editing, and publishing lectures, producing more podcasts with less work.

![Fig 1. How Podcast Producer works (captured from Podcast Producer v10.6.pdf, p15)](image)

**A Comparison of Podcasting System with Camtasia Relay**

The Camtasia Relay is another podcasting tool competitive to Apple’s Podcasting System. Currently the major difference between Apple’s Podcast Producer 2 and Camtasia Relay is Apple’s Snow Leopard Server’s dual-source video capture feature (Podcast Producer, 2009). This dual-source video capture enables the presenter to create picture-in-picture podcasts. For instance, one video source can record a presenter and the other source can record a slideshow or computer screen activity. The current version of Camtasia Relay is a software-based screen capture system that only records voice and computer screen activity. It can be used to audio record class lectures, software demonstrations, and slideshows, but it lacks the video recording capabilities of the presenter.

**Uses of Podcasting System in Teaching and Learning**
One significant advantage of Podcasting is the ability to automatically distribute podcasts through online subscriptions. Instead of students going to a specific web site and downloading lectures as they are posted, a subscription to the podcasts can be established, thus enabling new lecture materials to be downloaded to the student's computer automatically. This provides students and faculty an easy-to-create but with high quality output of teaching online. As universities move increasingly to hybrid or online teaching, and as faculty expands their online pedagogy skills to incorporate multiple methods of teaching and learning for online students, the podcasting system is a critical tool for faculty to create audio & video podcast for their classes.

Since the Podcasting system has its strength of developing a cutting edge digital learning environment, it is also possible to help student teachers to develop their own teaching portfolio. Supervisors podcast the student teachers’ teaching performance at the classrooms and the student teachers immediately get their teaching podcasts on their portable devices (iPod, iPad, or iPhone) or their own computer. This will enable the student teachers to view their teaching performance and communicate better with the supervisors. Because the Podcasting system has a wiki and a blog, the student teachers can develop components of their own portfolio with videos recorded by their supervisor.

The Department of Communication Sciences and Disorders (CSD) applies the podcasting system to video record student clinicians in their clinical internship experiences working with their clients during speech and language assessment and intervention experiences. The faculty utilizes the video recordings to give feedback to students about their clinical performances. Also, students have an opportunity to self reflect on their clinical skills and identify area of strengths and weakness. Due to the nature of the clinical experiences, the CSD must follow the Health Insurance Portability and Accountability Act (HIPAA) of 1996, which established specific standards and requirements for the electronic transmission of certain health information. As a result of the HIPAA guidelines, video recordings must follow specific requirements for the electronic transmission of certain health information. As a result of HIPAA, the CSD uses the podcasting system for video recordings as it accommodates a secured transmission and storage of the video recordings of clients and students in a clinical setting.

Further, this Podcasting system incorporates the assessment systems. So, not only student teachers but also the online class students can check their learning directly based on the assessment standards and rubrics. This is helpful for the students to improve their learning and decrease their drop rates of online classes.

**Podcasting in Educational Technology class: Working example**

One of the courses of the Educational Technology Certification program, *Advanced Media Production*, has utilized this Podcasting system within a hybrid course format, which combines both traditional in-person lectures and podcasts. This course covers various advanced software program to develop educational online media.

All podcasts were posted on the course podcast library along with corresponding lectures. Students downloaded lectures according to their needs and interest. Fig.2 shows one of the podcasts of the Advanced Media Production lectures.
Fig. 2 Podcast of a lecture of Advanced Media Production class, Flash II Music Button.

After students used the podcasting system in a semester, they were surveyed about their podcasting experience. None of the 22 students who initiated the course had previously used podcasting in a classroom setting. The survey results indicated that most students agreed or strongly agreed that podcasting enhanced their learning experience due to their ability to pause and replay (see Appendix). Although the overall quality of podcasting in classroom was positive among most of the students, there were students who opposed using only podcasting in the class. Due to nature of the one-way communication of the Podcasts, students recommended the podcasting system to be used as an optional media support system to the traditional in-person lecture.

Conclusions

Apple’s Podcasting system has emerged as the next generation course delivery innovation on campus. The effectiveness as a communication tool validates the use of podcasting in the classroom. The results of the survey provide evidence that students actively used this technology to facilitate their learning experience and, more importantly, that they perceive podcasting as an assistive enhancement to their classroom experience. Students like the pause/play features, as this appears to enhance their individual learning needs. As podcasting becomes more familiar to
students and educators, the use of podcasting system is likely to expand, not only for delivering online-courses but also supervising performance and creating portfolio and assessment tools.

What I like most about this class is

I really enjoy viewing the podcasts prior to doing the assignments/ projects. They are very useful and allow for me to go back and view a piece again if I am in need of reiteration of a topic.

I enjoy learning about the neat tools that I can use to teach. The podcasts were very helpful for this class.

What I like most about the podcasts is:
They are well put together and informative.

The podcasts are well organized. I like that Jiyoong starts the podcasts by saying what the tasks being covered are, in order. That enables me to scan through the podcast later if I need to be reminded how to do a particular task.

I really liked the Podcasts. I could watch them on my own time and get a head start or I could rewatch the ones I needed extra help on. I loved being able to do homework at my own pace at home and the podcasts were informative, helpful, and interesting. Thanks!

I like that I could see what was happening. I learn best by following tutorials so this was very helpful.

It was very useful to have seen and heard you through podcast compared to if you were to just have everything online through texts. Being able to see the instructor and hear the directions to how to use the different software made it seem as if we were in class. I would love to learn how to use that software as well maybe to make a video on a tutorial.

I think that podcast movie clips are helpful because you can pause and continue at your own pace. You are able to return to spots to review specific topics. It is nice to have both podcasts and direct presentation from teacher so questions can be asked if something is unclear.

step by step instructions

I can do them whenever I want. Don't have to be in the classroom to watch and respond to them.

I have had a great deal of trouble deciding on whether or not I have found the Podcasting to be beneficial. In some aspects it was helpful because we could go back and review the lesson after viewing it. We could also watch it at our speed because of stop and pause buttons. However, I struggled a little bit with strictly podcasted lessons. There were times when I would have liked to ask questions or have other examples shown but was unable to do so. Overall, I believe podcasting is excellent in addition to a regular lesson. I think it is good to have something for students to go back and watch at a different time. In regards to teaching elementary aged children I would be opposed to the sole use of podcasts. This method would limit student creativity and interaction with other students. I do however I appreciate being introduced to this type of learning, thank you.

It was nice to be able to view them whenever I wanted, and to look over how to do stuff again. It worked out well, and I really appreciate the effort you went through to enable us to get all the materials.
I liked the podcasting for the days when we actually had class because it gave me a chance to review concepts or ideas I might have missed. I think it’s useful and if you’ve got to teach the class you should podcast it anyway so people can review!

The podcasts were a cool new way to learn. It was nice to be able to go back to a part of the podcast that I needed to review to fully understand. Also because we did learn so much and there was a lot of information it was good to have the capability to go back to review a certain topic.

Personally I think being in the classroom with the teacher is the easiest way to learn, but having the podcasts as well as being in the classroom I think would be greatly beneficial to students. Like you said for the days were in the class you created the podcasts of our class for us to review if we needed after class while working on our projects. This was very helpful for myself and for those students you didn’t attend class or take a little longer to understand a topic.

I really appreciated you taking the time to organize and plan these video clips for our class. The way you broke down the steps was great and you explained each concept clearly. The podcasts allowed me to work at my own speed, which made me feel confident with the software/programming. I liked having the videos available for reference and extra practice.

Podcasting helped me greatly as the technical details might sometimes slip by me. Having the lessons recorded let me go back and check things. It also let me work on things on my own time, whether it is 6am or 3pm, etc.

The podcast movies were a great addition to the class. You were very thorough with how to access the software or how to download it. I think it would’ve been more helpful to work with you directly in class, then have the podcasts to refer back to after class time. I do think however, not having you in class forced us to conduct more trial and error by ourselves.

I think that the podcasts can be improved by:

1: They are one-way. If I didn't understand something I listened again but the information is the same and not having that instant communication via classroom interaction was hard for me.

2: If there were a feature to chapter podcasts so that a viewer could skip to a subtopic quickly, that would be ideal.

3: Being shorter.
AN EXAMINATION OF TEACHER PERCEPTIONS OF TRAINING METHODOLOGY
AND MATRICULATION AS RELATED TO SYSTEMIC TECHNOLOGY REFORM: A
CASE STUDY OF MISSOURI VETERAN EMINTS TEACHERS

A Dissertation

CHAPTER ONE
INTRODUCTION TO THE STUDY

Background

Technology use finds itself woven into the forefront of educational discourse making it relatively easy to forget computer use in education is a reasonably new phenomenon that has evolved to widespread use only within the last 20 years. During the school years of 1997-1998 and 1998-1999 MOREnet obtained funding from Southwestern Bell to initiate the Multimedia Interactive Networked Technologies (MINTs) Project in St. Louis, Missouri, schools. The MINTs project provided a high-speed internet connection to the classroom and placed technology on the teacher’s and students’ desks while attempting to determine whether eliminating the technology barriers traditionally experienced by schools could change teaching styles and strategies and improve student performance. There were six St. Louis County school districts involved in the MINTs project: Affton, Bayless, Jennings, Normandy, Riverview Gardens, and University City. The MINTs collaborative program brought together advanced communications and the traditional classroom environment to create an interactive learning experience. The program has served hundreds of students in six school districts and received a Smithsonian Award as one of the nation’s leading programs in demonstrating the links between technology and education.

Test scores in the MINTs classrooms improved, but even more importantly, attitudes and styles of teaching and learning changed also. The technology encouraged a new way of educating students— a way that engages them in their education by making resources available in a learning environment that fosters cooperation, collaboration, problem solving, and higher order thinking skills. The connections to parents were also strengthened as parents showed more
interest in the positive stories their children were bringing home. The preliminary results of this program were so successful it prompted the Commissioner of Education to launch a statewide initiative and change the way Missouri is thinking about educating its K-12 students. This new initiative is the enhancing Missouri’s Instructional Networked Teaching Strategies (eMINTS) Project.

The National eMINTS program partners with the Missouri Department of Elementary and Secondary Education (MO DESE), the Missouri Department of Higher Education (MO DHE), and the University of Missouri to provide technology enriched professional development services in the PreK-20 classrooms nationwide. eMINTS classrooms include high levels of technology for students and teachers with each teacher receiving 90–200 hours contact hours of professional development training. The average cost for inventory per classroom is between $9,000 and $37,000 depending on grade level. Each eMINTS classroom hosts at least one computer for every two students at grades 3-12; a teacher laptop computer; a SMART Board (interactive whiteboard) and projector; a printer, camera, and scanner; and productivity and multimedia project software (Beglau, 2009).

Currently, there are 3, 500 eMINTS classrooms with approximately 50,000 Missouri students in 260 of Missouri’s 524 districts. Of these classrooms, 35% are district-funded. On the post-secondary level, Lincoln University and Missouri State University are incorporating eMINTS into pre-service teacher education. Although Missouri was first state for eMINTS classrooms, there are now more than 250 eMINTS classrooms present in 80 districts in 8 states including Alabama, Arkansas, Delaware, Illinois, Maine, Nevada, New Jersey and Utah as well as in 4 regions in New South Wales, Australia (Beglau, 2009).
While several studies demonstrate the effectiveness of the eMINTS instructional methodology on student success, no research exists to determine veteran eMINTs teachers’ perceptions of training methodology and leadership matriculation as related to systemic technology reform. This study will examine the survey responses of 15 veteran eMINTS teachers and 15 of their non-eMINTS colleagues to determine if common threads for leadership advancement may occur from the training process utilized in the program.

Conceptual Underpinnings for the Study

Over the last 25 years, a substantive body of knowledge has emerged expressing the need for professional education programs to develop in teachers the technical knowledge and skills required for professional practice (Woolf & Quinn, 2009). A dilemma academia has not addressed is educators who did not seek a career in education for a strong love of technology or a propensity for adapting to rapid change; “yet they now find themselves facing…the inexorable advance of technology into their personal and professional lives” (Skiba, 2007, p. 343). The risk of teacher burnout exists when low decision authority and high demands are synergistic in terms of increasing the risk of emotional exhaustion among teachers (Santavirta, Solovieva, & Theorell, 2007).

A large body of research shows the development of teacher autonomy may offset the chance of teacher burnout and may even catapult teachers into leadership positions. A major aspect of leadership is teaching others to lead. Technology instruction may provide teachers with the tools they need become leaders themselves. This development of leadership can strengthen the organization of a school. In this way, a principal can directly affect classroom practices and align them with the school’s mission of improvement (Zepeda, 2004). Instructional leaders support teachers in curriculum development and provide opportunities for teachers to shape the
cultures of their schools (Zepeda, 2004). Teachers may then contribute to a number of aspects of running a school including developing curriculum, choosing materials, evaluating performance, building the budget, and setting policy and practices for hiring, promotion, and retention (Suh, 2008).

With the criteria of *No Child Left Behind* (NCLB), the abundance of research has focused primarily on student success rather than examining teacher satisfaction. Such is the case with existing research of the eMINTS professional development program which examines student achievement as related to program fidelity. Historical eMINTS program evaluation research results provide reasonable assurance that differences in eMINTS student performance vs. non-eMINTS student performance were due to changes in instruction created by eMINTS professional development and technology rather than to other factors such as socioeconomic status or student placement (Beglau, 2009).

“Although researchers have demonstrated a link between teachers autonomy and teacher motivation” related to education reform initiatives (Pearson & Moomaw, 2006, p. 44), no current research exists regarding teacher self-efficacy or advancement to leadership as a result of the eMINTS training methodology. It would seem a closer examination is in order to determine how eMINTS training structures and activities correlate with teacher expectations, strategies, and matriculation.

For those teachers who do not matriculate, the Maslach Burnout Inventory-Educators Survey (MBI-ES) may reveal individual teacher characteristics which support the effects of job-related stress or teacher burnout. Burnout is a psychological syndrome of emotional exhaustion, depersonalization, and reduced personal accomplishment that can occur among individuals who work with other people in some capacity. A key aspect of the burnout syndrome is increased
feelings of emotional exhaustion; as emotional resources are depleted, workers feel they are no longer able to give of themselves at a psychological level. Another aspect of the burnout syndrome is the development of depersonalization (i.e., negative, cynical attitudes and feelings about one's clients). The development of depersonalization appears to be related to the experience of emotional exhaustion, and so these two aspects of burnout should be correlated. A third aspect of the burnout syndrome, reduced personal accomplishment, refers to the tendency to evaluate oneself negatively, particularly with regard to one's work with clients. Workers may feel unhappy about themselves and dissatisfied with their accomplishments on the job. The consequences of burnout are potentially very serious for workers, their clients, and the larger institutions in which they interact.

The MBI is designed to assess the three components of the burnout syndrome: emotional exhaustion, depersonalization, and reduced personal accomplishment. There are 22 items, which are divided into three subscales. The general term recipients is used in the items to refer to the particular people for whom the respondent provides service, care, or treatment. The items are written in the form of statements about personal feelings or attitudes (e.g., "I feel burned out from my work," "I don't really care what happens to some recipients"). The items are answered in terms of the frequency with which the respondent experiences these feelings, on a 7-point, fully anchored scale (ranging from 0, "never" to 6, "every day"). Because such a response format is least similar to the typical format used in other self-report measures of attitudes and feelings, spurious correlations with other measures (due to similarities of response formats) should be minimized. Furthermore, the explicit anchoring of all 7 points on the frequency dimension creates a more standardized response scale, so that the researcher can be fairly certain about the meanings assumed by respondents for each scale value. In the original version of the MBI
(Maslach & Jackson, 1981a), there was also a response scale for intensity of feeling. However, because of the redundancy between the frequency and intensity ratings, the intensity scale was deleted from subsequent editions.

The nine items in the Emotional Exhaustion subscale assess feelings of being emotionally overextended and exhausted by one's work. The five items in the Depersonalization subscale measure an unfeeling and impersonal response toward recipients of one's service, care, treatment, or instruction. For both the Emotional Exhaustion and Depersonalization subscales, higher mean scores correspond to higher degrees of experienced burnout. Because some of the component items on each subscale had low loadings on the other, exists a moderate correlation between the two subscales, which is in accord with theoretical expectations that these are separate, but related, aspects of burnout. The eight items in the Personal Accomplishment subscale assess feelings of competence and successful achievement in one's work with people. In contrast to the other two subscales, lower mean scores on this subscale correspond to higher degrees of experienced burnout. The Personal Accomplishment subscale is independent of the other subscales, and its component items do not load negatively on them. In other words, Personal Accomplishment cannot be assumed to be the opposite of Emotional Exhaustion or Depersonalization. Indeed, the correlations between the Personal Accomplishment subscale and the other subscales are low.

Each respondent's test form is scored by using a scoring key that contains directions for scoring each subscale. The scores for each subscale are considered separately and are not combined into a single, total score; thus, three scores are computed for each respondent. If desired for individual feedback, each score can then be coded as low, average or high by using the numerical cutoff points listed on the scoring key (Maslach & Jackson, 1981).
Statement of the Problem

The National eMINTS (enhancing Missouri’s Instructional Networked Teaching Strategies) Center grants a professional development program to empower educators to use instructional strategies driven by technology (Beglau, 2007). A large number of the veteran eMINTS teachers who have successfully completed the training eventually leave the eMINTS classroom. Currently, no research exists which examines the long-term professional outcome for classroom teachers who participate in the systemic technological training reform of the National eMINTS Program.

Our inability to support high-quality teaching in many of our schools is driven not by too few teachers coming in, but by too many going out, that is, by a staggering teacher turnover and attrition rate. In general, the turnover rate among teachers is significantly higher than for other occupations (Ingersoll, 2002). Current research reveals the effects of work stress and burnout disrupt teachers’ normal habits. In addition, teachers may experience a lack of work enthusiasm and creativity, an inability to concentrate, lowered self-respect, loss of self-control in class, and an overreaction to moderate amounts of stress. Where schools are concerned, the biggest problems caused by work stress and burnout are the undesirable influences on the students (Yong & Yue, 2007). It is imperative for both professional development providers and those they serve to use research to examine dissatisfactions with the teaching profession and to use these findings to form policy and influence change which leads to quality instruction, leadership, and teacher retention.

Purpose for the Study

The purpose of this study is to investigate veteran eMINTS teacher’s perceived value of the eMINTS instructional model of design. The study will explore if a correlation exists between
veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the demands associated with training for and maintenance of instruction in the technology enhanced classroom.

**Research Questions**

Within the context of this study, the following research questions were addressed:

1. Is there a significant difference between the time veteran eMINTS teachers continue to teach in the same content area and grade level after completion of the eMINTS Professional Development Program and the time their non-eMINTS colleagues continue to teach in the same content area and grade level?

2. Are there significant differences between how veteran eMINTS teachers rate satisfaction in teaching after completion of the eMINTS training model and how their non-eMINTS colleagues rate satisfaction in teaching?

3. Are there significant similarities between how veteran eMINTS teachers score the Maslach Subscale Items of Emotional Exhaustion, Depersonalization, or Personal Accomplishment and how their non-eMINTS colleagues rate these subscale items?

4. Are there significant differences in the number of eMINTS teachers who assume leadership positions after completing the eMINTS National training Program and the number of non-eMINTS colleagues who assume leadership positions?

5. Are there similarities among perceptions held by veteran eMINTS teachers in relation to the eMINTS training methodology?
Limitations, Assumptions, and Design Controls

1. The eMINTS instructional techniques used to train veteran eMINTS participants may be different than techniques used to train current eMINTS teachers.

2. The questionnaire was a self-report by FY00, FY01, and FY02 veteran eMINTS participants and their non-eMINTS colleagues and does not include reporting from years FY03-FY10.

3. The study was geographically limited to Missouri.

4. There is no data to determine whether the locus of control of participants may have contributed to decisions toward leadership versus teacher burnout.

Definitions of Key Terms

Cohort. A cohort is a group of subjects who have shared a particular experience during a particular time. A team cohort can be used where membership of a group is defined by some factor other than a time-based one.

Deep acting. Deep acting describes the activity that is undertaken to actually feel an emotion that is thought to be required and may lead to Emotional Exhaustion, an item from the subscale of the Maslach Burnout Inventory (Näring, Briët, & Brouwers, 2006).

Depersonalization. Depersonalization (or depersonalisation) is a malfunction or anomaly of the mechanism by which an individual has self awareness. It is a feeling of watching oneself act, while having no control over a situation and one item of the subscale for the Maslach Burnout Inventory (Maslach, Jackson, & Leiter, 1996).

eMINTS. The National eMINTS (enhancing Missouri’s Instructional Networked Teaching Strategies) stemmed from the MINTs program and now partners the Missouri Department of Elementary and Secondary Education (MO DESE), the Missouri Department of Higher
Education (MO DHE), and the University of Missouri to provide technology enriched professional development services in the PreK-20 classrooms nationwide.

*eMINTS Professional Development Programs.* The eMINTS professional development programs are designed to help teachers learn how to integrate technology into their teaching, using instructional strategies that promote inquiry-based learning and encourage collaboration and community building among students and teachers. The eMINTS programs considered in this evaluation include: (1) eMINTS Comprehensive Professional Development (Comp PD), a two-year program consisting of approximately 250 hours of teacher professional development and support, for teachers in school-designated grades, including 10–12 classroom visits each year; (2) eMINTS4ALL, a two-year, 90-hour professional development program built for teachers in the grades above and below eMINTS Comp PD teachers, to support students for multiple years, including 8–9 classroom visits per year; and (3) Professional Development for Educational Technology Specialists (PD4ETS), a two-year program that prepares local district staff members to become eMINTS instructional specialists.

*Emotional consonance.* Emotional consonance captures the situation where somebody effortlessly feels the emotion that is required in a certain situation. Emotional consonance is a side effect of emotional exhaustion which is one item of the subscale for the Maslach Burnout Inventory (Näring, Briët, & Brouwers, 2006).

*Emotional exhaustion.* Emotional exhaustion is characterized by symptoms of physical and emotional depletion and one item of the subscale for the Maslach Burnout Inventory (Maslach, et al., 1996).

*Epistemology.* Epistemology or theory of knowledge is the branch of philosophy concerned with the nature and scope of knowledge. It addresses the questions: What is
knowledge? How is knowledge acquired? What do people know? How do we know what we know? Higher forms of cognitive success may involve epistemological features that cannot be evaluated from a belief view of knowledge but may reveal leadership tendencies.

*FY00, FY01, and FY02.* eMINTS participating districts are grouped according to the fiscal year their competitive application was accepted to participate in the eMINTS program. FY00 refers to the school year 1999-2000. FY01 refers to the school year 2000-2001. FY02 refers to the school year 2001-2002.

*Job Demand-Control-Support Model (JDCS).* The Job Demand-Control-Support Model is an occupational stress assessment used to determine the correlation between job related demands, control, and support on employee health and well-being outcomes. It is another model which may be used to determine burnout tendencies and is often used in conjunction with the Maslach Burnout Inventory (Van der Doef & Maes, 2002).

*Job demands.* Job demands refers to the psychological demands of a job, such as work load and role conflict (Van der Doef & Maes, 2002).

*Job control.* Job control refers to the amount of decision latitude the employee has in order to deal with these demands (Van der Doef & Maes, 2002).

*Leadership advancement.* Leadership advancement refers to transfer of either a veteran eMINTS teacher or non-eMINTS colleague from the grade level classroom into a Leadership Position.

*Leadership positions.* Leadership positions refers to district, building, or public leadership positions. District leadership would include district instructional coaching; directors of curriculum, federal programs, grant writing, public relations, and technology; fiscal officers; superintendents and assistant superintendents. Building level leaders refer to principals, assistant
principals, counselors, and building level instructional coaches or technology specialists. Public leadership refers to bureaucratic leaders such as local and state legislators; leaders of teacher advocacy organizations; juvenile justice officers; and city or state human services departments (Fowler, 2009).

*Locus of Control.* Locus of control is a term in psychology which refers to a person's belief about what causes the good or bad results in his or her life, either in general or in a specific area such as health or academics. Those with a high internal locus of control have better control of their behavior, tend to exhibit more political behaviors, and are more likely to attempt to influence other people than those with a high external locus of control; they are more likely to assume their efforts will be successful. They are more active in seeking information and knowledge concerning their situation. There is often a correlation with a high locus of control and leadership advancement (Rotter, 1966).

*Matriculation.* Matriculation refers to advancement or admission into a leadership position.

*MINTS.* In 1997, Southwestern Bell and the Missouri Research and Education Network (MOREnet) began the Multi-Media Interactive Network Technology Schools (MINTS) in St. Louis, Missouri, schools. The MINTs collaborative program brings together advanced communications and the traditional classroom environment to create an interactive learning experience.

*MOREnet.* The Missouri Research and Education Network (MOREnet) provides Internet connectivity, access to Internet2, technical support, videoconferencing services and training to Missouri's K-12 schools, colleges and universities, public libraries, health care, state government, and other affiliated organizations.
Established in 1991, MOREnet operates as a unit within the University of Missouri and is based in Columbia, Missouri. The MOREnet network is the foundation infrastructure. Members of the education community interact with each other via data and video services; public sector business applications are built and conducted on it; and Missouri citizens interact with their state government through it.

*No Child Left Behind (NCLB).* The Elementary and Secondary Education Act (ESEA), reauthorized as the *No Child Left Behind Act of 2002*, is the main federal law affecting education from kindergarten through high school. ESEA is built on four principles: accountability for results, more choices for parents, greater local control and flexibility, and an emphasis on doing what works based on scientific research (U.S. Government, 2009).

*Non-eMINTS colleagues.* Grade level equivalent colleagues who taught parallel in the same school, grade level, and content area(s) of veteran eMINTS teachers during the veteran teacher’s training and instructional duration in the eMINTS classroom.

*Ontology.* Ontology is the philosophical study of the nature of being, existence or reality in general, as well as the basic categories of being and their relations. Ontological assumptions concern on the nature of the world and human being in social contexts. Therefore, ontology in normative emphasis that social phenomenon is independent from other factors. Leadership ontology—leaders, followers, and shared goals—is useful for understanding the development of leadership direction, alignment, and commitment.

*Personal accomplishment.* Personal accomplishment describes feelings of competence in one’s job. Those with a feeling of personal accomplishment are less likely to suffer from teacher burn-out (Maslach, et al., 1996).
Satisfaction. Satisfaction with teaching is defined as satisfaction with past and present accomplishments; it explicitly assesses an individual's expectations of continued effectiveness at work.

Surface acting. Hochschild introduced the term surface acting to refer to the display of the characteristics of an emotion that are regarded as appropriate but are not actually felt. Continued surface acting may cause teacher burnout (Näring, et al., 2006).

Teacher Autonomy. If teachers are to be empowered and regarded as professionals, then, like other professionals, they must have the freedom to prescribe the best treatment for their students (as doctors and lawyers do for their patients and clients). Those who do not receive autonomy may become dissatisfied with their position and suffer from teacher burnout (Yong & Yue, 2007).

Teacher Burnout. Maslach maintains burnout is manifested in three ways: emotional exhaustion, alienation, and lack of sense of achievement. Emotional exhaustion refers to the absence of enthusiasm for work and is manifested as fatigue, irritability, and depletion of enthusiasm. Alienation is treating people at work with indifference and without human kindness. Lack of sense of achievement means dissatisfaction with one’s performance and is seen when teachers feel their efforts do not bring changes in students, or they do not receive the expected compensation or recognition. Work stress and burnout have negative effects on the individual and the organization (Yong & Yue, 2007).

Veteran eMINTS teachers. Veteran eMINTS teachers refers to teachers who have completed the eMINTS professional development training.
Summary

Thus far, this chapter has focused on the background and conceptual underpinnings of this study, a problem statement guiding the study, an explanation of the purpose of the study, a statement of research questions pertinent to the investigation, the primary investigator’s research hypotheses concerning these questions, the limitations of this study, and definitions of key terms used in this study. The focus of Chapter Two is on the vast body of literature dealing with technology reform in education, the National eMINTS Program, teacher burnout, and current research related to the teacher as leader.
CHAPTER 2

REVIEW OF LITERATURE

Introduction

This study is designed to investigate veteran eMINTS teacher’s perceived value of the eMINTS instructional model of design. The study will explore if a correlation exists between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the demands associated with training for and maintenance of instruction in the technology enhanced classroom.

Traditional teacher education programs are turning to non-traditional approaches to preservice teacher preparation as they struggle to keep up with increasing demand for teachers. One significant challenge is the rapid evolution of methods and pedagogy involved in meaningful integration of multimedia and technology in instruction while providing realistic situations within non-traditional teacher preparation courses that ground students’ theoretical learning. The eMINTS professional development model provides a multimedia-based, case-method alternative for developing teachers’ abilities to connect theoretical knowledge learned in classrooms with real-life teaching and learning scenarios each is likely to encounter in schools. Technology based teacher preparation helps teachers tie theoretical knowledge to practical situations and provides a realistic foundation from which to begin exploration of deeper issues and possible actions as educators. Existing literature documents this instructional evolution, provides sound evidence of purposeful training methods, warns of tendencies which may lead to teacher burnout, or reveals indicators for matriculation to leadership.
Technology Reform in Education

Traditional Preparation. Even as technology use and application rapidly advances, many of the issues related to technology use remain remarkably constant. “These include properly trained staff, adequate equipment, ongoing funding, and successful integration of technology in order to maximize learning. Effectively meeting such challenges can magnify the advantages of incorporating technology while diminishing the disadvantages” (Al-Bataineh & Brooks, 2003, p. 473).

Just as there is no one way to help students learn to read, there is no single approach for selection of technology resources and strategies. All instruction, including choice of technologies, needs to be modified to meet the readiness levels, learning preferences, and interests of a diverse student population. Having a wide range of technology tools allows teachers to adjust instructional strategies to fit the needs of the students and support multiple ways of teaching (Hemphill, 2009). For years, the lecture method was considered the gold standard for teaching, but faculties are now faced with demands from administrators, colleagues, and students to use other, technology-driven teaching techniques (Skiba, 2007).

The shift from traditional instructional roles presents the following exploration: How might technology impact teacher preparation? The need to recruit, prepare, and find a quality teaching force in today's schools is well documented in the literature, especially in critical shortage areas such as special education. Although teacher preparation programs and alternative certification programs are available, most of these programs rely on traditional methods of preparing teachers to work in today's classrooms. These methods include “college courses, field experiences, and some type of culminating student teaching” (Dieker, Hynes, Hughes, & Smith, 2008, p. 4).
There is a deep crevice between the expectations of students in today's schools and those who teach this generation of learners. In a study which examined the implications of technology on special and regular education classrooms, Dieker, et al. (2008) conjecture that “there may be an even wider gap between higher-education professionals who are preparing these future teachers to serve Generation M students” (p. 1).

The limited discourse in the traditional classroom contradicts research by Nonaka and Takeuchi (1995) who point out the imperatives of student collaboration. Cooperative engagement allows extracts from the tacit knowledge held in the brain of one individual to be made explicit before they can be incorporated into the tacit knowledge residing in the brain of another. Tacit knowledge can be made explicit simply through verbalization within dialogue making verbal discourse central to the learning process. Social communication within the classroom provides an opportunity for an individual’s skills and ideas to be exposed to teacher guidance or peer collaboration; the ‘wiser others’ according to Vygotsky (1978, as cited by Haldane, 2007, p. 259). The questions posed or suggestions offered by learners involved in the social discourse help them and the other learners who are listening to construct new concepts and ideas according to their past and current knowledge.

Additional recommendations about education reform reflect new conceptions of teaching and learning that assign primary importance to the way students attempt to make sense of what they are learning rather than to how teachers should deliver information. This current view, referred as constructivism in literature, depicts students as “actively constructing their knowledge by working on authentic tasks in which they must apply and represent ideas” (Karaman & Celik, 2008, p. 203).
Based on the constructivist view, many strategies are infused in teaching and learning in various educational contexts to improve instruction. In turn, student learning is inherently valuable because it is connected to individual experiences. Project Based Learning (PBL), Problem Based Learning, Inquiry Based Learning (IBL) and Cooperative Learning are the most basic strategies among constructivism. PBL is a model which centers learning on projects where learners decide how to approach a problem and what activities to pursue. They gather information from a variety of sources and synthesize or analyze using real skills, collaboration, and reflection. In the end, students demonstrate their newly acquired knowledge and are assessed by how much they have learned and how well they communicate it. Throughout this process, the teacher’s role is to guide and advise rather than direct and manage student’s work (Karaman & Celik, 2008, p. 204).

PBL increases motivation to study. Students know they share the responsibility for the learning process. Frank, Lavy, and Elata (2003) state, “this approach helps to develop long-term learning ability, allows them to acquire knowledge, skills, and personal and interpersonal abilities” (p. 283). By doing project, students acquire knowledge, both interdisciplinary and multidisciplinary. PBL can motivate students by engaging them in their own learning, allowing them to pursue their own interests and questions, and to making decisions about the process. PBL provides opportunities for interdisciplinary learning. PBL helps establish connections to life outside the classroom, addresses real-world concerns, and develops real world skills (especially those valued by employers). PBL provides unique opportunities for teachers to build relationships with students, since the teacher is coach, facilitator, and co-learner. PBL provides opportunities to build relationships with the larger community (Karaman & Celik, 2008, pp. 210-211).
In the 1999 publication, *Instructional Media and Technologies for Learning*, Heinrich, Molenda, Russell, and Smaldino (as cited by Hemphill, 2009), describe a process in which teachers may design and develop the most appropriate learning environment for their students. The ASSURE model continues as a popular guide for planning and implementing technology-rich lessons in the classroom. The ASSURE model covers the following lesson planning steps: (1) analyze learners; (2) state objectives; (3) select methods, media, and materials; (4) utilize media and materials; (5) require learner participation; and (6) evaluate and revise the plan. Using a systematic approach like the ASSURE model assists teachers to ensure proper planning and implementation of the most effective and appropriate use of technology to accommodate all students.

Overall, teachers need added support during their induction year, and they cite classroom management as the primary area in which they need support. Developing ways to further teachers' classroom management skills allows an increased focus on teaching and learning (Dieker, et al., 2008).

*Evolution of Methods.* As we anticipate the future of technology use in education, it is helpful to understand how its applications have evolved. Researchers in conjunction with a grant from the U.S. Department of Education have evaluated three stages of technology implementation. Each stage is examined to validate evidence of positive learning effects and to evaluate its potential impact on current technology decisions related to student learning. It should be noted these stages overlap and simultaneously continue to valuably function when properly used in educational settings. These findings, along with related research, give us a better understanding of lessons learned about best practices for technology integration (Al-Bataineh & Brooks, 2003).
The first phase, classified as print automation, dominated the 1980s. The Apple IIe computers used in our local school district were representative of those commonly used. In this stage, computers were often unused, sitting idly as a wasted resource. Lack of technical knowledge on the part of the teacher and difficulty in designing instruction for a single student in a classroom of many were the most noted reasons for lack of integration. In retrospect, these challenges make sense in light of the fact the print automation technology phase was notable for its emphasis on individualized self-contained lessons. It was logistically challenging to separate one student while the others received instruction in a traditional manner. As teachers’ roles were often relegated to allocating time to send students to a computer lab for drill and practice or electronic tutorials, it is not remarkable that many teachers found lab time sufficient and disregarded the computer that sat in the classroom corner.

Thus, even when early efforts were made to expose students to technology, actual usage per student was minimal. A result of this was an obvious disparity in the level of technical experience by students who received opportunities at home compared to the majority who did not. When one considers that even as late as 1998, over half of teachers had Internet access at home, lack of technical expertise was widespread. Often computer aides, known as specialists, were hired to demonstrate software programs in the classroom and to assist students in the makeshift computer labs. The computer specialist was frequently one of the only staff members who had technical knowledge and often faced resistance from educators reluctant to implement changes. It was not unheard of for a student’s knowledge base of technology to exceed the staff’s especially if the student had access to a home computer. Often the focus was on simply learning the basics of how to utilize the hardware such as turning on monitors and central processing units, loading software, and controlling input with a mouse. These basic techniques had to be
mastered before the learning of software applications could occur. Much of instructional time was taken in the logistics of the hardware. However, these basic computer skills laid the foundation of technical knowledge needed as technology implementation transitioned to the second phase of computer usage in education. Furthermore, and more importantly, research upheld that school-based computer applications resulted in an improvement in the attitudes of students toward school and subject matter.

Clearly, access to state-of-the-art technology alone does not enhance learning. The role of the teacher is pivotal. Staff expertise must go far beyond the basics of understanding the hardware and software. Knowledge needed includes types and purposes of software and appropriate uses of productivity tools by adopting a more learner-centered approach.

Successful integration of technology requires effective uses of learning theories and content-specific approaches to curriculum development. According to Valdez (2005), the second phase of technology use in education can be characterized as a shift to a focus on learner-centered practices that dominated the learning environments of the early to mid-1990s. These practices include cooperative efforts and the creation of products for public perusal, commonly known as multimedia applications. The advantages notable from this type of computer use are still central to the current learning environment. Students can use technology to access and evaluate large volumes of information to solve complex problems.

It is worthy to note that perhaps the greatest challenge in the current era of technology use is moving beyond simply increasing availability of technology. Teachers will need varied opportunities and training to increase their professional skills in order to achieve the use of technology to restructure schools or to teach higher order thinking. Currently, this third phase places a focus on data-driven virtual learning, according to Valdez (2005).
Current challenges in education are reflected as internet usage increases, promoting teachers to use technology to move to higher order thinking applications and the adaption of technology to meet the demands of the standards movement. In planning, districts must allow for how they will fund updates and provide ongoing staff training to make effective use of the technology available. Although leasing hardware is an option to consider, one must weigh the package proposal to ensure it includes operating system upgrades, software upgrades, and data transferability from the old technology to the new. While being able to provide up to date hardware is an ongoing challenge faced by schools, educators must not rely strictly on state-of-the-art technology as the means to promote effective teaching and learning strategies. This moving target of the latest and best quickly becomes obsolete by today’s standards.

In technology integration, as with almost any successfully implemented curriculum innovation, the catalyst for accomplishment remains the teacher. The newest challenge is to use technology to individualize instruction to help students meet standards. Teachers should consider using technology to adjust content to students’ individual learning styles to achieve this goal. A meta-summary verified students put more effort in tasks that incorporate technology. Properly implemented technology use offers schools an opportunity to transform the learning environment helping students to meet standards as a result.

For technology integration to be effective in the classroom, the following guidelines may be summarized from the three phases of technology evolution. Teachers must receive adequate ongoing training, technology use must be matched to the curriculum’s philosophy and theory of learning, and adequate numbers of computers must be conveniently located within the classroom. As McNabb (2005) notes, computers improve learning when there is “alignment of curricular goals and technology uses and assessment measures that capture evidence that learning has
"occurred’’ (p. 52). Addressing these challenges should enable schools to transition into a new phase of technology innovation (Al-Bataineh & Brooks, 2003).

Evolution of Pedagogy. Technology integration has served as an evolutionary agent in the roles of both teaching and learning (Adcock, 2008). This evolution in pedagogy has extended to the university level where the role of teacher educators has changed as well. Therefore, an important emphasis of many teacher education programs is to prepare teacher candidates to infuse technology into teaching. Technology education in elementary school programs has the potential for being used as a means of more effectively implementing the existing curricula as well as to prepare today's youth for tomorrow's world. To facilitate such implementation, tomorrow's teachers must be knowledgeable about such possibilities and the processes involved (Wentz & Wentz, 1995).

One catalyst for technology-assisted pedagogy depends on the teacher educator’s understanding of the value technology can contribute to the learning environment (Hughes, 2005). After all, Salomon (1979 as cited in Haldane, 2009) reminds us when considering the affordances of different media, that a medium in itself cannot influence learning; it is the attributes of a medium that can help to develop cognitive processes unique to that medium. He suggests there are three key attributes that characterize a medium: (1) its technology, (2) its symbol systems, and (3) its processing capabilities. From his research it can be derived, the effective use of a stable medium and the deliberative and reflective processes afforded by that medium would appear to aid the creation of the cognitive keys that help to structure the learning process and seem to be inextricably bound to the cognitive pace of the learner. Interactive technologies provide teachers with a number of opportunities to capitalize on periods of cognitive interaction in order to reinforce or scaffold student learning (Haldane, 2009).
The development of numerous assistive technology devices increases the potential for technology to level the playing field for students with disabilities (Dieker, et al., 2008). With evolving standards, many other new technological advances will be available for day-to-day use and should be a part of students’ daily school experience.

For an effective pedagogical shift, training in skills such as team building, problem solving, and critical thinking should be provided by districts to enhance teachers’ capacities in the current classroom functions (Hambright & Franco, 2008). Many times the tipping point of a small event, such as the introduction of a technology integrated instructional strategy, that makes a big impact is more accurately described as the “context” or “stickiness”. A desirable characteristic of a program’s context becomes “stuck” in the teacher’s perception and contributes to the program’s success. Buy-in or “stickiness” for new approaches may be linked to the choices of delivery of instruction (p. 270).

For this reason, cohort training is an effective way to scaffold new technology rich instructional strategies. Cohort delivery of content strengthens relationships among participants over time, especially when the cohort remains relatively intact throughout the program’s duration. The majority of cohorts complete their program of study intact; thus, attrition is low. Student satisfaction surveys indicate the cohort model is an important “stickiness” factor contributing to completion of educational programs (Hambright & Franco, 2008, p. 270).

While recruiting and retaining high-quality teachers is a practice a district can begin immediately, enhancing the pedagogical skills of teachers probably occurs over time. Marzano and Waters (2009) believe “it takes a considerable amount of time to develop a district in which enhancement of pedagogical skills occurs systematically and comprehensively” (p. 57).
Reconciling Beliefs and Practices. Individual teacher can have a profound influence on student learning even in schools that are relatively ineffective. Great teachers, not only employ research-based instructional strategies, but they also understand their purposes and use them intentionally (Marzano, Pickering, & Pollock, 2001).

Meaningful learning is a process in which new information converges on previous knowledge structures. Jonassen (1995, as cited by Lofström & Nevgi, 2007) has further elaborated Ausubel’s ideas by basing his model of meaningful learning on learning theory with a social constructivist perspective. Constructive integration of thinking, emotions and action leading to empowerment, and commitment and responsibility constitute the core of the concept of meaningful learning. Research supports grounding the basis for quality education in a constructivist view in which learners are considered to be active processors of information. Experiences of relevance and meaningfulness are central facilitators of learning. In this context, meaningful learning entails learner activity and intentionality, application of constructivist principles, collaboration, dialogue, reflection, connection to context, and transferability of knowledge (Lofström & Nevgi, 2007).

In this age of standards-based curricula and rigid accountability, one factor for student success is instruction that promotes academic and social accomplishment based on varied learning needs. With the current generational gap related to technologies, many teachers and policymakers do not readily understand how these new tools can equalize student learning opportunities and outcomes (Dieker, et al., 2008).

The Center for Teaching Quality, with support from the National Education Association, explored which working conditions matter to teachers most and how policy makers and practitioners can improve working conditions in a way that will enhance teacher and student
success (Berry, Wade, & Trantham, 2008). From the data it was found, time demands outside the work day appear to influence teacher attrition. This dissatisfaction is concerning as many professional development requirements occur beyond the normal work day. This calls for continued data purveyance of teacher perspectives to guide changes in curriculum and instruction.

Summary

Although technology is prevalent in classrooms, many teachers do not put it to best use. It is useful to look at how teachers and students are using technology to support learning (Pitler, 2009). Emerging technologies offer new opportunities for encouraging reading, writing, and collaboration. Effective technology integration in the classroom occurs when the focus of instruction is on student outcomes and when technology seamlessly supports the curriculum (Al-Bataineh & Brooks, 2003). Having a wide range of technology tools can support good instructional practices and strategies. In the end, the curriculum and students’ needs must drive the final decision for selecting the type of technology to be used (Hemphill, 2009).

All stakeholders in the educational arena need to be knowledgeable about effective uses of technology. Teacher and administrator training is critical to quality implementation. “High instructional quality within and between schools, or increased reliability, is possible when school districts ‘strike the right balance’ between direction and school support” (Marzano & Waters, 2009, p. 116). A personal understanding of technology is necessary for principals, superintendents, directors, and other educators to maximize the goal of providing proactive leadership.

One way for educators to meet the challenges of skillfully and effectively using technology for learning is to be knowledgeable about evaluating technology resources. The
content should be culturally unbiased, current, appropriate to the curriculum standards, and promote student interest. By reflecting on the cumulative best practices of technology integration and by avoiding ineffective practices, educators are better able to ‘‘make research-based decisions regarding the most beneficial approaches to technology . . . in educational settings’’ (Al-Bataineh & Brooks, 2003, p. 483). We must recognize the speed with which technology progresses and be responsive by adjusting our techniques as necessary. It also is appropriate to acknowledge that some technology applications remain constant when properly inserted into an aligned curricular plan. Although technology offers educators one of the most powerful allies impacting how education is delivered and supplemented, the ultimate success of our schools still remains in training and supporting quality, irreplaceable frontline teachers

The eMINTS Program

History of Program. eMINTS was born out of a 1997 demonstration project called MINTs (Missouri Instructional Networked Teaching Strategies). Mints sought to show the impact a technologically rich networked classroom could have on educational practice and student achievement. Thirteen Mints classrooms were installed in fourth, fifth and sixth grade classrooms in six school districts in St. Louis County, Missouri. Four of the six schools served a predominantly African American student body. In four of the six schools, the majority of students participated in the free and reduced lunch program. Evaluation conducted in the spring of 1999 by an independent evaluation team from OSEDA (Office of Social and Economic Data Analysis) documented important changes in student achievement at all grade levels (Beglau, 2009).
Based on early research findings about the improved student achievement found in the Mints classrooms, eMINTS was inaugurated in 88 third and fourth grade classrooms in 44 school districts across the state in fall 1999.

Since 1999, eMINTS classrooms have been added across the state using a combination of local, state and federal funds. MOREnet (Missouri Research and Education Network) administers eMINTS under a contract from the Missouri Department of Elementary and Secondary Education (DESE). MOREnet provides Internet connectivity, access to Internet2, technical support, video conferencing services, and training to Missouri's K-12 schools, colleges and universities, public libraries, health care, state government, and other affiliates.

eMINTS stands for enhancing Missouri's Instructional Networked Teaching Strategies. The eMINTS National Center is a non-profit unit within the University of Missouri. eMINTS is a collaborative education program sponsored by the Missouri Department of Elementary and Secondary Education (DESE) and the University of Missouri System Office of Academic Affairs. The eMINTS National Center serves as a resource base for Missouri schools and districts as well as for educators from across the United States who wish to collaborate with eMINTS staff and with one another to replicate the eMINTS instructional model (high-quality teaching powered by technology) within their educational systems. eMINTS transforms schools into places for learning where teachers and students use multimedia tools to better understand the world, work together, and achieve at new and higher levels.

The eMINTS National Center programs include professional development experiences for all educators (teachers, administrators, educational technology specialists, and library media specialists) who are interested in implementing the eMINTS instructional model in their schools or districts. The eMINTS National Center also provides faculty development for post-secondary
educators. Introductory short-term programs and customized workshops as well as intensive long-term programs are available.

*Impetus of Teacher Training.* The eMINTS instructional model is a set of research based strategies grounded in constructivist theory. The model supports educators in integrating technology and best teaching practices to create a learning community where teachers and students explore and create knowledge together using a variety of resources. Teachers facilitate student learning through the use of essential questions that stimulate thinking, build curiosity, create connections, and generate long lasting knowledge through issues that matter to students.

In a school that is fully implementing the eMINTS instructional model, observers will see students working collaboratively to solve real-world problems through teamwork and hands-on activities. Teachers guide and coach students in the creation of unique products that show deep student understanding of complex concepts.

The eMINTS instructional model requires conscious alignment of curriculum, professional development initiatives, technology acquisitions, and school vision. Collaborative leadership practices and school structures that support the school’s professional learning community in the implementation of the eMINTS instructional model are required for success. Critical elements of the eMINTS instructional model include:

- A carefully selected suite of hardware and software
- Constructivist, inquiry-based teaching practices
- Sustained, intensive professional development and classroom visits
- Implementation by school-based teams
- Rigorous external formative and summative evaluation (Beglau, M., 2009).
The eMINTS National Center offers professional development programs created by educators for educators. Leading experts at the University of Missouri, the Missouri Department of Elementary and Secondary Education and the Missouri Department of Higher Education have collaborated to produce programs that

- inspire educators to use instructional strategies powered by technology
- engage students in the excitement of learning
- enrich teaching to dramatically improve student performance (Beglau, M., 2009).

Programs range from short-term, customized awareness sessions (including online options) to full school or organizational-wide implementations requiring a long term commitment. Professional development geared to the needs and interests of preK-16 educators is delivered either by eMINTS staff or locally-based trainers who have completed eMINTS “train-the-trainer” certification.

Transforming preK-16 education through technology requires changes in the skill levels of both teachers and learners. Today’s students demand learning tasks that challenge and stimulate them as they use technology tools to acquire knowledge and skills for the 21st century.

Current Research. A September 2008 Program Evaluation by the Center for Children and Technology investigated the fidelity of the National eMINTS program and its impact on teacher mastery and student achievement. Regarding Program Fidelity, the findings suggest that there was a high level of fidelity to the core eMINTS concepts:

- The majority of instructional specialists addressed many of the key concepts.
- The majority of instructional specialists used the recommended instructional practices.
• There were few differences in PD Fidelity between eMINTS staff and participants or graduates of the PD4ETS program.

• During classroom visits, instructional specialists spent the most time working with teachers on lesson planning and modeling instruction and the least amount of time providing technology assistance and problem solving.

• eMINTS staff spent more time than participants or graduates of the PD4ETS program on lesson planning during classroom visits (Beglau, M., 2009).

Regarding Teacher Mastery, the findings indicate a wide range in the levels of mastery of the eMINTS concepts, with certain concepts more successfully mastered than others:

• Teachers displayed a high level of mastery of some core eMINTS concepts, such as integrating technology to support student learning and having students create authentic products to demonstrate their learning.

• Teachers displayed a lower level of mastery of other core eMINTS concepts, such as designing instruction to address diversity and having students generate their own questions to guide their inquiry (Beglau, M., 2009).

Regarding program impact, the findings suggest that higher PD fidelity is associated with greater teacher mastery of eMINTS concepts, and more time spent lesson planning in classroom visits is associated with greater teacher mastery as reflected in the lesson plans:

• There was a significant, positive correlation between PD fidelity and teacher mastery scores on the lesson plans teachers submitted in their portfolios.

• There was a positive trend between PD fidelity and teacher mastery on the WebQuests teachers submitted in their portfolios.
• There was a significant, positive correlation between the amount of time teachers spent on lesson planning during classroom visits and the scores on the lesson plans they submitted as part of their portfolios.

Also regarding Program Impact, the findings suggest that higher levels of teacher mastery of eMINTS concepts are associated with greater student achievement, higher levels of PD fidelity are associated with greater student achievement, and more time spent on lesson planning during classroom visits is associated with greater student achievement:

• There were significant, positive correlations between student MAP scores and teacher mastery on the lesson plan (in grades 3, 4, and 7), on the WebQuest (in grades 3 and 7), and on the classroom website (in grades 4, 5, and 7).

• There were significant, positive correlations between PD fidelity and student MAP scores in grades 3, 4, 5, and 8.

• There were significant, positive correlations between student MAP scores and lesson planning during classroom visits in grades 4, 5, and 8.

Overall, the Center for Children and Technology 2008 evaluation provides evidence the eMINTS program is being implemented with a high level of fidelity by both the eMINTS staff and participants and the graduates of the PD4ETS program; that teachers are mastering some, but not all, of the core eMINTS concepts; and that maintaining a high level of program fidelity is important for ensuring teachers are mastering the core program concepts, which may then result in higher levels of student achievement.

Summary. Currently more than 38,000 students in 2,000+ classrooms, grades 3–12, learn the eMINTS way every day across Missouri, Maine, Utah, Nevada, and Alabama with more joining the adventure soon. Two Missouri universities are incorporating eMINTS into their pre-
service teacher education programs. In addition, eMINTS has been named in new federal
educational technology legislation, ATTAIN, in May 2007. In 2005, eMINTS Comprehensive
Professional Development awarded International Society for Technology in Education (ISTE)
Seal of Alignment. The U.S. Department of Education recognized the eMINTS National Center
and Peabody Elementary, a St. Louis, Missouri, eMINTS school, in its 2004 National
Educational Technology Plan, “Toward a New Golden Age in Education.” The eMINTS
National Center was also recognized in the 2004 National Ed Tech Plan’s success stories in the
categories of Leadership and Teacher Training.

Teacher Burnout

Definition. Freudenberger (1974, as cited in Leung & Lee, 2006) first coined the term
“burnout” to describe work-related stress. The conception of burnout is articulated in the widely
used definition by Maslach and Jackson (1981) in which burnout is described as three correlated
but distinct facets: emotional exhaustion, representing an over-extended emotional involvement
with clients in which emotional bankruptcy occurs; depersonalization, representing the
development of a cynical and callous attitude towards the client in the work setting; and
decrement in perceived personal accomplishment, in which there is ineffectiveness in achieving
desired goals at work.

Maslach’s (1981) three burnout components on the intention to quit teaching provide data
on the associations among social support, burnout, and intention to quit. Results from Leung and
Lee’s (2006) structural equation modeling confirmed the three components of burnout acted
differently on intention to quit, with emotional exhaustion as the dominant factor.

The manifestation of burnout is a function of stressors engendered at both the
environmental, organizational, and personal levels. Among the explanatory models developed to
understand the manifestation of burnout is the transactional model that posits that burnout can be explained as the result of an interaction between triggering environmental variables and intra-personal traits (e.g. personality characteristics), which may facilitate or inhibit the manifestation of burnout (Maslach & Jackson, 1981). However, although it seems burnout occurs as a result of a complex interaction between individual characteristics and issues in the work environment, research has not systematically considered the role of person variables in this direction, especially in studying the manifestation of burnout in teachers’ samples.

Many contextual factors have been identified in the literature to relate to teachers’ occupational stress, such as interpersonal demands, lack of professional recognition, discipline problems in the classroom, the diversity of tasks required, bureaucracy, lack of support, workload, time pressure, the amount of paperwork required, and lack of resources provided. Travers and Cooper (1996, as cited by Kokinos, 2007) found teachers’ stress was also a result of lack of social recognition, large class size, isolation, fear of violence, lack of classroom control, role ambiguity, and limited professional opportunities.

Emotion is inextricably interwoven into organizational processes, and yet, the workplace is typically stereotyped as a rational, planned, and ordered enterprise devoid of irrational, spontaneous, and unruly emotion. Similarly, teaching is one of the professions identified as particularly stressful. Approximately one third of teachers report their job as “highly” or “extremely highly” stressful (Van Der Doef and Maes, 2002, p. 327). Furthermore, teaching has been associated with significant levels of burnout. Teaching is primarily deemed as a rational, rhetorical, and relational communication process, in which teachers strategically use messages and relational cues to influence students and their behaviors. However, teaching is also an emotional process, in which teachers can manage, monitor, and regulate their emotions to
achieve teaching effectiveness and to create a positive learning environment. Ideal teachers are known to remote feelings of enthusiasm, happiness, confidence, self-assurance, and passion about and satisfaction toward teaching (Zhang & Zhu, 2008).

The analyses conducted by Van Der Doef and Maes (2002) revealed significant correlates of burnout in teachers among high work and time pressure, student aggression, role ambiguity, further training, lack of task variety, high physical exertion, high colleague support, and lack of meaningfulness of the teaching job. For anxiety and depression, high work and time pressure, role ambiguity, high colleague support, and high physical exertion are significant predictors. Job satisfaction is associated with high task variety, less work and time pressure, less student aggression, higher support from the school management, better future prospects, and higher meaningfulness of the job. Contrary to expectations, high social support from colleagues is associated with higher levels of emotional exhaustion, depersonalization, and depression. Within a strong social network, teachers are motivated to go beyond their coping capacities in dealing with the demand of the job, as not to burden their colleagues (Van Der Doef & Maes, 2002).

Other factors contributing to emotional stress of teachers are behaviors such as surface acting (displaying an emotion that is not actually felt), deep acting (the activity undertaken to actually feel a required emotion), and suppression of emotion. In many professions, this emotional labor is thought to be related to high levels of burnout (Näring, et al., 2006, p. 303). Since identities are socially constructed, they are essentially malleable, multilayered, continuously negotiated and renegotiated, and defined and redefined. Tracy and Trethewey (2005, as cited by Zhang & Zhu, 2008) went beyond the fake-self, real-self dichotomy and proposed the crystallized self to represent the multi-dimensional, constantly shifting, ongoing, and emergent nature of identity. Tracy argued that emotional labor is affected by a variety of
factors including identity construction, sources of power, strategic interactions, and hidden
transcripts. When individuals construct and maintain preferred or authentic identities, emotional
labor discomfort can be eased (Tracy, 2005, as cited by Zhang & Zhu, 2008, p. 107).

Leung and Lee (2006) supplement our understanding as their findings reiterate teachers
experience a great deal of stress during the course of their career from the negative aspects of the
job, such as disciplinary problems of students, overcrowded classrooms, excessive paperwork,
demanding or unsupportive parents, lack of administrative support, and endless educational
reforms and innovations. There is increasing evidence that such stress may lead to teacher
burnout, which is expressed both physically and mentally (Borg, 1991, as cited by Leung & Lee,
2006). Such stress also affects the achievement of educational goals as it may lead to teachers’
detachment, absenteeism, and ultimately leaving the classroom for alternative careers (Maslach,
Schaufeli, & Leiter, 2001).

This is particularly concerning in a time when American schools have an urgent
challenge: the retention of teachers. Data suggest teacher attrition rates will continue to soar,
while student enrollments climb. A recent report indicates teacher attrition rates, particularly for
beginning teachers in their first three years of service, hover around 50% nationally (National
Commission on Teaching and America’s Future, 2009). Overcrowded classrooms, teacher
shortages, long work hours, and daily job demands placed on teachers are a major cause of
unrelieved stress (Mullins, 1993). Teachers often contend with unmotivated and difficult
students. Student resistance, misbehavior, and teachers’ management of disruptive classroom
behavior can be sources of workplace stress. Conversely, teacher nonimmediacy (Thweatt &
McCroskey, 1998) and noncaring can lead to student misbehaviors and negative teacher
evaluations, respectively. A teacher’s temperament may strongly influence that teacher’s affective orientations.

When polled directly, teachers cite pay as a major topic of dissatisfaction. Lack of administrative support is another major cause of burnout and frustration. Teachers request principals to strive to create environments in which positive support is apparent. When teachers deem working conditions to be poor, they leave to find work in better situations. In addition, many teachers blame high-stakes testing and accountability measures for the disappearance of professional autonomy.

Teacher autonomy is a common link that appears when examining teacher motivation, job satisfaction, stress (burnout), professionalism, and empowerment. An examination of constructs and their relationships reveals teachers need to have autonomy. Autonomy also emerges as a key variable when education reform initiatives are examined. Some researchers argued granting autonomy and empowering teachers is an appropriate starting point for education experts to solve current school problems (Pearson, 2006).

Stable personality characteristics predispose individuals to view the adverse events in a certain way that can either impair or facilitate the adaptation process and its psychological and physical health outcomes. Of the most comprehensive and well-developed models of personality is the five-factor model (Costa & McCrae, 1996), which posits that adult personality can be comprehensively described in terms of neuroticism (the susceptibility to psychological distress, inability to control urges, proneness to unrealistic ideas and inability to cope with stress), extraversion (the disposition towards positive emotions, sociability and high activity), openness (the proclivity towards variety, intellectual curiosity and aesthetic sensitivity), agreeableness (the inclination towards interpersonal trust and consideration of others), and conscientiousness (the
tendency towards persistence, industriousness and organization). The use of the five-factor model of personality to study the process of burnout has been applied to various populations. Zellars, Perrewé, Hochwarter, and Anderson (2006) studied burnout in a sample population of nursing workers and found that neuroticism predicted emotional exhaustion; extraversion and agreeableness predicted depersonalization; and openness and extraversion predicted personal accomplishment. Mills and Huebner (1998) have shown neuroticism and introversion correlated with the three dimensions of burnout in a sample of school psychologists. In addition, emotional exhaustion was associated with conscientiousness and agreeableness; depersonalization was associated with agreeableness; and personal accomplishment was associated with conscientiousness.

Burnout is considered to be an affective reaction to prolonged exposure to stress at work in which various job demands may exceed the individual’s adaptive resources. However, individual resources might also be depleted or strengthened by situations beyond the working environment (Innstrand, Langballe, Espnes, Falkum, & Aasland, 2008, p. 1).

Failure to control teacher’s work stress over extended periods of time may cause work burnout. Stress and burnout keep teachers from fully realizing their potential or effectively carrying out their duties. Teacher stress and burnout affect the school’s climate, morale, prevent the attainment of educational objectives, and increase the probability of teachers leaving their posts (Yong & Yue, 2007).

Work stress is the reactions of persons who feel external demands are beyond their endurance and result in physiological, psychological, and behavioral changes. The concept was first put forward by Freudenberger (1974) to describe the mental and physical exhaustion caused by excessively long hours of work, heavy workload, and excessive work intensity in workers in
the public relations sector. Pines and Aronson (1988) define work burnout as a long-term emotional state resulting in physical, emotional, and psychological exhaustion. Farber (1991) defines work burnout as a work-related syndrome coming from the individual’s cognition of a serious imbalance between input and output. Maslach (1982) maintains work burnout is manifested in three ways: emotional exhaustion, alienation, and lack of sense of achievement. Emotional exhaustion refers to the absence of enthusiasm for work and is manifested as fatigue, irritability, and depletion of enthusiasm. Alienation is treating people at work with indifference and without human kindness, for example when teachers take a negative attitude toward students and distance themselves from them as much as possible. Lack of sense of achievement means dissatisfaction with one’s performance and is seen when teachers feel their efforts do not bring changes in students, or they do not receive the expected compensation or recognition. Work stress and burnout have negative effects on the individual and the organization.

The effects of work stress and burnout on the individual include disruption of teachers’ normal habits, lack of work enthusiasm and creativity, inability to concentrate, lowered self-respect, loss of self-control in class, and overreaction to moderate amounts of stress. The effects of work stress and burnout on the organization are lower quality of service, low morale, loss of interest in work and life, indifference toward people or events, and inefficiency. Where schools are concerned, the biggest problems caused by work stress and burnout are the undesirable influences on the students (Yong & Yue, 2007).

Techniques and Instruments for Determining Burnout. The Maslach Burnout Inventory-Educators Survey (MBI-ES; Maslach, et al., 1996) is the foremost instrument used to examine burnout among professional educators and the instrument which is to be implemented in this study. This tool is used to determine burnout across the dimensions of emotional exhaustion,
depersonalization, and personal accomplishment. Maslach’s Burnout Inventory is customarily administered to evaluate the relationship between the stress-strain-coping continuum and measured outcomes of burnout.

A 2002 study by Van der Doef and Maes, investigated whether using a teacher-specific quality of work instrument would explain more variance in burnout, psychosomatic well-being, and job satisfaction than occupational stressors assessed with a general quality of work questionnaire. The Job Demand-Control-Support (JDCS) model, which assumes moderating effects of job control and worksite social support on the relationship between job demands and health and well-being outcomes, was tested. Results support occupational stressors which were assessed using a teacher-specific quality of work questionnaire to explain more variance in the outcomes under investigations. Furthermore, teacher-specific work aspects, like student aggression and further training, are significant correlates of health and well-being. In contrast, only limited support could be found for the assumed moderating effects of job control and worksite social support.

The job demand-control model (JDC model; Karasek & Theorell, 1990) provides a framework to explain the relation between the psychosocial characteristics of the work environment and health outcomes. It comprises two basic dimensions—psychological job demands and control or decision latitude. Job demands refer to the workload and have been operationalized in terms of amount of work, time pressure, and conflicting demands. Control includes two theoretically distinct concepts. Skill discretion refers to the extent to which the job involves the opportunity to learn new things, to develop skills, and to make use of one’s ability. Decision authority incorporates an individual’s possibilities to influence on work content and on how the work is done (Santavirta, et al., 2007).
Current Research Findings. Developing effective educators is a priority for ensuring that future generations learn successfully in the classroom. Along with educator quality there is a need to reduce attrition among educators by clarifying the prospective teacher’s understanding of the learning environment they will be entering. A growing body of evidence indicates attrition is higher for those with little initial preparation (Wei, Andree, & Darling-Hammond, L, 2009). For example, analysis of the Schools and Staffing Survey (SASS) data for 1999-2000 showed large differences in teachers' plans to stay in teaching between first-year teachers who felt well-prepared versus first-year teachers who felt poorly prepared (Dieker, et al., p. 4).

A study by Thornton, Perreault, and Jennings (2008) focuses on identification of the factors associated with a teacher's decision to transfer between schools within one large western district. The analyses were based on responses of 181 teachers who had recently transferred. Multivariate analyses were conducted to identify factors associated with teacher transfer. The findings indicate leadership/administrative issues, professional success concerns, and building factors can have a strong influence on a teacher's decision to transfer. The study provides insight into approaches for retaining teachers at their current worksites. Moreover, a high percentage of teachers who leave the profession are those with the characteristics associated with superior teaching, cognitive breadth and depth, adaptability, and creativity.

Five major motivational factors relate to teachers' decisions to leave the profession. These factors are: 1) lack of administrative support, school policies, and procedures; 2) instructional issues-class size, discipline problems, and students' motivation; 3) lack of opportunities for professional advancement; 4) inadequate classroom resources, materials, and equipment; 5) personal issues and monetary concerns (Thornton, et al., 2008). A study conducted by Provasnik and Dorfman (2005, as cited by Thornton, Perreault, & Jennings) found a high relationship
between reasons teachers transferred and reasons teachers left the profession. For both transferees and teacher leaving the profession, they identified lack of planning time, heavy workloads, low salaries, and problematic students as the top reasons for dissatisfaction.

A 2006 study by Timms, Graham, and Caltabiano explored relationships between teacher perceptions of school administration trustworthiness and teacher burnout and trust. The survey instruments measured administration trustworthiness (ability, benevolence, and integrity), morale, participate decision making, trust, burnout, and job stress. The study found there were significant effects for gender and school, with female primary teachers experiencing more burnout job stress than male primary teachers and secondary teachers (male and female). Female primary and secondary teachers reported less confidence in school administration trustworthiness when compared to male primary and secondary teachers although this differentiation was more pronounced in the primary school.

Teacher turnover is a particular concern for school administrators and educators because of the implications for future hiring practices and concern for the retention of good teachers. In Leiter’s revised model (2001, as cited by Maslach, Jackson& Leiter, 1996), it is suggested the affective (emotional exhaustion and depersonalization) and cognitive (personal accomplishment) dimensions of burnout experiences should be treated as different constructs with different predictors and consequences. In particular, both emotional exhaustion and depersonalization are associated with the defensive coping mechanism of escape that will lead to escape or the desire to escape, while personal accomplishment is more related to outcomes reflecting positive self-efficacy, such as control coping strategy. Individuals strive to obtain, retain, protect, and foster those things they value, which are referred to as “resources” (Lee & Asforth, 1990, 1996, as cited by Innstrand, et al., 2008).
In a myriad of studies, researchers have examined teachers’ intrinsic and extrinsic motivation. Intrinsic factors for teachers include: (a) desire to help students achieve, (b) desire to make a difference in society, and (c) sense of accomplishment when students learn. Extrinsic factors for teachers include: (a) pay, (b) nonmonetary fringe benefits, and (c) recognition of performance. The body of teacher research also supports that notion because intrinsic and extrinsic rewards in the teaching profession have received considerable attention; yet, few researchers have examined the effects of these rewards (Fraser, 1989, as cited by Pearson, 2006).

Various factors such as disciplinary problems, excessive work, and lack of social support are among the stressors that confront teachers. These findings are in line with the Conservation of Resources (COR) theory of stress (Hobfoll, 2001), on which Leiter (2001, as cited by Hobfoll, 2001) posited his model of burnout. According to the COR theory, people strive to obtain and maintain what they value (the resources). When resources are lost, are inadequate to meet demands, or do not lead to the anticipated returns, burnout is likely to develop. The theory also states certain behavioral outcomes, such as intention to quit and coping responses, are likely to occur as a result of burnout (Leung & Lee, 2006).

Hochschild (1983, as cited by Näring, et al., 2006, p. 304) was the first to note employees are often required to show certain emotions in order to please “the customer”. Having to show such emotions while one is not actually feeling them or having to suppress one’s own emotions when their expression does not seem appropriate were taken together in devising the concept of emotional labor. Hochschild already noted the requirement to express emotions that are incompatible with experienced emotions would cause repeated stress. Repeated stress is thought to lead to reactions of psychological strain and physical illness (Van der Doef & Maes, 2002). An increasing number of studies have explored the relationship between emotional labor and job
stress or burnout. Several studies have reported significant relationships between emotional labor and the emotional exhaustion dimension of burnout and thus made the theoretical importance of this relationship clear (Näring, et al., 2006).

In the research of Näring et. al, (2006), of the three emotional labor strategies that were measured, surface acting and suppression were found to be significantly related to depersonalization. This result replicates but also extends findings on surface acting in various professions and students.

The effects of job strain on emotional exhaustion, vitality, and emotional well-being proved to be consistent and robust across alternative formulations, and more restrictive cut-off points produced stronger effects. The main effect of high demands exceeded that of low decision authority in relation to emotional exhaustion. Furthermore, the two factors acted synergistically to increase the risk of emotional exhaustion, providing empirical support for the core mechanism of the job-strain model. In the case of the emotionally exhausted teachers who perceived their job as highly demanding and low in control, 69% of the effect could be attributed to the synergism of these two factors. This information could be used in the planning of interventions to prevent burnout (Santavirta, et al., 2007).

International research and practice have made great efforts to understand and prevent teacher burnout. Besides contextual factors such as job demands and job, research has now started to look at personality characteristics which may predict differences in teachers’ stress and burnout. One personality characteristic that has been suggested to play an important role in teacher stress and burnout is perfectionism (Stoeber & Rennert, 2008). Perfectionists may perceive a great deal of pressure to excel because they feel they have to live up both to their own
high standards and to those of others. Thus, it comes as no surprise that perfectionism has been associated with higher levels of stress and burnout.

The findings of a study conducted by Stoeber and Rennert (2008) show individual differences in perfectionism may be an important factor in teachers’ job-related stress appraisals, coping styles, and burnout. Moreover, the findings show different facets of perfectionism show different, sometimes opposite relationships. When multiple regressions were computed to tease out the differential relationships of the different facets of perfectionism, striving for perfection was positively related to challenge appraisals and active coping and inversely to threat and loss appraisals, avoidant coping, and burnout (emotional exhaustion, depersonalization, lack of personal accomplishment, and total burnout). In contrast, negative reactions to imperfection were positively related to threat and loss appraisals, avoidant coping, and burnout and inversely to challenge appraisals and active coping. Furthermore, perceived pressure to be perfect showed differential relationships depending on the source of pressure (Stoeber and Rennert, 2008).

Only perfectionists, who are concerned about mistakes and feel they have to be perfect, are likely to experience lack of personal accomplishment, become cynical about their job and careless about the people they should care for, and are at risk of physical and emotional burnout. Perfectionists, who are not overly concerned about mistakes and who do not feel they have to be perfect to be accepted by others, should not worry that their perfectionistic strivings will be detrimental for their mental and physical health or will lead to burnout. Instead their perfectionistic strivings may help them to actively cope with the challenges of their jobs (Stoeber & Rennert, 2008).

Hobfoll (2001) identified 74 work-related and nonwork-related resources that he divided into four groups: objects, conditions, personal characteristics, and energy resources. Examples of
work-related resources are “time for work,” “stable employment,” and “support from co-workers” (p. 420). Nonwork-related resources are, for example, “good marriage,” “free time,” or “time with loved ones” (p. 420). Stress occurs when these resources are (1) threatened, (2) lost, or (3) when individuals invest resources and do not reap the anticipated level of return (Hobfoll, 2001). Burnout is thought to result particularly from a lack of resource gain (and sometimes exposure to minor, chronic losses) following significant resource investment of time, energy, lost opportunities, and borrowing from family time and intimacy to support work.

When time for professional development is built into teachers' working time rather than required additional hours, their learning activities can be ongoing and sustained and can focus on particular issues over time. Job embedded professional learning time also supports the kind of context specific professional learning and action research that is effective in catalyzing change (Wei, Andree, & Darling-Hammond, 2009).

Many high-achieving nations also organize extensive professional development that draws on expertise beyond the school. Some mandate the number of formal professional development hours that teachers must participate in beyond the many hours spent in collegial planning and inquiry (Barber & Mourshed, 2007, as cited in Wei, et al., 2009).

Professional development policies and practices in high-achieving nations reflect many of the principles of effective professional learning outlined by research. These nations provide sustained and extensive opportunities to develop practice that go well beyond the limited one-shot workshop approaches still commonly found in the United States. They treat teachers as professionals and make teachers' professional learning high priority (Wei, et al., 2009).

Many of the countries that have established strong systems for high quality teaching have built these infrastructures in the last two decades through purposeful policy. This suggests
education policymakers in the United States could also develop such conditions with purposeful effort and clarity about what matters and what works to support professional learning and practice (Wei, et al., 2009).

Social support available to teachers has been found to be a useful strategy for preventing teacher burnout. Strong associations between support from supervisor and colleagues and emotional exhaustion and depersonalization have been documented. In Hong Kong, researchers found that seeking social support was a significant predictor to depersonalization and hence concluded that readiness to seek support from others may help teachers to guard against becoming depersonalized (Leung & Lee, 2006).

Among the three burnout components, emotional exhaustion was found to be the predominant factor predicting teachers’ intention to leave teaching in this study. The present findings are similar to the findings of Liu and Wang (2004, as cited by Leung & Lee, 2006) who found that emotional exhaustion is a salient factor that was strongly associated with mental health among primary and secondary school teachers (Leung & Lee).

Another important finding of the study was the differential effects of support from a supervisor and from colleagues as a form of coping resources for burnout on intention to quit teaching. Those teachers who perceived their supervisor as supportive were less likely to leave teaching, while having a good relationship with colleagues only had no or at best a minimal effect on their intention to quit (Leung & Lee, 2006).

To conclude, the present study shows that when operationalized as a three-component system of emotional exhaustion, depersonalization, and personal accomplishment, the concept of burnout enables a more precise assessment of the differentiated predictability on intention to quit among a sample of teachers. Findings from this study provide pertinent information for school
officials to prevent teacher turnover by considering and designing prevention and intervention programs concentrated on reducing a teacher’s emotional exhaustion. Support from a supervisor is found to be an important resource to reduce both teacher burnout and turnover intention among teachers (Leung & Lee, 2006).

Teachers’ work overload has been the subject of intense research, and the results of these studies show that a substantial proportion of teachers perceive their job as very stressful (Santavirta, Soloveia, & Theorell, 2007). The effect of job strain on burnout was proven to be consistent and robust across alternative formulations. The main effect of high demands exceeded that of low decision authority in relation to emotional exhaustion. Furthermore, the 2 factors acted synergistically to increase the risk of burnout. In the case of burnout, teachers who perceived their job as highly demanding and low in control, 69% of the effect could be attributed to the synergism of these 2 factors.

The most prominent advocates of 21st century education all stress the importance of learning essential content by way of authentic intellectual skills. These advocates’ documents invariably contain the terms critical thinking and problem solving. They emphasize the ability to argue, analyze others’ arguments, conduct research, and acquire such “habits of mind” as the ability to invent or synthesize information. Literacy—the ability to read, write, and make effective presentations—is central (Schmoker, 2008). There are many schools that use data to drive a curriculum rich in 21st century skills and that achieve both high test scores and deep learning.

Summary. Teaching is considered a highly stressful occupation. Burnout is a negative affective response occurring as a result of chronic work stress. While the early theories of
burnout focused exclusively on work-related stressors, recent research adopts a more integrative approach where both environmental and individual factors are studied.

Teachers’ stress has an impact on teachers as individuals, on the schools in which they work, and on the pupils they teach. Teachers who experience negative emotions at work and who have lost interest in their jobs would likely be less caring and experience emotional exhaustion (Teven, 2007).

Emotional exhaustion is a key characteristic of the burnout syndrome. Teachers’ individual characteristics, as well as job related stressors, should be taken into consideration when studying the burnout phenomenon. The fact that each dimension of the syndrome is predicted by different variables should not remain unnoticed especially when designing and implementing intervention programs to reduce burnout in teachers.

It is plausible to accept that teachers who are exhausted or who feel detached from their students do not respond to certain situations in a way that feels natural. In such a state, teachers might have to use surface acting and suppression more.
The Teacher as Leader

Epistemological and Ontological Assumptions. In classroom settings, learning is a shared enterprise involving instructors and students. However, in practice, teaching structures and activities can vary from the expectations, strategies, and activities of learners. Instructors may be unaware of how their students perceive their teaching. In some cases, fundamentally different epistemological beliefs may exist related to instructor–student roles (Perlman & McCann, 1998). Taken separately, instructor and student expectations and beliefs may be considered reasonable and appropriate. Together, however, misalignments are often evident among the expectations, beliefs, and practices of instructors and students. While successful instructors and students recognize the value of and employ complementary methods, some neither fail to recognize nor deploy complementary approaches (Song, Hannafin, & Hill, 2006).

Current educational practices tend to emphasize direct explanation (i.e., explaining things as clearly as possible to the learner) as well as process or performance perspectives. Some research argues for a shift in focus to students’ beliefs about and connections with conceptual artifacts. Conceptual change refers to the learning process of restructuring pre-instructional understanding to develop new interpretations and acquire new knowledge. Conceptual change, therefore, involves changes in both knowledge and beliefs about knowledge (Chi-Yan, & Treagust, 2004). Most conceptual change models emphasize how students approach learning, and encourage instructors and students to make their conceptions about to-be-learned content explicit from the outset (Song, et al., 2006).

The first place for educational leaders to look in helping negative people change and in creating positive, supportive learning environments is in the mirror. Negative people resist change, interfere with new ideas, reduce student learning (no child learns in the classroom where
the teacher complains all day), and dampen the spirits of other staff members. In addition, negative staff members destroy community support for education and can anger and frustrate board members (Weber, 2008).

A positive climate and vision bring increased community support, higher-quality teacher and administrator candidates, smoother negotiations, more supportive board members, and overall atmosphere of caring and support—and that leads to higher student achievement (Weber, 2008). While cognitive factors are clearly important to conceptual change, some have concluded that purely cognitive connections are unlikely to occur without affective influences (Song, Hannafin, & Hill, 2007).

Marion and Hewson (1999, as cited in Song, et al., 2006) suggested three additional factors influence conceptual change learning in conjunction with metacognitive factors: ideas, status, and justification. Ideas refer to both teacher and student conceptions about the subject under study. Hewson’s (1998) Teaching for Conceptual Change model suggested teachers made explicit both their and their students’ ideas during instruction. Status refers to the degree to which a student believes an idea is useful. Accordingly, Hewson advocated teaching practices that help to raise or lower the status of ideas. Raising the status of an idea increases emphasis; this may increase opportunities for students to accept it. In contrast, lowering an idea’s status may reduce the likelihood that students accept it (Song, et. al., 2006).

The Processes of Change Model is a systemic model of learning success where students encounter tasks and materials that induce conceptual change. They hypothesized that cognitive, metacognitive, and motivational sensitivity influence how students perceive a task. Cognitive sensitivity refers to the relationship between prior knowledge and the cognitive demands of the task (Song, et al., 2006).
Classroom obstacles to conceptual change have also been documented. Given the same instruction in the same classroom, some students demonstrate conceptual change learning while others do not. Similarly, evidence of conceptual change varies under different situations and circumstances (Chi-Yan & Treagust, 2004). While researchers have underscored the influence of factors such as prior knowledge, the introduction of new or alternative knowledge, the use of metacognitive learning strategies, and motivation, few have examined the interdependence among conceptual change factors such as epistemic beliefs, teaching, and learning. Epistemic beliefs refer to an individual’s beliefs “about the definition of knowledge, how knowledge is constructed, how knowledge is evaluated, where knowledge resides, and how knowing occurs” (Hofer, 2001, p. 199). Little effort has focused on the influence of associated beliefs and assumptions on teaching, factors that influence student expectations about learning, and their joint influence in typical learning environments. In this section, we present teaching and learning models and describe the influence of epistemic beliefs on the teaching practices of instructors and the learning practices of students (Song, Hannafin, & Hill, 2007).

Likewise, instructors’ expectations, beliefs, and practices often differ from those of students. Instructors may lack adequate knowledge or experience needed to teach specific topics effectively, fail to recognize student dissonance, or lack willingness to modify their teaching. Rather than reflecting and adapting to reconcile differences, teaching activities may proceed as initially planned, independent of evidence of student learning, thus not fully facilitating students’ conceptual change process. In such cases, instructors might attribute failed student performance to lack of prior knowledge and motivation, blaming them for failing to engage in their teaching activities rather than to the misalignment of expectations or their teaching. Ideally, instructors
and students mutually adapt their respective activities to reconcile dissonance (Song, et al., 2007).

According to Schommer’s (Schommer-Aikins, & Easter, 2007) framework, epistemic beliefs range from naive to sophisticated; naive beliefs indicate that knowledge is perceived as simple and a direct reflection of reality with no need for justification, while sophisticated beliefs indicate that knowledge must be understood contextually and must be open to reevaluation. Students with naive beliefs about knowledge tend to characterize knowledge as resting “in” authorities (usually the instructor). Accordingly, a student might expect the “instructor as expert” to explicitly organize and convey his or her knowledge, such as by directed lectures and explicit study guides. Conversely, instructors’ beliefs about teaching and learning influence how well they facilitate students’ conceptual change learning experiences (Song, et al., 2007).

When an instructor believes knowledge is complex and can be constructed by the learner, he/she might be expected to provide the students with opportunities to explore the to-be-learned subject, such as by project-based or inquiry-oriented learning approaches (Song, et al., 2007).

Epistemic beliefs influence both how instructors teach and students learn (Hofer, 2004), as well as their willingness to reconcile. Willingness to reconcile is influenced by several factors, including individual beliefs and personality traits. When instructors believe knowledge resides in authorities (i.e., the instructor in the classroom), it is unlikely s/he would change practices even according to situational demands. Consequently, a student may fail to learn novel ideas or skills such as new ways to write or technology applications (Schommer-Aikins, & Easter, 2006). In contrast, when instructors believe all knowledge is negotiable, they might inadvertently legitimize simplistic student understanding. Students may fail to recognize conventions or
canonical points of view, thus reinforcing, rather than challenging, naive conceptions (Schommer-Aikins, & Easter, 2006).

Among the myriad of expectations of today’s school leaders, the new generation of principals needs to create the conditions necessary for professional learning communities to flourish. They need to act as lead learners and set the tone within the organization that all community members continue to learn best practices and continue to work to meet the needs of all students. They must develop the skills necessary to collect and use data from a variety of sources to respond to accountability measures set forth in performance standards and help inform decisions related to school improvement. They must fully understand the scope and sequence of NCLB and must prove their ability to meet the standards and expectations set forth by the law. They must have the communication and interpersonal skills necessary to interact with all constituents of a school community including parents, students, teachers, central administrators, and community members. Furthermore, they must be able to create safe school environments and respond to issues particularly related to rising security concerns in the wake of various recent examples of school violence (Loeser, J., 2008).

Smith and Andrews (1989) identified four characteristics of successful instructional leaders:

- First, effective instructional leaders are resource providers. They must know the strengths and weaknesses of each teacher and be willing and able to provide the type of resources necessary to help each teacher grow.

- Second, effective instructional leaders are strong instructional resources. They are able to identify strong teaching and provide the type of feedback necessary to encourage and enhance improved pedagogy.
• Third, effective instructional leaders are strong communicators. In every mode of communication, they convey the core beliefs of the school and focus solely on optimal learning outcomes.

• Finally, they are visible and present in every school occurrence (p. 4).

Whether reconciled unilaterally or mutually, instructors and students can benefit by making their beliefs explicit to each other. However, since significant differences may exist between espoused and enacted beliefs, and between self-reported and actual practices, simply stating one’s epistemological beliefs may be insufficient. One practical option is to make visible the assumptions upon which courses are designed and developed. Instructors can engage in critical reflection activities to examine and reflect on their beliefs, such as through conversing with peers or colleagues or explicitly describing teaching philosophies to the students at the beginning of the course. By overtly initiating otherwise tacit information, the instructor can clarify the biases and expectations underlying course design and student performance. Another implication for teaching, especially for diverse student populations, is to provide opportunities for students to make their beliefs explicit. Louca, Elby, Hammer, and Kagey (2004) suggested observations and interviews were helpful in understanding students’ beliefs about knowledge and learning, their learning behaviors, and their approaches to learning tasks in different contexts. Students, in turn, can become increasingly proactive by explicitly articulating their learning philosophies to the instructor and making potential misalignments explicit (Song, et al., 2007).

The Impact of Locus of Control on Motivation, Self-efficacy with factors of motivation, locus of control, and personal attributes are part of the affective component in Borkowski’s model (Hall, Smith, & Chia, 2008). Successful information processing results when there is an integration of these metacognitive and affective components. Prior research supports
metacognitive factors in predicting academic success as measured by college GPA. There is a significant relationship between metacognitive factors and measures of internal locus of control (Hall, et al., 2008).

Borkowski’s model has been described as being a self-regulation process involving task analysis, strategy selection, strategy use, revision, monitoring, and performance feedback. Self-regulated learners are aware of their own learning processes, knowledgeable about various learning strategies, and effective in applying the most appropriate strategies for the tasks at hand. Self-regulation behaviors should not only make them academically successful (i.e., higher college GPA) but also possibly allow them to navigate through college requirements more efficiently and effectively (Hall, et al., 2008).

An affective component of self-regulation noted in Borkowski’s model is self-efficacy. Self-efficacy can be defined as the belief that one can be successful in accomplishing a task. Research has shown self-efficacy to be situation specific. For example, while there may be some overlap, academic self-efficacy is different from social self-efficacy. Increases in self-efficacy impacts both motivation and performance. Research supports the relationship between goal systems (self-regulatory systems) and self-efficacy and how these factors enhance motivation and performance (Hall, et al., 2008).

Burnout is higher among individuals who have an external locus of control, possess other-oriented empathy, and are more emotional than cognitive. Hence, teacher temperament is likely to be a significant variable in determining caring orientations and potential burnout. The present study was designed to provide a more comprehensive examination of the relationships among teacher temperament, caring, burnout, and organizational outcomes (Teven, 2007).
Instructional leadership is a leadership policy primarily used by school principals. The policy shifts principals’ focus from day-to-day school administration to the improvement of curriculum and classroom instructional practices. Recently though, in the current climate of standards-based learning, high stakes accountability, and relentless attention to improving educational opportunities for underserved students, instructional leadership has made its way back to the forefront of education policy. Instructional leaders support teachers in curriculum development and provide opportunities for teachers to shape the cultures of their schools. Teachers may contribute to a number of aspects of running a school including developing curriculum, choosing materials, evaluating performance, building the budget, and setting policy and practices for hiring, promotion, and retention. Research has also shown the most tangible improvement in student outcomes is made by placing highly qualified teachers in the classroom.

The instructors at any school bring to the institution a broad range of experiences and competencies. Instructional leaders may mentor teachers towards becoming leaders, establish times when teachers can directly contribute to important school conversations, and develop a school culture in which teachers feel invested in one another and the school. Instructional leaders must be supported by the districts in which they work. In the current era of standards based reform, school districts have a responsibility to ensure their students are learning. With the advent of instructional leadership, teacher leadership has evolved to become as much of a factor for success as principal leadership. Leadership development in teachers is fundamental to improving schools. As a school’s principal and administrators develop teachers’ leadership skills, teachers may be called upon to perform a variety of tasks which may change their roles within the school. Teachers in public schools are often isolated in their classrooms; they may feel a clear delineation between their classroom and the rest of the school. With the implementation
of instructional leadership, teachers may be called upon to contribute to school functions like choosing instructional materials, writing curriculum, deciding school policies and hiring practices, and analyzing and evaluating budgets. Imperative to the success of this new role is the acceptance of new teaching practices and a new school culture. Instructional leaders will usually observe classroom practices more often and increase their overall presence in classrooms. For instructional leadership to be successful, it is crucial for teachers and principals to accept and embrace these changes, form strong relationships in which teachers are not afraid of failure, and constantly work towards learning and implementing better teaching practices. Instructional leadership is one of the most empirically supported policies recognized by the education community. Studies on instructional leadership and its effectiveness abound, extolling the policy’s impact on student learning and the health of the overall institution. When implementation is successful, students are successful. However, some barriers to success and conditional requirements need to be taken into account. (Suh, 2008).

The professional development of leaders and teachers is also crucial. Instructional leadership today denotes changes in everyone’s roles. Using the case study of a school seeking to employ instructional leadership, providing professional development opportunities related to instructional leadership skills within the school is more effective than offering outside professional development opportunities. By providing these opportunities within school, teachers are able to adapt new perspectives and skills to the context of their environment (Suh, 2008).

Hall et al. (2008) found a significant relationship between metacognitive factors and measures of locus of control. Taken together, metacognitive strategies and internal locus of control lend support to Borkowski’s (1996) theory of executive functioning which is a process of self-regulation with knowledge and application of cognitive skills being liked to positive
motivational states. Borkowski’s model has been described as a self-regulation process involving task analysis, strategy selection, strategy use, revision, monitoring, and performance feedback. An affective component of self-regulation noted in Borkowski’s model is self-efficacy which is the belief that one can be successful in accomplishing a task. Research has shown self-efficacy to be situation specific (Hall, et al., 2008).

Wright University’s Teacher Leaders Program examined internal program leadership and determined teachers sought independence from the administrative-oriented responsibilities and teacher leadership capacities were best served within the confines of the individual classrooms. The ensuing teacher leader program’s title and mission thus implied teacher leaders primarily led students (Hambright & Franco, 2008).

*Current Research on Indicators for Leadership.* As noted by Yukl (2006), the term leadership is used in multiple contexts without being precisely defined. However, “most definitions of leadership reflect the assumption that it involves a process whereby intentional influence is exerted by one person over other people to guide, structure, and facilitate activities and relationships in a group or organization” (p. 3). What is known is the correlation between quality district and teacher leadership and student achievement (Marazano & Waters, 2009). In the 2009 publication, *District Leadership that Works*, Marzano and Waters identify a model which predicts that “when districts and schools are high functioning in terms of their leadership behaviors, they can positively influence student achievement” (p. 12).

The Institute of Educational Leadership in Washington, D.C. (2001, as cited in Tyson, 1993) acknowledged the “vital role of the teacher in providing instructional leadership, especially at a time when the demands of up-to-date management, political pressure promoting tests and standards, and the near-universal obsession with across-the-board accountability are
making principals more conscious of what happens in classrooms; and 2) the constantly reiterated proposition that well-prepared professional teachers are central to the decades-long push for school reform” (p. 2). This constitutes a very important trend toward recognizing the teacher as leader. Oddly, “the effort to create a cadre of leaders within the teaching ranks is rhetorically supported by nearly everybody and actually supported by very few” (Tyson, 1993, p. 1).

Leadership effectiveness is measured with multiple criteria dependent on intended essential outcome. Yukl (2006) focuses on primary traits, characteristics, or power as indicators or variables for evaluating effective leaders. Leader traits and skills; leader behavior; influence processes; follower attitudes and behavior; and performance outcomes are all situation variables among the primary types of leadership processes.

Bowers and Seashore (1966, as cited by Yukl, 2006) suggest leadership functions may be carried out by someone other than the designated leader of the organization. Review of their research finds leadership behavior among peers is related to subordinate satisfaction. “The work and culture of adults influence in complex ways educational practice and student learning. Teachers and administrators live at the center of the world and together shape the flow of leadership, determining its ultimate impact on students” (Donaldson, 2008, p. 145).

Summary.

The understanding of one’s own epistemic paradigm, ways of knowing, and epistemological beliefs allow for a more complete understanding of personal epistemology. Although research tends to limit personal epistemology to the nature of knowledge, researchers do “not deny the importance of studying the close links between beliefs about knowledge and beliefs about learning” (Perlman & McCann, 1998, p. 411). By combining the epistemological
ways of knowing, the ontological social assumptions, and the methodological assumptions of an individual which focuses on analysis of methods of gaining data, an interpretive paradigm of the lens through which we understand and construe change is better understood.

In general, it seems to be psychologically healthy to perceive that one has control over those things which one is capable of influencing. This internal locus of control is also referred to as “self-agency,” “personal control,” or “self-determination” (Mamlin, Harris, & Case, 2001, p. 25). Those with internal locus of control seem to be more achievement oriented and to get better paid jobs. It is worthy to ponder, do environmental circumstances cause locus of control beliefs or do the beliefs cause the situation, such as privilege and disadvantage?

Winston Churchill once said, “Success is going from failure to failure without loss of enthusiasm” (Lewis, 1995). In additional to a strong internal locus of control, successful leaders tend to possess other essential characteristics such as self-esteem, the need to achieve, screening for opportunity, goal orientation, optimism, courage, tolerance to ambiguity, and strong internal motivation. The good news is many of these leadership characteristics are learnable. For example, one can train the mind to recognize opportunity, optimism is a controllable state of mind (Seligman, 1988), and even the need for achievement can be increased (McClelland, 1983).
CHAPTER THREE

RESEARCH DESIGN AND METHODOLOGY

Introduction

The National eMINTS (enhancing Missouri’s Instructional Networked Teaching Strategies) Center grants a professional development program to empower educators to use instructional strategies driven by technology (Beglau, 2007). To date, more than 1000 Missouri teachers have participated in this rigorous program which requires more than 250 contact hours of face-to-face instruction. A large number of the veteran eMINTS teachers who have successfully completed the training eventually leave the eMINTS classroom. Currently, no research exists which examines the long-term professional outcome for classroom teachers who participate in the systemic technological training reform of the National eMINTS Program. The purpose of this study is to investigate veteran eMINTS teacher’s perceived value of the eMINTS instructional model of design. The study will explore if a correlation exists between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the technology enhanced classroom.

Research Questions

Within the context of this study, the following research questions were addressed:

1. Is there a significant difference between the time veteran eMINTS teachers continue to teach in the same content area and grade level after completion of the eMINTS Professional Development Program and the time their non-eMINTS colleagues continue to teach in the same content area and grade level?
2. Are there significant differences between how veteran eMINTS teachers rate satisfaction in teaching after completion of the eMINTS training model and how their non-eMINTS colleagues rate satisfaction in teaching?

3. Are there significant similarities between how veteran eMINTS teachers score the Maslach Subscale Items of Emotional Exhaustion, Depersonalization, or Personal Accomplishment and how their non-eMINTS colleague rate these subscale items?

4. Are there significant differences in the number of eMINTS teachers who assume leadership positions after completing the eMINTS National training Program and the number of non-eMINTS colleagues who assume leadership positions?

5. Are there similarities among perceptions held by veteran eMINTS teachers in relation to the eMINTS training methodology?

**Design for the Study**

The purpose of this study is to examine the perceptions of veteran eMINTS teachers toward the training methodology of the National eMINTS Program by gathering phenomenological reflective data. The study will further explore the possible relationship between teacher perceptions toward the eMINTS training methodologies and career influences toward matriculation to leadership or burnout.

The research method in the study is inductive analysis using a survey method. This will “provide a quantitative or numeric description of trends, attitudes, opinions of a population by studying a sample of that population” (Creswell, 2003, p, 153).
Population and Sample

This study draws from the cross-sectional survey responses of 30 teachers. The determinant for size in this group was to provide enough data to conduct an analysis which yields significant results as indicated by an alpha factor of .05 (Creswell, 2003). Participants are a convenience sample of 15 veteran eMINTS instructors from the FY00 (1999-2000), FY01 (2000-2001), and FY02 (2001-2002) cycles of the eMINTS National Program. The FY00, FY01, and FY02 sequences were chosen as they were the first three cycles of eMINTS participants and sufficient time has passed to allow for review of matriculation, leadership advancement, or “burn out”. Fifteen veteran teachers were chosen from the South quadrant area. The second component of this study is comprised of a convenience sample of 15 non-eMINTS colleagues of the veteran eMINTS teachers when they were eMINTS training participants in the FY00, FY01, and FY02 cycles. Comparative analysis of responses from veteran eMINTS teachers to their non-eMINTS colleagues will allow for consideration of variables in matriculation, leadership advancement, or “burn out” not related to the eMINTS training experience. Criteria for selection of the colleague sample will be by grade level and content area correlated with the EMINTS participants during the years of training.

Data Collection and Instrumentation

The model used to support the evaluation tools in this study was based on (a) a thorough review of the literature on the eMINTS instructional model, program evaluation, and teacher leadership, (b) feedback from the Veteran eMINTS Teacher Questionaire, and (c) feedback from the Maslach Burnout Survey tool developed by Christina Maslach.

After identifying the sample population, the researcher sent an informed consent letter (See Appendix A), Maslach Burnout Inventory (See Appendix C), and questionnaire (See
Appendix B) to explain the purpose of the study and request participation. The mailing outlined the purpose of the research, any risks that were present, and explained the participant’s right to withdraw from the study at any time. All responses were collected from a convenience sample. A follow-up mailing was made to the selected population requesting their participation and return of the study instruments.

*Veteran eMINTS Teacher Questionnaire*

The VETQ consists of 16 items used to collect perceptions of the eMINTS training process, as well as the specific age, gender, academic assignment, work environment, and job promotion data. The researcher designed the instrument utilizing the researcher’s own experience and training as a veteran eMINTS participant and knowledge gained from review of related literature on technology training systems. The survey was constructed to allow both veteran eMINTS teachers and their non-eMINTS colleagues to complete the same instrument for this study. Consequently, two key constructs were developed for the VETQ survey, teacher satisfaction, and leadership advancement (See Appendix C). The teacher satisfaction construct referred to how satisfied a teacher is now he/she has completed the eMINTS Professional Training modules. The leadership construct examined whether those who completed the eMINTS Professional Training Cycle advanced to leadership positions. Estimates of both constructs were supplemented by written comments made by teachers about what they liked and did not like about the learning experience.

The VETQ is divided into two sections. Section I (Questions 1 -8) is designed for study participants, and Section II (Questions 9-16) is designed exclusively for the responses of veteran eMINTS teachers. Demographic data collected (questions 1-5) includes specific age, gender,
academic assignment, years in that position, and years served in the classroom assigned during the eMINTS training cycle.

Questions 6, 7, and 8 seek specific information regarding job promotion or advancement following completion of the eMINTS National training cycle and satisfaction with the teaching profession. Questions 9-13 ask participants to provide their perception of how participation in the eMINTS Professional Development modules influenced pedagogical understandings and instructional methodologies.

Question 14 asks participants to gauge their current technological expertise in relation to their non-eMINTS colleagues. Specifically, Veteran eMINTS teachers were asked if they score themselves behind, equal, or ahead of their colleagues in technical understanding. Questions 15 and 16 provide a forum for respondents to express what they did or did not like about the eMINTS Professional Development experience. Responses to these questions were used to determine if a correlation exists between those teachers who express dissatisfaction in the teaching profession and those who express dissatisfaction with the eMINTS training experience.

**Maslach Burnout Inventory-Educators Survey**

The second instrument used, the Maslach Burnout Inventory—Educators Survey (MBI-ES), is designed to measure three subdimensions (exhaustion, depersonalization, and professional efficacy or reduced personal accomplishment) of burnout in educators (Langballe, et. al, 2006). Maslach (1982) maintains work burnout is manifested in three ways: emotional exhaustion, alienation, and lack of sense of achievement (Maslach & Jackson 1981; Maslach, et al., 1996). There are 22 items, which are divided into three subscales. The general term recipients is used in the items to refer to the particular people for whom the respondent provides service, care, or treatment. The items are written in the form of statements about personal feelings or
attitudes (e.g., "I feel burned out from my work," "I don't really care what happens to some recipients"). The items are answered in terms of the frequency with which the respondent experiences these feelings, on a 7-point, fully anchored scale (ranging from 0, "never" to 6, "every day"). Because such a response format is least similar to the typical format used in other self-report measures of attitudes and feelings, spurious correlations with other measures (due to similarities of response formats) should be minimized. Furthermore, the explicit anchoring of all 7 points on the frequency dimension creates a more standardized response scale, so that the researcher can be fairly certain about the meanings assumed by respondents for each scale value. In the original version of the MBI (Maslach & Jackson, 1981), there was also a response scale for intensity of feeling. However, because of the redundancy between the frequency and intensity ratings, the intensity scale was deleted from subsequent editions.

The nine items in the Emotional Exhaustion subscale assess feelings of being emotionally overextended and exhausted by one's work. The five items in the Depersonalization subscale measure an unfeeling and impersonal response toward recipients of one's service, care, treatment, or instruction. For both the Emotional Exhaustion and Depersonalization subscales, higher mean scores correspond to higher degrees of experienced burnout. Because some of the component items on each subscale had low loadings on the other, there exists a moderate correlation between the two subscales, which is in accord with theoretical expectations that these are separate, but related, aspects of burnout. The eight items in the Personal Accomplishment subscale assess feelings of competence and successful achievement in one's work with people. In contrast to the other two subscales, lower mean scores on this subscale correspond to higher degrees of experienced burnout. The Personal Accomplishment subscale is independent of the other subscales, and its component items do not load negatively on them. In other words,
Personal Accomplishment cannot be assumed to be the opposite of Emotional Exhaustion or Depersonalization. Indeed, the correlations between the Personal Accomplishment subscale and the other subscales are low (Maslach, et al., 1996).

Each respondent's test form is scored by using a scoring key that contains directions for scoring each subscale. The scores for each subscale are considered separately and are not combined into a single, total score; thus, three scores are computed for each respondent. If desired for individual feedback, each score can then be coded as low, average, or high by using the numerical cutoff points listed on the scoring key. The MBI takes about 10 to 15 minutes to complete. It is self-administered. Complete instructions are provided for the respondent. The Likert scale for this instrument ranges from 0 (very mild, barely noticeable) to 6 (major, very strong).

Research supports the validity and reliability of the MBI-ES as suitable measurement to assess burnout across a diversity of professions, including teachers and people working in the field of information technology (Maslach, et al., 1996). The MBI is the most widely used measure in research on burnout and is generally regarded as the measure of choice for any self-reported assessment of this syndrome. More extensive psychometric research has been done on the MBI than on any other burnout measure, and its multidimensional conceptualization of burnout has made it particularly appropriate for theory-driven research. The successful new development of the MBI-GS provides further evidence of the viability of both the measurement approach and the underlying multidimensional model for extending our knowledge about burnout.

The stability of the MBI's subscales over time is consistent with its purpose of measuring an enduring state. However, one consequence of this stability is that the measure is relatively
insensitive to minor fluctuations in experienced burnout. It also poses a challenge for researchers
who want to determine relationships over time; if the MBI subscales correlate highly with
themselves over the study interval, there will be less variance remaining to relate to other
predictors (Maslach, et al., 1996).

To date, no clinical research, on either burnout symptomatology or on diagnostic criteria,
has been done using the MBI. Thus, it cannot be used for individual diagnosis because there is
no solid basis on which to identify meaningful cutoff scores or dysfunctional patterns of
response. However, the MBI can be used as a self-assessment tool. Individuals can compare their
scores to the norms presented in the MBI Manual to see where they stand in relation to other
people in their occupational group. This exercise can help people develop an awareness of
whether burnout is an issue they need to address. The awareness that a problem exists can be the
first step in alleviating any form of job burnout (Maslach, et al., 1996).

Although the original Maslach Burnout Inventory was designed to measure burnout in a
variety of human services occupations, a number of studies have focused specifically on the
teaching profession. There are several reasons for this high level of interest in teacher burnout.
First, the teaching profession is one of the largest and most visible professions in the United
States. Second, the teaching profession has been subject to increased pressure by society to
correct social problems (e.g., drug, alcohol, and sexual abuse), educate students in academic and
skill areas, provide enrichment activities, meet the individual needs of all students with a wide
range of abilities, and encourage moral and ethical development. Third, a number of national
reports have illustrated the fact many teachers are leaving the profession, while fewer are
choosing to become teachers. This has resulted in teacher shortages in certain disciplines and
predictions of future shortages in all areas. Because of the high level of interest in teacher
burnout and the need for more research in this particular area, the MBI-Educators Survey was
developed and first published in 1986, in the second edition of the *MBI Manual*.

*Development of MBI-ES.* The MBI-Educators Survey (MBI-ES) (Maslach, et al., 1996) measures
the same three burnout dimensions as the original MBI. As in other helping professions, an
initial aspect of educator burnout, emotional exhaustion, is the tired and fatigued feeling that
devels as emotional energies are drained. When this feeling becomes chronic, teachers find
they can no longer give of themselves to students as they once could. Teachers who no longer
have positive feelings about their students are experiencing the second component of teacher
burnout, depersonalization. Among the many ways teachers can display indifferent, negative
attitudes toward their students are using derogatory labels (e.g., "They are all animals");
exhibiting cold or distant attitudes, physically distancing themselves from students (e.g.,
barricading themselves behind their desk), and "tuning out" students through psychological
withdrawal. The third aspect, a feeling of low personal accomplishment from the job, is
particularly crucial for teachers. Most teachers enter the profession to help students learn and
grow. When teachers no longer feel they are accomplishing this, they can focus on fewer areas to
receive rewards (e.g., putting in more time to make more money) (Maslach, et al., 1996).

The MBI-ES is basically the same as the MBI. However, in some of the items the word
recipient has been changed to student. In the teaching profession, students are the teachers’
recipients. This change was made to ensure clarity and consistency in the interpretation of the
items. The same procedures should be used to administer the scale, and the same key is used for
scoring. Cautions and recommendations regarding the use and interpretation of the MBI also
apply to MBI-ES.
Two studies substantiate the validity and reliability of the MBI-ES with these changes. Factor-analytic studies by Iwanicki and Schwab (1981, as cited in Maslach, et al., 1996) with 469 Massachusetts teachers and by Gold (1984) with 462 California teachers support the three-factor structure of the MBI-ES. In regard to reliability, Iwanicki and Schwab report Cronbach alpha estimates of .90 for Emotional Exhaustion, .76 for Depersonalization, and .76 for Personal Accomplishment, whereas Gold reports estimates of .88, .74, and .72 respectively. These reliabilities parallel those of the MBI (Maslach, et al., 1996).

Studies using the MBI-ES have identified personal, organizational, and role related conditions that are related to the three MBI scales. These studies have identified some recurring themes and unanswered questions worthy of noting for future research. Studies that have examined the relationships between teacher demographics and burnout have consistently found certain background factors predict a small but significant amount of variance in burnout subscales. Age has now been shown to be a significant predictor of Emotional Exhaustion, with younger teachers tending to score higher than older teachers. Male teachers tend to score higher than female teachers on the Depersonalization scale. This finding is consistent with research with other helping professions (Maslach & Jackson, 1985). Teachers who work with high school and junior high school students tend to have lower levels of personal accomplishment than their elementary school counterparts. High school teachers also have more depersonalized feelings toward students than either elementary or junior high teachers.

Survey research using the MBI-ES and employing multiple regression techniques has identified organizational factors that contribute to teacher burnout. Among the many variables that have been studied in relation to educator burnout are role conflict, role ambiguity, participation in decision making, reward systems, need deficiency, freedom and autonomy, and
social support networks. Research using the MBI-ES with educators has depended upon samples of opportunity, single school districts, or cross-sectional samples. However, many of these studies have used data obtained from individual teachers and have translated the findings to the organizational level. In doing this, researchers have assumed an individual's assessment of the organization reflects that of others within the organization. Studies that employ such analyses and make such assumptions are subject to the problem of "ecological fallacy." That is, data gathered at one level (teacher) are used to draw inferences about another level (organization). In terms of burnout research in educational settings, the organizational facts that have been found to be related to burnout may only be teacher-perceived contributors. To correct this problem, data must be aggregated and then analyzed at the school level (Maslach, et al., 1996).

In addition to research, the MBI-ES can be used at the school district level to detect potential problems. It can be administered anonymously to all members of a school district and then analyzed by various populations. If a particular school, department, or grade has significantly higher scores, or if the entire district is significantly higher than the educator norms in the MBI Manual, then follow-tip organizational analysis may be warranted (Maslach, et al., 1996).

Data Analysis

Demographic Analyses

Demographic analysis was performed on the data from the VETQ to investigate the relationship between gender, age, academic assignment (eMINTS vs. non-eMINTS), working environment, teacher burnout, and job promotion. Items 1-5 provide profile and demographic data. The responses were grouped by veteran eMINTS and non-eMINTS teacher colleagues. The data were analyzed using SPSS to determine frequencies and percentages for each group.
Analysis for Research Question 1

The Demographic Data Section of the VETQ survey yields information for the initial research questions #1: Is there a significant difference between the time veteran eMINTS teachers continue to teach in the same content area and grade level after completion of the eMINTS training model and the time their non-eMINTS colleagues continue to teach in the same content area and grade level? The data was analyzed using an independent samples $t$-test of the variables classroom assignment and years in the same position.

Analysis for Research Question 2

Data analyses of the responses to item 7 gauge an interval scale response to satisfaction with the teaching profession for both eMINTS teachers and their non-eMINTS colleagues. The data were analyzed using frequencies and percentages for each group to respond to research questions #2: Are there significant differences between how veteran eMINTS teachers rate satisfaction in teaching after completion of the eMINTS training model and how their non-eMINTS colleagues rate satisfaction in teaching? This comparison will be used in a cross-tabulation with a chi-square to determine if there are patterns among eMINTS teachers who gauge satisfaction with teaching and non-eMINTS teachers who gauge satisfaction with teaching.

Analysis for Research Question 3

Comparative analyses of the responses derived from the Emotional Exhaustion, Depersonalization, and Personal Accomplishment subscale items of the Maslach Burnout Inventory (MBI-ES) were used to determine significance among veteran eMINTS teachers and non-eMINTS teachers regarding subscale items. The data were analyzed using a non-parametric Mann-Whitney $U$ Test of significance for each convenience sample to respond to research
questions #3: Are there significant similarities between how veteran eMINTS teachers score the Maslach Subscale Items of Emotional Exhaustion, Depersonalization, or Personal Accomplishment and how their non-eMINTS colleagues rate these subscale items? The Mann-Whitney $U$ Test determines chances of obtaining greater observations in one population versus the other with the assumption: 1) The two samples under investigation in the test are independent of each other and the observations within each sample are independent. 2) The observations are comparable (i.e., for any two observations, one can assess whether they are equal or, if not, which one is greater).

**Analysis for Research Question 4**

Comparative analyses of the responses to item 6 determines if there are differences in the number of eMINTS teachers who assume leadership positions after completing the eMINTS National training program and the number of non-eMINTS colleagues who assume leadership positions. The data were analyzed using frequencies and percentages for each group to respond to research question #4: Are there significant differences in the number of eMINTS teachers who assume leadership positions after completing the eMINTS National training Program and the number of non-eMINTS colleagues who assume leadership positions? This comparison will determine significance between those who advance to leadership and those who are satisfied with teaching. For each analyses, a test of significance ($p<.05$) was used to determine if eMINTS instructors experience more or less teacher burnout or job promotion in comparison to non-eMINTS personnel.
Analysis for Research Question 5

Responses to items 9-14 of the VETQ, regarding veteran eMINTS perceptions of the eMINTS training methodology, were coded using percentages for each response; a mean score for each subpart was calculated, with the means presented in rank order. This data were analyzed to respond to research question #5: Are there similarities among perceptions held by veteran eMINTS teachers in relation to the eMINTS training methodology? Summaries of categorical variables included frequency and the percentage of response within each category. Statistical analysis comparing teacher perspectives was performed using a $t$-test. All analyses were performed with SPSS.

To assure trustworthiness of the VETQ, the researcher used low inference descriptors. The use of description phrased verbatim (i.e., direct quotation) of participant responses reduced the lack of subjectivity on part of the researcher. Further, triangulation between the Maslach Burnout Inventory and the VETQ allows for "cross-checking" of information and conclusions through the use of multiple data collection sources provides a “holistic’ understanding of the with plausible explanations about the phenomena being studied” (Merriam, 1998, p. 204). Similarities or agreement of the data between the two instruments was used to ascertain validity or corroboration as common themes emerge.

A final strategy to assure accuracy of reporting was the validity measure “member-checking” (Creswell, 2003, p. 196). Member-checking determines truthfulness of the qualitative findings through taking the findings back to the Veteran eMINTS Teachers and their colleagues to determine whether they find the themes and conclusions are accurate.
Summary

This study was designed to investigate veteran eMINTS teachers’ perceived value of the eMINTS instructional model of design. The study explores whether a correlation exists between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the technology enhanced classroom.

This study draws from the cross-sectional survey responses of 15 veteran eMINTS instructors from the FY00 (1999-2000), FY01 (2000-2001), and FY02 (2001-2002) cycles of the eMINTS National Program. The second population for this study was a select sample of 15 non-eMINTS colleagues of the veteran eMINTS teachers when they were eMINTS training participants in the FY00, FY01, and FY02 cycles.

The Veteran eMINTS Teacher Questionnaire (VETQ) instrument for this study was developed by the researcher based on the researcher’s experience, training, as a veteran eMINTS participant, and knowledge gained from review of related literature on technology training systems. A second instrument, the Maslach Burnout Inventory--Educators Survey (MBI-ES), was used to measure three subdimensions of burnout in the study participants. Responses items were correlated statistically comparing teacher perspectives with teacher burnout responses using a t-test.

The survey was sent to the sample group along with a cover letter and informed consent form. Follow-up phone calls, emails, and mailings requesting participation in the study were made to increase the return rate.

The profile and demographic data collected were analyzed using frequencies and percentages. Responses to items of the VETQ, regarding veteran eMINTS perceptions of the
eMINTS training methodology, were coded using percentages for each response; a mean score for each subpart was calculated, with the means presented in rank order.

Subscale total means were calculated and analyzed using an independent samples t-test at alpha=.05. A Pearson correlation at alpha=.05 was made between indicators of leadership advancement on the VETQ and indicators for teacher burnout scale on the MBI-ES.

Research questions for this study are reviewed and data collected for this study are presented in the following chapter. A data analysis is presented in tabular form. A discussion of the data analysis is also provided.
CHAPTER 4

RESULTS

Introduction

While several studies demonstrate the effectiveness of the eMINTS instructional methodology on student success, no research exists to determine veteran eMINTs teachers’ perceptions of training methodology and leadership matriculation as related to systemic technology reform. The purpose of this study was to add to the current field of research regarding the effectiveness of the eMINTS Instructional Program. This study investigated veteran eMINTS teacher’s perceived value of the eMINTS instructional model of design. The study explored whether similarities exist between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the demands associated with training for and maintenance of instruction in the technology enhanced classroom.

Research Questions

Within the context of this study, the following research questions were addressed:

1. Is there a significant difference between the time veteran eMINTS teachers continue to teach in the same content area and grade level after completion of the eMINTS Professional Development Program and the time their non-eMINTS colleagues continue to teach in the same content area and grade level?

2. Are there significant differences between how veteran eMINTS teachers rate satisfaction in teaching after completion of the eMINTS training model and how their non-eMINTS colleagues rate satisfaction in teaching?
3. Are there significant similarities between how veteran eMINTS teachers score the Masclach Subscale Items of Emotional Exhaustion, Depersonalization, or Personal Accomplishment and how their non-eMINTS colleagues rate these subscale items?

4. Are there significant differences in the number of eMINTS teachers who assume leadership positions after completing the eMINTS National training Program and the number of non-eMINTS colleagues who assume leadership positions?

5. Are there similarities among perceptions held by veteran eMINTS teachers in relation to the eMINTS training methodology?

Profile and Demographic data

This study drew from the cross-sectional survey responses of 30 teachers. The determinant for size in this group was to provide enough data to conduct an analysis which yields significant results as indicated by an alpha factor of .05 (Creswell, 2003). Participants were a convenience sample of 15 veteran eMINTS instructors from the FY00 (1999-2000), FY01 (2000-2001), and FY02 (2001-2002) cycles of the eMINTS National Program. The FY00, FY01, and FY02 sequences were chosen as they were the first three cycles of eMINTS participants and sufficient time has passed to allow for review of matriculation, leadership advancement, or “burn out”. Fifteen veteran teachers were chosen from the South quadrant area. The second component of this study was comprised of a convenience sample of 15 non-eMINTS colleagues of the veteran eMINTS teachers when they were eMINTS training participants in the FY00, FY01, and FY02 cycles. Comparative analysis of responses from veteran eMINTS teachers to their non-eMINTS colleagues allows for consideration of variables in matriculation, leadership advancement, or “burn out” not related to the eMINTS training experience. Criteria for selection
of the colleague sample were grade level and content area in correlation with the Veteran eMINTS teacher sample.

The profile and demographic data was presented in a descriptive form and analyzed using frequency of responses. Comparisons of the frequency were made in order to describe the participants of this study. The demographic information is summarized in Tables 1.a, 1.b, 1.c, and 1.d.

Satisfaction with Teaching

Data analyses of the responses to item 7 gauge an interval scale response to satisfaction with the teaching profession for both eMINTS teachers and their non-eMINTS colleagues. The data were analyzed using frequencies and percentages for each group to respond to research questions #2: Are there significant differences between how veteran eMINTS teachers rate satisfaction in teaching after completion of the eMINTS training model and how their non-eMINTS colleagues rate satisfaction in teaching? Table 3 shows the Crosstabulation responses for both Veteran eMINTS Teachers and their Non-eMINTS colleagues for satisfaction with teaching. It can be noted the majority of both samples responded they were Very or Completely satisfied with teaching with a Veteran eMINTS Teacher response of 12 of the

*Teacher Burnout*

Comparative analyses of the responses derived from the Emotional Exhaustion, Depersonalization, and Personal Accomplishment subscale items of the Maslach Burnout Inventory (MBI-ES) were used to determine significance between veteran eMINTS teachers and non-eMINTS teachers regarding subscale items. The data were analyzed using a non-parametric Mann-Whitney $U$ Test of significance for each convenience sample to respond to research questions #3: Are there significant similarities between how veteran eMINTS teachers score the Maslach Subscale Items of Emotional Exhaustion (see Figure 7), Depersonalization (see Figure 8),
Figure 7

Boxplot graph presenting raw score computations for Maslach Inventory Emotional Exhaustion Subscale distributions for Veteran eMINTS Teachers and their Non-eMINTS Colleagues.

or Personal Accomplishment (see Figure 9), and how their non-eMINTS colleagues rate these subscale items? The Mann-Whitney $U$ Test determines chances of obtaining greater observations in one population versus the other with the assumption the continuous distributions for the test variable are exactly the same (except their medians) for the both Veteran eMINTS Teachers and
their Non-eMINTS Colleagues. The second assumption underlying the use of this test for this study is the case study represents random samples from both Veteran eMINTS Teachers and their Non-eMINTS Colleagues, and the scores on the test variable are independent of each other.

Figure 9

Boxplot graph presenting raw score computations for Maslach Inventory Personal Accomplishment Subscale distributions for Veteran eMINTS Teachers and their Non-eMINTS Colleagues
The results of the Mann-Whitney $U$ test show no significant difference, $p < .843$ (see Table 6), in Emotional Exhaustion between the sample groups. The Veteran eMINTS Teachers had a slightly higher average Emotional Exhaustion rank of 15.80 as compared to the average rank 15.20 of their Non-eMINTS Colleagues but this difference is not significant (see Table 5).

The results of the Mann-Whitney $U$ test show no significant difference, $p < .885$ (see Table 6), in Depersonalization between the sample groups. The Veteran eMINTS Teachers had a slightly higher average Depersonalization rank of 15.70 as compared to the average rank 15.30 of their Non-eMINTS Colleagues but this difference is not significant (see Table 5).

Perceptions of eMINTS Methodology

Responses to items 9-14 of the VETQ, regarding veteran eMINTS perceptions of the eMINTS training methodology, were coded using percentages for each response; a mean score for each subpart was calculated, with the means presented in rank order. These data were analyzed to respond to research question #5: Are there similarities among perceptions held by veteran eMINTS teachers in relation to the eMINTS training methodology? Summaries of categorical variables included frequency and the percentage of response within each category. Statistical analysis comparing teacher perspectives was performed using a t-test. All analyses were performed with SPSS.

The majority of the Veteran eMINTS Teacher sample, 73.3%, noted the eMINTS instructional model improved classroom teaching substantially (see Table 13).

A lack of resources, such as time, can be a contributing factor in teacher dissatisfaction. The majority of Veteran eMINTS Teachers, 40.0%, identified travel as the most negative aspect of the eMINTS Professional Development experience (see Table 20). eMINTS teachers are required to participate in 100 hours of training outside of the regular school day each year in a central training location. For some Veteran eMINTS Participants, this meant an additional 2 hours driving to or from training in the evening after the normal school day recessed.

Summary

In summation, there were found to be no significant differences among the Veteran eMINTS Teachers and their Non-eMINTS Colleagues in regards to the three subscales, Emotional Exhaustion, Depersonalization, and Personal Accomplishment, of the Maslach Burnout Inventory-Educators Survey. Additionally, Levene’s Test for Equality of Variances determined there were differences among the two samples in relation to advancement to leadership. There is a significant difference between the numbers of Veteran eMINTS Teachers who advanced to leadership positions versus their Non-eMINTS Colleagues. Five Veteran eMINTS Teachers advanced to leadership positions after completing the National eMINTS Program Training while only two of their colleagues from the sample advanced in the same time period. The most notable data came from 100% affirmation by Veteran eMINTS Teachers that the National eMINTS Instructional Program had a positive career impact.
CHAPTER 5
SUMMARY OF FINDINGS AND DISCUSSION

Overview of the Study

This study was designed to investigate veteran eMINTS teacher’s perceived value of the eMINTS instructional model of design. The study explored if a correlation exists between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the demands associated with training for and maintenance of instruction in the technology enhanced classroom.

This study draws from the cross-sectional survey responses of 30 teachers. The determinant for size in this group was to provide enough data to conduct an analysis which yields significant results as indicated by an alpha factor of .05 (Creswell, 2003). Participants are a convenience sample of 15 veteran eMINTS instructors from the FY00 (1999-2000), FY01 (2000-2001), and FY02 (2001-2002) cycles of the eMINTS National Program. The FY00, FY01, and FY02 sequences were chosen as they were the first three cycles of eMINTS participants and sufficient time has passed to allow for review of matriculation, leadership advancement, or “burn out”. Fifteen veteran teachers were chosen from the South quadrant area. The second component of this study is comprised of a convenience sample of 15 non-eMINTS colleagues of the veteran eMINTS teachers when they were eMINTS training participants in the FY00, FY01, and FY02 cycles. Comparative analysis of responses from veteran eMINTS teachers to their non-eMINTS colleagues allowed for consideration of variables in matriculation, leadership advancement, or “burn out” not related to the eMINTS training experience.
The profile and demographic data was presented in a descriptive form and analyzed using frequency of responses. The Maslach Burnout Inventory-Educators Survey (MBI-ES; Maslach, et al., 1996), the foremost instrument used to examine burnout among professional educators, was administered to all participants in this study. The tool is used to determine burnout across the dimensions of emotional exhaustion, depersonalization, and personal accomplishment. Maslach’s Burnout Inventory is customarily administered to evaluate the relationship between the stress-strain-coping continuum and measured outcomes of burnout. There were no significant differences among Veteran eMINTS Teacher and Non-EMINTS Colleague responses in the three subscales.

Purpose of the Study

The purpose of this study was to investigate veteran eMINTS teacher’s perceived value of the eMINTS instructional model of design. The study explored whether a correlation exists between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burn out from the demands associated with training for and maintenance of instruction in the technology enhanced classroom.

Summary of Findings

Teaching Position

The Demographic Data Section of the VETQ survey was analyzed for information in response to research question #1: Is there a significant difference between the time veteran eMINTS teachers continue to teach in the same content area and grade level after completion of the eMINTS training model and the time their non-eMINTS colleagues continue to teach in the same content area and grade level? The data was analyzed using an independent samples t-test of the variables classroom assignment and years in the same position and found there to be no
significant difference between the time veteran eMINTS teachers continue to teach in the same content area and grade level after completion of the eMINTS training model and the time their non-eMINTS colleagues continue to teach in the same content area and grade level.

Satisfaction with the teaching profession

Data analyses of the responses to item 7 gauge an interval scale response to satisfaction with the teaching profession for both eMINTS teachers and their non-eMINTS colleagues. The data were analyzed using frequencies and percentages for each group to respond to research questions #2: Are there significant differences between how veteran eMINTS teachers rate satisfaction in teaching after completion of the eMINTS training model and how their non-eMINTS colleagues rate satisfaction in teaching? This comparison was calculated using a cross-tabulation with a chi-square and determined there are no significant patterns among eMINTS teachers who gauge satisfaction with teaching and non-eMINTS teachers who gauge satisfaction with teaching.

Teacher Burnout

Comparative analyses of the responses derived from the Emotional Exhaustion, Depersonalization, and Personal Accomplishment subscale items of the Maslach Burnout Inventory (MBI-ES) were used to determine significance among veteran eMINTS teachers and non-eMINTS teachers regarding subscale items. The data were analyzed using a non-parametric Mann-Whitney $U$ Test of significance for each convenience sample to respond to research questions #3: Are there significant similarities between how veteran eMINTS teachers score the Maslach Subscale Items of Emotional Exhaustion, Depersonalization, or Personal Accomplishment and how their non-eMINTS colleagues rate these subscale items? The Mann-Whitney $U$ Test determined there was no significance between how veteran eMINTS teachers
scored on the Maslach Subscale Items of Emotional Exhaustion, Depersonalization, or Personal Accomplishment and how their non-eMINTS colleagues rated these subscale items.

*Leadership matriculation*

Comparative analyses of the responses to item 6 were analyzed to determine if there are differences in the number of eMINTS teachers who assumed leadership positions after completing the eMINTS National training program and the number of non-eMINTS colleagues who assumed leadership positions. The data were analyzed using frequencies and percentages for each group to respond to research question #4: Are there significant differences in the number of eMINTS teachers who assume leadership positions after completing the eMINTS National training Program and the number of non-eMINTS colleagues who assume leadership positions? This comparison determined there was no significance between those who advance to leadership and those who are satisfied with teaching between the two sample groups.

*eMINTS constructivist methodology*

Responses to items 9-16 of the VETQ, regarding veteran eMINTS perceptions of the eMINTS training methodology, were coded using percentages for each response; a mean score for each subpart was calculated, with the means presented in rank order. This data were analyzed to respond to research question #5: Are there similarities among perceptions held by veteran eMINTS teachers in relation to the eMINTS training methodology? Summaries of categorical variables included frequency and the percentage of response within each category. Statistical analysis comparing teacher perspectives was performed using a \( t \)-test.

It was determined there were similarities among perceptions regarding the impact of the eMINTS Instructional Model. In response to VETQ question nine, 73.3% of Veteran eMINTS Teachers said the eMINTS instructional model improved classroom teaching significantly. In
response to VETQ question ten, 33% of respondents stated the amount of time required for professional development by the eMINTS National Center was adequate while 40.0% found it slightly overwhelming. In response to question eleven, 100% of Veteran eMINTS Instructors said the eMINTS professional development model had a positive impact on their career. 60% of those sampled revealed they continue to use some of the constructivist, learner-centered methods proposed by the National eMINTS Center when surveyed in question twelve. For question thirteen, 46.7% of participants noted they moderately use constructivism in the classroom. 73.3% of those polled believe themselves to be ahead of their colleagues in technical expertise (question fourteen). When Veteran eMINTS Teachers were asked in question fifteen what they liked about the eMINTS Professional Development experience, 60.0% stated teacher collaboration while the remaining 40.0% liked the technical training. Four participants did not respond to question sixteen. However, from those that did respond the majority, 40.0%, stated they did not like the added stress of traveling to training.

Conclusions

Although this study examined the differences in burnout and advancement levels in two teacher groups, without analyzing their causes its results may nonetheless be of interest to teachers considering participating in the National eMINTS training model. For those schools which have considered of applying for the eMINTS grant, but have not yet done so because of concerns with the stresses of added technology training, studies such as this may give them the confidence they need to explore the opportunity further. Veteran eMINTS Teachers overwhelmingly agreed the eMINTS Instructional Model had a positive impact on their teaching career.
At the same time, teachers who are experiencing symptoms of burnout and are considering leaving their jobs may find that they can achieve greater job satisfaction, not by leaving the teaching profession, but by teaching in an eMINTS classroom. In the teaching profession, burnout may contribute to and result from both poor classroom climate and school disorganization. School boards may want to sponsor research into the conditions in individual schools which lend themselves to lower levels of teacher burnout and attempt to implement change within their schools. The implications of this study affect not only teachers but also schools, students and communities, and indicate the importance of carrying out further related research.

Limitations of the Study

Self-Report

One of the primary limitations of this study was that the research was based entirely on self-report measures. As the constructs of burnout, efficacy, administrative supports, and curriculum supports are all affected by self-perceptions, it is appropriate to measure these constructs via this method. However, the measures of implementation were also collected through teacher self-report, rather than by an observer, and previous research has found low levels of correspondence between teacher self-report and observed levels of implementation (Wickstrom, Jones, LaFleur, & Witt, 1998).

Population Size and Demographics

The sampling frame should be representative of the population. Considering there are currently over 3,500 eMINTS teachers, 15 Veteran eMINTS teachers may not be an accurate representative of the entire eMINTS population. Further, as those surveyed were all from the
eMINTS South area and experienced the same Cluster Specialist for training, eMINTS teachers from other areas may have alternative perspectives of the eMINTS training model.

Locus of Control and Self-Efficacy

A limitation of this study is the failure to consider individual teacher traits such as locus of control or self-efficacy. Locus of control is a term in psychology which refers to a person's belief about what causes the good or bad results in his or her life, either in general or in a specific area such as health or academics. Those with a high internal locus of control have better control of their behavior, tend to exhibit more political behaviors, and are more likely to attempt to influence other people than those with a high external locus of control; they are more likely to assume their efforts will be successful. They are more active in seeking information and knowledge concerning their situation. There is often a correlation with a high locus of control and leadership advancement (Rotter, 1966).

Teacher efficacy has been defined as "teachers’ belief or conviction that they can influence how well students learn, even those who may be difficult or unmotivated" (Guskey & Passaro, 1994, p. 4). In addition, the construct includes teachers’ judgments about their own capacity to manage student behavior. Low levels of teachers' instructional and classroom management efficacy were associated with poor job performance (Betoret, 2009), and efficacy beliefs have a strong influence on behavior (Tschannen-Moran, Hoy, & Hoy, 1998; Tschannen-Moran & Hoy, 2001). Teachers with a stronger sense of efficacy set more challenging goals for themselves and their students, take responsibility for student outcomes (Ross, 1995), and are more likely to adopt innovations (Fuchs, Fuchs, & Bishop, 1992). Teacher efficacy has been linked to more successful implementation of prevention curricula. In order to fully understand
why a teacher does not advance to a leadership position, it may be important to more closely examine the locus of control and efficacy scale of individual teachers.

*Alternative reasons contributing to burn-out*

The three subscale items for teacher burn-out may be affected by any one of a plethora of contributors to emotional exhaustion, depersonalization, or personal accomplishment. A limitation of this study may be consideration for other factors aside from eMINTS placement and training. Other factors which may contribute to burn-out are an unsupportive school leader, witnessing other teachers failing in their classrooms, parents who fail to support learning and students who have behavioral problems.

*Implications for Practice*

There are several implications which flow logically from the aforementioned conclusions. First, as eleven of the fifteen Veteran eMINTS Teachers left the eMINTS Classroom after extensive hours of eMINTS specific training, it would be worthwhile to more closely examine the reasoning for departure. If there are similar reasons noted for leaving the classroom, other than matriculation to leadership or retirement, the school may more carefully select participants to ensure continued integrity of the program.

In a second implication it may be noted all fifteen Veteran eMINTS Teachers said the eMINTS training program had a positive impact on their teaching career. Of those, five advanced to leadership positions after completing eMINTS training. In addition, twelve of the fifteen Veterans stated they felt a moderate to high level of Personal Accomplishment. These combined points may be considered a testimony to the effectiveness of the eMINTS Instructional Model and a selling point for district level participation.
A final implication of the study is the negative impact Veteran eMINTS Teachers stated travel for training had on the overall eMINTS experience. Perhaps the National eMINTS program may consider more site specific or online opportunities to reduce the stress associated with the requirements of intensive eMINTS training. For example, Maine’s Learning Technology Initiative (MLTI) eMINTS program is part of a ubiquitous 1-to-1 digital learning program which provides laptop computers and wireless classrooms to all 7th and 8th grade students and their teachers, along with resources, technical assistance, and professional development for administrators and teachers. Teachers are given online resources for instruction and on-site support by area cluster specialists as needed. This type of delivery allows teachers to complete their daily commitments without adding undue stress of a lengthened work day or travel. A similar model may positively influence teacher perspectives of the National eMINTS Training Model.

Recommendations for Further Research

There are numerous recommendations for further study of technology based instructional practice, teacher burnout, and advancement to leadership. There is much which has not been investigated regarding the cognitive and pedagogical design of technology based instruction. Understanding an effective model of teacher technology integration preparation may hold promise of more general applicability in the investigation of the mediated nature of student learning. How may we credibly prepare pre-service teachers to effectively use classroom technology to supplement student understanding?

Larger sample size

The study could be repeated with a larger population sample. Though low correlations were found between teacher burnout and demographic data, no statistically significant results
were achieved, possibly due to the small sample size. A larger-scale study could generate statistically significant results.

*Different populations*

The current study was performed using a convenience sample of a population from the South eMINTS area were Veteran eMINTS Teacher participants experienced training under the same eMINTS Cluster Specialist. A repeat study using a sample from the remaining eMINTS area populations showing similar trends could further verify whether a relationship exists between the eMINTS Instructional Teacher Preparation Model, teacher burnout, or advancement to leadership. Further, a possible area of research could be evaluation of specific eMINTS Cluster Specialist effectiveness.

*Locus of control and self-efficacy*

The present study assumes that a lower level of teacher burnout is attributable to the environment experienced by teachers; however, it does not analyze the characteristics of teachers seeking work in schools. Research carried out by Sadowski (1993) there was a positive correlation between an internal locus of control in teachers and lower burnout levels. A further study could be carried out to investigate the level of internal locus of control for eMINTS teachers. The literature reviewed also included a study by Evers (2000) which found that teachers with a strong sense of self-efficacy suffered less from the symptoms of burnout than teachers with low self-efficacy. An additional study could be conducted to verify whether the percentage of teachers with a high level of self-efficacy in eMINTS classrooms is greater than that of their Non-eMINTS Colleagues. These studies could help determine the extent to which training for the eMINTS classroom leads to a teacher burnout level.

*Personality differences*
The personality traits of teachers who seek participation in eMINTS classrooms may vary from those of their colleagues, and it may be these traits, rather than the eMINTS environment itself, that account for either sample’s level of burnout. A longitudinal pretest-posttest study which tests teachers twice – once before eMINTS training and a second time once they have completed eMINTS training– would show whether the confounding variable of personality has an effect on the level of burnout experienced.

Causes of burnout

For the study to be useful to school boards and administrators, the differences in environmental factors leading to burnout must be considered. A study could be performed to investigate the factors leading to burnout that are present in eMINTS classrooms yet absent in Non-eMINTS classrooms. If substantial differences are identified, a study that focuses on why these factors are absent in Non-eMINTS classrooms could help administrators and boards in eMINTS schools reduce the factors that lead to teacher burnout.

APPENDIX A

INFORMED CONSENT LETTERS
Dear Veteran eMINTS Teacher,

I am inviting you to participate in a research project to study Veteran eMINTS Teacher’s perceived value of the eMINTS instructional model of design. The study will explore if a correlation exists between veteran eMINTS teacher perceptions and matriculation to a position of leadership or, conversely, burnout from the technology enhanced classroom. Along with this letter is a short questionnaire that asks a variety of questions about how technology has impacted your professional achievements and instructional technique. You will also find a form, the Maslach Burnout Inventory--Educators Survey (MBI-ES), which is designed to measure three subdimensions (exhaustion, cynicism, and professional efficacy) of burnout in educators. I am asking you to look over each questionnaire and, if you choose to do so, complete it and send [or give] it back to me. It should take you about 10 minutes to complete.

Through your participation I hope to understand the correlation between systemic technology reform for educators and its relation to leadership advancement. I am optimistic the results of the survey will be useful for encouraging classroom teachers to seek advanced technological training, like that provided by the National eMINTS Program. I hope to share my results by publishing them in a scientific journal. There are no foreseeable risks to the participants or to the subjects of this study. Benefits to the subjects or society may include an understanding of the impact of the eMINTS instructional model on teacher matriculation to leadership.

You will not be identified personally and I guarantee complete confidentiality of your responses. I promise not to share any information that identifies you with anyone outside my research group which consists of me and my doctoral advisors at the University of Missouri-Columbia. Please do not put your name on this questionnaire or other identifiable characteristics. You are not required to answer all items and may withdraw at any time without penalty. If you do not feel comfortable returning your survey to me in person, you may also mail it to the address on the enclosed stamped envelope.

Each survey should take you about 10 minutes to complete. I hope you will take the time to complete these questionnaires and return them. Your participation is voluntary and there is no penalty if you do not participate. Regardless of whether you choose to participate, please let me know if you would like a summary of my findings. To receive a summary, write:

Julie R. Thompson, Director of Curriculum and Instruction
West Plains R-VII Central Administration Building
613 W. First Street
West Plains, MO 65775

If you have any questions or concerns about completing the questionnaire or about being in this study, you may contact me at 417-270-0811. This project has been approved by the Institutional Review Board at The University of Missouri-Columbia (Project #: 1161397).

Sincerely,

Julie R. Thompson
Dear Research Participant,

I understand you are the colleague of a former Missouri eMINTS teacher. I am inviting you to participate in my research project to find out teacher opinions regarding the use of technology in the curriculum. My work is part of the requirement for the Doctor of Education degree in Educational Leadership and Policy Analysis at the University of Missouri—Columbia. I want to understand what relationship, if any, may be found in improved technology integration and leadership advancement. I have attached a short survey and a copy of the Maslach Burnout Inventory which I hope you will fill out and return it to me. It should take you about fifteen minutes to complete. There are no foreseeable risks to the participants or to the subjects of this study. Benefits to the subjects or society may include an understanding of the impact of the eMINTS instructional model on teacher matriculation to leadership.

Each survey should take you about 10 minutes to complete. I hope you will take the time to complete these questionnaires and return them. You are not required to answer all items. Your participation is voluntary and there is no penalty if you do not participate. Regardless of whether you choose to participate, please let me know if you would like a summary of my findings. To receive a summary, write:

Julie R. Thompson, Director of Curriculum and Instruction
West Plains R-VII Central Administration Building
613 W. First Street
West Plains, MO 65775

If you have any questions or concerns about completing the questionnaire or about being in this study, you may contact me at 417-270-0811. This project has been approved by the Institutional Review Board at The University of Missouri-Columbia (483 McReynolds • University of Missouri • Columbia, MO 65211 • 573 882-9585 phone • 573 884-0663 fax-- Project #: 1161397).

Sincerely,

Julie R. Thompson

APPENDIX B

VETERAN EMINTS TEACHER QUESTIONNAIRE (VETQ)
Survey

Veteran eMINTS Teacher Questionnaire

SECTION 1: DEMOGRAPHIC DATA

This section is to be completed by all survey participants.

Note: All responses are strictly confidential and will remain anonymous. Please choose one:

☐ I am a Veteran eMINTS Teacher.
   If yes, select your year of participation:
   ☐ FY00 ☐ FY01 ☐ FY02

☐ I am the colleague of a Veteran eMINTS Teacher.
1. What is your sex?
   ○ Male
   ○ Female

2. What is your age? (circle one)  26-35  36-45  46-55  56-65  Over 65

3. Are you still a classroom teacher?
   ○ Yes   ○ No (If not, please briefly explain.)

If you responded Yes to the question above, what is your current teaching assignment? Please specify grade level and content area.

________________________________________________________________________

4. How many years have you been or were you, if no longer applicable, a classroom teacher?

5. Is this the same position you held during your eMINTS training?  ○ Yes  ○ No
   (If you are the colleague of a MO eMINTS teacher but not an eMINTS teacher yourself, is this the same position you held during your colleague’s eMINTS training?)

   If yes, how many years in this position? _____________
6. Did you advance to a new position after completing your eMINTS training?
   ○ Yes  ○ No
   *(If you are the colleague of a MO eMINTS teacher, have you advanced to a new position after your colleague’s completion of eMINTS training?)*
   If you answered YES above, to what do you attribute this job advancement?
   OR choose  ○ N/A

7. How would you currently gauge your satisfaction with the teaching profession?
   ○ Not at all  ○ Minimally  ○ Somewhat  ○ Moderately  ○ Very  ○ Completely

8. If I could select a new career:
   ○ I would still choose to become a teacher.
   ○ I would NOT choose to become a teacher.
Survey

Veteran eMINTS Teacher Questionnaire

SECTION 2: VETERAN PERCEPTIONS
This section is to be completed by Veteran eMINTS Teachers Only.

Note: All responses are strictly confidential and will remain anonymous.

9. To what extent did the eMINTS instructional model improve your classroom teaching?
   - Not at all
   - Very little
   - Moderately
   - Substantially
   - Completely

10. The amount of time required for professional development by the eMINTS National Center was—
    - Insufficient
    - Adequate
    - Slightly overwhelming
    - Moderately overwhelming
    - Overwhelming

11. How did eMINTS professional development impact your career?
    - eMINTS PD had a positive impact on my career.
    - eMINTS PD had a negative impact on my career.
    Briefly explain:

12. How would you currently gauge your instructional methodology in relation to the eMINTS Instructional Model?
    - I continue to use the constructivist, learner-centered methods proposed by the National eMINTS Center.
    - I continue to use some of the constructivist, learner-centered methods proposed by the National eMINTS Center.
    - I do NOT use the constructivist, learner-centered methods proposed by the National eMINTS Center.
13. To what extent do you currently use the constructivist, learner-centered methods proposed by the National eMINTS Center?

- Not at all
- Very little
- Moderately
- Substantially
- Completely

14. In relation to technical expertise, I would gauge myself:

- behind my non-eMINTS colleagues.
- equal to my non-eMINTS colleagues.
- ahead of my non-eMINTS colleagues.

15. What, if anything, did you like about the eMINTS Professional Development experience?

_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________

16. What, if anything, did you NOT like about the eMINTS Professional Development experience?

Teachers in peer-mediated classrooms

Am I still the teacher?:
The teacher’s role in a peer-mediated learning environment

Teachers in peer-mediated classrooms

Abstract

This study explores the professional roles and identities of teachers who are participating in a student-centered instructional model in urban science and mathematics classrooms. In this model, the Peer Enabled Restructured Classroom (PERC) program of the Math and Science Partnership in New York City (MSPinNYC), the teacher plans, facilitates, and assesses student learning with the assistance of high school Teaching Assistant Scholars (TA Scholars). Contrary to traditional, teacher-centered classrooms, the majority of PERC class time is spent with the TA Scholars directing learning experiences in their groups of four students. The teacher is no longer the chief source of information in the classroom. This shift in classroom focus had a variety of impacts on the participating teachers’ sense of their role in the instructional experience and their identities as teachers. Some teachers believed that they had now become the teachers they had always wished to be, while others experienced as loss of identity as their concept of teacher-as-explainer was challenged by implementing the model. Findings also include challenges and possibilities of the new roles that the teachers developed in the PERC model classroom.
Teachers in peer-mediated classrooms

Research Objectives

While previous studies have examined the development of teacher identity and roles at different points in teachers’ careers, the impact of specific pedagogies on teachers’ identities is absent from the literature. This study seeks to fill this gap, exploring the ways teachers perceive their roles in the classroom and their identities as teachers when they implement student-centered, peer-facilitated pedagogy.

Background

This study was conducted as part of the work of the Math and Science Partnership of New York City (MSPinNYC), a National Science Foundation-funded project to improve mathematics and science learning in urban classrooms. The instructional model was named Peer Enabled Restructured Classrooms (PERC) to emphasize the complete change in approach to learning and the central role of the peer-instructor in this process. The PERC program is being implemented in algebra and biology classes in New York City high needs schools, both in summer school and academic year classrooms. The PERC model involves peer-mediated instruction, in which the students spend the majority of the class period working in a small group led by a Teaching Assistant Scholar (TA Scholar). The group activity is carefully planned by the teacher and implemented by the TA Scholars, who provide feedback to the teacher about the instruction and students’ progress. The TA Scholars are students who have passed the course and the associated state exam, but not at a very high level, and are usually one to two years older than the students taking the class. During class, the teacher conducts whole class instruction for approximately 10 minutes and spends the majority of the class time observing student interactions and supporting group functioning. Teachers occasionally work one-on-one with individual students during the group work time. The class ends with a summary or assessment, either whole class or group-based. During a focus group at the beginning of the 2009 summer program, experienced TA Scholars argued forcefully that the PERC classroom would function the same way if the teacher left the room but would be completely altered by the absence of the TA Scholars. While the TA Scholars may have a limited view of the entire classroom process, their perspective certainly suggests that the PERC model has altered the classroom from a teacher-centered to a student-centered learning environment.

The PERC program initially was developed during summer school for high school students who had not passed their state mandated exam in mathematics or science. During the five weeks of the program, the students spend four days a week working with their teachers and TA Scholars. The students’ day consists of a two-hour class followed by a 90 minute tutoring session that focuses on exam preparation. After lunch, the teachers and TA Scholars meet together to reflect on the morning and plan for up-coming lessons. The TA Scholars and teachers then work separately to prepare for future instruction. While the program began using undergraduates as TA Scholars, most TA Scholars in summer 2009 were high school students supervised by one undergraduate per class. Based upon the tremendous success of the summer revision program, in which students pass the state exam at a rate of two to twelve times the rate of standard summer school programs in the city, an academic year model was piloted in spring of 2008 and implemented fully in the 2008-2009 and 2009-2010 academic years. During the academic year program, the TA Scholars are scheduled into both a PERC class to support students taking the course for the first time and their own TA Scholars class, in which they learn
Teachers in peer-mediated classrooms

The pedagogical skills and review the content necessary to implement the PERC lesson, as well as learn advanced mathematics and science content and college preparation skills.

The program has been highly successful for the students, both in terms of test scores and affective responses to learning (Gerena & Keiler, 2009a; Gerena & Keiler, 2009b; Keiler, 2010). TA Scholars also report positive outcomes in terms of self-confidence, understanding of and affective response to science and mathematics, and plans for college attendance. However, while the project has carefully structured, examined, and documented the impacts on both the students and the peer-instructors, the experiences of the teachers have remained relatively unexplored. The current study analyzes the perspectives of the teachers who have participated in the program during the summers of 2008 and 2009 and the 2008-2009 and 2009-2010 academic years. The focus of the study is the examination of the teachers’ perceptions of how implementing this student-centered pedagogy affects their roles and identities as teachers.

Literature Review

“Teacher identity is based upon the core beliefs one has about teaching and being a teacher that are constantly changing and evolving based upon personal and professional experiences” (Grier & Johnston, 2009, p. 59). Cohen (2008) argues that, “teachers’ identities are central to the beliefs, values, and practices that guide their engagement, commitment, and actions in and out of the classroom” (p.80). The initial development of teacher identity is prevalent in the literature. For example, Volkman and Anderson (1998) examine the interaction between personal and professional identity in a first year teacher’s development, analyzing the interactions between reality and expectations. Proweller and Mitchener (2004) argue that students play a central role in the development of their teachers’ professional identities. Grier and Johnston (2009) review the career changer literature, describing the loss of identity many new teachers experience as they leave established careers and enter the classroom. Their own work highlights the challenges these previously competent adults faced as they took on the roles of novices and learners in their development of teacher identities. Eick and Reed (2002) argue that the past experiences of new teachers affect their development of a teacher identity and this identity then affects the pedagogies that teachers choose to implement. Similarly, Rex and Nelson’s (2004) study of the pedagogical choices of secondary English teachers demonstrates that such decisions are strongly affected by teacher identity. Teacher self-efficacy is related to the concept of teacher identity. Davis, Petish, and Smithey’s (2006) review of the literature describes the impact of teacher self-efficacy on their choice of pedagogies, with stronger self-efficacy being associated with inquiry-based instruction. Additionally, multiple studies have demonstrated that participating in inquiry-based instruction increases teachers’ self-efficacy (Richardson & Liang, 2008). However, there is an absence of research exploring the ways in which practicing teachers’ roles and identities are affected by implementing new pedagogies, which is the focus of the current study.

Methodology

This study draws on a variety of data sources (Stake, 1994, 1995; Yin, 2009) to explore teacher perspectives about their roles and identities in peer-mediated classrooms. Data was collected during the summers of 2007, 2008 and 2009, as well as during the 2008-2009 and 2009-2010 academic years. Twenty teachers, along with their TA Scholars and students, were
involved in the study. Data sources included semi-structured interviews (Kvale, 1996; Merriam, 1988), focus groups (Krueger & Casey, 2009), surveys, reflective writing, and classroom observations. Categories emerged through close reading of the data and patterns developed within the categories through reiterative review of the data (Huberman & Miles, 1994).

Findings

“How do I do this?”

As with Grier and Johnston’s (2009) study, the teachers participating in the MSPinNYC program had to develop an identity of novice and learner. However, while previous work explored this experience for career switchers, the teachers in this study were not changing careers but developing new pedagogies to implement in their existing classrooms. The teachers in the current study had a wide range of responses to this learner identity. Some claimed to welcome the opportunity to develop new skills that they thought would benefit their students while others resisted losing their expert identities. Those who were eager to learn implemented the model quickly compared with their peers who tried to hold onto their expert status, regardless of their own preferred pedagogies.

“This was the best way to come into the program.”

The MSPinNYC has established summer school as a primary means of orientation to the PERC program and professional development for the participating teachers. During the summer of 2009, nine teachers entered the program by teaching the full 5 weeks of summer school. The teachers worked in three pairs and one trio to plan and implement the four PERC classes. Each morning the teachers facilitated the PERC classes, supervised the tutoring sessions run by the TA Scholars, and met with their TA Scholars to get feedback and give them their assignments for the next day. Each afternoon the teachers collaborated with the researchers and professional development staff to discuss the days’ lessons and student progress, and then to plan the subsequent day’s lessons. A TA Scholar who was a college student with experience in the program led the high school TA Scholars during their planning time. The TA Scholars worked together in the afternoons to prepare their tutoring sessions for the following day. Four additional teachers spent one week participating in the classes and being mentored to plan their own PERC lessons for the academic year. Two teachers had no summer experience but had the opportunity to observe the PERC and TA Scholars classes in their school during the spring of 2009.

In interviews both during the summer and the 2009-2010 academic year, summer school teachers attributed their successful entry into the program to the collaborative planning with peer teachers and mentorship by researchers and professional development staff. They claimed that having targeted feedback about their PERC lesson plans was critical for them as they changed their thinking about their role in the classroom and learned how to teach through the TA Scholars. During the academic year, teachers complained about mentoring from professional development staff that waivered from issues central to PERC into other aspects of their teaching and interactions with administrators. Teachers who were isolated in implementing PERC within their schools were frustrated by the lack of collaborative planning during the academic year. While planning upcoming lessons was a major component of monthly professional development meetings and teachers shared lessons and resources across schools through online communication, daily planning with a peer PERC teacher in the same discipline proved invaluable to the teachers who were able to continue this type of relationship year-round.
Teachers who spent a week in the summer program claimed that sitting in on real PERC classes and planning PERC lessons under the mentorship of professional development staff enabled their smooth transition to PERC teaching. Teachers who did not experience summer school argued that being able to see the PERC and TA Scholars classes in action the previous spring was necessary and sufficient for their introduction as a PERC teacher. Each teacher claimed that the way he or she entered the program was appropriate.

“It lets me be the teacher I always wanted to be.”

Some teachers described the ways in which participating in the MSPinNYC PERC model allowed them to fulfill their vision of what it means to be a teacher. Teachers in this group tended to view themselves as facilitators of learning and believed that the model allowed them to live this role in ways that had not been possible in the traditional classroom. They described the shift in their role in the classroom from dispenser of information to assessor of understanding. At the end of the 2008-2009 academic year, one teacher reflected that in her favorite lessons she did not talk to the whole class at all and the lesson was completely implemented by the TA Scholars, allowing her to listen to the students and gain insight about what they could do. Another teacher, new to the program in the 2009-2010 academic year, expressed a similar perspective during his first month, claiming that the most effective lessons were review carousels completely facilitated by the TA Scholars. These teachers argued that planning effective learning experiences for the peer-instructors to implement was their most important function in this new system. They claimed that they were working harder than ever to prepare for PERC classes, but that during class they were much more relaxed and reflective than in previous years. They perceived that the active engagement of the students in the learning process had reduced classroom management demands. Further, they explained that when a student did need personal attention from the teacher for a behavioral issue, the TA Scholars ensured that the rest of the class was still learning. Thus, the PERC model allowed them to reduce their identity as disciplinarians. One of the teachers who learned the PERC model in the summer enthusiastically described September of 2009 as the best start of her 4-year career.

“I hardly teach anymore.”

For other teachers, learning to be a program teacher challenged their very concept of what it means to teach. These educators claimed that their favorite mode of both learning and teaching was lecture. However, most teachers in this group acknowledged that this pedagogy was not effective for their students, as evidenced by their test scores and their behavior in class. Still, these teachers’ identities seemed to be wrapped up in their role as lecturer. In a 2009 summer professional development session in which he was demonstrating the PERC model, one teacher claimed, “I hardly ever teach anymore.” When challenged to explain this claim, it became clear that he equated ‘teaching’ and ‘explaining.’ This attitude was prominent for several teachers as they entered the program, having a very clear sense of their identity as the person who explained concepts and processes to their students. However, the concept of teaching for several of these teachers changed through their participation in the summer program. This was evident in end-of-summer interviews in which teachers used language such as “Now, I rarely talk when I teach.” Thus, they were still ‘teaching,’ but in new ways.

Teachers in this category also initially believed that they had more control over the classroom when they were the center of instruction. During the summer of 2009, one teacher, who had just finished the first year of his alternative certification program, expressed frustration that a
learning activity in which the students were highly engaged and demonstrating increased understanding was taking longer than he had planned. He claimed, “When I am teaching, I know how long it is going to take.” When the researcher queried, “Then have you ever know how long it takes the students to learn it?” he stood in stunned silence, eventually responding, “I never thought about it that way.” Throughout the 2009-2010 academic year he referred to this moment as an epiphany in his teaching, when he first realized that planning was not about him and what he would do but instead was about student learning.

“The TAs know them much better than I do.”

A critical part of many teachers’ identities seemed to involve their care for and understanding of individual students. Some believed that they understood their students better because of the structure of the PERC classroom. One teacher described her surprise at the higher order thinking that her students could do with the TA Scholars compared to the lower order questions she had asked the same students in previous classes. Another teacher described the personal interactions she had with students, particularly those who were struggling, in her PERC classes in contrast to the whole group overview she had before joining the program. Teachers talked about the increase in information accessed as they listened to the small group interactions, claiming that it was easier to listen carefully when they did not have to think about their responses to student questions or the next question to pose to students themselves.

Other teachers perceived the TA Scholars as a buffer between themselves and their students. One teacher claimed that teachers did not know that a student was an English Language Learner because they relied on the TA Scholars for that kind of information. Another teacher expressed dismay that the TA Scholars seemed to have a much deeper understanding of student learning progress than he did. While he initially intimated that the TA Scholars were blocking his direct access to this information, during subsequent conversation with a researcher this teacher admitted that he had not accessed this level of insight about his students when his classes had been teacher centered. What was different with the PERC model was that the TA Scholars had demonstrated the kinds of information available about student understanding in this classroom. This teacher admitted that he was jealous of his TA Scholars’ insights, while believing that he needed to look at more of the students’ written work in order to catch up on this understanding.

“What is my role regarding the TA Scholars?”

Even though every teacher to participate in program has praised the impact that the TA Scholars have on student learning and affect in their PERC classes, all but one of the teachers has seemed to struggle with some aspects of their relationships with the TA Scholars. In many cases, this could be attributed to the teachers’ over estimation of the TA Scholars’ maturity and independence. Becoming managers of other instructors in their classrooms was a new role that proved difficult to master.

Throughout the summer of 2009, teachers praised the TA Scholars for their in-class efforts, but complained to the administrative staff and researchers about the lack of effort that the TA Scholars were putting into their preparation for class and tutoring sessions. The staff and researchers encouraged the teachers to be clear and firm with the TA Scholars about expectations, reminding them that the teachers are the bosses in an employer-employee relationship. Teachers also were reminded that most of the TA Scholars were high school students and needed to be monitored to ensure that they were meeting expectations. For example, when a researcher saw the TA Scholars in the computer lab looking at You-Tube videos
unrelated to the upcoming lessons, she talked to the teachers about increasing their level of supervision of the TA Scholars’ work. Teachers increased their vigilance for that day, but quickly returned to leaving the undergraduate TA Scholar to supervise the high school TA Scholars. This led to continuing frustration for the teachers, as many TA Scholars did not complete assignments unless the teachers actively intervened.

During the 2008-2009 and 2009-2010 academic years, teachers whose TA Scholars class was scheduled during the first period of the day had significant attendance problems in that class. They claimed that some TA Scholars who took their PERC work very seriously and made a positive impact on their students’ learning were much less committed to their own preparation class. When asked what they were doing about this problem, some teachers said that they did feel comfortable “coming down hard” on the TA Scholars. A similar phenomenon occurs around homework. The MSPinNYC PIs feel strongly that doing homework is a critical aspect of the college preparation component of the TA Scholars’ course. Holding the TA Scholars responsible for the assigned homework is another standard that most teachers struggle with maintaining. Assigning and completing homework is rare in these urban schools, and participating in this cultural shift is something most teachers do not impose upon their TA Scholars during the teachers’ first year in the program. However, a dramatic shift in perspective takes place as teachers enter their second year in PERC. Second year PERC teachers are much more comfortable being demanding of their TA Scholars from the beginning of the year, imposing strict attendance and homework policies. This change in requirements seems to reflect a shift in attitude from being grateful that the TA Scholars are there in the PERC class to seeing that the TA Scholars benefit from the program themselves and need to be held accountable.

“What will my AP think?”

In addition to their own responses to the experience, the teachers’ identities included concern about how others would view their teaching in the new model. Some teachers expressed concern over how MSPinNYC program staff members were evaluating their performance in the PERC classrooms. These teachers shared their anxiety and perceptions that they were being judged as they learned to teach in the PERC model during summer school. Other teachers described apprehension about how their base school assistant principals would view their work as they implemented the model. Still other teachers articulated the value they felt in being treated as professionals in the classroom as the model was developed, implemented, and tested. One teacher claimed, “You have no idea what it is like to have someone come into your class and treat you as an equal, intelligent professional.” While some teachers discussed the tutors’ perceptions of them, none discussed how their students might view them in their new classroom roles.

Importance of the Study

Teachers’ identities and their perception of their roles in the classroom have implications for teacher retention as well as student learning. If teachers are not comfortable with their identities and if they believe that their work is not valued, they tend to leave the profession (Costigan, 2004, 2005; Flores, 2006; Sparks & Keiler, 2003), exacerbating urban teacher shortages (Baker & Smith, 1997; Ness, 2001; Pigge & Marso, 1997; Scherer, 2003). It would not serve the schools or their students well to participate in a highly effective educational model only to have the teachers involved change careers. This study highlights important shifts in teachers’ roles and
Teachers in peer-mediated classrooms

identities as they implement this peer-mediated educational model, as well as their affective responses to these changes. These responses affected the facility with which the teachers learned to implement the model and their ability to implement it effectively.

The findings of this study have shaped the development of the professional development program for the next phase of the MSPinNYC. When schools enter the program, two teachers in a subject area will become PERC teachers together. This will facilitate collaborative planning of both the PERC and TA Scholars classes. It will enable teachers to visit each other’s classes, benefitting both the observed and observing teacher (Showers & Joyce, 1996). Teachers will have the opportunity to observe PERC and TA Scholar classes the spring before they join the program as part of their orientation. This is consistent with the findings of this study as well as Topping’s (2001) claim that teachers are more willing to implement pedagogies that they have seen used in actual classrooms. In response to teacher concerns about professional development staff behaving like administrators, a clear division will be developed between the professional development staff, who work with the teachers, and the project director, who works with the school administrations. Mentoring will focus on planning for PERC and TA Scholar classes, as well as developing relationships with the TA Scholars. This will satisfy the common teacher desire for mentoring tied to their daily work (Carter & Keiler, 2009). MSPinNYC research will continue to explore the development of teacher roles and identities in the PERC program, developing insights about both program entry and growth and development within the program.

TITLE: “Insights into Five Centuries of Gender and Ethnicity Challenges To Women of Diverse Populations Serving in the American Armed Forces.”

TOPIC AREA: Teacher Education, Social Studies Education

PRESENTATION FORMAT: This will be a presentation of a Power Point and Paper Session of research about challenges that diverse populations of women face in the American military because of their ethnicities and gender.

Abstract:
What have been the impacts of societal perspectives and discrimination regarding gender, ethnicity, color, and class on diverse American women [e.g. Native American, African American, Asian Pacific, and Hispanic American] in the armed forces between the 17th and 21st centuries? The “official” history of women in the US military begins in the 20th century with the establishment of the army nurse corps in 1901. That history records almost one-half million women who served in wartime and 1.2 million women veterans counted by the 1990 census. The “official” history ignores tens of thousands of women who have served the military since this country’s founding. Contemporary women in the armed forces who engage in combat are subjected to additional challenges of “balancing family life with a military career, inadequate military health care specifically for women, high rates of sexual assault and harassment, and opportunities for career advancement.”

Section One Introduction

RATIONALE FOR CHOOSING THE TOPIC
The “official” history of women in the US military begins in the 20th century with the establishment of the army nurse corps in 1901. That history records almost one-half million women who served in wartime and 1.2 million women veterans counted by the 1990 census. The “official” history ignores tens of thousands of women who have served the military since this country’s founding.

Contemporary women in the armed forces who engage in combat are subjected to additional challenges of “balancing family life with a military career, inadequate military health care specifically for women, high rates of sexual assault and harassment, and opportunities for career advancement.”

OBJECTIVES OF THE TOPIC
The cognitive or knowledge based objectives of this paper include [1] analysis of the historical roles of diverse populations of women in the US military between the 17th and 21st centuries; [2] learning about selected cases of challenges to diverse populations of women in the US military; and [3] comparison of war/peacetime contributions of diverse populations of women in the US military.

Affective objectives of this paper focus on [1] valuing the contributions of diverse populations of women in the US military; [2] gaining insights into the psycho-social impact of discrimination by color, gender, and/or ethnicity on diverse populations of women in the US military; and [3] rethinking how to teach about women in the US military, especially diverse women populations.

METHOD USED FOR THIS PAPER
The method used to conduct the research for this study was a qualitative one. Qualitative research is a method that seeks insights through verbal and written, rather than statistical and measurable, data. Qualitative research is used when there is an exploratory study that seeks to identify the dimensions of a problem, draw assumptions based on collected data from documents and a variety of primary and secondary sources, and attempts to understand the motivations of the stakeholders involved with the problem.

THE PROBLEM STATEMENT
What have been the impacts of societal perspectives and discrimination regarding gender, ethnicity, color, and class on diverse American women [e.g. Native American, African American, Asian Pacific, and Hispanic American] in the armed forces between the 17th and 21st centuries?
Section Two Selected Review of Literature:

Most of the sources consulted for this study were found through various internet searches that uncovered websites for inclusion in this limited study of diverse American women [e.g. Native American, African American, Asian Pacific, and Hispanic American] in the armed forces between the 17th and 21st centuries. A plethora of websites are available through the various browsers available to researchers. How does one know if the quality of the content on the websites is valid and worthy of inclusion in his/her study? The following seven criteria must be applied in evaluating the quality of internet websites.

<table>
<thead>
<tr>
<th>Authority</th>
<th>Who says? Know the author. Who created this information and why? Do you recognize this author or their work? What knowledge or skills do they have in the area? Is he or she stating fact or opinion? What else has this author written? Does the author acknowledge other viewpoints and theories?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objectivity</td>
<td>Is the information biased? Think about perspective. Is the information objective or subjective? Is it full of fact or opinion? Does it reflect bias? How? How does the sponsorship impact the perspective of the information? Is a balance of perspectives represented? Could the information be meant as humorous, a parody, or satire?</td>
</tr>
<tr>
<td>Authenticity</td>
<td>Is the information authentic? Know the source. Where does the information originate? Is the information from an established organization? Has the information been reviewed by others to insure accuracy? Is this a primary source or secondary source of information? Are original sources clear and documented? Is a bibliography provided citing the sources used?</td>
</tr>
<tr>
<td>Reliability</td>
<td>Is this information accurate? Consider the origin of the information. Are the sources truth worthy? How do you know? Who is sponsoring this publication? Does the information come from a school, business, or company site? What's the purpose of the information resource: to inform, instruct, persuade, and sell? Does this matter? What's their motive?</td>
</tr>
<tr>
<td>Timeliness</td>
<td>Is the information current? Consider the currency and timeliness of the information. Does the page provide information about timeliness such as specific dates of information? Does currency of information matter with your particular topic? How current are the sources or links?</td>
</tr>
<tr>
<td>Relevance</td>
<td>Is the information helpful? Think about whether you need this information. Does the information contain the breadth and depth needed? Is the information written in a form that is useable (i.e. reading level, technical level)? Is the information in a form that is useful such as words, pictures, charts, sounds, or video? Do the facts contribute something new or add to your knowledge of the subject? Will this information be useful to your project?</td>
</tr>
<tr>
<td>Efficiency</td>
<td>Is this information worth the effort? Think about the organization and speed of information access. Is the information well-organized including a table of contents, index, menu, and other easy-to-follow tools for navigation? Is the information presented in a way that is easy to use (i.e., fonts, graphics, headings)? Is the information quick to access?</td>
</tr>
</tbody>
</table>

Source: Teacher Tap – It is a free, professional development resource that helps educators and librarians address common questions about the use of technology in teaching and learning by providing easy access to practical, online resources and activities. [http://eduscapes.com/tap/topic32.htm](http://eduscapes.com/tap/topic32.htm)

A major source of information consulted in this study is the Women in Military Service for America Memorial website. ([http://www.womensmemorial.org/H&C/h&cwelcome.html](http://www.womensmemorial.org/H&C/h&cwelcome.html)) The web pages are divided into four main categories:

- **Collections**, highlighting photographs, documents, textiles, artifacts and audiovisuals available for research;
- **Exhibits**, featuring selected visuals from the many special and permanent exhibits currently on display at the Women’s Memorial;
- **History**, offering an overview of the history of women who have served in or with the US Armed Forces and resources for further study; and
- **Oral History**, providing a how-to guide, consent forms and a finding aid for those interested in the oral history program as well as excerpts from the hundreds of oral histories in our collections.
A second important website about women in the American military is the U.S. Army Women’s Museum, Fort Lee, Virginia. ([http://www.awm.lee.army.mil/](http://www.awm.lee.army.mil/)) The “about us” page explains that:

The U.S. Army Women's Museum is the only museum in the world dedicated to Army women. The Museum honors women's contributions to the Army from the Revolutionary War to the present, telling their stories with interactive exhibits and videos throughout the gallery, as well as film presentations in our theater. The museum also has an extensive research and learning center, unique gift shop and memorial garden.

A limited review of the literature about women during the American Revolution, and Civil War is included here. Julia Ward Stickley is known for her work about a Revolutionary War woman soldier in "The Records of Deborah Sampson Gannett, Woman Soldier of the Revolution," in the National Archives’ publication *Prologue* 4 (1972): 233—241. Another interesting website sponsored by the National Archives, is entitled Women Soldiers and Nurses of the American Civil War.

It is an accepted convention that the Civil War was a man's fight. Images of women during that conflict center on self-sacrificing nurses, romantic spies, or brave ladies maintaining the home front in the absence of their men. The men, of course, marched off to war, lived in germ-ridden camps, engaged in heinous battle, languished in appalling prison camps, and died horribly, yet heroically. This conventional picture of gender roles during the Civil War does not tell the entire story. Men were not the only ones to fight that war. Women bore arms and charged into battle, too. Like the men, there were women who lived in camp, suffered in prisons, and died for their respective causes.

Both the Union and Confederate armies forbade the enlistment of women. Women soldiers of the Civil War therefore assumed masculine names, disguised themselves as men, and hid the fact they were female. Because they passed as men, it is impossible to know with any certainty how many women soldiers served in the Civil War.

The army itself, however, held no regard for women soldiers, Union or Confederate. Indeed, despite recorded evidence to the contrary, the U.S. Army tried to deny that women played a military role, however small, in the Civil War. ([http://american civi1war.com/women/](http://american civi1war.com/women/))

**Sarah Emma Edmonds Seelye served two years in the Second Michigan Infantry as Franklin Thompson [Art]. In 1865, she received a military pension.**

**ALBERT D.J. CASHIER ne JENNIE HODGERS**

The work of Deanne Blanton is well known for its focus on women in the Civil War. She has experience as a military archivist at the National Archives in Washington, D.C., and has served as president of the Society for Women and the Civil War. (http://www.swcw.org/DBlanton.html) She has written Women Soldiers of the Civil War, Parts 1, 2, 3. A 1993 review of Blanton’s work in the National Archives’ Prologue Magazine [Spring 1993, Vol. 25, No. 1] indicated that

Even though some modern writers have considered Seelye and Cashier, the majority of historians who have written about the common soldiers of the war have either ignored women in the ranks or trivialized their experience. While references, usually in passing, are sometimes found, the assumption by many respected Civil War historians is that soldier-women were eccentric and their presence isolated. Textbooks hardly ever mention these women…… For the most part, modern researchers looking for evidence of soldier-women must rely heavily upon Civil War diaries and late nineteenth-century memoirs. (http://www.archives.gov/publications/prologue/1993/spring/women-in-the-civil-war-1.html)

Clandestine Women: Spies in American History, an exhibit presented at the National Women’s History Museum is significant for its exposure of information about women who have been labeled “shadow warriors.” (http://www.nwhm.org/spies/1.htm)

While spies and their stories naturally fade into obscurity, women operatives in particular have been largely overlooked by writers and historians. At least part of this reality can be traced to the secret nature of espionage work. ……Researchers are finding long forgotten records, attesting to the heroism and patriotism of these “shadow warriors.” With this exhibit, the National Women’s History Museum honors the contributions of female intelligence officers throughout American history and the spirit and dedication characterizing their service. To view the exhibit, click the next button on the bottom of each page, or jump ahead to a specific section (American Revolution, Civil War, World War I, World War II, Cold War, and Post Script).

Phillip Kalisch’s book review of Cadet Nurse Stories: The Call for and Response of Women During World War II, written by Thelma M. Robinson, R.N., MSN, PNP and Paula M. Perry, AD, RN and PHN, revealed that “More than 50 years after World War II, cadet nurses tell their stories about how they helped win the war on the home front by serving in hospitals during the worst nurse shortage in history. Recalling what it was like to serve their country, these women share touching historical and personal stories about their experiences.” More than 180,000 Cadets served in more than 2,000 hospitals as student nurses.

NATIVE AMERICAN CADET NURSES
http://www.rpadden.com/nurses/native_cadets.htm
RESEARCH QUESTIONS

Multiple preliminary research questions were formulated by the writer about the central focus in this study, diverse women populations in the American military service.

1. Who were the little known or ignored diverse women who have served the military?
2. Why have women enlisted in the armed forces?
3. Why has the American government recruited women into the armed forces?
4. What are selected examples of American Women’s military experiences between the 17th and 21st centuries?
5. What have been the highlights of diverse populations of American women in the military?
6. What are some selected cases of challenges to diverse populations of American women in the military?
7. What are the contemporary challenges to women in the American armed forces?

Section Three Analysis of Data and Findings

Who were the little known or ignored diverse women who have served the military?

Women of a variety of ethnicities have defended America in both war and peacetime. Their contributions, for the most part, have not received the recognition, or the rewards that they have deserved. Native American women’s contributions in the nation’s armed forces are sparsely known.

Historians have only recently rediscovered and verified the actions of an Oneida woman, Tyonajanegen, at the battle of Oriskany during the American Revolution (1775-1783). Tyonajanegen was married to an American Army officer of Dutch descent. She fought at her husband's side on horseback during the battle, loading her husband's gun for him after he was shot in the wrist.

The World War I Army Nurse Corps included Fourteen Native American women, two of whom served overseas. A little known fact is that nearly 800 Native American women saw military service during World War II. Private Minnie Spotted-Wolf of Heart Butte, Montana was the first Native American woman who enlisted in July 1943 in the U.S. Marine Corps Women’s Reserve. Many Native American women enlisted in the armed forces in the 1950’s and 1960’s during the Korean and Vietnam conflicts. It was not until the 1970s and 1980s that the number of Native American women who enlisted in the armed forces increased. Five hundred and nine Native American women and Native Alaskan women were serving in the military forces of the United States as of 1994. The first known Native American service woman killed in combat during Operation Iraqi Freedom in March, 2003 was a member of the Hopi people, Lori Piestewa,

In keeping with Native American heritage and culture, the tribes showered the Piestewas with gifts – blankets, shadow boxes, paintings and eagle feathers ………the most frequently asked question on the Hopi reservation was: ‘Why did Lori join the Army?’…..Perhaps it was because she followed in the legacy of those before her – her father, a Vietnam veteran, and her grandfather, a World War II veteran.…..Maybe it was because of early ROTC involvement……Only Lori could give us the answer. Whatever the reason, the question should not be
why did she, but rather, why is it strange for her not to? (http://userpages.aug.com/captbarb/wimsaex.html)

Pfc. Lori Piestewa, right, and Jessica Lynch pose at Fort Bliss, Texas the day before their deployment to the Middle East in Feb. 2003. The Army notified the Piestewa family in Tuba City, Ariz., Friday, April 4, 2003, that they had recovered Lori's remains after rescuing Jessica, who was in Piestewa's company in Iraq http://dopeless-hope-fiend.blogspot.com/2009/01/lori-ann-piestewa_3274.html

Women in the United States Armed Forces share a common history of discrimination based on their gender, but black women have faced a double blow based on both their color and gender. A minor number of Hispanic women joined the American armed forces when, in the early 20th century, the national government first began to accept females into the military. Traditional Hispanic cultural values mitigated Hispanic women’s military enlistment because they were discouraged by their families from traveling long distances or from working outside their homes. (http://www.womensmemorial.org/HisHistory.html) Only a limited number of Asian Pacific American service women have revealed the stories of their military experiences, even though they have served on the domestic front and foreign theater during war and peace. (http://www.womensmemorial.org/APA.html) “The ‘official’ history of American women in the armed forces ignores tens of thousands of women who have served the military since this country’s founding.” (http://www.gendergap.com/military/usmil1.html)

WHY HAVE WOMEN ENLISTED IN THE ARMED FORCES?

Five major reasons may be identified as to why women have enlisted in the American armed forces of the years: [1] to perform services for the male troops; [2] to carry on the work of men; [3] to spy for “their side” in the armed conflict; [4] to free a man to fight; and [5] to use military service as a stepping stone for career advancement.

[1] To perform services for the male troops

Women served in the military during the American Revolution to assist on the battlefields as: nurses, water bearers, cooks, laundresses, and saboteurs. Union and Confederate women were allowed to provide medical aid and casualty care to the troops on both sides of the fighting lines during the Civil War in one of the few socially acceptable contributions to their respective nation’s military efforts. (http://www.womensmemorial.org/WHM982.html) Men were known to resent women tending to naked soldiers and see the bloody horrors of warfare on the battlefields and in hospitals. Nursing duties during the Civil War included

- Tending to and cleaning wounds
- Feeding meals
- Administering medications
- Comforting the dying
- Searching for wounded on the battlefields
- Assisting doctors during operations
- Writing letters for the soldiers
- Talking to soldiers and building up moral
- Transporting and delivering supplies
- Overseeing sanitary conditions at various facilities
- Standing up for their moral convictions in the face of graft, correction, and incompetence and changing it whenever they could.

(\url{http://www.dtdsk8.org/6_8/8/Civil%20War%20Webpage-RS/duties.html})

Minimal remuneration of thirty dollars a month was paid to over one thousand civilian contract nurses during the Spanish-American War. (\url{http://www.womensmemorial.org/Highlights.html})

[2] To carry on the work of men

There are some examples of women who enlisted in the military, disguised as men, to carry on the work of males in the armed forces. Obituaries of female soldiers during the Civil War supply much of the information about their service. (NARA, Records of the Adjutant General's Office, 1780's - 1917, RG 94). A death notice on October 4, 1920 for Mrs. Elizabeth A. Niles indicated that she successfully concealed her gender with “close cropped hair and a uniform” during the Civil War as a soldier fighting next to her husband, Martin, in the Fourth New Jersey Infantry. (\url{http://www.archives.gov/publications/prologue/1993/spring/women-in-the-civil-war-3.html})

“Historians are not sure how many women entered military service in disguise during the eighteenth and nineteenth centuries, because only those who were ultimately discovered are recorded.” (\url{http://www.womensmemorial.org/WHM982.html}) Deborah Samson of Plymouth, Massachusetts volunteered in the colonial army during the American Revolution disguised as a young man in October, 1778. She enlisted as Robert Shirtliffe and served for the entire length of the War in the Captain Nathan Thayer’s of Medway, Massachusetts Company. Her duties varied, and she was twice wounded during her three years of service: by a sword cut on the side of her head, and a bullet wound through the shoulder. She was able to keep her gender a secret during her service. Only when she was stricken with a brain fever prevalent among the soldiers was her true identity uncovered. (\url{http://www.undelete.org/military/timeline1.html})
How did women soldiers successfully enlist in the services, and thereafter, continue to deceive their males in the ranks and their superiors?

It was probably very easy. In assuming the male disguise, women soldiers picked male names. Army recruiters, both Northern and Southern, did not ask for proof of identity. Soldier-women bound their breasts when necessary, padded the waists of their trousers, and cut their hair short…… Most recruiters only looked for visible handicaps, such as deafness, poor eyesight, or lameness. Neither army standardized the medical exams, nor those charged with performing them hardly ever ordered recruits to strip. That roughly 750 women enlisted attests to the lax and perfunctory nature of recruitment physical checks.

[3] To spy for “their side” in the armed conflict

The gathering of information about one's enemy is an age old activity. Leaders needed to know the strengths and weaknesses of their enemies. “Through the ages spying developed into an art form and no one was better at it than women.” Espionage and its related intelligence collection often have not been acknowledged for the major role that they have played in American History. The “fairer sex” served as General George Washington’s spies or “field agents” against the overwhelming odds of the British forces during the Revolutionary War. “Women have effectively served in the shadowy world of espionage as couriers, guides, code breakers, intelligence analysts, even as covert agents—spies.” Housewives and young girls were recruited by both sides during the Revolution as cooks and maids. They could eavesdrop on conversations about “troop movements, leadership changes, and equipment shortages and deliveries without raising suspicion” because of their unlimited presence throughout the forces’ campsites. They clandestinely disseminated their intelligence pieces to the appropriate military and civilian leaders on their sides, with great danger for their own lives.
“This changing perception of gender roles made Civil War intelligence gathering much more dangerous for females, especially those serving undercover.”  
(http://www.nwhm.org/spies/8.htm)

Several women of color stand out as spies during the Civil War on behalf of the Union cause. Mary Elizabeth Bowser, a lesser known spy who was born a slave amid the Van Lew family members in Richmond, Virginia and emancipated in 1851, remained as a servant in their home. She later was placed in Confederate President Jefferson Davis’ home by the Union “Spymaster” Elizabeth Van Lew [known as “Crazy Bet”]. Davis assumed that Bowser was illiterate because of the anti-literacy laws in the ante-bellum South, and he negligently left his important papers untended and uncovered to Bowser’s eyes. His miscalculation resulted in the transfer of Confederate information to “Crazy Bet” when Bowser memorized the intelligence in the documents. (http://www.nwhm.org/online-exhibits/spies/9.5.htm)

Harriet Tubman is a well known example in American History of a woman of diverse ethnicity who served as a military nurse, scout, and spy for the Union army. 

…. the Union Army asked [her] to organize a network of scouts – and spies -- among the black men of the area. She not only organized a sophisticated information-gathering operation, she led several forays herself in pursuit of information. In July of 1863, [she] led troops under the command of Colonel James Montgomery in the Combahee River expedition, disrupting Southern supply lines by destroying bridges and railroads. …. [she] is credited …. with significant leadership responsibilities. ..... General Saxton….said ‘This is the only military command in American history wherein a woman, black or white, led the raid and under whose inspiration it was originated and conducted.  
(http://womenshistory.about.com/od/harriettubman/a/tubman_civilwar.htm)

[4] To free a man to fight

The periods of the American Revolution and the Civil War were ones in which women were not expected to serve in the military, but it was anticipated that they would demonstrate their willingness to perform actions on behalf of the common good through their patriotism, morality, and virtuousness. Women were known to boycott specific goods and engage in home production to meet their domestic
needs. One area of special importance was their role as “Deputy Husband,” fulfilling their husbands’ responsibilities while the men served in the military. ([http://www.americanantiquarian.org/Exhibitions/Womanswork/waryears.htm](http://www.americanantiquarian.org/Exhibitions/Womanswork/waryears.htm))

World War I saw the employment of women working under contracts with the American Army as drivers, secretaries, clerks, and telephone operators. The first women to enlist in the service during World War I joined the Navy and the Marine Corps, and more than 12,000 women were stationed stateside. In excess of 400 women died in the military as a result of their service overseas. ([http://www.womensmemorial.org/DidYouKnow.html](http://www.womensmemorial.org/DidYouKnow.html))

An example of women who served the nation during wartime “to free a man to fight” was the women in Minnesota, who enthusiastically took on the everyday jobs of their men at the start of World War II. They joined up with women’s military units, worked in defense plants, and assumed the jobs of the men who had gone to war. ([http://stories.mnhs.org/stories/mgg/intro.do?id=24](http://stories.mnhs.org/stories/mgg/intro.do?id=24)) Women were employed stateside in positions that men normally would occupy, if the latter were not serving in the military overseas. Some of the jobs that the women engaged in were as pilots traveling from base to base, office personnel, radiomen at air bases, and drivers in motor pools. ([http://stories.mnhs.org/stories/mgg/scene.do?id=14](http://stories.mnhs.org/stories/mgg/scene.do?id=14))

![WWII Clip Art](http://www.historyimages.com/WWII/clipart.html)

Eventually, the government recognized the significance of organizing women’s branches of the military, so that men could fight. A poster designed by Steele Savage in 1944 encouraged women to join the Women's Army Corps, the Navy WAVES, Marine Corps Women's Reserve, and the Coast Guard SPARs, thereby freeing a man to fight in the War. ([http://stories.mnhs.org/stories/mgg/resources/artifact.do?shortName=women](http://stories.mnhs.org/stories/mgg/resources/artifact.do?shortName=women))
“All branches of the armed forces conducted massive publicity campaigns urging women to volunteer and ‘Free a Man to Fight.’” (http://www.jewishvirtuallibrary.org/jsource/US-Israel/women.html)

[5] To use military service as a stepping stone for career advancement

Some women followed the troops to their camps during the Revolution, War of 1812, and Civil Wars for reasons other than engaging in combat. An example of this situation was during the War of 1812 in North Carolina. Marital security during wartime apparently was a factor in why women joined their husbands at the front.

The women that were in the camp during the War of 1812 were wives of the soldiers, they were chosen by a lottery system. Only six wives were allowed in camp for every one hundred soldiers. The women were employed as seamstresses, nurse maids, laundry maids and scullery maids. It is said that the women were given the hard jobs and the men looked after the dangerous jobs. The women also had to cook and clean for their own families, the life was very hard and the women were very much respected by the men. If a woman's husband was killed or died she had three to six months to grieve and then she had to re-marry or leave the camp, most re-married for the security. There are at least two reports of women who married four times in five months because their husbands died. (http://www.rootsweb.ancestry.com/~nc1812tp/facts.htm)

Women in the Union and Confederate camps during the Civil War also frequently were the wives of the soldiers, and would serve as paid laundresses to the men in the camps. In addition to laundering the troops’ clothing, the women would mend the uniforms, write letters, and cook for the soldiers. Usually four women were allowed to engage in these activities per camp. Most of the time the women stayed behind the lines. (http://www.freewebs.com/civilwarladies/whoweare.htm)
This picture was taken in a Civil War Camp near Washington DC in 1862.  
It shows a soldier with his wife and children.

LC-B811- 2405 [P&P]  

http://old-photos.blogspot.com/2009/07/civil-war-women.html

Women also disguised themselves as soldiers so that they could be closer to the military camps and promote their "trade". “An added difficulty is that if a female soldier's sex was discovered it [was] likely that the commanding officer would deny any knowledge of her and she would be labeled a prostitute.” (http://www.geocities.com/yosemite/2518/cladinuniform.htm) There were women during the Civil War who were “camp followers,” who came from the ranks of prostitutes, as well as women whose men were in the military, had been left to fend for themselves, and who sought the security of performing housekeeping jobs for the soldiers in the camps. Venereal diseases were present among the soldiers as a result of their sexual liaisons. “By 1862, Washington D.C. had over 7,500 prostitutes. (http://www.freewebs.com/civilwarladies/whoweare.htm)

Women in the 21st Century American military envision their time in the service as a true stepping stone to career advancement. Lt. Gen. Claudia Kennedy, writing in 2001, indicated that

The military offers a great way for a woman to get a start in life, by having a two or three year job that gives her something for her resume that shows leadership and a strong work ethic, and is readily understood by people who don't have a traditionally good appreciation for what women do…… We have all grown more confident of the ability of women to perform not only the traditional women's jobs, but those that are new and unusual for women to fill. 

Lt. General Claudia J. Kennedy http://www.wic.org/bio/ckennedy.htm
WHY HAS THE AMERICAN GOVERNMENT RECRUITED WOMEN INTO THE ARMED FORCES?

Three major reasons have fueled the recruitment of women into the American armed forces: [1] To fill shore positions during wartime; [2] To fill overseas positions during wartime; and, [3] To fill possible combat positions during wartime. The events surrounding World War II encouraged patriotic fervor among the women of the nation, as evidenced by the fact that over four hundred-thousand women responded to the government’s call through posters and magazine advertisements for women to participate in military service. (http://www.undelete.org/military/posters.html)

[1] To fill shore positions during wartime

The Navy enlisted 11,880 women as Yeomen (F) to serve stateside in shore billets and release sailors for sea duty. They were active as air traffic controllers, parachute riggers, and radio operators. The Army established the Women's Army Auxiliary Corps (WAAC) in 1942, which was converted to the Women's Army Corps (WAC) in 1943. Starting in 1942, the Navy recruited women into its Navy Women's Reserve, called Women Accepted for Volunteer Emergency Service (WAVES). (http://www.womensmemorial.org/Highlights.html) The Women Air force Service Pilots (WASP) were organized and flew as civil service pilots. WASPs flew stateside missions as ferriers, test pilots and anti-aircraft artillery trainers. “Gallant WASP pilots – women who flew every airplane made during WWII – including an experimental jet at 350 mph at 35,000 feet (flown by Ann Baumgartner in 1944) – yet were not considered military pilots until decades later.” (http://userpages.aug.com/captharb/pilots.html) The Marine Corps created the Marine Corps Women's Reserve in 1943. Marine women served stateside as clerks, cooks, mechanics, drivers, and in a variety of other positions. The Coast Guard established their Women's Reserve known as the SPARs (after the motto Semper Paratus - Always Ready) in 1942. SPARs were assigned stateside and served as storekeepers, clerks, photographers, pharmacist's mates, cooks, and in numerous other jobs. (http://www.womensmemorial.org/Highlights.html)

[2] To fill overseas positions during wartime

Women served as helpers and nurses to the military during wartime before World War I. Over 12,000 women served in stateside positions in the Navy and Marine Corps during World War I. Over four hundred women died as a result of their World War I service. (http://www.womensmemorial.org/)
DidYouKnow.html) The Army recruited and trained 233 bilingual telephone operators to work at switchboards near the front in France during World War I, and sent 50 skilled stenographers to France to work with the Quartermaster Corps. The shortage of available nurses for the military during World War II impelled the national government to organize the Cadet Nurse Program. (http://www.rpadden.com/nurses/nurses.htm) More than 180,000 women were recruited into the U.S. Cadet Nurse Corps during World War II. They provided urgently needed nursing in more than 2,000 hospitals. During the Korean conflict, Navy nurses served on hospital ships, as well as in the States at Navy hospitals.

U.S. Navy recruiting poster from World War II showing a Navy Nurse with a hospital ship http://www.solarnavigator.net/biology/nursing.htm

[3] To fill possible combat positions during wartime

The question of whether or not women should serve in the American military has been a controversial issue for many years, even though other nations [e.g. Israel] do include females in compulsory military service and as combatants during wartime. Separate military services were established for American women in 1942, but they were not granted professional military status until 1948 in the Women's Armed Services Integration Act, signed by President Harry S. Truman, and which limited the number of women in the total military to 2 percent. This percentage was maintained until the 1970s, and since has been increased to 14%. The law also forbade women from serving on naval combat vessels. (http://www.cdi.org/issues/women/combat.html)

Several issues have been at the heart of the controversy about women in the American military serving in combat: unqualified women would serve in key military positions if there were no quotas on who could serve in the military; it is too dangerous to put women in the position of becoming prisoners of war [e.g. this did occur in the Gulf War]; there would be a greater probability for acts of sexual molestation and rape if women were on the front lines of combat; should women be subjected to the horrors of war; women do not have the physical strength and endurance to serve in combat; women would disrupt the esprit de corps of the combat unit in the event of romantic relationships and pregnancies.
Extra demand for more combat personnel was present during the 1991 Gulf War, at which time the bans on women flying combat missions and serving on combat ships were lifted. More than 90% of military tasks were lifted for women by President Clinton. “The Iraq and Afghanistan wars have changed everything. For the first time, women have lived and fought for long periods beside men, exposed to the same dangers…….The blurring of the lines is reflected in the baldest of statistics. In Iraq and Afghanistan, 125 US women have paid the ultimate price.” ([http://www.guardian.co.uk/world/2010/jun/23/us-military-women-in-combat](http://www.guardian.co.uk/world/2010/jun/23/us-military-women-in-combat))

**WHAT ARE SELECTED EXAMPLES OF AMERICAN WOMEN’S MILITARY EXPERIENCES BETWEEN THE 17TH AND 21ST CENTURIES?**

A chronological view of women’s roles in the American military depicts a concise overview of their various experiences and interaction with the government. Most of the data in this chart came from The Women’s Research and Education Institute. ([http://www.wrei.org/WomeninMilitary_DidYouKnow.htm](http://www.wrei.org/WomeninMilitary_DidYouKnow.htm))

<td>the first female colonel of the U.S. Army. She moved to El Paso and opened a hotel. For years it was a favorite stop of '49ers heading for the Civil War. Dr. Mary Edwards Walker was awarded the Congressional Medal of Honor. Women disguised as men served on both sides, served as spies, and nurses—including aboard at least one hospital ship. Historical records verify the fact that over sixty women were either wounded or killed at various battles during the Civil War.</td>
</tr>
<tr>
<td>1898-1901</td>
<td><strong>Spanish American War</strong> In 1898 when Teddy went charging up San Juan Hill, after the Battleship Maine blew up in Havana Harbor, sanitary conditions for the wounded soldiers were deplorable. There were typhoid fever epidemics in the camps and few qualified medical personnel. Congress quickly authorized the U.S. Army to procure female nurses but not with military status. They were hired as civilians under contract and over one thousand women were recruited to serve - for thirty dollars a month. From 1898 to 1901 more than 1500 women served in the states, overseas, and on a U.S. Hospital ship. Spanish American War Nurse Clara Maass died as a result of yellow fever. Army Contract Nurse Maass volunteered to participate in an experimental treatment program, after having survived the war. A stamp was issued in her honor in 1976. Dr. Anita Newcomb McGee was instrumental in the recruiting of these women and continued to argue for nurses as a permanent part of the military. When Dr. McGee became Acting Assistant Surgeon General in charge of a new Nurse Corps Division she drafted the necessary legislation to begin the process of giving nurses some sort of military status. Yet they had no rank, equal pay, or benefits.</td>

**2000**

**Attacks on the Cole** Two women sailors were killed and five were wounded in the terrorist attack on USS *Cole*.

**Afghanistan and Iraq conflicts** About 10 percent of the U.S. Forces currently serving in Afghanistan and Iraq are women.

**SUMMARY**

Did you know that there are almost two million women veterans? From the American Revolution to Panama, Bosnia, Kosovo, Afghanistan and Iraq, women have served in some way in every conflict. Not that they were legal in the early days. History tells us that thirty three thousand women served in World War One and almost 500,000 took part in World War Two. During the Korean era 120,000 women were in uniform and seven thousand were deployed in theater during Viet Nam. During Desert Storm seven per cent of the total U.S. forces deployed were women - over forty thousand of them. On these pages you will find the history and accomplishments of those women who have served this country - *voluntarily* - since it's beginning.

**WHAT HAVE BEEN THE HIGHLIGHTS OF DIVERSE POPULATIONS OF AMERICAN WOMEN IN THE MILITARY?**

Women of diverse ethnicities have served this nation since its earliest days, through the multiple armed crises that America has been involved with both stateside and abroad. Four major ethnic groups of selected Native American, African American, Hispanic American, and Asian Pacific American women are chronicled as to their achievements and significant contextual events for those achievements in the following slides for the 9th Hawaiian International Education Conference.

• 1990s:
  • 1,509 NATIVE AMERICAN & NATIVE ALASKA WOMEN SERVIN IN MILITARY FORCES
What are the highlights of events and achievements in the military for African-American women?

- **AMERICAN REVOLUTION**
  - No documented records of women's military service

- **CIVIL WAR**
  - Nursing or domestic chores in medical settings
    - 181 served in convalescent & US government hospitals in MD, VA, NCA
  - Laundering or cooking for soldiers
  - Employment with units of enlisted freed black men
  - Union army paid black women to raise cotton on plantations for Northern government to sell

What are the highlights of events and achievements in the military for African-American women?

- **CIVIL WAR**
  - “Though best known for her work in freeing slaves, after the outbreak of the Civil War, Harriet Tubman also served as a soldier, spy, and a nurse, for a time serving at Fortress Monroe, where Jefferson Davis would later be imprisoned.

  Her experience leading slaves along the Underground Railroad was particularly helpful because she knew the landscape so well. She recruited a group of former slaves to scout the locations of rebel camps and report on the movement of the Confederate troops.

  In 1863, she actually went with Colonel James Montgomery and several black soldiers on a gunboat raid in South Carolina. Because Harriet Tubman had inside information from her scouts, the Union gunboats were able to surprise the Confederate rebels.”

What are the highlights of events and achievements in the military for African-American women?

- **SPANISH AMERICAN WAR**
  - SERVED AS NURSES [32+]
  - US SOUGHT FEMALE YELLOW FEVER “IMMUNES” WHO HAD SURVIVED THE DISEASE

  - ENTER 21ST CENTURY PROUDLY W/ CONTRIBUTIONS FOR 50 YEARS SERVICE

- **2001:**
  - The Army promotes the first woman to brigadier general in the Judge Advocate General’s Corps. She is also the first Asian-Pacific-American woman promoted to brigadier general.

What are some selected cases of challenges to diverse populations of American women in the military?

Women in the American armed forces face challenges stemming from bias against their gender. However, challenges to women of diverse ethnic populations also are confronted with issues pertaining to their backgrounds as Native Americans, African Americans, Hispanic Americans, and Asian Pacific Americans. A brief overview of challenges to women in the American armed forces demonstrates the varieties of problems that women have had to face throughout the nation’s history:

- **CIVIL WAR:**
  - Wages
  - Segregation
- **POST-WORLD WAR I:**
  - Non-Permanency of position
- **WORLD WAR II:**
  - Barred from service
  - Ceiling on numbers; Entry quotas
  - Denied application
  - Segregation
- **POST-WORLD WAR II:**
  - Denied service abroad
  - Non-Implementation of Executive Order
- **1950s:**
  - Denial of Civil Rights
Charity Adams Earley, commander of the 688th Central Postal Directory Battalion in World War II, summarized the history of women in the military when she wrote in 1989: The segregated military offered minimal chances for African-Americans to be promoted. Nonetheless, Charity Adams was one of two women in the WACs to have the rank of major. In 1946, she briefly was promoted to Lieutenant Colonel prior to her retirement. ([http://www.nytimes.com/2002/01/22/us/charity-adams-earley-black-pioneer-in-wacs-dies-at-83.html](http://www.nytimes.com/2002/01/22/us/charity-adams-earley-black-pioneer-in-wacs-dies-at-83.html)

The future of women in the military seems assured. ....... What may be lost in time is the story of how it happened. The barriers of sex and race were, and sometimes still are, very difficult to overcome, the second even more than the first..... During World War II women in the service were often subject to ridicule and disrespect even as they performed satisfactorily.... ([http://www.womensmemorial.org/BBH1998.html#1](http://www.womensmemorial.org/BBH1998.html#1)

![Image of women soldiers](image_url)

The following selected examples demonstrate the types of problems that diverse populations of women have encountered in the American military.

**During the Civil War: SUSIE KING TAYLOR,**

[Nurse, cook, laundress was never paid for her service].

- “The first colored troops did not receive any pay for eighteen months, and the men had to depend wholly on what they received from the commissary... their wives were obliged to support themselves and children by washing for the officers, and making cakes and pies which they sold to the boys in camp. Finally, in 1863, the government decided to give them half pay, but the men would accept none of this.... They preferred rather to give their services to the state, which they did until 1864, when the government granted them full pay, with all back due pay.”
- “I was very happy to know my efforts were successful in camp, and also felt grateful for the appreciation of my service. I gave my services willingly for four years and three months without receiving a dollar. I was glad, however, to be allowed to go with the regiment, to care for the sick and afflicted comrades.” ([http://www.womensmemorial.org/BBH1998.html#1](http://www.womensmemorial.org/BBH1998.html#1)
Post World War I: RESPONSE TO REQUEST FROM CONGRESSMAN SOMERS TO COLONEL DARNELL, ARMY MEDICAL CORPS FOR PERMANENT PLACEMENT OF BLACK WOMEN IN THE MILITARY NURSING CORPS

- “The question of opening the Nurse Corps to... colored nurses has from time to time received the serious consideration of this office; but because of the necessity... of arranging their tours of duty in various regions of the United States as well as in our overseas dependencies [,] and of the difficulty if not impossibility of arranging proper quarters and messing facilities for them [,] their employment has been found impracticable in time of peace. You may rest assured that when military conditions make it practicable... to utilize colored nurses they will not be overlooked.”

(http://www.womensmemorial.org/BBH1998.html#1)

World War II: DOVEY JOHNSON ROUNDTREE

- Johnson applied to the newly formed WAACs in 1942
- Refusal by the recruiter in Charlotte, NCA to give Dovey an application
- Johnson obtained her application in Richmond, VA
- Eventually, Dovey was accepted into the first officer candidate school class of the WAAC
- Johnson was 1 of 36 other African-American women in August, 1942 as part of the first class of women Commissioned as officers

(http://www.womensmemorial.org/BHMSys.html)

World War II: BLACK WOMEN BARRED FROM THE WAVES

- Director Mildred McAfee and Dr. Mary McLeod Bethune helped Secretary of the Navy Forrestal push through the admittance of Black women into the WAVES
- SPARS OPENED TO BLACK WOMEN OCT. 20, 1944
- On October 20, 1944, the SPARS were opened to Black women
- However, the Navy refused to admit Japanese American women throughout World War II

(http://www.womensmemorial.org/BBH1998.html#1)

The post-World War II period witnessed a milestone in the American military as a desegregated organization. However, the process to achieve complete success for that goal was a difficult one.
SELECTED CASES OF CHALLENGES TO DIVERSE POPULATIONS OF WOMEN

• “To facilitate the order, the Truman administration formed an executive committee headed by Charles O. Fahy, to prepare and submit a plan for desegregating the services.
  • Almost two years elapsed, however, before the Fahy Committee submitted its final report.
  • In the interim, the services followed established policy regarding recruiting, training and assigning black personnel.”
  http://www.womensmemorial.org/BHMSys.html

SELECTED CASES OF CHALLENGES TO DIVERSE POPULATIONS OF WOMEN

• RESULTS OF EXECUTIVE ORDER 9981
  • DISCRIMINATORY PRACTICES DID NOT END IMMEDIATELY
  • INITIALLY SOME MILITARY LEADERS WERE RELUCTANT TO IMPLEMENT THE EXECUTIVE ORDER
    • BELIEVED MILITARY WAS NOT A PLACE FOR “SOCIAL EXPERIMENTS”
    • WORRIED THAT UNIT COHESION WOULD BE HARMED IF WHITES & BLACKS FORCED TO TRUST EACH OTHER FOR SUPPORT

http://www.womensmemorial.org/BWOHistory.html
SELECTED CASES OF CHALLENGES TO DIVERSE POPULATIONS OF WOMEN

- In January 1950, the Fahy committee submitted its report, and the Army issued a new directive entitled, "Utilization of Negro Manpower in the Army."
  - This directive announced the elimination of quotas, segregated units, and segregated facilities.
  - The Women's Army Corps (WAC) conformed with the Army directive by revising its administrative policies and assignment procedures.
  - By the middle of that year, WAC training and field units, as well as billeting and messing facilities, were integrated.
WHAT ARE THE CONTEMPORARY CHALLENGES TO WOMEN IN THE AMERICAN ARMED FORCES?

Women in the American armed forces have not only had to contend with the challenges previously alluded to in this paper. They have been confronted with limitations to the extent of their service in the various military agencies. The following slide from the 9th HICE Conference presentation sets down the multiplicity of restrictions that women have had in the military into the 21st century.
American women in the military still encounter challenges to their presence in the armed forces. Contemporary articles in the press emphasize that the barriers outlined above slowly are being withdrawn from women in the military, but there is extensive controversy about them. At this time, multiple other challenges present themselves for women in the military, as pointed out in a 2009 report by Iraq and Afghanistan Veterans of America:

…balancing family life with a military career, inadequate military health care specifically for women, high rates of sexual assault and harassment, and opportunities for career advancement,….

Highlights of the report indicated that [1] “Female troops must deal with challenges their male counterparts don't; [2] “women face inadequate health care, sexual assault, higher divorce rates; [3] “Feminine hygiene products, birth control pills (are) hard to find in theater”; and. [4] “Almost 15% of female vets of recent wars screened positive for sexual trauma.” The report pressed the Pentagon to address women’s areas of concern, since women were leaving the military at a faster rate than the men.
DID YOU KNOW as a result of the progress of the 1990s, women are now excluded from only 9 percent of Army roles—although that figure represents nearly 30 percent of active-duty positions. Army women cannot be assigned to the following occupational fields: infantry, armor, special forces, cannon field artillery and multiple launch rocket artillery. Also closed to women are: Ranger units at the regiment level and below, ground surveillance radar platoons, combat engineer line companies, and short range defense artillery units. In the Air Force, 99 percent of all occupations are open to women. Navy women are only excluded from submarine crews and SEAL teams, special boat unit crews and support positions with the Marine Corps ground combat units. The Marine Corps has opened 92 percent of its occupational fields to women, however 38 percent of positions are closed to women. Closed occupational fields include infantry, tank and assault amphibian vehicles and artillery. All Coast Guard occupations and positions are open to women.

Section Four Summary

RESEARCH QUESTIONS:
1. Who were the little known or ignored diverse women who have served the military?
2. Why have women enlisted in the armed forces?
3. Why has the American government recruited women into the armed forces?
4. What are selected examples of American Women’s military experiences between the 17th and 21st centuries?
5. What have been the highlights of diverse populations of American women in the military?
6. What are some selected cases of challenges to diverse populations of American women in the military?
7. What are the contemporary challenges to women in the American armed forces?

CONCISE DESCRIPTION OF FINDINGS

1. Women always have been involved with the defense of the safety and security of the nation.
2. Various positions on the home front and overseas have been filled by women to enable men to serve in the military when women were not yet included in the ranks of the nation’s warriors.
3. Gender, color, and ethnicity have been factors in the unequal standings of women and men in the military.
4. Women in the military have not been accorded full recognition for their military service in the realms of salary, medals, and promotions in rank.
5. Military service has become an attraction for American women, but has limited women’s capacities as wives and mothers because of inequitable policies.
LIMITATIONS OF THE STUDY
1. The type of sources used for this study has been limited mostly to internet resources.

2. More secondary sources than primary interviews have been used for this study.

3. The study has been more cursory than an in depth collection of data to respond to the research questions. This is the first iteration of this study.

RECOMMENDATIONS FOR FURTHER RESEARCH
1. Each of the research questions in this study should be addressed with more primary source data.

2. Interviews should be conducted with women who have served in the military and who have not divulged their stories about discrimination because of their gender, ethnicity, and class.

3. Legal cases taken by women in the military against those who have discriminated against them should be reviewed and integrated into history texts.

4. Primary source diaries stored in various collections focused on diverse populations of women who have served in the military should be reviewed and included in educational texts.

5. Women of diverse ethnic populations should be encouraged to write their stories of service in Iraq and Afghanistan.

DID YOU KNOW FACTS ABOUT DIVERSE POPULATIONS OF WOMEN IN THE AMERICAN MILITARY

FROM THE DEPARTMENT OF VETERAN AFFAIRS

http://www1.va.gov/WOMENVET/herstory/DID_YOU_KNOW_MASTER.asp
MARCH 16, 2010 - DID YOU KNOW women did not officially serve in the U.S. military until the Army and Navy Nurse Corps were established in 1901 and 1908 respectively. Prior to that time, women served with the armed forces as contract and volunteer nurses, cooks, and laundresses and even in disguise as soldiers. For example, during the American Revolution, Deborah Samson enlisted in the Continental Army as Robert Shurtleff and served as an enlisted soldier for approximately one year.

APRIL 27, 2010 - DID YOU KNOW there are over 50 monuments dedicated to women Veterans or by women Veterans organizations in our VA national cemeteries. Some of VA National Cemetery Administration’s oldest monuments dedicated to women date back to the late 1800s. (Source: VA National Cemetery Administration)

MAY 4, 2010 - DID YOU KNOW the United States Army remained segregated during World War II. A group of African American women played a significant role in maintaining troop morale during the conflict. These women belonged to the 6888th Central Postal Directory Battalion, part of the Women’s Army Auxiliary Corps (WAAC). The 6888th Central Postal Directory Battalion was made up of 855 enlisted African American women and officers. The battalion was commanded by Major Charity Adams Earley, the highest ranking African American woman in the military by the end of the war. The 6888th was the only all African American, all female battalion. It was deployed overseas first to Birmingham, England then later to Rouen, France. When the women arrived in Birmingham in 1943 they saw letters stacked to the ceiling of the temporary post office. Much of the mail had been there for as long as two years waiting to be sent to soldiers in the field. The women were charged with delivering mail to approximately seven million American troops stationed in Europe. The successful delivery of the mail was an important morale booster for men on the front. One difficult task was sorting letters to guarantee that they were sent to the correct “John Smith” or “Tommy Jones”. To ensure delivery, women worked three shifts, seven days a week. Although they were contributing to the war effort in significant way, the women of the 6888th were still kept separate from the other American troops. The women slept in segregated barracks and ate in segregated dining halls. The women of the 6888th Central Postal Directory Battalion played an important role in World War II by carrying out the important task of delivering mail, by boosting military morale, and by making history as the only battalion of African American women to go overseas. (Source: Smithsonian National Postal Museum Web)site: http://www.postalmuseum.si.edu/AfricanAmericanHistory/p7.html#_edn1#_edn1

MAY 25, 2010 - DID YOU KNOW CPT Dovey (Johnson) Roundtree, WAAC/WAC, a native of Charlotte, NC, was a graduate of Spelman College in Atlanta and a protégée of the influential African American educator, Mary Macleod Bethune, when she was selected as a member of the first class of officer candidates of the WAAC in 1942. After the war, CPT Roundtree used the G.I. Bill to attend Howard University Law School. When she graduated with her law degree in 1950, there were only 83 black women lawyers in the United States compared to 6,165 white women. She established a law firm in northwest Washington, DC, to serve the black community there. During the course of her legal career, Roundtree handled several high-profile cases. Sarah Keys v. Carolina Coach Company, a landmark civil rights case involving bus travel across state lines, was decided by the Interstate Commerce Commission in November 1955, the same year as the more famous Rosa Parks incident, which involved a city bus. In its decision on Keyes, the ICC found the practice of designating separate seats for white and
black interstate bus passengers to be “unjust discrimination and undue and unreasonable prejudice and disadvantage … and is therefore unlawful.” (Source: Women In Military Service For America Memorial archives)

**JUNE 22, 2010**  
**-**  
**DID YOU KNOW** the following historical facts about American Women and the Military:

- The first woman awarded a disability pension by Congress for wounds incurred during military service was Margaret Corbin. She took over her fallen husband's cannon in the Battle of Fort Washington during the American Revolution and she herself was wounded.
- During the War of 1812, two women served as nurses aboard United States, Stephen Decatur's flag ship.
- During the Civil War women disguised as men served on both sides. Women also served as spies, nurses—including aboard at least one hospital ship and one, Dr. Mary Walker, received the Congressional Medal of Honor.
- Women have served in the American armed forces for over 100 hundred years--since 1901--when the Army Nurse Corps was established. The Navy Nurse Corps soon followed in 1908.
- Women who were not Nurses were first enlisted in the Navy and Marine Corps during World War I. Only nurses served in the Army during this war; but the Army did hire about 200 civilian women who were fluent in both English and French to serve as telephone operators. These women, often referred to as the "Hello Girls," were later given veterans' status.
- 432 American military women were killed during World War II. 88 were prisoners of war all but one of these in the Pacific Theater.
- 7 women died in the line of duty while serving in theater during the Vietnam War. Their names can be found inscribed on the Vietnam Memorial.
- Almost 41,000 women served in theater during Persian Gulf War. 13 women were killed and two were taken as prisoners of war.
- To date, more than 20,000 women have served as peacekeepers in Bosnia and Kosovo.
- Two women sailors were killed and five were wounded in the terrorist attack on USS Cole.
- About 10 percent of the U.S. Forces currently serving in Afghanistan and Iraq are women.

Source: Women's Research and Education Institution

**AN ADDITIONAL DID YOU KNOW?**

Native Americans have the highest percentage serving in the military than any other group in America.

More than 12,000 Native Americans served during World War I, though they weren't official U.S. citizens.

More than 44,500 served in World War II, a greater per-capita rate than any other ethnic group.

More than 50,000 served in Vietnam, 90 percent of them as volunteers.

Submission ID: 1568
Abstract

In this current globalized era, the requirement for educating culturally competent citizens has become an urgent matter. To achieve this, the first step is to diversify our teaching and learning models so that we can have open-minded students that are “actively seeking to understand cultural norms and expectations of others, leveraging this gained knowledge to interact, communicate and work effectively outside one’s environment” (Hunter, White, & Godbey, 2006, p. 270). In this study, the author explains how cultural competency relates to the development of knowledgeable world citizens and studying abroad helps train culturally competent global citizens. The second half of this paper outlines how studying and/or teaching abroad programs for higher education faculty could help enhance institutions and thus students, becoming more competitive in the global economy. Through such programs, institutions will benefit from the increased diversity, and the promotion of study abroad programs for students will be much more effective with faculty members giving first-hand account of their studying/teaching experience abroad.
Promoting Cultural Competency through Study Abroad Programs

for Higher Education Faculty

Introduction

In this current globalized era, the requirement for educating culturally competent citizens has become an urgent matter. To achieve this, the first step is to diversify our teaching and learning models so that we can have open-minded students that are “actively seeking to understand cultural norms and expectations of others, leveraging this gained knowledge to interact, communicate and work effectively outside one’s environment” (Hunter, White, & Godbey, 2006, p. 270). Bennett (1993) argues that, “Probably one of the most threatening ideas encountered by students is [this] concept of difference and the implications this concept brings along with it” (p. 181). That is, how we perceive the differences determine the scale and limit of our interactions with other cultures. In this context, intercultural communication competence is the first big step towards creating culturally competent citizens.

Banks (2001) claims for students to become successful in a diverse world, they need to have the ability to communicate and negotiate among diverse cultures. Banks and Banks (1993) use the term ‘ethnic encapsulation’ to refer to the cultural deprivation that results from the limited knowledge of any culture other than one's own. Not knowing other cultures significantly handicaps the attempts to help them. More importantly, misconceptions and stereotypes about other cultures limit the solutions to the problems created by cultural differences. Antal (2002) argues that misunderstandings and conflict occur when people interpret and judge what they see, the tip of the iceberg, according to
their own norms, values, and assumptions. Thus the behavior of others may seem strange, illogical, or “barbaric” (Barnlund, 1998, p. 39).

Howard Gardner (1995), in Leading Minds: An Anatomy of Leadership explains that in order for a leader to lead a country or an organization, he or she needs to be aware of the presence of other opinions, ideas, and alternative solutions to the problems. He claims that traveling abroad “opens one up to the perspectives of different cultures and ideologies” (p. 248). He reports that Winston Churchill traveled widely to Cuba, India, Sudan and South Africa; Chiang Kai-shek traveled to Japan and Soviet Union; Tojo Hideki (prime minister and military leader of Japan during much of the WWII) completed military training in Berlin; Vladimir Lenin first traveled voluntarily and then was exiled to Europe; and Franklin D. Roosevelt made the European tour. Joseph Stalin traveled entirely within the Soviet Union; Mao Zedong traveled widely within his own country but did not go abroad. Young Adolf Hitler traveled only in Germany and Austria. He further explains:

It is more difficult to maintain a monolithic perspective—a simplistic, often exclusionary story—when one has been exposed regularly to contrasting viewpoints. Those individuals who have not traveled widely are therefore in a more favorable position to see everything from the perspective of their compatriots, most of whom are also parochial, if not xenophobic. (p. 249)

However, Gardner notes that the ability to travel is facilitated by the possession of wealth. The decision not to travel is the problem in this context. Even when one has the opportunity to do so, one deliberately might wish not to be exposed to experiences that might complicate his/her view of the world. One of the most important qualities of a leader is his/her adaptation to the world, and thus his/her response to the change. As
Gardner says, “Those who would lead in the world of the future must be aware of, and find ways of coping with, new and often complexifying trends” (p. 303).

**Study Abroad Programs in the U.S.**

Thomas (2006) explains that many of the colleges and universities in the U.S. have developed some form of a study abroad program that enables their students to receive a learning experience outside their homeland. Zachrisson (2004) confirms that study abroad programs continue to grow. *Open Door’s* 2009 report informs that the number of Americans studying abroad increased by 8.5% to 262,416 in the 2007/08 academic year. Europe continued to host the largest share of U.S. students (56%). Latin America hosted 15% and Asia hosted 11% of all American students studying abroad.

With the increasing number of students in study abroad programs across the country, lack of data on the number of faculty members participating in such programs is alarming. Study abroad literature focus on the benefits of studying abroad for students but do not mention that if and how faculty members would benefit from studying and/or teaching abroad. Faculty members’ participation in programs abroad would be an added benefit in promoting of global citizenship and their experiences would contribute to the common knowledge within the societies they live and work. In this study, the author explains how cultural competency relates to the development of knowledgeable world citizens and studying abroad helps train culturally competent global citizens. The second half of this paper outlines how studying and/or teaching abroad programs for higher education faculty could help enhance institutions and thus students, becoming more competitive in the global economy.
Benefits of Studying Abroad

The Commission on the Abraham Lincoln Study Abroad Fellowship Program (2005) explains that participating in study abroad programs does not necessarily produce experts. However, it does start “a process of inculcating awareness of international and intercultural issues [and this process] promises to vastly increase American global literacy” (Tajes & Ortiz, 2010, p. 17).

There is a comprehensive list of research studies on the benefits of study abroad programs for students in the U.S. These studies focus on study abroad programs and explain that study abroad programs enhance students’ worldview and thus cross cultural effectiveness; provide a global perspectives; increase self-reliance self confidence and personal well being (Carsello & Creaser, 1976; Kuh & Kaufman, 1984; Carlson & Widman, 1988; McCabe, 1994; Kitsantas & Meyers, 2002). These and many other similar reports provide evidence to students’ reporting higher levels of openness and flexibility, emotional resilience, and personal autonomy (Kitsantas & Meyers, 2002; Carlson & Widaman, 1988; Nash, 1976; Ward & Kennedy, 1993). Further, findings demonstrated that study abroad programs significantly contribute to the preparation of students to function in a multicultural world (Kitsantas, 2004) and are important in ensuring the future security of the United States, economic prosperity, and skills needed for global leadership. (NAFSA: Association of International Educators, 2008; Bikson & Law, 1994; Lincoln Commission, 2005; NASULGC Task Force of International Education, 2004; Treverton & Bikson, 2003).

Gilson (2010) explains that students who study abroad show characteristics such as “self-confidence, professional competence, and personal ambition” (p. 7). He further
confirms that students returning from study abroad programs hold a broader worldview, are more tolerant and have an increased respect for diverse cultures. Teichler (2004) explains the benefits of studying abroad in three areas. The first is Knowledge Transfer, where knowledge is more frequently and rapidly transferred from one country to another. The second, International Education and Research, provides an understanding of different cultures regarding their socio-cultural, political, economic, and educational systems. There is a high demand in the business world for foreign language proficiency and field knowledge about other countries, and these skills will be even more in demand in the labor market as these students graduate. The third benefit is Border-crossing Communication and Discourse where learning and research in an international setting is one way of experiencing different views, which will then broaden one’s horizon and promote global perspectives as a leap forward in students’ developing critical and reflective thinking skills.

Carlson, Burn, Useem, and Yachimowicz (1991) found that the students participate in study abroad programs to improve their cultural understanding, to improve their career prospects, and join their friends also participating in such programs. They concluded that the students who participated in study abroad programs showed significant differences in global perspectives and cross cultural cosmopolitanism. These results are consistent with that of McCabe (1994), Carlson and Widaman (1988), and Kitsantas and Meyers (2002). Further, students who study abroad benefit from this experience by their increased commitment to peace and international cooperation. They develop a transnational understanding regarding their empathy of viewpoints of other nations (Carlson, Burn, Useem, & Yachimowicz, 1990). Hadis (2005) explains that the
higher education faculty in the U.S. found the students who return from study abroad programs to be more appreciative of different cultures, more mature, independent, and self-aware. That is, students returning from their study abroad experiences provided evidence of positive changes.

Undsey (2005) explains that when students live in and observe a different society than their own with different concepts of social justice where the dignity and worth of individuals and human relationships are more highly valued, it helps U.S. students develop a deeper sense of appreciation for these values. She further commented that:

The study-abroad experience seems to enhance students' self-awareness, especially with respect to recognizing and, at times, challenging their own values, biases, beliefs, and ways of thinking as well as those of their country. In addition, by being exposed to a different culture, they developed more sensitivity to and appreciation of diversity, which they could directly relate to social work practice. (p. 245)

In short, students who participate in study abroad programs come back as different people with different perspectives and most importantly with a greater empathy towards other nations. There is a significant change in their commitment to peace by living in and observing other cultures.

There are various academic, financial, and other personal reasons affecting the number of students participating in study abroad programs and their choice of target country. It is not the intention of this author to analyze the reasons behind the choice of participating in a study abroad program for students or which country to travel, should they choose to participate in one. However, this study is a proposal to the higher education administrators and faculty in the U.S., nevertheless a modest proposal to
promote and encourage “studying and/or teaching abroad” programs for the faculty members in their respective institutions.

Study Abroad Offices in universities across the United States have been promoting their basketful of options for students to study abroad. Independent study abroad programs focus on Europe and faculty-led groups are rather limited in focus and the number of students. It is usually one or two faculty members leading various weekly trips around the world, more so focused on Europe as well. That is, it is not necessarily that the students do not have enough options to choose from, but it is partly lack of faculty participation and their willingness to promote such programs in their classrooms.

However, such trips do not go beyond a sight-seeing experience, whether it is a conference presentation trip or leading a group of students in a study abroad program or a short term research trip. Participation in international conferences or conducting short term research does not necessarily replace a well planned extensive study or teach abroad program for higher education faculty. Bresler and Ardichvili (2002) argue that being a tourist in a foreign country is different than conducting a long term research in a foreign country. The main difference is the time the person spends in the foreign country to include the rhythm, pacing of intensity, and activities involved during that period. For a tourist, taking a photograph would be sufficient to describe what has been happening, but an international scholar should describe the picture within that picture and go far beyond including historical, cultural, and personal reflections regarding the same photo. Another consideration is that people spending longer periods of time in a host country tend to observe from an insider’s perspective. They, at times, are able to participate in the everyday life along with locals. Last but not the least is the purpose of the visit. Purpose
is important in the sense that it shapes the person’s observations and directs-redirects the purpose of the visit and its interpretation. It is not where we go, and who we talk to, but how we go and how we talk that are significant. Kay and Watson (1982) explain that “We must get inside the skin of other people as nearly as we can. We must learn the ‘language of life’ as far as possible. We must ‘make sense’ of their conditioning and concern in their idiom” (p. 133). In order to achieve this, a weekly trip to a country with a group of students would not necessarily suffice.

Study Abroad Programs for Higher Education Faculty

Confirming the benefits of teaching abroad programs for faculty members, Wilson (1984) conducted four studies on the impact of overseas faculty exchanges and found that such exchanges also enhanced their classroom teaching upon their return. Garson (2005), after spending a year teaching in Cairo, Egypt, explains that she has “learned to be more patient, compassionate, and more tolerant… try to be more aware of my own expectations and those of others” (p. 325). She further inserts that global teaching is letting go of much what people think they know so that they can be open to new understandings. Cushner (2007) explains the impact of international experience within the framework of teacher education through “situative theory” (Putnam & Borko, 2000, as cited in Cushner, 2007, p. 36). According to situative theory, the context in which the learning by individuals occurs is an integral to one’s cognition. Students with international experience develop alternative perspectives, thus becoming global citizens. With all the proven evidence of the positive impact of study abroad for students, Hser (2005) argues that, “Many university administrators do not support internationalization
even though there is an increased awareness of the impact of global change on the university” (p. 39).

Dewey and Duff (2009) explain four types of barriers in getting faculty members to be more involved in internationalization of their campuses. The first barrier is the availability of the information and transfer of information across departments. This is mostly due to the lack of connection between international programs departments of universities and their academic departments. The second barrier is that funding is rather difficult for any type of international involvement. The third barrier is policy and regulation challenges. For example, it is expected of tenure track or tenured faculty members to contribute to the university and the community through service and scholarly work. These policies limit faculty members’ involvement with international work. The last barrier is that institutional support in regards to staff to facilitate such programs for the faculty.

However, if we agree with what the current literature suggests, participation in study abroad programs enhances academic, social and cultural skills of students, makes them aware of transnational issues, and makes them better leaders of tomorrow, I propose to send higher education faculty to study or teach abroad. If we want more students to participate in study abroad programs, first we need to educate our faculty. Sending faculty members to programs outside the continental United States would greatly enhance their academic capabilities, and also send a positive and encouraging message to students with their instructors being role-models. How can we expect a strong promotion of study abroad programs in U.S. classrooms if instructors have not experienced a study/teach abroad program first hand? I argue that if teachers promote such study abroad programs
to their students in their classrooms, while giving account of first-hand experience, the
number of students participating in study abroad programs, in any given institution,
would increase. “Inspiring students to study abroad is certainly not the only reason”
(Hulstrand, 2009, p. 48) but we also need the engagement of faculty and administration in
such programs to promote the peace by interacting with different cultures in their own
countries and carrying the intercultural dialogue to different platforms.

Challenges and Recommendations

Sending faculty abroad is a challenge for institutions and a significant
commitment for the faculty. However, when calculate the cost and benefit of such
programs, institutions will recognize the urgency of cultivating culturally competent
faculty and students. With a rather aggressive job market and the urgency of the need for
cultural competence for the students, it is imperative that we look at the issues through
‘problem solving’ perspective. In this part, the author explains the limitations when
implementing such programs for higher education faculty and proposes multiple solutions:

1) Tenure Track assistant professors can be required to spend a semester
abroad teaching or studying abroad (i.e. learning a language) by adding study/teach
abroad criteria to the promotion system for acquiring tenure. While the [assistant]
professor is spending a semester (or two) abroad, a faculty member from the sister
institution could be invited to teach his/her classes, so, the U.S. institutions would not
need to hire an adjunct professor to take over his/her classes (cost concerns would also be
eliminated). This way, while U.S. institution could benefit from having its faculty
member enhance his/her academic, social and cultural skills and gain a global perspective,
students could benefit from having a foreign professor who would bring a different
perspective. This exchange would help establish new partnerships with different institutions across the world, given the experience and expertise a foreign professor would bring to such host institutions.

2) Universities could promote faculty members’ spending his/her sabbatical leave at a foreign country – studying or teaching. This could be done with various incentives such as providing travel and research funding support. Institutions can facilitate the process by helping the faculty member locate a foreign institution where he or she can spend a semester/year doing research and/or teaching and/or participating in professional development programs including language programs.

Limitations for the Faculty

Family responsibilities are a big concern for faculty members considering spending a semester or a year abroad. However, once the study/teach abroad becomes a requirement for promotion of junior faculty, they will know from the beginning that they will have to study-teach abroad once they accept the employment. With institutional support, they will have to make the necessary arrangements for their family sometime during the probational period of their employment. And of course, institutional support regarding the financial arrangements in this case is imperative. For example, when promoting study-teach abroad programs among faculty, incentives could include paying for the traveling expenses for the family and helping them find schools in the host country for their children (If they do not want their children to change schools, summer programs could be arranged, which could also enhance their children’s social, cultural, and academic skills).
Promoting Cultural Competency

Conclusion

Exchange programs, sabbatical leaves, professional development semesters, foreign language programs, are just few of the many possible programs for higher education faculty. They could spend a semester or a year at a university, a private research institution, a think-tank, or a government institution. Alternative programs and institutions could be found to make their experiences academically, socially, and culturally productive and enhancing. The questions here is, are U.S. institutions willing to support such programs, mostly financially, and are the U.S. higher education faculty willing to model a “global citizen” for their students? The internationalization of U.S. campuses is not only for the benefit of recruiting and retaining international students, but also for providing opportunities for current faculty members to improve their understanding of the world.

It is explained through this study that study/teach abroad programs have benefits to institutions, individuals, and to the society in general. Sending faculty members abroad whether to study or to teach would help promote study abroad programs to students while also enriching students’ classroom learning as faculty members’ share their experiences from abroad. Through interaction with different cultures, negative stereotypes could be overcome, which will then contribute to the peace process. There are many considerations while planning to study/teach abroad programs for higher education faculty, but, with necessary commitment and serious planning by universities, it is possible.
Promoting Cultural Competency

Shortcomings of Multicultural Education

Abstract

Banks (2001) claims for students to become successful in a diverse world, they need to have the ability to communicate and negotiate among diverse cultures. Some argue that when the cultural diversity and global tolerance are promoted within multicultural education, traditional elitism and its shortcomings would be overcome (Schugurensky, 2002). Others argue that multicultural education hinders the assimilation efforts and creating a divisive society (Bernstein, 1994).

With the shifting cultural texture and demographics of the United States (J. A. Banks, 2006b; Irvine, 2003), redefining multicultural education has become imperative. There are many views on the benefits or shortcomings of the multiculturalization of education. The question is not whether a multicultural education should be adopted but it is rather what we understand from multicultural education and how we are going to initiate such a reform within an educational system when we cannot even define ‘multicultural.’ It starts with a deep exploration of ‘I’ regarding our intercultural communication competence.

This study explores intercultural consciousness and leadership developmental progression model developed by Karim (2003). Through this model, he explains intercultural consciousness and how it can be integrated in a leadership model. In this study, the assumptions and suppositions given by Karim (2003) are explained and solutions are offered stemming from these assumptions and suppositions.

Keywords: Multicultural education, Intercultural communication.
Shortcomings of Multicultural Education

Introduction

With the shifting cultural texture and demographics of the United States (J. A. Banks, 2006b; Irvine, 2003), redefining multicultural education has become imperative. According to the data provided by the National Center for Education Statistics (NCES), between 1979 and 2008, the number of school-aged children (children ages 5-17) who spoke a language other than English at home increased from 3.8 to 10.9 million, or from 9 to 21 percent of the population in this age range (NCES, 2009). NCES (2010) reports that in 2007-2008, 58% of public school teachers of grades 9 through 12 are females with 83.5% defined as belonging to “White” race/ethnicity. Hispanics constituted the 6.6% and Blacks 6.9% of all teacher population of public school teachers of grades 9 through 12. The implications of the difference between the number of students with diverse backgrounds and the number of diverse teachers available to meet the needs of these students are certainly worth exploring. In order to further understand these implications, this paper attempts to define (and redefine) multicultural education, explain its shortcomings, and offer recommendations for further discussion.

Multiple Definitions of Multicultural Education

With the emphasis on minority learning, Gibson’s (1976) survey outlined five models where culture and education are explored in a combined fashion. 1) Multicultural education for cross cultural understanding was designed to teach that there are differences among cultures and that the teaching should be designed so that the emphasis on respecting one another’s culture is apparent. 2) Culturally responsive education was developed mostly for K-12 education to include the cultures of the minority students in the curriculum and adapt teaching strategies accordingly to fit the needs and expectations of these students. 3) Bicultural education was adopted mostly to emphasize the importance of teaching languages and the skills needed to be
able to function in the other cultures efficiently. In this, the language and culture of the minority students are reinforced in the curriculum and through the teaching methods used. 4) *Cultural pluralism* was specifically designed to strengthen the socio-cultural, political, economic, and educational participation of minority students within societies. In this, it is important to note that the cultures do not mix but simply find a way to live with each other through providing equal opportunities to every member of the society. 5) *Multicultural education as an experience of the individuals in the society* designed to help the society to work well harmoniously and respectfully.

Even though Ogbu (1992) had suggested that multicultural education has yet to be defined by the scholars, there has been a sufficient number of definitions to justify an action. Banks (1993) explained that the multicultural education started in the United States during the civil rights movement of the 1960s. Since then, there has been a wealth of interest and research on multicultural education (J. Banks, 1993; J. A. Banks, 2001a, 2001b, 2004, 2006a, 2007; J. A. Banks & Banks, 2001; Cochran-Smith, 2001; Ladson-Billings, 1995, 1999a, 1999b; Ladson-Billings, 2003, 2006; Perry, Moore, Acosta, Edwards, & Frey, 2006; C. Sleeter, 2008, 2009; C. Sleeter & Stillman, 2005; C. E. Sleeter, 1991, 2001, 2008; C. E. Sleeter & Bernal, 2004).

Banks and Banks (2001) define multicultural education as:

> an idea, an educational reform movement, and a process whose major goal is to change the structure of educational institutions so that male and female students, exceptional students, and students who are members of diverse racial, ethnic, language, and cultural groups will have an equal chance to achieve academically in school. (p. 1)

They further explained that, "the term multicultural education describes a wide variety of programs and practices related to educational equity, women, ethnic groups, language minorities, low-income groups, and people with disabilities" (p. 6). Multicultural education may mean
making changes within the curriculum in one school but a total change leadership in another school.

Gay (2000) and Ladson-Billings (2004) defined multicultural education as adopting a culturally responsive pedagogy with trained instructors facilitating it. Nieto (1996) defined multicultural education as “antiracist education” which is “a process important for all students” (p. 307). Jay and Jones (2005) defined multicultural education as “the common term used to describe the type of pluralist education” where “its advocates are seeking for all children receiving an education, pre-K through college” (p. 3). The National Association of Multicultural Education (NAME) described multicultural education as a “philosophical concept built on the ideals of freedom, justice, equality, equity, and human dignity as acknowledged in various documents, such as the U.S. Declaration of Independence, constitutions of South Africa and the United States, and the Universal Declaration of Human Rights adopted by the United Nations” (http://www.nameorg.org/resolutions/definition.html). Kahn (2008) described multicultural education as a “process, a philosophy, a concept, which is dynamic, multifaceted, and polemic” (p. 531).

Benefits and Shortcomings of Multicultural Education: An Overview

Nieto (2004) explained that the increase in cultural/ethnic diversity has caused many educators to recognize and own the need to expand their understanding of multicultural education, especially in public schools. With a very long history of immigration of people from many different cultural groups, the need for multicultural education and embracing diversity has become increasingly urgent. Smith (2009) asserted that success or failure of multicultural education depends on the effective preparation of teachers and administrators. When the teachers and administrators understand the learning needs of students and recognize how these needs can
be different than the needs of the students from the dominant culture, then the actual learning occurs. That is, when “we really see, know the students we must teach” (Delpit, 1995, p. 183), we start making a difference in the lives of these students. In order to achieve this, teacher preparation programs are responsible for designing programs that are appropriate and in line with the needs of these teacher candidates. These programs do not only need to challenge teacher candidates to leave their “comfort zones” but the programs themselves need to examine and expand their knowledge and understanding of diverse cultures these teacher candidates will serve (Ball, 2000; Cruz, 1999; Garcia & Willis, 2001; Gay, 2002).

Some argued that when the cultural diversity and global tolerance are promoted within multicultural education, traditional elitism and its shortcomings would be overcome (Schugurensky, 2002). Others argued that multicultural education hinders the assimilation efforts and creates a divisive society (Bernstein, 1994). Some further claimed that a good liberal education embodies a rather mono-cultural education, where national origins and race are not confused with culture as a learned attribute (Bernstein, 1994; Bloom, 1994; Souza, 1991; Grant & Graham, 1994; Chavez, 1994).

One significant shortcoming of intercultural communication competence research and the multiculturalization of education attempts is that it focuses on majority interacting with minority groups (Giles & Evans, 1986; Glaser, 1994; Taylor, 1998). Exceptions to this include Sigelman and Welch (1993) and Sigelman, et. al. (1996) studying the racial attitudes of Blacks toward whites and Powers and Ellison (1995) studying Blacks’ convictions on interracial dating and friendship. All these studies focused on Black/African American and White/European American populations. Many ethnic and racial groups (Black/African Americans, Latino, Asian Americans,
and White/European Americans, etc.) that form the basis of today’s multicultural environment are ignored (Stein & Rinden, 2000; Hood & Morris, 1997).

Advocating for multicultural education, as it is defined and practiced today in U.S. schools, whether K-12 or higher, has become a shallow application of a bicultural education. Bicultural, in this study, is defined as interactions between African-Americans and European-Americans in certain States and Hispanics and European-Americans in certain States. ‘Shallow’ in this context is defined as the poor and misguided attempts to multiculturalize the education. One example of the underestimation of the significance of a multicultural education is even though multicultural education is a necessary ingredient of quality education, it is perceived by most educators as to be embraced in times of crisis or simply a luxury (Banks & Banks, 2002).

A scholar and practitioner Nieto (2000) limits the shortcomings of the multicultural education to the “color-blindness”:

Many teachers and schools, in an attempt to be color-blind, do not want to acknowledge cultural or racial differences … Although it sounds fair and honest and ethical, the opposite may actually be true … color-blindness may result in refusing to accept differences and therefore accepting the dominant culture as the norm. (p. 138)

It is the lack of the ability “to relate and communicate effectively when individuals involved in the interaction do not share the same culture, ethnicity, language, or other salient variables” (Hains, Lynch, & Winton, 2000, p. 2). Another strong advocate of so-called multicultural education is Lisa Delpit. She argues that educational reforms are not designed with children of color in mind (Delpit, 1995).

Delpit (1995), Nieto (2000), Banks and Banks (2002), Fuller (1992), and many other scholars argue that it is rather the mono-cultural curriculum and the shortcomings of teacher education programs that are mainly composed of female European Americans that create the
achievement gap. Fuller (1992) compiled the statistics revealing that the majority of students in teacher education programs are European-American, middle-class females, products of suburbs, small cities or rural areas. Dilg (1995) warns that white teachers’ approach to multicultural education (mostly the curriculum aspect of multicultural education) as an outsider carries the danger of ignorance.

Despite increasing ethnic diversity in the United States, many educators do not seem to understand that multicultural education is the broader understanding, involvement, and appreciation of more than two cultures. Jay (2003) explained that “Despite a tendency to equate ‘Americanness’ with ‘Whiteness’ by individuals both outside and inside the United States, the United States is comprised of many different racial, ethnic, linguistic, and cultural groups” (p. 3). Contrary to the popular discourse of creating equity within the current education system, King (1991) argued that culturally relevant teaching that is successful helps produce a relevant black personality. His argument is relevant in the sense that culture is significant for individual and group identity. It “gives people a sense of who they are, of belonging, of how they should behave and of what they should not be doing” (Harris & Moran, 1991, p. 12).

With all the shortcomings of the application of so-called multicultural education, the author argues, that the focus, as it is presented in the current literature, is on why the children of African-American population in the U.S. schools are not excelling in their classes comparable to the children of European-American populations. There are facts and the author does not argue against these facts where African-American students score low on the standardized tests. For example, Garcia (1994) argues that research on African-American students tends to focus on dropouts, literacy gaps, and educational delinquency. Another example to arguing the dominance of the White race is Critical Race Theorists’ argument that official school curricula
are designed to maintain a “White supremacist master script” and they are “culturally specific artifacts” (Delgado, 1995, p. 21). Regarding instruction, Delgado argued that the “current instructional strategies presume that African-American students are deficient” (p. 22). When the African-American/Black students are given tests, Gould (1981) argued that it is a movement to legitimate African-American students’ deficiency. Tate (1997) further commented that the current multicultural paradigm, currently popular in the U.S., exists to benefit Whites. The question here is whether Whites are promoting advances for Blacks when only Blacks promote White interests (Bell, 1980).

In order for learning to occur in classrooms, we need to examine a wide variety of perspectives, including our own (Curtis, 1998). Lawrence (2005) claimed that for an antiracist multicultural education to be more than superficially effective, it must go beyond the lack of multicultural ingredients in the curriculum, policy and structure issues within schools and how school personnel, specifically teachers, interact with students and with each other (see also Banks & Banks, 1995; Lee, 1995; Nieto, 2000). It is the innate rejection of culture difference as threatening as it is because “it challenges an individual to reconsider ethnocentric views of the world and negotiate each intercultural encounter with an open mind and as a unique experience” (Mahoney & Schamber, 2004, p. 312).

Through this study, I postulate that the solution to the challenges of establishing a multicultural education lies in the understanding of the relationship between the individuals rather than implementation of a policy model or educational reform within an educational system. An education system, which does not recognize its problems and challenges as they are, rather than creating superficial challenges and solutions, is bound to fail in the long run.
However, it should also be noted that intercultural communication and thus research is problematic as members of cultural groups may be blinded to significant aspects of their own culture. This is also a limitation of an education system where educators “represent ethnically diverse individuals and groups in all strata of human accomplishment instead of typecasting particular groups as dependent and helpless victims who make limited contributions of significance” (Banks & Banks, 2002, p. 33).

**Multicultural Education through Development of Intercultural Communication Competence**

I argue that even though the curriculum, teacher education, and policies within the current education system have shortcomings, learning occurs in a system where intercultural communication competence is valued. With the most culturally sensitive curriculum and appropriate legislations regarding teacher education, intercultural communication competence remains the first big step towards success.

Karim (2003) developed a Leadership Developmental Progression Model. In this model, he made nine assumptions and suppositions about human tendencies and inclinations. Through this model, he explained intercultural consciousness and how it can be integrated in a leadership model. In this study, these assumptions and suppositions given by Karim (2003) will be explained and solutions will be offered stemming from these assumptions and suppositions. Relevance of intercultural competence and thus consciousness in achieving multiculturalism in education will be explained further in this study.
Leadership Developmental Progression Model

Karim (2003) explained that:

Intercultural consciousness goes beyond mere recognition and knowledge of cultural differences and language acquisition (in case of language differences). Intercultural consciousness is a state of mind that requires holistic engagement of one's cognitions, behaviors, emotions, and beliefs. It requires extensive self-reflection and critical self-analysis. It demands intentional inquiry and comprehension of the lived experience and world view of the ‘Other’ [Said (1979) defines “other” as people that are alien to the West]. It requires patience, tolerance of uncertainty, creativity, and flexibility in behaviors and thinking. (p. 37)

These nine assumptions and suppositions developed by Karim (2003) are:

1. Most people are culturally encapsulated and ethnocentric in their world view.
2. People tend to behave differently in their dealings and action with in-groups versus out-groups.
3. People feel cognitively, emotionally, and behaviorally challenged in unfamiliar situations and settings.
4. People prefer to avoid uncertainty and reduce anxiety.
5. People tend to behave in self-protective ways if they perceive threats to their psychosocial identity.
6. People attempt to reduce cognitive dissonance.
7. People repeat or avoid behaviors and experiences that have pleasant or unpleasant outcomes, respectively.
8. People's evaluation of self and others is influenced by violation or confirmation of their expectation, and their attribution processes.

9. Most people perceive themselves as morally decent, interpersonally sensitive, and socially just. (p.35)

**Intercultural Consciousness**

The rest of this study will focus on explaining these assumptions and suppositions and offer a starting point, which is understanding ‘why we do what we do’. It begins with an exploration of the ‘self’.

1. *Most people are culturally encapsulated and ethnocentric in their world view.*

   Banks and Banks (1993) use the term “ethnic encapsulation” to refer to the cultural deprivation that results from the limited knowledge of any culture other than one's own. Not knowing other cultures significantly handicaps the attempts to help them. More importantly, misconceptions and stereotypes about other cultures limit the solutions. Antal (2002) argued that misunderstandings and conflict occur when people interpret and judge what they see, the tip of the iceberg, according to their own norms, values, and assumptions. Thus the behavior of others may seem strange, illogical, or “barbaric” (Barnlund, 1998, p. 39). Teachers, students, and administrators who have limited (and are often misinformed and stereotyping) knowledge of other cultures are part of the problem rather than part of a solution. *Do I know enough about other cultures?*

2. *People tend to behave differently in their dealings and action with in-groups versus out-groups.*

   According to social identity theory, people are attracted to others who are similar to themselves because this similarity reinforces their self-image (Tajfel, 1982) and individuals
Shortcomings of Multicultural Education

perceive and treat in-group members more favorably than out-group members. An essential part of intercultural communication is sincerity. When in-group interaction differs from out-group interaction sincerity of the individuals becomes questionable.

We need to understand that intercultural communication requires a great deal of accountability between what we say and how we act. A big step is how close these two are to each other. *Am I doing what I am saying? Am I “walking the talk”?*

3. People feel cognitively, emotionally, and behaviorally challenged in unfamiliar situations and settings.

Once we place a young female European American in a classroom where she is called ‘White’ rather than ‘Madam’, or ‘Miss’, it is rather unfair to expect her to disengage herself from her ‘convictions’ if there is any. That is, calling the teacher ‘White’ enforces the difference and widens the gap. Educated in a system where there were only ‘similar cultures’, we cannot expect her to grow as a teacher, while also disregarding the treatment she is getting from students and teachers of color. Rather than blaming the ‘young female European-American teacher from the suburbs,’ we need to understand that with the education and life experiences she had, more help needs to be extended to her, especially during her first few years in the profession. Once you add the pressure of being a new teacher to the pressure of racial sensitivity, it is therefore natural for a teacher of any color to be less effective.

Macphee (1997) argued that rural children do receive images of socio cultural diversity mostly through the media, but, and these images alone cannot provide a complete or accurate portrayal of any cultural group. Barta and Grindler (1996) explained that despite the teacher's best intentions, the fact that cultural differences are not always perceived positively, particularly when viewed from the perspective of the mainstream culture [in some institutions, the Black
population forms the mainstream culture, in some the Hispanic population, and in others the White population] and bias against diversity, not diversity itself, is the cause of the turmoil. What am I expecting when I educate the educators and do not take responsibility of my teachings? How informed am I about ‘diversity’? What is my perception of “diversity”?  

4. People prefer to avoid uncertainty and reduce anxiety.

Hofstede and Hofstede (2005) defined Uncertainty Avoidance as the “extent to which the members of a culture feel threatened by ambiguous or unknown situations” (p. 167). There is tolerance for ambiguity and chaos in weak uncertainty avoidance cultures whereas in strong uncertainty avoidance cultures, there is a need for precision and formalization. However, tolerance for ambiguity and avoiding uncertainty create a system where it becomes a diversion and an excuse for the failure as avoidance of uncertainty reduces anxiety and creates a superficial cultural shield. That is, once you do not see it, it does not exist. Identifying the problem is not sufficient but taking responsibility for and acting upon it is the big step towards the solution. What am I doing to face the truth and accept the differences?  

5. People tend to behave in self-protective ways if they perceive threats to their psychosocial identity.

This is related to above discussions of uncertainty avoidance and the fear of the unknown. With the limited knowledge on different cultures, people tend to form a protective shell around them and avoid change. That is, if someone needs to change, it has to be the ‘other’, rather than ‘I’. If someone violates the space we are living in, we tend to be defensive and this defensiveness leads to more failures.  

The individualistic characteristic of the U.S. society is also significant. Hofstede and Hofstede (2005) explained that “Individualism pertains to societies in which the ties between
individuals are loose: everyone is expected to look after himself and herself and his or her immediate family” (p. 76). If a culture, other than my own, violates my space, and if I know that it is here to stay, I will defend myself and protect my own culture. Why am I being defensive?

What is the threat?

6. People attempt to reduce cognitive dissonance.

“Cognitive dissonance” as defined by Merriam-Webster Online dictionary is “psychological conflict resulting from incongruous beliefs and attitudes held simultaneously”. It is also in accordance with uncertainty avoidance where people also avoid the unknown.

Rothman (1997) exerts that cultural misunderstandings are often experienced as conflicts. These conflicts are seen as threats not only to goal achievement, but also to the sense of self respect, competence and identity of the people involved.

If there is a problem, it is not because of me, but because of the ‘other’ and I do not take any responsibility in its creation and growth. How responsible am I for the creation and growth of this problem?

7. People repeat or avoid behaviors and experiences that have pleasant or unpleasant outcomes, respectively.

People tend to avoid situations where they have encountered unpleasant outcomes and repeat the behaviors where they were previously rewarded / appreciated in the society. It is the expectations of the society and norms within the society that determine the behaviors of individuals. By repeating the popular discourse of being a strong supporter of a multicultural education, blaming either the curriculum or the new generation (mostly young female European-American) teachers, I will be accepted into an elite group where such discourse does not create a conflict and thus I am legally, culturally, socially, and psychologically accepted into the system.
Therefore, I will keep on doing what I am doing and I will not step outside the social and political norms of the society. Should I go outside the line by initiating a rather provocative discussion and face losing my place in the society?

8. People's evaluation of self and others is influenced by violation or confirmation of their expectation, and their attribution processes.

Social expectations and norms have been discussed above. People tend to repeat their actions if these actions have been confirmed by the society. Then, the definitions and cultural labels attributed to other cultures are natural outcomes of such confirmations. If others are not behaving in the way that I am expecting them to do, then, it is my responsibility to define them as nonconformists, creating an unnecessary conflict and division within the society. Vygotsky (1986) argued that learning does not take place in cognitive isolation, but within the context of activities and social interaction likely informed by the day-to-day contingencies of culture. Who am I? What are my expectations from the society and what does society expect from me?

9. Most people perceive themselves as morally decent, interpersonally sensitive, and socially just.

People tend to justify their behaviors through various situations they have previously encountered. It is the selective perception and acceptance of the partial truth as it is psychologically comforting. It is the avoidance of understanding of ‘I’ and accountability that it brings. Since our childhood, we have been blaming others, for example, our sister or brother for breaking mom’s most valuable vase. When we are young, it is our siblings. When we are older, it is other people, but never ‘I’.

While an advocate of the popular discourse, Lewis (2001) explained, “Color-blindness enables all members of the community to avoid confronting the racial realities that surround
them, to avoid facing their own racist presumptions and understandings, and to avoid dealing with racist events” (p. 801), it is rather questionable whether such attributes can be expanded to the overall society. Nieto (2000) argued that multicultural education “challenges and rejects racism and other forms of discrimination in schools and society and accepts” and “affirms the pluralism (ethnic, racial, linguistic, religious, economic, and gender among others) that students, their communities, and teachers reflect” (p. 305). She did not only argue that multicultural education rejects racism, she also confirmed the importance of teachers’ cultures in the learning process. *Am I truly sensitive to the racial elements in the culture I am living, including the cultural differences of the dominant race? What are my standards of judging “the other”? What is “morally decent” and “socially just” for me? Have I ever met a person identifying himself/herself as “racist”?*

**Discussion and Conclusion**

Bennett (1993) argued that, “Probably one of the most threatening ideas encountered by students is this concept of difference and the implications this concept brings along with it” (p. 181). That is, how we perceive the differences determine the scale and limit of our interactions with other cultures. In this context, intercultural communication competence is the first big step towards creating a culturally sensitive education. “Exploring the construct of cultural difference is fundamental to learning about other cultures” (Mahoney & Schamber, 2004, p. 311) and we need to start with a close look at our intercultural communication competence. Are we communicating our sincere attempts to understand other cultures effectively, or are we simply blinding ourselves with our own convictions on what is right for the students?

The solution is not simply to create a culturally responsive pedagogy with a curriculum designed with children of color in mind, and turning young, female, white suburban teachers into
culturally competent and responsive educators. I do not argue the relevance of such discourses in the current education system. However, what I am arguing is that these do not constitute the essence of the solution but it is, rather, an understanding of ‘who I am’, and ‘why I do what I do’ as to start the ‘change’.

It is also not necessarily the information provided by the schools that will enhance our intercultural communication competence but an understanding of why we do what we do will. Gudykunst (1998) explained that intercultural competence includes not only knowledge of the culture and language, but also affective and behavioral skills. Examples to such affective and behavioral skills are empathy, human warmth, charisma, and the ability to manage anxiety and uncertainty. There is no question that racism is a big concern and dominance of a single culture and presents a real threat for any education system. However, not belonging to the mainstream culture should not justify the failure of the minority education.

From a pedagogical point of view, cultural sensitivity provides a road map to multiculturalization of education and thus equality. From a political point of view, ‘divide and rule’ style of management applies where schools, through singling out the differences (unique characteristics), are creating culturally distinct groups. Through these divisive policies, it becomes easier to focus on a problem where political sensitivity becomes a handicap. School management focuses on maintaining a superficially equal education rather than focusing on the learning outcomes of students from all cultures within the system. In order to have a better understanding, we need to take a close look at the policies as how an educational ideology is transferred to procedures, and regarding application, and how these procedures are practiced.

To achieve multiculturalism in education, we need to have a clear definition of what we understand from ‘multicultural education’. Through a clear definition, we can make the
necessary changes in the policies. After we make the necessary changes in the policies, we need to have leaders with strong intercultural communication skills in order to communicate the vision of a multicultural education. The process of defining multicultural education, making the necessary changes in the policies, and finding a leader to communicate these can be achieved through serious and sincere applications of each of these steps, respectively. However, before we start to ‘change’ the world, we need to understand ‘why I do what I do.’ Whoever you are, wherever you are, whatever you want to accomplish, it all begins with an understanding of ‘I’.
Shortcomings of Multicultural Education

Abstract
The recent proliferation of college anonymous confession boards (ACBs) as a component of social networking touches higher education and presents implications for administrators, student services professionals, faculty, and students. It is important to understand the characteristics of college ACBs and how they affect college students to contemplate institutional roles and responsibilities. This study examines college anonymous confession board (ACB) activity for 20 higher education institutions in Ohio over a twelve month period and reports the posting and reply activity recorded in two phases to discover the level of activity present on an
ACB for select Ohio higher education institutions. In addition to the level of participation discovered, results of a content analysis of the postings and replies reveal the nature and scope of the discussions occurring on these college sites. The potential implications and challenges from college ACB participation and the responsibilities of those in higher education to consider their extent of involvement are discussed.

**Purpose of the Study**

Originally conceived as a forum for college and university students to exercise free speech without fear of retribution, college ACBs have quickly evolved into an ethical and legal grey area of higher education. Given that ACBs are a recent occurrence at many campuses across the United States, it is important for administrators, student affairs professionals, faculty, and students to consider potential implications on the higher education experience. ACBs present problems that continue to plague many colleges and universities despite the desire to prevent their spread and usage. In addition to worrying about classes, extracurricular activities, work, and other typical college issues, students must also be concerned that they do not appear in postings on such sites. Administrators and faculty in higher education institutions must be aware that these sites exist and the extent to which they have infiltrated their campuses and impact students. Only with this awareness can colleges and universities be prepared to manage their response and help students fight the verbal attacks taking place on these boards. Investigating the proliferation of college ACBs and the participation level and impact on higher education institutions in the state of Ohio provided the impetus for this research. Results may provide insights to administrators, faculty, and students to assist in developing meaningful strategies to address the impact of these ACBs on colleges and universities.

The research questions for the study include:
1) What is the activity level of a college ACB in select Ohio higher education institutions?

2) How do Ohio public and private institutions compare in their level of anonymous confession board activity?

3) What are the most discussed topics for those selected Ohio higher education institutions?

4) Specific to Greek life, are college ACB postings for those selected institutions more positive or negative in nature and tone?

**Perspectives and Conceptual/Theoretical Frameworks**

Anonymous confession boards created for higher education students purport to offer a venue for open discussion and dialogue about campus life, sexuality, religion, politics, and any other topics of interest to college and university students. Perhaps the best definition of an ACB is provided by the mission statement of the College Anonymous Confession Board (ACB) as: “The College ACB or College Anonymous Confession Board seeks to give students a place to vent, rant, and talk to college peers in an environment free from social constraints and about subjects that might otherwise be taboo.” (College ACB, 2009, para. 2). According to Morgan (2008), anonymous confession boards allow users to post information to the internet and promise that they will remain unnamed. Similar to a celebrity gossip site, college ACBs generally focus on topics such as the sex lives of students and rumors surrounding Greek societies (Morgan, 2008). Juicy Campus, a college ACB which eventually shut down due to economic reasons, did not even require that its users register for an account with the site (Morgan, 2008; Storch, 2009). What makes these sites especially unsettling is that those who use them often times provide the names of those being discussed (Morgan, 2008). As a result, they can be devastating for those involved. For example, one Juicy Campus post identified a Yale sophomore by name and provided a link to a website where one could watch him in a pornographic movie with three
other men (Morgan, 2008). Any perusal of College ACB, a current anonymous confession site, will uncover posts discussing the biggest slut on campus, fraternity hazing, and drinking habits (www.collegeacb.com). Some students who have been defamed by these sites have been so devastated that they have resorted to self-harming and suicidal behavior (Storch, 2009).

Given the impact and apparently the staying power of anonymous confession boards, those at any higher education institution should be concerned with how to contend with the impact of college ACBs on students and student life. However, doing so appears to be no easy task. One may think that an institution could simply block the site to help eliminate its impact. However, Storch (2009) argues that this is largely impossible and ineffective. These sites are not hosted on the network of any college, and banning them may lead to the requirement that all offensive sites be prohibited by a particular institution (Storch, 2009). Furthermore, this type of action also involves the issue of freedom of speech and may also encourage more students to visit the sites (Storch, 2009). Legal remedy appears absent as there is no avenue available to sue the websites or their owners due to protection granted to them by The Communications Decency Act (“Gossip and Slander,” 2008). According to Bleiberg and Storch (2009), the best way to handle ACBs could possibly be to simply educate students and provide them help with determining who posted offensive material and pursuing legal action against them.

**Study Methodology and Results**

**Methods**

To sample the amount of ACB usage within the state of Ohio, the most active collegiate ACB, College Anonymous Confession Board (www.collegeacb.com), was selected for participation calculation and content analysis. Data collection and analysis were divided into two phases to investigate activity over time and research was conducted in two phases. Phase
one involved activity on College ACB for postings occurring June 1, 2009 to January 2, 2010. Phase two focused on activity from those same boards from January 3, 2010 through July 31, 2010. Aggregating data from Phase One and Phase Two provided data for one year of College ACB activity for the selected institutions.

Higher education institutions identified for the study included both public and private colleges and universities in the state of Ohio. Initially 12 public institutions and 21 private institutions were selected for analysis (n=30), however a review of College ACB revealed that one public and 12 private institutions did not have a board on College ACB and were eliminated from the study, leaving 11 and 9 institutions respectively (n= 20). Data were collected for each of these institutions recording the number of overall posting and replies occurring within each institution’s section of the College ACB website during the identified time period. Table 1 presents data for public institutions and Table 2 highlights data for private institutions.

To analyze the content of the postings, eight categories were specified to classify discussion content. The categories selected were: sex, drugs, professors, parties, off-campus activities, advice for students, Greek life, and postings related to student organizations. A content analysis of all discussion board postings for each institution revealed the nature and tenor of the posting. If a posting or reply pertained to one or more of the categories, the posting was dually counted in each classification. To provide more specific data concerning Greek life postings, those identified posts were judged to be either “positive” or “negative” based on the message and content.

Results

Of the 20 institutions examined for both Phase One and Phase Two, only 19 had active boards on College ACB as of the final day of the study. While some postings were recorded for one institution, during Phase Two, it had no active board as of August 27, 2010. Of the 20 institutions, 14 institutions had active sections (defined as six or more postings and replies) during Phase One, and 15 institutions had active sessions as defined as six or more postings and
replies during Phase Two. Posting and reply activity per institution ranged from four to 3,524 during both phases of data collection. Especially noteworthy were Kent State University and Miami University of Ohio, boasting total postings of 642 and 3,524 respectively. Of the 5,783 total postings and replies for all institutions, public institutions exhibited greater activity with a total of 4,983 postings while public institutions recorded 800 postings. Although the breakdown of the number of participating institutions was fairly equal (11 public and 9 private), public institutions clearly demonstrated a higher level of activity which may be attributed to the high levels of activity of Kent State University and Miami University of Ohio.

The content analysis performed revealed that the nature of the postings and replies focused overwhelmingly on sex and negative aspects of Greek life, again with Kent State University and Miami University of Ohio disproportionately contributing to those totals. Clearly, students with an interest in participating in ACBs do so to discuss those two topics as postings for other topics were significantly less frequent.

Conclusions and Implications

While overall use of college ACBs in the Ohio institutions examined is not yet widespread, activity over the 12 month period studied indicates that institutional activity is increasing overall. Further, the malicious nature of many of the postings has increased considerably over this period and suggests a troubling trend. Very few of the postings contained information that one may find useful. For example, there were very few postings related to college advice, student organizations, off-campus activities, parties, and professors. In contrast, most postings and replies dealt with the topics of sex and Greek life. Although the topic of Greek life could be useful if used in a positive manner, many of these postings were used to speak negatively about rival fraternities or sororities.
From a student perspective, several disturbing issues emerge relative to ACB activity. Undoubtedly the most obvious concern is an anonymous posting containing false or exaggerated information. Along with the disturbing nature of some of the posts, the fact that posts do not expire contributes to the concern that these malevolent rants may persist in perpetuity. It is possible that a college ACB post could be viewed by a potential employer, spouse, or acquaintance – with damaging consequences. Especially when a post contains the name and/or a picture of the student targeted, safety issues are of paramount concern. Several student groups have recognized the negative impact of these sites and have organized to block access at several colleges and universities, including Pepperdine, Columbia, and Yale (Morgan, 2008). However, to date no institution as has blocked access to these sites from campus computers (Young, 2008). To do so would be a potential violation of the first amendment and oppose the objective of higher education as providing a place for unlimited exploration and access to information. It may also appear as a move toward censorship by higher education administrators. Even if access to campus computers was blocked, administrators have no authority to block access and participation from off campus computers.

Questions persist regarding institutional responsibility. The dilemma for administrators creating educational programs aimed at ACBs is whether this will only increase interest and traffic by drawing greater attention through protest (Young, 2008). Faculty may wonder whether to discuss these boards and student responsibility as part of their advising responsibilities. Student affairs professionals should consider their obligation to inform and educate students about their ethical responsibility and accountability if they choose to participate in a college ACB. Although the question of educating and possibly inadvertently encouraging use is probably a valid concern, ignoring the issue does nothing to assist students understand the nature
and scope of ACBs for those who initiate the postings or fall victim to their effects. One suggestion to incorporate student information and education may be to introduce this issue through the institution’s student code of conduct as one of many expectations related to student behavior. Subsequent investigation and analysis of student conduct violations related to ACB participation through student judicial affairs offices could reveal the institutional effect.

Given the destructive nature of the postings found as a result of this research, future research should be conducted concerning the effects that these websites can have on students and campus communities specifically in regard to areas such as student life and student judicial affairs. Additionally, research should also be conducted to see if these trends can be demonstrated in other states and nationally.

Abstract

The need for sustainable, meaningful teacher professional development to support rising professional demands remains an ongoing challenge for educators. The use of current technologies, such as online learning systems, to leverage the development of learning communities, including communities of practice (CoPs), where teachers with a common interest engage in continuous interaction and knowledge sharing (Wenger, 2000), is a rising trend. The increasingly popular blended CoP model (National Staff Development Council, 2008; Wenger, 2000), allows teachers to build trust and community in-person, while extending knowledge sharing online in an anytime, anyplace environment. Blended CoPs are purported to promote ongoing and meaningful professional development (National Staff Development Council, 2008). Yet, further research is needed to determine how to effectively leverage current technologies to create truly blended communities that enhance teacher learning and professional practice.

In-depth case studies of two developing blended CoPs in a large, urban school district explored the role the blended environment played in supporting the CoPs in accomplishing their goals. The objectives of the case studies were to (1) identify elements of CoP culture, facilitation, design, discourse and patterns of communication that supported and hindered the accomplishment of CoP goals, and (2) establish a set of recommendations to assist developers and leaders in the creation of sustainable, successful blended teacher learning communities. Data collection for each CoP spanned a four month period and included: four online and four in-person observations; semi-structured interviews with the leaders and five selected participants based on low, average or high levels of engagement; and initial and final reflective surveys. The results of the case studies were used to develop a preliminary framework for administrators and teachers interested in establishing truly blended CoPs. The framework includes 16 recommended key components with suggested elements for culture, facilitation, design, discourse and patterns of communication; and includes how these components might look in the blended environment. While more research is needed to determine the validity of the framework, the framework presents a starting point for district administrators and CoP leaders interested in providing sustainable, meaningful teacher professional development using an in-person and online blended model.
Introduction

The demands placed on schools and teachers are consistently increasing due to advances in technology, increasingly diverse student populations, and enhanced standards and accountability (Darling-Hammond, 1998; Garet, Porter, Desimone, Birman, & Yoon, 2001). As a result, sustainable and meaningful professional development is essential. Professional development can increase teachers’ skills for teaching today’s students, but teacher professional development must be more than just a group of training workshops, institutes, meetings or in-service days. Instead, it must be a process where learning how to put knowledge into practice is supported within a community of teachers, administrators, and staff developers (Schlager & Fusco, 2003). According to the National Staff Development Council,

Staff development that has as its goal high levels of learning for all students, teachers, and administrators requires a form of professional learning that is quite different from the workshop-driven approach. The most powerful forms of staff development occur in ongoing teams that meet on a regular basis, preferably several times a week, for the purposes of learning, joint lesson planning, and problem solving. These teams, often called learning communities or communities of practice, operate with a commitment to the norms of continuous improvement and experimentation and engage their members in improving their daily work to advance the achievement of school district and school goals for student learning. (Learning Communities, 2008)

The traditional forms of staff development mentioned previously do not follow the National Staff Development Council’s belief in collaborative and continuous learning, and are commonly criticized as being ineffective in providing teachers with the activities, content and time needed to increase their knowledge and develop meaningful changes in classroom practices (Darling-
Hammond, 1998; Garet et al., 2001). The traditional forms of staff development previously mentioned are often problematic, as studies show that teachers who spend more time studying teaching, especially in their own practice, are more effective overall, particularly in teaching higher-order thinking skills and for meeting the needs of diverse learners (Druva & Anderson, 1983, as cited in Darling-Hammond & Ball, 1997). For instance, a meta-analysis of 65 research articles on science teacher learning and outcomes for students by Druva and Anderson (1983), found that teachers’ effectiveness, defined by what teachers understand about the material and about the teaching discipline more broadly, depended on the amount and kind of teacher education, including the content area training they had, and on the types of professional development opportunities they experience later in their careers. A great deal of what teachers encounter in traditional forms of staff development “does not consider them as learners, is not designed to help them develop over time, does not focus on the content or the students whom they teach, and does not offer opportunity for focused analysis and reflection” (Darling-Hammond & Ball, 1997, p. 16).

One reason for this disconnect is that often districts and schools “must choose between serving larger numbers of teachers with less focused and sustained professional development or providing higher quality activities for fewer teachers” (Desimone, Porter, Garet, Yoon, & Birman, 2002, p. 105). Desimone et al. suggest that this is a profound problem in improving teaching practice, and that in order to transform teaching instruction, schools and districts need to focus their professional development programs on smaller numbers of teachers, for longer periods of time, instead of trying to train larger groups of teachers in short-lived, superficial professional development workshops. In a three-year longitudinal study on the effects of professional development on teaching instruction, Desimone, et al. found that teachers must
engage in active learning on a continuous basis, where they immerse themselves in the process of creating knowledge with others and are not just recipients of information. Teachers must interact with their colleagues regarding their work and student learning continuously, in order to develop a deeper understanding of how children learn, and to develop effective teaching practices (Desimone, et al.).

Problem Statement

The rising need for teachers to participate in meaningful, ongoing and sustainable professional staff development in order to reach the needs of a diverse student population must support continuous learning for teachers and it must be relevant to their practice of teaching. Furthermore, the new knowledge and skills acquired must reach the classroom to promote student learning. Traditional forms of professional development that employ a “one-size-fits-all” approach often fail to reach teachers in these ways, resulting in lack of participation, engagement, and sometimes even complete withdrawal, in the professional development programs. Teacher participation in staff development means that teachers are not just idly listening and receiving information, but are choosing to actively take part and contribute to the experience; whereas engagement entails more effort for contributing and connecting to the professional development. This includes both taking and giving knowledge, at a deeper and more profound level (Clark, 1999). If teachers do not value the professional development and are not engaged in the learning process, teachers are less likely to choose to participate in the continuous learning and problem solving endorsed by the National Staff Development Council (2008); resulting in a disconnect between the professional development and teacher learning. When this disconnect happens, there is often no direct impact on the teacher or his/her teaching practices. Therefore, there is a continued need to find innovative ways to engage teachers in professional
learning that affects professional practice in positive ways; that focuses on long-term, sustainable
teacher learning, such as professional learning communities or communities of practice
recommended by the National Staff Development Council (2008).

Technology offers an innovative way to engage teachers in professional learning that is
relevant to their teaching practice. As the use of technology continues to grow in education, the
importance of learning how to leverage technology to help facilitate alternative ways of reaching
teachers for professional staff development also continues to grow. This includes learning the
facilitating and hindering factors of the use of different types of technologies for professional
development that will enhance teaching practices, such as the use of the Internet to create online
learning communities of teachers. The next section explains the development of learning
communities and the use of technology as a way to leverage and enhance professional
development and emphasizes that presently, not enough is known about how to utilize
technology to reach its greatest potential in supporting and facilitating alternative forms of
professional development (Barab, Schatz, & Scheckler, 2004; Russell & Schneiderheinze, 2005).

Review of Literature

Information and Communication Technologies (ICT) and digital technologies have supported the
evolution of different types of learning, including online learning environments, and
collaborative learning communities (Barab, Schatz, & Scheckler, 2004; Friesen & Clifford,
2003; Laferriere, Lamon, & Chan, 2006; Schlager & Fusco, 2003). The advent of online
technologies, such as the Internet, produces opportunity to carry out the need for innovative
professional development, that reaches teachers in more collaborative and constructivist ways,
which is shown to support instructional improvements amongst teachers (Borko, 2004). The use
of online learning communities, if done correctly, can transform the learning environment for
teachers. As noted by the National Staff Development Council (NSDC), online learning communities “provide new structures and media for reflecting, communicating, and acting; facilitate modeling and visualization; allow for construction and discovery of knowledge; expand access to information, networks, people, and ideas; and increase the flexibility of time and places for learning” (2001, p. 15). A community, whether online or in-person, contains elements such as mutual trust and interdependence among members, a sense of belonging and connectedness, shared values and goals, and overlapping histories between members (Rovai, 2002).

An essential component of online learning communities is collaboration among participants (Laferriere et al., 2006; Lock, 2006; Schlager & Fusco, 2003). Although there are many different types of learning communities, the term learning community used in this study represents a group of teachers with similar interests and goals that collaborate in learning about and enhancing their teaching practice. As the NSDC (2008) suggested, the most powerful forms of staff development occur in ongoing collaborative teams that meet on a regular basis. A Community of Practice (CoP) is one such learning community, with the goal of increasing knowledge about everyday practice. Teachers who are members of learning communities, such as Communities of Practice (Lave & Wenger, 1991), are likely to meet, collaborate and share knowledge regularly. This non-traditional sharing of knowledge is likely to focus on problem solving and improving daily practice, allowing teachers to create meaning in the learning process (NSDC, 2008).

CoPs are social learning systems (Wenger, 2000), where the knowledge shared by a group of people is much greater than a single individual’s knowledge. In a CoP, a group of people with a common interest in practice, such as a group of teachers, comes together to both give and take knowledge from each other on a continual basis. According to Wenger, there are
four main characteristics of a CoP. Those characteristics are, (a) that the group share a common interest in practice; (b) that knowledge is shared in the context of a community, where mutual communication and trust is apparent; (c) that the knowledge shared and/or the need for new knowledge revolves around a common topic or interest, which entails meaning-making; and (d) that the participants within the community share a minimum level of knowledge within the particular field, which gives them the notion of identity within the group. Sustainable and meaningful professional staff development, where teachers are in an environment of shared knowledge, should lead to improved classroom teaching practices and enhanced student achievement.

Learning communities, such as CoPs, can happen in many different settings; as Rovai (2002) proposed, community is setting specific, and can be created in either a physical or virtual setting. Some found that it is difficult to build a community in a purely online environment (Barab et al., 2004; Friesen & Clifford, 2003; Hur & Hara, 2007), and that face-to-face interactions, as well as online community building are more likely to make online Communities of Practice successful in building community. A hybrid, or blended online community, has elements of both online and in-person communication for its members and may be a more feasible way to instill a “we all create, we all learn” model (Barab et al.). Persistence is viewed as teacher participation within the CoP that is continuous and ongoing. Meaningful participation is viewed as teachers both sharing and receiving knowledge related to current teaching practices and reflection for each teacher, where what is learned actually affects teaching practice. In-person training coupled with a 24/7, anytime, anyplace online environment may be the key to persistent and meaningful participation in a blended CoP. A second argument for the use of a blended approach to building community online is that the greatest problem with virtual
communities is withdrawal and attrition (Johnson, 2001). By including a face-to-face component, participants are more likely to develop trust and community, which can promote their choice and willingness to continue within the CoP.

Although much of the literature purports that a blended or hybrid approach to professional learning communities, such as a CoP, can enrich professional development in meaningful ways, there is little empirical research that supports these ideas (Hew & Hara, 2006, 2007). Further research of blended online communities and how these communities affect teacher learning and professional staff development are needed. There is a gap in the literature on if, and how, the use of online technologies along with in-person professional development supports meaningful and sustainable teacher learning, and whether teacher learning in this environment affects teachers in positive ways. Furthermore, much of the research on blended online learning is tied to higher education; there is very little research regarding the use of blended online learning to facilitate online learning communities for professional staff development in the K-12 setting (Hew & Hara, 2006). Furthermore, research on CoPs to date in both in-person and in online environments has relied heavily on the use of the qualitative case study method (Hew & Hara, 2006, 2007; Johnson, 2001); however, no studies have focused on blended CoPs with teachers, using an online learning management system, such as Blackboard.

**Purpose Statement**

The purpose of this study was to complete in-depth case studies of two developing blended CoPs in a large, urban school district to explore the role the blended environment played in supporting the CoPs in accomplishing their goals. The objectives of the case studies were to (1) identify elements of CoP culture, facilitation, design, discourse and patterns of communication that supported and hindered the accomplishment of CoP goals, and (2) establish
a set of recommendations to assist developers and leaders in the creation of sustainable, successful blended teacher learning communities.

Methods

This multiple case study focused on two groups implementing a blended method of professional development in a large, urban, southern California school district. The ethnic make-up of the district was made up predominantly of 81.7% Hispanic, 6.3% African American, and 5.8% Caucasian. The English learner population was 40.9%, and 77.2% of the student population were on free and reduced lunch. A total of 80.6% participated in some kind of compensatory education (Education Data Partnership, “District Reports,” 2010). Furthermore, 23 of 44 schools (52%) were named as a Program Improvement school, based on the school’s Adequate Yearly Progress (AYP), under No Child Left Behind. Although the district continued to make progress in meeting NCLB requirements, it was in the third year of district Program Improvement (California Department of Education, “AYP Reports,” 2009). All of these statistics were higher than the County average, and show a resounding need for teachers in the district to be highly skilled and competent in their work.

The district began implementing the blended CoP model in 2007-2008 for professional development to reach student needs, using the Blackboard Learning Management System (LMS). Researcher Jennifer Wagner was put as the lead teacher specialist responsible for training and supporting the use of Blackboard for professional development and classroom practice. At the end of year one, 11 professional development groups met and used Blackboard in some capacity to facilitate ongoing communication and sharing of resources. In 2008-2009, the researcher selected the two most highly developed groups that showed the most promise in implementing a blended CoP. Both groups targeted district priority areas for student
achievement. The first group (Math, Science & Technology) included 34 secondary math and science teachers (70% female and the average years teaching experience was 6.6) focused on best practices and integrating technology into their content areas. The second group (Teaching Teacher Specialists) included 23 teachers (18 elementary, six secondary; 87% female; and an average of 13 years teaching experience). The teaching teacher specialists focused on the development of literacy for all and increasing the academic achievement of the English learner population.

Data collection and analyses for each group included two phases across a four-month period as displayed in figure 1 below.

*Figure 1. Data Collection Phases*

The objective of phase one was to understand and contextualize each group in terms of it’s blended CoP development by (1) interviewing each CoP leader; (2) conducting an
anonymous survey through Survey Monkey, regarding initial engagement (based on Shin and Chan’s [2004] 5-point likert scale) and group goals, participation levels, types of activities, levels of communication, and early perceived value for members; (3) and observing online and in-person meetings and activities. This phase also informed the selection of members to interview in phase 2. Table 1 summarizes the teacher leaders for each group.

The objectives of phase two were to continue to determine the goals of each group, and member perceptions of how culture, facilitation, design, discourse and patterns of communication affected the accomplishment of these goals. This phase also focused on the extent to which members valued and participated in the group (or not) and the benefits and challenges they experienced. Five members per group were selected for in-depth interviews based on their levels of engagement (low, semi and high) as shown in Table 2.

These participants were also followed during online and in-person observations. At the end of the year, all members of both groups were asked to complete an anonymous final reflection using Survey Monkey. This reflection asked them about their experiences and included open-ended questions on goals, practice, community, value, levels of communication, and recommended changes (if any) to the blended environment. The survey also asked for input regarding the emerging supporting and hindering themes found during the course of data collection. Themes were stated and participants were asked to agree or disagree and explain why.
The final reflection provided valuable data that was cross-referenced with all other data sources in the final analysis of the groups.

Table 3 describes the data sources and analysis methods used to determine the role the blended environment played in supporting the groups in accomplishing their goals and the elements of culture, facilitation, design, discourse and patterns of communication that supported and hindered these goals.

</tbody>
</table>

Both Excel and HyperResearch were used to code the data and the Constant Comparative Method (Lincoln & Guba, 1985) was applied to identify and confront emerging themes within and across datasets. The themes were then compiled into a set of recommendations to assist developers and leaders in the creation of sustainable, successful blended teacher learning communities.

**Results and Discussion**

According to Johnson (2001), two important aspects to a CoP are collaborative learning and negotiated goals for the group as whole. Adult learning theory also suggests that continued learning for adults depends on attaining satisfaction, especially regarding making progress towards individual learning goals (Butler, 1992). Group goals as well as individual goals are essential to a sustainable professional development community, as they help to keep the community focused on the learning and the work of the group. Also important to a learning community, such as a CoP, is that goals, norms and expectations are established within rather than outside the group, in a top-down way.

Results indicated the goals for each group remained consistent over time yet shifted in priorities. The math, science and technology group focused on integrating teaching in their content area and developing community for sharing and collaboration, and the members’
individual goals coincided with group goals. The teaching teacher specialist group focused on increasing the academic achievement and reclassification of ELs, providing support and professional development to staff at school sites, and sharing and collaborating on best practices, and member individual goals echoed group goals, with two notable exceptions. First, most set sharing and collaborating with group members on best practices as their primary goal. Second, many desired to be the first to try new district initiatives at their site. The priorities for the math science and technology group shifted from integrating technology into their curriculum at the beginning of the year to community building and collaboration amongst members toward the end of the year. One explanation for the shift is that the level of collaboration amongst members, both online and in-person, declined as the year progressed, leading members to feel that there was more of a need for collaboration at the end. The priorities for the teaching teacher specialist group shifted from supporting the academic achievement of English Learners at their respective school sites to developing balanced literacy modules for district-wide deployment for professional development. Members conveyed that these shifts contributed to the sustainability of the group over time. At the end of the study, 88% of the math, science and technology members felt the group goals were accomplished and 95% felt their individual goals were met. Likewise, 90% of the teaching teacher specialists felt the group goals were accomplished and 78% felt their individual goals were met.

Members indicated that culture, facilitation, design and discourse and patterns of communication all impacted the accomplishment of group goals. Salient elements related to these factors are identified in Table 4.

</tbody>
</table>

**Culture.** The culture of a community for professional development revolves around negotiated goals, norms and expectations, community development, relationships that involve collaboration and trust, and knowledge sharing (Hew & Hara, 2007; Johnson, 2001; Rovai, 2002; Wenger, 2000). The culture of both CoPs was largely established by leadership, and was not negotiated as a group. Goals, norms and expectations were disseminated to participants, instead of created within the CoP. The lack of shared input into goals, norms, and expectations appeared to produce a level of frustration for participants in both groups, and the inability to share in leadership and have equal input hindered goal accomplishment in each CoP. As Johnson posited, “The negotiated process helps to establish leadership and ownership over process and problems; thus, increasing both interest and learning (p. 47).”
A distinct characteristic of a true CoP is that the participants make decisions regarding the direction that it takes; decisions do not come from a top-down, external entity, but from within the community itself (Hew & Hara, 2007; Wenger, 2000). Although there must be a leader who begins the process of facilitation within the CoP, leadership should be shared amongst members, and eventually natural leaders will emerge within the community, if allowed (Johnson, 2001). Notably, the role of a community coordinator or facilitator is critical for the day-to-day work to progress (Wenger, 2000). That role was fulfilled by four teacher specialist leaders in the math, science and technology group and by a program administrator in the teaching teacher specialist group. They each were able to facilitate the on-going activities of the groups, yet as Wenger suggested, community needs many different types of leaders in order to progress, such as thought leaders, networkers, people who document what occurs, initiators, as well as others. In both groups, leadership never relinquished control over all of the workings of the CoP, and thus, did not allow for other teacher leaders to emerge. Leaders set the agendas, set the tone of the CoP, chose the topics to be covered, as well as the types of activities that would occur. Although both CoP leaders encouraged discussion and input during activities, there appeared to be very little co-facilitation or shared leadership when it came to what took place within the CoP. As a result, the experience became more like a long-term professional development training program, than a true community of practice.

**Facilitation.** One contribution to the literature is that the different types of leadership within each CoP affected relationships and accountability. The math, science and technology group leadership was comprised of teacher specialists, who were teachers on special assignment during the 2008-2009 school year. Leaders and participants perceived each other as equals, since the specialist leaders held no real power over the teachers. There was no way for leadership to
hold the participants accountable for participating and engaging in the community. Yet, the almost equal level of power between the group leaders and the teachers allowed for high levels of trust and rapport amongst the community.

The teaching teacher specialists’ group leadership on the other hand, was a district program administrator, who had to navigate between being their primary professional developer and being their supervisor, with administrative power over them. Along with being evaluated by their site principals, the leader also evaluated teachers on supporting the group program. She commented on how challenging that navigation was, and brought in other trainers to give the members outside knowledge and perspective. The higher level of power that she held, and the fact that leadership shifted from the previous year, affected relations. Towards the beginning, members did not necessarily trust her and were slow to open up. As the year progressed member trust increased and stronger relationships were established.

**Design.** There are several important features for effective professional development, such as it is sustaining and intensive; it is connected to and derived from teachers’ work with their students (data driven); it is content focused, and focused around solving specific problems in practice; and it includes opportunities for collaboration, coaching, modeling and hands-on learning (Darling-Hammond, 1998; Greene, 2004; Wei, Darling-Hammond, Andree, Richardson, & Orphanos, 2009). Another aspect of effective professional development is that it is focused on the specific needs of the adult learners, with the ability to differentiate the professional development as needed (Butler, 1992). The online component adds another dimension to the professional development, and should include further structured opportunities for learning and collaboration, including scaffolding in order for learners to feel comfortable in that environment.
Each group had some elements of effective professional development, yet there were certain gaps within the design of the environments. For the math, science and technology group, a common in-person meeting comprised of an introduction to the meeting/training, a lecture-style presentation that included discussion, and then hands-on activities that frequently incorporated modeling and group activities. A typical in-person teaching teacher specialists’ group meeting comprised of a community building activity, a presentation/training given by leadership or an outside trainer, and then small group activities and whole group discussions usually linked to district initiatives, English learners, or literacy. There was very little room for the groups to stray from the agenda, which was detrimental to both groups. Teachers wanted more time to share and collaborate with each other in small groups, and they wanted more input into what occurred within the community. Teachers also wanted more time for informal communication, feeling that informal conversations were where unexpected learning and sharing took place. This traditional top-down environment, was also found online for both groups, and was detrimental to a collaborative, knowledge-sharing environment (Friesen & Clifford, 2003; Laferriere et al., 2006). The key is to strive for both leader and teacher participant ownership of the community, where everyone can share knowledge equally.

Furthermore, there was a general lack of differentiation for the members in both groups. Instead, a more “one size fits all” model was utilized. Teachers wanted much more differentiation, to fit their specific needs. Although modeling and hands-on learning occurred for the math, science and technology group, there was very little evidence of either for the teaching teacher specialists’ group. The lack of structure and differentiation online for both groups hindered the use of Blackboard. Technology alone can not bring about change in teaching and learning for teachers, (Laferriere et al., 2006), instead much more time and energy must be spent
in making the online environment a valuable and useful tool for collaboration in a blended CoP. More training in how to utilize the online environment effectively was needed for both leadership and participants.

CoPs must not be designed for one specific purpose, but should be able to evolve naturally over several years (Johnson, 2001; Koch & Fusco, 2008; Wenger, 1998). Both groups were designed for a specific purpose, with room for evolution of the community. They were also still very much in the beginning stages of developing as a CoP, in-between what Wenger calls the coalescing stage and the active stage. The coalescing stage is where participants recognize the potential, explore connectedness, define joint projects or learning, and negotiate community. In the active stage, participants engage in developing practice, where there are joint activities, artifacts are created, and interest, commitment and relationships are continually renewed. CoPs exist and evolve over a period of years, not days, and the groups had not yet reached their potential. In order for teachers to develop and advance in practice that ultimately enhances student achievement, change must be slow, steady, and sustained over long periods of time (Darling-Hammond, 1998; Friesen & Clifford, 2003). More longitudinal research is needed to capture changes over time.

Lock (2006) and Johnson (2001) found that online communities, by their very nature, must be deliberately designed, yet true community cannot be deliberately created or defined; “communities of practice emerge within the designed community via the ways their participants interact and use the designed community (Johnson, p. 53).” Virtual communities must be designed, such as deciding on what type of communication technology will be used, [e.g. Blackboard], but there must be a legitimate task and practice-oriented reasons for teachers to participate in the designed online environment (Johnson). Both groups utilized Blackboard as an
extension to what occurred in-person, however there were very little legitimate task or practice-oriented activities designed in Blackboard; it was more open-ended when it came to what was discussed, and who participated. The discussions were not focused on specific tasks or development of artifacts, which was one thing that participants in both groups wanted more of, a more legitimate and meaningful reason for participating in Blackboard.

One drawback to utilizing online environments is that the teachers or facilitators do not intuitively understand how to construct an online environment so that the quality of the learning is equal to that of being face-to-face (Dehler, 2004). The facilitators in both groups knew how to navigate through Blackboard technologically, but they did not intuitively understand how to utilize Blackboard in a pedagogical, or andragogical, sense (Knowles, 1980). Therefore, there was a need for much more support and training in online teaching/facilitating pedagogy, which would have ultimately supported the use of the Blackboard environment in online collaboration (Johnson, 2001). The current study established that technology was seen as a barrier for teacher participants as well. Scaffolding (Vygotsky, 1978), was needed for both facilitator and teacher participant learning to ensure that they had the skills needed to successfully navigate through, and utilize the online environment for meaningful communication and collaboration.

**Discourse and Patterns of Communication.** Discourse was defined as the topics of conversations and learning in the group and how they occurred. Closely matched to discourse, are the patterns of communication, which was defined as the social interactions based on learning the content and topics of discourse. The notion of *discourse communities*, “groups in which expressions of thought, either written or spoken, share characteristics of vocabulary, communicative intent, subject matter, form of presentation, etc. (Chalmers & Keown, 2006),” applies to both groups studied. In a CoP, a collective vocabulary and discourse is key to the act
of sharing knowledge and improving in common practice. It was evident that the groups, shown by the topics introduced and discussed both in-person and online to a certain extent, possessed a shared discourse, that supported the group goals. Also, the content and knowledge shared (discourse topics) were leadership driven, which goes against the framework of a CoP, where leadership is shared within and amongst all members.

The math, science and technology group in-person topics centered around specific teaching strategies and classroom management (usually given in lecture-style presentations), and on learning how to integrate the technology that was given to them into their teaching practices. New technology was usually learned through modeling and hands-on training by leadership or by outside “expert” trainers. Both approaches are consistent with recent research that indicates teachers are more likely to try new teaching strategies that have been modeled for them in professional development settings (Wei, et al., 2009). Similarly, teachers commonly convey that professional development is most valuable when it provides opportunities for “hands-on” work that builds their knowledge of academic content and how to teach it to their students (Wei, et al.). The teaching teacher specialists’ group in-person topics were more presentation/discussion-based, with little hands-on or modeling evident.

The teaching teacher specialists’ discourse was also conducive to the perceived goals of the community, and centered around supporting the academic achievement of English learners, literacy, and providing support as a coach/leader at their school sites. Evident in both groups was that the majority of online discussions, which most often centered on aspects of technology for the math, science and technology group and on ELs and literacy for the teaching teacher specialists’ group occurred during the first half of the year, indicating a decline in communication amongst members in the online environment. Common reasons for the decline
were: lack of leadership presence, lack of time, and too many outside responsibilities. One of the key structural supports for teachers engaging in professional learning is the allocation of time for such activities within teachers’ work day/work week (Wei, et al., 2009). For the teaching teacher specialists’ group, this was the norm for in-person meetings, but for the math, science and technology group, in-person meetings were established on Saturdays, which was found to be challenging for many. There was no apparent time allocated for continuing communication and collaboration online; for example, Blackboard was an add-on to their professional learning, with the expectation that teachers would participate on their own time. Some teachers expressed wanting time within their structured group meetings, to be able to work with Blackboard. What would have helped to continue communication online was if the blended environment was truly a blend, where working and communicating online took the place of some in-person meetings, instead of Blackboard being an addition to all meeting days.

Communication online was found to be surface level for most participants, with no deep level of engagement; however, in each community there was a small group of teachers who persisted in communicating online, and who participated in deeper levels of discussions. Communication in the face-to-face environment was most often initiated by leadership, and centered on the topics of discourse outlined above. The most effective communication was found to be face-to-face interactions in both communities, although this may be related to the fact that the groups were still in the development stage, and were still trying to learn how to best utilize a blended environment. Even though in-person was the environment of choice, Blackboard was widely found to hold value as a communication and collaboration tool. The district was essentially in the midst of a paradigm shift in communication for professional development, moving from traditional face-to-face methods, to incorporating an online component that would
allow for on-going communication, and continuous connection to the community. The fact that accessing Blackboard regularly was not yet a habit, and was still so new to the culture of the district, most likely affected the level of communication in Blackboard. A longitudinal study would help reveal more success in a blended professional development CoP as the use of the online environment becomes more of a standard within the school district.

**Communities of Practice (CoPs)?** A resounding question throughout the study was whether each group was in fact a CoP, as they related to the framework established by Wenger (1998, 2000) and extended to online CoPs by Johnson (2001). Arguably, neither group was a true community of practice, although each exhibited some elements of a CoP. Table 5 indicates the framework elements, and the degree to which each group met that element, from a ‘yes’ signifying that the element was met, to ‘some evidence’ but not enough to be fully established, to ‘no’ evidence of that element in the group.

Conclusions and Implications.

Supporting and hindering themes for culture, facilitation, design and discourse and patterns of communication were used to develop a preliminary framework with 16 recommendations designed to help school, district and professional development leaders (1) understand how to create a model for the design and development of effective blended learning communities; and (2) potentially increase student achievement through teachers’ continuous learning, knowledge-sharing and transference of both knowledge and skills to the classroom. This blended CoP framework is provided in Table 6.

<tr>
<td>Facilitation: participants within the CoP drive the direction that it takes; it does not come from a top-down, external entity, but from within the community itself</td>
<td>No</td>
</tr>
</tbody>
</table>
### Negotiated, shared Facilitation

- Ensure facilitation by leaders and members is collectively negotiated, agreed upon, revisited, and re-established throughout the life of the program.
- Have leadership support and encourage fluid and dynamic facilitation.
- Encourage members to provide input into all aspects of CoP activities (e.g., topics covered, types of activities, who designs and provides information).
- Have members facilitate discussions and content in both aspects of the blended environment. Provide members opportunities to take on new leadership roles as they gain new knowledge and expertise.

### Sense of Community and Trust must be established and nurtured

- Facilitate continuous opportunities and activities for relationship and trust building.
- Provide ample time and means for members to get to know each other and connect names to faces and roles, such as opportunities to share personal and professional information (e.g., through discourse, narratives and media such as pictures, voice and video).
- Provide members with opportunities to engage in informal conversations during each session.
- Facilitate small group, task-oriented activities with many opportunities for open-ended discussion.
- Model and support active participation and established group norms to promote trust and deep levels of communication.
- Ensure that members, including subgroups, share in the decision making of critical aspects of the program.
- Provide ongoing opportunities for feedback and ensure all members view content and activities as relevant and engaging.
- Limit access to continuous members and invited guests.

### Effective and on-going facilitation from leadership

- Continuously solicit member participation and feedback.
- Personally contact members who disengage to learn about issues and encourage them to come back.
- Use evidence to reflect on what is occurring and modify, as needed.
- Encourage natural leaders to emerge and take on various roles.
- If multiple leaders exist, allow time for planning and reflection as a team; and take time to establish and model positive relationships.

### Design

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Within Blended Environment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Negotiated Design</strong></td>
<td>• Ensure design and management of blended environment are collectively negotiated through the life of the program.</td>
</tr>
<tr>
<td></td>
<td>• Allow members to take an active role in how the blended environment is designed and managed; including what tools will be used online.</td>
</tr>
<tr>
<td></td>
<td>• Experiment with new designs and tools to keep both environments active and evolving.</td>
</tr>
<tr>
<td><strong>Members are physically close in proximity</strong></td>
<td>• Recruit membership from the same school site to allow for more informal meeting and discussions to promote a sense of community.</td>
</tr>
<tr>
<td></td>
<td>• Build on prior relations among members to enhance relationships and trust.</td>
</tr>
<tr>
<td><strong>Built in time for CoP within teachers’ work day or week</strong></td>
<td>• Provide convenient meeting times and locations (e.g., at school sites, during common planning times, after school, during already scheduled PD times, asynchronously online, and/or synchronously in online ‘classroom environment’).</td>
</tr>
<tr>
<td></td>
<td>• Provide time during in-person meetings to model and practice working with the online environment to support and encourage its ongoing use.</td>
</tr>

Modeling and hands-on learning opportunities

- Have facilitators model how to collaborate and engage in deep levels of discourse in the blended environment.
- Provide members opportunities to learn to utilize new online tools while in-person.
- Focus on concrete, practical models (such as how to teach a concept or skill in the classroom or at a school site) that can be utilized right away, rather than abstract, theoretical principals.
- Provide hands-on activities that allow teachers to experience what their students (or other teachers) will experience when they teach the concept or skill.

While more research is needed to determine the validity of the framework, the framework presents a starting point for district administrators and CoP leaders interested in providing sustainable, meaningful teacher professional development using an in-person and online blended model.

**Significance of the Study**

The need to create sustainable and productive communities of practice for teacher professional development has become increasingly important in finding new, innovative ways to reach teachers for continued learning of their craft. The idea of online collaborative learning communities, such as a CoP, to increase teachers’ knowledge and skill sets, and to help professional development become more supportable and sustainable, has been increasingly present in the literature; although both Schlager and Fusco (2003) and Laferriere et al. (2006) suggested that despite the enthusiasm given to the use of technology in education, the potential of online/e-learning environments to transform and improve teacher learning and practice is neither sufficiently explored nor well understood. The education system as a whole is far from reaching the potential impact of web-based technology as a tool in teaching and learning (Russell & Schneiderheinze, 2005).

The implications of how online learning communities increase teacher knowledge sharing and learning and thus, increase their ability to better teach their students is suggested, but hard evidence in the form of empirical data is difficult to find. Although many studies discuss online learning in a college environment, more studies are needed to learn how communities of practice
impact teachers involved in professional staff development online in a K-12 setting; especially in how communities of teachers are developed and maintained, what factors contribute to the sustainability and success of the communities, what is valuable to teachers in this environment, and whether teachers gain anything from participating in a blended online teacher community.

As the need for quality professional staff development continues to grow, it is undeniably important to conduct further research on whether the use of online learning environments can help to leverage teacher learning, by helping to create learning communities. The current study added to the body of knowledge on the creation of blended communities of practice for teacher learning, by gleaning the supporting and hindering themes of culture, facilitation, design, discourse and patterns of communication in implementing successful blended CoPs. The study further added to the body of knowledge of blended CoPs, by compiling a list of 16 recommended key components, including specific elements for the blended environment for each key component. While more research must be conducted to learn the effectiveness of putting the 16 key components into practice within a blended learning community for teacher professional development is needed, the 16 recommendations show promise as to establishing concrete methods of practice for community leaders in advancing teacher learning to ultimately support student academic achievement.

The current study was especially significant to the school district in which it took place, as it helped in understanding how to create a model for the design and development of effective blended CoPs, that will potentially increase student achievement through teachers’ continuous learning, knowledge-sharing and transference of both knowledge and skills to the classroom. The research presented in this paper was the dissertation work of Jennifer M. Wagner from the UC, Irvine and Cal Poly, Pomona Joint Ed.D. program.

THE FOLLOWING IS AN ABSTRACT AND THE RESEARCH IN PROGRESS WHICH SHOULD BE COMPLETED BY OCT. 17, THE REQUIRED FINAL DATE FOR SUBMISSION.

TITLE

ENRICHING SOCIAL WORK POLICY AND COUNSELING COURSES WITH UNDERSTANDINGS AND KNOWLEDGE ABOUT ISLAM

ABSTRACT-

Social work clinical counselors and policy shapers are increasingly being called upon to effectively service the increasing number of Muslim students and clients in need of counseling and social welfare services. It is important to understand the context of Islam and activate...
cultural competency to more effectively provide these services. This paper will use a four dimensional ecological model as the basis for understanding, assessment, and intervention to improve counseling and policy services for Muslims.

RATIONALE
The National Association of Social Workers (NASW) Code of Ethics calls for culturally competent practice by the social worker in a society marked by ethnic and religious diversity. With the increased presence and expansion of the Muslim population in the United States, relevant social welfare policy formulations and clinical need be based on greater substantive understanding and knowledge of relevant Islamic world views and experiences. As noted by Crabtree “…many social work practitioners lack the basic knowledge they need to be able to work more confidently with Muslim communities.” The objective of this paper will be to enhance cultural competency for enriching units on diversity in social work welfare policy and counseling courses, and to provide guidance on issues a professional should take into account when working with Muslim populations.

The ecological/environmental model of analysis, assessment and intervention, effectively used in many Human Behavior in Social Environment (HBSE) courses, is an effective social work and counseling assistance model for understanding and knowledge with Moslem clients. The model used in this paper is based on that ecological lens and provides an essential persistent analytical guideline for working with all culture groups.

The SWK ecological/environmental model has four interactive dimensions which encompass the essential characteristics shaping human identity and behavior: #1 institutional, #2 psychological, #3 biological, and #4 the cultural/family. These four dimensions shown in the following illustration can applied for use with Muslim clientele, but also serve as a persistent model for cultural competency to generate analysis, understanding, and intervention at stages for enhancing course and practice effectiveness. In this paper, emphasis will be on essential components of each of these four dimensions for use with Muslim populations.
The relevance of each of these four analytical dimensions for a particular individual varies with his/her particular culture and individual time and space situation. However, using this model to secure information provides the social worker with a persistent analytical framework for enhanced cultural competency in policy making and clinical work with clients.

**QUADRANT OF FOUR DIMENSIONS OF ANALYTICAL MODEL: INSTITUTIONAL, PSYCHOLOGICAL, BIOPHYSICAL, CULTURAL**

**ANALYTICAL MODEL FOR THE SOCIAL WORKER - HBSE MUSLIM QUADRANT**

To understand and most effectively work with Muslim populations a social worker or counselor should approach this task by referring to interactions between four ecological dimensions shaping human identity as used in Human Behavior and the Social Environment (HBSE) courses: Institutional, Psychological, Biological/Natural, and Cultural. These four identity shapers can be used as probes by social workers for analysis, assessment, and potential interventions with Muslim groups or Muslim individuals in the environment, with due recognition to the potential cultural diversity within the Muslim religion (Stambler-9/5/10)

**PERSON IN THE ENVIRONMENT (PIE)**

**MUSLIM IDENTITY**

Hans Kung (Swiss theologian), Islam

“No peace among the nations without peace among religions.

No peace among the religions without dialogue between the religions.

No dialogue between the religions without investigation of the foundations of the religions.”

**BIO-PHYSICAL CONCEPT OF NATURE**

**GENETIC, BIOLOGICAL, PHYSICAL**

(GENES? GENDER, RACE)

**RACIAL PROFILING A CULTURAL REACTION TO MUSLIMS**
Students in my social work are requested to select and research topics related to their choice of components from any one of the four dimensions (institutional, psychological, biological and/or cultural), and report on the relevance of their research for shaping cultural competency on Islam, as related to the text chapter on diversity.

Applying this model, what should a social worker know about Muslims to effectively work with that population?

**DIMENSION #1 INSTITUTIONAL DIMENSION**

1. **DEMOGRAPHICS IN ARAB AND MUSLIM WORLDS**

Of overarching importance for applying this ecological/environmental model with the Muslim population is the religious/spiritual dimension which permeates all aspects of the Muslim world. Belief in Islam and adherence to the Qur’an as the word of God, with Mohammad as his Prophet, is a total embracing system which guides and direct observant Muslims in all aspects their behavior, thinking, and socially constructed realities. For the observant, the Qur’an is viewed as unchanging truths by God in a separate metaphysical time overlaying human
history, providing guidance for all aspects of life, and metaphorically relating events to universal truths. Given the reality of this dominant and all embracing world view, the social worker should be culturally sensitive to the religion of Islam, the ways this lens may differ from a secular perspective, and the metaphorical value system for Muslims who find meaning in historical events and relationships which they feel link to metaphysical truths.

A Western oriented and secular social worker working on Muslim issues should learn as much as he/she can about Islam, but recognize personal limitations and be prepared, where relevant, to refer the client or policy to an Imam (a Muslim religious leader and counselor), or if they are born in the USA to a Muslim social worker who can relate to the concern from a religious experiential perspective.

A social worker should draw a distinction between Islamic principles and practices and those grounded in specific Muslim cultures and recognize diversity in the culture practices of Muslims from different countries. (Crabtree, 4) Arabs today number about 285 million spread over 22 Arab countries in North Africa and the Middle East. Many non-Arab nations have adopted Islam leading to a total of 1.3 billion Muslim people worldwide. The majority of Arabs are Muslims, but the majority of Muslims are not Arabs but Indonesians, Malaysians, Iranians, Turks, etc. In counseling American Muslims, Kobieisy (2004) notes there is need to recognize the multiplicity of cultural environments from which people of the Moslem religion come, ranging from a more moderate Islam and Asian culture to Saudi Arabia’s more intense type of Islam.

Effective SWK requires understanding that there is great diversity in the cultural and ethnic composition of these Muslim groups, although there is a common core of the highly defined and structured Islamic religion, and a view of Umma (the transcending concept of Muslim family); Shahada, the profession of faith- Muslims submit and pray to one God; Siyam – fasting on the holy month of Ramadan; learning to control one’s instincts; Salah-praying and submitting to the will of God five times a day; Zakat: a tax devoted to providing financial help to the poor, to emphasize with the people and offer help; and the Hajj: pilgrimage to Mecca. (Kobiesy, 116)
By the year 2015, Gisela Web notes (Webb, n.d.) Islam is expected to be the second largest religion in the United States, following the largest, Christianity. Currently, there are approximately four million Muslims in the United States, and approximately 650 Mosques. Muslims in the United States have come from multi sources. Two-thirds of Muslims in the United States are either foreign born and their descendants, with the other one-third, those who have been born in America, mostly black. (Web, n.d.) The major constituents of Islam in America who see themselves as orthodox or traditional Muslims, are those immigrants bringing Islam from their home countries and African Americans, most of whom are converts, and the Sufi groups of “spiritual co-fraternities.” Facing identity issues in a secular society, all the Muslim groups are involved with the central question of how to define themselves and Islam in an American society of pluralism and diversity, where separation of church and state and a strong secular dimension shape American identity. Also, Muslims face concern of understanding how issues are shaped in a globalized society where there is an Islamic revival, or re-islamization, and neo-fundamentalism which “…combines technical modernism, deculturalization, the “…rejection of both traditional Muslim and modern Western cultures, resulting from westernized Muslims asserting their identity in a secularized and non-Muslim society.” (Roy, 2007) <cup.columbia.edu/static/interview-roy-oliver-globalized>

2 INSTITUTIONAL DIMENSIONS:

CLASH OF CIVILIZATIONS OR A MESHING OF COMMON VALUES?

Samuel Huntington noted in 1996 that there is “Clash of Civilization” between the West and Islam, but not all analysts agree with the actuality or inevitability of a clash. Hans Kung, the erudite Catholic Swiss theologian has written numerous respected scholarly books, including volumes on Christianity, Judaism, and Islam. In his voluminous well balanced book on Islam, Kung relates the existential situation facing Muslims with the existential problem facing other religions in the contemporary world, recognizing that the religious dimension in Islam has unique features. (p. 22).

Like Judaism and Christianity, in this transitional phase of world history Islam is involved in a fundamental conflict of tradition and innovation; how this can finally be resolved in a balanced way is an open question. As with Judaism and Christianity, so
with Islam, one asks oneself whether this religion will succeed in preserving its religious ‘substance’, its essence’, despite all the differences and conflicts, despite all the different strands and schools and the battles between traditionalists and modernists, (can) at the same time reshape itself for a new generation. Will the Islamic peoples, who are caught up in a tremendous crisis of existence at the height of modernity as a result of their confrontation with Western imperialism and colonialism and with European science and economics, technology and democracy, succeed in accepting the challenge of a new era and work creatively toward a new post-modern form of Islam? In this globalized world, all the great religions are in transition from the crisis of modernity into a ‘postmodernity’ of some kind (or under whatever name) and are thus exposed to the same kind of structural problems. (Kung, 22)

In addition to this linkage of Islam with general religious problems of postmodernity and secularization facing other religions, Kung notes the distinctive feature of Islam, which this author feels should be of particular significance for the social worker. Islam and Muslims face an additional problem in that their religion is enmeshed with the civil sphere.

...for the great majority of Muslims even today, Islam is not simply a part of life, what secularized people are fond of calling the ‘religious factor’. For believing Muslims, their life and religion, religion and culture, are interwoven in a lively way as are their religion and politics. Islam seeks an all-embracing view of life, an all pervasive attitude and a way of life which determines everything. (Kung, 24)

Given this distinctive reality of Islam, the social worker should be sensitized to the profession’s secular roots and predispositions. There has been an attempt at the bridging of this chasm created by a secular society by fundamentalist Christian social workers, and Muslim social workers.

**INSTITUTIONAL DIMENSION:**

There is a new social context facing Islam and the west. Olivier Roy (2007), notes that the encounter between Islam and the West has long existed, dating back from the beginnings of Islam. However in recent years Islam has been facing a new situation with Muslim populations moving to and taking root in Western societies. The West has been using two models in responding to these increases in Muslim populations, assimilation and integration (Roy, 2007, x) Roy notes that,
English speaking countries like the US, United Kingdom and Canada as well as Northern Europe have focused on a multicultural model by supporting cultural pluralism for including the Muslim population, while France has stressed the assimilationist model. The secular societies of the West have confronted incoming Moslem populations with a new set of values: freedom of expression, democracy, separation of church and state, human rights and women’s rights, not characteristic in Muslim societies. This Western environment is challenging for varied and nuanced groups of Muslims as a new reality of secular society and responses are still being formulated and adjusted to by the Muslim groups,

…for a minority in western societies which have been secularized by: a separation of church and state; because civil society no longer defines itself through faith and religious practice (the United Kingdom, Germany and the Scandinavian countries); or because of a convergence of self-definition and political practice as in France laicite. In turn, the secular societies to which Moslems have migrated, have confronted Islam with two types of responses: multiculturalism in which religion remains embedded in culture as in England and the USA, and assimilationism as in state enforced secularism in France in which religion is clearly decoupled from culture and national loyalties, and which rejects the Anglo-Saxon multiculturalism view as either one destroying national unity or an instrument of ghettoization. Both types of responses by the West require religious adjustments both in the receiving countries and by the incoming Moslem populations which have to work out how one should live as a Moslem in a secular culture, how a Moslem should react when confronted by secularism. How one relates to separating religion from culture. (Roy, 2007)

The new social environment poses a third pessimistic response model of rejectionism by Western societies. This third response ignores both multi-culturalism and assimilationism, and contends that integration of Muslims into Western Society is not possible. This view has been presented by some European politicians, and among others by the Danish psychologist Nicolai Sennels, 2009, who was involved in hundreds of hours of research and therapy with 150 young Muslims in the Copenhagen youth Jail. It is his contention that,
…Muslims don’t understand our Western way of trying to handle conflicts through dialogue. They are raised in a culture with very clear outer authorities and consequences. Western tradition using compromises and inner reflection as primary means of handling outer and inner conflicts is seen as weak in Muslim culture (not religion). To a great extent they simply don’t understand this softer and more humanistic way of handling social affairs. In the context of social work and politics, this means they need more borders and stronger consequences to be able to adjust their behavior. (the Opinionator April 5, 2010, p. ?).

Sennels indicates that the strong and proud Muslim culture makes it very difficult for Muslims to adapt their values. He notes, “In Germany, only 12 percent of their 3.5 million Muslims see themselves as more German than Muslim; in France and Denmark, only 14 percent of the Muslim populations respectively see themselves as more French or Danish than Muslim.”

(The issue of national secular identity vs. religious domination is the issue of the ground zero Mosque being publicly debated on 9/11/10. This could serve as an important indicator if Muslims are ready to forgo what is clearly their constitutional right to build a Mosque on ground zero, but refrain from this religious triumphalism to build a Mosque to Allah by submitting to strong American national of the sacredness of the area. Should political Islam triumph over American identity? 9/11/10)

.4 INSTITUTIONAL DIMENSION:
AMERICAN CONTEXT FOR ISLAM

Islam in America has developed special features. In American Islam, Timani notes, that, “…Black Muslims have adopted (a) puritanical form of Islam that has only recently begun to challenge the more moderate and balanced form of the religion that Muslim immigrants have brought with them to America.” (Timani, 108) (check to validate this as a valid portrayal) He contends that small communities of Muslims in America were Americanized and assimilated.

“…when Anglo conformity was promoted as the norm for citizenship and the Protestant establishment determined what is American… (These Muslims) followed the patterns of immigration and assimilation that refashioned them into American citizens. …The result was that their names were anglicized, their children attended public schools (making it easier and
faster for them to Americanize) and they became ignorant of important Islamic practices.”

(Timani, 110)

Timani contends that the Black Muslims under Elijah Mohammad were a movement of un-Islamic nature entrenched in issues of race relations and discrimination against blacks and presented a unique version of Islam, not supported by the mainstream Moslems. He also notes that Islam in America reflects primarily the waves of Muslims who came to America in the 1960’s, 1970’s and 1980’s. They came to America partly because of the relaxed immigration laws but also because, “…the rise of secularism and nationalism in their homelands that drove many of them into exile.” The secular and nationalist Muslims ruled their countries and cracked down on the Muslim Brotherhood which contended that, ”Islam is the solution,” and that Islamic laws should replace those with increasingly Western emphasis in their societies. According to Timani, the crackdown on the Brotherhood, “…led to the mass migration of well-educated middle class and devout Muslims who were unable to express their political views in countries that were becoming increasingly dangerous and hostile to them.” (112 - CHECK TO DETERMINE IF THIS IS AN ACCURATE DESCRIPTION OF THE SITUATION)

According to Timani (2010) Muslims in the USA have pursued a tolerant, pluralistic and democratic Islam and attempted, “ to tailor an Islam that fits America without compromising their religious beliefs.” He claims that Muslims ran from their nations because they wanted to practice Islam without state control, and that Muslims in America “Admire the American democracy, pluralism culture and religious tolerance and freedom of worship provided in American society (Timani, 113) TO CHECK THIS OUT)

5 INSTITUTIONAL DIMENSIONS:

HISTORICAL CONTEXT OF INTERNATIONAL SOCIAL WORK: TRADITIONAL AND ALTERNATIVE PERSPECTIVES (SCHRIVER, 500)

Social workers should understand that the historical contexts of social work contribute to shaping the perspective of social workers, and social work issues when working with immigrant populations, many of whom today are Muslims.

There are four distinguishable phases in the history of International social work suggested by Mayadas and Elliot (1997, 162)
.1 **Phase One** - The early Pioneers 1880’s-1940’s

The early part of this phase focused on the transfer of new social welfare approaches from Europe to the United States through: The Charity Organization societies of giving aid to the poor through poor relief, through women volunteers to investigate and verify the circumstances for poor relief. The Charity Organization societies focused on individual treatment to rehabilitate clients and insure that they were self-sufficient. (Mary Richmond) The Settlement House Movement of Jane Addams was not concerned with individual treatment but with neighborhoods and activities that helped poor people, focused on adult education, youth clubs, recreational activities that catered to the needs of deprived peoples living in the slums. In this period of time (preceding the large migration of Muslim populations) social workers focused primarily on socio-economic deprivations and urban encounters of rural populations.

.2 During phase two (1940’s-1970’s) professional application of social work was characterized by cultural imperialism, exporting models of social work from the United States to other countries. According to Schriver (501) “The underlying values remained primarily paternalistic, ethnocentric, and colonialistic, and services were based primarily on social control, remedial, medical and crisis-oriented approaches. Social work was not particularly sensitive to the cultural differences between the United States and the countries to which it exported a social work education model based on practice with individuals, even though many of the cultures of the other counties were more collective and group focused (Mayadas and Elliot, 1977, 176 (as reported in Schriver, p. 501)

.3 Phase three was a reconceptualization and indigenization of social work (1970’s-1990’s). A period of rejection by developing countries of the Western focused model for a, “…more radical liberationist and social development oriented model. Including “values of regionalization, polarization, separation and localization” (Mayadas and Elliot, 1997, 177)

.4 The current 21st century Phase Four has social work becoming more, “…social development oriented, comprehensive, and sensitive to the needs of the cultural and social contexts of different countries and regions and greater cultural competencies.”
For Western raised and educated social workers, Schriver notes there have been a number of issues raised including:

.1 the universality of social work values;
.2 the nature of social work itself—whether the profession should be committed to remedial, activist, or developmental forms of practice;
.3 The dominance and “professional imperialism” of Western influences on social work and stress on social work in the developing world freeing itself from the ‘in-built’ assumptions and cultural biases of first world theories and models of practice and the need to develop indigenous models;
.4 The idea that “social work is a Western invention and the product of modernity. The notion of progressive change fits this paradigm. The question as to “whether or not, for example, Western perspectives and practice are really responsive to the personal and social needs of the populations of other regions.” (Schriver 502)
.5 “Indigenization is postmodern to the extent that it questions the dominance of ‘social work as a Western invention’ and seeks to relate it to local culture, history and political, social and economic development.” (Schriver, 502) The Western model is ethnocentric, and the issue of nations and peoples developing their own models based on local needs and practice fits in with the need to indigenize social work for Muslim populations.

.6 Issue of multiculturalism vs. universalization of social work values (cultures with collectivist values on issues of kinship, community networks and extended family systems (Gray and Fook, 2004, p. 627. In Schriver, p. 502).
.7 With the heavy Muslim immigration that has marked US population changes during the past 20 years, I would add, the need for social workers to attune themselves to human behavior developed in Muslim societies with socially constructed realities which differ from those of Western societies.

**DIMENSION #2  PSYCHOLOGICAL DIMENSION**

ISSUE OF APPLICABILITY OF THE WESTERN SOCIAL WORK MODEL TO MUSLIM POPULATIONS
The question raised by Barise is whether or not secular–based social work can integrate spirituality and mesh with Islam which is holistic and does not perceive a Cartesian dichotomy between flesh and religion. The professional field of social work with roots in the 19th century has developed and functions in the secular world, and requires modifications for adaptation to Muslim populations in their religious world. In his article Barise, notes that, “Professional social work was initiated in the Western world in the early twentieth century on the basis of a secular, euro-centric world view. Thus social work is shaped by socio-cultural contexts... the West provides a core base of the social work discipline.” (Barise, 2)

Barise notes other differences between the Islamic perspective in Canada and Canadian concepts of social work as they relate to, “…the nature of spirituality and its scope, the nature and hierarchy of human needs, the source of help, the nature of problems and their solutions, to name but a few,” (Barise, 16) and suggests that the social work analysis and intervention suggested by Saleeby’s strength-based perspective is most compatible with the teaching of Islam and their guided life, and that the traditional secular-based social work should be shaped to fit in with the Islamic religious world view.

The role of the Imam in meeting the (2005) mental health needs of the Moslem populations is indicated in an article by Osman (2005, 133)

Although Imams have little formal training in counseling, they are asked to help congregants who come to them with mental health and social service issues. Imams need more support from mental health professionals to fulfill a potentially vital role in improving access to services for the minority Muslim communities in which there currently appear to be unmet psychosocial needs.

How do Western social work values relate to a Muslim world view? The chart below has been developed for this paper, based on narrative and quotations from David Hodge in his article on Social Work and Islam, (Jan. 2008)

| Shari’a-The way of life a written Muslim law guide. Not the word of God but divinely inspired extends of the teachings of the Qur’an and Hadith. Formulated in the seventh century seeking to inspire legal practice with Islamic principles and referred to as Islamic family law. Open to interpretations, and transformation on the basis of socio-cultural texts. Islam can be defined as submission & giving one’s whole self over to God. Unifying umma for a common Islamic discourse. |

| Arab language and history are central to Muslims since Islam was revealed to an Arab prophet, Mohammad and the Qur’an was written in Arabic. Islam provides strict rules and laws, the Shari’a based on the Qur’an and the prophets life (Sunna) of just faith and prayer but legislation pertaining to almost every issue in life Islam is a social religion that suggests a balanced
order in society. Finding legal ways to satisfy the sexual instinct of me through polygamy, and the sexual control of women through veiling (Dwairy, 148)

**DIMENSION #2 PSYCHOLOGICAL DIMENSION:**
**STRUCTURED STAGES FOR MOSLEM COUNSELING**

The social worker should become familiar with system of counseling connected with Islam as a highly structured format and although comparable to some western counseling approaches, requires insider knowledge of Islam and the religious rituals. The Western secular practitioner has paradigms of psychoanalysis, behaviorism, and humanism from which to select intervention methodology. These theoretical systems have been modified with diversity dimensions of culture, gender, identity and religion that influence the counseling encounter. This author feels the counseling journey requires someone well versed in Islam to negotiate. Somayah Abdullah refers to the three categories of counseling intervention (which are stages) located within Islamic doctrine. The first category is the Muslim personal law (MPL) which regulates family life. This in one of the most common ways of seeking assistance in which a religious leader, Imam, is consulted for counsel on social and mental health issues, and/or marital and family problems. The second category of counseling provided by the Islamic religious system is traditional healing based on a model of spirit (jinn) it includes many different forms and is practiced by local healers. The third category is Sufism, the mystical tradition of Islam. Sufism reflects the mystical tradition of Islamic personal and spiritual development in relation to the divine, and in a wider sense, “... is an interiorization of Islam based on a vision of the unity of God in everything including self actualization” (Abdullah, 49)

Each of these counseling categories provides a framework and knowledge of counseling for working with Muslim clients, and requires the practitioner to be steeped in Islamic tradition.
Clearly, a practicing Muslim would hesitate leaving religious based counseling from God connected practitioners to choose a secularized deliverer as opposed to the God based intervention model.

The Muslim frame is that of three systems, with expertise for practitioners required in at least one of the categories MPL, Jinn, or Sufism which are entrenched in Muslim communal life and merge Qur’anic texts, the Sunna (the Prophetic example) and Shariah (Islamic law) “People within Muslim communities have divergent views on these systems but, Muslims across a range of social strata participate in these services; often they choose them above traditional secular services because of their Islamic basis and only when they fail the client would secular services be an option” (Abdulla, 44)

**DIMENSION #2 PSYCHOLOGICAL DIMENSIONS - COUNSELING**

**CRABTREE ISLAM AND SOCIAL WORK**

.1. Notes major “…concerns…regarding the question of the social integration Muslim minority ethnic groups in the West.”

2. Saeed et al. (1999) argue that the “concept of ummah (the university community of the faithful means that a global Islamic community supercedes national and ethnic identities” (3?)

3. In an interesting British govt. proposal to deal with radical Islamists Members of extremist groups have not “clearly” committed a crime would receive therapy and counseling under new Government plans to “deradicalise” religious fanatics. (Kirkup, ?)

**PSYCHOLOGICAL DIMENSION:**

**IN WHAT WAY SHOULD THEORIES OF MUSLIM DEVELOPMENT AND PSYCHOLOGY SHAPE SOCIAL WORK WITH MUSLIMS**

Is the Western developmental psychology model of Maslow by a western imposition with a bias toward individualism? (Saeed et.al.),
Personal Strengths And Assets: Western and Muslim Perceptions

There are significant different values and viewpoints which differentiate Western and Muslim perceptions of the self, and consequently affect the value of social work therapeutic intervention. Hodge and Nadir note that from a Muslim perspective, many helping professionals do not respect Islamic values and this bias is reflected in the therapeutic modalities used by counselors and social workers. They note that Western counseling intervention modes reflect Freud and Maslow’s emphasis on therapy directed toward self-actualization and self-efficacy and utilize strategies directed toward raising the client’s level of self-understanding. The Western assumptions are seen as dichotomous and split the secular from the spiritual or religious. Western epistemological assumptions of “…individualism, self-determination, independence, self-expression, egalitarian gender roles, communication expressing individual opinion” are not viewed as congruent with Muslim holistic values in which the religious and …spiritual informs all aspects of existence.” (Hodge and Nadir, 2008)

Western perceptions of suitable therapeutic interventions for the dysfunction reflect assumption about personal development stages of a healthy person should go through various life stages on the road to self-actualization, a secular concept on the meaning of life. This different perception of stages of development requires that cultural competency education for social workers include counseling strategies and developing social work skills with better relevance of culturally competent practice models.

Mental health work with Muslims is problematic because often mental health concerns such as depression, anxiety, and psychosis are, “…still viewed in a shameful manner in many Muslim communities. Often such issues are dealt with privately in the home or with the help of extended family. “ (Khaja, 2008, 2) These issues also can be met with extreme resistance and anger. Khaja relates that in Saudi Arabia and Pakistan a stigma still exists because mental illness is seen as an affliction of evil spirits, and that “Muslim mental health patients in such areas are reported to have been chained, burned, beaten or undergone exorcisms.” (Khaja, 2)
Teaching social work students to assist Muslim clients requires that they learn about the tenets of the Moslem religion and how Muslim families function.

In Western counseling techniques the focus might be on people realizing strengths, coping mechanisms, dealing with past conflicts, and finding solution… in Muslim counseling methods we try to help families in a deeply holistic manner…(with a ) focus on balance between mind and body, focusing on spirit, mind, soul, intellect, body and emotion connected area, because if one is not functioning well there is need to focus on inner tranquility with a strict diet, fasting, prayer and meditation. The objective should be to have a balance of physical, emotion, spiritual and mental health. (Khaja, 4) Other gender counseling also poses problems of occupying private space together, or looking directly at a counselor of the opposite sex, or shaking hands.

Focus on healing one’s heart is seen as the ultimate form of healing with mental health problems often viewed as resulting from a sick or dead heart. “It is believed that a person with a sick heart is focused on materialistic things in this world such as “lust”, “desire”, and worshipping material things, and as noted Farid, as a consequence, they will suffer deeply (Khaja, 4). He reports on four areas of particularly poisonous for the heart: talking a great deal without praise of God, uttering evil words, glances of the eye that become focused on things more beautiful than worship. He also suggests eating tiny portions of food to encourage humbleness of the soul and reduce temptations. (Farid, 20??) For the Western trained social worker, direct eye contact is considered respectful and a sign that you are giving your client undivided attention, trust and self-esteem. For the Muslim client, direct eye contact may be seen as a lack of respect and lack of humility. Cleanliness is crucial for Muslims and associated with religious values. Muslims will want to wash their hands, face and forearms, and feet before praying.

### DIMENSION #2- PSYCHOLOGIOCAL:

COUNSELING MODELS EFFECTIVE WITH MOSLEM CLIENTS

Kobeisy (p. 103-105) has developed a comparison of different counseling models and their effectiveness: cases with Muslim clients. (Kobeisy refers to the Sue, Arredonon and McDavis (1992) components for the culturally competent counselor)

1. “counselor awareness of his or her own assumptions, values, and biases”- beliefs and attitudes factor
2. “the understanding of the worldview of the culturally different client”; ---the knowledge factor
3. “the development of appropriate intervention strategies and techniques- the skill factor (Dwairy counseling Arab and Muslim Clients)

**Characteristics Of Arab And Muslim Clients Of Significance For The Counselor**

Otto Klienberg and Martha Wolfenstein have suggested a concept of cultural behavior clusters but recognize the range of diversity within these clusters. Dwairy refers to these as psycho-cultural differentiations.
There are common psycho-cultural features among Arab and Muslim clients which differentiate them from Western clients.

“Arab/Muslim clients” are less autonomous than Western clients. The former tend to focus on external circumstances and have difficulty addressing internal and personal issues. Terms such as self, self actualization, ego, opinion and feeling, have a collective meaning for them. They are preoccupied with duties, expectations and them approval of other and family issues.” (Dwairy, 2008, 147)

Authoritarian and Collective Cultures

The social system of both the Arab and Muslim worlds tend to be collective and authoritarian. The individual is very submissive to the family and norms and the family is ruled by patriarchal hierarchical authority. Political rights in Muslim societies are limited and the individual tends to rely on family and tribe rather than the state. “The individual is expected to serve the collective in order to receive the family support necessary for his or her survival and most citizens of Arab/Muslim countries rely on the family fore than the state in issues of child care, education, finding jobs, protection, and so on.” (Dwairy, 149) (Note how this explains home schooling growth for Muslim families)

The implication for counseling is that objectives of self fulfillment should not be set as the goals. “In this social system, two polarized options are open to individuals: (1) to be submissive in order to gain vital collective support, or (2) to relinquish the collective support in favor of self-fulfillment” Most Arab/Muslims will be submissive in order to gain vital collective support, rather than favor self-fulfillment. (Dwairy, 149)

(The exposure that takes place in Muslims to Western values of science, technology and individualism, can result in both a negative mixture of antagonism and rage, and a positive identification and glorification of Western values. Muslims vary in their rage against the West and their glorification of the West. (Dwairy, 149)

PSYCHOSOCIAL DEVELOPMENTAL CONCEPTS

Western theories of development emphasize a separation-individuation process that normally ends in the individual developing an independent identity after adolescence,...” and that an accurate and positive theoretical framework for the individual life-span is movement toward those goals. Whether its Freud or Erikson, the
formation of an independent ego identity from full dependency to full independency is the healthy direction in an individualistic society. In Western society, dependency of an adult is considered a personality dependency disorder whereas in collectivist authoritarian culture, autonomy and independency is seen as a disorder. The separation – individuation process is not the goal for Arab adolescents because, “…their identity is enmeshed in that of the family, to which they are always loyal.” (Dawari, 151)

The development of individualism in Western society goes along with the concept of personality. In Arab/ Muslim societies, “…the concept of personality is in the interpersonal domain rather than the intrapsychic one with, “…norms, values, rules, and familial authority, rather than personality,” explaining the behavior of an individual. (Dwairy, 151) In Arab/Muslim families, Dwairy contends that the interpersonal domain rather than the intrapsychic domain provides the main dynamic and the appropriate social coping skills for this type of conflict deals with personal needs vs. family control rather than defense mechanisms that manipulate the ego and superego. The collective personality in the Arab/Muslim society behaves in the context of social layers defined contextually in social roles, gender, age and professions, rather than as a consistent individual across social situations.

Among most Arab/Muslims,

“…the individual and the family, the mind and the body, reality and imagination are not distinguishable entities. Patterned disorder that are described in the fourth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV) are not Displayed clearly among Arab/Muslims. For instance, depression which is considered in the West to be a mood disorder clearly characterized by sad feelings, hopelessness and helplessness, is manifested among Arab/Muslims in somatic complaints, frequently with no feelings of sadness hopelessness, and helplessness (Al-Issa, 1989, in Dwairy, 153).

Many Arab/Musims have a different concept of reality from that of Westerners. And consider visions and dreams as true reality rather than the physical one and on the basis of dreams and visions, they make crucial decisions in their lives (Dwairy, 1977)

“Almost all counseling and psychotherapeutic intervention (except for behavior therapy) aim to resolve the intrapsychic order while revealing unconscious (typically forbidden) contents, and help the client to accomplish self-actualization.” (Dwairi, 153)
COUNSELING AND SOCIAL WORK INTERVENTIONS BASED ON THE ARAB/MUSLIM IDENTITY (KOBEISY, 134-135)

### APPROACH

| Psychoanalytical | Sigmund Freud | this treatment has several benefits as well. The therapist offers an empathetic and nonjudgmental environment where the client can feel safe in revealing feelings or actions that have led to stress or tension in his or her life. Oftentimes, simply sharing these burdens with another person can have a beneficial influence. |

| Adlerian | |
| Person-centered | |
| Behavior | |
| Existential | |
| Gesalt | |
| Transactional | |
| Rational –emotive and cognitive behavior therapy | helps patients to understand the thoughts and feelings that |
influence behaviors. CBT is commonly used to treat a wide range of disorders, including phobias, addiction, depression and anxiety. Cognitive behavior therapy is generally short-term and focused on helping clients deal with a very specific problem. During the course of treatment, people learn how to identify and change destructive or disturbing thought patterns that have a negative influence on behavior.
Islamic Counselling & Psychotherapy
Trends in Theory Development

According to Abdullah,

“It is not unusual to find that counselling professionals find themselves at a loss to intervene effectively with clients who adhere to an Islamic value system especially when it is at variance with their own. For the client this situation is commonly experienced as an inability on the side of the practitioner to fully understand him/her. Given that Islamic counselling is not yet in a form where its actual implementation can be monitored, it first requires guidelines that can be integrated into a theoretical framework, a purpose to which this article is directed.”

Islamic counselling is not a new concept. When studying its historical location, a distinction may be made between cultural and professional modes of Islamic counselling. In the former, counselling is not an explicit exercise, but alluded to in the religio-cultural rituals of Muslim communities. In the case of the latter, we set Islamic counselling as a formal discourse, comparable with mainstream, predominantly western counselling paradigms. (Abdullah(???)Islamic Counselling)

In professional terms, Islamic counselling would be a confluence of counselling and psychotherapy with the central tenets of Islam. This is acceptable in as far as it provides a broad purpose for Islamic counselling by linking it with an overarching intent of helping clients attain positive change in their lives. However, as counselling theories take on various philosophical positions such an analysis can become quite problematic. This is especially so given the nature and scope of Islam as a religious worldview, and debates on Islamic counselling that call for the rejection of western
counselling theories. Application of Islamic principles to theories outside the realm of Islam or using concepts from mainstream counselling to inform an Islamic approach is therefore discouraged.

In such arguments it is often asserted that Western psychology is devoid of religion and foster distorted concepts of humankind that are rooted in materialism. Counselling that is based on Islam is then forwarded as a feasible alternative. Writers of such positions do simultaneously concede that western psychotherapy and psychiatry has its merits in dealing with psychological suffering and behavior modification. What is proposed then is that Muslims use the positive aspects of western counselling, integrate it with the spiritual, and develop Islamic psycho-spiritual counselling methodologies that would facilitate positive change in Muslim clients. Exploring the Qur'an, the Sirah of the Prophet and his traditions, as well as the biographies of the Prophet's companions, will provide detailed instructions for implementing successful therapy. In the main, though, it is Sufism (tasawwuf), the mystical tradition of Islam, which is credited with providing the basis for Islamic psychology. It is forwarded as the main frame of reference from which to develop a professional Islamic counselling approach.

**RELIGION AFFECTS PERSONALITY**

Islam and personality

*Psychology of Religion and Spirituality 2009, Vol. 1, No. 2, 81–96*

© 2009 American Psychological Association 1941-1022/09/$12.00 DOI: 10.1037/a0015737
Almost every traditional personality theorist had something to say about religion, but the topic of how religious beliefs might affect individuals’ views of human nature remains largely unstudied. All religions, however, contain certain implicit ideas regarding personality that are likely to impact individual behavior. This article draws on Islamic sources to consider what a practicing Muslim might believe about motivation, personality development, the self, the unconscious, psychological adjustment, and the individual and society. In general terms, understanding these beliefs can be useful in the broader study of how cultural issues affect personality. More specifically, understanding Islamic beliefs related to personality can assist in planning for the provision of psychological services to Muslims, as well as understanding the psychological perspectives of Muslims who are not extremists.

When psychology speaks, for instance, of the motif of the virgin birth, it is only concerned with the fact that there is such an idea, but it is not concerned with the question whether such an idea is true or false in any other sense. The idea is psychologically true inasmuch as it exists. Psychological existence is subjective in so far as an idea occurs in only one individual. But it is objective in so far as that idea is shared by a society—by a consensus gentium. ——Carl Jung, The Autonomy of the Unconscious, 1938

Smither, Robert & Khorsandi Alireza .(2009). The implicit personality theory of Islam

Psychology of Religion and Spirituality Vol. 1, No. 2, 81–96

“All religions contain certain implicit ideas regarding personality that are likely to impact individual behavior. This article draws on Islamic sources to consider what a practicing Muslim might believe about motivation, personality development, the self, the unconscious, psychological adjustment, and the individual and society.”

Jung’s views, unlike those of Freud, recognized the impact of religious culture on personality developments of the individual.

DIMENSION #3

BIOLOGICAL SHAPERS OF MUSLIM IDENTITY

ARE THERE ANY BIOLOGICAL OR NATURE FACTORS THAT SHOULD SHAPE HEALTH REALTED SOCIAL WORK WITH MOSLEMS?

NOTE: THE FOLLOWING ARE INITIAL VIEWS ON THE BIOLOGY RELATED CATEGORY IN THE QUADRANT AND QUESTIONS FOR FURTHER RESEARCH CONSIDERATION

There are bio-physical characteristics related to the Muslim religion mediated by cultural backgrounds of the clients about which social workers should be aware when working with Muslims in a health care setting. Hyder Gulam, a Muslim lawyer and nurse in Australia refers to factors of importance: (Gulam, 2003, 84)

.1 Where possible, health care should be administered by someone of the same sex as the patient;
.2 In the context of body modesty, “Muslims generally wear clothing that does not reveal the shape of their bodies” and hospital clothing should meet this requirement;
.3 The right hand should be used to feed or administer medication because the left hand is considered unclean;
.4 Unnecessary touching between people of the opposite sex should be avoided;

.5 The male considers the beard as an important religious symbol, and permission is needed for shaving by another male;

.6 Prayers may be performed while lying down or while seated by the Moslem patient, and the healthcare worker should not disturb the Muslim patient in these positions if they are at prayer.

.7 Because the Moslem holy day is Friday, patient visits on that day probably will be greater than expected.

.8 For the newborn child, it is important to have prayer calls by a learned person (an Imam, Mufti or Sheik) recited in each ear soon after birth, and head shaven on the seventh day (or thereabouts) after birth.

.9 The practice of circumcision is performed on all male children as a religious rite. Genital mutilation as a cultural practice among some African Moslem, has no basis in the Islamic faith.

(Barise, Abdullahi *Social Work with Muslims: Insights from the Teachings of Islam* ... Ph.D. Associate Professor College of Arts and Sciences, ... *Social Work with Muslims: Insights from the Teachings of Islam* ...

NOTE THE MOSLIM VIEW OF MIND-BODY CONNECTION )

**DIMENSION #4 FAMILY CULTURAL SHAPERS OF MUSLIM IDENTITY**

(THE FOLLOWING IS AN OUTLINE FOR FURTHER RESEARCH CONSIDERATION)

Mezzo- The Immediate Culture

Family, Work, Culture, Religion, Neighborhood, Local Economy & Resources, Co-Workers

(Interventions?)

Religion- Five Pillars Of Islam
- Geographical Diversity of Moslem Locations
- Reasons For Migrating To USA
- Length of Time In The USA
- Degree of Acculturation
- Types of Schooling In USA - Assimilationist Or Separationist
- Islamic Values & Concern With Losing Islamic Values
- Religious Conflicts With Secular Values
- Sunni/Shiite
Religious Stereotypes & View Of Islam as The Superior Religion
Dhimni And Infidel Concepts
- Spiritual Prejudices
- View On Organic Connection Between Mosque And State
Responding To Perceived Discrimination
- Social Group
- Concept Of Umma –
  Family
Kin Network & Extended Family

WHAT CULTURAL FACTORS SHOULD BE CONSIDERED FOR SHAPING MUSLIM COUNSELING?

.1 issue of religion or culture
.2 view on connection between mosque and state
.3 five pillars of Islam
.4 Islamic values and concerns about losing Islamic values
.5 length of time in the US and reasons and values in migrating
.6 degree of acculturation
.7 types of schooling in USA- assimilationist or separationist
.8 Islamic values & concern with losing Islamic values;
.9 concerns on how to deal with a secular society -religious conflicts with secular values
.10 view on the outsider dhimni and infidel concepts
.11 responding to perceived discrimination and 9/11
.12 primary/secondary social group
.13 concept of umma –
.14 kin network & extended family

The family is the critical decisive force determining major decision in life choices “Decisions concerning clothing, social activity, marriage, housing, size of family, and child rearing are made within the family context where the individual has only minimal space for personal choice. Within this system…a person learns to be helpless as an individual, avoids personal initiative or challenges, and expects matters to be arranged by some external force. To maintain the cohesion of the collective system, authentic self-expression of feelings is not welcome; instead, one is
expected to express what others anticipate. This way of communication within the collective is directed by values of respect (Ihtiram) fulfilling social duties (wajib), and pleasing others and avoiding confrontations (mosayara). Emotional expressions on good or bad occasions, such as marriage or death, are very much ruled by social norms, (Dwairy, 150)

**MUSLIM TEEN AGE PROGRAM**

In 2007, (Sadek Hamid) referred to the development of a culturally directed social work program at the University of Chester in Britain with the development of a first British degree program in Muslim Youth Social Work which specifically is tuned in to cultural and religious aspect of the environment which shape Muslim youth behavior in Great Britain.

“There are three relationships critical for defining Moslem identity particularly important to understand middle Eastern Muslim culture. The first is the relationship of umma- or nation which comprises all Moslems viewing them as brothers and sisters in the larger religious family. This identity related to the religious group is significant for understanding the importance of faith for the Muslim identity. Separation from the faith is not only separating from God but also from the larger religious family. Relating to a family is of central importance to Muslim identity. Ones actions reflects on the family and can bring shame or honor to the family as a whole. Muslims live not only to please their god but also to please their family. The third relationship is a perspective of their religion as it differs from other religions. They view other religions as immoral and helps bring clarity to a dimension of their extremism. These Muslims want to avoid being led away by a corruption of their faith by immorality and mainstream culture and are willing to use force and laws to keep their people practicing pure Islam (McGoldrick, 2005)

**FAMILIES**

Islam provides a common core of basic values for the family. Values recognized by the Koran include the following (Shriver p. 308- based on Hall and Livingstone, p. 144) “hospitality and generosity in giving and spending; respect for elders and parents; wealth and preeminence of male children; subordination of women to men; modesty; intensive religiosity; equality of all human beings; and health and strength”

2 Hodge notes (2055, p. 165, as quoted in Schriver p. 309)

The basic unit for Muslims if the family…However, “family” is often conceptualized broadly to include relatives or even broadly, the whole Islamic community. It is the family, most specifically the husband and wife, that is understood to be responsible for
reproducing spiritual and social values. Thus, family, both nuclear and extended, is essential to the spiritual and social health of the broader umma (community).

Yet, although Islam provides a common core of basic values

“...It is very important to understand that Moslem/Arab families have significant diversity in terms of which and to what extent values within Islam are emphasized” (Schriver, 309 reference to Hall and Livingstone, p. 143). “No particular set of beliefs and values exists that is representative of all Moslems” (Hodge, 2005, p. 164 as quoted in Schriver p. 309, and there are variations and differences in degree in which the various tenets of Islam are perceived and practiced by different individuals (Schriver, 499)

Schriver notes (p. 309) that there diversity among Moslem/Arab families to the degree with which they have behaviors and: Arab families place a high value on the patriarchal arrangement that extends to the roles, obligations, and status of family members; family is the major basis for identity with family welfare superseding the welfare of the individual. The family is a “…reference point for behavior and spiritual directives. “

Family Structure
The religion of Islam influences the family structure of Muslim families

Arab families place high value on spirituality in the form of Islam. The patriarchal arrangement is its traditional family structure … (most) who follow Islam conform to a hierarchical organization of authority that extends to roles, obligations, and status. The welfare of the family supersedes the welfare of the individual, making the family the basis of identity… and a reference point for behavior and spiritual directives. (Hall and Livingstone, 2006, 143) (AS REFERENCED IN JOE SCHRIVER, P. 309)

Schriver- (p. 309) refers to Al-Krenawi and Graham, 2000, p. 299) - “In summary, Al-Krenwi and Graham suggest that social workers who work with Muslim families should:

Have an understanding of Muslim family arrangements as more hierarchical and less flexible; Have an understanding of the implications of gender construction within Muslim society, which limits women’s movements outside the home; Appreciate that the client may be reluctant to work with a practitioner of the opposite sex; 4. Have a basic understanding of Islam… and Islamic traditions as well as their common practices and implications
There are seven common beliefs that are included in the Islamic world view (Rehman and Dziegielewski, 2003, 33) In Schriver p. 499
The belief in one God Allah...as the one and only Creator/Sustainer of the heavens and the earth; the belief in the Divine Will (Al-Qadr/fatalism); the belief in the angels of Allah; the belief in the revealed books of Allah (the Torah, the Psalms, the Qur’an and the Gospel; the belief in the messengers of Allah (prophets); the belief in the day of judgment; and the belief in life after death

TITLE

RELIGIOUS AFFILIATED MUSLIM CHARTER SCHOOLS: CHALLENGES TO THE ROLE OF EDUCATION IN ASSIMILATION AND INTEGRATION OF YOUTH INTO AMERICAN SOCIETY

ABSTRACT (Limit 100 words) Public support for charters with religious affiliation is radically changing the nature of American public education and society and challenging our practice of religion-state separation. In 2010, there were 4,936 publicly supported charter schools operational in forty-one states, with over 1,665,779 million students. The number of charters currently is increasing, encouraged by President
Obama’s Race to the Top education program Among these public supported charter schools are culture based schools of Christian, Jewish, or Muslim religious affiliation. In particular, religious affiliation of 375 Muslim charter schools poses a unique problem for the principle of separation and public support for schools role in Americanizing, assimilating and integrating youth of different cultures into American society. Up to 90 of these Muslim culture schools with public support in 20 states are reportedly connected to the Turkish Islamist Fetullah Gulen Community.

#1 RELIGION IN THE PUBLIC SCHOOLS

Religious values are reflected in the public education system in the American community From the time of the founding of the public school system in the 1850’s, schools have reflected the characteristics of their demographic communities.

The Protestant Christian faith has been dominant until now and so have the Christmas songs, programs and public prayer at graduation ceremonies. With the shifting demographics the issue of these Protestant Christian practices has become more of a legal issue. There has been a demographic shift with the growth of other religions. Currently only 25% of immigrants are Protestant and world religions such as Islam, Orthodox Christianity, Buddhism and Hinduism now account for 2.5% of the U.S. population.” (Marshall, p. )

With the increased migration and education of Muslims in the United States, we can expect that Muslim communities also will be represented in the public school system. Given these changing demographics “Every week, we see legal cases involving schools and religion all over the United States.” (Marshall, p. )

The connection between schools and their communities in the USA, MAKES disconnecting schools from the religions of their communities difficult at best. With the recent expanded Muslim immigration and the establishment of their communities, schools have been affected by the Muslim religious world view, and the linkage of schools and Islam by the schools which serve Muslim populations which serve the Muslim populations, and view of serving Allah through a linkage between education and Islam. Theoretically, under the concept of church-state separation, schools should be disconnected from religion but the difficulty is that schools are located in communities and community values are clearly considered in designing education.
Religion in Education vs. Education about Religion

Almost everyone agrees that, in American public schools, teachers should not "teach religion" by actively advocating any religious worldview: theistic, atheistic, agnostic, new age,... But should we teach students about religion? And if so, what should be taught in schools serving religious communities and how should their religious commitments be reflected in education?

Charles Haynes, contends that education about religion is compatible with the U.S. Constitution, and when it's done properly, it is legal and constitutional. The constitutions First Amendment sets the legal parameters for religion in the public schools, "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof ....

On one end of the spectrum are those who advocate what might be called the "sacred public school," where one religion (theirs) is preferred in school policies and practices. Characteristic of the early history of public education, this approach still survives in some parts of the United States, particularly the rural South. From the “Bible wars” of the 19th century to current fights over posting the Ten Commandments in classrooms, attempts to impose religion in schools have fueled countless lawsuits and bitter fights in communities throughout the nation. Not only is this model unconstitutional, it is also unjust.

In recent decades, however, some on the other end of the spectrum have pushed for a "naked public school," where religion is excluded in the name of the establishment clause of the First Amendment. The influence of this mistaken view of the First Amendment is apparent in the virtual silence about religion in most of the curriculum and the confusion among many school leaders about the religious-liberty rights of students. But the First Amendment does not mandate that public schools be religion-free zones. This approach is also unjust and, when the rights of students are violated, unconstitutional (Haynes, p. )

There is a third model “civil public school” which includes study about religion, where appropriate, as an important part of a complete education. Warren Nord in his book,
Religion and American Education, believes that religion should be an explicit part of public school curricula, and argues that every child should take at least one introductory course in religion. He suggests that public education provide space for religious education through released time programs where religion can be taught by the religious adherents rather than an attempted neutral sociological analysis.

3 CONVERSION OF RELIGIOUS SCHOOLS TO CHARTER SCHOOLS

The issue of church state separation in education has been accentuated by the fiscal crisis and the rise and expansion of religious affiliated charter schools, which are really private public schools supported with public funds. This issue is being faced and negotiated with by Catholic and Jewish schools which are able to teach a separate secular curricula as secular subjects. However, the problem is being accentuated with Muslim Charters schools, because of the organic nature of Islam does accept separation between secular and religious subjects. Unlike Catholic and Jewish schools, Muslim school curricula activities are directed to religious imperatives of Islamizing the curricula itself and not separating the secular from the religious. Catholic and Jewish schools are more able to separate the religious studies areas from those of secular studies.

3.1 CATHOLIC SCHOOLS TO CHARTERS

The history of private Church run Catholic schools provided important landmarks in religious education in the USA.

In the nineteenth century, there were experiments in which Catholic school buildings were leased to the public school, and religious instruction was offered before or after classes. In communities such as New Haven, Hartford, Poughkeepsie, although the leasing arrangement was rejected in New York City in 1875. “The experiments faded, and by the 1880’s, bishops in Brooklyn, Louisville and Buffalo were ordering that Catholic parents be refused absolution if they failed to send their children to Catholic schools.” (Howard Ralph Weisz)

In the contemporary period conversions of schools are providing an opportunity for Catholic Schools with modifications, to change into charter schools. This has been one way a number of the dioceses have responded to the increased costs of Catholic education. In Washington D.C., seven previously converted Catholic schools were in their second year of conversion in 2009. In fall 2009, eight formerly Catholic schools in the Archdiocese of Miami opened as charters. In winter of 2009, the Diocese of Brooklyn
applied to New York State to convert one of its schools to a charter. The trend is expected to continue reflecting the recommendation of the influential report from the Thomas B. Fordham Institute, “Who will save America’s Urban Catholic Schools?”, that encouraged bishops to consider converting other Catholic schools to charters as alternatives to closing. This option originally turned down, is being re-considered at this time. The Catholic administration has had to consider whether financially ailing Catholic schools can be de-Catholicized of Church symbols and still retain their essence, and whether the schools which converted to charters would seriously draw students from the private Catholic schools. The plan is to have religious instruction continued through the parishes and not through the charter schools. Arnie Duncan, when Chicago’s school chief had proposed Catholic schools in Chicago converting to charters. Msgr. Kieran Harrington, noted that private Catholic schools “…are optimal because they address the formation of the whole person—the mind, the body, the soul” but that value-based charter schools with spiritual values had to be considered as alternatives to the closed private Catholic schools. (Paul Moses, p.)

3.2 JEWISH SCHOOLS

Jewish religious schools have not been directly converting from parochial schools but have been establishing culture charters with religious affiliation - Jewish affiliated charters. This has been posing potential problems and posing alternatives for the Jewish religious schools which may have tuitions of $8,000 plus per year compared to the affiliated culture schools being supported as public schools.

A key concern regarding Christian and Jewish religion affiliated charter schools is their assumptions and loyalties to their religious ideology within the context of the accepted American nation state. That does not mean congruence on all issues, i.e. Catholic and Jewish affiliated schools have clear differences with dominant value systems and can be expected to disagree on the social issues such as abortion. Whether these be Catholic, Jewish or other religious affiliations, the assumption is that in political matters and identifications loyalty to the nation state predominates. Although religious values do provide the cohesion and transcendent loyalty in most cases, they do not
override the values of the nation state. Muslim affiliated school represent a different perspective and in their affiliation,

3.3 MUSLIM SCHOOLS
In the mix of 165 Muslim schools in the U.S. are Sunday schools as well as 95 full-day schools and home schooling. The Muslim schools being established as charters can be classified into two categories. The first category are those clearly and structurally identified with Islam such as the Tarek ibn Zayed Academy (TIZA). That school is so blatantly Islamic in nature that the Minnesota Department of Education has issued two citations against it, and the ACLU has brought a legal suit against them. The second category, in contrast, are the Muslim affiliated charter schools which go under the culture school category. They are more hidden and in many cases deny their affiliation with Muslim agencies. For example, numbers of them are affiliated with the Fetullah Gulen Muslim movement, a world network of Muslim schools. (Fetullah Gulen is a Turkish citizen living in Pennsylvania who is considered as number 13 among 50 of the world’s most influential Muslims (Lumbard and Ali Nayed, 2010)

The Gulen movement operates more than 90 primary and secondary charter schools in the United States, and between 500-700 Islamic schools around the world. According to Guy Rodgers, Gulen oversees a worldwide network of businesses, schools, foundations and media outlets, with an estimated budget of 25 billion dollars. (Schwartz, 2010) The history of Islamic schools in the United States reflects a growing religious awareness and commitment of the Muslim population. There also are a number of Muslims who engage in home schooling for their children.

As noted by Rogers, Gulen’s movement in the U.S, runs over 90 charter public schools in at least 20 states.

What makes Gulen particularly dangerous is his strategic and tactical means to achieving this goal of triumphal Islam. In a sermon in 1999 aired
on Turkish television, Gulen said, (Rogers, p. )

You must move in the arteries of the system without anyone noticing your existence until you reach all the power centers ... until the conditions are ripe, they [the followers] must continue like this. If they do something prematurely, the world will crush our heads, and Muslims will suffer everywhere, like in the tragedies in Algeria, like in 1982 [in] Syria ... like in the yearly disasters and tragedies in Egypt. The time is not yet right. You must wait for the time when you are complete and conditions are ripe, until we can shoulder the entire world and carry it ... You must wait until such time as you have gotten all the state power, until you have brought to your side all the power of the constitutional institutions in Turkey ... Until that time, any step taken would be too early—like breaking an egg without waiting the full forty days for it to hatch. It would be like killing the chick inside. The work to be done is [in] confronting the world. Now, I have expressed my feelings and thoughts to you all—in confidence ... trusting your loyalty and secrecy. I know that when you leave here—[just] as you discard your empty juice boxes, you must discard the thoughts and the feelings that I expressed here.

Gulen is patiently employing taqiyya (stealth conversion of the infidel) on a global scale and in the U.S.

FGC affiliated schools reflect the Gulen’s exhortation to “move in the arteries of the system without anyone noticing your existence until you reach all the power centers...” Indeed, the fact that so little has been written about the FGC schools here in the U.S., as well as the accolades that have been accorded the FGC as a model of “moderation” by some in our government, would appear to confirm that the FGC and its schools are doing an excellent job of heeding Gulen’s exhortation and masking their true intent.

The Gulen schools promote Islam as does the TiZA school in Minnesota. One particular school (and likely numerous others) appears to be in
violation of state law because the school’s affidavit for its charter does not acknowledge that it is connected with a religious institution or group. In other words, those who chartered this school practiced *taqiyya* by hiding this fact.

As another example of the use of *taqiyya*, Jane’s Middle East Quarterly articles gives examples of how FGC’s Turkish language media outlet *Zaman* runs stories with information and headlines that are missing from the English language media outlet *Today’s Zaman*. This practice of two different messages, one to the indigenous Islamic population and one to the West, is common in the Islamic world, and has led many in the West, including political leaders and academics, to be misled as to the true intentions of Islamists.

In building a sophisticated and well-funded worldwide network, including a substantial presence here in the U.S., Fethullah Gulen is following in the footsteps and exhortations of Mohammed, who counseled patience and deception as a means of overcoming the infidel when the power of the infidel was greater than the power of the *umma*, the Muslim community. In a very real sense this is as or more sinister than the frontal assault strategy of Islamist organizations such as al Qaeda and Hamas, because, like the proverbial “frog in the kettle,” we are incrementally “boiled alive” without realizing it.

The activities of the Gulen school are variously known as “cultural jihad,” “creeping jihad,” “stealth jihad,” and “creeping shariah.” Much of Europe and Great Britain has been Islamized through this process, a process that invariably does not lead to peaceful coexistence between Muslims and non-Muslims, but leads to Islamic self-segregation, increased Islamist militancy and aggression, and the eventual forced imposition of Islamic shariah law within the society.
The FGC charter schools in America may outwardly appear innocuous, but they are serving a greater and long-range objective of Fethullah Gulen. The West need to be less gullible and more discerning when it comes to the elements of “stealth jihad” within our midst.

The history of Islamic schools in the U.S. reflects a growing religious awareness and commitment by the Muslim population. Muqtedar Kahn has noted (Kahn, n.p.) that a major objective of Islamic education in America was,

…it to resist cultural assimilation while encouraging political and economic participation in the mainstream.” He noted that Muslims want the power and wealth that America can offer, but they wish to eschew its socially liberal culture, particularly its sexual mores.” Full-time and Sunday schools proved a popular way to try to keep their children from turning “too American.”

Kahn notes,

Muslims began to migrate in large numbers to the United States in 1965, after immigration laws were reformed. .. Their early material success enabled the emergence of a highly ambitious leadership that began to have grand visions for the American Muslim community.

The material success of the Muslim community contributed to their vision for their community including drumming up more support for Muslim causes worldwide. They felt it necessary,”…to preserve the Islamic identity of the next generation and unite different ethnic groups so the American Muslim community would speak with one voice.”

The lack of qualified Islam-studies teachers in the United States resulted in short-term fixes including importing many imams and other religious leaders from Muslim countries to teach their children. Currently, about 5 percent of roughly 2 million American Muslim children attend full-time Islamic schools, but many more attend Sunday schools, and numerous attend charter schools with Muslim religious affiliation.” (Kahn, n.p.)

4. CLASH OF CIVILIZATIONS AND LOYALTIES
The Samuel Huntington historical narrative of 1995, the Clash of Civilizations postulates the existence of a clash of civilizations between Islam and the West. As he noted,

> It is my hypothesis that the fundamental source of conflict in this new world will not be primarily ideological or primarily economic. The great divisions among humankind and the dominating source of conflict will be cultural. Nation states will remain the most powerful actors in world affairs, but the principal conflicts of global politics will occur between nations and groups of different civilizations. The clash of civilizations will dominate global politics. The fault lines between civilizations will be the battle lines of the future. (Huntington, p. )

Mohamed Elmasry retired head of the Islamic Congress in Canada with a strong and fervent Islamist/political Islam perspective, notes the faith base of Islam compared to the nation-state and political base of Western societies,

> In discussing a religion, any religion, we must consider also those factors which compete against it and know how to recognize them for what they are, as quasi-religious; I’m speaking chiefly about nationalism, materialism and secularism. Here, we must distinguish between secularization and secularism. The first describes the change from a religious to a non-religious culture, in which all spheres of life are equally affected and included, whereas secularism pertains to an ideology, an attitude toward life that rejects spiritual values and the religious world-view. Islam accepts the former state – secularization – while rejecting secularism. This is because, for a Muslim, that which is spiritual cannot be separated from all other aspects of life.

Elmasry notes that Islam does not accept the concept of nationhood,

> Islam freed itself early from the restrictive bonds of nationhood by envisioning itself as an international community. It was, and in many ways still is, that sense of international fellowship that continues to nourish and sustain our faith. One of Islam’s great contributions to the religious experience of humankind has been to demonstrate the way in which faith can be harnessed to the creation of a complex and successful earthly community – not a Utopian or idealized one, but a matter-of-fact everyday one – a community in which people’s primary needs, hopes and ambitions are not
denied, but channeled into a collective pattern of pious fellowship. Islam has preserved the essence of that ideal community in the Qur’an, where one can read and learn of a people united in sensible and sober fellowship, guided by the justice of Qur’anic teaching.

Elmasry quotes Prof. Ninian Smart from his book, “The Religious Experience of Mankind,” to differentiate between the concept of church as a religious quest and Islam, which already has found the answer.

From the standpoint of religious history, Islam’s importance lies partly in the stress it lays on the social dimension. It is a faith which demands institutions, but not those of a [Christian] Church, centered primarily in the promotion of religious quest by itself: rather, it demands institutions which cover the whole life of the community. There is nothing in Islam (except in a few sects here and there in its history) corresponding to the Church. There is no place for a special institution within society devoted to the ends of the faith. For it is the whole of society which is devoted to the ends of the faith.

Elmasry clearly rejects the corrupting influences of the what he considers the ‘colonialist’ Western Civilization. He notes,

…the impact of Western culture upon Muslims has assailed the very foundations of our society by undermining traditional and extended family dynamics, and by introducing an education system that reflects non-Islamic ideals and aims. Largely as a result of this systemic Western influence the economic and material prosperity of the individual has now become the deciding factor for many of today’s Muslims when dealing with contemporary societal issues. The remedy will not be easy but I believe it is within our power to make the changes that will save who we are, and can be, in this world.

5 WHY ISLAMIC SCHOOLS?

For a Muslim parent, full-day Muslim schools, charter–affiliated schools and home schooling offer a moral choice for the religious education of their children. The underlying political agenda is not necessarily part of their plan. (Badawi, 2005)

Dr Mohamed Elmastry notes the importance of Islamic education in the context of
Western Imperialism and colonialism,

The problem -- indeed, the universal dilemma -- facing Muslims is how to preserve their culture and values within their heritage, while integrating them with the culture and values of the rest of the world. It has now become a matter of survival for the Muslim world to pay attention to decolonizing Islamic culture. This must be done through proactively protecting language, religion and tradition -- in that order. By “tradition” I mean family values and our “Oruf,” or social customs. There is, certainly, no substitute for an objective and critical examination of how the colonizing powers of Europe and the Americas have used language, religion and tradition to oppress Muslims and other indigenous and aboriginal peoples for more than 500 years. But I believe that the remedy for half a millennium of such abuses is within our reach. (Elmastry, n.d.)

Elmasry notes a consequence of western colonization of Islam has resulted in the secularization of Muslim curricula in Muslim countries. He notes, In Muslim countries today, Islam -- instead of being the whole focus of education -- is incorporated into the curriculum as a separate subject, following the Western model of education...the plain fact remains; a school where Islam is taught as one subject among many others is a secular school...Unfortunately, American cultural domination in education and many other areas shows no signs of waning. To preserve Islamic culture through language, religion and tradition, Muslims urgently need to devise a grand collective plan for the next 10 to 20 years. In fact, the decolonializing of Islamic culture should be classed as a matter of national security and governments of Muslim countries must be strongly encouraged to allocate the necessary resources to implement cultural preservation programs without delay. The result of not decolonializing Islamic language, religion and tradition will be the inevitable de-Islamization of Muslims themselves. They will become accustomed to formulating their thoughts within the fabric of foreign cultures. No matter how faithfully they practice their faith, their world view and their values will become foreign to Islam.
Sara Rimer notes that in Minneapolis Minn. immigrants see charter schools as a haven for their values and not necessarily as advocates.

“… conceived, by charter advocates as a way to improve academic performance for immigrant families, they have also become a haven where children are shielded from the American youth culture that pervades large district schools… “amid the wave of immigration that has been reshaping Minnesota for more than three decades, the International schools are among the 30 of the states 138 charter schools that are focused mostly on students from specific immigrant or ethnic groups…to listen to teachers, administrators and parents-Somali immigrants who are relatively new to Minnesota, as well as Hmong and Latinos who have been in the state for decades- is to understand,” the fears of cultural loss are universal. When the immigrant children attend the schools permeated with American culture…”They’re assimilating to a society that parents see as threatening and frightening. It’s anti-authority, anti-studying. It’s materialistic,” and is a reaction to the reality that large numbers of immigrant children become alienated over time and fail to graduate.

Minnesota with its strong charter-school movement, and similar places, “… offers immigrant parents, who have long been conflicted about their children becoming Americanized a strong voice in their children’s education.” (Suarez-Orozco, 2008)

The immigrant status should be considered as a driving force parallel concurrent with the tenets of Islam.

The Muslim American Society Council of Islamic schools (MASCIS) recognizes this negative motivation as posing a problem for developing an integrated and cohesive Muslim curriculum for these schools. They note the problems posed by “… Islamic schools (as) merely a refuge from the (negative) influences of public schools rather than a genuine system in and of themselves,” and suggest the need to develop a systematic curricula for Islamic schools in North America. This unsystematic and lack of integrated curricula also poses an opportunity for Islamists such a
Gulen to provide the glue for developing an Islamist integrated curricula.

.7 THE NATURE OF MUSLIM SCHOOLS
In 2009, Erickson notes a 2006 study which identified about 240 Islamic schools in the USA with an enrollment of over 38,000 students, but that most Muslim students in the U.S. probably 97% or more, attend public schools

WHAT ARE ISLAMIC SCHOOLS TEACHING
Islamic School’s of America refers to their Tarbiya Project. They note, “Curriculum reform efforts in the past have sought to Islamize conventional textbook knowledge. What is now needed is a comprehensive curriculum that has Tauhid (God-centeredness in all its aspects) as its core content and approach.”

Timani, Hassan (Islamic Schools in America) notes,

“…Islamic organizations and Muslim educators have capitalized on the ills of the public schools to put pressure on Muslims to build Islamic schools, where (re) Islamizing Muslim children would be the goal. But, in the process many of these children may end up alienated and isolated from the rest of society, and, in some cases exposed to anti-American, anti-secular, and anti-Western propaganda.”

Daniel Pipes notes in the New York Sun March 29, 2005, that Islamic schools are teaching hatred of Christians and Jews.

Elmasry recommends a number of educational interventions to save the Muslim world including,

English as a second or third language should be introduced only during the last three years of secondary school, and then only as a tool to communicate with others internationally or professionally.
The first three years of a child’s school life should be spent in a reformed
or updated version of the traditional Koottab, in which students not only learn to read and write, but also memorize the Qur’an and are taught how to practice Islamic etiquette. Educational curricula should place higher importance on teaching a comprehensive survey of Islamic history, Islamic civilization, and the varied Islamic arts such as story-telling, etc.

CONCLUSION: CHALLENGES TO AMERICAN EDUCATION AND AMERICAN SOCIETY

The title of this paper is:

RELIGIOUS AFFILIATED MUSLIM CHARTER SCHOOLS: CHALLENGES TO THE ROLE OF EDUCATION IN ASSIMILATION AND INTEGRATION OF YOUTH INTO AMERICAN SOCIETY

At this time this paper is still a work in progress and requires additional extensive research and weighing of evidence before reaching a valid conclusion. However, at this time, it is clear there are special challenges to our pluralistic society posed by public support of religious affiliated charter schools and the undermining of the principle of church-state separation. Publicly supported Muslim charter school education poses a unique problem to the survival of our pluralistic society unlike that of public support for Christian or Jewish affiliated Charters. The problem is both in terms of assimilation and Americanization of Muslim immigrants and the diversity principle in our society. In this time period when radicalization of some Muslim youth to political Islam is posing significant challenges and threats to the US society, questions should be raised as to the validity of using public funds for encouraging an increasing potential threat to American society.

The Effectiveness of Using Moodle and Jusur Programs to Manage E-courses on Developing Academic Achievement of Teachers College Students in “Instructional Software” course and Their Attitudes Towards them

Dr. Sultan Howedey Al-mutairy
Department of Educational Technology - Teachers College
King Saud University
Fahad_3007@hotmail.com

Abstract: this study aimed to discover how different Learning Management Systems (LMS) affected some important educational variables, by comparing the effect of using two LMS “Moodle and Jusur” on the development of students’ academic achievement of teachers college at Riyadh (King Saud University) in the “instructional software” course and their attitudes towards LMS. The results of this study indicated that Moodle and Jusur have a positive effect in the development of students’ academic achievement. Also, The results showed that both Moodle and Jusur have positive effect in improving students’ attitudes towards LMS, although Moodle is more affective than Jusur.

Introduction:
Learning Management System (LMS), also known as Virtual Learning Environment (VLE) (Yasara & Adiguzela, 2010; Gladun et al, 2009; Chang, 2008), sometimes also known as Course Management System (CMS), provides the platform for the web-based learning environments (Cavus et al, 2006); it offers a great variety of channels and workspaces to facilitate information sharing and communication among participants in a course; it is an e-learning infrastructure with the functions of delivering the courses, supporting collaboration, assessing the learner performance, recording learner data, and generating reports to maximize the effectiveness of the entire learning organization (Yasara & Adiguzela, 2010; Romero, 2008). The main components of Learning Management System are (Kok, 2008):
- mapping of the curriculum into course topics that can be assessed and recorded.
- tracking of student activity and achievement within the curriculum presented online.
- support of online learning, including access to learning resources, assessment and guidance.
- online tutor support.
- peer group support.
- general communications, including email, group discussion and web access.
- links to other systems, both in-house and externally.

Many organizations, both academic institutions and commercial corporations, are purchasing LMS as a product to be used in their organization for learning, training and development purposes. The number of LMS available today is in the increase. There are many open source LMS available, as well as commercial packages (Chang, 2008). Some examples of open source LMS are Moodle (developed by Martin Dougiamas, Australia), Claroline (developed by Université Catholique de Louvain), A-tutor (developed by University of Toronto), ClassWeb (developed by University of California, Los Angeles), Coursework (developed by Stanford University), and LON-CAPA (developed by Michigan State University). Some examples of commercial LMS, in which a license must be purchased to use the product, include Blackboard Inc., ANGEL Learning, and Apex...
Learning. Moreover, an example of Arabic system is Jusur (developed by National Center of E-learning and Distance Learning in the Kingdom of Saudi Arabia).

According to a review of the literature, many studies have emphasized the important role of LMS in the learning and teaching process (e.g. Al-salom, 2010; Hussein, 2010; Yasara, & Adiguzela, 2010; Gladun et al, 2009; Al-mutairy, 2008; Kakasevski, 2008; Romero, 2008; Machado & Tao, 2007; Cavus et al, 2006; Naqvi, & Ajiz, 2006; Al-Jarf, 2005; Godat, 2005; Tsinakos, 2004; Larkin et al, 2003). There were also many studied which compared different LMS. For example, Machado & Tao (2007) compared Moodle and Blackboard, they argued that Moodle learning management system is the more efficacious and effective learning management system than the Blackboard learning management system, also, Al-Jarf (2005) compared Nicenet, WebCT and Moodle in EFL instruction, they (Nicenet, WebCT and Moodle) were used to teach grammar to freshman students at the College of Languages and Translation, King Saud University in Saudi Arabia. Al-Jarf’s study showed that Nicenet was more popular than WebCT and Moodle among Saudi EFL freshman students enrolled in their first grammar course at COLT, using Nicenet had a positive effect on students’ achievement. Moreover, the Nicenet group revealed positive effects of online instruction on students’ attitudes towards online instruction and the grammar course.

Al-Jarf (2005) recommended that online courses be selected carefully and online instruction be introduced gradually when used in a no-tech environment and with freshman students with a low proficiency level in English and computer terms and with no prior experience in online instruction such as Saudi EFL freshman students at COLT, also recommended that online instruction from home may start with Nicenet. When students become more sophisticated linguistically and technologically, they might proceed to Moodle and WebCT. Since Moodle and WebCT are open source courses, the instructor may start with two tools (discussion forums and resources) and add tools gradually.

**Jusur** (www.elc.edu.sa/jusur)

is an LMS designed by the National Center of E-learning and Distance Learning in order to manage the E-Learning process in the kingdom of Saudi Arabia. Using Jusur system, users can log on and access the training courses. As the student completes the course, scores are tabulated and reports generated. Likewise, managers and administrators can access reports on the LMS and track the students’ progress. The key features of Jusur System are;

- **log in**: registering students in the portal.
- **schedule**: planning the course and the way of teaching it.
- **delivery**: making the course available for users.
- **tracking**: following up the students’ progress as well as issuing reports of students performance.
- **communication**: students contact with each other through forums, emails and file sharing.
- **evaluation**: testing students through quizzes and examinations and grading them.

Jusur also has a learning content management system (LCMS), which is a system that can access learning object repository which enables subject matter experts, with little technology expertise, to design, create, deliver, and measure the results of e-learning
courses rapidly. LCMS applications fundamentally change the value of e-learning content delivery by offering a scalable platform to deliver proprietary knowledge to individual learners and researchers.

The most of the universities staff in the Kingdom of Saudi Arabia are using Jusur as a learning management system, and some of them use other open or commercial programs, such as Moodle. Thus, this study aimed to identify which one is better to be used, by comparing the effect of using Moodle and Jusur on the development of students’ academic achievement of teachers college at Riyadh (King Saud University) in the “instructional software” course and their attitudes towards LMS. As an example of studies about Jusur, Hussein (2010) aimed to identify the attitudes of faculty members at King Saud University towards the use of Jusur as an e-learning management system, the results showed that there are a positive attitudes of the members of the faculty at King Saud University towards e- learning management system Jusur, although not activate enough.

**Moodle** ([www.moodle.org](http://www.moodle.org)):

Moodle (modular object oriented developmental learning environment) is an open source Course Management System (CMS), also known as a Learning Management System (LMS) or a Virtual Learning Environment (VLE). It has become very popular among educators around the world as a tool for creating online dynamic web sites for their students. It has been developed by Martin Dougiamas as part of his Ph.D. in education thesis (Kok, 2008). Romero (2008) assumed that Moodle is one of the most commonly used, a free learning management system enabling the creation of powerful, flexible and engaging online courses and experiences.

Open source software, which means that it is free to download it, to use it, and to modify it. Pan (2007) claimed that there are many criteria for open source software such as; free redistribution (copies of the software can be made at no cost), source code (the source code must be distributed with the original work, as well as all derived works, derived works (modifications are allowed), integrity of the author’s source code, no discrimination against persons or groups, no discrimination against fields of endeavor, distribution of license, license must not be specific to a product, and license must not contaminate other Software. Due to being an open source software, Moodle is free to download, use, modify, and even distribute and sell (under GNU General Public License), all with no license fee (Kok, 2008). Michael & Tao (2007) asserted that the main advantages to an open source learning management system are the ability to modify these products and redistribute them back into the community. In the more popular open source projects, as new features become available they can be integrated into the users’ existing system as needed at minimal cost. The disadvantages to open source software are a lack of dedicated support unlike proprietary systems from software manufacturers and if an organization modifies the common code base too dramatically the ability to upgrade to future releases of the software is impaired. Open source software also requires personnel with the requisite knowledge base to implement the software which may require the addition of new personnel or additional training for current personnel.

The underlying philosophy of Moodle is maximum instructor control and minimal administrator control. Once the course area is created in Moodle, the instructor manages its materials with minimal (if any) assistance by the administrator. The
instructor has also control over which course pages and files to publish. An administrative documentation, a teacher’s manual, and documentation created by other users are available on Moodle’s web site. For those users and institutions without any server and support infrastructure to host their own online materials, a Moodle hosting service is available at a reasonable price. Moodle can also be utilized as a collaboration tool for remote project partners (Kok, 2008).

The study:
The study hypotheses were:
- There are statistically significant differences at the level of (0.05) between average scores of the subjects in pre- and post-test application of the academic achievement test of the "instructional software" course, in favour of post-application.
- There are statistically significant differences at the level of (0.05) between means of scores of the subjects in pre- and post-measurement of the attitudes towards Moodle as LMS, in favour of post-measurement.
- There are statistically significant differences at the level of (0.05) between means of scores of the subjects in pre- and post-measurement of the attitudes towards Jusur as LMS, in favour of post-measurement.
- There are no statistically significant differences at the level of (0.05) between means of scores of the subjects in the post measurement of the attitudes towards Moodle and Jusur as LMSs.

The study tools were: achievement test on “instructional software” course, and attitudes towards LMS scale. Validity and reliability of the academic achievement test and the attitudes towards LMS scale were ensured. The sample of the study consisted of (41) students, they were enrolled in an e-course called “instructional software”. One of the e-course units consists of 6 lessons, they were divided into two parts, every part consists of 3 lessons. The sample of the study studied the first 3 units using moodle as LMS, then the same sample studied the next 3 units using Jusur as LMS. The researcher applied academic achievement test and attitudes towards LMS scale (Moodle and Jusur) as a pre-test. The sample studied the first 3 units using moodle as LMS, then the researcher applied attitudes towards LMS scale (Moodle), as a post-test. The same sample studied the next 3 units using Jusur as LMS, then the researcher applied academic achievement test and attitudes towards LMS scale (Jusur), as a post test.

The findings:
The results of this study indicated that there were statistically significant differences at the level of (0.05) between average score of the subjects in pre- and post-test applications of the academic achievement test of the “instructional software” course, in favour of post-application. Therefore, both Moodle and Jusur have a positive effect in the development of students’ academic achievement.

There were also statistically significant differences at the level of (0.05) between the means of scores of the subjects in pre- and post-measurement of the attitudes towards Moodle as LMS, and also the attitudes towards Jusur as LMS, in favour of post-measurements in both treatments. However, there were statistically significant
differences at the level of (0.05) between the means of scores of the subjects in the post measurement of the attitudes towards Moodle as LMS, and the post measurement of the attitudes towards Jusur as LMS, in favour of post-measurement of the attitudes towards Moodle as LMS. Therefore, both Moodle and Jusur have a positive effect in improving students' attitudes towards LMS, however Moodle is more effective than Jusur.

6. Abstract:

   Any profession defines and distinguishes itself from the rest through its core tasks and competencies. For special education, competencies need to be articulated, when upgrading the level of competence of its practitioners and responding to the needs of special learners at the grassroots level. Given the Philippine geographical situation, the Delphi was deemed appropriate for establishing these competencies. The Delphi is a qualitative method, which creates shared judgment and understanding among a panel of experts from geographically dispersed locations who examine a particular issue. Fifty-six Delphi panelists identified the special education forecasts within the next five years, the tasks required within those forecasts and the competencies necessary to perform the special education tasks.

   A total of three surveys were conducted. The initial survey using two – open ended questions yielded 107 special education forecasts, 272 special education tasks, 474 knowledge competencies, 528 skill competencies and 569 professional dispositions. Through a group of inter-raters, these were trimmed down to 35 forecasts, 10 categories of special education tasks, and 39 subtasks.

   Special education forecasts, tasks and perceived capabilities of special education practitioners to perform the tasks were rated using a Stapel scale. Standard deviation was computed to describe the consensus level of the panel for all items. Significant differences between the desirability and feasibility of special education forecasts and the accuracy and importance of special education challenges were analyzed using the T-test. Analysis of variance and post hoc analysis using Tukey HSD determined the differences of the ratings given by the
different types of Delphi panelists for special education forecasts, special education tasks and perceived capability of special education practitioners to perform these tasks. To compare the similarities in the perceived capabilities of various practitioners, proximities were computed using Euclidean Dissimilarity Coefficient Measure.

The final progressive special education competency framework has 81 knowledge and skill competencies under seven strands namely: Foundations, Instructional Planning, Instructional Methods and Strategies, Learning Environment, Assessment and Evaluation, Collaboration, and Personal Growth and 16 professional dispositions.

The results of the study strengthen the knowledge base of special education teacher training programs and improve practice.
Increasingly, students with disabilities such as autism or seizure disorders, are requesting that animals accompany them to school. In some circumstances, these requests have been denied, resulting in media attention and litigation. In those cases, school administrators have been concerned that the presence of the animal would negatively impact other persons in the school who have allergies, or that the animal was not needed, given that the school district could offer aides or other services to assist the student. Now and with few exceptions, the 2010 publication of federal regulations implementing the Americans with Disabilities Amendments Act of 2008 (“ADA”), 42 U.S.C. § 12101 et seq. (2008), 28 C.F.R. Pt. 35 (2010), require public schools to modify their policies, practices, and procedures to permit the use of service animals by students with disabilities. The law also restricts public school officials from asking certain questions about the animal for which school attendance is requested.

The ADA regulations state that certain species of animals may be considered to be service animals, such as miniature ponies, but that other species are not service animals, such as wild animals. The determination of whether a requested animal is a service animal is up to the discretion of school officials and requires careful consideration of the need for a service animal and the functions the animal would perform for the student. Whether an animal is considered a “service animal” under federal law or whether these animals are merely companion animals that help students stay calm or feel safe, it is up to school administrators to make decisions to permit such animals to attend classes with the student, or to deny the request.

This paper provides a framework to consider requests for use of service animals in public
schools. School officials should consider these requests in light of school district policy, the access and nondiscrimination provisions of the ADA, and if applicable, an inquiry under the Individuals with Disabilities Improvement Act (“IDEA”) to determine whether an animal, even if not statutorily defined as service animal, is an appropriate related service or needed methodology to provide educational benefit to a student with a disability.

Access to Public Schools

Federal Law

The definition of “service animal” in the 2010 ADA regulations is found in Title II, Part 35, Nondiscrimination on the Basis of Disability in State and Local Government Services, 28 C.F.R. Pt. 35.104 (July 23, 2010, Effective March 15, 2011). Title II prohibits state and local governmental entities from discriminating on the basis of disability. Title II regulations provide that public entities must make reasonable modifications in their policies, practices, or procedures when the modifications are necessary to avoid discrimination on the basis of disability, unless the public entity can demonstrate that making the modifications would fundamentally alter the nature of the service, program, or activity. 28 C.F.R. Pt. 35.136(a). The Office for Civil Rights (“OCR”) enforces Title II. Notably, an animal that poses a “direct threat” to others is an animal that poses a significant risk to the health and safety of others that cannot be eliminated by a modification of policies, practices or procedures. 42 U.S.C. §12111(3); 28 C.F.R. Pt. 36.208.

Under Section 504 of the Rehabilitation Act of 1973, 29 U.S.C. § 794 (2008); 34 C.F.R. Pt. 104 (2008), and enforced by the OCR, federal recipient schools are required to provide students with nondiscriminatory access to facilities, programs, and services so that they may be provided an equal educational opportunity. Section 504 prohibits recipients of federal U.S. Department of Education funds from discriminating on the basis of disability.

The ADA regulations define a service animal as any dog that is individually trained to do work or perform tasks for the benefit of an individual with a disability, including a physical, sensory, psychiatric, intellectual, or other mental disability. Other species of animals, whether wild or domestic, trained or untrained, are not service animals for the purposes of this definition. Miniature horses may be service animals for the purposes of the ADA if the miniature horse has been individually trained to do work or perform tasks for the benefit of the individual with a disability. 28 C.F.R. Pt. 35.136(i)(1).

A public school district is not responsible for the care or supervision of a service animal. A service animal shall have a harness, leash, or other tether, unless either the handler is unable because of a disability to use one, or if such use would interfere with the service animal’s safe, effective performance of work or tasks, in which case the service animal must be otherwise under the handler’s control (e.g., voice control, signals, or other effective means). 28 C.F.R. §35.136(d).

However, a public school official may ask an individual with a disability to remove a service animal from the premises if the animal is out of control and the animal’s handler does not take
effective action to control it or if the animal is not housebroken. With regard to a trainer of a
service animal, know the school board’s visitor policy. The focus of the inquiry should include
the permissibility of the trainer’s entry into the building during the school day, with or without a
service animal.

State Law

State law may require public schools to permit the use of a service animal by a student. If that is
the case, it is important to comply with the law and grant the parent’s request. In Kalbfleisch ex
rel. Kalbfleisch v. Columbia Community Unit Sch. Dist. Unit No. 4, 2009 WL 4829008 (Ill.
App. Ct. Dec. 16, 2009), a three-judge appellate panel in Illinois state court found “ample
evidence” to uphold the lower court’s issue of an injunction finding that a five-year old student
with autism would be irreparably harmed under state law if he did not bring his dog with him to
school. In considering the parents’ request that the child be accompanied to school by a service
dog, the school district determined that the dog would have served no educational purpose as it
was a companion animal that did not meet the definition of a service animal, and would have
impacted at least one student with allergies to animal fur. District officials argued that the
student could attend school without the animal if he chose to and that his behaviors were
volitional. The parents, however, contended that the dog provided a calming influence on the
child, reduced his tantrums, and provided the child with consistency throughout the various
environments he encountered during his day. Because the plain language of state law permitted
the use of service animals, the court held that it was not necessary for the parents to prove the
dog was a service animal in order for it to issue a preliminary injunction. See also, K.D. v. Villa
Grove Comm’ty Unit Sch. Dist. No. 302 Bd. of Educ., 110 LRP 50317 (Ill. App. Ct. 2010) in
which the court affirmed that a 6-year old boy with autism could bring a dog to school even
though the dog did not respond to commands given by the one-on-one aide rather than the child,
or provide him with educational benefit.

Management Issues

Under the ADA regulations, individuals with disabilities shall be permitted to be accompanied
by their service animals in all areas of a public entity’s facilities where members of the public,
participants in services, programs or activities, or invitees, as relevant, are allowed to go. 28
C.F.R. §35.136(g). When a request for use of a service animal is made, school officials may not
require documentation, such as proof that the animal has been certified, trained, or licensed as a
service animal. Furthermore, school officials shall not ask about the nature or extent of a
person's disability, but may make two inquiries to determine whether an animal qualifies as a
service animal:

a. Is the animal required because of a disability? (No need to ask if the disability is
obvious.)

b. What work or task has the animal been trained to perform?

Examples of work or tasks include, but are not limited to, assisting individuals who are blind or
have low vision with navigation and other tasks, alerting individuals who are deaf or hard of hearing to the presence of people or sounds, providing non-violent protection or rescue work, pulling a wheelchair, assisting an individual during a seizure, alerting individuals to the presence of allergens, retrieving items such as medicine or the telephone, providing physical support and assistance with balance and stability to individuals with mobility disabilities, and helping persons with psychiatric and neurological disabilities by preventing or interrupting impulsive or destructive behaviors. The crime deterrent effects of an animal's presence and the provision of emotional support, well-being, comfort, or companionship do not constitute work or tasks for the purposes of this definition. 28 C.F.R. Pt. 35.104.

These inquiries and rules which apply to service animals, also apply to miniature horses. 28 C.F.R. §35.136(i)(C). In determining whether reasonable modifications in policies, practices, or procedures can be made to allow a miniature horse into a specific facility, school officials must consider:

a. The type, size, and weight of the miniature horse and whether the facility can accommodate these features;

b. Whether the handler has sufficient control of the miniature horse;

c. Whether the miniature horse is housebroken; and

d. Whether the miniature horse's presence in a specific facility compromises legitimate safety requirements that are necessary for safe operation. 28 C.F.R. §35.136(i)(2).

**Free Appropriate Public Education (FAPE)**

In addition to nondiscriminatory access to educational programs, services, and facilities, Section 504 has an additional relevant component to consider in that recipient elementary and secondary schools also must provide a FAPE to qualified students with disabilities. A FAPE is the provision of a regular or special education comparable to the education provided to students without disabilities and is based on a student’s individualized educational needs. 34 C.F.R. Pt. 104.33(b) (2000). The provision of a FAPE may include related aids and services, including the possibility that a student may need a service animal for assistance in order to have access to participation in, and gain the benefits of, the programs and services offered by the school. 34 C.F.R. Pt. 104.4(a) (2000).

Under the IDEA FAPE provisions, the relevant question is whether the use of a service animal is a related service to assist a child with a disability to benefit from special education or is the appropriate methodology to provide the student with educational benefit. The process in which a school must engage under the IDEA to make decisions regarding the use of service animals for a student with a disability is a highly fact specific, case-by-case inquiry into the details of the student's needs, the nature and severity of the disability and its impact on the student, and the
appropriate methodology to be used to meet those needs.

Even if the animal requested does not meet the definition of service animal, school officials would be wise to consider whether the student requires use of an animal in order to receive educational benefit. In Gallia County Local Sch. Dist., 36 IDELR 205 (SEA OH 2002) a state hearing review officer (“SRO”) affirmed the impartial hearing officer’s order (“IHO”) and concluded that, under the IDEA, the student, diagnosed with separation anxiety disorder and social phobia, needed a dog for companionship in order to attend school. In arriving at the decision, the SRO applied a preponderance of evidence standard to determine whether the full time use of a companion dog in school was necessary for the provision of a FAPE under the IDEA. The dog was determined to provide the student with some meaningful educational benefit in the least restrictive environment to meet her “current” needs. The school district was ordered to permit the student the use of the dog at all times in school, while on school property, and on the school bus; and elementary school staff and students were to be trained on the use of a service dog. Thus, use of the dog was a necessary component of a FAPE under the IDEA, not as a service animal trained to perform tasks or do work, but as an emotional companion providing comfort to the student.

Related Service

The use of a service animal may be required under the IDEA as a related service. “Related services” are transportation and such developmental, corrective, and other supportive services as are required to assist a child with a disability to benefit from special education, and includes speech-language pathology and audiology services, interpreting services, psychological services, physical and occupational therapy, recreation, including therapeutic recreation, early identification and assessment of disabilities in children, counseling services, including rehabilitation counseling, orientation and mobility services, and medical services for diagnostic or evaluation purposes. Related services also include school health services and school nurse services, social work services in schools, and parent counseling and training.

“Orientation and mobility services” are those services provided to blind or visually impaired children by qualified personnel to enable those students to attain systematic orientation to and safe movement within their environments in school, home, and community; and may include teaching children to use a cane or a service animal to supplement visual travel skills or as a tool for safely negotiating the environment for children with no available travel vision. Because the list of related services is nonexhaustive, a service animal may be necessary as an other supportive service as are required to assist a child with a disability to benefit from special education.

In Cave ex rel. Cave v. East Meadow Union Free Sch. Dist., 480 F. Supp.2d 610 (E.D.N.Y. 2007), the federal court denied a parent’s request under Section 504 for a preliminary injunction to require the school district to permit the presence of the service dog as a reasonable accommodation for a student with a hearing impairment. The court found extensive testimony on the effects of animal dander on people with such allergies to be persuasive and found that the presence of a dog in school would severely impact persons with allergies. Importantly, the court
found it persuasive that the parents did not exhaust their administrative remedies under the IDEA first. On appeal, the Second Circuit Court affirmed, reiterating that the parents should file a request for a due process hearing under the IDEA to seek to incorporate the use of the dog into the IEP as a related service. “A request for a service dog to be permitted to escort a disabled student at school as an ‘independent life tool’ is hence not entirely beyond the bounds of the IDEA’s educational scheme.” Cave ex rel. Cave v. East Meadow Union Free Sch. Dist., 514 F.3d 240 (2d Cir. 2008).

The parents bear the burden of proof at a due process hearing and must show that empirical evidence supports the need for a service animal in lieu of human supports, and that their student needs the animal in order to receive a FAPE. In Bakersfield City Sch. Dist., 51 IDELR 142 (SEA CA 2008), an administrative law judge (ALJ) who heard the due process complaint found no violation of the IDEA. Although the dog did not qualify as a service animal, school officials did not follow procedures in their decision making. They were required to consider whether the student needed the animal as a related service in order to receive a FAPE. The ALJ found that the parents’ proffered evidence that the dog was essential to the provision of a FAPE was not based on peer-reviewed experimentally and empirically based research, but was based on anecdotal reporting. The ALJ also determined that the district’s recommendation of a one-on-one aide was the least restrictive means to provide supports to the student as the aide could make human judgments as to when to wean away from the student when appropriate in order to facilitate communication with his peers, where the dog would be nothing but a constant companion. The presence of the dog was not required for the student to receive a FAPE.

If an animal will be necessary in order for a student to have access to the educational programs or benefits, or the provision of a FAPE, consider the procedures for removing animals from the premises at any time given that they may be ill, may pose a direct threat to others, or may interfere with educational and operational functions.

Under the ADA/Section 504 and the IDEA, school officials may offer alternative means to accomplish the requested service or need, but the alternative must actually be appropriate to achieve all of the work or purposes the service animal provides with respect to the student’s disability. In New Mexico Dept. of Educ., 103 LRP 57802 (SEA NM 2002), the IHO concluded that the determination of whether or not to use a dog as part of the special education program of a student with a hearing impairment was a choice of methodology, and therefore up to the school district. Testimony at the due process hearing established that student’s dog was not used to perform tasks or other disability-related services through work, but was instead used as a means of therapy. The IHO concluded that the purpose of the dog was to confer educational benefit, not to compensate for any lack of mobility or other disability as would a service dog. However, the IHO found that other means of accomplishing the same educational benefit sought by the proposed use of the dog were evident in the IEP, considered by the team, and made part of the child’s educational program. Because the decision of whether to permit use of the child’s dog was a choice of educational methodology, and because the district’s chosen methods conferred educational benefit, the decision not to use the student’s therapy dog and the subsequent non-use of the dog did not constitute a denial of a FAPE.
Conclusion

In summary, a service animal may be necessary under Section 504/ADA for a student with disability to access the facilities, services, and benefits of the educational program, and whether reasonable modifications would facilitate that access. A service animal also may be a necessary related service to enable a student with a disability to receive a FAPE under the IDEA. Therefore, a school official must know the definition of service animal, the needs of the student, and identify the nature of the tasks the animal is trained to perform through a case-by-case, interactive process with the parent/guardian and the child, if appropriate. Document the specific ways in which an animal or other related service will assist the student and the effects of the disability.

The school administrator should be sure that student’s educational planning team considers and documents all the student’s educational needs and discusses all the methods proposed to meet those needs before proposing a FAPE such as the diagnosis of the specific disability; the needs that stem from it; consider the parent’s request for the service or comfort/therapy animal; identify and verify the need for such a service or comfort animal; and directly address the function(s) that the service or comfort/therapy animal is expected to perform in relation to the student’s disability as this may impact the school district’s methodology choices.

The school administrator should also know policy and procedure regarding the animal’s access to water; the walking, caring, feeding, clean up of the animal’s waste; and any restrictions such as requiring that the animal be restrained at all times by being leashed or that the animal be restricted to certain spaces on school property. Other considerations should be made regarding the animal’s vaccinations and other veterinary records but do not condition a service animal request on the parents’ submission of such information.
Cultural Perspectives on Attention Deficit Hyperactivity Disorder: A Comparison between Korea and the US

Abstract

Attention Deficit Hyperactivity Disorder (ADHD) is one of the most commonly diagnosed behavioral disabilities in US classrooms. Even though the exact cause of ADHD is not known, several factors are accepted as possible causes, including heredity, genetic or organizational factors, head injury, poor nutrition, infections, parental substance abuse, and exposure to toxins in early childhood. Among many possible causes of ADHD, this author focused on cultural perspectives on ADHD based on Ross’s (1987) statement that each culture has different rates, behaviors, and perceptions of ADHD. By comparing Korean and US parents’/teachers’ perspectives on ADHD through a review of research, this researcher found that cultural influence was one of the important factors affecting ADHD diagnosis and treatment.

*Keywords*: ADHD, Confucianism, culture, East Asia, Korea, parents, teachers, USA
Cultural Perspectives on Attention Deficit Hyperactivity Disorder: A Comparison between Korea and the US

Attention Deficit Hyperactivity Disorder (ADHD) is one of the most commonly diagnosed behavioral disabilities in the US classroom setting. According to the National Institutes of Health (NIH), ADHD is estimated to affect three to five percent of school-age children in the US (1998). Researchers with the Centers for Disease Control and Prevention (CDC) analyzed data from the 2003 National Survey of Children’s Health that revealed approximately 4.4 million children aged 4 to 17 years old were reported to have a history of ADHD diagnosis; of these, 2.5 million (56%) were reported to be taking medication for the disorder (CDC, 2005, p. 842). Regardless of the high percentage of occurrence, however, children’s ADHD is diagnosed only by teachers’ or parents’ observation in most cases. As Rowland, Lesesne, and Abramowits (2002) point out, a lack of reliable diagnoses, such as laboratory tests, has made reported estimates of prevalence difficult to interpret.

For most of the children diagnosed with ADHD, stimulant medications such as methylphenidate and amphetamine are recommended. As Advokat (2009) observed, the legal and illegal usages of stimulant medications for students diagnosed with ADHD have increased in the US (2009). Stimulant medications have been regarded as effective in helping students with ADHD to achieve better concentration, organization, and task completion while they are doing classroom activities. However, many researchers have questioned the effectiveness of stimulant treatment in their recent studies, because using stimulant medications may promote drug abuse, researchers find no clear evidence of improved academic achievement, and the drugs have side effects. For example, according to Giedd, Castellauos, Casey, Kozuch, King, Hamburger, and Rappart (1996), children with ADHD who received stimulant medication generated more hostile
responses to provocation than children with ADHD who did not receive stimulant medications. The researchers reasoned that the first group’s more aggressive responses to provocation may be exacerbated by administration of Methylphenidate (2009).

Every culture has children with ADHD (Barkley, 1996). Even in the US, where children with ADHD are found across diverse ethnic groups, different types of behaviors among different cultural groups are observed, which indicates each culture has different rates, behaviors, and perceptions of ADHD (Ross, 1982). Ross found that classrooms in Thailand have comparatively fewer students with ADHD because children are expected and trained to behave and talk quietly in public in Thailand. Likewise, East Asian countries have lower rates of ADHD diagnosis, mainly due to their cultural background, Confucianism. East Asian societies highly value education, harmony with others, and loyalty to the country, parents, and elders. The cultural environment of East Asian countries contributes to having fewer students with ADHD and different concerns in the classroom setting when compared to US classrooms.

According to Lee (2008), students’ socioeconomic (SES) background also contributes to ADHD. Based on the findings of the study, students from low income single parent families, or families where both parents work, show a higher rate of ADHD than students from high income, two-parent families. Szanmari, Offord, and Boyle (1989) argue that the reason could be family problems related to low economic status. DuPaul and White (2006) argue that the major contributive factors of ADHD are genetic and organizational factors: The brains of those with ADHD may differ with respect to the balance of certain chemicals, referred to as neurotransmitters, as well as the size and operation of specific brain components, such as the prefrontal cortex. Also, the nature of classroom tasks and behavior management styles at home and school could affect the expression of ADHD.
In this review of research, I answer the following question: “Do cultural influences impact ADHD diagnosis and treatment?” I compare different cultural views and treatments of ADHD among Korean teachers and parents and US teachers and parents. I also compare perspectives regarding ADHD in the two countries, especially focusing on medication, by looking at the history of ADHD.

Theoretical Framework

Causes of ADHD

The exact cause of ADHD is not known. However, several factors are accepted as possible causes, including genetic factors: the brains of those with ADHD may differ with respect to the balance of certain chemicals, referred to as neurotransmitters, as well as the size and operation of specific brain components, such as the prefrontal cortex (Batchelder, 2003). McLoughlin, Ronald, Kuntsi, Asherson, and Plomin (2007) examined genetic and environmental influences on ADHD in a large-scale twin study. Substantial genetic influences were found for inattention and hyperactivity, as well as moderate to high genetic correlations between the two symptom domains. Even so, the genetic correlations between inattention and hyperactivity also show some etiological independence of the two symptom domains. Heredity is another factor. ADHD tends to run in families, which suggests that children may inherit a tendency to develop ADHD from their parents. Organizational factors, such as the nature of classroom tasks and behavior management styles at home and school, also are known to affect the expression of a child’s ADHD. Other possible factors are head injury, poor nutrition, infections, substance abuse, and exposure to toxins such as lead in early childhood. Psycholgiou, Daley, and Sonuga-Barke (2008) found that physical or sexual maltreatment and post-traumatic stress disorder (PTSD) symptoms overlapped with those of ADHD.
ADHD Diagnosis and Treatment

According to Singh (2008), reliable diagnosis rates for ADHD are difficult to find in most countries because medical or scientific diagnoses are not used for ADHD diagnosis. Instead, teachers or parents observe symptoms of ADHD from a child and refer the child to doctors. Then doctors check whether symptoms have persisted for at least six months and whether symptoms and impairment have been present in at least two settings, such as at school and at home. Most of the time, if the child meets the criteria, doctors recommend that the child be medicated. Breggin (1997) and Diller (1998) negatively described this process because under-resourced teachers may advise a parent of a misbehaving child to get immediate medication rather than utilize pedagogical techniques and resources. Generally, treatment with stimulant medication is known to improve the core symptoms of ADHD and has resulted in positive responses in more than 75% of the children (APA, 2000). However, as many as 20% of children showing ADHD symptoms derive no real benefit from medication. Rabiner (2009) stated that some children experience side effects such as decreased appetite, weight loss, sleep problems, headaches, jitteriness, social withdrawal, and stomachaches that prevent the child from receiving medication. Moreover, many children who benefit from medication still have difficulties with primary ADHD symptoms or associated problems that must be targeted via other means. Also, parents, teachers, and doctors disengaging from the social responsibility to raise well-behaved children have been pointed out as another negative aspect of ADHD medication. Timimi (2002) argues that millions of children and their families are being treated unfairly by placing the children on highly addictive drugs with no evidence of long term benefits. As stimulants are known to be potentially addictive drugs with cardiovascular, nervous, digestive, endocrine and psychiatric side effects (Breggin, 2001, 2002), authors of a U.S. federal government report on ADHD
concluded that no compelling evidence was available to support the claim that ADHD is a biochemical brain disorder (National Institutes of Health, 1998).

**ADHD in the USA**

ADHD is one of the most commonly diagnosed behavioral disabilities in the U.S. classroom setting. According to the record of the National Institutes of Health (NIH) Consensus, ADHD is estimated to affect 3 to 5 percent of school-age children in the US (1998). Researchers with the Centers for Disease Control and Prevention (CDC) analyzed data from the 2003 National Survey of Children’s Health that revealed approximately 4.4 million children aged 4–17 years were reported to have a history of ADHD diagnosis; of these, 2.5 million (56%) were reported to be taking medication for the disorder (CDC, 2005, p. 842).

**ADHD in Korea**

The term ADHD was introduced in Korea in 1987 with a study entitled “Effect on behavioral modification for children with attention deficit hyperactivity disorder through attention training” (Choi, 1987). After 10 years, about 7.6% to 9.5% of Korean children were reported to have ADHD (Cho & Shin, 1994; Kim & Chae, 1998). In Korea, information about ADHD was introduced through a public education campaign: “An ADHD awareness day” was held in 2004 and 2005 by the Korean Academy for Child and Adolescent Psychiatry. In a 2005 campaign, 103 psychiatrists and 8000 audience members participated in the education program nationwide. A media campaign was carried out simultaneously. After the campaign, public awareness about ADHD in Korea increased and many people sought psychiatric help for their children (Cho, 2006).

Approximately half of children with ADHD show overt symptoms by the time they are five years old, and most begin to display behavioral problems during the early school years when
they have to follow instructions from teachers and obey school rules. In Korea, children with ADHD are reported to have difficulty with self-control both at home and in school, to have a tendency to show aggressive behaviors, to suffer from low self-esteem, to have frequent fights with peers, to experience isolation in social situations, to display problems with underachievement, and to have learning disabilities (Silver, 1992). Students who are diagnosed as having ADHD also show developmental disorders (11.6%), conduct disorders (9.3%), oppositional defiant disorders (7%), anxiety (7%), enuresis (4.7%), and mental retardation (4.7%) (Hong, Kim, Shin, & An, 1996). Currently, the Korean Ministry of Health and Welfare does not recognize either developmental disorders or learning disorders as disabilities. ADHD is not recognized as a disability either (Lee, 2008). Therefore, finding an accurate prevalence rate of children with ADHD in Korea is difficult.

Social and Cultural Perspectives on ADHD

According to Batchelder (2003), social and cultural factors are keys to understanding trends in ADHD diagnosis and methylphenidate treatment. Batchelder (2003) pointed out that consumption rates of methylphenidate have increased dramatically across the world; in many countries, five-to seven-fold increases in consumption rates have occurred over the past decades. However, different diagnoses and treatments among different countries also have been observed. For example, Jacobson (2006) studied a group of 53 English 10 and 11-year-olds to investigate why the English diagnose ADHD much less frequently than Americans, and found that English children who were defined as normal in England exhibited the symptoms of ADHD as it is defined in America. According to the results of the study, less than one percent of English children are diagnosed as having ADHD while approximately five percent of American children are labeled as having ADHD.
According to Isanski (2009), people in western cultures value autonomy and independence while people in East Asia attach a very strong moral aspect to learning and education. In addition, East Asian children are more accepting of what Americans might call excessive parental involvement. Interpretation of behavior also varies among parents, health care providers, and school personnel. According to Bussing, Koro-Ljungberg, Gary, Mason, & Garvan (2005), parents interpret their observations of children’s behavior based on their own sociocultural and ethnic experience, in combination with what they have been taught about ADHD.

**School as a Culture**

Schools are institutions in which prominent cultural values and expectations are infused in the developmental and learning processes of young people. According to Singh (2004), school can be viewed as a culture in which children’s development intersects with prevailing expectations and values in relation to their behavior, performance, and achievement. One of the functions of schools is to generate cultural knowledge about children’s behavior. Also, educators in schools must have ways of interpreting and handling children who do not meet the normative expectations. Prout and James (1997) stated that although the immaturity of children is a biological fact, the ways in which this immaturity is understood and made meaningful is a fact of culture.

In most cultural contexts, educators are mandated to provide children with care not just for their minds, but also for their bodies and their spirits, through exercise, health education, meals, basic healthcare screening and moral education. Schools operate on two broad levels of relationships: a micro level and a macro level. At the micro-level, the relationship is between a teacher and a child. Concerns such as how the teacher understands the child, what kind of relationship they have, how long they have been working together, and how experienced the
The teacher is important. The relationship between the teacher and the school is also considered to be at the micro level. To what extent the school administrators and the teacher support each other’s educational vision and practices, and what degree of independence a teacher has in implementing educational strategies to deal with problem behaviors in the classroom, are important concerns. At the macro-level, the relationship is between the school and broader state and national policies that govern children’s intellectual and emotional development within the school setting. Is this a public or a private school? Is this a school with an integrative approach to children with special needs? Does the school have the resources to support children with special needs and behavior problems? How do the children at the school perform at the state or national level in educational achievement? All these are important macro level concerns.

**Confucianism**

Confucianism is a Chinese ethical and philosophical system developed from the teachings of the Chinese philosopher Confucius (551–479 BC), who emphasized human morality and right action. At the basis of the teachings of Confucianism is the importance of education for the moral development of the individual so that the state can be governed by moral virtue rather than by the use of coercive laws. East Asian cultures and countries strongly influenced by Confucianism include China, Japan, Korea, and Vietnam, as well as various territories settled predominantly by Chinese people, including Singapore and Taiwan. Just like other Confucian cultures, Koreans value “Harmony by morality” acknowledge, the best philosophy, according to Confucian doctrine. To maintain harmony, people should know the order according to hierarchies of age, social status, gender, and family. Lower hierarchs are expected to respect higher hierarchs by obeying, and higher hierarchs are expected to care for lower hierarchs. Since high social status can be achieved by education, education is one of the great values in Confucian
cultures. Any delinquent behavior is regarded as “non-moral” and the individual and the group to which the individual belongs should feel shame. The “shame” then becomes a stigma among members of the society (Feng & Hua, 2004).

Method

Selection of Empirical research

Basic information about ADHD and general concerns about ADHD in different cultures were gathered through reviewing articles and related books. Then I analyzed selected articles to review the different cultural perspectives on ADHD between Korea and the US. Searches of Education Abstracts Full text, ERIC, and PsycInfo using the descriptors “ADHD” yielded about 12,000 articles. Then I added three more keywords, “culture,” “Korea,” and “USA,” and limited the date published to between 1999 and 2009. Among the 38 articles found, I chose 21 studies that were peer reviewed, data-based, and empirical for this review.

All of the researchers of my chosen articles used qualitative research designs, especially interview, to evaluate cultural perceptions on ADHD and disabilities. Four researchers among the 21 studies reviewed directly compared Korean (or East Asian) and US parents’ and teachers’ perspectives on ADHD; 14 researchers studied cultural influence on ADHD, specifically looking at different cultures; and the remaining four researchers studied cultural perspectives on other disabilities.

Because the main method of all studies in this review was interview, each individual’s experiences and voice were well heard. However, due to the small numbers of participants in the studies, and the nature of qualitative study, I need to include more studies with larger populations to achieve objectivity and generalism.
Results

Teachers’ Perspectives on ADHD in the U.S. and Korea

Lee (2008) conducted in-depth interviews with 10 U.S. teachers who had 4 to 30 years experience in pre-kindergarten through third grade. Teachers were concerned mostly about ADHD behaviors that disrupted the regular flow of class, such as not paying attention, being constantly off task, excessive movement and talking, and being physically and verbally aggressive to other children. Teachers worried about losing instruction time by having to constantly stop such distractions and redirect students. Teachers’ reactions to the interruptive behavior were to refer the child to third party school personnel, such as a counselor, principal, or special education teacher.

In Hong’s study (2008), however, Korean teachers answered that inability of children to control themselves was the most challenging problem in the classroom. Korean teachers worried most about students with ADHD stubbornly refusing teacher direction and ignoring classroom rules. Korean teachers’ reaction to children with ADHD was shame about their concerns over their inability to fulfill their duties as a teacher. Another challenge teachers faced was maintaining the trust they earned from the other children in their classrooms. Teachers worried that other students would think that their teacher was no longer capable of stopping the problematic behaviors demonstrated by their peers with ADHD.

Parents’ Perspectives on ADHD in the US and Korea

Collett, Gimpel, Greenson, and Gunderson (2001) found significant relationships between parental discipline styles and children’s ADHD behaviors. Parents of children with ADHD had more parent-child interaction problems than parents of children without ADHD (Seipp and Johnston, 2005). According to Barkely (2006), parenting contributed to symptom exhibition and
development of comorbid disorders. According to Lee (2008) and Hong (2008), Korean and US parents’ perspectives on ADHD also were different. The U.S. parents were concerned more about their children’s behavior while Korean parents were concerned more about their children’s academic achievement.

An interesting difference related to parental concerns is that U.S. parents responded positively or neutrally to the use of medication because medication helps to reduce behavioral problems, while Korean parents responded negatively because medication does not help to increase children’s academic achievement. In Korea, in most cases, the mother is the primary and critical caregiver of children with ADHD (Kendall, Leo, Perrin, & Hatton, 2005). Also, the traditional culture of Confucianism has a strong influence on parenting practices, and obedience is seen as an essential value in achieving and maintaining family harmony and functioning, upholding the family’s right to raise their children as they see fit (Yang, 2008). Although over the last several decades, Korean traditional values of parenting and family life have been influenced by western culture, the vast majority of parenting beliefs and practices in Korea still conform to many of the traditional values grounded in Confucianism (Kim & Park, 1997; Park & Chesla, 2007). Korean traditional values of parenting are based on the concept of filial piety, or Hyo. In Hyo, parents have absolute authority over their children and teach their children the laws of family honor (Choi, 1997). Children have to obey their parents. Korean traditional culture is family-based, with more value placed on family than on personal or individual needs or desire, whereas in the US, individualists tend to stress independence, autonomy in choice and actions, self-reliance, uniqueness, and achievement.

**Alternative Treatments of ADHD**
In both the US and Korea, social skills training was regarded as a very important alternative treatment to teach children how to read others’ reactions and how to behave more acceptably (Sawyer, 2004). The limitations were long waiting lists for public services and the expensive of private services. In the U.S. setting, Singh (2008) suggested the need for more resources such as better classroom environments, more special educational services, and smaller class sizes to reduce the need for more ADHD diagnoses and stimulant drug use in the classroom. Armstrong (2000) advocates for Gardner’s theory of multiple intelligences, a concept that takes a more multi-cultural approach to human learning and cognition. Gardner says that our educators and culture focus most of their attention on linguistic and logical-mathematical intelligence. Unfortunately, children without skills in these areas end up being labeled learning disabled, ADHD, or simply underachievers. Gardner stated that instead of overly focusing on traditional views of intelligence as uni-dimensional, the various types of intelligence, including linguistic, logical-mathematical, spatial, bodily-kinesthetic, musical, interpersonal, intra-personal, and naturalist intelligences should be considered.

Within national contexts, cultural attitudes and practices in relation to child behavior have made a big difference in mediating the ways in which a child is perceived at home and at school. In Korea, public understanding of ADHD is still quite poor and the stigma of child psychiatric diagnosis and stimulant treatment was high. Often parents are the ones who view their child’s behavior as being symptomatic of ADHD, having consulted websites and /or friends in their efforts to deal with their child’s behavior (Singh, 2000). Schools are still under-resourced to deal with children with ADHD-type behaviors and teachers tend not to know very much about the diagnosis and behavioral/educational methods of treatment. According to Hong (2008), Korean
teachers have difficulties in distinguishing ADHD from other disorders, including emotional
disturbances.

In general, Korean teachers try to give a child with ADHD an opportunity to develop
responsibility and suggest support for the child through individual tutorials for schoolwork as
much as possible. For example, a teacher could have a student stay after class, because if the
teacher pays too much attention to a child with ADHD during a class period, it might cause
inconvenience to other children, and this way, the teacher can check whether the student is
following along with his/her studies. The teacher cannot cure a child with attention deficit in an
hour or in a year. Therefore, as a fundamental responsibility, the teacher tries to help the child
accomplish the goal of a day’s study by keeping him after school (Hong, 2008). Korean teachers
believe when a problem occurs in class, teachers should be able to guide and cope with children
based on their knowledge of developmental characteristics and should provide the children with
appropriate methods for learning. They tend to blame themselves for being unable to control the
situation and provide appropriate guidance and care for the child with ADHD. While teachers in
the US would seek help from a third party, Shwerder (1998) argues that Korean teachers focus
more on emotional difficulties than behavioral problems, compared to U.S. teachers. According
to Shrewder (1998), being able to sensitively consider other people’s emotions, desires, and
needs, and to control one’s own to fit in is regarded as an important social skill in Confucian
cultures where the interdependent self is valued.

In the United States, on the contrary, public education provides expert alternatives such as
psychosocial therapies to focus on the behavioral, psychological, social, and school problems
associated with the illness; behavior modification (parent training, classroom behavior
modification), and applying a section 504 plan (providing preferential seating in the classroom,
reduction in length of assignments, extra time during testing, or testing in a quiet space to compensate for distractibility) to benefit students with ADHD (DuPaul & White, 2006).

Discussion

The different responses of Korean and US teachers to the most challenging behavior of students with ADHD in the classroom appear to be based on the cultural influences on the teachers. According to the studies and reviewed, in the US culture, each individual regards him/herself as an independent being, so teachers did not want other individuals (i.e., students with ADHD) to interrupt their class time. Also, in the process of treating students with ADHD, U.S. teachers brought in third parties, such as school personnel for diagnosis, planning interventions, and the student’s replacement into special education. Inviting third parties to the classroom can be interpreted as meaning that US teachers do not consider students’ interruptive behaviors during class to reflect negatively on the teacher him/herself. On the other hand, Korean teachers emphasized on their responsibility for disciplining students, so that when the Korean teachers were interrupted by students with ADHD, the teachers took it as an offense to their authority. In other words, under the Confucian influence, Korean teachers are afraid of losing face and authority over the students. Also, according to Hong (2008), another concern that Korean teachers had about children with ADHD which is distinct from U.S. teachers’ concerns, was that the students did not have any friends: the students were psychologically or physically isolated from other children in their daily group lives. The teachers were afraid that a child with ADHD might not be able to form friendships even after he/she grew up, and this would cause the student to have difficulty living a normal life as an adult. The concern for “normal life” in harmony with others also is an influence of Confucianism. U.S. teachers, on the other hand, focused more on students’ current and individual behaviors in the classroom.
Conclusion

While investigating whether teachers’ and parents’ perspectives on ADHD are influenced by culture, I found that cultural influence plays an important role: In Korea, according to Confucianism, parents and teachers tend to focus more on children’s academic achievement and take children’s distracting behaviors as a negative reflection on themselves and their authority. Korean teachers and parents try to take personal responsibility for children’s distracting behaviors, and have negative attitudes toward medication because the medication does not help to increase academic improvement. U.S. parents and teachers, influenced by western culture’s focus on independence, tend not to take personal responsibility for the children’s behaviors but to focus more on children’s current problems and treatment. U.S. parents and teachers did not mind a third party’s engagement in dealing with children with ADHD and their behaviors. U.S. parents were more positive about medical treatments because medication helps to reduce children’s distracting behaviors. As I learned in this literature review, different perspectives on ADHD exist due to different cultures, different histories, and different personnel who are in charge of the setting. However, I could find only a limited number of empirical studies that focused on cultural perspectives on diagnosing and treating ADHD. Further researcher could test parental and school environment variables in longitudinal studies and revisit the way we approach ADHD. Hartmann noted that in light of the findings (evolutionary ADHD), we must consider the way we access ADHD treatment in adults, moving from a broken/pathology/therapy model to a skill-set/opportunity/coaching model.

INTERPRETING LOGICAL GAPS

Abstract

Narrative is one analytic method in qualitative research that allows character to reveal themselves through their speech. In the Sociologist’s view of narrative, people communicate meaning through a range of linguistic practices in which they make sense of personal experience in relation to their own culturally and historically specific discourses, and how they draw on, resist, and transform those discourses as they narrate their selves, experiences, and realities. In this study, I conducted online interviews with the mother of a son with Autism Spectrum Disorder. Our online conversations were coded using narrative analysis procedures of logical gap and flash. Analysis of the data generated four main themes regarding use of logical gaps and flash forward, including awakening from recalling the past, avoiding difficult topics, showing cultural influences, and exhibiting current issues.

Keywords: Qualitative research, Narrative analysis, Flash, Logical gap, Autism Spectrum Disorder, East Asian Culture
Interpreting Logical Gaps in Conversation with the Mother of a Son with Autism Spectrum Disorder

Narrative is one analytic method in qualitative research that allows characters to reveal themselves through their speech. Narrative analysis is analysis of a chronologically told story, with a focus on how elements are sequenced, why some elements are evaluated differently from others, how the past shapes perceptions of the present, how the present shapes perceptions of the past, and how both shape perceptions of the future. Some advocates see it as an "empowering" social science methodology insofar as it gives respondents the venue to articulate their own viewpoints and evaluative standards. According to Labov and Waletsky (1967), narrative analysis implies that ordinary people’s oral narratives of everyday experience are worthy of study in themselves. Labov and Waletsky (1967) also pointed that narrative recapitulates past experience by matching a verbal sequence of clauses to the sequence of events which actually occurred.

Narratives are gathered through interviewing, which is understood as a discursive act (Mishler, 1986) in which the interviewer and the respondent "are engaged in creating the meaning of the questions and answers that constitute the narrative as they negotiate understanding through language" (Alvarez & Uría, 2002, p 40). The interviewer and respondent jointly create the narrative framework. The major approaches in contemporary narrative inquiries include the psychologist’s view, the sociologist’s view, the anthropologist’s view, and the autoethnographic view. In this study, I will focus on the sociologist’s view.

In the sociologist’s view of narrative, researchers are interested in how people communicate meaning through a range of linguistic practices, how their stories are embedded in the interaction between researcher and narrator, how they make sense of personal experience in
INTERPRETING LOGICAL GAPS

relation to culturally and historically specific discourses, and how they draw on, resist, and transform those discourses as they narrate their selves, experiences, and realities. The sequence of narrative is called the main line. A main line usually contains an event that represents a completed moment of action in a timely order. Most narratives should follow main line. However, there are some narrative factors that do not follow the mainline: Flash and Logical gap.

Flash is a literary narrative or vernacular oral narrative which consists of a flash back (to a time prior to that of the immediately preceding narrative clause), or flash forward (to a time that is after the time of narrative clauses that follow the flash). Flashed clauses will always be specially marked in some way: by a change in voice quality, pitch, a discourse particle (such as meanwhile or but), a change in tense or aspect marking on the verb. Logical Gaps during the narrative include an interesting case of an apparent “gap” in the logic or coherence due to psychological, social, cultural, or individual influences on the narration, about the topic of the narration that the narrator does not recognize in the moment.

For this research, I interviewed a mother who has a son with Autism Spectrum Disorder. I chose the narrative method to analyze my interview with her, focusing especially on flash forward and logical gaps in her narration. By using this method, I learned that how individuals narrate their own experience is as important to the meanings they communicate as is what they say. Also, I believe this method is one of the interlocutional methods that narrators use to support their points in the conversation, broaden their explanations, or show their psychological status (to avoid the topic, for example) while the conversation is going on. Therefore, analyzing logical gaps could help researchers, as interpreters of conversations, to deepen their understanding about the narrator and the conversation. According to Bruner (1986), Gubrium & Holstein (1997), Hinchman & Hichman (2001), Laslett (1999), and Polkinghorne (1995), flash and logical gap
INTERPRETING LOGICAL GAPS

are retrospective, meaning that they are ways of understanding one’s own and others’ actions, of organizing events and objects into a meaningful whole, and of connecting and seeing the consequences of actions and events over time, including the narrator’s community, local setting, organizational and social memberships, and cultural and historical location.

My goals in this research are 1) to understand cultural influences on Asian parents’ perspectives on autism, and 2) to observe the role of the logical gap and flash in analyzing narrative data. Therefore my research questions are 1) Are there cultural influences on parents’ perspectives on autism? and 2) Under what situations do flash and logical gap appear, and how can interlocutor interpret them?

Theoretical Framework

Autism Spectrum Disorder

Autism Spectrum Disorder (ASD) is the fastest growing pediatric developmental disorder, affecting as many as 1 in 150 children (Centers for Disease Control and Prevention, 2007), and of unknown etiology. According to Bodfish (2004), ASD is characterized by deficits in behavior, language, and social communication. Deficits manifest prior to the age of 36 months, and the diagnostic procedure generally involves a multidisciplinary team including psychologists, pediatricians, psychiatrists, and other health professionals. Symptoms are classified on a spectrum, with varying degrees of functioning among individuals with ASD. Some individuals with the autism have significant cognitive impairments, whereas others perform in the average or gifted range of intellectual functioning (Wing & Potter, 2002).

Researchers have studied parents or caregivers of children with ASD and point out that children’s challenging behaviors ha3 been documented as predicting variables of parental stress (Quine & Pahl, 1985; Singer & Irvin, 1991). Also, caregivers of children with ASD have higher
rates of depression and stress when compared to caregivers of both typically developing children and children with intellectual disabilities (Blacher & Mcintyre, 2006; Fishman & Wolf, 1993; Hastings, 2003; Ross & Cuskelly, 2006).

**ASD and East Asian Culture**

In response to major demographic changes, researchers and service providers have begun to direct their attention to the impact of culture on parental beliefs and practices surrounding childhood disability (Kalyanpur & Harry, 1999; Lynch & Hanson, 1998). Researchers of ethnicity and ASD have indicated that parents from different cultures have varying point of views regarding ASD symptomology (Morrier, Michael, Hess, & Heflin, 2008). According to Chan (1992), Fatimilehin & Nadirshaw (1994), Green (1982), and Ryan & Smith (1989), the ways Asian families respond to the challenges associated with raising children with ASD is different from their Western counterparts. These researchers point out that some groups of Asian parents experience higher levels of emotional stress and difficulty accessing social services.

In East Asia, Confucianism places a very strong moral emphasis filial duty and obedience, education, harmony in the group, and distinctions between right and wrong. If any individual violates or fails to follow the Confucian rules, not only the individual but the entire group with which the individual is involved feel shame or loses face. According to the East Asians, physical or mental impairment is also regarded as a “failure” or “wrong” physical/mental condition. Due to this cultural influence, East Asian parents suffer more from negative public responses, high levels of shame and embarrassment, much less acceptance of and less knowledge about individuals with ASD. Cho, Singer, & Brenner (2003) point out in their study that Korean mothers of children with ASD in Korea experience more difficulties than their immigrant counterparts in the U.S., where the Confucian culture norms are not dominant. Approximately
INTERPRETING LOGICAL GAPS

one half of the mothers in Korea described having suicidal ideas and feelings when they first learned that their child had a disability, and the mothers felt powerful emotions of shame and humiliation when their children exhibited problem behavior in public. Chinese families also face many difficulties because of social and cultural beliefs about disability (McCabe, 2007). A Chinese mother reported many openly discriminatory beliefs and practices against individuals with disabilities and their families. Public schools in China often reject students with autism, limiting opportunities for intervention. Moreover, because of the lack of knowledge and social systems for disabilities, including ASD, parents are believed to be the ones who should provide care to their children all the time. In the East Asian culture, parents’ sacrifices and decisions that demonstrate love for their children is regarded as highly moral and right.

In the United States, where autonomy and independence are emphasized, parents of children with disabilities are full members of their child’s educational team as mandated by the individuals with disabilities education act. Intervention programs that involve parents have been found to increase parents’ sense of competence and confidence about their child’s learning and development (Bruder, 2000; Dawson & Osterling) as well as to provide support for the emotional and logistical stresses that result from having a child with ASD.

Method

Participant and setting

The participant is the mother of a child with ASD who came from Vietnam in 1999. She had her son in 2000 and found out that he has ASD 14 months later. She confessed that she devoted herself to taking care of her son without having any other private activities, hobbies, or time of her own. Our three interviews or conversations were conducted online because of long geographic distance between us; she is in Minnesota and I am in Arizona. The interview was
 semi-structured. I sent her general questions via email first for her to preview and she answered me briefly, then we had free discussions about each question during our online conversations. The general questions and her responses were;

How did you feel when your son was diagnosed as having autism?
→ Shocked, lost targets to live, did not know what autism is and how to help my son.

What did your husband say about it?
→ Mournful, could not say a word.

Did you let your family know about it?
→ Yes…right away, hoping to find any information or help.

What was the first thing that you did for your son?
→ Followed all tests from Doctors’ recommendations and tried to make an appointment with the Neurologist.

Is there anything special that you are doing for your son, now?
→ Special Ed, DAN now, Respect. Love and Hope

Do you think medication or hospital helped your son’s autism? (If yes, why? If no, why?)
→ Yes, in some of fields but not totally yes.

Do you trust medication or medical doctors?
→ Not completely. Some medication might good for this patient but not for the other patient. Medical Doctors…they have different experiences…different ideas….trust them or not depends on many other circumstances….example when you read the book What Your Doctor May Not Tell You About Children’s Vaccinations-Stephanie Cave, M.D., F.A.A.F.P. with Deborah Mitchell.

How would you describe your daily life?
INTERPRETING LOGICAL GAPS

→ Accept, strive, and hope

How would you describe your son P’s daily life?

→ Free-minded, carefree, and regardless

How would you describe your husband’s daily life?

→ He tries his best to take care of his son so when he cannot take care of him anymore, he doesn’t have the feeling of regret.

Would it be different if you were in Vietnam, now? If yes, How would it be different?

→ Sorry I do not know that it would be different or not if I were in VN.

What do you wish right now in concerning with P?

→ I wish P can talk to easy communication with others and help himself for what he wants and needs and learn to be a useful person.

What do you wish right now concerning yourself?

→ I wish I can be more calm and patience.

Then in our online conversation, we had more and deeper narrative conversations about each questions.

Data analysis

The narrator’s stories in our online conversations were coded using narrative analysis procedures of the logical gap and flashes (Hill, 2005). In analyzing narrative story, analyzing grammar, especially tense, is important, because mixing the usage of tense (e.g., using present tense when complete tense should be used) is characteristic of flash. Analyzing the logical gap in a conversation is an interesting task because it is obvious that where a logical gaps occur, there are changing tenses (from past to present, or present to past). People tend to ignore logical gaps in their interpretation of conversation, treating it as unnecessary, distracting information.
INTERPRETING LOGICAL GAPS

However, I believe the logical gap is one of the ways that narrators use as an interlocutional method to support their points in the conversation, broaden their explanation, or show their psychological status (e.g., to avoid certain topics) when the conversation is going on. Therefore, analyzing occurrences of logical gap could help researchers, as interpreters of the conversation, to have deeper understanding about the narrator and the conversation.

Result

I found four common categories in which the narrator used logical gaps and flash forwards: awakening from recalling the past, avoiding difficult topics, showing cultural influences, and exhibiting current issues. I have bolded sentences that exhibit logical gaps and to protect my interviewee’s privacy, I use the acronym A to indicate the participant, S to indicate myself, and P to indicate the participant’s son, who has ASD.

Awakening from past recalling

In <conversation 1>, the mainline of the narration recalls the narrator’s past, focusing on her experience with her grandfather when she was young. Then suddenly she asked me if I knew how old she was, changing the tense from past to present. Here, a logical gap by flash-forward occurred. While she was recalling the past, she might have thought of how long ago it was, and suddenly come back to the present, recognizing how old she is now. In other words, she woke up from recalling the past.

<Conversation 1>

A (11:23 AM): My grandpa hated that...
S (11:23 AM): you would be her worst friend if you borrow her books...hahahaha
A (11:25 AM): He taught how to hold the book...get my notebook to write ....but it is hard for me....One time he said "you are the King of lazy people."
INTERPRETING LOGICAL GAPS

A (11:25 AM): that is why I miss him forever.

S (11:25 AM): hahahahahaha hahaha

S (11:27 AM): see? ? ? your nick name "turtle" started from when you were young....right?

A (11:27 AM): S, do you know how old I am?

A (11:28 AM): maybe I am older than you almost 20 years? ? ?

S (11:28 AM): really?

S (11:28 AM): how old are you?

A (11:29 AM): 41 in US but 42 in VN

S (11:29 AM): I remember your face at the airplane......you looked so young!!!!!!

A (11:30 AM): so small but old....in VN the year follows Moon Calendar.

Avoiding Difficult Topics

The narrator seemed to unintentionally avoid answering hard questions by using logical gaps; she had a hard time expressing her feelings by remembering the time when her son was diagnosed as having ASD. In <conversation 2>, the mainline focused on how she felt when she first learned that her son has ASD. She used logical gaps twice in a short conversation to avoid the topic. In <conversations 2 and 3>, she also used flash-forward, exhibiting logical gaps from the mainline of telling her feelings about her son’s ASD. Throughout our conversations, I learned how she and her family struggled and were frustrated when they first heard about her son’s ASD (Her East Asian culture would increase her negative feelings about the son’s diagnosis). I could understand why she did not want to recall those hard times. When I asked her how she felt when she first learned about her son’s ASD, she immediately asked me whether I could email her all the questionnaires in advance. She continuously had difficultly staying engaged with the
INTERPRETING LOGICAL GAPS

mainline of the conversations. She joked (“you need more laugh for your baby”. [I was pregnant at the time]) and mentioned how P is good at typing, while she was telling me about her feelings of anger and frustration in the past in <conversation 3>.

Her joke, “you need more laugh for your baby”, in <conversation 2> also could be analyzed as showing a cultural influence. In East Asian cultures, traditionally, pregnant women are strongly recommend to see, listen to, and talk about only good or positive things in order to benefit the unborn child’s benefit. The narrator would be concerned about my pregnancy since she regarded her story as negative. She exhibited this cultural attitude once more at the end of the conversation, saying “I hope we will talk about funny things with you so your daughter must be a happy girl....healthy and intelligence.”

<Conversation 2>

S (10:15 AM): How did you feel at the first time when you heard from the doctor about P’s autism?

A (10:17 AM): yesterday I forgot to talk with you that...to save time and easier for me that you could give me all your questions and I answer ...after that we just talk more about what we need.

S (10:17 AM): that's very good idea!!!!!

A (10:22 AM): at that time the word autism is what I was totally do not know it? I did not know what it is...what is that disease....what happens if what got that? What will come with P....after that I came home....went to public libraries...got on computer....google....search.... ..the more I read the more I confused...hopeless......was weary...

S (10:22 AM): right....

S (10:22 AM): I could imagine how you would be desperate...
INTERPRETING LOGICAL GAPS

A (10:24 AM): but the end or today...or you could send the last part of your interview's questions to my e-mail...

S (10:24 AM): yes, I will. Thank you for your great suggestion.

S (10:25 AM): did you start to go to hospitals right away? or did you try some traditional way?

A (10:25 AM): am I silly? just for fun...you need more laugh for your baby....than my story.

S (10:25 AM): hahahahaha

S (10:26 AM): you are right!!!!!!!!!

S (10:26 AM): but your story is also great, too = )

S (10:27 AM): I am happy to know you more~~~~

A (10:29 AM): I knew nothing about traditional way to do? ? ? Nothing to do at hospitals in USA too. Doctors just said that autism is new...nobody know the reason...the cuase...so it has no treatment...

<Conversation 3>

A (10:40 AM): each time I complained about P’s behavior...the doctor just said ...repeat....the people with autism act that way...

S (10:40 AM): oh......

S (10:40 AM): how did you feel when you hear the doctors are repeating same things all the time?

A (10:42 AM): at that time the time Paul has diagnosis...many other doctors , nurses, and teachers in US....also like me....when i first concerned or said autism I had to explain or show them the evaluation of P

S (10:43 AM): yes~
INTERPRETING LOGICAL GAPS

A (10:48 AM): I was angry with myself...I could not believe what the doctor worked for....I tried to talk with one of P's teacher in building blocks....kind of early intervention.... i talked i showed her all things I worried for P ...and she went to see the doctor with me for the next appointment after that....but nothing changed...she consoled me...i have the same displeased like me...when we were hearing what the doctors explained....very simple....autism signs....like that...like this....no medicines...no treatment...

A (10:49 AM): P……..

S (10:50 AM): Oh......what a disappointment..

A (10:52 AM): P's teacher was consoled like me, and she had the same displeased thinking like me.....( clearly than above...sorry... when I type...I did not read it...)

S (10:53 AM): hiihi...Thank you....

S (10:53 AM): The teacher was P's teacher?

A (10:54 AM): Do you know ...P's typing is much more faster and accuater than me...even he doesn't look at his hands or keyboard.

S (10:54 AM): wow...really?

S (10:54 AM): only 10 year old boy?

A (10:55 AM): yes...he is good at computer and typing about 150-230/ characters each minute for 95% accurateness

SEOK (10:55 AM): wow.......amazing!!!

Cultural Influence

In< conversation 4>, the narrator talked about early interventions with her son, which kept her busy. Then she exhibited logical gap (using flash forward), saying that I am lucky because my mother could come and help me to take care of my baby. I could see the cultural
INTERPRETING LOGICAL GAPS

bridge, of how the narrator connected her busy/hard time during those days and my mother’s coming to help me. In the East Asian culture, traditionally many grandparents serve as caregivers of their grandchildren when the babies are very young, and their help is taken for granted (Brinton, 2001). Recalling her own hard time, being busy in the past without extra help from parents, would have brought to mind the idea that I was lucky to have my mother come to the U.S. to help me out. Also, in the later part of conversation 4, the narrator mentioned her constrained relationship with her mother-in-law. I believe the narrator reveals a national culture of constrained “in-law” relationships, in which the birth of an imperfect child would only increase the tension between mother-in-law and the daughter-in-law she might hold responsible for the child’s disability.

<Conversation 4>

A (11:03 AM): after the assessment about 6 months, he went to early intervention

S (11:03 AM): so...that will be when P was 24months?

A (11:04 AM): he was around 24 months or older little bit...wait for School's assessment, speech, occupational..Physical therapists' assessments...

S (11:04 AM): did he have early intervention at his school? or some other institution?

A (11:05 AM): In US, we have early childhood….head start..or preschool for kids under 5 years old....and early intervention for kids not develop normal ...not typical....most of kids in early intervention are special needs.....

A (11:06 AM): I was very busy doing many things at that time…I did all things by myself…If I were in VN, my mother would help me to take care of me and P…… going to market or cook.
INTERPRETING LOGICAL GAPS

A (11:07 AM): you don't need time to cook or go to market...your mother in law takes care about that.

S (11:07 AM): you are right!!

A (11:08 AM): you are lucky

S (11:08 AM): My mother will come first 3 months....then she goes back to Korea.....then my mother in law will come and stay other 3 months....then will go back to Korea

A (11:09 AM): wow how lucky you are!

S (11:09 AM): thank you!!!!

A (11:10 AM): I just like to be with my mom only....If mother- in- law...I better need my husband is enough...hi hi...ha ha...

S (11:11 AM): kahahahahaha!! ! I agree with you!!

A (11:11 AM): my mother in law is nice...we have no fight....but i do not know why I can not feel comfortable when i live with her....maybe because...with my mom she takes care of me everything....10 0% and my MIL I have to look for her all the times? ?? ? I am crazy!!!

Mother in laws say that they think us like their own daughter....but I think "daughter" and "daughter in law" are different.

A (11:13 AM): what my mom has said is always what it is ....and what my MIL has said I have to think again to see what it means...what she wants me to do? ??

In <conversation 5>, the narrator exhibited another logical gap by using flash forward; the main line was a past event, about how she and her husband met. Suddenly she mentioned that she felt like I was a “police officer,” maybe due to my direct and consecutive questions. In East Asian cultures, people do not ask questions directly. As Hall (2009) pointed out, interviewers should start with some small talk, then ask open-ended questions and go very slowly into the
INTERPRETING LOGICAL GAPS

details while leading the interviewees indirectly in such a way that they feel they are still in charge. When the narrator in my study was asked many direct questions in a way that she had not experienced in her culture, she have felt offended.

<Conversation 5>

S (10:19 AM): How long did you two date and when did you get married?
A (10:22 AM): We knew each other 1986....then friends ....He left VN in 1991....
S (10:22 AM): ahh, so at that time, you were not married, yet.
A (10:23 AM): no....he had come back and to visit me and date ....and we married in 1997
S (10:24 AM): oh....wow~~~
A (10:24 AM): I feel like you're a police officer.
S (10:24 AM): so you get married in Vietnam. = ) then came to U.S. with your husband.
S (10:24 AM): puhahahahahaha
S (10:24 AM): really? ??
S (10:25 AM): I am sorry if you feel that way.....hahaha
A (10:25 AM): yes....after that almost 2 years ...waiting for papers to go to USA
S (10:26 AM): ahhh~~~ so your husband went back to U.S. and you were waiting for him in Vietnam.....?
S (10:26 AM): I mean paper.
A (10:26 AM): yes

Current Issues

The mainline in <conversation 6> was a description of the narrator’s daily life. Suddenly the narrator exhibited a logical gap by mentioning a library near her house. This logical gap
INTERPRETING LOGICAL GAPS

could be bridged with the sentence, “I even do not have enough time to enjoy... borrow some books for myself.” Reading books would be one of her favorite hobbies, but due to her son’s ASD, cannot find her own private time for that activity. When the narrator was telling me about her tightly compacted schedule, the word “library” naturally came out to represent her “private time.” Then her narration branched to a book that I gave her when I first met her. That was about 5 years ago and the book was very thin. Even though she likes the book, and she likes to read books, she had only read that book one and half time during past five years. This could be interpreted to mean that she has very little private time.

<Conversation 6>

A (11:00 AM): I try to wake early...5 AM or earlier....but I cannot because

S (11:01 AM): wow...that's pretty early

A (11:01 AM): when I put P in bed at 9PM...follow the schedule...but taking care of the kid like my son...not easy to keep schedule on time...for almost everything.

A (11:02 AM): After P gets in bed....i need to do all work in day if I can....I do not want to wait until tomorrow.

A (11:04 AM): Clean up, write note for P’s Teachers, prepare P's backpack, plan ....what food, snack, drink....ready for P at school and home tomorrow

A (11:05 AM): check my paper work....take care of myself....then pray....until sleep...Do I miss any part?

S (11:06 AM): no no no......I am thinking "wow.....so busy!!!!!"

S (11:06 AM): What time do you go to bed, then?
INTERPRETING LOGICAL GAPS

A (11:07 AM): In the morning I want to wake up early to do some stuff in bathroom ...then get ready P's clothing...food. ...+....If have time....I read Autism News....check email in Autism group...MY reading...

A (11:09 AM): usually 10- 11PM....some day 12PM....2..3...4 . AM....happen all the time....MY husband told me ...I am a turtle...hi hi...that is ok.

S (11:09 AM): hahahahaaha turtle!!!! why he calls you turtle?

A (11:12 AM): I stay up late to make homework...print paper works for P...make books...picture books...he is visual learner.....or prepare every thing ready...so when i get in the table work with him....he doesn't need to wait for me...

S (11:12 AM): oh,,,

S (11:12 AM): very diligent mother!!!

A (11:13 AM): I am turtle because I am too slow.....slow but steady....hi hi

S (11:13 AM): Aha!!!!!

S (11:14 AM): your nick name...Turtle... .haha...I like it!!!

A (11:15 AM): My town house is next to the library...I hope I can live and work in the library whole day....I even do not have enough time to enjoy...by borrow some books for myself...

S (11:16 AM): oh....you like books..?

A (11:17 AM): that why P is my only son.

A (11:17 AM): yes

S (11:19 AM): I love books, too... and I like the smell the old books have.....

A (11:19 AM): I still keep the book you gave me.

S (11:19 AM): oh....you do?
The mainline in <conversation 7> was the narrator’s suspicion that a vaccine was the cause of her son’s ASD. The narrator exhibited a logical gap by flashing forward from recalling the past: warning me to be careful with my baby’s vaccinations because she knew that I was pregnant and soon would have to vaccinate my child.

<Conversation 7>

S (11:04 AM): When did you first know that P had autism?

A (11:07 AM): when he is 18 months old, he has the diagnosis of autism...but I knew something wrong with him after he got shot at 12 months old and few hours after that he got high fever even he had tylenol...very 4 hours....and went to MR....

S (11:08 AM): oh....

A (11:08 AM): ER...sorry

S (11:08 AM): what kind of shot did he have? do you remember?

A (11:10 AM): MMR, DTP, Varricella drop...

S (11:10 AM): oh......

S (11:11 AM): After you went to the ER, did he get better?

A (11:12 AM): after some tests and medicines.....

A (11:14 AM): he got 2 times for influenza shots....each time after shot he got flu!! high fever again...hives...vomit...1 time had to see Dr...and i time took him 2 weeks...sick.

S (11:15 AM): ohhhhhhh.....

A (11:15 AM): be careful with vaccine and flu shot for your baby
INTERPRETING LOGICAL GAPS

S (11:16 AM): oh,,,,,, yes.....I should be very careful.....thank you. ....Then what did the doctor said? Did he say that it is normal symptom for every child? or only P react sensitive?

A (11:17 AM): some DR. advices ....take it slow....and if no need shot....don't give to the baby

Discussion

My research questions were answered by analyzing the interview. I could categorize four ways that the narrator exhibits logical gaps, often using flash forward: awakening from past recalling, avoiding difficult topics, showing cultural influences, and exhibiting current issues.

The participant also showed that she was influenced by East Asian culture throughout her narration. Especially in <conversations 4 and 5>, the narrator showed the influence of East Asian culture in that she prefers indirect conversation and wished to have P’s grandparents’ help to take care of her son. In <conversations 2 and 3>, the narrator had a hard time discussing her feelings about her son’s disability, indicating that she went through not only a physically but also mentally hard time due to East Asian perceptions of disabilities as something “shameful” or “physically wrong.” It was interesting to observe that she did not exhibit difficulty in “explaining about ASD.” or “what she did for her son’s ASD” (conversations 6 and 7). However, when she was asked “how she felt” about her son’s ASD, she exhibited logical gaps to avoid the topic. In other words, the narrator had an easier time describing the “fact” than her “feelings”.

The online discussions that made up the interviews were convenient for three reasons: first, because the interviewee was in Minnesota and I was in Arizona; second, because they made possible an ongoing conversation in which the interviewee was able to exhibit logical gaps using flash forward. If I had relied only on email interviews without the ongoing conversation, the participant would have been able to think longer and write/ rewrite answers for the questionnaires logically, which would not have allowed her to exhibit logical gaps. Lastly, since
INTERPRETING LOGICAL GAPS

neither the interviewer nor the interviewee are Native English speakers, it was easier to communicate in an online conversation (in written language) than orally. However, the online conversation had the limitations in that the interviewer could not see the interviewee’s non-verbal clues, such as body language and facial expressions. The interviewee also had more chances to filter her ideas while typing answers to my questions, which may have resulted in fewer logical gaps than if we had the same conversation face-to-face.

Since this study had only one participant, it is hard to generalize its findings. Further studies could enlarge on these findings by increasing the number of participants, including participants from different cultural groups, and then comparing the categories in which members of each cultural group exhibit logical gaps and how a particular culture influences the family’s perspectives on ASD. Given the importance of the cultural context in which family life is embedded, it is important to bring to light sources of support or stress in that environment, as well as the cognitive styles and beliefs of family members (Bronfenbrenner, 1979; Gallimore, Weisner, Kaufman, & Bernheimer, 1989).

Perspectives on Principal Leadership Competencies: Two Case Studies In Southern Mexico

Abstract

The purpose of this study was to examine the perceptions of school principals and teachers about the principal leadership competencies. The study was conducted in two schools located in rural communities from the Southeast Mexico. Data collection involved document analysis and surveys addressed to principals and teachers. Findings of the study indicate that principal perspectives are different from those of teachers. While principals emphasized motivation and leadership competencies, teachers were more concerned about the principal school management competencies. Some differences were found on teacher perceptions about principal effectiveness in relation to teacher level of preparation and years of experience.
PERSPECTIVES ON PRINCIPAL LEADERSHIP COMPETENCIES: TWO CASE STUDIES IN SOUTHERN MEXICO

INTRODUCTION

One of the main challenges for improving Mexican education is to provide education opportunities for all students, increasing the quality of educational process and the transition between educational levels, as well as improving the integration of the whole educational system (Mexican National Plan of Development (2001-2006)). These challenges are particularly important in the case of Mexican high school education.

High school education has a very important role in national development (PNE 2001-2006). According to the National Plan of Development (2001-2006), Mexico needs to improve the quality of this educational level by increasing innovation and providing more access opportunities for all students. Thus, administrators at this educational level need to innovate and provide quality education for all students, particularly those who live in remote rural areas. However, this is a challenge for most principals since most rural schools in Mexico confront serious educational problems, such as low academic achievement, lack of preparation of the administrative staff and limited resources (Blair, 2002). Given the important role of principals in school effectiveness and innovation, more research is needed on principal competencies. Particularly, more studies are needed on the competencies of principals of schools located in remote rural areas in Mexico (Fernández y González, 1997; Fernández, 1988; Cisneros-Cohenour, 2001; Cisneros-Cohenour & Merchant, 2005).

OBJECTIVE

This study focused on examining the leadership competencies of school principals from the perspectives of the principals and teachers from two schools located in rural communities in Southern Mexico.

PERSPECTIVE OR THEORETICAL FRAMEWORK

Deal & Peterson (1994) and Lashway (1996), state that effective principals need to be well organized passionate and creative leaders. Stolp (1994), also
state that school principals have to be both managers and leaders. As leaders, they have to promote a vision expressing the central values of the school. As managers they develop structures and policies that help to institutionalize the vision.

Kyrillidou & Blixt (1992) also examined the competencies of effective principals. They stated that all principals need to develop essential competencies required for effectively accomplishing their roles. Studies on principal leadership in Mexico found that most principals in elementary and junior high schools start their positions without having prior preparation in the required competencies for the position (Cuellar, 1989; Cisneros et al, 2003; Cisneros & Merchant, 2005).

Given the limited number of studies examining the competencies of school administrators in Mexico, Cisneros-Cohernour et al (2005) conducted a study examining the competencies of school principals for elementary and secondary schools, as well as for higher education administrators in Southern Mexico. This study was part of that research, conducted in rural schools in Yucatan, Mexico.

METHODS

This was a descriptive study conducted in two high schools of the Southeast of Mexico. Two questionnaires were used to collect information from the principal and teachers perspective about principal leadership competencies. Participants were two principals and 79 teachers: school A = 37 teachers; school B = 42 teachers.

The survey addressed to principals was a self-assessment questionnaire designed by Cisneros-Cohernour et al. This survey was developed after a review of the literature on principal competencies that was later validated with a Delphi of experts from the US and Mexico who worked for the last ten years on principal preparation in Mexico. Then, the survey was validated with a sample of principals from elementary, junior high and high schools in southern Mexico. The final version of the survey has 110 items measuring the following nine competencies: management, communication and human relations; academic development; education for a globalized society; legislation; leadership; motivation; ethical, social and professional responsibility.
The second survey addressed to teachers was an adaptation of the Principal Evaluation Form Questionnaire developed by Kyrillidou & Blixt (1992). This survey includes 30 items focused on measuring the following competencies of the principal: management, professional development and personal characteristics.

RESULTS

Findings of the study indicate that the principal of School A believed that she demonstrated in her work the competencies related with motivation and leadership. She believed the competencies she used less were ethical, social and professional responsibility and education for a globalized society. She added that she would like to receive preparation in these two sets of competencies. Although this principal indicated that she considered all competencies to be important, she believed motivating school personnel and leading the school were essential for an effective school leadership.

On the other hand, the principal of school B stated that he used more in his job the competencies related to academic development and ethical, social and professional responsibility. He stated interest on receiving professional development about the competency related to education for a globalized society. Although this principal also stated that all competencies were important, but he believed that the essential competencies for an effective principalship were: motivation, ethical, professional and social responsibility.

Results from the teacher survey show that school personnel have a different perspective of the principals' competencies. Teachers gave a high assessment to the principals in the following aspects of the competency of professional development:

- Allowing an harmonious relationship among teachers
• Promoting a high morale of the staff
• Being respected by students
• Promoting harmony among school stakeholders
• Making the staff feel trusted by the administration
• Attends
• Attending the school every day

Both principals obtained high assessment from the teachers in relation to certain personal characteristics:

• Dressing in an appropriate way
• Demonstrating maturity and emotional stability

However, principals obtained lower scores from teachers in the following aspects of the management competency:

• Providing clear and consistent instructions to the staff
• Reducing non-academic work that affect academic responsibilities
• Having resources for schools to support school work available for teachers
• Organizing academic meetings only when they were necessary
• Establishing a working schedule according to the school and staff needs.

Of the two principals, the principal of school A was better evaluated by the staff in relation to her personal characteristics. However, teachers who had low experience in the job (1-10 years of experience) or high experience (21-30 years of experience) rated more positively this principal than did those with medium experience in the job (11-20 years of experience). It was also found that teachers who were less prepared (bachelor degree) provided a higher
assessment of the two principals in the competency related to management
than did those with a higher degree (graduate degree).

CONCLUSIONS

Findings of the study were consistent with the work of Cuéllar (1989),
Cisneros-Coehernour & Merchant (1999) and Cisneros-Coehernour (2001)
regarding the lack of experience and preparation of the principals prior to their
appointment. It was also found that principals do not use all the expected
competencies for their job, nor are prepared in all of them. Although both
considered all the competencies as important, they were not interested in
receiving professional development in all of them.

Teachers evaluated higher the principal of school A than did the teachers of
school B. These findings were consistent with School Department Officials who
indicated that the performance of students in school A was higher than those of
school B. The principal of School A also had a strong positive reputation within
the community surrounding her school.

In spite of these findings, it is desirable for both principals to receive
professional development in all the competencies, primarily in those related to
school management, ethical, social and professional responsibility and
education for a globalized world. Future studies could examine deeper
differences in teacher and administrator perceptions and the challenges faced
by principals in their real work. This research should use multiple methods of
data collection and examine deeply the complexities of the school context and
the reasons for possible explanations of principal behavior.

EDUCATIONAL SIGNIFICANCE

The study is important because it adds to the literature on school leadership
in Mexico, primarily on effective competencies for principals of rural schools in
Latin America. This research is necessary given that most of the studies have
been conducted in other countries and cultures. The inclusion of teachers and
principals perceptions was important because it allowed examining similarities
and differences between these two stakeholders at the school level. The
research also permitted to validate findings of prior studies on school leadership
competencies from abroad (Harris, Day and Hadfield, 2003; Checkley , 2000)
as well as other studies on principal leadership conducted in Yucatan in other educational levels (Cisneros-Cohermour et al, 2003; Que, 2005). Results of the study can be used for designing and implementing professional development for school principals.

Abstract: The New York State Education Department is encouraging a special education service referred to as “integrated co-teaching.” Researchers analyzed observational and interview data from high schools throughout the state to determine how special and general educators implemented the service. With appropriate supports, co-teachers were effective in using the model.

Abstract: This study demonstrated how collaboration between a university instruction librarian and academic faculty increased student learning in the area of information literacy. By integrating library instruction into Education course assignments, undergraduate and graduate students became more confident in using online databases for research and applying these skills to future research.
6. **Abstract**

This study aims to describe how learner-initiated questions contribute to their understandings in the Japanese-language lesson. Japanese-language classes were monitored in terms of learners’ spontaneous dialogues. Observation records were analyzed with encoded written protocols that included paralanguage and non-verbal communication. As a result, three effective student-initiated questioning cases; Paralanguage and Assimilation, Re-questions and Conjectures, and Endeavors and Illustration, were extracted. Besides, we confirmed prospecting problems to develop learners’ autonomy. Finally, we proposed perspectives to train effective self-directed skills of students, and considerations of a teacher in charge to encourage students to ask questions.
Study on Effective Questions in the Japanese-Language Classroom

Abstract
This study aims to describe how student-initiated questions contribute to their understandings in the Japanese-language lesson. Japanese-language classes were monitored in terms of students’ spontaneous dialogues. Observation records were analyzed with encoded written protocols that included paralanguage and non-verbal communication. As a result, three effective student-initiated questioning cases; Paralanguage and Assimilation, Re-questions and Conjectures, and Endeavors and Illustration, were extracted. Besides, we confirmed prospecting problems to develop learners’ autonomy. Finally, we proposed perspectives to train effective self-directed skills of students, and considerations of a teacher in charge to encourage students to ask questions.

1. Introduction

Recently, number of learners of Japanese-language is about 3.7 million (Japan Foundation, 2010), and areas and public interests concerning Japanese-language are also expanded. And then, it should be paid more attention especially to communication among related people. For example, Japanese-language is used considerably in the Internet, and number of users is ranked as fourth in all world languages (Miniwatts Marketing Group, 2010). Also, Japanese-learners use Internet as a learning tool in daily life. Knowledge written in Japanese-language in Wikipedia reaches 700 thousands in article number, and ranked as sixth within 250 regional languages in the world (Wikipedia, 2010).

But, communication style of Japanese-learner become more passive, even their chances to express opinions and language skills are increased. So language environment changes, the purpose of Japanese-language classroom is changing simultaneously. The communication between students and teachers has to be reconsidered, especially an interaction from students to a teacher. There were a lot of preceding studies which investigated communication in a language classroom, this study focused on how was the discourse process and how could we describe about the student’s questioning in learning environments.

2. The Communication in the Classroom

2.1 Students’ Utterances

Students’ utterances observed in a lesson were classified into categories by Nohara (1999). Passive Utterance (PU) is compelled by a teacher, and Spontaneous Utterance (SU) is specified as asking something or response spontaneously to solve a learning issue. In addition, this SU is divided into "Aggressive Spontaneous (AS)" and "Selective Spontaneous (SS)." For instance, a question or a request addressed directly to overcome the problem that a student is confronted is called as AS, and an utterance as giving assistance to others and contribution to team work without any relation with a learning problem is called as SS (see Figure 1).

Thus, a student's utterance in a lesson is recognized as a category, and SU is evaluated positively as a factor to promote an interaction (Nohara, 1999). In addition, the question with AS leads the IRE
(initiation-reply-evaluation) structure (Mehan, 1985), and the problem is related to a student’s cognition, then categories were recognized as an important learning strategy (Ikuta & Maruno, 2005).

![Figure 1: Student’s Spontaneous Utterance in the Japanese-language Lesson](image)

2.2 Questioning and Understanding
Most researchers and educators recognize that the question as an important instrument in classroom practice, and they believe that questioning plays important role in learning (Morgan & Schreiber, 1969). Obviously, a student initiated question is the provision of chances to summarize their fragmented knowledge through communication, although these could be obtained privately. However, the empirical study reported that questions asked by the teacher far exceed the number asked by students. The ratio of teacher questions to student questions was as high as 95 to 5 in some classrooms (Floyd, 1960).

If we observed lesson record that involved the questioning pattern T-S-T-S-T-T, where T is used to signify a question asked by a teacher and S is used to signify a question posed by a student, we could suspect that a student was raising a question for the purpose of clarifying what the teacher said. It would also seem that there is little interaction among students and this pattern indicates the discourse is quite teacher directed. On the other side, S-T-S-S-S-S-S-T pattern would appear that students had become actively involved in asking questions.

Also, it could invoke further detailed patterned lesson analysis, but the study in this article, we focused substantial properties around questions in Japanese-language lessons by a native-teacher, and investigated potential factors of questioning by a learner for resolving vague understanding.

This learner initiated questioning is strongly related with self-directed learning skills as follows (Thomson, 1998).
1) Skills to create climate where learning can be maximized.
2) Skills to identify own learning needs.
3) Skills to draw realistic learning objectives from the learning needs.
4) Skills to plan learning activities that effectively uses learning resources.
5) Skills to locate relevant learning resources to achieve the objectives.
6) Skills to carry out the learning plan.
7) Skills to self-monitor the learning process and outcome using appropriate assessment measures and criteria.

These skills entail emotional factors more than rubric. And, intrapersonal communication, non-verbal communication and paralanguage are subordinated with questioning. In addition, questioning entails relational autonomy that is an awareness of both self-direction and collaboration between teacher and students, and between student and student (Ebata, 2010).

However, the research of questioning is just beginning to evolve to confirm the attributes of successful and unsuccessful students and more studies are needed. Since native teacher govern the process of a lesson, what exactly is the role of the foreign student?

2.3 Additional Factors to Influence on Dialogue
When students attend dialogue in a language classroom, they may face some problems. According to Usuki (2000), learner autonomy is based on the learner’s awareness of their responsibility for their own learning. So especially in the case of Japanese-language students in foreign country, they have to control their awareness by themselves because it’s difficult to improve their communicative competences without their initiated actions during a lesson. Wenden (1991) said, ‘autonomous learner are self confident learners who believe in their ability to learn and to self direct or manage their learning.’ Then, the action of questioning is the way to recognize what they can not understand, and it is needed that self-directed action should be arisen in the classroom lesson. However, despite of
recognized importance of student initiated question, the questioning has some accompanying problems below (Table.1).

<table>
<thead>
<tr>
<th>Problems of a Teacher’s Side</th>
<th>Problems of a Learner’s Side</th>
</tr>
</thead>
<tbody>
<tr>
<td>・ When a learner's language ability is not enough, the learner might not understand the teacher's reply. Therefore, the suitability of teacher’s utterance greatly controls the success of the understanding.</td>
<td>・ Personal problem is revealed, and it arises fear of limited knowledge to be appeared by the question in front of peers.</td>
</tr>
<tr>
<td>・ The communicational initiative of the lesson is governed by the learner, and a teacher becomes difficult to manage the lesson.</td>
<td>・ There is uneasiness to comprehend language, and it frequently occurs not to understand what a teacher says.</td>
</tr>
<tr>
<td>・ There is uneasiness to comprehend language, and it frequently occurs not to understand what a teacher says.</td>
<td>・ A self-directed question seems to be an interrupt of lesson process, and then hesitation arises to mind other students.</td>
</tr>
</tbody>
</table>

Thus, the student initiated question doesn't appear easily in the lesson. Because it looks to interrupt the lesson flow, hesitation introduces the insufficient understanding as well.

Saitoh (1989) mentioned that questions in the lesson are appeared as cues of dialogue and style of exercises in the textbooks, and arranged by the formative pattern. And, she clarified the difference of question between the learning situation and the conversational situation. She also indicated that it was difficult to master the everyday language from the ordinal lecture. That is because, in the most of textbooks students’ utterances are often set in a passive situation. So it is important to encourage student’s self-directed actions and to increase spontaneous utterances of students.

3. Investigation

3.1 Target lessons

![Figure 2: Japanese-language Class in France](image)

In this study, we investigated the following lessons to know factors of teacher-student’s communication, and inquired about effects of students’ spontaneous utterance.

<Lessons Investigated>
- Lessons : Teacher training lessons in Japan and regular lessons at the overseas university (see figure 2)
- Learners : 8-30 students, beginner level
- Teacher : Japanese native speaker
- Date : May, 2006 and March, 2010

3.2 Method of Investigation

Observed lessons are a short-term class of teacher training program in Japan and a regular subject of Japanese-language major in France. Using video records, written protocols were described for further study, and documents were included statements of non-verbal communication or paralanguage appropriately. Next, we marked dialogues which students solved their own problem spontaneously during the lesson. Then, we focused on
functions of strokes seen after student’s AS, and described effects of the communication.
For data encoding, we used triangulation method and took possible considerations to reliability for documentation.

4. Results

Most questioning action had been observed when the student made the utterance actively and spontaneously under
without any obligation. "Paralanguages and Assimilation", "Re-questions and Conjectures," and "Endeavor and
Illustration" were shown as questioning where students could try to overcome boundary of the barrier (see figure
3).

Figure 3: The Process of Student’s Understanding Using Questions

4.1 Termination of Understanding (Type I shown in figure 3)
In the classroom, students sometimes did not reach understanding (Type I-1). In this case, student asked the
meaning of the word ‘inu’, but the teacher didn’t explain and forwarded to the next step. If the student wanted to
understanding, he should ask to the teacher again; ‘Benkyou shimasita ga, wasuremashita. Mouichido
oshietekudasai. (I learned but I forgot. Please teach me one more time.)’

<Type I-1>

01S: Sensei, inu wa nandesukara? (Teacher, what is the meaning of ‘inu’?)
02T: Sensyuu kurasu de benkyou shimashitayo. (We learned the word last week.)
   Jya, tsugi ikimasu yo. (Now, let’s move on to the next.)
   - No utterance was coming out -

Students frequently hesitated because they did not know the way how to ask the question, especially novice
students. This hesitation is also explained by intrapersonal communication. It refers to communication within a
student, and includes all of the thoughts, fears and anxieties that a student may have about his/her utterance (Bylis,
Holmes, & Starkey, 2007).

<Type I-2>

01T: Hai, jyaa, Ratena san? (Ok, well, Mr.Ratena ?)
02SI: Yon ? Batsu ? (Number four ? False ?)
03T: Yon desu. Batsu desu. Doushite ? (The answer is four. The answer is false. Why?)
04SI: A...U ... B san wa ... (Ah...U...Mr.B is...)
05T: Un. (Yes.)
06S1: Iki...nai. (Does not go.)

07T: Un, Ikimasuyo... Demo, Gohan wo Tabemasu.Ikimasu. (Yes, he goes, but he has dinner, and he goes.)

(Charlene raised her hand)

Hai, Charlene san. (Yes, Ms. Charlene.)

08S2: A san to B san, Issyo ni Hanabi ni ikimasu. (Mr. A and Mr. B, go to see fireworks together.)

09T: Soudesune, Soudesune. A san ga ryouri wo tsukurimasu. ryouri wo tsukurimasune. Issyo ni tabemasyou to iimashita. Dakara B san wa, Gohan wo tabemasu, Hanabi ni ikimasu. Ne. Dakara Ikimasenne. Gohan wo tabetekara wa ikimasenne. Dakara Batsu desune. Hai, jya, gohan, Cindy san. (That’s right, that’s right. Mr. A cooks dinner. He cooks dinner, right? He said let’s eat together. So Mr. B, he eats dinner, goes to see fireworks. No, no. He goes to see fireworks and then eats dinner. Ok? So, ‘doesn’t go’. He doesn’t go after eating dinner. Then, the answer is ‘false’. Ok, then, Number five, Ms. Cindy?)

This dialogue was an example that student did not to solve his problem. In exercise correction of listening class, Ratena (S1) told collect answer to the teacher (02S1). Nevertheless the teacher asked why he selected this answer, he could not respond. And then, another student Charlene (S2) raised her hand, answered the teacher’s question (08S2). After her answer, the teacher begun to explain the exercise. Finally, Ratena (S1) lost his chance to explain, but he didn’t insist.

4.2 Reach Understanding (Type II shown in figure 3)
In this part, we expound ways how students reach understandings.

<Type II-1 (Paralanguage and Assimilation)>

01T: Watashi wa kinou, ‘Nattou’ wo tabemashita. (I ate Nattou yesterday.)

02S1: ‘Nattou’ wa nandesuka? (What is ‘Nattou’?)

03T: Eh..., ‘Nattou’ wakarimasuka? (Eh...Do you know ‘Nattou’?)

04S: (No one answered, everyone looked at S1.)

05T: ‘Nattou’ wa nihon no ryouri desu. Tabemono desu. (*Nattou is a Japanese dish. It’s food.)

(With the gesture eating ‘Nattou’)

06S1: A.... (Oh.)

07T: Koudesu, Wakarimasuka? (Like this, can you understand? ) (Continued to same gesture.)

08S1: (laughing)

09T: Hai, Kore wa ‘Hashi’ desune. ‘Hashi’. (Ok, this is ‘Hashi’. ‘Hashi’. )

(Draw a picture to eat ‘Nattou’ with gooey threads using ‘Hashi’.)

10S2: Beans, small beans in the pack.

11S1: A.... (Ohhh.)

12T: Hai, ‘Nattou’ wakarimasuka? (Ok, Now do you understand ‘Nattou’ ?)

13S1: A.... (With nodding, everyone laughing)

The meaning of "Natto" that the teacher showed was not able to be understood here, so the student asked it. The teacher confirmed prior knowledge to the class (03T) whether there is another person who did not know Natto or not. The gesture, the teacher pulled the gooey threads of Natto, was shown, and she draw it on a blackboard and explained continuously. However, another student (S2) who saw the picture and recognized first, and then begun an explanation to S1 in English (10S2). After this advice, S1 said "A…", and showed understanding with the nod.
Students’ reply with silence leaded teacher’s additional explanation with drawing, and also a cue from another student enhanced to reach understanding. During dialogue, frequent expressions of non-verbal actions and paralanguage were used to express level of understanding by students, and this communication way was essential to process smooth lesson strokes.

<Type II-2 (Re-questions and Conjectures)>

01S: Sensei, ‘Hana’ to ‘Hana’. (Teacher, ‘Hana(nose)’ and ‘Hana(flower)’)
(With pointing her nose)
‘Flower’ Onaji? Hatsuon wa onaji? (Flower. Same? Same pronunciation?)
02T: ‘Hana’ to ‘Hana’ (Nose and flower.)
(With drawing flower on the board)
03S: U....n, Wakaranaidesu. (Un…, I can not understand.)
04T: (With emphasize the accent and pronunciation)
‘Hana’ to ‘Hana’. (Nose and flower.)
05S: U...n, It’s not same, but I don’t know.
(Shake her head.)
06S: Wakarimasuka? ‘Hana’ to ‘Hana’. (Do you understand? Nose and flower.)
07S: (Consent with reluctance)
Daijyoubu desu. (It’s ok.)

When noun "Nose" was introduced, the student who knew "Flower" questioned about the difference of the accent. First, a teacher wrote on a blackboard, and confirmed the difference meaning between the nose and the flower (02T). Next, a teacher pronounced it to emphasize the difference of accent. However, the student said in English that she was not able to understand, finally she said, "It is OK."(07S).

Summarizing these, a student made repeated re-questions to clarify the correct pronunciation, and finally she did cognitive efforts by conjecturing and reached acceptance.

<Type II-3 (Endeavors and Illustrations)>

01T: Hai, Jya tsugi, Shuka san. (Ok, now next, Ms. Shuka.)
02S1: A..., Rampu ga tsukuto, Kaitai maisuu no botan, A...oshimasu. (Oh…, when the light is on, and then the number how many tickets you want to buy, eh… push.)
03T: N? (Excuse me?)
04S1: E, suimasen. (Oh, just a moment please.)
05T: Osuno wa dare? (Who does push the button?)
06S1: E...a, Dokoni arun darou, A... Osu? (Eh…oh, where is…oh, push?)
08S1: Iya, A.... watashi ‘to’, watashi ‘to’…. wo tsukatta, watashi wa ‘to’.... wo tsukattann desuyone. (No, eh… I ‘and then’, I use ‘and then’, I select to use ‘and then’ in this case.)
09T: Un. (Yes.)
10S1: Ittandesukara, e... (I say that, and…)
11T: Tsukaukotoga dekimasen. (You can not use that.)
12S1: E. (pardon?)
13T: Kokowane, ‘osu’karane. (This is not good, because it’s ‘push’.)
14S1: Chigau, chigau, watashi wa sou itta, a...a... ranpu ga tsukuto, (No, no, I said so … When the light is on, and then …)
15T: Ramp ga tsukuto… (When the light is on, and then …)
16S1: Kaitai maisuu no botan wo oshitekudasai. (Please push the button how many tickets you want
Student’s AS is sometimes interrupted in a larger-scale lesson. During activity to collection of exercises, the teacher assigned Shuka to tell her answer (01T). She presented her intended answer to a teacher, and tried both to know T/F of her proposed example and to know the way of composition (08S1). Finally, although, Shuka continued to ask the reason, teacher expanded the conclusion into the classroom (21T). This reasoning activities required strong endeavors to maintain communication with a teacher.

5. Conclusions

Through our observational study, we confirmed three types of learning activities that overcome the existing barrier. That is,

i) Paralanguage and Assimilation

ii) Re-questions and Conjectures

iii) Endeavors and Illustration

These observed cases required students’ self-directed actions to process their learning to reach the goal, and it was required some cognitive thinking skills to understand as well. These actions are closely related with the findings seen in preceding study of section 2.2.

‘Paralanguage” is derived from fundamental skill 2). On the other hand, ‘re-question” is based on the skill 1) and nature of ‘endeavors” is appeared in 5) and 7) (see section 2.2 above). The self-directed learning skills are able to develop through careful guidance and introduction of awareness to students. Dillon (1988) suggests that teachers need to modify their behaviors if they really want their students to ask questions, and they can do this by asking fewer questions.

Accompanied “thinking” activity was frequently assisted by classmates or group discussion during reasoning exercises. Thus, ‘communicational autonomy’ of each student is crucial to improve environment of Japanese-language lessons. Then, it needs to develop teaching techniques for getting students to listen to and interact with each other. It needs to change communication patterns by using remarks such as “What do you think about …?” addressed either to the group as a whole or a specific student, or “What can you add to that?” or “How do you feel about that?” or “What might be a different interpretation for that?” (Blosser, 1997).

There were many beneficial aspects in students’ self-directed questioning that could contribute understandings, but there have been few cases reported. Because, university education is structured to discourage learner autonomy, or students’ past social experiences do not reinforce their autonomy, then students are not good at being autonomous in language lesson (Thomson, 1998). But solving the problem under cooperating situation in which another student’s positive advice invented made good atmosphere to the class. It can introduce deepen understanding in the entire class and invents good atmosphere to ask questions by leaner.

As a known operational problem, Ohira (2000) proposed the relation between teachers’ question and students’ utterances, "Person stops problem solving, because a limitation of processing effort interrupt” during exchange
between Japanese native speaker and non-native speaker. Therefore, it is important to know the limitation of processing effort of a learner more than improving the teacher's reply to the student's question. As conclusion, the student's questions were extracted from the dialogue in this study, and functional sequence of questions was investigated. In spite of limited data, summarized three effective student-initiated questioning cases illustrated requiring future challenges for skill development of students. We also feel importance to explore our investigation into comparative study between classroom conversation and daily conversation to develop more authentic lesson tasks in the next stage.

Training Elementary Teachers to Teach Active Physical Education:  
A Case Study Using the SPARK Curriculum

Objective:  
Given the continuous increase of childhood obesity and the concern for rapidly growing health care costs, promotions of health behaviors among this population is especially crucial. Among Hawaii’s Department of Education (DOE), a large portion of the elementary Physical Education (PE) classes are not taught by PE specialists.

One promotional strategy used in recent behavioral interventions is to train teachers using the Sports, Play, and Active Recreation for Kids (SPARK) PE curriculum. SPARK aims to train teachers in proven methods and promote life-long physical activity among all children involved which will subsequently ensure quality PE, create social capital within the schools, and provide children with the recommended levels of activity. This project documents a case study of the teachers from an elementary school implementing SPARK.

Methods:  
All teachers from one Kaua‘i DOE elementary (K-6) school participated (K=14.3%, 1st=21.4%, 2nd=14.3%, 3rd=14.3%, 4th=14.3%, 5th=14.3%, 6th=7.1%). Program expectations include the teachers’ implementation of SPARK for >30 minutes at minimum once per week (recommended 3 times per week) and participation in the evaluation. Trainings were organized and facilitated by a certified SPARK trainer to ensure effective implementation of organized physical activities. Prior to the intervention, participating teachers self-reported their knowledge of national and state physical education standards, teachers’ knowledge of SPARK standards, teachers’ level of confidence in teaching physical education, which they reported again after the training and again during at a nine-month follow-up assessment. A one-month treatment fidelity follow-up assessment had the teachers self-report the level of student engagement in activities, how well the material helped students achieve standards, teachers’ intention of sharing information received, and teachers’ intention of using the material in the future.

Results:  
There were a total of 15 (100%) pre-training, 15 (100%) post-training, and 14 (93%), one and 13 (87%) nine month follow-up surveys received from the participating teachers.

Knowledge of Standards
Before the training, the majority of respondents (n=13, 86.7%) reported knowing the national and state PE standards *Slightly Well*, most (n=11, 73.3%) also reported knowing *None* of the SPARK PE curriculum before the training.

After the training, the majority of respondents reported they knew the national and state PE standards *Well* (n=12, 80.0%), and just over half of the respondents knew the SPARK PE curriculum *Well* (n=8, 53.3%).

The Nine Month Follow-Up Survey indicated that almost half of the respondents know the national/state PE standards *Well* or *Slightly Well* (n=6, 46.2%). The majority (n=9, 69.2%) of the respondents reported knowing the SPARK PE curriculum *Well*, nine months after the training.

**Pre-Training Knowledge Comments**

How well do you know your national/state PE standards?

- We’ve had a P.E teacher for at least five years- so while I join the class- I have not recently received standards after.
Overall, how well do you know the SPARK PE curriculum?
- Brief overview end of last school year here at Kilauea.
- Never heard of it before this week.
- Our PE teacher (when we had one) used it last year.

Post-Training Knowledge Comments
How well do you know your national/state PE standards?
- Pat (Mr. Owens-the trainer) made them easy for us to remember.
- Great instruction.

Overall, how well do you know the SPARK PE curriculum?
- Very organized, clear, and teacher friendly.
- Learned lots and lots but need to review and “find it” in the curriculum.
- I love it - I think the activities are very teacher friendly.
- Love it. Can’t wait to implement!
- Wish we had the notebooks- that would have helped.
- With binder as a guide.
- Very interesting and fun program.
- It was great to participate in the various activities which helped me to gain a better understanding of how to teach.

Confidence of Teaching PE
Participating teachers were also asked “Are you confident in teaching PE to your students?” They could indicate (1) Definitely No, (2) No, (3) Yes or (4) Definitely Yes. The majority of respondents of the Pre-Test (n=9, 60%) and Post-Test (n=12, 80%) reported Yes, they were confident in teaching PE. Of the respondents of the Nine Month Follow-Up survey 100% (n=13) indicated Yes or Definitely Yes when it comes to their confidence in teaching PE.
Pre-Training Confidence Comments
Are you confident in teaching PE to your students?
• Yes, but I’m happy to have a more concrete plan.
• I am confident to teach games and go outside and have fun, but not to teach PE standards.
• Took PE from Sue Hanson in college, have…children for movement, taught summer fun and afterschool for many years.
• I am sure I will after learning more about SPARK.
• I’m invested in finding movement “games” to incorporate classroom information… science, math, etc.
• I am a very active person. I always do morning exercises with my students to recharge their brains. I love playing games with my kids.

Post-Training Confidence Comments
Are you confident in teaching PE to your students?
• Thank you, this was very helpful in understanding how to use SPARK curriculum.
• I look forward to teaching these lessons, units, etc.
• I feel much more confident now in teaching PE to all my students. Great ideas to get started! Thanks so much!
• After the workshop I feel much more comfortable teaching my students.
• YEP!
• Look forward to using program.
• Yes! Thank you!
• Mahalo for the training.

There were statistically significant improvements in national/state PE standards and SPARK PE curriculum knowledge gained after the training. Before the training, the average knowledge level for national/state PE standards was Slightly Well and after the training, average scores were between Slightly Well and Well for knowledge in national/state PE standards. The average knowledge level for SPARK PE curriculum was between None and Slightly Well and after the training, average scores were Slightly Well to Well for the SPARK PE curriculum. The average score for confidence levels in teaching PE before the training was between Yes and No. Post training scores was between Yes and Definitely Yes.

Comparing Pre- and Post-Training and 9-Month Follow-up
One-Month Treatment Fidelity Surveys

A follow-up reflection form was completed one month after the respondents had implemented the SPARK PE curriculum in their classroom. Of the 15 participants, 14 (93%) completed this post-training reflection form.

Respondents were asked “How well do you think the material/information helped your students achieve our national/state standards?” After the SPARK curriculum implementation all respondents reported the material was either Extremely Helpful (n=11, 78.6%), Helpful (n=1, 17.1%), or Slightly Helpful (n=2, 14.3%).
One Month Follow-Up Material/Information Helped with Standards Comments

How well do you think the material/information helped your students achieve our national/state standards?

- The lessons address … standards very effectively.
- I didn’t have the book- and that would have been helpful when the material was being introduced.
- I think after the workshop and I was able to effectively teach skills to my students that will help them achieve state standards.
- Yes! It helped me plan PE sessions with little effort: materials and directions on lesson plan.
- We are working on the standards and enjoying it.
- I liked the in-service that also went with it. Liked the idea of having children do “stunts” individually but when I did it with the children I ran out of interactive and physical games.
- Use to follow directions per lesson. I also like that it tells you exactly what materials to use and how you can adapt using other materials/equipment.
- Each PE lesson is presented in a clear, organized and systematic manner which made it fun to present and the kids has fun participating (while meeting standards!).
- The kids are learning and having fun at the same time.

The One Month Follow-Up Survey also asked “Overall, how engaged were the students in the material/information that was presented to them in the classroom?” Over half of the respondents reported the students were Extremely Engaged (n=8, 57.1%), followed by Engaged (n=4, 28.6%), or Slightly Engaged (n=2, 14.3%).

One Month Follow-Up Engagement of Material/Information Comments

Overall, how engaged were the students in the material/information presented to them?

- Students are very engaged in the activities and thoroughly enjoy the activities. They don’t even realize they’re learning because it is so much fun.
- We have only done a couple of lessons.
- Kids enjoy the games.
• I made sure there was enough materials for all students to participate so all students were doing the activities at the same time.
• There’s a difference between 5th and 6th graders- 5th is very enthusiastic- some 6th graders are too jaded for some activities.
• Students are engaged, having fun, and exhausted. They love PE.
• We all broke a sweat. (Every PE!)
• Found the book did not really have enough ideas written out. Also liked the dance activities- but where is the CD?
• They are having lots of fun.
• Students not only were engaged, but they were having fun!
• The students were often bored with some of the initial activities as soon as possible once we started the aerobic games- there was more participation/engagement.
• Kids love the activities and interaction.

The One Month Follow-Up Survey then asked “Do you intend to share this information with others that did not attend the workshop?” Participants reported a range between Definitely Yes to No. After the implementation, over half reported, Yes (n=8, 57.1%), followed by Definitely Yes (n=4, 28.6%), and No (n=2, 14.3%) to sharing this information with others.

![Bar chart showing responses to sharing information](chart.png)

Respondents were asked “Would you use the material/information from the workshop again?” All participants reported Yes (n=14, 100.0%).
Would you use the material/information from the workshop again?

Respondents were asked “If you would teach this material again, what additional changes, if any, would you make the next time?”

- Now I can, I have the notebook. My problem was waiting for the notebook- if it had been given to us at the class that would have been REALLY helpful.
- At this point I need to just be more familiar with the entire program. See the big picture.
- I wouldn’t change anything.
- I’d request additional training for some of the activities (or videos); and a glossary for some of the terms (i.e. “jump tuck”).
- Yes! I wouldn’t change anything.
- The only thing is the length of time. I might consider shortening the time or trying some of the warm-ups indoors because of the heat from the sun, students tire out easily.
- None, it’s great.
- I feel the workshop was very good but I was disappointed in the book. There does not seem to be enough activities. Write out more “specific” teacher talk ideas.
- Some activity/game directions need to be written more clearly.
- I wouldn’t make any changes. Easy to follow lessons!
- Some of the lessons I had to read through several times and discuss with teachers in order to understand it clearly.
- More activities in a 45 minute period. Starting with more aerobic activities after warm up.
- Organize it better in my plan books.

Lastly, the survey asked “Thinking about your own professional development, what might be your next steps? Responses were grouped into two themes: Continued Learning and Improvements, and Curriculum and Delivery.

**Continued Learning and Improvements**

- Get more input from other teachers on other lessons and what worked and what didn’t.
- I plan on talking with others to see what works best. How can I integrate other areas into PE?
- Check out more games for the children.
• Investigate further – tasks children can do individually to meet teacher standards (ex. Locomotor activities).
• To read further in the book, and to keep practicing the games and starters.
• I would be interested in attending another workshop if available.
• It would be helpful to have another day of workshops to see more variety of activities in action.
• Getting more in shape to keep up with the students.
• Keep teaching/learning!

Curriculum and Delivery
• To plan a years curriculum.
• To continue to implement the SPARK curriculum. I just received my binder so I am excited to try new activities.
• Improve on how I deliver the lessons. It’s still trial and error on some things like length of time teaching lesson, evaluating the kids.
• I need time to look over the notebook and plan- that is what I will do during the break.

Additional Information from Nine Month End of Project Follow-Up
A follow-up survey was completed nine months after the respondents had completed the SPARK PE training. Of the 15 participants, 13 (87%) completed this post-training reflection form.

The Nine Month Follow-Up Survey asked “The SPARK training helped you implement PE during the school year?” Over half (n=7, 58.3%) of the respondents reported that Yes the training helped them implement PE and the remaining respondents Definitely Yes to the same question (n=5, 41.6%). The majority of the respondents (n=7, 58.3%) responded with Definitely Yes when asked “The SPARK binder helped you implement PE during the school year?”

![Bar graph showing responses to the question: The SPARK training helped you implement PE during the school year?](chart.png)

Nine-Month Follow-Up Comments

- I enjoyed the curriculum and so did my students. They were active and having fun.
- I enjoyed the beginning workshop put on by the UH instructors.
- The training was the key to being successful with using the program. Without it the binder would have been much more intimidating to use.
- I like the program and ideas. Students love it.
- This is the first year I have taught 4th grade. I am learning more about the standards and curriculum as I progress through this year and into the next. Being as P.E. is 1x a week I am doing my best to familiarize myself with standards and curriculum more and more. *This year I was very fortunate to have a parent volunteer teaching P.E. to my class with me.
- I started out strong and now do very short warm-ups, then go straight to playing a game.
- We have to share binders for 3 1st grade teachers. More would have been nice.
- SPARK is an excellent program that sure makes teaching P.E. easier!
- I wanted to listen to the dances and teach the children the dances. I listened/put the cd into the computer and it had the words to the dances but it didn’t have the music. I was informed that the cd was $50 and I think that is a little steep. Also I was disappointed with text cd because there was not anything extra that was not in the book.
- Furlough days have been on Friday, our P.E. time was also Friday – while we did P.E. from time to time other days, we mainly did line dancing on Wednesday afternoon for a half hour.

Conclusion:

Overall, the SPARK Elementary Teacher Training was well received. The Pre, Post, and Follow-Up survey results indicated that participants significantly improved their knowledge on national and state PE standards, as well as SPARK PE curriculum. Additionally, most participants indicated the materials and information presented at the training were Extremely Helpful in getting the students Extremely Engaged in the classroom after the SPARK PE curriculum was implemented. Every participant reported that they would use the information and material presented to them again.
Continued learning and improvement, and curriculum & delivery were suggested as possible next steps for future professional development.

**Recommendations for Future Implementation**

1.) Insure binders/curricula are with the teachers prior to or at the SPARK training.
2.) When organizing the initial training, schedule a booster for midway through the school year to refresh.

Abstract

The acquisition and use of mobile computing devices by school districts is projected to increase by 50 percent over the next five years (America’s Digital Schools, 2006). Mobile computing devices (e.g., handheld computers and iPods) offer some of the same applications (e.g., word processing) and functionality (e.g., Internet access) as laptops with enhanced portability at half the cost (Education Week, 2010). Additionally, they afford students the opportunity to access learning resources anytime/anywhere and can facilitate communication and collaboration.

Research indicates mobile devices can help students meet content standards in English Language Arts (ELA) and improve student engagement and productivity (e.g., Vahey & Crawford, 2003; van t’ Hooft et al., 2004). Furthermore, they can meet the National Educational Technology Standards (NETS) requiring the use of digital tools and resources to develop students’ critical thinking and problem-solving skills (ISTE, 2010). Yet access to mobile devices alone is not sufficient for teachers to effectively integrate them into their instruction (Lawless & Pellegrino, 2007; Warschauer, 2006; Wenglisky, 2005). Teachers need support, including models of effective integration into instruction aligned with standards-based curriculum in order to effectively use of these devices to support academic achievement (Educational Support Systems, 2008; Lawless & Pellegrino, 2007). Further research is needed to provide teachers with these models and support.

In 2005, the Palm Academic Leaders (PALs) project was launched by the Los Angeles County Office of Education in fifteen schools across the County. The program provided a set of 30 handhelds site for teachers to integrate into their ELA instruction.
These in-depth case studies examined the integration of handhelds in 4-5th grade ELA instruction among four teachers deemed “highly effective” at integrating handhelds into their weekly instruction for a three year period (based on program and administrator observations). The objectives of the case studies were to identify (1) effective practices for integrating the handhelds to support achievement of ISTE’s National Educational Technology Standards (NETS), and the California English Language Arts (ELA) content standards, and (2) factors that support the ongoing integration of the devices. Teacher interviews, classroom observations, and teacher/student artifacts were used to meet these objectives. The teachers described a variety of ELA reading, writing and vocabulary development activities aligned with these standards along with support features essential to their ongoing integration of the devices. Results can assist educators in supporting the successful integration of mobile devices.

**Introduction**

Increasing access to computers and integrating them into the curriculum to meet State Academic Content Standards and National Educational Technology Standards (NETS) remains a challenge for educators (Educational Support Systems, 2008). Furthermore, limited resources hinder district efforts to purchase new computers, upgrade aging equipment, and provide the necessary professional development for teachers. The acquisition and use of mobile computing devices by school districts is projected to increase by 50 percent over the next five years (America’s Digital Schools, 2006) because mobile computing devices (e.g., handheld computers and iPods) offer some of the same applications (e.g., word processing) and functionality (e.g., Internet access) as laptops with enhanced portability at half the cost (Education Week, 2010). Additionally,
mobile computing devices afford students the opportunity to access learning resources anytime/anywhere and can facilitate communication and collaboration.

**Problem Statement**

Research by Lawless and Pellegrino (2007) and Warschauer (2006) and Wenglisky (2005) conveys that providing schools and teachers with access to technology alone will not improve the integration of technology into classroom instruction. Instead, extensive professional development including strategies and models of technology integration, along with planning time and ongoing technical support are essential (Bauer & Kenton, 2005; Becker, 2000; Lawless & Pellegrino, 2007). In order to effectively integrate technology, teachers need models of how to implement seamless lessons aligned with standards-based curriculum. The use of technology to support curricular standards is endorsed by the National Educational Technology Standards (NETS) and Performance Indicators for Teachers developed by the International Society for Technology in Education (ISTE, 2007). Yet various reports including the 2008 California Technology Assistance Project (CTAP) annual statewide Evaluation and the EdTech Profile teacher self-assessment confirm teachers are seeking assistance on how to effectively integrate technology to meet these standards. Professional development is essential because, "the true digital divide is not the quantity, but the quality of computer use that makes a difference to student achievement" (Wenglisky, 2005,p. 48).

**Background to the Problem**

Professional development to help teachers meet English Language Arts Standards is priority for many states. A review recent National Assessment of Educational Progress (NAEP) statistics shows that Black and Hispanic students are still not achieving in
English Language Arts skills such as reading at the same rate as their White counterparts. On average, minority students at the 4th grade are scoring 27-30 points lower on standardized tests and only 23% are at the proficient or above level as reported by NAEP (National Center for Education Statistics, 2007). These statistics are similar in California where recent California Standards Test (CST) test scores indicate that the percentage of students at the 4th and 5th grade achieving proficient or advanced levels in English Language Arts has steadily increased over the last four years. However, a more detailed analysis indicates that 4th and 5th grade minority students (Black and Hispanic) are not increasing at the same rate as their White or Asian counterparts. In 2007 the State Superintendent for Instruction, Jack O'Connell, indicated a commitment to develop partnerships and identify resources that will help close the achievement gap for all students. The goal is to have all students achieve at the proficient or advanced level in English Language Arts skills as identified in the content standards (California Department of Education, 2007c).

**Literature Review**

A review of research suggests that the use of computers can increase students' level of engagement and that increased engagement can lead to higher achievement (Norris & Soloway, 2004; van 't Hooft & Vahey, 2007; Warschauer, 2006). Recent studies on the use of handheld computers to support English Language Arts instruction show that handhelds can improve student engagement in English Language activities such as note-taking, vocabulary development, and collaborative writing (Vahey & Crawford, 2003; Yarnall, Carriere, Stanford, Manning, & Melton, 2007). Studies also show that the use of handhelds can facilitate more student-centered instruction along with
increased student achievement. A study of one elementary school district that implemented the use of handhelds for reading and writing activities found that teachers became more student-centered in their instruction and attributed an improvement in student reading scores to their use of handhelds (Tomasino, Doubek, & Ormiston, 2007).

The potential of handheld computer use to address the needs of students in English Language Arts and improve student engagement and productivity is evident (Vahey & Crawford, 2003; van t' Hooft et al., 2004). However, there is a need to further investigate the conditions in which this can occur and the effective instructional strategies that support their integration into the curriculum.

**The School PalmOne™ Academic Leaders Program**

In an effort to promote the effective use of technology in teaching, the Instructional Technology Outreach (ITO) division of the Los Angeles County Office of Education (LACOE) in partnership with K12 Handhelds, a private business, initiated the School PalmOne™ Academic Leaders (PALs) program in March 2004. As the regional lead agency for the California Technology Assistance Project (CTAP) in Los Angeles County, LACOE's goal in 2004 for the program was to increase the use of handheld computers in Los Angeles County public schools to improve teaching and learning. This is consistent with CTAP's goals to (a) increase technology integration through professional development, (b) assist technologically underserved communities, and (c) introduce emerging and cost-effective technologies (Los Angeles County Office of Education, 2004). Based on its experience training administrators and site-based coach/mentor teachers, LACOE recognized that handheld computers are cost-effective...
and mobile and can provide one-to-one access for students. In 2004, 15 schools were selected through an application process to receive a school set of 30 handheld computers and related training for use at grades 4, 5, or 6 in the 2004-05 school year as part of the School PALs program. These grade levels were deemed appropriate by project coordinators because most classrooms at this level are self-contained and cover all content areas, thus providing the opportunity to explore the use of handhelds in a variety of subjects.

School proposals submitted to LACOE in 2004 for participation in the School PALs program provided insight into the motivation, expectations, and objectives of the handheld computer program at each school site. Teachers described their instructional objectives and how handhelds could benefit their instructional program. Two teachers from each school were selected by the principal or volunteered to participate and implement the use of handhelds in their instruction.

During the first three months of the 2004-05 school year, the site administrator and two teachers from each school (totaling 30 teachers) were provided three days of training in the use of handheld computers by LACOE and K-12 Handhelds trainers. LACOE and K-12 Handhelds also did a presentation at each school for school parent or community groups to launch the program. Almost every school held this presentation at an evening meeting with parents of participating students. Some sites conducted the meetings in both English and Spanish. Other schools also distributed the handhelds to each student at the end of the meeting.

During the 2005-06 school year, two days of training were added to the project to further enhance and support the continued use of handhelds by the 28 teachers
participating in the project. (After the first year, one school opted to discontinue due to site administrative and staffing changes.) Based on the positive feedback of teachers and students using handhelds, some schools expanded the project to other classrooms and grade levels in 2005-06.

In July 2007, Tech Ed Services, a private company based in Downey, California, completed a summary evaluation report on the School PALs program. Based on LACOE project coordinators' observations, teacher and student questionnaires, and videotape testimonials of teachers, 70% of the teachers demonstrated some success in integrating handhelds into their instructional program. Through informal interviews and questionnaire responses, teachers reported that students and parents were enthusiastic about the use of handhelds, noting an increased interest in school and classroom activities. Teachers' observations and reviews of student work revealed that student productivity and engagement increased with more students completing assigned work and staying on task (Tech Ed Services, 2007).

The summary report, along with project coordinators' informal observations of classroom lessons using handhelds, showed the potential of handhelds to support the instructional program. The report indicated that 96% of the 28 teachers who participated in School PALs felt that handheld use improved student engagement and productivity while promoting collaborative work among the students. A majority of the teachers indicated handheld use is effective in English Language Arts instruction for activities such as vocabulary development and writing skills. However, not all School PALs classrooms were successful integrating this tool into the curriculum. About 30% of the project teachers reported some difficulty in integrating handhelds into their classroom
instruction (Tech Ed Services, 2007). Based on informal observations, School PALs project coordinators also indicated some teachers focused on the basic operation of the handheld and did not necessarily integrate technology into the curriculum to support content standards. Through questionnaires other teachers in the School PALs program indicated a need for more strategies on how to effectively integrate handhelds into the curriculum (Tech Ed Services, 2007).

The School PALs project ended in 2007 and schools were encouraged to continue the project on their own initiative with local school and district support. A review of Schools PALs schools and teachers by project coordinators found a majority of schools did not continue the program due to (a) lack of ongoing technical support and professional development, (b) changes in their teaching assignments, (c) change in leadership (principal), and (d) a focus on other newer technology tools. However, some schools expanded the program and continued to use handhelds on a regular basis.

In 2007, project coordinators reported there were three schools and four teachers that participated in the School PALs program that were integrating handhelds in their elementary instruction on a regular basis (2-4 times a week) and their use of handhelds focus primarily on English Language Arts activities. These data were consistent with prior School PALs’ questionnaires, which indicated that teachers indicated their use of handhelds mainly focused on English Language Arts activities such as writing, vocabulary development, and spelling (Tech Ed Services, 2007). The success these schools and teachers provided the motivation for this study.

**Purpose of the Case Studies**
The purpose of these in-depth case studies was to examine the integration of handhelds in 4-5th grade ELA instruction among the four teachers deemed “highly effective” at integrating handhelds into their weekly instruction across. The objectives of the case studies were to identify (1) effective practices for integrating the handhelds to support achievement of ISTE’s National Educational Technology Standards (NETS), and the California English Language Arts (ELA) content standards, and (2) factors that support the ongoing integration of the devices, to inform professional development and support for the effective integration of technology into curriculum and instruction.

Methods

Four teachers who were teaching 4th or 5th grade and had been using handheld computers for at least three years (2006-2009) were purposefully selected for in-depth case studies from the School PALs project schools. The teachers represent a sample of 28 PALS teachers who described ways they integrated handhelds in their instruction and indicated (i.e., through School PALs questionnaire and informal interview data) that they feel comfortable developing standards-based, technology-infused lessons (Tech Ed Services, 2007). Each of the teachers had a classroom set of handheld computers and provided one-to-one access for each of the students. The four teachers were selected because they:

• were recommended by their school principal based on observations of their effective teaching and use of technology in the classroom.

• were recommended by School PALs project coordinators who informally observed classroom uses of handhelds and implementation of the program.
• indicated through questionnaires they use handhelds to support English Language Art activities such as writing and vocabulary development.
• shared resources and samples of activities that support the use of handhelds through web links and demonstrations of activities to other teachers.

(Tech Ed Services, 2007).

These studies utilized interviews, classroom observations, and review of teacher artifacts to gather data on the use of handhelds over a six-month period from April through October 2009. Table 1 summarizes the use of these data collection tools in relation to the research questions.

Table 1

<table>
<thead>
<tr>
<th>Research Questions</th>
<th>Teacher Interviews</th>
<th>Classroom Observations</th>
<th>Teacher Artifacts</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Research Question 1:</strong> How do experienced upper grade (4-5) School PAL teachers who are identified as “effective” with handheld use, integrate handhelds into English Language Arts instruction?</td>
<td>Semi-structured interviews provided insight into how the handhelds were being used by the teachers.</td>
<td>Observations identified how handhelds were being used including the types of applications (i.e., word processing) and how teachers were managing their use.</td>
<td>Data from teacher lesson plans provided information on how handhelds were used in the English Language Arts curriculum and the specific activities that addressed ELA content and NETS standards</td>
</tr>
<tr>
<td><strong>Research Question 2:</strong> What attitudes, beliefs, and backgrounds are associated with the effective use of handhelds?</td>
<td>Interviews provided insight to teacher attitudes and beliefs on handheld use.</td>
<td>Observations identified attitudes or beliefs articulated by teachers related to the continued use of handhelds.</td>
<td>Data from teacher materials provided information beliefs associated with continued use of handhelds.</td>
</tr>
</tbody>
</table>

Two semi-structured formal interviews lasting 30-45 minutes took place with each participant between April and June 2009. Then, informal follow-up interviews took place with all four teachers to confront and validate data gathered from prior interviews. All
interviews were recorded and transcribed with participant permission. Classroom observations were completed using a modified version of the ICOT tool developed by ISTE. Each observation was scheduled in advanced and included a pre-conference, 30 minute observation, and post-conference. During the pre-conference, participants were asked to identify the content standards the lesson will address. The classroom observations then focused on the teaching strategies and student activities that supported the achievement of the NETS and ELA content standards while integrating the use of handhelds. Finally, teacher artifacts provided evidence of practices described in interviews and observed in classrooms. Throughout the studies the teachers collected and submitted materials relevant to the effective use of handhelds in their ELA instruction including past or present teacher lesson plans, assignments, samples of student work, applications, and other electronic or printed documents.

As suggested by Miles and Huberman (1994) data collection and analysis were interwoven throughout the case studies. The process included gathering, coding and confronting data using HyperResearch. Codes were aggregated into themes related to the handheld applications, ELA activities, alignment with NETS and ELA standards and factors associated with ongoing use. Only practices that met the English Language Arts content standards for instruction and the NETS standards for teachers were identified as effective. A clear picture of each teacher was provided through detailed descriptions of the setting and events (Creswell, 2003; Yin, 1994)

**Summary of Findings**

The following provides a summary of findings from teacher interviews, classroom
observations, and a description of teacher artifacts. For the complete findings please see Chavez (2010).

Schools and Teachers

The four case studies were conducted in three different southern California school districts. The studies included four teachers, two from grade 4 and two from grade 5. Table 2 provides a summary of the schools and teachers. Pseudonyms were used for the teachers and schools to ensure privacy and confidentiality of the participants.

Each of the teachers participated in the School PALs program, attended six professional development day/workshops (including two one-on-one sessions held at their site) and used handhelds for at least four years in their English Language Arts instruction. In addition, each teacher had a classroom set of handheld computers (one for each student) and associated peripherals including keyboards. Table 3 summarizes the findings for each of the teachers.

Page 1873
Writing Activities

The use of handheld computers in grades 4-5 by the four teachers studied indicates a focus on English Language Arts activities with an emphasis on writing activities. Each teacher described some type of writing activity (i.e., essay assignments) in his or her interviews and how students were motivated to increase their productivity (i.e., more sentences) through the use of handhelds. Mrs. Jones described her use of handhelds in having students create poems while using the beaming feature of the handhelds to provide immediate feedback to students. Mrs. Smith and Mr. Cruz described using handhelds to have students write sentences and create paragraphs. Mrs. Clark described having students write journal entries and create sentences using vocabulary words. In each of these instances, the four teachers emphasized that students were more motivated to write and increased their productivity due the ability to compose with handhelds using a keyboard, revise easily electronically, and see their output (i.e., printouts).

The teachers attributed some of these positive results to the use of handhelds versus the use of traditional paper and pencil for writing activities. In the past using pencil and paper was more time consuming (i.e., loss of papers) and challenging for students with poor cursive writing skills. Each teacher mentioned student writing was difficult to read, students were not attentive to detail (i.e., spelling), and some students lost interest (i.e., no revision) using paper and pencil.

Alignment with English Language Arts Standards

As the four teachers described their use of handhelds in the classroom and classroom observations were conducted, it became evident that their instruction and use of handhelds was aligned to the English Language Arts content standards. For example, Mrs. Clark described the specific content standard (Writing Content Standard 1.3 – Using Adverbs) being addressed in her
lesson as she had her students create sentences using adverbs. Students created sentences using their handhelds and included adverbs as part of their anthology reading (i.e., “Wildfire Story”) assignment. In another example Mrs. Smith cited the requirement to create a “500 word essay” as part of the 5th grade writing standards. Most of the students completed their essays with more than 500 words. Mr. Cruz in his use of the Open Court reading curriculum cited the alignment of the adopted curriculum with California standards as he adapted suggested curriculum activities using handhelds. Mrs. Jones cited the content standard related to using poetry and icons in literature as she conducted her lesson with students.

Many of the activities described by the teachers are aligned under the areas of Reading and Writing in the English Language Arts Content Standards. For example, the overarching goal of the 5th Grade Writing Content Standard 1.0 states: Students write clear, coherent, and focused essays. The writing exhibits the students’ awareness of the audience and purpose. Essays contain formal introductions, supporting evidence, and conclusions. Students’ progress through the stages of the writing process as needed. (English Language Arts Content Standards for California Public Schools, 2010). Mrs. Smith, in her Personal Narrative Writing assignment and rubric for students, demonstrated the alignment with Writing Standard 1.0 by asking students to “have a main point that is clear and well developed” along with “precise and vivid sensory details” that support the main idea. A further review of the California English Language Arts Content Standards for writing in grades 4 and 5 reveals that many of the writing activities teachers described or demonstrated are in alignment with standards.

Alignment with National Educational Technology Standards

Many of the teacher practices and student activities observed in this study are also in alignment with the National Educational Technology Standards (NETS) for teachers. In 2008 the
NETS standards were updated to reflect more process and learning experiences in the use of technology in instruction rather than a specific technology application/proficiency (i.e., word processing). The focus of the standards is on the teacher’s ability to facilitate effective learning experiences using digital tools while exhibiting the knowledge, skills, and abilities to participate in a global/digital society. For example, NETS Standard 1: Facilitate and Inspire Student Learning and Creativity states, “Teachers use their knowledge of subject matter, teaching and learning, and technology to facilitate experiences that advance student learning, creativity, and innovation in both face-to-face and virtual environments.” One of the performance indicators under NETS standard 1.b indicates teachers should “engage students in exploring real-world issues and solving authentic problems using digital tools and resources.” Mrs. Jones demonstrated alignment with this standard in her “Weather Project” by asking students to do a research report and slideshow presentation using handhelds computer applications (i.e., slideshow) on the weather in different states and its impact on the lifestyle/economy of the respective state. Many of the other handheld activities utilized by the teachers in this study were also alignment with the most recent NETS Standards (2008).

Factors that Promote Ongoing Integration

Table 4 provides a set of recommendations for teachers and administrators seeking to integrate mobile computing devices into instructional programs. These recommendations emerged from the factors the teachers identified that as influencing their ongoing use and integration of handhelds into their instructional program.

<tbody>
<tr>
<td>Professional Development - Provide teachers professional development in the use of the device on an ongoing basis (yearly) including at the school site on a one-on-one (teacher-trainer) basis. Introduce new technologies to teachers who have a positive attitude towards technology use and believe its use can have a positive impact on student learning.</td>
<td>Personal/Instructional productivity – Seek to utilize the device for personal productivity (i.e. calendars) and ways to meet content and technology standards. Spend time beyond the regular school day to gather more information on how to use the tool to meet student outcomes.</td>
</tr>
<tr>
<td>Technical Support – Provide teachers technical (i.e. trouble-shooting) support via phone or online during the school day to address technical problems.</td>
<td>Student Assistance – Seek to utilize students for technical support and as “assistants” to help other students use the device. Develop management strategies/policies that allow students to take responsibility for maintaining devices.</td>
</tr>
<tr>
<td>Access and Use – Provide teachers the use of the device for their own personal productivity on a 24/7 basis. Also provide students 24/7 access on a one-to-one basis.</td>
<td>Student Exploration – Allow students to explore and “play” with the device to become comfortable using the tool. Also allow students to use the device 24/7 to complete assignments and get assistance at home from parents or others.</td>
</tr>
<tr>
<td>Collaboration – Create a forum (Community of Practice) for teachers to collaborate online and/or face-to-face to share ideas, lessons, and frustrations in the use of the device. Consider pairing teachers at the school site who are simultaneously integrating the tool into their instruction for ongoing support.</td>
<td>Teacher and Student Collaboration – Work with other teachers to share ideas, lessons, and strategies for integrating the device into instruction. Look to develop lessons that are student-centered and align with content standards. Allow students to work collaboratively on assignments and encourage peer review.</td>
</tr>
</tbody>
</table>

Key factors to the use and integration of handhelds into the curriculum include professional development and technical support along with the opportunity to network with fellow teachers for discussion on issues/ideas related to integration into the curriculum. These findings are consistent with Silvernail and Lane’s (2004) study of laptop computer use in one-to-one learning environments where students were allowed to use laptops 24/7.

Studies on the use of laptop computers in one-to-one learning environments suggest that 24/7 access helps students spend more time outside of regular class on
instructional activities such as writing (Jeroski, 2003; Rockman, 2000). These case studies suggest that students benefited from having their own handheld for 24/7 access. Teachers described students being more engaged in writing activities and seeking more help with assignments outside of class (i.e., parent help). The students valued the opportunity to create and share assignments electronically. As educational agencies seek to provide access for students and teachers, agencies should consider the benefits of providing access on a one-to-one, 24/7 basis. The cost of handheld computers provides a viable solution for schools seeking to provide access for every student.

Conclusions

Previous research conducted on the use of handheld computers in K-12 education has focused on how handheld computer use affects student motivation, engagement, and productivity. These four case studies contribute to the literature by describing effective teacher practices in the integration of handh olds into the English Language Arts instruction in grades 4 and 5 and the factors that contributed to teachers’ ongoing integration of the devices.

In 2003, handheld computers were touted as the solution for schools interested in providing computer access at an affordable cost for every student (Norris & Soloway, 2004). Studies on the use of handhelds suggest they could provide the same applications as more expensive desktop or laptop computers and have the same impact on student engagement and productivity (Norris & Soloway, 2004; van ‘t Hooft et al., 2004). In spite of the initial success in the use of handheld computers as described in the Palm Education Pioneer (PEP) program (Vahey & Crawford, 2003), the K-12 educational community did not embrace the use of handhelds on a large scale as compared to laptop computers. Some in the educational community speculate this was due to the small screen size of the
handheld and the inability to utilize high-level multimedia applications afforded to laptop computers. Some studies show teachers had difficulty integrating handhelds on a regular basis (Velastequi, 2005; Warschauer, 2006). For example, Velastequi’s (2005) study of handheld use across one school district in grades 6-8 found teachers did not embrace the continued use of handhelds after one year due to technical and management problems associated with a class set of 30 handhelds. Contrary to Velastequi’s (2005) findings, these case studies suggest the type of applications (i.e., word processing) utilized by students and teachers is not necessarily dependent on one particular type of handheld device, and can be effective in English Language Arts instruction.

These case studies indicate handheld computer use can help students in reading, writing, and vocabulary development activities by increasing student engagement, motivation, and productivity. Additionally, the teachers indicate key factors to the use and integration of handhelds into the curriculum include professional development and technical support along with the opportunity to network with fellow teachers for discussion on issues/ideas related to integration into the curriculum. The findings are similar to studies on laptop computer use in one-to-one learning environments (e.g., Silvernail & Lane, 2004) that convey the importance of technical support and professional development with an emphasis on student writing activities.

It is important to emphasize handheld computers utilized by the teachers in these case studies (i.e., Palms) were never fully embraced by society nor were they embraced by the educational community. As a result, they are no longer manufactured and have been replaced by newer smaller mobile technologies such as the Smartphone and iPod Touch. The evolution of handheld computer devices has seen the incorporation of more sophisticated
applications/functions including access to the Internet, into much smaller and more powerful devices. Despite this evolution, the teachers in these case studies demonstrated success in the use of Palm handhelds and offer insight into effective practices likely to transfer to new emerging mobile computing devices (i.e., iPods).

Schools interested implement newer computing devices such as Netbooks and Thin Clients in alignment with content standards, especially English Language Arts standards, could benefit from the insights provided by these case studies. English Language Arts practices to consider include the use of word processing applications for student writing assignments such as journal entries, poetry creation, and essay assignments. The use of applications such as slideshow for projects or presentations can allow students to demonstrate communication skills. The practice of using handheld computers to send or share files with students and teachers also provides for increased collaboration and opportunities for review to improve the quality of student work. Schools should consider the deployment of mobile devices on a one-to-one basis to help facilitate the effective use.

The teachers also described the technical support and professional development provided by LACOE and K-12 Handhelds as essential to their integration of handhelds into their instruction. Other studies (Becker, 1998; Becker & Reil, 2000) confirm the importance of providing this support for the integration of technology into the curriculum. The teachers described in detail the value of having professional development provided on a one-to-one basis and onsite as part of the School PALs program. Additionally, the teachers described the value of having a partner teacher integrating the use of handhelds at the same time. This enabled the teachers to share ideas for using the handhelds and solutions for technical problems. Having a larger “network” of teachers using handhelds also enabled teachers to share practices online and
create a type of “community of practice.” Wenger (1998) describes a community of practice as having the potential to have a positive impact on teacher practice. The value of providing professional development and a forum for collaboration among teachers should not be understated when considering the introduction of new technology tools for classroom instruction. Schools should consider creating a type of community of practice for the introduction and integration of new handheld technologies.

Lastly, these findings suggest teacher attitudes and beliefs affect their ability to integrate handhelds into their classroom instruction. Consistent with Windschitl and Sahl (2002), all four teachers displayed a positive attitude towards the use of handheld technology in the classroom and a firm belief that students must be exposed to technology tools to better prepare them for the 21st century workplace. The teachers confirmed that their attitude and beliefs helped them spend additional time outside their regular workday to learn how to use the handhelds and not become discouraged. As new technologies are introduced to teachers (i.e., Whiteboards), it is important to select teachers for initial use who have a positive attitude towards the potential of technology to support classroom instruction.

**Strengths and Limitations**

The strength of these case studies was the ready accessibility to the teachers for interviews and their openness to allow the researcher into their classrooms for observations to gather data. The researcher was able to observe teacher practices as a non-participant and follow up with teachers to discuss data gathered. This access allowed for in-depth analysis into teacher practices and the factors that contribute to the effective integration of handheld computers.

One of the limitations of the case studies was that there were only a few remaining teachers still using handheld computers. Many of the teachers in the original School PALs
program were not available. The small number did not allow for a larger or random sample of teachers using handhelds. The opportunity to include a larger sample of teachers together with teachers who stopped using handhelds would have provided for a comparison of why some teachers stopped using handhelds. The lack of a large number of teachers using handhelds also limited the amount data gathered and analyzed.

Another limitation of this study was that the teachers using handhelds agreed to participate in the study because they were very grateful for the resources provided and interested in participating in future projects like the School PALs program. It was also noted the teachers were demonstrating model lessons when being observed that may have not been indicative of everyday practice. Social desirability limited the study as many of teachers most likely wanted to please the researcher and demonstrate success.

A final limitation of the case studies was the timing and the ability to gather more data through classroom observations. Teachers were readily available for interviews; however, scheduling classroom observations was challenging due to student testing and school events taking place in the spring. This limited the opportunity to gather data through classroom observations. Data analysis was more dependent upon data gathered from interviews.

**Directions for Future Research**

Thomas Greaves, president of the Greaves Group, an educational consulting firm, indicated the need for large-scale empirical data on the use of mobile computing devices to determine the impact on student learning. He noted, “data and related research will better help districts develop the policies and practices needed to effectively implement this technology” (Education Week, 2010, p. 10).
The following are directions for future research that would help other educational agencies seeking to implement the use of mobile computing devices: A similar study of teacher practices using other types of handheld computing devices such as Smart phones or iPods.

- A large-scale longitudinal study of the impact of mobile computing devices on student learning in different content areas and at different grade levels.
- A study of professional development practices that contribute to the effective integration of mobile computing devices in classroom instruction.
- A study of teacher attitudes, beliefs, identities, and backgrounds associated with the effective integration of mobile computing devices in classroom instruction.
- A study of the policies needed to effectively utilize mobile computing devices while ensuring the safety of students and network security.
- A study to identify the critical steps in preparing students to use the technology.

As further research studies are considered for the use of mobile computing devices it is recommended these studies include how the use of these devices promotes 21st century learning skills such as communication, collaboration, and critical thinking. Critical thinking skills are referenced in current content standards and are the focus of many content standards. How teachers address these skills and measure or assess them effectively is a critical need for the educational community. A research study on the specific aspects of the technology that promote 21st century learning skills is needed. Related factors of teacher/student access, frequency of use, applications, and teaching strategies would need to be examined to identify the impact on student outcomes. As educators promote the use of technology to improve teaching and learning, they would be well served by a large-scale longitudinal study on how mobile computing devices can prepare students for the 21st century workforce.

Abstract

Young children perceive themselves and the surroundings through movement. What is learned in the early stages of child development and knowledge acquiring in the later stages is based on the development of movement. By experiencing movements, young children not only improve their movement ability but also learn to know, express themselves and build positive self-concept during exploration. Movement curriculum is commonly administered in three ways in kindergarten: music games, physical fitness curriculum and singing with movements. If only one of the three activities is administered, or that the activity is heavily relied on memory or imitation, reaching the goal of comprehensive learning and self-expression would be difficult. Creative dance, which is characterized by openness and exploration with stimulating effect on creativity, could break the emphasis on memorizing and imitation, leading to the goals described above. Therefore, bringing the concept of creative dance into movement curriculum could lead to comprehensive learning in young children.

Picture books have long been a favourite in young children. It has been considered a very useful material for developing children’s’ literacy. In the early stages where children start learning writing and developing interests in reading, picture books provides them a way to “read”. Furthermore, picture books can have multiple educational values. These include expanding everyday encounters, enrich learning experience, improving cognitive skills, increasing language expressing skills, developing personality and providing aesthetic experiences. For this reason, it is widely applied in child education. The phoneme, music of language, structure of story and picture in a picture book has beneficial effects on young children’s language, cognitive and art experiences. Picture book can have abundant knowledge, which is essential in early childhood education.

In recent years, integrated curriculum has become the main stream in general
education. Educators who supported this notion believe that this is a way for learners to achieve comprehensive, integrated learning. The present study also adopts this notion by integrating picture books with dance. Specifically, the study uses the case study method, focusing on a kindergarten which adopts “picture book thematic teaching model” in Taiwan. The objective is to understand the picture book thematic teaching model and to develop a guide/principle for the integration of movement and the model. The time spent for observation is one theme of picture book thematic teaching. During this period, the author observes one class, participate all activities in the kindergarten, takes pictures, scan students’ works and collects data. Teaching rational is acquired through interview with teachers of the kindergarten. Conclusion and recommendation will be developed from the data collected.

**Key words**: creative dance, picture book, thematic teaching
Course Design – Veterinary Exam Room Communication

Christina Ritchie
Pepperdine University
EXAM ROOM COMMUNICATION

Abstract

Professionals in the small animal health industry have long theorized the existence of a gap between technical and non-technical skills of practicing veterinarians. A consortium of veterinary educators identified the competencies necessary for professional veterinary success and agreed that a strong foundation of non-technical skills, such as communication, is more likely to lead to success. Given this hypothesis, management executives of XYZ designed the “Exam Room Communication” course to meet the skills gap identified. This paper will address the course design including objectives, target audience, needs assessment, design methodology, development and evaluations of the course along with financial and implementation issues. Formal evaluation of the course will allow XYZ to determine its business value as well as the immeasurable value of the increased level of quality medicine practiced by doctors who are better able to connect and relate to their clients.
Course Design – Veterinary Exam Room Communication

Introduction

“Exam Room Communication” is designed to meet a skills gap that has long been theorized in the small animal health industry, but never been empirically proven nor addressed. This course in its development will go through a rigorous target audience analysis and needs assessment to determine the specific skill set to assist veterinarians in creating a stronger bond with the humans and their animals both in and outside of the exam room. It is through this human animal bond that pet owners and veterinarians are able to work together to provide the highest level of care for animal companions who cannot speak for themselves.

The conception behind the course development and how it came to fruition will be discussed in this paper. To provide some structure to this journey, the instructional design model, ADDIE, will be roughly followed. ADDIE is an acronym for analysis (target population analysis and needs analysis), design, development, implementation, and evaluation.

Overview of company

“Exam Room Communication” is a course designed for veterinarians employed by XYZ Animal Hospitals. XYZ is a publicly traded company (on NASDAQ) that owns and operates more than 525 animal hospitals. It is the largest free standing animal hospital company in the United States. Within XYZ Animal Hospitals there are 15,000 employees that support these hospitals as well as the corporate offices. Of these 15,000, 2,200 are veterinarians. XYZ provides more medical continuing education in the United States for veterinarians than any other
EXAM ROOM COMMUNICATION

organization. XYZ Animal Hospitals aspires to provide the highest quality medicine for the pets that visit their hospitals.

While XYZ veterinarians are some of the most technically proficient doctors in the industry, XYZ has never provided any “soft skill” training for this population. Once the training organization had established itself within XYZ, executive management sought to implement the idea of soft skill training for doctors. The first iteration for the soft skill training was to provide XYZ doctors with “sales” training. While veterinarians may actually be “selling” their services, this is not an idea that is embraced by the profession; veterinarians went to school to provide medical care to animals, not sell their services to owners. The benefit of this training was determined that the underlying need for “sales” training is the desire to increase revenue, retain clients, and provide high quality medical care. Translating the objective of sales training into a language palatable to the target audience is of obvious importance. Hence, “Exam Room Communications” was determined to suffice and cover all of the bases in a politically sensitive manner.

Objectives

The business objective in financial terms is to increase revenue as measured by average transaction charge. The second business objective is to reduce client churn as measured by average client tenure. Finally, the business sought to increase the value per client based on average annual sales per pet. Increasing revenue, reducing client churn and increasing per client value are perfectly suitable to share with the board of directors and shareholders, however to ensure acceptance and openness with the veterinarian population, the objectives need to be restated.
The learning objective for “Exam Room Communication” is simple and straightforward: improve patient care through the demonstration of strong communication skills in the exam room. This learning objective assumes communication skills are the foundation of open relationships between veterinarians and clients, which has been demonstrated in the literature to lead to better quality medicine being practiced. Much research has been done around the correlation between the perceived quality of the doctor and their communication skills (Buller, 1987; Hall, 1981; Roter, 1987). Evidence suggests the higher the level of communication skills will equate to a higher the level of client satisfaction (Simpson, 1991; Howells, 2006). It has been suggested that improving basic communication skills may also simply advance the interviewing skills of some doctors therefore increasing the quality of information provided by the client (Roter, 1987). Finally, when a doctor possess strong communication skills, they increase their ability to generate a positive impact on the clients, and on patient care in general (Maguire, 2002). Upon identifying the primary learning objective for the development of this course, the next step is to better understand the primary audience for the course.

Target audience analysis

Veterinarians are a unique group of professionals. Veterinary students study as many as five different species during their four years of medical school and must be proficient in each of those species in order to pass the licensing exam, also called “boards.” However, the veterinarian has an additional challenge because he or she works with a patient that cannot communicate for themselves and they must also interact with the client, a human being. In order to pass “boards,” every veterinarian must know how to diagnose and treat animals, but no “boards” require any interpersonal skills whatsoever. This lack of attention to what is a critical component of the role of a veterinarian is concerning for many. The KPMG Mega Study, the largest study conducted...
to date within the veterinary industry, found that “Many [veterinarians that participated in the study’s focus groups] said that they did not get enough management, communications, and other skills necessary for nonprivate practice” (Brown & Silverman, 1999, p. 163).

The concern is so great that a group of veterinary educators came together to address the issue. This group of veterinary schools formed a consortium to identify the competencies necessary for professional veterinary success (Lewis, 2003). The group agreed the veterinary students entering school with a stronger foundation of “non-technical” skills, such as communication, are more likely to succeed (Lewis, 2003). At this time, a few veterinary schools have adopted basic communication training for the students, however the veterinarians currently in practice are not benefitting from this addition to the veterinary curricula.

XYZ recognized from its own experience with client concerns that much of the feedback on doctors (veterinarians) did not concern lack of technical competence, but rather communication skills, a gap which can also be seen in human medicine. “Most complaints about [human] doctors relate to poor communication, not clinical competence…” and “(a)ssessing and discriminating patient’s emotions could have an impact on the quality and accuracy of history taking and diagnosis” (Birks, 2007 p.370). As mentioned earlier the KPMG Mega Study The Brakke Study, in addition to the KPMG Mega Study, identifies that while veterinarians are adequately trained in technical skills, few possess the “non-technical” skills to connect with clients or manage a practice (Brown & Silverman, 1999; Cron, Slocum & Goodnight, Cron, 2000; Lewis, 2003). Having identified this skill gap in veterinarians, a thorough needs assessment will be conducted to identify the exact elements on which to focus the training course.
Needs assessment

Working with an external company, four different data collection tools have been identified: online survey, interviews, focus groups and direct observation. Each of these tools has different benefits and detriments, therefore being pooled to minimize the detriments while maximizing the benefits. It is also very important this needs assessment provides valid and reliable results, so that XYZ Animal Hospitals can make the best choice for the business.

The first tool identified is the online survey. The online survey is appealing for this needs assessment because it is an inexpensive, effective way to reach a large number of veterinarians in a relatively short period of time. Having over 2200 veterinarians across 40 different states, this wide reaching tool is ideal for gaining insight from a large group of people across many different sections. The downside of an online survey includes the limiting factor of a static instrument. The questions may be interpreted incorrectly, there is not an opportunity for follow up questions, it can have low response rates, and the online nature of the survey will bias our sample set as many of our more seasoned veterinarians are not comfortable using email or the internet (Sanders, 2008). By adding telephone and in-person interviews, we are able to address some of the challenges with online surveys.

Telephone and in-person interviews will be the next level of data collection. Interviews were identified as means for collecting data because they allow greater depth of knowledge to be shared with the interviewer. Since the interviewer is not static, he or she has the ability to ask the veterinarian further questions about responses provided. The use of questions allows ideas and understandings to be further explored allowing the interviewer to provide greater depth to the initial answers. The downside to interviews is their consumption of time. The data from
EXAM ROOM COMMUNICATION

Interviews must be synthesized and corroborated with other interviews or one of the other data collection methods. In order to improve data validity and reliability the interviewer must be well trained and experienced at collecting the information as well as the data analysis personnel must also be well schooled in combing through the data to identify themes.

Focus groups are the third form of data collection used to determine the skill gaps in veterinarians. Focus groups allow participants to build on each others’ ideas often times creating a synergistic feeling and great ideas that would not otherwise be uncovered. As was mentioned before, the facilitator must be skilled in managing a focus group as it can deteriorate into an unproductive complaint session if not managed appropriately. It is also important the groups be carefully selected watching to not place subordinates in the same group as their supervisor, creating an expectation of confidentiality, and assisting participants in understanding the reason for the group. When structured and facilitated appropriately, focus groups will provide great insight into the thoughts from our doctors.

Our final means for gathering data for the “Exam Room Communication” needs assessment is observation. Observation is an important component in our needs assessment as many of the doctor-client interactions only happen behind closed doors. Only through observation can a third party truly see how a veterinarian interacts with his/her clients and any performance barriers that may inadvertently exist. The obvious downsides to observation are the impact the observer has on the performance of the veterinarian, the amount of time and cost involved and the massive data analysis that must follow observations (Sanders, 2008). Knowing all of these challenges, a matrix of data collection methods will be created to minimize the downsides of each individual method, maximize the benefits of each method and validate the information gathered.
EXAM ROOM COMMUNICATION

The data gathered through this extensive needs assessment will be the first thorough empirical study of the skill gap in practicing veterinarians. Whether the data shows that the skills needed for veterinary success are trainable behaviors or simply personality factors, the benefits of uncovering this information will be revolutionizing for the small animal health industry. Second only to gathering the data for this initiative, the design of the course will be challenging.

Design methodology

Based on the results of the needs analysis, the goal of the design of “Exam Room Communication” is to create a format that will most effectively deliver the skill training needed. It is likely that a blended learning approach will be used. Instructor lead training will maximize the benefit of human interaction through role play and simulation as well as the visibility of non-verbal communication. Online information distribution will be used to disseminate foundational reading prior to the instructor lead session. After completion of training, online collaboration spaces will allow small groups of doctors to share video recordings of exam room performance, so the group can provide ongoing feedback to each other, keeping the learning alive.

The only assignments made during this course will be the follow-on learning as mentioned above. Doctors will be divided into small groups and required to meet virtually on a monthly basis, to share how they have applied the learning in their practice. These sessions will be structured with a mentor doctor that will serve to add structure to these meetings. During each session one doctor will be asked to share his/her experience using communication skills either through a verbal story or an uploaded video snippet. The sharing doctor will be asked to address what he or she learned from that particular client interaction and what they can apply to
future client engagements. After the doctor has presented his/her scenario for 20 minutes, the floor will be opened for others to share what they saw or heard during the doctor’s statement. All participants will be instructed to only provide feedback to the sharing doctor if it is requested; otherwise the group will speak on what they learned from the case presented or what they have learned in their own practice of communication skills in their hospital. These small group meetings will be a required assignment, however as this is a professional environment, no grade will be provided. In an effort to convey the importance of these interactions, participation will be included as a component of the doctors’ annual performance evaluation.

Development

Development of the training both instructor lead and online will be outsourced. It is critical that presentation of this training be as engaging and professional as possible to deliver the value proposition for this initiative by XYZ. While actual development will be monitored and reviewed closely by a team of XYZ executives, regional medical directors and XYZ doctors, the process will be completed by a company that has demonstrated success in the past on these types of initiatives within other large organizations.

Evaluations

“Exam Room Communication” will be an ongoing training initiative beyond initial roll out, so it is important that as feedback is received the course is adjusted to reflect the needs of the group. Evaluations will be conducted at the completion of each segment of the training i.e. after the online pre-training, the instructor lead segment, and at a preset number of small group meetings. Each of these situations will provide us with a level one, reaction evaluation allowing us to fine tune the presentation of the material (Kirkpatrick, 2008).
The follow-on small group interactions will provide us with an informal level two evaluation (Kirkpatrick, 2008). The discussion within these groups will provide insight into the learning that has been carried back into the hospitals and what is being put into practice.

The final level of evaluation to be conducted on “Exam Room Communication” will be a level three/four evaluation thus looking for a change in behavior through business metrics/results (Kirkpatrick, 2008). This final level of evaluation will be conducted through annual performance evaluations and monitoring of business metrics. Performance reviews include measurements on client relationships and retention, which a change in behavior should be effected by the “Exam Room Communication” course. Additional metrics to be observed include average transaction charge and client churn. The average transaction charge is expected to increase for each doctor. Meanwhile, client turnover should decrease over the measured timeframe. These two evaluation levels are combined, because they will not be formally measured, but rather casually monitored.

Financial issues

XYZ Animal Hospitals will independently fund this training initiative. The only investment expected on the part of participants is their commitment, dedication and time. XYZ feels that the value of this program will bring an increase in revenues and therefore is a good investment in the veterinarians in the XYZ organization.

Implementation issues

Implementation of this blended learning course will present many challenges. The XYZ internal learning management system will be used to distribute the pre-training materials, whatever they are deemed to be. Meanwhile, the instructor lead training will be done live in
EXAM ROOM COMMUNICATION

central locations across the country. With over 2,000 doctors, roughly 120 instructor lead classes will need to occur in order to accommodate a student/instructor ratio of 1:20, which will allow for more interaction. A team of instructors made up of professional facilitators coupled with experienced mentor doctors will attend a train the trainer session to equip them with the basic material presentation to be done across the country. Periodic conference calls will be conducted to share experiences in the classroom and make any needed adjustments to the course materials. Depending on the number of training teams created, the full national roll out will likely last between two and three months. The combination of professional facilitators along with experienced veterinarians both attending train the trainer together with the ongoing conference calls will allow the full roll out to happen in as smooth a manner as possible.

The follow-on small groups will be facilitated by some of the mentor veterinarians. Each of these mentors will be asked to submit a minimal report on the attendance and general discussion of the group he or she mentors. This is not an effort to monitor individual doctor performance, but rather the themes that are being carried from the training into discussions after the fact and will assist with level two evaluations as mentioned earlier. The mentor veterinarians will be asked to participate in ongoing periodic phone conferences to ensure that the direction of the follow-on learning is appropriate.

After the national roll out of “Exam Room Communications,” the course will continuously be offered at various locations across the country to accommodate new veterinarians as they join the XYZ family. The frequency will be determined by the level of veterinary turnover.
EXAM ROOM COMMUNICATION

Conclusion

“Exam Room Communication” will attempt to be the first course of its kind in the small animal health industry. While communication skills have long been hypothesized as being the primary skill gap for practicing veterinarians, this has never been empirically proven. The development of this course will include an in depth need assessment that will identify the trainable skills that exist between outstanding doctors and struggling doctors. The design of the training will play to the distributed environment that exists in XYZ while also meeting the learning needs of the veterinarians by combining the power of online learning for the distributed nature of the company, while also delivering multiple live instructor lead sessions to deliver interactive communication learning. Formal evaluation of the course will allow XYZ to determine the business value of the training; however, the immeasurable benefits of this training include increasing level of quality medicine doctors will be able to practice and the greater care our pets will receive, if they are better able to connect and relate to the client. Which for those of us that have pets in our lives, as MasterCard would say, “is priceless.”

Critical Evaluation of Multimedia Courseware

Professor Ali Simsek
Institute of Communication Sciences
Anadolu University
Yunus Emre Campus, Eskisehir, Turkey

E-mail: asimsek@anadolu.edu.tr

Although multimedia is not a new concept in the field of educational technology, its meaning has changed radically in the last two decades. Traditionally, the term multimedia would refer to “the use of several technologies during a course.” Currently, however, it refers to “a complex system integrating various technologies managed by the computer toward certain instructional goals.” It means purposeful integration of visual, auditory, and textual messages. The shift in the new definition is on integration rather than separate uses of various technologies.

The success of multimedia technologies in education depends largely on software used. If software is designed according to principles of effective instruction, learning is successfully facilitated. If software is not effective, on the other hand, the technology itself does not bring any success. This means that multimedia software should be critically evaluated before use in order to assess whether it can promote higher achievement and better attitudes.

There are several methodologies of software evaluation. These are checklist evaluation, expert review, case study, experimental comparison, and meta-analysis. There are also modified versions of these approaches. For example, traditional checklist method is revised and known as perspectives interaction method, media comparison method is revised under the name of pedagogical dimensions approach, simple case study is now known as enhanced case study, and several other methods are criticized and replaced with postmodern perspectives.

The purpose of this paper is to create a functional combination of critical evaluation methods for multimedia courseware. Toward this purpose, a number of methods have been analyzed for their individual comprehensiveness and strengthening compatibility with other methods. Results generally suggest that a congruent combination of multiple methods representing various educational orientations provide more reliable information about the appropriateness and quality of courseware than employing any well-known individual method of courseware evaluation.
Abstract

Preventing and Treating School Bullying: Understanding Teacher’s Role

Edilburga W. Saptandari
Faculty of Psychology, Gadjah Mada University

Bullying is becoming one of big issues in schools in Indonesia. Data from research done in bullying showed that most bullying cases happened in elementary education. This research focused on the role of teachers on preventing and treating school bullying cases at schools. Thirty one teachers in a school were trained in "Guru Peduli" training. This training aimed to improve teachers' awareness, knowledge, and skills in preventing and reducing bullying cases. The teachers filled out questionnaires on bullying to measure their knowledge, behavior and attitude scales. Questionnaire on bullying aimed to know into what extent the teachers understand how much they understand what bullying is. The questionnaire on attitude and behavior scales on bullying aimed to get teachers' responds towards bullying cases at schools. The data showed that bullying knowledge and attitude and behavior scales means increased after the training. There was an observation done to the school's students after the training. The data obtained from the observation showed that the number of bullying cases was decreasing significantly after the training.

6. Abstract:

Task-based language teaching has been reported as an effective way of promoting interaction between learners in language classrooms in recent years, with an increasing amount of research appearing that incorporates technology to facilitate these tasks. While much of this research has focused on the positive aspects of these interactions, there is evidence that problems also occur, such as conflicts between group members during collaborative work (Jeon-Ellis, Debski and Wigglesworth 2005) and a general lack of structure (Debski 2000; Lynch 2000; Toyoda 2000). The current study reports on one such case, where the task outcomes fell far short of the level expected by both the teacher and researcher. This paper attempts to identify the factors that worked against the successful achievement of two collaborative tasks: message exchanges through a bulletin board system (BBS) with Japanese students, and production of websites in Japanese based on the BBS messages, which were assigned to Year 10 Australian students learning Japanese in two Computer-Assisted Language Learning (CALL) classes. Audio recordings of on-task talk, BBS messages, and student websites were analysed to see if any clues regarding the unsuccessful task outcomes could be found. The factors that influenced the learners’ task performance were examined from four perspectives; 1) the tasks, 2) teacher attributes, 3) learner attributes, and 4) the learning environment. In the first category, the tasks, the communication task and the web task were looked at to see if the learners were clearly instructed and the levels of the tasks were appropriate for the learners. In teacher attributes, characteristics of teachers’ attitudes, assistance and computer skills were examined. In learner attributes, task productivity (both the BBS messages and learner web pages) and computer skills were analysed to see if there were patterns or characteristics in unsuccessful output. The learning environment included analyses of the computer hardware and software, availability of technical support, time constraints, and other environmental or circumstantial factors to see how they affected learner performance.

The results indicated that there were several factors that limited learners’ successful task outcomes, including a lack of technical support, explicitness and frequency of task instructions, an inaccurate assessment of the learning environment, a lack of teacher motivation and expertise in CALL, failure by the learners to actively engage in the tasks, learners’ limited computer skills, and features inherent to the mode of interaction. These issues are discussed with regard to the creation of tasks that are conducive to active learner engagement.

The Link Program: Connecting Adult Learning Program to the Labour Market

Description:
The Adult Learning Program at Nova Scotia Community College provides adult learners with a High School Graduation Diploma. The Link Program was designed to create a direct link from the Adult Learning Program (ALP) to participation in the labour market. Connecting ALP, post-secondary programs and workplace experience will create a seamless program leading to employment.

Retention is a significant issue within all adult-based programming. One of the many reasons is that learners do not see the link between their secondary (high school) programs, their post-secondary (core) programs, and their employment goals. Often adults enter programs uncertain of their final destinations. During times of difficulty and stress, the lack of long-term employment goals exacerbates this uncertainty making programming exiting more likely.

The Link Program creates a pathway from out of school to High School to Post-Secondary (Continuing Care Certificate) to a Career. The program uses a blended learning cohort model and combines what is traditional three years of programming into 2 years.

Essential program components:
· Dual credit program options: Dual crediting allows the learner to apply learning bundled as a credit to two programs. In the Link Program it was significant that the courses from the Continuing Care Assistant Program could be applied as electives to meet the required credit hours for the Nova Scotia High School Graduation Diploma for Adults.
Prior learning assessment and recognition: Learners were assessed prior to entering the program and any prior learning was credited towards the program. Nova Scotia Department of Education houses a database for credit equivalency that was access in this process.

Student support: The learners in this program had access to a counselor who met with them regularly regarding fit, progress, career aspirations, financial management, wellness and goal/career planning. They also benefitted from experienced faculty, the support of a program co-ordinator, disability services and accommodations, tutoring and a student/employer mentorship program.

Project-based, workplace-oriented credits: The curriculum in both programs was reviewed and areas identified for project-based instruction and connection to workplace skills and realities.

Work experience: The learners were exposed to the workplace within the first eight weeks of the program. This exposure continued throughout the program cumulating in a five week work placement.

Targeted Audience:

The Link Program targeted employment insurance and income assistance recipients who had completed at least grade 10 and who had the desire and capability to complete a long-term career plan consistent with the needs of the Nova Scotia labour market (e.g., Continuing Care Assistant).

The program was offered in three rural campuses where there was a need for Continuing Care Assistants: Truro Campus (Truro Campus), Annapolis Valley Campus (Middleton NS), Marconi Campus (Sydney, Cape Breton). Each location had 20 potential seats.

In October of 2008 the enrollment in the program was:
Annapolis Valley Campus - 20
Marconi Campus - 13
Truro Campus - 23

To be eligible for the program participants needed to meet the following criteria:
• 19 years of age or older
• Out of school at least one year
• No high school diploma
• Completed at least grade 10 or ALP Level III or equivalent (i.e. GED)
• Clean criminal record
• Child abuse registry check will be required for work placement and employment
• Updated immunizations, including Hepatitis B
• Proof of English language competency
• Employment insurance and/or income assistance recipient (some exceptions may apply)
Participants also signed a statement of Understanding that reinforced the career requirements of Continuing Care Assistants. The statement of understanding included conditions such as:
• Ability to work all shifts – evenings, weekends, holidays and overnights
• Ability to meet the physically demanding CCA working conditions
• Driver’s license and access to a vehicle is required.
• Willingness to sign one-year Return of Service Agreement with an employer

Benefits:

Dual-crediting and applied learning will be the foundations of this program. Learners will complete compulsory credits toward their high school diplomas and will use credits earned in core programming as electives. This will significantly reduce the number of courses required and the length of time spent completing the educational component (for some, this may be up to one year of full-time study). Programming elements will be connected so that students understand the link between what they are learning and its practical work-related application. Prior learning assessment and recognition practices will be embedded to ensure learners are not repeating outcomes that they have mastered. Upon graduation, learners will receive their high school diplomas and their post-secondary program diplomas.

Completing The Link Program means students will have acquired the credentials and skills required to secure long-term employment in the Nova Scotian workforce.

Partnerships:

The Nova Scotia School for Adult Learning worked with the Nova Scotia Community College to create and deliver The Link Program. Department of Community Services was involved in the identification and support of program candidates. Employers provided one year return-of-service agreements, orientation, class visits, student mentorship, job shadowing and work placement opportunities.

Outcomes

a) Long-term

• Increased both the participation of those who are not currently in the labour force and providing opportunities for those who may be participating but who are under skilled will assist with the impending negative demographic shifts.

• Those with higher literacy skills require fewer services from both the health and social services systems.

b) Short-term
Increased access and opportunities for individual Nova Scotians to quality programs and services.

Created higher skilled pool of labour.

Increased number of Nova Scotians with high school diploma through the Nova Scotia High School Graduation Diploma for Adults.

31 graduates with both their High School Graduation Diploma for Adults and their Continuing Care Assistant Certificate.

12 learners moved on to other educational programs (ALP, Adult High School).

98% of learners passed the Provincial on the first attempt.

100% of learners had two or more job offers prior to Graduation.

Faculty reported their level of engagement and satisfaction with the program as the highest they have experienced in their career (average years of experience >25).

Employers reported their highest level of satisfaction with Link Program learners’ work placements.

Learners’ reported a significant increase in confidence and life satisfaction.

Lessons Learned

Specific to Link
Although we are still documenting the numerous lessons learned some stand out very clearly based on stakeholder feedback:

- Ensure a program coordinator has industry knowledge and is hired early the process
- Hold advisement meetings with each learner prior to acceptance
- Connect learners with the employers early and often
- Conduct professional development for the sponsoring agencies early
- Add a transition period at the beginning of the program to ease the learners into the culture and workload
- Ensure that the curriculum outcomes are achieved with consistent workplace applications
- Focus on employability skills throughout the program
- Embed service learning projects throughout the experience
- Ensure student support is available for both academic and non-academic needs
General

- Cohort learning enhanced learner success and satisfaction
- Learning connected to career goals and employment was a strong motivator for learners
- Employer mentors benefitted both the employer and the learner
- Team teaching model or two instructors was optimal
Validities of the Signed and Unsigned Lecture Questionnaires using the Item Response Theory

Hideo Hirose
Department of Systems Design and Informatics, Kyushu Institute of Technology
Iizuka, Fukuoka 820-8502 Japan
hirose@ces.kyutech.ac.jp

Abstract

Teachers often raise a question that the lecture questionnaires are necessary or not. In this paper, we first show the recent statistical analysis for the official unsigned questionnaire evaluation results took in our faculty. We have found that, 1) the evaluation scores of lectures by students have been proportionally risen up to years, which means that lectures have been improved, 2) to take a look at the distribution of the evaluation scores as well as the mean value is crucial. These two indicate that taking the questionnaires enhances the teaching skills of teachers.

In addition to the official questionnaires, the author has been taking the Web-based signed lecture questionnaires to three mathematics subjects for more than five years. Using these stocked data, we have, next, analyzed the relationship between the signed and unsigned lecture questionnaires, and have found that, 3) since there are few synchronized relationships between the signed and unsigned evaluation scores, we should be cautious of using one of either signed or unsigned questionnaires, and 4) detailed analysis for the questionnaires is also important to grasp the student lecture comprehension and satisfaction, via the item response theory to investigate whether the official lecture questionnaires in the department and the Web-based signed lecture questionnaires are reliable or not; the questionnaires are reliable.

Keywords: lecture questionnaire, evaluation, item response theory (IRT), signed form (registered form), unsigned form (bearer form), Web-based questionnaire.

1 Introduction

Although the official faculty development systems (FD systems) are mandatory since 2008 in Japan by the suggestion of MEXT (Ministry of Education, Culture, Sports, Science and Technology), our faculty has been continuing our own FD activities since 2002. The main subject is the lecture questionnaires. Until 2004, the results of the questionnaires are sent to each teacher, and the whole statistics are closed. From the second semester in 2004, we have changed the system; each result became open to teachers, students, and staffs.

At the beginning, we tackled the FD activities aggressively. However, as the day passes, teachers often raise a question that the lecture questionnaires are still necessary or not. I also began to use the minutes paper [11], and have been using the Web-based lecture questionnaires since 2002. I feel vaguely that continuing such an activity is still important [2]. Thus, let me investigate here what the continuing FD activities brought us.
First, we show the recent statistical analysis for the official unsigned (bearer) lecture questionnaires took in our faculty. All the statistics regarding the questionnaires are being processed in open. The basic statistical tools are such as the correlation to know the relationship between the unsigned official lecture questionnaires and Web-based signed (registered) lecture questionnaires.

Next, we analyze the relationship between the signed and unsigned lecture questionnaires in detail using the item response theory. That is, we investigate whether the official lecture questionnaires in the department and the Web-based signed lecture questionnaires are reliable or not. This analysis will show that it is important to grasp the student lecture comprehension and satisfaction.

2 Trend of Faculty Official Unsigned Lecture Questionnaires

In our faculty, we have two semesters, and more than 350 lectures are opened in a semester. The number of students is about 1,500 from freshman to senior. All the teachers are mandatory to carry out the lecture questionnaires at the end of the lectures. Students mark 2, 4, 6, 8, 10 scores as the evaluation points; the higher, the better. The class sizes are from 10 students to 100 students.

Figure 1 shows the trend of the mean values of the evaluation points since 2004. The results for the first and second semesters are separately dealt with because the types of classes are a bit different from each other. We can see that the evaluation scores of lectures by students have been proportionally risen up to years, which means that lectures have been improved. I believe that the decision of score opening to the public made this progress as well as the teacher’s effort.

3 Trend of Web-based Lecture Questionnaires

Since 2003, the author has been using the Web-based questionnaires at each lecture time; thus, 15 times answers are obtained to each student. The questions are that 1) to urge review of the lecture, I ask what the point was, 2) to know how attractive the lecture, I ask what the discovery was, 3) to know what extent students understand the lecture, I ask what the questions were, 4) to find the technical skill for lectures, I ask what the improvements were. In addition, the comprehension points and the overall satisfactory points are marked by 1 - 10 scores; the higher, the better.

Figure 2 shows a trend of the evaluation points to Subject A (Statistics and Data Analysis); scores are understanding points and the overall points. We can see that 1) the overall points are a bit larger than the understanding points, 2) there are high correlations (correlation coefficient value is 0.83) between the overall points and the understanding points, 3) the points have been risen up to years similarly to the official unsigned results. This also shows that continuing the questionnaires will
improve the lecture skills.

Figure 2: Trend of the mean evaluation points of a signed lecture questionnaire result.

4 Signed and Unsigned Web-based Lecture Questionnaires

The official questionnaires are carried out in unsigned, on the contrary, the Web-based questionnaires are carried out in signed. Are there any differences between the two answers? Although we cannot know the differences to each student, the mean values can be compared with each other. Figure 3 shows the differences between the two evaluation scores to Subjects A, B (Mathematical Computation), and C (Probability Theory). If there is a strong relationship between the two evaluation scores, we can use one of either signed or unsigned questionnaires. However, this might be in vain. Any synchronized indications are not observed. The unsigned questionnaires are carried out only one time at the final lecture time, and the Web-based signed questionnaires are carried out at every lecture time. Did this cause the difference? Figure 4 indicates a denial to this conjecture. The figure shows the evaluation scores to each lecture time; fluctuations due to the lecture time are not observed. Thus, we should be cautious of using one of either signed or unsigned questionnaires. We will later discuss the detailed analysis for the unsigned Web-based lecture questionnaires using the item response theory (IRT).

5 Distribution of the Evaluation Scores

We can roughly grasp the trend of evaluation by looking at the mean values of scores for questionnaires. However, we should be cautious; mean value 5 is obtained when all the students give point 5 every lecture time, and also obtained when half the students give point 1 at every lecture time and the rest of half gives point 9 at every lecture time; the evaluation distribution reveals the details for the evaluation. Figure 5 shows typical cases for evaluation distribution.

Figure 6 shows an actual distribution of Subject B. This subject starts in 2005. First, the teacher delivered the high level to students; in 2006, he changed the lecture level much easier; in 2007, he could find the appropriate lecture level. To know the distribution of the evaluation scores is important.
Analysis of Lecture Questionnaires using the Item Response Theory

So far, we have investigated the results of the evaluation scores for questionnaires using the basic statistical methods believing that the evaluation scores are true. However, some students may give scores 5 every time, and some may carefully give appropriate scores. We may not believe in the scores for questionnaire as they are. Thus, we have tried to analyze the scores as accurate as possible using the item response theory (IRT) which will be shown in appendix.

Figure 4: Evaluation scores to each lecture time.

Figure 7 on the left shows the score data matrix of Subject A in 2006; column corresponds to lecturing date (lecture time) and line corresponds to student id; dark purple regions mean the absences. We can see that 1) some students give high points at every lecture and some low. With a small number of exceptions, we do not observe the drastic fluctuation during the series of lectures. On the right in the figure, the IRT analysis results are given. After obtaining the IRT parameters of problem difficulties and student abilities, we have rebuilt the score matrix using the success (evaluation) probability (1) to every cell in the matrix. Looking at the two figures, we can see that 1) there is a similarity between the two matrix, 2) the unreliable evaluation fluctuations seem to be relaxed, 3) each student evaluation stands out sharply, 4) there seems little fluctuations among lecture times. Therefore, we may believe in the true scores.

The parameters of problem difficulties are seen in Figure 8 where the item characteristics curves to each lecture day are shown; the discrimination parameters are all small and similar to each other. Then, we can proceed to use this result with confidence; that is the results of the lecture questionnaires are reliable.

Figure 9 shows the re-evaluated trend for
overall scores using the IRT from 2003 to 2008 fiscal years. Comparing this figure with Figure 2, we can find the sharpness to Figure 9. That is, it is recommended to use the IRT re-evaluation together rather than to use the basic statistics alone.

7 Concluding Remarks

In this paper, firstly, we have shown the recent statistical analysis results for the official unsigned lecture questionnaire evaluation results took in our faculty, where we have found that 1) the evaluation scores of lectures by students have been risen up to years, which means that lectures have been improved. Making this progress is due to the decision of score opening to the public. We have, next, investigated the features for the signed and unsigned questionnaires. We have found the following: 2) continuing the questionnaires will improve the lecture skills; 3) since there are few synchronized relationships between the signed and unsigned evaluation scores, we should be cautious of using one of either signed or unsigned questionnaires; 4) it is important to know the distribution for the evaluation scores. Lastly, we have analyzed the questionnaire evaluation results using the item response theory, where 5) the results of the lecture questionnaires are found to be reliable.

The author appreciates Mr. Sakumura for his cooperation to this study.

8 Appendix: Item Response Theory

For effective evaluation of students’ abilities, the item response theory (IRT) [5, 6, 9, 1] can be used, and this gives the students’ abilities accurately in addition to the problem difficulty. Adaptive e-learning systems [10] and test methods appropriately used may enhance this feature. We have introduced a student self-learning system embedded [15] in the e-learning system, via Moodle [12], and a new adaptive test method is also proposed recently [7] to perform the optimal test. Moreover, we have introduced a Web-based students’ evalua-
In the IRT, we assume a student $i$ having ability $\theta_i$ takes a problem $j$. If the student is successful in giving the correct answer with probability $P$, such that
\[ P_j(\theta_i; a_j, b_j) = \frac{1}{1 + \exp(-1.7a_j(\theta_i - b_j))}, \]
the likelihood for all the students, $i = 1, 2, \ldots, N$, and all the items, $j = 1, 2, \ldots, n$, will become
\[ L = \prod_{i=1}^{N} \prod_{j=1}^{n} P_j(\theta_i; a_j, b_j)^{\delta_{i,j}} \times (1 - P_j(\theta_i; a_j, b_j))^{1-\delta_{i,j}}, \]
where $\delta_{i,j}$ denotes the indicator function such that $\delta = 1$ for success and $\delta = 0$ for failure; $a_j$ and $b_j$ are constants in the logistic function, and they are called the discrimination parameter and the difficulty parameter, respectively; the larger the value of $a_j$, the more discriminating the item is, and the larger the value of $b_j$, the more difficult the item is. In a statistical sense in common, $P_j$ in Equation (1) is a logistic probability distribution function with unknown parameters $a_j$ and $b_j$; the random variable is $\theta_i$. However, $a_j$, $b_j$, and $\theta_i$ are all unknown here; see Figure 10.

By maximizing $L$ in Equation (2), the maximum likelihood estimates may be obtained. However, it is not easy to obtain the item parameters and the students’ abilities together. There are $2 \times n + N$ unknown parameters to be estimated. Therefore, the item parameters are first estimated by using the marginal likelihood function by eliminating the students’ abilities such as
\[ L(U|a, b) = \prod_{i=1}^{N} \left[ \int_{-\infty}^{\infty} g(\theta) \prod_{j=1}^{n} L(u_{ij}|a_j, b_j) d\theta \right], \]
where $g(\theta)$ denotes the ability common to all
Figure 9: An example of the re-evaluated trend using the IRT from 2003 to 2008 fiscal years.

the students (usually a standard normal distribution) and $U$ denotes all the patterns of $u_{ij}$, taking the value of 0 and 1. The EM algorithm [4] is usually used in such a case [1]. Then, the students’ abilities are obtained by maximizing the corresponding likelihood function. To circumvent the ill conditions so that all the items are correctly answered or incorrectly answered, the Bayes technique is applied [1].

To the scores of the lecture questionnaires, we cannot use Equation (2) as it is; that is, we have assumed that $\delta_{i,j} = 0, 1$, the discrete value. Thus, we have modified to allow the continuous value to $\delta_{i,j}$ such as $0 \leq \delta_{i,j} \leq 1$. For convenience, the vacant cells are occupied in advance with the mean observed values to each student.

Leadership Style in Higher Education During Time of Fiscal Distress

LEADERSHIP STYLE IN HIGHER EDUCATION

Abstract

This paper explores leadership characteristics of individuals in higher education during a time of fiscal crisis. The implications of this review of the literature and the research discussed looks at the commonalities, trends, purpose, and a generalized view of future leadership characteristics as it pertains to the context of application in crisis. This paper examines (1) leadership in higher education during a time of fiscal crisis, (2) crisis management/leadership styles, and (3) leadership in higher education using California as a case study. The paper concludes with the overarching idea that as long as leaders within higher education uphold effective crisis management traits like strong communication skills, goal-setting, and establish strong relationships, the institution will triumph over the challenges presented during a time of economic instability.

Keywords: higher education, leadership style, fiscal crisis
LEADERSHIP STYLE IN HIGHER EDUCATION

“No generalizations about higher education [leadership] are true except this one: No generalization about higher education is true, since each campus has its own heritage, its own setting, its own course of future development.”

(Kerr, et al, 1994, pp. 41)

All over the news, the topic of conversations with neighbors, and concerns in the workplace, all originate with the uncertainty of the end date to the current economic recession. While people are screaming “jobs, jobs, jobs,” the question of preserving the institution of higher education and guaranteeing an educated workforce is also of great concern. Education in the United States is the driving factor in generating workers for the future in addition to being a huge provider of jobs itself. In 2010, there was the largest fall in jobs in the education sector since the Department of Labor started maintaining records in the 1950s; a loss of 121,000 jobs in public and private elementary, secondary and technical school and higher education (Mandel & LeVine, 2009).

This literature review will look at the traits of leaders within higher education during a time of economic distress. This paper will examine (1) leadership in higher education during a time of fiscal crisis, (2) crisis management/leadership styles, and (3) leadership in higher education using California as a case study.

Why study leaders in higher education during a time of fiscal crisis?

Similar to many other sectors of the United States economy, the institution of higher education has undergone and will continue to undergo great strain as a result of the struggling economy. Typically, in times of fiscal crisis, many patrons go back to school in pursuit of a higher education. However, unlike most businesses, which strive for an increase in demand, the institution of higher education has limited, and now scarce,
resources. When the economy slows down, the amount of funds from taxes decreases because the sale of goods declines in addition to the reduction of property values. Public higher education depends on government funding, specifically funds collected through taxation. With the decrease of funding, public higher education is faced with the challenge of sustaining the institution with fewer resources.

According to the National Bureau of Economic Research (NBER, 2008), a private, nonprofit and nonpartisan research firm founded in 1920, whose main focus is to explain the workings of the economy, the United States entered into its current recession in December 2007. As defined by NBER, a recession is a decrease in economic activity across the economy, which lasts more than a few months. Recession indicators can include real income, manufacturing and wholesale-retail trade sales; however, domestic production (GDP) and employment are the primary gauges (National Bureau of Economic Research, 2008). During the first 10 months of the recession, 1.2 million employers cut payrolls along with the downturn in the housing market, leading to one of the more severe recessions since the Great Depression of the 1930s (Isidore, 2008).

During a time of fiscal deficit, the public institution of higher education is typically undergoes great pressure to make change. However, the product they produce, educated citizens, is of greater value to society than ever before. Dealing with diminishing funds caused by a decrease in property taxes, cuts in state and federal funding, attenuating endowments, and limited educational donations, schools are forced to maintain the same amount of service with fewer resources. Some colleges have undergone such harsh deficits, forcing them to pull from reserves. No prediction of change or relief appears in sight for the recent future (Masterson, 2008).
While primary education is struggling to provide children with the building blocks they need to thrive as adults, pupils considering higher education are seeing their options dwindle before their eyes. According to a poll conducted by the College Board and the Art and Science Group, from a random sample of students who registered for the Scholastic Aptitude Test (SAT), one in six college-bound students had changed their future higher educational plans. Due to the recession, 41% of the 971 polled respondents expressed interest in attending a public university or college close to home, while 15% said they considered attending a community college (Supiano, 2009). While students are looking for financial alternatives as a means to save money, only four percent stated the recession directed them to consider avoiding college all together (Supiano, 2009).

Periods of economic instability are by no means a new phenomena to the institution of higher education. Aside from the Depression of the 1930’s, the United States has undergone a period of economic recession approximately every 10 years; near the end of each decade (Breneman, 2008). Now, in the current recession, which started in 2007, it becomes imperative to review the past in order to adapt and prepare for the future.

In the stagflation of the 1970s, the costs to run a college or university exceeded the revenues generated from tuition fees. However, enrollment increased by more than three million from 1979-1980 as students found themselves in an unaffordable or dreary labor market. The peek in student enrollment tripled the amount of college revenues between 1970-1980 (Breneman, 2008). Advocates like the Carnegie Commission and the Committee for Economic Development lobbied for a cost of public higher education shift and placement of the financial burden to the student, rather than the taxpayer. As a result,
the federal government passed the 1972 Amendments to the Higher Education Act, thus creating the Pell Grant program as a means to expand federal loans to students to assist in lessoning the burdens of increased fees (Breneman, 2008).

With the election of President Ronald Regan and his emphasis on less government, the trend to pass the burden of higher education onto the student rather than the taxpayer flourished. As state appropriations for higher education decreased, the cost of tuition continued to increase at public colleges. However, college enrollments were stable because the baby-boom generation began to age and the population of 18-year-olds began to decline, which lasted until the mid 1990s (Breneman, 2008). During the 1980s, a leader within the realm of higher education was fortunate because enrollments remained strong, no student revolts came about and there were no OPEC oil issues; in essence no major crises occurred to effect higher education (Kerr et al., 1994). While crisis management was not a huge focus during this decade, as the population evolved, the institution of higher education underwent a paradigm shift and started focusing attention on the teaching and learning of adult students.

Unlike previous recessions, which greatly targeted blue-collar employees, the fiscal volatility of the ‘90s greatly impacted the lives of many white-collar workers, who found themselves unemployed. As unemployment increased, the taxes collected by the state began to decrease because of the economic lull, and later government spending towards higher education fell. In order to accommodate the challenging times, colleges and universities started to increase class size, eliminate courses, not fill open faculty positions and even initiated another increase in the cost of tuition (Breneman, 2008). The federal government developed programs like the tax-preferred college-saving plans and
tax credits for tuition, to assist middle to high-income families and was followed with the 1992 Amendments to the Higher Education act to expand loan availability (Breneman, 2008).

In looking back at the recession of the 1990s, three valuable lessons were learned from this turbulent time. First, when revenues are less than anticipated, higher education institutions will undergo a greater percentage loss than their K-12 counterparts. Next, when states cut higher education funds, the financial burden is likely to shift onto the student and parent. The final trend learned from the 1990s was that during the time of a recession, states are not likely to increase the investment in financial aid programs (Callan, 2002).

As the economic climate began to clear up in the 2000s, state appropriations neglected to provide additional funds to higher education as a means to keep up with the inflating demands of Medicaid, thus triggering another increase in tuition costs (Breneman, 2008). However the demand for higher education was strong and colleges and universities underwent another hike in student enrollment (Breneman, 2008).

The current higher education system now experiences multiple-tuition hikes and ever diminishing funds. As a professor of economics at the University of Virginia, Breneman (2008) concluded that, “Contrary to popular view, colleges have proved to be adaptable and creative in their responses to changing economic circumstances. They have been particularly skillful at diversifying their sources of revenue. Whether colleges can find a source of support not already tapped is far from certain” (pp. A-112). In the midst of these trying economic times, the system of higher education must undergo the strength and talent of a leader equipped in leading during a time of crisis.
What is Crisis Management/Leadership?

Similar to the vast amount of definitions used to describe leadership, the specific title of “crisis leadership” is not much different. A working definition for this paper identifies crisis leadership as “the process of responding to a low-probability, high-impact situation by influencing others to overcome or take advantage of the situation, regardless of its cause, optimizing the effect, in a timely framework” (Pearson & Clair, 1998, pp. 60). A crisis could include, but is not limited to, economic challenges, actions from individuals, government influence, political transformation, natural disasters, and spread of disease (Shrivastava & Mitroff, 1987).

Going a step further, Klann (2003) explains crisis leadership as “a special case in which these specific tools of influence [communication, clarity of vision/values and caring] perform a critical role. In a crisis, timelines are more critical,” (pp. 12). However, being in a designated role of leadership does not necessarily make a leader qualified to handle a crisis situation, let alone the current fiscal crisis (Klann, 2003).

In his book Managing in Turbulent Times, Peter F. Drucker (1980) advises and cautions public institutions, who may believe their strategy is best because it aims at a ‘happy medium,’ that…. Most commonly an institution only profits during the extreme: when standards are set by a market leader or when a specialist supplies a specific product or service. Drucker supports his notion with the example of the success of small denominational colleges in the United States, which have found a niche, concentrated their resources, and offer a small campus with a “home”-like environment (Drucker, 1980).
Effective leaders in the time of a crisis have the ability to influence others and avoid using fear as a tactic. The three most influential tools for a leader to apply and positively affect one’s followers are: communication, clarity of vision and values and compassionate action towards one’s followers (Klann, 2003). Communication is essential, even in a non-crisis environment in that it confirms the vision and values of an organization. The leader’s ability to communicate includes one’s aptitude to articulate verbal and oral expressions, make eye contact, and not interrupt while others are speaking, as well as to reiterate the key points of the communication in order to confirm the understanding of the respondent (Klann, 2003). Ensuring an organization’s vision and values are clearly presented must be relayed by the leader, especially in a time of crisis. A leader must ensure the vision is interrelated with the values of the intuition in order to present a common goal and objective.

In agreement with Klann (2003), former president of Nassau Community College and author Sean Fanelli (1997), explains that in times of a crisis, a leader within the community college system must act efficiently and quickly while being able to “communicate, communicate and communicate. Communicate with the board, communicate with the college community, and communicate with the stakeholders” (pp. 65). An open relationship between the board of trustees and the president is necessary when pre-planning for a crisis. Although difficult because of its unexpected nature, pre-planning for a time of crisis will assist in lessening the impact of the crisis. Another term for a community college president could easily be “chief communicator,” because of his/her capacity and close relationship with the college. During both times of crisis and non-crisis, the president must uphold his/her leadership role and be the one who
communicates with the college, not the trustees who are frequently detached from the
day-to-day functions (Fanelli, 1997). If addressed appropriately, a crisis situation can
strengthen the relationship between the president and board of trustees to increase the
president’s ability to act as an authentic leader.

The last method Klann (2003) presents, to be applied by a leader during time of
crisis, is genuine interest and concern for others in the organization, also known as an
authentic leadership style. In order for affective communication to occur, a leader must
be empathetic: to imagine what it feels like to be on the receiving end. In having a
concern for the followers, a leader will meet the emotional needs of the people. Klann
claims, “When normal, emotionally healthy people are treated with respect, dignity,
approval, appreciation, attention, significance, value and trust they will generally respond
in kind” (2003, pp. 15). A leader’s authentic style will allow them the ability to sell the
vision and goals while leading the organization out of a situation of crisis.

In addition to Klann’s three key components and styles a leader should uphold in
time of crisis, there are leadership traits that can assist the leader as well as hinder their
ability to formulate a solution. A crisis is best managed when the leader takes charge and
executes greater authority than they would during times of non-crisis (Simone & Baker,
2003). In addition, leaders are to act in a confident and decisive fashion as a way to
increase their effectiveness (Yukl, 2002).

To avoid a crisis from escalating, there are four main response mechanisms a
leader can practice: dominance, hierarchical appeal, restructuring and negotiation
(Simone & Baker, 2003). Although dominance, through the application of fear, and
hierarchical appeal by forwarding issues to “the next” level of authority, may be effective
in some scenarios, for higher education in a time of crisis, restructuring and negotiation are more likely to have a positive impact. Restructuring is literally the concept of reorganization of the institution, whether it is through the merger of two departments, elimination of job positions or an alteration of hours (Simone & Baker, 2003).

The last mechanism, and most frequently used to prevent a negative occurrence from advancing into a crisis, is bargaining and negotiation (Atkinson, 1980). Bargaining is suggested for the leaders well versed in this skill because it does require practice in order to be effective. When financial resources decrease, either integrative or consensus bargaining should occur. Integrative bargaining happens when a solution is mitigated to benefit both parties, while consensus bargaining allows both parties to participate in the development of a solution (Atkinson, 1980; Simone & Baker, 2003).

In a time of crisis, when little compromise is attainable, very similar to the current environment with the limited amount of funds allocated to higher education, Daniel Goleman (2000) suggests a leader adopt an authoritative leadership style and support this style of leadership with affiliative and coaching leadership approaches in order to efficiently and effectively find a solution. Authoritative leaders organize followers and work towards a vision, communicate effectively, and generate confidence (Goleman, 2000). While authoritative leaders possess self-confidence, affiliative leader are better at communicating and mobilizing followers to join. Because crisis has no established end date, it is necessary for leaders to coach and grow new leaders for future occurrences. A coaching leadership style works to develop future teams and strives to improve performance (Goleman, 2000).
Leadership in Higher Education

Evolving from an institution consisting of one school, Harvard University, with nine students in 1640, to a system of over 18.2 million students enrolled in over 3,300 schools nationwide in 2009, the institution of higher education faces many challenges as it continues to mature (National Center for Education Statistics, 2009; Kerr, Gade, Kawaoka & Ebrary, 1994). As a result from the changes occurring in higher education a call for a new form of leadership is apparent in order to uphold the vital part that higher education plays in the United States. Colleges and universities must work through the current economic conditions as a means to sustain the U.S.’s possession of three-quarters of the world’s best universities (Kerr et al., 1994).

According to the evolving role of the president, Kerr (1994) presents three models addressing how president in higher education are viewed: “organized anarchy,” “faculty opinion,” and “presidents make a difference.” The first model, “organized anarchy,” explains that the role of the president is mainly important to the president him/herself. The function of the president is an ambiguous role, where the president often times does not know what he/she should be doing. While each presidential position comes with a job description, often time the day-to-day responsibilities encompass much more. In the second model, “faculty opinion,” the president is viewed by faculty as “autocratic” or “despotic.” This model is present when more than two-thirds of the faculty sees the president as doing an average or poor job in the role of leadership. The last model presented by Kerr, entitled “presidents make a difference,” is when the president upholds his/her role, takes on the most responsibility and provides the glue to hold the entire organization together (Kerr et al., 1994). In the publication of his book *On Leadership,*
John W. Gardner (1990) supports Kerr’s model of “presidents make a difference” (Kerr et al., 1994). Garner explains that the role of the leader is to help in selecting and developing goals and values, motivating followers, promoting unity through their influence of the followers. During a time of fiscal crisis, the leader must strive to demonstrate model three: “presidents make a difference” in order to lead the institution out of the debris.

Upholding Kerr’s notion that a generalization cannot be made regarding leadership in the institution of higher education, no one model fits all situations. However many modern theories suggest the use of authentic leadership be applied in the realm of education (Begley, 2001; Crippen & Wallin, 2008; Villani, 1999; Evans, 2000). Authentic leadership, being a rather new paradigm of leadership, is still in its formative phases and continues to maintain a high probability of undergoing continued change and evolution (Northouse, 2010). For use in this paper, authentic leadership, as defined by the developmental perspective of Avolio, states that this leadership style is “something that can be nurtured in a leader, rather than as a fixed trait. Authentic leadership develops in people over a lifetime and can be triggered by major life events, such as severe illness or a new career” (Avolio & Gardner, 2005, pp. 207). Authentic leadership is embedded in one’s strong ethics and is made up by four elements: self-awareness, personal moral perspective, balances process and transparency within a relationship (Avolio, Walumbwa, & Weber, 2009).

Using the theory of authentic leadership, Bill George developed a practical approach to the style of leadership looking at the characteristics, qualities and traits of a leader. George claims that an authentic leader possesses five basic characteristics: (1)
clear understanding of purpose, (2) strong values, (3) development of solid, trusting relationships, (4) practice self-discipline regarding one’s values and (5) zealous about one’s mission (2003). According to the theory, these characteristics must be upheld by today’s higher education leaders.

Specific Concerns

The economic challenges facing the higher education system have varying effects from institution to institution. The community college system has been viewed as the “workhorse” of higher education because it must respond to the needs of the specific community (Boggs, 2001). The primary role of leaders within the community college system is to provide vocational programs and workforce development, thus increasing the stakes in the push to transfer funding from the university level to the community colleges.

With the initial purpose of defending a civilized way of thought and to provide schooling of ministers, the role of universities has greatly evolved (Kerr et al., 1994). During a time of shrinking budgets, undergraduates at public colleges will bear the bulk of the pressure through higher tuition, larger classes, and less ability to communicate with tenured faculty (Lewin, 2009). States are now facing deficits totaling around $350-billion and higher education has and will see an additional decrease in funding allocations. The federal stimulus package of 2009 included approximately $40-billion intended to offset the cuts to education, however these funds did very little to actually offset deficits (Kelderman, 2009).

As governmental funding decreases, community colleges are now looking to external funding. Universities are turning to online education in an attempt to decrease the overhead of the college (Cejda & Leist, 2006). Meanwhile, distance education may
appear as a cheaper alternative, yet comes with the increased costs of training staff and the necessary upgrade of technology products.

To increase the weight of the floundering economy onto the college and university system, this sector of higher education may undergo even greater cuts. A *New York Times* article entitled “State Colleges Also Face Cuts in Ambitions,” presents the issue of transferring funds from the university system to the community college level (Lewin, 2009). The costs to run a community college are far less than the expenditures needed at the university level because there are no funds needed for research. While community colleges can run on smaller budgets, there has been an increase in the discussion of decreasing funding at the community college level in order to distribute more funding to public universities in California.

At the community college level, the most important qualities to be demonstrated by a president are adaptability, flexibility, and sound judgment (Pierce & Pedersen, 1997). Personal adaptability and the skill to work with an array of stakeholders, including students, parents, boards of trustees, government entities, as well as the community at large, is vital to the success of a president. In addition to a president’s adaptability, he or she must be flexible and mediate among the various entities involved at the community college level. The skill to bargain and negotiate is critical for a president in times of crisis as well as non-crisis (Simone & Baker, 2003; Pierce & Pedersen, 1997). Lastly, the hardest to achieve is the aptitude to listen to an eclectic range of issues, weigh the options, and finally make a strategic and sound decision. As community colleges find themselves in the current financial struggle, a president’s capability to make tough choices will determine which campuses will thrive and which ones will dwindle.
Similar to the preparations that would take place in response to the threat of an earthquake or flood, a college must prepare for a time of economic recession. Though the date a crisis may hit is unknown, a strong leader must be able to anticipate a time of disaster. According to Brian Kelly, author of “Colleges in the cross hairs: Consumers must be careful but also have more choices,” it was only a matter of time for the bursting of the educational bubble (2009). Higher education was one among many industries, like investment banks, condominium sales, and subprime mortgage lenders, to benefit during the past two decades (Kelly, 2009). Kelly explains that alumni giving was up while tuition was inflated much more than cost of living increases, thus leading to the “golden age of campus life” (2009). Instead of being an avid student of physics and understanding the concept of “what goes up, must come down,” colleges did not prepare themselves for the bubble burst and a recession expansion across industries.

As higher education continues to undergo a negative fiscal climate during the current recession, leadership is becoming very political (Gunter, 2001). Politics, the notion of who gets what, when and how, increases when resources become scarce. Potential leaders in the realm of higher education are being scouted from the political and business sectors, rather than from academic or administrative arenas (Appadurai, 2009). The university president’s role as a fundraiser to the campus is ever-increasing as private giving, and state and federal dollars shrink. College and university presidents from the business and political realm come into the position with a database of potential financial contributors. In addition, as the recession places pressure on the economy, business leaders see working in education as a stable sector of the economy, ensuring job security.
The “new” wave of leaders in higher education will prove to be beneficial as well as a liability to the institution. A president with a business or political background is predicated to better handle the media, create a positive relationship with the board of trustees and to master the social factors embedded in the role of leadership. Besides, a president with a business background will most likely stick to and uphold a performance-based model, which should be beneficial during a time of fiscal crisis, this might be costly to class sizes, the field of research and curriculum. Conversely, relationships with faculty, maintaining clarity of new educational practices and published research, and sustaining a genuine concern for the institution of higher education will likely suffer (Appadurai, 2009).

Despite the challenges posed to the level of higher education during a time of financial crisis, with the direction of a strong leader who has a vision for a positive future, the system can reorganize to be better than before. Never before has there been a better time to improve upon the institution of higher education.

Higher Education in California: A Case study

Receiving final approval by February 1960 from the Board of Regents, the California State Board of Education as well as the legislature, the original Master Plan for California’s Higher Education set out to accomplish four goals (University of California: Office of the President, 2009). The first objective is for the Master Plan is to create a system to uphold quality and allow access to higher education for all students. The second dimension set out to generate a cohesive and rational system to include universities and colleges in California. In doing so, colleges would be less likely to compete and work together in providing a universal system of higher education attractive
to all students. In correlation to the second mission, the plan established a framework for higher education and encouraged the three segments of higher education (University of California universities, State colleges and Community colleges) to reach excellence within their respective realms. The mission of the University of California schools is to become the state’s primary research institutions; meanwhile, state schools are to provide undergraduate education and graduate research for students in pursuit of a higher degree. The last piece to the higher education equation is community colleges, which are to provide academic and vocational instruction, allowing students to complete lower division courses or obtain a certificate or credential. Finally, the Master Plan recognizes the critical role of private and independent colleges, thus creating a continuum of higher educational opportunities in California (University of California: Office of the President, 2009).

The term “social contract,” coined by Rousseau and conceptually present in the U.S. constitution, is an agreement between the government and citizens. People are to give up freedoms as a means for the government to ensure social order through its assertion of authority (Rousseau, 1762). On a micro level, the social contract of higher education is the agreement between colleges/universities and the citizens to be provided with the opportunity of higher education to all. In the report “Breaking the Social Contract: The Fiscal Crisis in California High Education,” paid for by the William and Flora Hewlett Foundation and commissioned on behalf of the California Education Round Table, suggested that the course of higher education in the late 1990s was unsustainable (1998). The study reported that the increase of college costs out-paced available funding. A frequent tactic used in the past to offset the cost of higher education
was to raise tuition rates because higher education had been seen by some as a private good, thus the justification that a student should bear more of the funding burden rather than the taxpayer was an obvious conclusion (Breneman, 2008).

The increase in tuition fees has prevented many California residents from being able to pursue their goals in higher education. As predicted in the report, as tuition fees increase, by 2015, up to 45% of students will be denied access into college (Benjamin et al., 1998). In order to prevent this prediction from becoming a reality, the report recommends: (1) political leaders in California reallocate additional public funds to higher education; (2) colleges restructure in order to redistribute scarce resources; (3) institutions in higher education diversify their mission; (4) colleges and universities establish a sharing mechanism to capitalize on the efficiencies of increased productivity; (5) the state creation of a strategic plan to distribute scarce resources and; (6) Californians be open to pursue an alternative form to postsecondary education (Benjamin et al., 1998). While these are all worthy suggestions, it is essentially up to the decisions of the legislature and executive offices in California to determine what the future will likely hold.

As California enters into a new decade, the predictions made over ten years ago have become a reality because little action was taken to address the needs of higher education in the state. Between furloughs, a term made familiar to many government employees by Governor Arnold Schwarzenegger, frozen budgets, and IOUs, the entire state of California has become a prime case study of fiscal disaster (Associate Press Writer, 2010). As of February 14, 2010, California was $6 billion short of funding needed to maintain basic programs in the current fiscal year and estimated another $14 billion in
shortcomings on July 1. With the increasing deficit of the state, higher education will not go unharmed (Associate Press Writer, 2010).

While the politics in Sacramento further cripple the economy and viability of the state, the system of higher education have not passively stood by waiting for the legislature to comprise a “fix.” Leaders in higher education are considering every solution. For example, UC Berkeley’s public policy professor proposed entirely eliminating student fees. The universities would receive funding through a required percentage of alumni income (Gordon, 2010). No possible solution is being denied attention as the system of higher education must take action to hopefully succeed, or otherwise go by the wayside.

**Recommendations in moving forward during times of fiscal crisis**

The current state of economic crisis throughout the United States and the great pressures placed on the system of higher education is a call to action for all leaders within the system. When a crisis arises, leaders must rise to the occasion (Quinn, 2005). Leaders within the state governmental roles of power (governor and legislature) and leaders within higher education can no longer disregard the structure of higher education in hopes that the fiscal crisis will soon pass. Though the economic cycle is often times predictable, and should recover on its own according to Adam Smith’s theory of the invisible hand, the institution of higher education is in need of reorganization in order to ensure the continued vitality and the possibility of continued public higher education in the United States.

As stated by Clark Kerr, author of the California Master Plan for Higher Education, it is highly difficult to predict the future of higher education (Kerr et al.,
Nevertheless, history does repeat itself and an economic downtown is not unknown to the budgets of higher education. Higher education managed to survive and even prevail after the most severe fiscal crisis in the United States: the Great Depression of the 1930’s. However, a new trend has developed during the previous recessions, which may limit the favorably of public higher education, and that is the advent of private education. Private colleges such as the University of Phoenix and DeVrey University are increasingly becoming viable options as they accommodate students, focus on customer service and, most importantly, are now comparable at cost to public colleges and universities. “Our traditional institution can learn valuable lessons from these new entities [private colleges], particularity in their focus on accessibility, convenience and service to nontraditional students” (Breneman, 2002). By reviewing the trends of private colleges, the public institution of higher education may remain competitive in attracting students and faculty.

As proposed by Klann (2003), the ability to communicate, develop a clear vision and strong values, as well as to express empathy, are all integral leadership traits (2003). Communication is vital not only in time of non-economic hardships, but imperative during times of crisis. Communication must occur between the leader and his or her employees, but the stakeholders such as community members and customers, which in this case are students. When a leader establishes, communicates and remains focused on the mission of the organization, all parties involved will know the direction of the college or university. For example, the original vision of the California community college system was to “offer academic and vocational instruction at the lower-division level” (Rosenhall, 2010). Though during the past decade, community colleges have taken
on additional roles in the community, such as providing remedial education, recreational courses, and allowing high-school students to get a head start on their college courses free of charge. If community colleges were to go back to their mission and decrease the additional services provided, they might be able to cut their budget and better adapt to limited state funding (Rosenhall, 2010).

Coming out of a recession will require thinking outside of the box and reorganization. While many industries are struggling, leaders in higher education must seek out synergies. For example, if a college campus is in need of infrastructure expansion, its leadership should look at the use of other local facilities. In doing so, the community becomes a unit working together to overcome harsh economic barriers. While some revenue can be raised from private-public partnerships, public colleges and universities must look at diversifying their sources of income; again looking at synergies and mainly turning towards private fundraising (Breneman, 2002).

Due to the federalist structure implemented in the constitution of the United States, state government has been given the greatest authority regarding public education. However, during a time of fiscal crisis, it is necessary for all levels of government to work cooperatively. For example, the Republicans in the House of Representatives introduced a bill that would prevent California, along with nine other states, from providing lower tuition to illegal immigrants at the cost of the taxpayer and the general institution of higher education (Wall, 2010). While education falls under the jurisdiction state government, this bill introduced by Congress is an example of the federal government getting involved and working at the state level.
There are also other tactics to be considered as a means to conserve funds. First, outsourcing entities like the bookstore, food service and maintenance will get educational institutions out of industries they are not familiar with and can return focus on their key mission: education, and in some instances, research. In addition, outsourcing will encourage competition, thus lowering the cost of service. Second, if the demand still exists, colleges should look to international students and out-of-state students who are willing and able to absorb a higher tuition. Implementation of distance education will attract a new body of students, but will also accommodate current student enrollment while maintaining and even decreasing the overhead costs (Breneman, 2002). Finally, community colleges should charge a premium program fee for specialized degrees such as nursing and culinary arts. The fee would still fall lower than that of private institutions, thus remaining competitive and allowing for some expansion of resources (classes offered, faculty, etc.), therefore accommodating additional students.

Similar to not having one solution to addressing the fiscal crisis in public higher education, one leadership style will not fit all situations undergoing crisis. The affect on higher education caused by the recession of the late 2000’s will not have a ‘one size fits all solution.’ All 50 states undergo much variance in the way their institutions of higher education are structured as well as in the allocation of state funding. Finally, studying financial hardships in the past will provide leaders with suggestions for the future, though each recession is unique, unpredictable, and with an unknown end date (Callan, 2002).

One thing is certain and apparent in previous studies; a leader in higher education who sets out to see his or her or her organization flourish must be well versed at communicating and establishing a vision. A college with a concert vision will ensure all
faculty and staff are on the same page working towards the same outcome; at this time, a means to conserve funding.

Conclusion

Though it is safe to say that most Americans have in some way, shape or form, been affected by the recession, there is a light at the end of the tunnel. A time of fiscal crisis will force the institution of higher education to examine its current functions, and reorganize in order to rise to the occasion (Quinn, 2005). Higher education in the United Stated has proven and must continue to be adaptable (Pierce & Pedersen, 1997), while favorably positioning itself post-crisis (Breneman, 2008). With leaders upholding effective crisis management traits such as strong communication skills (Klann, 2003; Fanelli, 1997), being visionaries of the organization (Klann, 2003; Garner, 1990), all while displaying an authentic style of leadership (Klann, 2003; Begley, 2001; Crippen & Wallin, 2008; Villani, 1999; Evan, 2000; George, 2003), the institution of higher education will continue to thrive. The new wave of leadership will need to be politically savvy through their relationships with the various groups within the organization like the faculty, elected officials, unions, donors and students (George, 2003). The next couple of years will lead the way for the increased use of technology and an offering of effective and efficient education for all.

Using Fading to Enhance Perception of Compression in Novice Listeners

Alabama State University
24 June 2010
Abstract

The ability to detect subtle nuances in full-frequency sound is a necessity for individuals in the fields of audio production and post production. However, training competence in critical listening is a difficult and lengthy process. The present experiment explores means of enhancing perception of compression, a signal processing technique that involves dynamic attenuation of an audio signal, and its artifacts in casual listeners. In the present experiment, the effects of gradual reduction in the intensity of compression (fading) and visual feedback on acquisition of perception of subtle compression were investigated. College undergraduates were exposed to short clips of music and were required to make yes/no judgments regarding the presence of compression. Participants in the experimental group received visual feedback about the accuracy of their performance, while participants in the control group were not provided with feedback. Results suggest that fading and visual feedback are effective and cost-efficient techniques for enhancing acquisition of perception of compression. Applied implications of the findings in the context of music industry education are discussed.
The field of audio post-production has traditionally consisted of a small, elite club of professionals whose practices involve the use of complex and expensive equipment such as signal processors (Izhaki 2009). For almost half a century, the restrictive nature of the industry was advantageous to major record labels who exercised near absolute control over the recording and distribution of music (Terrell 2005). However, recent developments in low-cost audio recording technology, and websites such as “YouTube,” have greatly increased interest, as well as a sense of personal empowerment, amongst the general public in regards to all aspects of recording equipment and techniques (Huber and Runstein 2010).

However, as the aspiring audio engineer begins to explore this formerly restrictive world of audio, it becomes apparent that simply possessing professional-quality recording equipment does not in itself produce professional results (Huber and Runstein 2010). When novices encounter these technical and intellectual barriers, many seek guidance and find that there is no shortage of books, instructional CDs, online courses, university degree programs and tips-n-tricks websites available to everyone from the hobbyist to the working professional on the recording, mixing and mastering processes involved in audio production and post-production. Ironically, as the individual sifts through the overwhelming amount of information in their quest for knowledge, many find application of the techniques increasingly difficult. This difficulty may be reduced by quality instruction in college or university degree programs in audio production and post-production.

The reasons for the high failure rate among the general public in this area are not altogether clear. It is possible, although unlikely, for an individual to acquire knowledge of the subject without formal training and then successfully apply that knowledge. For example, anecdotal evidence indicates that the average child can quickly acquire knowledge of computers
that surpasses most adults. Considering the ease with which children learn about new technology, adults should be able to learn to produce professional quality results within a Digital Audio Workstation (DAW). Certainly information is readily available on how to operate all major DAW software including ProTools, Cubase, SONAR and Logic. Furthermore, there is a wealth of information available on how to operate software run within DAW hosts such as VST plugins and ancillary audio hardware such as A/D/A converters. We have observed that the average college freshman can learn what equipment to buy in order to assemble a project studio capable of producing professional quality recordings in a short period of time, and we believe that the average person can acquire sufficient knowledge to operate this equipment after approximately one to two semesters of intense study. If our assumptions are valid, then the airwaves, TV and internet should be filled with professional quality recordings produced by a variety of independent artists. However, this is not the case. Leaving ancillary factors, such as TV and radio program directors, record labels and web content managers aside, the reason for this deficit must be related to a failure to apply these complex processes adequately.

Common to all aspects of quality audio production is the need for an engineer to possess a requisite skill set that contains a theoretical knowledge of audio, signal flow, acoustics, psychoacoustics and critical aural perception (Huber and Runstein 2010). Information on all aspects of recording and producing audio, with the exception of aural perception, is ubiquitous and can be readily acquired by motivated individuals. The possible deficiency in available pedagogy in the area of aural perception may be a critical inhibiting factor in the full development of individuals seeking to become audio engineers via self-directed study.

If the primary distinction between the professional audio engineer and an educated novice is a trained critical ear then the following questions must be examined:
1. What do engineers need to be able to hear in order to produce quality recordings?
2. Have effective methods been developed to train the ears of the aspiring engineer?
3. What are the best techniques for developing critical listening and technical competency?

The purpose of the present research is to examine the aforementioned questions and propose pedagogical techniques for one subset of audio engineering, specifically competency in the perception of compression that can be adapted to other subsets within the discipline.

Everest is among the few audio professionals who have developed a formalized ear training regimen for audio engineers. The author offers this work with the intent to “accelerate, not replace, the usual slow learning process [of the audio engineer] on the job” (Everest 1997, 2). The regimen, which contains both text and audio CDs, includes numerous examples and exercises useful for training the ear to identify various frequencies, changes in sound level, distortion, masking, binaural perception and certain types of reverberation. However, with the exception of the training exercises related to frequency perception, the material fails to address the perception of signal processing techniques used in audio production and post-production such as compression and limiting.

Compressors

The audio processors traditionally used in mixing and mastering processes, many of which are attributable to Les Paul’s work during the 1940s-1950s, include reverb, delay, modulation effects (e.g. chorus, flange) noise gates and dynamics processors such as expanders, limiters and compressors (Shea 1990). The functional durability of these devices is evidenced by the development of their digital corollaries in the last quarter century. The consensus of traditional audio professionals is that the effective use of audio processors, whether as analog
hardware, digital hardware or software plugins, requires both theoretical and practical knowledge of processor functions (Izhaki 2009). Additionally, an audio engineer’s ability to aurally perceive the subtle nuances of sound change, while manipulating various types of dynamic processors, is a fundamental skill required during production and post-production processes (Katz 2002).

Of all the signal processors available to audio engineers, perhaps the most critical is the compressor and its variants, the limiter and expander. The compressor is often applied at all stages of recording, from tracking to mastering. However, both novices and audio professionals may experience deterioration in perceived sound quality from their use. Authors such as Izhaki, do not hesitate to observe that, “the most misused and overused tool in mixing is the compressor - an especially worrying thing considering how predominant compressors [are] in contemporary mixes. Compressors, to a large extent, define much of the sound of contemporary mixes” (Izhaki 2009, 272). Similar opinions are held by Huber and Runstein who state that “the use of compression, limiting and/or expanders is one of the most misunderstood aspects of audio recording. . . [but] a well-done job won’t be obvious to the listener” (Huber and Runstein 2010, 491).

The compressor is a member of a family of devices known as dynamics processors. The primary function of these devices is to adjust the overall dynamic range of the audio track to which it is applied. Because the overall dynamic range of music can periodically exceed 140 dB and the specified dynamic range of a commercially released CD can not exceed 96 dB, a compressor may be inserted into a signal chain to reduce the dynamic range of the recording to accommodate Redbook CD specifications for the 96 dB ceiling (Huber and Runstein 2010). In contrast, if a recording’s dynamic range is less than 96 dB and the genre of the song being
mastered lends itself to having both loud and soft passages, the engineer can use an expander to lower the volume of the softer sections and raise, if possible, the level of the louder passages.

The typical modern compressor includes threshold, ratio, attack, release and gain controls. The threshold is the level, usually described as dB below 0dBFS, at which the compressor begins to operate. Signals below the threshold are unaffected, whereas signals above the threshold are attenuated by a degree set by the compressor’s ratio control, which defines the degree of signal attenuation that will occur. Ratio determines the degree of output relative to input. For instance, a ratio of 4:1 indicates that for every four dB input, only one dB will be output.

Attack and release controls affect the envelope of attenuation produced by compressors. The user can define the amount of time required for onset (attack) and offset (release) of compression. Incorrect selection of attack and release times can increase the number of sonic artifacts, such as distortion, produced by the compressor. Finally, the gain stage of the compressor is used to either attenuate or boost the signal after compression.

The ability of compressors to alter the dynamic range and sonic quality of audio tracks, combined with the complex interactions of its controls, allows for effects ranging from subtle control of peaks to ‘squashed’ and distorted signals containing little to no dynamic range. Audio professionals consider the setting of a compressor primarily a series of critical listening exercises. Specifically, the engineer (1) evaluates the raw track within the mix, (2) listens to the soloed track and makes initial settings, (3) listens to the soloed track with initial treatment, (4) evaluates the track within the mix, and if necessary (5) repeats steps 2-5 until desired results are achieved (Izhaki 2009). It should be acknowledged that the audio engineer will often revisit the initial compressor settings applied in the later stages of production.
Among signal processors, compressors are perhaps the most subtle and difficult to master. This is at least in part due to the change in frequency balance caused by dynamically altering the perceived loudness of a signal. Bruce Swedien, legendary engineer for Quincy Jones, emphasized this by noting that, “compression in general will remove high frequencies” when applied to audio (Clark 2005, 51). Like any signal processing technique, application of compression involves a compromise between the desired effect of the processor and sonic artifacts unrelated to signal attenuation that can be produced by compressors. As highly respected mastering engineer Bob Katz has noted, “audio processing is the art of balancing subjective enhancement against objective degradation” (Katz 2002, 202). It is unfortunate that, given the complex interaction of cognitive and technical skills required of the engineer while compressing a track, many college audio textbooks offer little more advice than “pay attention to the overall amount of compression that goes on in each song you hear and develop your own values for how much compression you like” (Gibson 2005, 191). We contend that aural competency in the use of compressors requires more than a simple “listen and copy what you like” approach; extended exposure and organized feedback are necessary components of acquisition of competency in these tasks.

If, as we contend, audio engineers’ ears must be adequately trained in order to successfully apply compression to audio, and no known comprehensive pedagogical technique addressing this specific skill exists, the development of such a technique may have broad benefits for all individuals attempting to acquire the skillset.

For over a hundred years, colleges and universities around the world have utilized a codified pedagogy for the training of music students’ ears. These courses, usually called Ear Training or Musicianship, are used to develop the music student’s skills in melodic, harmonic
and rhythmic perception, dictation and sight reading. This method involves presentation and feedback from the professor in the classroom, and it has been used successfully to develop musical competence.

A Black-Box Model of Music Perception

Because of the extreme variations in the frequency and timbre of different instruments, many of whose exact mechanisms of timbre modification are poorly understood, the acoustics of instruments are often modeled with a ‘black box’ approach in which the output of any given instrument is a function of both input and system variables. Input variables consist of the sound source. For instance, the input to an acoustic guitar could be the strumming, plucking or striking of strings at various locations on the guitar. Both the location and manner of string stimulation contribute to the input variable. System variables consist of sound modifiers and are far more diverse between instruments than input variables. For instance, the sound modifiers of an acoustic guitar are controlled primarily via the bridge of the instrument and include the top and bottom plates of the guitar, the air between plates, type of material used to construct the plates, material used to construct the neck and fretboard, type of strings used and the shape and size of the sound hole in the body. Both input and system variables contribute to the actual output of the instrument, but this is rarely heard by the listener. Rather, the output of the instrument serves as input to the room in which the instrument is heard. System variables in the room such as size and materials used to construct the room act to further modify the sound. The room’s output is what is ultimately heard by the listener.

Room effects can be greatly reduced in a number of ways. An anechoic room can be constructed in which all room reflections are absorbed via sound-absorbing material such as acoustic foam. However, eliminating all reflections can be difficult and expensive. An
alternative to the creation of an anechoic room is presentation of instrument output in ‘free space’ such as outdoors on grass. However, extraneous stimuli such as wind noise may act as system modifiers of the instrument’s output. The most practical and controllable method of eliminating room effects is through the use of headphones. Because the sound of the instrument is projected directly into the ear, the problem of room reflections is eliminated. However, projection of sound via headphones requires amplification of sound which represents another system variable. Fortunately, audiophile-grade signal paths and headphones have been developed that transduce instrument output into a perceptually identical signal. Thus, system variables produced by amplification have far less effect on the perceived sound of an instrument than do room variables (Howard and Angus 2009).

Applying the ‘black box’ approach to a complex musical signal (rather than a single musical instrument) is considerably more difficult for a variety of reasons. First, since a complex musical signal will encompass various frequencies within the full range of human hearing, the input variable of the source varies with the material being presented. That is, the input of ‘rock’ music will differ based on the instruments being played and their influence on each other, instrument tuning, scales and modes of the music being played and dynamic range of the music. Second, studying a complex musical signal necessarily involves recording and amplification of the source. Since the signal path used to record the signal can flavor the sound, the signal path itself must be considered a system variable. To minimize the effects of the signal path, high-grade components must be used throughout the entire signal path. Third, professional recording of music almost always involves the use of one or more room microphones in order to capture the music in a natural way. That is, the signal of the instrument is combined with controlled room acoustics to create a natural sound. In the absence of room microphones, music
tends to sound dry (due to a lack of natural reverberation) and incoherent (slight reverberation helps to aurally connect the sounds of instruments). Finally, since most audio is now recorded in a digital format due to the clarity and lack of noise that it provides, the manner in which digital audio is recorded must be considered a system variable to the input signal. Furthermore, professionally recorded music almost always involves some level of compression and equalization to individual instruments, an entire mix or both. Audio engineers add these elements to create ‘smoothness’ and loudness that is perceived as pleasant by the listener. Thus, compression and equalization represent system variables that are not specific to digital music but are an important component of all recorded music. To better understand how these factors contribute to perception of quality, the influence of additional room variables can be eliminated by presenting all music via studio-grade headphones.

It is important to recognize that black-box models are not created with the intent of explaining internal processes related to perception. Instead, they represent tools that allow researchers to make informed decisions regarding how to isolate variables and predict behavioral outcomes. The present model meets these criteria. If one is interested in understanding how audio production techniques such as compression and equalization (third-level modifiers) affect perception of sound quality, the model indicates that first-level (instrument) and second-level (room) modifiers must be carefully controlled in order to isolate the effects of the third-level modifiers. Furthermore, the model makes a variety of predictions regarding how sound quality will be assessed. For instance, assuming that professionally recorded audio involves each of the nine stages described in the model, the elimination of any of these stages (e.g. feeding instrument outputs directly into third-level system modifiers) should result in the perception of sound quality being less natural than if all stages were included. Similarly, reducing the number of
third-level system modifiers should result in perception of music being more natural (although not necessarily better) since hearing live music does not involve any third-level variables. That is, following room modification the instrument sound sources are output directly to the ear.

The Black-Box Model of Music Perception. In the first level, input and system variables related to individual instruments are output to the second level in which room-related sound modifiers further change the complex audio signal. During recording, the combination of instrument and room variables are combined and form the input for a complex musical signal. System variables in the third level are sound modifiers that are introduced during mixdown, mastering and digital conversion.

Fading

While many of the basic principles underlying learning are well understood in psychology, the dissemination of information to fields that could potentially use that information has often been slow. One reason for this is a lack of collaboration between disciplines. While
the information is available in many articles and books, its immediate applicability is not always apparent. One area in which many of the basic principles of learning can find utility is music industry education.

_Fading_ is a technique in which the intensity of a prompt is gradually altered based on the participant’s performance. Fading inherently involves the intrinsic or extrinsic reinforcement of response forms, as this is the criteria by which the intensity of the prompt is modified. This procedure and the processes underlying it have been studied for decades and are well understood. Fading is a central technique in the field of Applied Behavior Analysis and has been used extensively to treat a variety of behavioral issues. Although historically used primarily to treat behavioral issues related to developmental disabilities (e.g., Sidman and Stoddard 1964; Berkowitz, Sherry and Davis 1971; Luiselli, Ricciardi and Gilligan 2005), it has been successfully used to treat common behavioral issues as diverse as caffeine abuse (James, Stirling and Hampton 1985) and childhood insomnia (Piazza and Fisher 1991). Furthermore, the efficacy of fading has been established in a variety of non-human animals ranging from monkeys (Meisch 1995) to pigeons (Ploog and Williams 1995).

While there is little evidence of its formal use in music training, it may be useful for training musical competence. For instance, in training basic rhythm, an instructor may introduce a metronome to guide rhythm. Generally, the metronome is used to establish rhythm until internal rhythm is established. Once established, the metronome is removed. An alternative to this approach, and one that may be more effective, is to gradually reduce the loudness of the metronome as internal rhythm improves. Because auditory attention is largely a cognitive phenomenon, that is to say that the ears do not need to be pointed at the metronome for the sound to be processed, reducing the loudness of the metronome may allow the learner to allocate more
of their attention on their instrument and less attention on the metronome. As metronome loudness decreases, a greater proportion of the learner’s attention may be directed toward their instrument and internal rhythmic processes. Since auditory attention is cognitive, a learner could dynamically allocate attention to the metronome as needed. However, as the loudness of the metronome decreases, it will represent a smaller proportion of the available auditory stimuli and will thus be less likely to attract the attention of the listener.

Carefully arranged fading procedures may also be exceptionally useful in the training of many of the critical listening skills necessary for audio engineering. One difficulty in using fading for training critical listening skills is the inherent subjectivity of judging sound quality. Because there are not universal standards regarding what makes music sound “good,” using fading to enhance overall perception of sound quality may not be possible. However, most audio engineers agree that the creation of professional-quality mixes and masters involve the application of certain processes. These processes include, but are not limited to, compression, limiting, equalization, A/D conversion and reverberation. While there is a great deal of disagreement about what constitutes “good” when applying any of these processes, most agree that an understanding of the processes and equipment necessary to implement them are essential.

While disagreement about the nature of sound quality exists, an understanding of the way signal processing equipment affects sound is a necessary prerequisite to success in audio engineering. This is an area in which fading may prove exceptionally useful. The present experiment was designed to determine how fading of compression may enhance novice listeners’ ability to detect the presence of compression in unfamiliar music. In the experiment, we used clips of traditional jazz and modern electronic music. These genres were selected because they
represent opposite ends of the compression spectrum; traditional jazz is often compressed lightly or not at all, whereas modern electronic music tends to be very heavily compressed.

In the present experiment, participants were presented with a set of compressed and uncompressed music clips. Fading was used during training to gradually reduce the intensity of compression in each of the clips. During training, participants were provided with visual feedback regarding their performance in order to guide identification of compressed music clips. We hypothesized participants who were exposed to heavily compressed clips whose degree of compression was gradually reduced as a function of participants’ performance would correctly identify more compressed clips during testing than participants who were not exposed to fading training prior to testing.

Method

Participants

Sixteen psychology undergraduate students at a small state university were selected as participants. None of the participants had received any formal musical training, and none of the participants reported any history of hearing deficits.

Materials

Four 15-20 s clips of music were used during experimentation. Two clips were traditional jazz and two clips were instrumental electronic music. The jazz clips were performed by a jazz combo consisting of piano, guitar, bass, drums and voice. The clips were recorded using two AKG 414s for piano, two Neumann KM185s for overheads and a Coles 4040 on electric guitar into Steinberg’s Cubase 4 DAW software at 24-bit/96kHz quality via MOTU A/D/A converters.
Both electronic clips consisted of drums, bass, synth lead and synth pad. All sounds were produced using Native Instruments Battery 3, Native Instrument Kontakt 3 and Cakewalk Dimension Pro software instruments. The clips were recorded and mixed at 24-bit/96kHz in Cakewalk’s SONAR 7 DAW software using MOTU D/A converters.

All clips were normalized and then compressed using Sonitus:Compressor at a ratio of 3:1 with a 15 ms attack. Release time of the compressor was adjusted to fit the tempo of the song. Training clips were compressed at compression thresholds of -40dB, -30dB, -20dB and -10 dB. Another training clip was processed to produce 5dB of signal attenuation (compression threshold of approximately -6dB). Gain was added to each of the compressed clips to equalize the perceived loudness of each clip. Each clip was then published in 24-bit/96kHz quality in three forms: loud (no additional processing), moderate (-3dB) and quiet (-6dB). Digital music clips were presented to participants via Sony MDR-7506 headphones connected to a MOTU A/D/A converter. Clips were played using Cakewalk’s SONAR 7 DAW software.

Prior to training, participants were required to complete a questionnaire containing demographic and hearing-related questions. Experimenters recorded all responses using custom data recording forms that included participant and session demarcation, randomized numbers corresponding to music clips, correct/incorrect response selection area and criterion change checklist.

Procedure

Prior to experimentation, experimenters recorded music clips in two locations. Acoustic jazz clips were recorded at Alabama State University’s audio recording studio using the equipment described above. Electronic clips were recorded at Burning Hammer Audio Laboratory, a small, home-based studio in Montgomery, Alabama using the equipment described
above. Whereas both electronic clips consisted of original material arranged for the purpose of the present experiment, both jazz clips were extracted from a recording of Miles Davis’ “Donna Lee.” Once recorded, each clip was mixed and normalized. Compression was not added to individual tracks. While this produced mixes that sounded less polished than if track compression had been used, it avoided participant confusion related to discriminating between track compression and mix compression. The two tracks used for training were then compressed at a ratio of 3:1 at thresholds of -40dB, -30dB, -20dB, -10dB, (approximately) -6dB and 0dB, producing a total of 18 training clips. Although it resulted in no gain reduction, the uncompressed clip was passed through the compressor with a 0dB threshold to ensure that any sonic artifacts unrelated to compression produced by the compressor would be present in all clips.

All participants were psychology undergraduates who were selected due to their normal hearing and lack of musical training. Each participant, tested individually, was seated at a small table facing the experimenter. The participant was fitted with headphones and was presented with a set of automated instructions that explained the process of compression, provided examples and described the procedure of the experiment. All music clips used in the instructions were presented at the loudest level that would occur during experimentation, and participants were encouraged to adjust the volume knob on the MOTU converter to ensure that the clips were comfortably loud. The instructions with examples lasted approximately three minutes.

Following the instructions, participants in the experimental group began the training phase of the experiment. Each training session consisted of up to 100 trials, and participants were required to complete as many sessions as necessary to achieve competence in identification of the lowest level of compression (i.e. 5dB of attenuation). On each trial, participants were
presented with one of twelve music clips. Half of the clips were compressed, while the other half were uncompressed. While only four different clips were used at each criteria level of the experiment (compressed jazz, uncompressed jazz, compressed electronic and uncompressed electronic), each of the clips were presented at three loudness levels resulting in a total of twelve clips. Each of the six compressed clips changed when participant response criterion was reached in the manner described below. Order of clip presentation was randomized in each session via a random number generator.

All participants began the experiment being exposed to uncompressed and heavily compressed (-40dB threshold) music clips. On each trial, a randomly selected clip was played by the experimenter and the participant was instructed to indicate whether or not the clip was compressed. When participants made a verbal yes/no response, the experimenter provided visual feedback about their performance via a “thumbs up” or “thumbs down” hand gesture. Each session consisted of 100 trials divided into ten blocks of ten trials. Participants were required to reach a performance criterion of 80% correct responses per block in order to reduce the compression threshold. That is, when participants obtained at least eight correct responses in a block of ten trials, the compression threshold was increased by 10dB, thus resulting in less severe attenuation of the compressed signal. This process of gradual reduction of the intensity of a stimulus based on the performance of the participant represents the psychological principle of fading. In order to complete the training stage of the experiment, each participant had to reach the criterion for each compression level (-40dB threshold, -30dB threshold, -20dB threshold, -10 dB threshold and -6dB threshold). Participants required between two and six training sessions to reach criterion with the clip attenuated by only 5dB. Each training session was separated by no less than one day and no more than four days.
Following completion of training, each participant was tested using different music clips. Again, twelve clips of music (four clips x three loudness levels) were presented in random order for 100 trials. Each participant completed 100 trials, irrespective of performance. All compressed clips were presented at the lowest compression level (5dB of attenuation). Participants were again asked to indicate whether each clip was compressed, but no feedback was given by the experimenter regarding the accuracy of the participants’ responses. Following completion of the testing session, participants were provided with evidence of participation for purposes of extra credit in psychology courses and were dismissed.

Each participant in the experimental groups was then matched with a control participant based on age and sex. Like participants in the experimental group, participants in the control group were psychology undergraduates with no formal musical training and no reported history of hearing deficiencies. Participants in the control group were treated identically to their matched experimental participant, except that they were not provided with feedback regarding their performance during training. Each control participant completed the same number of training trials as their matched experimental counterpart and completed 100 testing trials.

Following completion of the experiment, mean number of correct responses during testing was calculated for each group and compared using a one-tailed paired t-test.

Results and Discussion

Mean numbers of correct responses were compared between the experimental (n=8) and control groups (n=8) using a one-tailed paired t-test. As hypothesized, participants in the experimental group (M=56.875, S=10.162) made significantly more correct responses than participants in the control group (M=47.5, S=5.632). This was confirmed using a one-tailed
paired t-test, \( t(7)=1.908, \ p=.049 \). These results suggest that fading accompanied by immediate organized feedback produces more correct responses than simple exposure.

The observed differences between group performances are relatively modest. This could be due to a number of factors. First, data were analyzed using a paired t-test. This was due to our intention to match participants across a variety of factors. Unfortunately, our participant population was relatively small and did not allow for matching across factors such as amount of time spent listening to music per week. Instead, participants were matched only across age and sex. Selecting a paired t-test for analysis involves the assumption that there is a definite relationship between pairs. Paired t-tests are often used to compare pre-treatment and post-treatment performance. In such situations, the comparison being made is between the same individual at different times. In this case, the assumption of relatedness of pairs is accurate since the comparison involves the same individual. It is not clear that matching across such a narrow set of criteria as that used in the present experiment is sufficient to create a definite relationship between pairs. This point is important, because the criteria for reaching significance are lower when using an independent t-test. That is to say, the difference between experimental and control group means would have produced a lower p-value if an independent t-test had been used. We chose to select more conservative criteria for analysis to avoid overstating the effectiveness of fading and visual feedback on the perception of compression.

Second, all participants were novice listeners with no formal musical training. Furthermore, none of the participants had declared majors or minors in music-related fields. Thus, we may assume that their inherent level of interest was lower than that of students actively pursuing degrees in music-related fields. This was confirmed repeatedly in informal conversations with participants. Some participants reported being bored during the experiment
and disinterested in the topic of study. The lack of interest may have resulted in insufficient attention being directed at the music clips. Presumably, this would be less of an issue with Music Industry majors, since they have voluntarily declared an interest in music via their selection of major.

Finally, the modest difference between groups may stem from the inexperience of participants. Since all participants were novice listeners, perception of sonic artifacts as subtle as those produced by compression may have been overly difficult. It is likely that some minimal critical listening skills are required to benefit most from the training program, and because participants were novice listeners, they did not possess the requisite skills necessary to gain the most from the training experience. It is worth acknowledging that compressors reduce gain and each clip was presented at three loudness levels. It is possible that participants had difficulty distinguishing between gain reduction caused by the compressor versus changes in gain made manually for each clip. If the modest differences between groups are a function of inexperience, it is likely that extended training would enhance performance.

It is also worth noting that the primary difference between groups was in the receipt of visual feedback. Participants in the control group were exposed gradually to less compressed music, but they did not get feedback about their performance. Simple exposure may be sufficient for the development of some degree of critical listening competence, and the difference between groups may have been greater if the control group was exposed only to the most lightly compressed music clips. That possibility is currently under investigation.

Irrespective of the cause of the modest difference between groups, the difference was still significant. Thus, a program involving fading of signal processing techniques and immediate
feedback about performance appears to be an efficient and economical means of developing critical listening skills related to audio engineering.

As indicated in the black-box model of music perception discussed earlier, it is possible to use fading and feedback to emphasize listening competency at virtually any level of music creation, production and post-production. For instance, system variables in the first level (sound modifiers) such as string tension could be gradually modified to enhance perception of tuning. System variables in the second level (room modifiers) such as degree of reverberation could be gradually decreased to enhance perception of wetness/dryness of a music signal. Considering the robust applicability of fading and immediate reinforcement across a variety of behaviors and species, it is reasonable to assume that competency in identifying any of the modifiers in the black-box model could be acquired via fading and immediate reinforcement.

The issue of criteria for training completion is currently unresolved. We set a criterion level of 80% correct responses on a block of ten trials for advancement to the next lower compression level. Performance during testing could likely be enhanced by increasing the criteria, although this would almost certainly lengthen the duration of training substantially. One must consider that issues such as frustration and fatigue may contradict the effects of training, so selecting criteria that meet the needs of a program while avoiding such issues is important.

**Implications for Music Industry Education**

A critical consideration during course development is ensuring that students have the basic prerequisite skills required to benefit from the course. This is often accomplished through prerequisite courses that must be taken prior to enrollment in the course. However, in music industry programs, critical listening courses are rarely required as prerequisites. Instead, critical listening is often integrated into entry level courses such as Physics of Music and Basic
Perception of Compression

Recording. This is problematic for two reasons. First, even introductory courses require some degree of critical listening competence, and by integrating critical listening training into the course throughout the semester, students may be required to retrospectively apply those skills to previously presented audio material. Second, critical listening skills are developed over an extended period of time, and there is a great deal of variability in the amount of time necessary to acquire each of the skills that contribute to the general skill set of critical listening.

The results of the present experiment suggest a low-cost means of establishing basic listening skills prior to beginning the curriculum of any music technology or audio production academic program: automated, feedback-based programs involving fading that emphasize competence in a single signal-processing technique. This approach overcomes some of the problems associated with integrating critical listening skills into courses. First, it allows instructors to safely assume that a basic set of listening skills have been acquired prior to enrollment in their courses. The skill set required by each institution could be tailored to the needs of each program. This would not only assure that the skill set necessary for success in the course had been acquired, it would also free up additional time to address issues directly related to the course.

Second, it would allow students to develop the skill set at their own pace. In the present experiment, we found a high degree of variability in the number of training sessions required to reach full competence. Because participants were tested individually, they were able to spend the necessary time required to correctly identify compression-based artifacts. This would not be possible in a group-based classroom. Furthermore, it allows flexibility in when the skills are acquired. Students who have spent several hours in classes prior to critical listening training may be fatigued or may have difficulty focusing auditory attention. A software-based training
program can be made freely available to students so they can benefit from the training when they feel prepared. This could be accomplished by making the program available on student service sites such as BlackBoard and WebCT or could be provided to students for installation on personal computers.

An automated system also has the advantage of providing consistency in training. Because courses are often taught by a number of instructors, assurance of consistency between sections of a course is difficult. An automated system overcomes this by allowing an objective assessment of skills deemed necessary in the field of audio engineering.

In summary, critical listening skill acquisition is necessary for success in the music industry. In any academic program, time- and resources-management are prime considerations in course development. Results of the present research suggest training using fading of signal processing artifacts combined with visual feedback can enhance perception of the presence of those artifacts in unfamiliar recordings. Such a technique is advantageous because it can be automated for computer-based training, is relatively inexpensive and allows instructors to ensure that all students have met the minimum criteria necessary to benefit from courses.

The Effects of Comic Books and Graphic Novels on Literacy

Jessica E. Platt
The Effects of Comic Books and Graphic Novels on Literacy

Comic books, when knowledgeably selected and made easily accessible, may help to promote literacy, increase overall language skills, and encourage further exploration into other forms of media. Comic books are beginning to be acquired in libraries, including school media centers, classroom libraries, academic libraries and public libraries. Some teachers have even integrated them as part of reading and writing curricula, an activity which increases the benefits of this media for struggling or reluctant readers. The scholarly world has finally begun to reconsider the potential of comic books and graphic novels as educational tools. This may be due to the positive changes that have occurred (and are continuing to occur) in the comic book industry. Furthermore, few people involved with teaching literacy would argue that comic books are not attractive reading materials (Hill, 2006).

The American Library Association began promoting comic books as a tool for teen literacy in 2003. These materials have proven to circulate in public libraries at a rate twice that of traditional books and are extremely popular with readers of all ages. In fact, comic books and graphic novels are even being used by some college professors to increase literacy skills. English professor Rocco Versaci in San Marcos and Physics professor James Kalalios at the University of Minnesota are two such individuals who have brought comic books directly into their teachings. Versaci asks students to “critically examine the very definition of literature” using comics; Kakalios offers an intro to Physics course called “Science in Comic Books” (Pennella, 2004).

Before attempting to determine whether comic books and graphic novels have a significant impact on literacy, it is important to understand the basic concepts behind this idea, namely, the difference between comics and graphic novels and the meaning of the term literacy.
McCloud (1993) defines comics as “juxtaposed pictorial and other images in deliberate sequence, intended to convey information and/or produce an aesthetic response in the viewer.” Gaps between the text and images are often just as important as the text and images themselves and demand viewer participation, thereby creating a unique reading experience. Graphic novels may also be defined in this way, although they utilize the book format rather than thin, single issues. They sometimes bring together a series of comics; at other times, they are conceived as novels. Graphic novels are more appropriate for inclusion in libraries because of the durability of their bound format. It should be understood by librarians and educators that graphic novels (and comics, for that matter) are a medium, not a genre.

The definitions of literacy have changed as society has evolved. As recently as 150 years ago, literacy was simply measured by a person’s ability to write his or her own name. The concept of literacy has widened over the years to include the ability to read longer and more difficult texts, to distinguish between facts and opinion, and to write effectively. Due to concerns by researchers such as Eliot Eisner and Howard Gardner, the definition of literacy was broadened even further to minimize unfair advantages to students (Gallego & Hollingsworth, 2000). Since the early nineties, the field of literacy has seen an expanded conceptualization to consist of such inclusive language as new literacies, multiliteracies, media literacy, and visual literacy. Some researchers advocate the power of combined images and text and believe that visual representations deserve to be considered valuable representations of learning in schools. In fact, since literacy is considered necessary to succeed in other subject areas, the association of visual representation with literacy may be seen as one of the most powerful alignments. It is unfortunate that, at a time when young people make up such a large group of consumers of mass media and popular culture, curricular standards and teaching practices have moved further away
from real-life engagements with media to more traditional approaches to teaching and learning (Sanders-Bustle, 2003).

Most children who are provided with adequate instruction do become literate members of society. Unfortunately, approximately thirty percent fail to reach functional levels of literacy (National Center for Educational Statistics, 2003, as cited by Morrison, Bachman, and Connor, 2005). A portion of children in this group are learning disabled or have language or other communication challenges, but many simply receive instruction that is not effective for them (Morrison, Bachman & Connor, 2005).

Purpose of the Study

The purpose of the current study is to closely examine the effects of comic books on literacy by performing an extensive literature review and surveying librarians on The University of Alabama’s School of Library & Information Studies’ Listserv (SLIS-L), as well as employees of comic shops. It is the goal of the author to determine whether comic books have a significant impact on literacy rates among various age groups. This knowledge may be shared with professionals and the public in the hope of increasing understanding and acceptance of this much-maligned media form and thus helping to improve literacy rates.

Literature Review

Many studies have been performed on the effects of comic books and graphic novels on literacy, and “literacy research has shown the potential usefulness and high interest level of comic books” (Horner, 2006). Since 1978, studies have found mainly positive correlations between comic books/graphic novels and literacy, beginning with Arlin & Roth (1978), whose findings contradicted the writings of anti-comic activist Fredric Wertham. When one considers the concept of emergent literacy, there is no debate that “visual images have a valued role in
emergent literacy as young children begin making sense of their worlds through visual cues that inform reading and writing” (Sanders-Bustle, 2003, 159). However, visual images are not only effective for teaching young children.

“The rise of graphic novels, in particular the Pulitzer Prize-winning Holocaust-themed *Maus: A Survivor’s Tale*, by Art Spiegelman, has paved the way for wider acceptance of comic books as literature. Graphic novels represent a real, viable component of literature” (Finkel, 2008).

Further evidence of the respect this medium has garnered is seen in the fact that over thirty comics research libraries now exist (Scott, 1990).

A misconception about comic books and graphic novels is that they are easy to read, since their pages contain many pictures. In reality, they are often more challenging to read than plain prose (Schneider, 2007). Wright (1979) measured three 100-word samples from a variety of comics using the Fry Readability Graph and found that comics were more challenging to read than previously thought. In addition to developing vocabulary, comic books help teach context and introduce plot and sequencing. Moreover, for some students comics may also help pave the way into classroom discussions of higher-level text.

Comic books have also been used successfully to teach English Language Learners and autistic children (Finkel, 2008; Ranker, 2007; Gallego & Hollingsworth, 2000). Norton & Vanderheyden (2004) found that comic books have a positive effect on English Language Learners for the following reasons: they often combine a low reading level with a high interest level; the vocabulary is simple, but unlike many instructional texts, the situations in the comics are entertaining; the situations in the comics and the comics themselves provide an entry into North American popular culture; the comics are a shared experience with peers, and they also
depict daily American high school life, including aspects to which ELL students may not yet have been exposed. Perhaps most importantly, the “interplay between the pictures and the text [allows] the pictures to act as guideposts to unfamiliar vocabulary in the text, providing multiple cues towards meaning.”

Comics and graphic novels have been found to motivate reluctant readers. In fact, Bintz (1993, as cited by Lavin, 2004) found that “reluctant” readers often aren’t; their low reading ability scores did not indicate an inability to read effectively, but rather, a choice not to read effectively in the case of materials they found boring or irrelevant. These readers often used shortcut strategies to get through these “boring” materials as quickly as possible at the expense of comprehension. As the founder and director of the Comic Book Project (hosted by Columbia University’s Teachers College), Bintz has seen real-world examples of the effects of comic books on literacy. The School of Arts and Enterprise, a charter high school in Pomona, California, and the Newton D. Baker Elementary School of Arts in Cleveland are just two examples of schools that have seen positive results after implementing the Comic Book Project. Comic books foster comprehension and help readers visualize meaning and understand inference, which is difficult to teach young children because of its level of abstraction (Finkel, 2008).

Other researchers have found similar results regarding the motivation to read. Ujiie and Krashen (1996) found a correlation between reading for pleasure and reading comic books. In their study, they found that 65 percent of heavy comic book readers read for pleasure daily, compared with 37 percent of non-comic book readers. Sixty-five percent of heavy comic book readers said they liked to read, while only 48 percent of non-comic book readers made this claim. Krashen went on to say in *The Power of Reading* (1993), that light reading may be the “cure” for
The Effects of Comic Books and Graphic Novels on Literacy

the literacy crisis: the most significant predictor of literacy, he says, is not any specific type of
education program, but time spent in voluntary reading. Marsh & Millard (2001), in their case
study of 69 students whose school developed a comic book lending library, reported that children
had increased motivation to read and increased literacy because of the comics. Twenty-eight
percent of the students surveyed found that borrowing comics had made the children want to
read more at home, and the study also shed light on another interesting fact: even at the age of
seven or eight, children seemed to recognize the low status of comic books in academic settings.
Eighty-three percent of children surveyed thought that teachers would be opposed to letting them
borrow comics. This causes one to wonder: if children are aware of this low status of their
reading interests, what effect does this vilification of their reading choices have on their attitudes
toward reading? Jones (2002) discussed this problem as it relates to teens. The way to improve
adolescent literacy is to “show respect for the reading choices of young people. We compliment;
we don’t condemn…. To say or to convey the attitude of ‘at least they are reading something’ is
to show disrespect for what the teen, for whatever reason, has chosen to read.”

It should be noted that, while this medium is an effective motivational tool for reluctant
readers and those who have difficulty reading, gifted readers have also shown an interest in
comic books (Lavin, 2004).

Interviews with librarians indicate that, although teens are the most enthusiastic readers
of graphic novels, this medium is extremely popular. Amy Alessio, teen coordinator for the
Schaumburg District Library in Illinois, states that with a collection of 6,000 books, her library
circulates approximately 2,000 graphic novels per month. Eva Volin, head children’s librarian in
Alameda, California, echoed this, saying, “Graphic novels tend to turn at least two to three times
more often than general nonbestseller titles do.” David Serchay, youth services librarian for the
Margate Branch of the Broward County Library System and author of *The Librarian's Guide to Graphic Novels for Adults*, says that circulation of graphic novels at his library has been very high—so high, in fact, that they have a separate budget and a graphic novel selection committee (Hogan, 2009).

Gorman (2003) has summarized the popularity of this medium by saying, “Just putting them on the shelf resulted in half the children’s graphic novel collection going out in half an hour.” Furthermore, “very low-level readers may not be ready to tackle a chapter book, but pictures draw them in. Their curiosity leads them to the text” (Reynolds, 2004).

**Research Questions**

Two different surveys were administered for the current study. One was given to library professionals and students in The University of Alabama’s School of Library & Information Studies program, and the other was administered to comic shop employees in Montgomery, Alabama. Once surveys were returned, each participant was assigned a participant number for identification in order to protect privacy and ensure confidentiality.

The number and types of questions asked on each survey differed according to the population being surveyed. The Survey for Librarians contained the following questions:

- What is your position? (Please state your exact position and indicate the type of library where you currently work.)
- Do you believe that graphic novels and comic books improve literacy? If so, in what ways and for what age groups? Please explain.
- Have you ever collaborated with school teachers or comic shops to promote graphic novels or comic books? Please explain.
The Effects of Comic Books and Graphic Novels on Literacy

- Do you think that comic books and graphic novels can have educational value, in terms of motivating reluctant readers, providing visual cues for low-level readers, etc.? Please explain.

- Do you try to stay up to date on popular comic books, for readers’ advisory and collection development purposes? How do you stay up to date?

- Do you believe that comic books and graphic novels have a positive effect on English Language Learners? Please explain your beliefs on this issue and describe any experiences you have had.

- Please describe your experiences or opinions in general with comic books and graphic novels as they pertain to literacy.

- Are the graphic novel sections in your library separated by age or interfiled with fiction and nonfiction? Please explain.

- Is funding for graphic novels separate, or is it part of the teen, adult, and/or youth collections?

- How do circulation statistics on graphic novels in your library compare to the statistics for fiction and nonfiction titles?

- Since your library acquired a graphic novel collection, have more people begun to enter and use the library? If so, what age groups?

- How long has your library had a graphic novel section?

- How are graphic novels received by staff? By patrons? Is there a specific group who really seems to embrace them?

- Who are the main patrons of graphic novels in your library?
The Effects of Comic Books and Graphic Novels on Literacy

- Do you find it helpful when publishers put suggested ages on books? If graphic novels are separated by age in your library, how do you decide where to shelve graphic novels for which the intended age of readers is unclear?
- Does managing and maintaining a graphic novel collection pose any special challenges?
- Does your library provide any special programming or publications (storytimes, book clubs, displays, bibliographies, etc.) to promote graphic novels?
- In what ways could library staff better promote graphic novels?

The Survey for Comic Shop Employees contained the following items:

- Name of Business:
- What is your position?
- Are the comics and graphic novels in your business separated by age?
- What percentage of your customers would you say are
  11 years old and under? ______
  Age 12-18? ______
  Age 19-25? ______
  Age 26 and older? ______
- Do you find it helpful when publishers put suggested ages on books? If you separate materials by age, what do you do when you are unsure which age group a graphic novel should be shelved under?
- Do you believe that graphic novels and comic books improve literacy? If so, in what ways and for what age groups? Please explain.
The Effects of Comic Books and Graphic Novels on Literacy

- Do you think that comic books and graphic novels can have educational value, in terms of motivating reluctant readers, providing visual cues for low-level readers, etc.? Please explain.

- Do librarians or schoolteachers ever partner with you to promote the reading of comic books or graphic novels? Please explain.

- In what ways do you think library staff can better promote graphic novels?

- Please describe your experiences or opinions in general with comic books and graphic novels as they pertain to literacy.

Participant Profiles

Participants included two groups: library professionals and students of The University of Alabama’s School of Library & Information Studies program, and comic shop employees. Of the twelve participants in the library field, two have worked in a school library media center; three were academic librarians; one was a paraprofessional in an academic library; one was an academic library director; three were paraprofessionals at a public library; one was a systems administrator at a public library; one was an adult services supervisor at a public library; one was a branch manager of a public library; and two were students in The University of Alabama’s School of Library & Information Studies. (There was a small amount of overlap in these numbers, as two participants identified themselves as belonging to two different groups.) Only two comic shop employees were surveyed, and they were both comic shop owners.

Method

All participants in the library field were recruited on The University of Alabama’s School of Library & Information Studies listserv (SLIS-L). They affirmed their willingness to participate in the study by replying to an email invitation received via the listserv. Those who
replied to the invitation were sent a consent form and survey via email, and were asked to return both documents via email within one week. Approximately 24 surveys were distributed to this population, and twelve were returned.

All participants in the comic book industry were recruited in person. They were approached in their place of business, given an overview of the study and asked if they were interested in participating. Those who were interested were given a consent form and a survey and were asked to complete both documents within one week. Both documents were picked up by the researcher to minimize the burden on participants.

After collecting the data (receiving the surveys and consent forms), each participant was assigned a Participant Number to ensure confidentiality. From that point on, participants’ names were no longer used but were stored on a thumb drive accessible only to the researcher.

Results

Those surveyed in the library field provided the following information:

- Do you believe that graphic novels and comic books improve literacy? If so, in what ways and for what age groups? Please explain.

Eleven participants indicated that they do believe that graphic novels and comic books improve literacy. One person had mixed feelings; he felt that they may be a good way to spark interest in reading, but may actually limit literacy if they are the only type of book read.

- Have you ever collaborated with school teachers or comic shops to promote graphic novels or comic books? Please explain.

Three people surveyed responded that they had collaborated with others to promote graphic novels or comic books. One person had collaborated with a Reading Intervention teacher; one had collaborated with local comic shops to host “author talks”; and one had loaned
materials to comic shop clerks. (These materials were later ordered and sold to teachers who were encouraging high school students to create their own graphic novels as part of a school assignment.) Nine respondents had not collaborated with others for promotional purposes, but at least one of these nine people thought it was a good idea.

- Do you think that comic books and graphic novels can have educational value, in terms of motivating reluctant readers, providing visual cues for low-level readers, etc.? Please explain.

All twelve participants believed that comic books and graphic novels could have educational value.

- Do you try to stay up to date on popular comic books, for readers’ advisory and collection development purposes? How do you stay up to date?

Four people indicated that they stay up to date on popular comic books by consulting a Reading Intervention teacher; being an active member in organizations; attending professional conferences; staying aware of award winners; or by reading comics blogs, The New York Times’ Graphic Books Best Seller List, reviews, publishers’ catalogs, Library Journal, Booklist, and/or Diamond Bookshelf. Three respondents indicated that they either get a cursory glimpse of what is popular by reading professional materials, subscribe to gaming and comics newsfeeds, or visit comic shops and solicit recommendations from the clerks. Five people indicated that they do not stay up to date on these materials.

- Do you believe that comic books and graphic novels have a positive effect on English Language Learners? Please explain your beliefs on this issue and describe any experiences you have had.
There were no negative responses to this question, but seven people gave more information than others about why they believe that comic books and graphic novels have a positive effect on ELLs. One person responded that, “having a visual seems like it makes learning easier.” Another person, who had a certificate to teach English as a Second Language, stated that the emphasis is on communication skills rather than academic grammar. This person wrote that the “short, pointed dialog that is present in most comics, along with the visual reinforcement, can actually be more effective than having a new language learner read prose-only material.” This same person emphasized the importance of good selection skills on the part of the librarian. Another respondent wrote that, “assisting ESL learners with an easier to digest form of reading and comprehension than straight written library materials” can be accomplished with comic books. Another person stated that verbal humor and pictures are effective in teaching language to ELLs, while another wrote that comic books could help foster cultural literacy. Others believed that the pictures in comic books help build comprehension of English words, allowing greater fluidity while reading, and one person stated that “pairing words with images is a powerful way to learn a new language.” Three people had no experience with English Language Learners but felt that this medium would probably be effective in teaching language skills, and one person felt that it depends on the subject matter presented (i.e., an abundance of graphic violence or sexual content may have a negative influence on shaping an individual’s values). Only one person indicated that he did not know whether this medium could have an effect on ELLs.

- Please describe your experiences or opinions in general with comic books and graphic novels as they pertain to literacy.
Many respondents indicated that anything that gets people reading is worthy, and that comic books and graphic novels can serve as a gateway to other forms of literature. Some said that they could improve literacy by “attracting a new crowd,” and that graphic novels were always “hot” items in their libraries. One person mentioned that she worked at a low-income school and that graphic novels were extremely popular at their annual Book Fair. One librarian stated that graphic novels are slowly becoming more accepted as legitimate reading material, perhaps simply in an effort to attract patrons to the library. Another person wrote that his library commonly sees fathers and sons reading graphic novels together before checking titles out. That same person wrote, “We see young boys spending time reading where they were once idle. We see consumers of audiovisual material moving to books where there is a strong tie-in.” One respondent wrote that comic books helped him become a better reader as a child, giving him “visual experience of some of the words [he] knew only in the abstract.” Another wrote that, “While graphic novels shouldn’t entirely supplant a traditional reading curriculum, they are fun, useful for helping develop literacy skills, and beautiful.” Yet another wrote about how reading comic book adaptations of literary works inspired him to seek out the original works. One respondent summed up all the responses by writing, “They are under-used, high interest literacy tools that have place in the classroom and the library. Why not harness this enthusiasm for literacy?”

- Are the graphic novel sections in your library separated by age or interfiled with fiction and nonfiction? Please explain.

Four respondents indicated that most of their library’s graphic novels are placed in juvenile literature or the young adult section, but adult graphic novels are placed in the general fiction collection. One person wrote that graphic novels are in the fiction collection, since theirs
is a small library with no space to create a separate section. One person who worked in an academic library indicated that graphic novels were not separated by age. Another wrote that they are separated into children’s, young adult, and adult sections, and another responded that all graphic novels are placed in nonfiction and arranged according to the Dewey Decimal Classification system. Four others either did not know the answer to this question or it did not apply to their current employment situation.

- Is funding for graphic novels separate, or is it part of the teen, adult, and/or youth collections?

For two of the respondents, funding for graphic novels was part of the youth collection; for three, it was part of the general collection (two of these were academic librarians). At one person’s library, there was funding for graphic novels in each budget allocated for children’s, young adult, and adult collections. One person simply indicated that the budget was “separate,” and five either did not know the answer or the question was not applicable to their current employment situation.

- How do circulation statistics on graphic novels in your library compare to the statistics for fiction and nonfiction titles?

One respondent indicated that juvenile graphic novels comprised 10 percent of circulation in juvenile fiction in a given year. Young adult graphic novels made up 36.4 percent of the young adult fiction circulating during that time. The same respondent wrote that the turnover is fast on many of these titles. “Roughly halfway through the year, that is approximately 1,500 checkouts out of a collection of 650 items.”

Another respondent wrote, “We can’t keep them on the shelves.” Yet another echoed this, writing that circulation statistics on graphic novels compare “very favorably” to the statistics for
fiction and nonfiction titles; “Generally, a graphic novel title will circulate about as many times in a year as a lower-end best-seller.” Another did not have statistics but indicated that “the graphic novels circulation is heavy.” Seven respondents either did not know or the question was not applicable to their current employment situation.

- Since your library acquired a graphic novel collection, have more people begun to enter and use the library? If so, what age groups?

  One person wrote that boys between the ages of nine and sixteen are using the library more frequently to check out graphic novels; another indicated that more men and boys have begun to use the library but provided no ages. One person wrote that his library does see more traffic, but “it could be because [they] have a spectacular new library building that draws the community in.” One person who works in a school setting wrote that the acquisition of graphic novels has not had an effect on library traffic. Eight others either did not know or the question was irrelevant to their current employment situation. (One of these eight individuals wrote, “We have no such section. Acquiring one might improve that situation, though.”)

- How long has your library had a graphic novel section?

  One person indicated that for children, a graphic novel section had been in place for 2-3 years; for young adults, 5-7 years; and for adults, 1-2 years. One of the libraries had had a graphic novel section for less than one year; three had a graphic novel section for 16 months to 3 years; one had a graphic novel section for 5 years or more; two libraries did not have one; and four respondents either did not know the answer or the question did not apply to their current employment situation.

- How are graphic novels received by staff? By patrons? Is there a specific group who really seems to embrace them?
One person wrote that teens and their young adult librarian seem to embrace graphic novels the most. One person working in a school library media center wrote that, “The teachers are very supportive of the use of graphic novels and would purchase them for classroom libraries. The patrons, both students and their parents, love them.” Another wrote, “Patrons read them in-house frequently, especially in conjunction with wait-times for computers. A great many fathers come in with their young sons and read a few titles together before checking out others.”

Not everyone saw such positive reception of the medium, however. One person wrote, “Some staff questioned the appropriateness of having graphic novels in an academic library collection. Because of the attention brought to graphic novels in the past few years, and especially the mainstream awards won by graphic novelists, faculty and students are interested in them and probably appreciate having award-winning titles as well as other titles in our academic library collection.”

Another person echoed this by saying that some staff see value in graphic novels while others think “they’re a waste of time…. [Despite the fact that] circulation numbers indicate that graphic novels are popular, some parents have expressed concerns that their kids aren’t reading ‘real’ books.” Another person wrote that he has also received complaints from parents, and younger adults (ages 18-35) seem to enjoy graphic novels most. Yet another wrote that some teachers are neutral on the issue, but others see their value for reluctant readers. Five people either did not know the answer or the question did not apply to their current employment situation.

- Who are the main patrons of graphic novels in your library?

One person indicated that juvenile boys were the main patrons of graphic novels; two others identified students in grades K-5 as their main followers. Two respondents wrote that teens are the largest group, and one person wrote that “teen and tween boys, disproportionately
African-American” fall into this category. One other respondent wrote that many ages use graphic novels, but “teens are probably the main graphic novel readers.” Another wrote that their main patrons of graphic novels were “middle class, mostly male, mostly white, with disposable income, between the late teenage years and the early thirties.” One person wrote about a graphic novel course that was offered in their school’s Department of English a few years ago, causing students and the instructor for that class to use graphic novels heavily. Four people either did not know the answer or the question did not apply to their current job situation.

- Do you find it helpful when publishers put suggested ages on books? If graphic novels are separated by age in your library, how do you decide where to shelve graphic novels for which the intended age of readers is unclear?

Seven respondents indicated that they found these age suggestions helpful. One of these people wrote that both publishers and vendors offer this helpful service, and the librarian herself worked with the Guidance Counselor and the Reading Intervention teacher to level books for which age suggestions were not available. This person also noted that she did most of her purchasing through Mackin, “which is very good about suggesting reading or age levels.” Another of these respondents depended on professional reviews to delineate where to shelve graphic novels. However, two people did not find age suggestions helpful; one felt that it showed “fear of visual information” and the other did not find specific age listings necessary, preferring instead labels such as “Suggested for Mature Readers.” Three respondents either did not know the answer or the question did not apply to their current employment situation.

- Does managing and maintaining a graphic novel collection pose any special challenges?
Seven out of the twelve respondents cited special challenges posed by managing and maintaining a graphic novel collection. These challenges included gaining administrative support and support from library clerks who had been in such positions for more than three decades; sending titles to the bindery, which caused slow processing of new acquisitions; greater wear and tear than other titles; the difficulty of keeping up with series; the problem of standing order plans for graphic novels; finding reviews; replacing missing volumes; making cataloging and classification decisions; and proving [graphic novels’] value to funding sources and authority figures, like teachers and principals. Another person wrote, “There is a great deal one must learn to become conversant with the medium, which seems to be continually expanding and developing.”

Two people did not think that graphic novel collections pose any special challenges, and three people either did not know or the question did not apply to their current employment situation.

- Does your library provide any special programming or publications (storytimes, book clubs, displays, bibliographies, etc.) to promote graphic novels?

The responses to this question were evenly divided. Four respondents indicated that they do provide special programming to promote graphic novels, such as giving book talks, providing a manga drawing program in the summer for children and teens, creating face-out displays for graphic novels, and sponsoring discussion panels and “how to” seminars. One of these people wrote that promotion was unnecessary—that graphic novels promoted themselves. Four people indicated that they do not provide special programming, and four others either did not know the answer or the question was not related to their current employment situation.

- In what ways could library staff better promote graphic novels?
The responses to this final question of the survey were wide-ranging and informative. One person wrote that she liked the idea of working with educators to get disinterested kids interested in reading. A school library media specialist wrote that creating Reading Counts tests would encourage the reading of graphic novels, as well as book talks by kids, perhaps via podcast or vodcast. Another person suggested educating parents about the medium; presenting on the cultural significance of comics and how filmmakers use storyboards based on comics; holding workshops for kids and teens to teach them about visual storytelling and helping them create digital comic books; and holding discussions of political cartoons to show that we rely on visual storytelling in different situations. Another person wrote that working more closely with early education teachers may help promote graphic novels, and someone with a similar response wrote that librarians should meet with teachers and administrators to explain their value; book talk them to teachers and students; and develop lessons or units using graphic novels to get them incorporated into the classroom. Yet another claimed that the creation of “Read” posters featuring superheroes is a good promotional activity, as well as holding author talks, developing readers’ advisory skills, and forming book clubs. One academic librarian suggested a review of the subject headings assigned to graphic novels. This particular librarian claimed she was considering creating a research guide that would help patrons identify the titles currently held by her library. One person reiterated that graphic novels need no promoting. “The main thing would be not tucking them away in 741.5, where my prior library system relegated everything from Calvin & Hobbes to Sandman.” Finally, one respondent claimed that, “Nothing is better than reading them and becoming familiar with the artists, the writers, and the limitless potential of this medium.” Two respondents did not have promotional suggestions.

The comic shop owners surveyed provided the following information:
The Effects of Comic Books and Graphic Novels on Literacy

- What is your position?

One of the respondents identified himself as the owner of his shop, and the other indicated that he is the owner, CEO and janitor.

- Are the comics and graphic novels in your business separated by age?

Both comic shops contain a section for younger people and children, but most titles are displayed on main racks and are sorted by company in alphabetical order. One of the respondents wrote, “We leave it to parents to decide if a particular book is suitable for their child, much like the movie industry.”

- What percentage of your customers would you say are
  11 years old and under? _______
  Age 12-18? _______
  Age 19-25? _______
  Age 26 and older? _______

The breakdown of percentages of customers was similar for both stores surveyed. In one store, customers were broken down as follows: one to five percent make up customers age 11 and under; five percent of customers are between 12 and 18; 40+ percent are between 19 and 25; and half of all customers are age 26 and older. In the other store, ten percent of customers are 11 years old and under; ten percent are between 12 and 18; 30 percent are between 19 and 25; and half of the store’s customers are at least 26 years old.

- Do you find it helpful when publishers put suggested ages on books? If you separate materials by age, what do you do when you are unsure which age group a graphic novel should be shelved under?

Both owners find it helpful when publishers put suggested ages on books, and neither
censored materials (although one did state that he sometimes puts specific titles in a sleeve or keeps them behind the counter). Since both shops contain a section for children, most of the other titles are kept in alphabetical order and are not separated by age group.

- Do you believe that graphic novels and comic books improve literacy? If so, in what ways and for what age groups? Please explain.

Both respondents felt strongly that graphic novels and comic books improve literacy. One owner wrote, “Like any skill, practice makes perfect. All age groups (even adults) benefit greatly from keeping their brain active.” The other owner felt that graphic novels and comic books especially help children under the age of twelve (and gave himself as an example).

- Do you think that comic books and graphic novels can have educational value, in terms of motivating reluctant readers, providing visual cues for low-level readers, etc.? Please explain.

Both people surveyed felt that this type of media could have educational value. One respondent quoted Albert Einstein: “Imagination is more important than knowledge.” He also cited the motivational power of stories about heroes and villains. The other participant wrote that, as a child, he was motivated to read due to cliffhanger endings in comic books.

- Do librarians or schoolteachers ever partner with you to promote the reading of comic books or graphic novels? Please explain.

One owner claimed that some of his long time customers are librarians and teachers, and that his shop has donated books to both groups. He stated that his shop would welcome more involvement, and wrote, “Alabama is a poor state and any concept that promotes reading should be a welcome activity.” The other person surveyed did not provide an answer to this question.
• In what ways do you think library staff can better promote graphic novels?

The same owner in the previous question who mentioned Alabama’s lack of funding cited the problem again here as it relates to libraries. He went on to state,

“In my view, graphic novels would be a wonderful method to get kids hooked on reading. I believe that if librarians had attractive graphic novel displays they would be amazed at how many kids checked these books out.”

The other person surveyed did not provide an answer to this question.

• Please describe your experiences or opinions in general with comic books and graphic novels as they pertain to literacy.

One person shared his opinion that today’s children are not reading enough and that there are too many electronic distractions in the modern world. He lamented the fact that less than five percent of his customers are children, since when he was a child (fifty years ago) he and his friends could not wait until the corner candy store received a new stock of comics. This same person acknowledged the fact that comic books are not the most challenging form of literature to read, but wrote, “It is great practice in basic reading skills. Also, today’s books contain first-class writing and art.”

The other respondent shared an inspirational story about helping a local girl learn English through reading comic books. He wrote that there is a Chinese restaurant next door to his business, and one day a Chinese girl three or four years old came in to his shop. She knew very little English but seemed interested in his collection of comic books. She began visiting his shop regularly for comics (such as the Archie series), and each time she visited the shop she learned more and more English by asking the owner about the meaning of words in the comic books. She took three or four comics with her each day, returning the next day with a more expansive
vocabulary. The owner reported that this girl is now going into the third grade and has been
placed in advanced classes in school. He wrote, “I feel Archie, Casper, Dennis the Menace and
Katy Keene comics, as well as many other titles, helped her greatly in her learning to read. I feel
that there are many stories like this.”

Conclusion

Since its conception, the graphic novel has gained respect and larger, more diverse
audiences. Research has shown, and is continuing to show, how this medium increases literacy
rates and motivates people to read. For many modern librarians, the question is not whether to
include graphic novels in their collections, but rather how to handle their cataloguing and
provide access to these materials for patrons.

The results of the current study reflected the findings of other researchers regarding the
effects of comic books and graphic novels on literacy. This study differed from others in that it
focused on the perceptions of comic shop employees (owners) in addition to those of librarians.
Although the current study was small and cannot be generalized to apply to these populations as
a whole, it does provide an interesting look at the current views of information professionals
regarding a form of media that, although it has existed for years, is only beginning to acquire the
respect it deserves.

A strong library collection shows diversity in viewpoints and media, helps promote
literacy, and increases both knowledge of cultures and the motivation to read. The acquisition of
graphic novels by librarians may provide all of these benefits not only to the collection, but also
to the library’s patrons.

**Acculturation, Social Distance, and Second Language Acquisition among English Language Learners who are Refugees**

Through the process of escape and refugee resettlement many survivors of political upheaval, civil war, and ethnic cleansing will enter the United States as legal permanent residents. As the children of newcomers enter U.S. schools the primary concern will be to teach them English. Another consideration must be that of a positive acculturation experience into U.S. American society. Defined as adjusting to a new culture while maintaining the cultural traditions, beliefs, values, and language of the heritage culture, the acculturation process can be quite difficult for culturally and linguistically diverse ELLs and their families (Herrera, Perez, & Escamilla, 2010). Because parents of newly arriving refugee students may suffer homesickness, melancholy, apprehension about the future, and frustration during initial efforts to begin establishing their lives again in the new host country, the acculturation process may occur differently and at a varied pace for members of the same family. The children may feel vulnerable and defenseless if their parents are unable to provide the reassurance and constancy normally associated with parenting, thus faltering during acculturation (Igoa, 1996).

Both children and adults may experience cultural bereavement, or a sense of loss of culture, a feeling of being estranged from what went before and a fear of becoming detached from all that was traditional and comfortable in the homeland. Children experiencing cultural bereavement wonder why they are in the new place, what will happen to them and who they can trust (Eisenbruch, 1988). Without a concerned and informed adult to guide the process and to provide reassurance that the acculturative experience allows the maintenance of the heritage culture and language while learning the new language and adapting to the new culture, the refugee student will be hesitant, constantly wondering if the path he or she takes will cause the loss of cultural and linguistic identity. What is the impact of a failed acculturation experience? What may
teachers do to mediate the negative effects of social and psychological distance experienced by many newcomer refugee students?

The purpose of the presentation was two-fold – to explore the acculturative needs of refugee students and to discuss the impact of the refugee experience on acculturation and second language acquisition. First a demographic overview of the latest new arrivals was provided along with a discussion of current trends in refugee resettlement in the United States. Particular attention was given to the Burmese, Iraqi, and Bhutanese. Subsequently, essential information for educators regarding the refugee experience was offered. Promising ways educators may attend to issues of social and psychological distance as they relate to newcomer ELLs were also discussed.

Schumann (1978) has suggested that learning a new language is actually part of a larger acculturation process. According to Schumann (1986) the success of second language acquisition is dependent in a significant way on how positive the acculturation process is, stating “the learner will acquire the second language only to the degree that he acculturates.” (p.379). He goes on to say that certain factors will either promote or stifle contact between the macro group in society and the newcomers, effectively affecting the acculturative process of the incoming refugees, political asylees, and immigrants. For students, the degree of social and psychological distance they may experience as ELLs will greatly influence the success of their attempt to learn a second language.

During the presentation the possible impact of new trends in refugee resettlement on teaching and learning in the bilingual, ESL, or regular education classroom was explored, particularly in relationship to Schumann’s notion of social and psychological distance. In addition potential auxiliary school-related outcomes of changes in refugee resettlement were discussed in detail.

The ability to analyze complex systems is fundamental to ecology literacy (Jordan, Singer, Vaughan, & Berkowitz, 2009; Sabelli, 2006). Yet deciphering ecosystems is challenging because, like all complex systems, they transcend spatial, temporal, and cognitive boundaries (Pickett, et al, 1997) and necessitate understanding how different components and processes are interconnected (Covitt, Gunckel, & Anderson, 2009; Jacobson & Wilensky, 2006; Jordan et al., 2009; Mohan, Chen, & Anderson, 2009). Furthermore, complex systems are comprised of multiple interrelated levels that are dynamically related, making it difficult even for experts to understand and to predict (Simon, 1996).

The very nature of this complexity makes it challenging for learners to grasp associations and interactions among a system’s components (Ben-Zvi Assaraf & Orion, 2005; Gallegos et al 1994; Penner, 2000). Often, learners focus on simple linear relationships and visible components of an ecosystem (Hmelo-Silver, Marathe, & Liu, 2007; Hogan, 2000; Hogan & Fisher Keller, 1996; Leach et al. 1996; Reiner & Eilam, 2001). For example, when asked to draw or name components of an aquarium system, novices tended to emphasize visible components, such as fish and rocks, and rarely mentioned invisible components, such as oxygen, nitrogen, and bacteria (Hmelo-Silver, Marathe, & Liu 2007; Hmelo-Silver & Pfeffer, 2004). Grotzer & Basca (2003) also report that student explanations favor single causal and linear connections between system components.

In this paper, we present the results of a technology-intensive classroom intervention designed to support middle school students’ understanding of an aquatic ecosystem. The goals of our intervention are to help learners develop deep understanding of ecosystems and to use tools that make the relationships between a system’s structures, behaviors, and functions explicit.

Aquariums as Models for Learning

To help students understand complex systems, we implemented a two-week aquarium unit that was designed by a team of learning scientists, middle school classroom teachers, and ecologists. The technology consisted of a suite of computer tools: a function-oriented hypermedia (Liu & Hmelo-Silver, 2009), simulations of macro- and micro-level processes (Liu & Hmelo-Silver, 2008; Gray et al. 2008), and the Aquarium Construction Kit (ACT; Goel et a. 2010; Vattam et al. in press).

Our instructional approach builds upon structure-behavior-function theory (Goel et al., 1996; Goel et al., 2009). The structure-behavior-function (SBF) approach is useful to explain dynamic systems with multiple components and levels (Goel et al., 2009; Liu & Hmelo-Silver, 2009). We view SBF theory as providing a conceptual representation that is consistent with both canonical explanations in biological systems and with expert understanding (Bechtel & Abrahamson, 2005; Hmelo-Silver et al., 2007). In
addition to helping students organize their system knowledge, the SBF representation provides a scaffold for overall knowledge organization.

In a biological system, structure refers to components of an ecosystem that have form, such as fish or cells. Behaviors represent the processes within systems. These refer to mechanisms such as photosynthesis or nitrification. Functions refer to the outputs of a system or the role(s) of a particular structure within a system. An example of a function would be that fish produce energy.

**Technology Support for Learning about Complex Systems**

It is difficult for learners to understand many aspects of ecosystems because they have not had opportunities to engage with those processes that are dynamic and outside their perceptual understanding (Jacobson & Wilensky, 2006). In addition to helping students organize their system knowledge, the SBF representation also provides a scaffold for overall knowledge organization because it helps learners consider the relationships among form and function as well as the causal behaviors and mechanisms. We make SBF explicit through the use of hypermedia, organized in terms of SBF (Figure 1), through NetLogo simulations that make behaviors visible (Figure 2a and b) and through the ACT tool (Figure 3a and b), which makes SBF explicit as students build models using the language of the SBF conceptual representation.

![Figure 1. Function-centered hypermedia](image)

Along with the hypermedia and ACT tools, students also used NetLogo simulations to learn about the behaviors and functions in an ecosystem (Wilensky & Reisman, 2006). Using these simulations, (Figure 2) students had opportunities to explore factors that would affect the dynamic balance in the aquarium. For example, the macro fish spawn simulation allowed students to manipulate different aspects of the ecosystem such as initial population, spawning rate, filtration level, and amount of food. Thus if the students overfed the fish, then the increasing ammonia (from fish excretion) in the water would affect water quality and have toxic effects on the fish, leading to mortality. This helped problematize water quality, which is a black box in the macro simulation. This created the need for students to identify some of the invisible components within an ecosystem. For example, using the micro-level simulation, students could observe how crucial the nitrification cycle is for the overall health of an ecosystem and understand the important role that bacteria play in converting toxic forms of nitrogen (ammonia) into less toxic forms of nitrogen.
Figure 2. NetLogo Fish Spawn and Nitrification simulations

Figure 3a. ACT: A space to create models
Instructional Context

The science teacher introduced the unit by asking students to articulate their ideas about the functions of ecosystems. This allowed the teacher to gauge the students’ prior knowledge. The teacher then moved on to the ACT modeling tool and asked the students to represent their thoughts about ecosystems as structures behaviors and functions. The students recorded their ideas in a table within the ACT tool (Figure 4).

The teacher also encouraged the students to use the hypermedia to build on their ideas about the ecosystems. The teacher then asked students explore the NetLogo simulations. In the simulations, students could manipulate various ecosystem components (e.g., number of fish, amount of food, number of plants) in order to maintain a healthy ecosystem (Eberbach & Hmelo-Silver, 2010). The students
worked in groups and had opportunities to refine their models. At the completion of the two-week period, students presented their models to the rest of the class.

Methods

Participants
Fifty-four seventh grade students from a suburban public middle school in the northeast United States participated in this study during their regular science instruction.

Data Sources
The students completed tests before and after the intervention. In each pre and post-test, students drew components of an aquatic ecosystem and were asked to show relationships between these components. In addition, students answered open-ended questions about different parts and processes of an aquatic ecosystem as well as solved problems related to ecosystems.

Coding for pre and post tests
The scoring criteria for the pre and post tests are summarized in Table 1. All of the questions (17) were coded based on two different scoring schemes. The first examined student explanations of relationships between structures and their related behaviors and functions. The codes were assigned to the answers/explanations on a four-point scale, shown in the upper part of Table 1. Each response was scored for the complexity of the SBF relationship the student identified.

We also coded for whether the students were able to identify and explain relationships between micro and macro elements within an ecosystem. Only eight of the 17 questions were coded for Macro and Micro (MM) level because only these questions provided opportunities for students to explain both micro and macro level connections. The other questions on the assessment were specific to either macro or micro elements within an ecosystem. The micro-macro relationship score was assigned as shown in the lower part of Table 1.

The following student response on the importance of ‘waste’ to the aquatic ecosystem illustrates how these scoring schemes were applied. The student wrote:

Waste is normally produced by organisms such as fish. It contains ammonia. Through the nitrogen cycle, bacteria breaks it down into nitrite then nitrate (which is a less toxic form of nitrogen), which is then used for plant growth.

The response indicates the presence of multiple structures, such as fish, ammonia, bacteria, nitrites and nitrates. We considered “waste” as a structure; we coded “bacteria breaks it down” as behavior and “which is then used for plant growth” as its function. We assigned this response an SBF relation score of 4 as the student has identified at least one structure in relation to behaviors and functions. In addition, we assigned this response the maximum score of 3 for the micro-macro coding it as reflects connecting macro (waste) and micro (ammonia, nitrogen cycle) level structures and processes. Inter-rater reliability was calculated by having two independent raters code 20% of the sample. The overall reliability was 87% agreement.

**Results**

All pre and post tests were compared using a paired t-test. Overall, we found significant gains on all measures from pre to post test as show in Table 2. The maximum score for the SBF relationship is 68 and for macro-micro is 24. We found that students reached near ceiling at posttest on both coding schemes, with moderate to large effect sizes.

Discussion

The results show that using SBF as a tool for instruction helps students deepen their understanding of relationships within a system. Post-instruction, the relationships that students identified were more complex. Students were more likely to identify relationships between the parts and the mechanisms of the system. In addition to considering relationships across different levels of the system (i.e., across structures, behaviors, and functions), students, post-intervention, were more likely to generate ideas at both macro to micro levels, connecting the visible to the invisible. Indentifying more invisible structures and relations is not surprising as it is a major focus of our instruction, but the connections across different scales of a system, we contend, are a robust consequence of SBF oriented instruction.

The SBF language provides students with the opportunity to develop a conceptual framework where multiple levels and non-linear phenomena can interact. Traditionally, such integration about ecosystem abstractions has been difficult for students. As Linn and Hsi (2000) argue, students’ ideas are often distinctly linked to particular contexts and experiences, and confronting novel ideas can cause cognitive conflict. In addition, if students are generating ideas about complex systems in pieces (as suggested by DiSessa, 1993), requiring the students to see the relevance of these pieces or cognitive resources when encountering a problem may be a fruitful approach. Although this remains to be tested, perhaps the SBF framework provides students with a “glue” to link ideas not only about the system being studied but also to the cognitive resources they already hold. Certainly SBF-oriented instruction has resulted in more sophisticated reasoning about problems related to complex systems (e.g., Liu & Hmelo-Silver, 2009). Our future directions include an investigation into the potential for SBF instruction to result in students’ ability to transfer ideas from one complex system to another.

School of Education
Binghamton University
P. O. Box 6000
Binghamton, NY 13760
mlawson1@binghamton.edu
Abstract
This study describes an exploratory pilot study in academic reading assistance established for dyslexic Danish university students at the Counseling and Support Center at the University of Aarhus, Denmark. The purpose of the study was to explore the nature of the dyslexic students’ difficulties in relation to reading in English as a foreign language and to provide explicit instruction and practice in reading academic English texts. The need for the training program, the participants, the instructional procedure, and the training materials are illustrated as well as the effects and limitations of the program as observed by the instructors and the students. Observations revealed that the students had great difficulties reading English words and text. However, the awareness training seemed to facilitate a compensatory strategy for reading texts in English as a foreign language.
Keywords: Dyslexia, university students, foreign language reading, compensatory strategies.

Literature Review
The process of reading and comprehending texts written in a native language (NL) or first language (L1) has several fundamental elements in common with the process of reading similar texts written in a foreign language (FL) or a second language (L2). However, the two individual processes also differ significantly in many respects. An abundance of research describes different factors influencing the development, performance, and comprehension processes relative to reading in a FL or L2 (Abersold & Field, 1997; Aldersen, 1984; Grabe, 1991; Scarcella & Oxford, 1992; Singhal, 2005). Of particular interest are such factors as the cognitive development and strategy awareness of the individual embarking upon reading texts in a L2 or FL, the reader’s language proficiency in the L1, and his or her potential to transfer successful reading skills from the native to the target language. Moreover, researchers have examined the reader’s language proficiency in the L2 or FL and the reader’s metacognitive knowledge and ability to understand and explicitly discuss the rules and grammatical features of the L1.

Several pedagogical implications and areas of instructional focus have been suggested in relation to the factors influencing L2 or FL reading (Abersold & Field, 1997, Singhal, 2005). In connection with the reader’s cognitive development and language proficiency in the L1, successful instructional applications include an increased focus on language and vocabulary acquisition as well as explicit assistance to the reader in applying his or her knowledge of decoding and letter-sound relationships in relation to new words. In connection with the reader’s language proficiency in the L2, pedagogical suggestions for instruction include an intense focus on language acquisition to expand vocabulary. In relation to metacognitive knowledge, instructional suggestions include explicit teaching of strategies for constructing meaning from texts.

The research and literature on teaching reading to L2 or FL learners and the suggested pedagogical applications are to a great extent sound and practical. However, most of the literature has not focused explicitly on individual differences in relation to FL or L2 learning and reading that cannot be remedied by means of traditional instruction (Lundberg, 2002, Granschow, Sparks & Schneider (1995). Certain groups of readers of L2 or FL literature have an inflexible cognitive system which prevents them from employing a multiplicity of diverse strategies in approaching written texts as well as a limited or deficient L1 proficiency which inhibits them from enhancing L2 or FL reading by means of transferring successful reading strategies from L1 to L2. Moreover, certain groups of L2 or FL readers do not have the level of L2 or FL proficiency necessary for the reading to progress and improve, nor the metacognitive knowledge needed to explicitly discuss linguistic issues. In other words, the research and literature on teaching reading to L2 or FL learners and the pedagogical
applications suggested in the literature are not targeted toward the individual learning differences of readers with persistent linguistic coding deficits and learning disabilities such as dyslexia.

The linguistic coding deficit hypothesis sets forth the theory that difficulties in relation to FL or L2 acquisition are caused by an inherent linguistic coding deficit affecting both oral and written L1 and FL/L2 learning (Downey, Snyder & Hill, 2000; Ganschow & Sparks, 1991; 1993a; 1993b; 1995; Sparks, Ganschow, & Pohlman, 1989). The theoretical assumption underlying the hypothesis is that individuals who experience difficulties with the linguistic system of their L1 will experience similar difficulties in relation to the linguistic system of their L2 or FL. In other words, there is a direct link between L1 and L2 or FL learning, and the ability or disability of an individual to obtain FL fluency is the L2 or FL equivalent of a L1 language acquisition capacity. The difficulties are not specific to the L1 or the L2 but to an underlying linguistic coding deficit or language learning difficulty which interferes with the acquisition of oral and written competencies in relation to not merely the L1 but the L2 or FL.

The specific linguistic coding deficit of dyslexics stems from an underlying phonological impairment in language processing which affects the perception, coding, and production of phonological representations (Goswami, 2000; Hatcher & Snowling, 2002; Metsala, 1997; Snowling, 2000; Stanowicz, 1994). Stable phonological representations are vital in successful reading acquisition in that the process requires successful mappings between graphemes and phonemes which enables the reader to decode written words. Strong phonological representations will serve as a catalyst in establishing mappings between orthography and phonology and furthermore provide a scaffold for multiletter, morphemic, and inconsistent orthography to phonology correspondences. A deficit at the level of phonological representations, however, will impede the ability to establish these sets of mappings between orthographical and phonological units in relation to both single letter and multiletter sequences and ultimately constrain the reading development and reading ability of an individual. This is the case for many dyslexics whose phonological representations and mappings between orthography and phonology are unstable, unreliable, and at times nonexistent.

Due to the unstable phonological representations and insufficient knowledge of the relationship and correspondence rules between orthographic and phonological segments, dyslexic readers are largely dependent on forming and recognizing visual representations of letter sequences instead of establishing grapheme–phoneme mappings (Ben-Dror, Pollatset & Scapati, 1991, Castle & Coltheart, 1993, Coltheart, 1981; Coltheart, Curtis, Atkins & Haller, 1993). Rather than reading words by means of converting the words’ graphemes to phonemes, dyslexics primarily read words by means of retrieving the phonological form appropriate to the visual or orthographic stimuli from the mental lexicon. Dyslexics, in other words, compensate for their phonological coding deficit by means of forming visual representations of chunks of letters. Research has shown that these visual representations rely on a type of morphological awareness as they often consist of the words’ morphological stems (Elbro & Ambak, 1996; Casalis, Colé, & Aopo, 2004).

This implicit ability of some dyslexics to employ visual recognition of words’ morphological stems as a compensatory strategy in reading allows a number of dyslexics to acquire a relatively appropriate speed of reading which enables them to obtain successful reading comprehension skills. However, the ability to employ visual recognition of words’ morphological stems as a compensatory strategy in reading usually falters when the dyslexic individual is faced with a text written in a language other than his or her L1. The morphological structure of words and the rules for word formation processes vary from one language to another rendering the dyslexic incapable of transferring the visual representations
of words' morphological stems that have been established as a compensatory reading strategy in relation to his or her L1 to the reading of L2 or FL texts. Moreover, the linguistic coding deficit or phonological impediments of the dyslexic applies to his or her L1 as well as his or her L2 or FL rendering him or her incapable of reading L2 or FL words by means of relying on grapheme-phoneme mappings. When approaching a text written in a language other than his or her L1, the dyslexic is in other words bereaved of the support of the compensatory reading strategy of visual recognition that has secured a relatively successful level of reading performance in his or her L1 and is forced to learn how to read anew by means of establishing new and stable visual representations of the words of the L2 or FL. This is an issue for a great number of dyslexic university students in Denmark.

Purpose of Study

The purpose of this study is to describe an exploratory pilot study in the form of a program in academic reading assistance that was established for dyslexic Danish university students at the Counseling and Support Center at the University of Aarhus, Denmark. The purpose of the program was to explore the nature of the dyslexic students’ difficulties in relation to reading academic texts in English. The need for the training program, the structure of the program, the participants, the instructional procedure, and the training materials will be described as well as the effects and limitations of the program as observed by the instructors and the students.

The Training Program

The Need for the Training Program

The majority of the course reading in the various departments at the university level in Denmark consists of academic books and articles written in English. English poses a challenge for a considerable number of Danish university students but particularly for the 1-2% of the students who have been diagnosed with dyslexia. Despite their phonological reading impediment, most of the dyslexic students who have fulfilled the requirements for admission to postsecondary education have developed a relatively successful level of reading performance in relation to the Danish language on account of their implicit ability to compensate for their phonologically based reading impairment by means of visual recognition. However, these visual representations of Danish words cannot be employed in the reading of academic texts in English, which impedes the students’ reading performance and consequently their comprehension of the academic English texts. In order for these students to acquire the reading competence necessary for successful comprehension of academic texts in English, it is necessary for them to establish a substantial number of visual representations of English words as a compensation for their deficient ability to decode the words.

Participants

The group of individuals who participated in the training consisted of twenty-seven dyslexic students who were receiving academic reading and writing assistance at the Counseling and Support Center at the University of Aarhus. The participants consisted of fourteen men and thirteen women between the ages of twenty-two and thirty-six. The participants were all enrolled in postsecondary education at the University of Aarhus. Of the twenty-seven students, eighteen were enrolled at the bachelor’s level and nine were enrolled at the master’s level. Various departments of study, and institutes were represented amongst the students: the Department of History and Area Studies, the Department of Aesthetic Studies, the School of Economics, the Department of Political Science, the Department of Psychology, the Department of Chemistry, and the Department of Theology.
All of the participants had been tested for dyslexia and identified as dyslexics at the Counseling and Support Center at the University of Aarhus or at another recognized Dyslexia Center in Denmark using comprehensive testing materials designed with the purpose of uncovering specific linguistic weaknesses of dyslexics in relation to reading, spelling, and writing.

**The Structure of the Program**

The program consisted of three interdependent courses titled English Morphology Awareness Training, English Syntax Awareness Training, and Academic English Vocabulary Workshop. The course on English Morphology Awareness Training was a prerequisite for English Syntax Awareness Training, and English Syntax Awareness Training was a prerequisite for the Academic English Vocabulary Workshop. Each of the three interdependent courses was held over a period of five weeks mid-semester. Two assistant professors specialized in dyslexia testing and academic reading and writing assistance were assigned to teach the courses. The students assigned to the courses met with the instructors for a period of two hours each week during which they received intensive instruction and guidance in English morphology and syntax awareness training as well as intensive instruction in building an academic English vocabulary.

**Instructional Procedure**

During each instructional period, the students received a half hour general instruction to morphological analysis and segmentation, lexical and phrasal composition, or vocabulary guidance, and the remainder of the time instruction was carried out on an individual basis. During the instruction, the students’ performances were continuously assessed and remedied by means of a dynamic interaction and discussion between the instructor and the individual students. Each student’s individual needs were assessed by means of a strategy where the instructors continuously asked questions as to how each student understood the teaching materials and the concepts of morphology, syntax, and vocabulary. Students’ questions were often answered with other questions to guide their understanding and to help the students in adopting a morphological, syntactical, and vocabulary strategy that would serve as a personal compensatory reading strategy.

The students were instructed to apply the strategies obtained during the two hour instructional period to the reading of the individual academic texts in English that they were studying during the week. The students were instructed to report back on their performance during the week so that successes or difficulties could be noted or remedied. The students reported back by means of meeting with the instructors during office hours or by contacting the instructors by phone or email.

**Training Materials**

The training materials for the program were comprised of specially designed and application specific handouts as well as individual exercises in morphological and syntactical segmentation of English words and sentences designed by the two professors instructing the program. The training materials included a number of written exercises designed impromptu by the instructors to remedy some of the specific and individual difficulties exhibited by the students in relation to morphological, syntactical analysis, and vocabulary as well as a translation exercise to assess the ability of the students to successfully translate English morphological and syntactical segments into correct and comprehensible Danish.

The individual handouts were designed in such a manner that the students were able to achieve an unequivocal understanding of English morphology, syntax, and vocabulary. All of the explanations were concise, specific, and supplied with several examples to support the students’ understanding and reading of English words. For example, one of the handouts for the class on English Morphology Awareness Training consisted of a systematic and meticulous illustration of examples of English derivational and inflectional affixes. The
affixes were deliberately segmented from the morphological stem and placed as an individual unit to the left of the page as a means of supporting the students in developing visual recognition skills in relation to English affixes and consequently assisting them in attaching meaning to the affixes while developing the ability to segment the affixes from the word and focus on the most prominent semantic unit of the English word: the morphological stem (see Table 1).

</tbody>
</table>

In addition to the instructional handouts with explanations and examples of English morphology, syntax, and vocabulary, the teaching materials consisted of lists of exercises in morphological and syntactical segmentation and identification. For example, one exercise for the course on English Syntax Awareness Training consisted of well-known exercises in identifying the phrasal category of underlined constituents adapted from Jannedy, Poletto and
Wledon’s *Language Files* (1994) to meet the specific needs and metalinguistic awareness of the dyslexic students attending the course (see Table 2).

Table 2  
Identify the phrasal category of the following constituents.

<table>
<thead>
<tr>
<th>Constituent</th>
<th>Phrasal Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Our loud neighbors will be away this weekend.</td>
<td>Verb phrase</td>
</tr>
<tr>
<td>Me and my friends play basketball every Saturday.</td>
<td>Noun phrase</td>

<td>Verb phrase</td>
</tr>
<tr>
<td>The cat on the couch thinks that you are crazy.</td>
<td>Verb phrase</td>
</tr>
<tr>
<td>He joined us silently but willingly.</td>
<td>Verb phrase</td>
</tr>
</tbody>
</table>

After successful completion of the exercises in morphological segmentation, identification of phrasal categories, and vocabulary building the students were presented with similar exercises that however, forced the students to apply the knowledge gained from the earlier exercises in relation to English words and sentences encountered in academic books and articles studied at the particular department of study. The students were encouraged to select an excerpt of written text from a scholarly book or article of choice and apply their knowledge of morphological segmentation, identification of phrasal categories, and vocabulary to the written excerpt. For example, an exercise from the course on Academic English Vocabulary Training encouraged the students to select 10 academic English words from an excerpt from one of their textbooks and identify their parts of speech, phrasal category, make a guess at the definition of the word, and look up the word in a dictionary (see Table 3).

Table 3  
Choose 10 English words from your textbook. Write the sentence in which the word appears, and complete the following exercises.

<table>
<thead>
<tr>
<th>Compute: ”We present a new method to compute the free energy of arbitrary solids”</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) Part of speech Compute = verb</td>
</tr>
<tr>
<td>b) Phrasal Category “Method to compute the free energy of arbitrary solids “ is a noun phrase.</td>
</tr>
<tr>
<td>c) Guess Calculate</td>
</tr>
<tr>
<td>d) Replace the word with your guess “We present a new method to calculate the free energy of arbitrary solids”</td>
</tr>
<tr>
<td>Both compute og calculate er verbs.</td>
</tr>
<tr>
<td>e) Dictionary Definition Compute (vb): to determine or calculate by means of a computer</td>
</tr>
<tr>
<td>f) Danish translation Compute (vb): Beregne.</td>
</tr>
</tbody>
</table>

Finally, the teaching materials included translation exercises consisting of excerpts from academic English and Danish articles. The purpose of the translation exercises was to force the students to apply their knowledge of individual English morphemes, lexical and phrasal categories, and vocabulary in a given and defined textual context. The excerpts were
chosen specifically for their vast employment of various English derivational and inflectional morphemes, lexical and phrasal categories, and vocabulary that might pose semantic or syntactic difficulties for the students attending the seminar. The students were instructed to translate the excerpts.

**Observations: Effects and Limitations of the Program**

**Effects**

The training program appeared to have a facilitative effect on the students’ ability to recognize and understand English words when reading. As expected, the dyslexic students' visual recognition strategies in relation to English words and sentences initially appeared insufficient to sustain reading of academic English texts. The students’ reading appeared especially limited by their insufficient mappings between English orthography and phonology. As a result of these insufficient mappings, the students seemed unable to recognize individual parts of speech and phrasal categories when reading text. For example, the students would focus on the whole words "unidirectional" and "unspeakably," unable to identify the morphological stems "direct" and "speak." The students, in other words, did not appear to have established visual representations of English morphological stems which made them incapable of employing a morphological analysis strategy in relation to English words.

The handouts and exercises for the English Morphology Awareness Training, English Syntax Awareness Training, and the Academic English Vocabulary Workshop, however, seemed to have a facilitative effect on the students' ability to employ a visual recognition strategy in relation to English words. This was particularly the case for the handouts for the course on English Morphology Awareness Training. Several students reported that the handouts were instrumental in helping them establish visual representations of English affixes independently of the English words themselves, which in turn assisted them in segmenting the affixes from the word’s stem and in focusing on the semantic information contained in the stem. Seeing the derivational suffix "ity" independently of the morphological stem "stupid," for example, enabled the students to create a visual representation of the suffix as a separate morphological unit which assisted them in recognizing this particular suffix in other words such as "absurd-ity," "activ-ity," and "actual-ity," and furthermore enabled them to focus on the morphological and semantically transient stems of the words. The training, in other words, seemed to have a facilitative effect on the students’ ability to read English words.

The improvement of the students’ ability to recognize and employ inflectional and derivational morphology moreover seemed to have an effect on the students' syntactic awareness. By introducing the students to the visual appearance of individual morphological units and aiding them in segmenting and attaching meaning to individual phrasal categories, the students were forced to actively recognize, segment, and process individual morphological and phrasal units and categories. This seemed to facilitate the development of a morphological awareness that rendered the students capable of recognizing not only the form and function of singular words but the interconnection and interdependence of various words and semantic units at the syntactic level. The students seemed to become aware of how the derivational suffixes mark parts of speech which assisted them in noticing the interactions between the suffixed English words and in determining syntactic structure. This morphological and syntactical awareness aided the students in recognizing academic English words and in determining the meaning of vocabulary.

Overall, the pilot study in academic reading assistance seemed to be a valuable tool for the participants in terms of visually recognizing academic English words and sentence structure. At the end of the course, some of the students exhibited a heightened level of metalinguistic knowledge in that they were not only capable of applying a linguistic strategy...
to the reading of English words and sentences but also of discussing rules and exceptions of linguistic compositions with the instructor and co-learners. Despite these facilitative effects, however, the training also had its limitations in that students encountered a number of difficulties in relation to reading English text that could not be easily remedied.

**Limitations**

Despite, the seemingly facilitative effect of the awareness training on the students' ability to recognize academic English words and sentence structure, there were two prominent areas of difficulty that arose for the students in connection with the training. Firstly, the students encountered difficulties in applying the linguistic awareness gained from the instructional handouts and exercises in relation to certain academic English words in the scholarly textbooks read at their department or institute of study. This was particularly the case in connection with academic English loan words deriving from Greek or Latin sources such as “adenine,” “pyrrhotite,” and “schizoid.” Words of Latin and Greek origin are often composed of morphological affixes different from common English morphemes and this factor rendered the application of morphological segmentation of the words difficult for the students.

Secondly, the students encountered difficulties in relation to the establishment of visual representations of several academic English words that could not be developed entirely independently of phonological training. English morphological processing is interconnected with English phonology in relation to a significant number of words such as "clarify" and "ability." In connection with such words, it was difficult for the students to utilize the visual representations that they had established in connection with the seminar since the spelling and visual representation as well as the vowel quality of the words' morphological stems were altered with the addition of the suffixes which meant that the reading of the words required knowledge of phonological decoding as well as morphological segmentation.

Despite the limitations, however, the observations from the pilot study provide important implications for further research into the nature of dyslexic students’ foreign language reading.

**Implications for Further Research**

The observations from this pilot study in academic reading assistance for dyslexic university students provide new and important implications for further research into compensatory tools that can be employed by dyslexic students to improve their FL or L2 reading skills. Preliminary results from the three courses in English Morphology Awareness Training, English Syntax Awareness Training, and Academic English Vocabulary Workshop provide some indications in terms of alleviating difficulties among dyslexic university students in relation to FL reading. The training program seemed to prove valuable as an instructional proposal in that it appeared to improve the students’ awareness of the English language and their ability to regulate their reading strategies according to this awareness. However, the preliminary results of need to be more rigorously tested, and studies that further explore the specific relationship between dyslexia and FL reading skills need to be carried out. In connection with this training program, no direct comparison was made between the dyslexic students' performance level in Danish and English respectively or between the awareness levels of dyslexic university students in relation to control groups. In order to inspect these aspects further, tests that examine in detail the ability of dyslexics to read text in their L1 as well as their FL or L2 must be developed along with comparative studies examining the FL or L2 reading differences of dyslexics and control groups. Such initiatives could further form a basis for the development of instructional materials aimed at strengthening the foreign language reading ability of dyslexic students.

Assessing the emotional reaction of adult learners in a simulation-based training

Pierre-Majorique Léger (HEC Montréal)*
Patrick Charland (UQAM)
Julien Perret (HEC Montréal)

Abstract

In the field of education, not many researchers have investigated the role of emotional reaction on learning. As part of an ongoing research project on neuroeducation, this communication reports preliminary results about the emotional reaction of adults in a simulation-based training. The electrodermal activity (EDA) of four subjects was tracked in a simulation aiming to assess the performance in an Enterprise Ressource Planning system (ERP) training. EDA is an index of autonomic nervous system activity measured by the potential difference between two areas of the skin. EDA has been widely used as an objective measure of emotional reaction, such as arousal. The subjects were all new trainees in a large Fortune 1000 organization. The ERP simulation game (ERPsim) was used to simulate a realistic usage context of an ERP system. End-users were placed in a situation where they had to make decisions and manage the operations of their virtual enterprises using a real-life ERP system (SAP). The four subjects were all part of the same team and competed against four other teams in the simulation. During the training, the subjects were exposed to various instructional approaches, ranging from traditional seminar to, video training, group problem solving and hands on business simulation. While results are still being analyzed, preliminary analysis suggests that the subjects’ emotional reaction is highly correlated with their financial and problem solving performance in the simulation. Also, results show that emotional reactions of most of the subjects follow a polynomial function (u shape), which suggest that the simulation based approach keep subject emotionally engaged until the end of the 12 hours training. The objective of this first phase was primarily to pretest the research protocol and identify the challenge related to scaling up this investigation to a larger group of participants. Our next phase is to monitor a larger number of learners and compare their emotional reaction to a control group of participants.

Exploring Online Technologies in Teaching Psychology and Neuroscience at a Distance: Animations and Virtual Worlds

Trevor H. Gilbert, Ph.D.
Chair & Associate Professor
Centre for Psychology
Athabasca University
Athabasca, AB, Canada, T9S 3A3
phone: (866) 242-8768
e-mail: trevorg@athabascau.ca

The teaching of all levels of science can be a difficult task, but even more so when it is provided at a distance. While students may have access to quality course materials and instruction, it can remain challenging for learners to understand fundamental concepts. A large body of research has identified the significance of visualization, graphics, and digital animations in learning. Well-designed visual tools can help learners take in large amounts of information in relatively short time periods, and learners can construct a personal visualization of the subject matter. The use of online interactive tools has potential to encourage more active learning and increase learner motivation, acting to ultimately enhance learning outcomes.

In order to supplement student understanding of essential neuroscience concepts and methods, we have developed a set of interactive animated tutorials (NeuroAnimations), and the more recent Virtual Behavioural Neuroscience Laboratory (VBNL). The virtual world known as Second Life (SL), the most advanced virtual space, has attracted an increasingly large number of educators worldwide who are actively using SL to achieve a variety of educational objectives. SL provides an immersive environment in real time, allowing for interactions between both objects and avatars, creating a sense of reality that doesn’t exist in the traditional distance education setting. Preliminary evaluation indicates a high level of satisfaction with the NeuroAnimations and the VBNL learning environment.

3. **Paper**
   This paper is a research proposal to study the impact of ongoing attention and emphasis given to accountability. Existing literature on the topic is the main source of information.

   The objective of the proposal is to come up with meaningful, relevant questions related to accountability and its impact on curriculum. Primary area being explored is the impact of accountability on curriculum design and instructional strategies. Tentative analysis of its impact is done to lead to a more relevant, meaningful, and honest questions related to the topic.

   The possible impact of the national curriculum standards adopted by several states is also explored. Issues such as student achievement, teacher preparation programs, and classroom dynamics are discussed in relation to how it is affected by public’s perception of the issues on school accountability.

   Literature reviewed is not limited to research articles. Included in the review are government documents, newspaper articles, and state standards.
CULTURAL AWARENESS FOR RURAL EDUCATORS

Abstract

Cultural awareness is a necessity for today’s rural educators. This interactive forum workshop is designed to foster a greater awareness of the cultural differences prominent in rural areas and the challenges faced by rural educators. The intention is to foster the identification of various cultural differences, while enhancing the development of the critical skills necessary to overcome these differences in the classroom. This workshop will provide helpful tips and techniques on managing the cultural differences often experienced by rural educators. The workshop emphasis is the integration of cultural differences into rural educational curriculums to create a positive learning environment. The workshop encourages the active exchange of information among participants through a round robin style presentation with group exercises in the six topic areas.
Title: Louisiana Teachers’ Familiarity, Usefulness and Recommendation of Content Literacy Strategies

E-mail: mary.howe@waldenu.edu
Introduction

The Louisiana Department of Education (http://www.doe.state.la.us/) adopted William G. Brozo’s research-based content literacy strategies (Brozo, 2008) for use in the state’s K-12 classrooms in 2008. These strategies were infused in the state’s comprehensive curriculum, which provided specific English/Language Arts units that support the state’s standards. Teachers were encouraged to select activities and assessments from the curriculum that best suited their students’ needs, while implementing content literacy strategies that provided the foundation for teaching and learning.

Along with the state’s comprehensive curriculum, the department of education provided each school district with a copy of the recommended content literacy strategies (Brozo, 2008). This document contained the rationale for each strategy, its purpose, steps for implementation and original sources. Some descriptions included content-specific samples that could be used for classroom instruction.

Problem Statement

Research has shown that students, who have been equipped with literacy strategies, comprehend complex content specific texts. Many teachers are aware of content literacy strategies, but do not use them when teaching. On the one hand, teachers, who are familiar with these strategies but do not find them useful, will not recommend them to their colleagues. On the other hand, teachers, who are familiar with these strategies and find content literacy strategies useful, will recommend their use. The state department of education in Louisiana has included specific content literacy strategies into
its comprehensive curriculum (Louisiana Comprehensive Curriculum, 2008). Including these strategies in the state’s mandated curriculum, does not guarantee that teachers know what they are, use them or recommend their use.

After a thorough search of numerous databases and Louisiana’s Department of Education’s website, literature has not been published regarding the state’s K-12 public school teachers’ familiarity, use or recommendation of the research-based content literacy strategies contained in its comprehensive curriculum.

This study will investigate the degree to which Louisiana teachers are familiar with the research-based content literacy strategies, find them useful and recommend these content literacy strategies.

Content Literacy Strategy Perspectives

With the passage of the No Child Left Behind (NCLB) Act (2001) and recommendations from the National Reading Panel (2000), emphasis has been placed on literacy instruction connected to successful reading achievement. The five essentials of effective reading (National Reading Panel, 2000) – phonemic awareness, phonics, fluency, vocabulary and comprehension – ensure that teachers are covering all of the components of reading, which can be taught through strategic teaching. Strategic teaching allows numerous skills to be taught at one time in meaningful context (Kraglar, Walker, & Martin, 2005). More specifically, when literacy instruction implements vocabulary (Santoro, Chard, Howard, & Baker, 2008) and comprehension strategies (Kinniburgh & Shaw, 2009) that reinforce reading skills for students, students can easily identify the strategy that works best for them, when reading narrative and expository texts. Neufeld (2006) asserted that learning from expository text is an integral part of
learning subject-specific content; therefore, literacy instruction must be seen as a part of
the learning process. Two positive outcomes can be realized from effective literacy
instruction. Teachers can improve instruction and students can learn content at a more in-
depth level. Furthermore, students are provided with strategies to learn subject specific
content independently and can transfer these strategies to other content areas (Ambe,

Teachers and students become familiar with literacy strategies through purposeful
planning, implementation and reflection (Mason, Meadan, Hedin, & Corso, 2006).
Providing teachers opportunities to discuss, observe and use these strategies will promote
proactive decision making in planning lessons and content units and selecting appropriate
strategies. During these sessions teachers can identify their students’ literacy strengths
and weaknesses, examine content goals and objectives, and make appropriate
instructional decisions that support learning (Misulis, 2009).

The Purpose of the Study

This research study will focus on teachers’ implementation, familiarity,
usefulness and recommendation of the strategies to colleagues.

Specific Research Questions

The following research questions will guide this study:

Quantitative Questions

1. To what degree are Louisiana teachers familiar with the state’s recommended,
   research-based content literacy strategies?
2. To what degree do Louisiana’s teachers recommend the state’s recommended, research-based content literacy strategies?

3. To what degree do Louisiana’s teachers use the state’s recommended, research-based content literacy strategies?

4. Is there a relationship among teachers’ familiarity, recommendation, frequency of use, frequency of modification and literacy expertise?

5. Does the number of pre-service courses which included literacy strategies make a difference to first year teachers on familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies?

6. Does the length of teaching experience make a difference on familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies?

7. Does SES of the school make a difference on teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies?

8. Does school category level (Level 1, 2, 3, or 4) make a difference to first year teachers on familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies?

Qualitative Question

9. What types of modifications were made if teachers modified the literacy strategies?
Setting and Sample

According to the 2009 Louisiana DOE report there are 46,197 public school teachers and 1,471 public schools with 796 Elementary (54%), 219 Middle/Jr.High (15%), 301 Senior High (20%) and 155 Combination Schools (11%). At 5% margin of error, 95% confidence level and a conservative response distribution of 50%, we need a minimum random sample of 381 teachers. With an approximation of 30 teachers per school, at a minimum, we need to randomly sample 12.7 schools. However, 75 schools will be randomly selected and 5 teachers will be randomly selected per elementary, 18 per middle/Junior High, 13 per Senior High for a total of 600 teachers.

Data Collection

A three-part literacy survey, the Literacy Strategy Survey, will be used to measure implementation, familiarity, usefulness and recommendation of the content literacy strategies as well as teachers’ demographics. The Literacy Strategy Survey will serve as the only source of data collection. The survey will be entered electronically by each participant via SurveyMonkey.com (Lodico, Spaulding, Voegtle, 2010). Using SurveyMonkey.com will reduce interruptions to classroom teachers’ timetables and allow participants to respond to the survey at their leisure. Principals of the selected schools will be notified that their teachers will be sent email messages requesting their participation. Participants will be provided information regarding the project objectives and directions for completing the survey and the necessary URL to connect them to the SurveyMonkey site. The survey will include a statement on the first page stating that responding to these questions will equate to their consent and that the survey will be anonymous. Participants will be directed to read each prompt and respond using radio
buttons that corresponds with their selections. SurveyMonkey.com will collect and compute raw scores for each prompt. Data collection will begin in the fall of 2010, approval has been received by the IRB.

Instrumentation

A three-part Literacy Strategy Survey consisting of content literacy strategies from the Louisiana’s comprehensive curriculum (http://www.doe.state.la.us/), was designed by the researchers to collect teachers’ responses regarding their implementation of, familiarity with, usefulness of and recommendation of the content literacy strategies and demographics. This instrument was modified from a similar questionnaire (Howe, Grierson, & Richmond, 1997) that was used to determine whether 1st -3rd grade teachers were familiar with content area strategies, their frequency of use, and applicability in their respective grades. The Literacy Strategy Survey will be designed as an online survey using SurveyMonkey.com (Lodico, Spaulding, Voegtle, 2010).

Part 1 of the literacy strategies survey will provide teacher (grade level taught, years teaching experience, and graduate hours in reading – literacy expertise) and school (level of school – elementary, middle or high school, SES, race/ethnicity, & school category) demographics data. Part 2 of the survey will yield scores for teachers’ familiarity, usefulness and recommendation. The independent variables (preservice courses, length of teaching experience, SES, and school category level) will be considered in determining factors that might impact teachers’ implementation, familiarity, usefulness and recommendation of the recommended literacy strategies. Part 3 of the survey will determine the teachers’ usage of the strategies and whether they modified the strategies any way.
The survey was reviewed by a panel of reading experts for content validity. Changes to the survey were made upon their recommendations. Reliability will be calculated utilizing Cronbach’s Alpha.

Research Method

A quantitative method was chosen for this study because a 3-part quantitative survey, the Literacy Strategy Survey, will serve as the only data source for this study. Only the final question on how teachers have modified the strategies will be discussed qualitatively. The first three questions on the familiarity of Louisiana teachers with the strategies, the degree to which the teachers recommend the strategies, and the degree to which the teachers use the strategies will be analyzed using descriptive statistics. The hypotheses are listed below along with how each hypothesis will be analyzed.

H0: There is no significant relationship among teachers’ familiarity, recommendation, frequency of use, frequency of modification and literacy expertise.

H1: There is a significant relationship among teachers’ familiarity, recommendation, frequency of use and frequency of modification and literacy expertise.

The data will be analyzed utilizing a correlation matrix.

H0: There is no significant difference among the number of pre-service courses which included literacy strategies on first year teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

H2: There is a significant difference among the number of pre-service courses which included literacy strategies on first year teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.
The data will be analyzed utilizing ANOVA.

$H_0$: There is no significant difference among the lengths of teaching experience on teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

$H_1$: There is a significant difference among the lengths of teaching experience and teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

The data will be analyzed utilizing ANOVA.

$H_0$: There is no significant difference between the SES of the school on teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

$H_1$: There is a significant difference between the SES of the school on teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

The data will be analyzed utilizing ANOVA.

$H_0$: There is no significant difference among the school category levels (Level 1, 2, 3, or 4) on first year teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

$H_1$: There is a significant difference among the school category levels (Level 1, 2, 3, or 4) on first year teachers’ familiarity, recommendation, frequency of use and frequency of modification of the literacy strategies.

The data will be analyzed utilizing ANOVA.

Alaska Statewide Mentor Project
Proposal for International Conference on Education
Honolulu, Hawaii, January 4-7, 2011
http://hiceducation.org/

Title:
Metamorphosis of a Mentor Project: Adapting to fit the needs of Diverse Populations through Technology and Cultural Introspection

Paper:
The Alaska Statewide Mentor Project (ASMP) serves early career teachers in diverse locations across the state, from rural and remote villages to the largest cities, and from Alaska Native communities to the large districts composed of students from over 80 different language regions of the world. While several rural locations may be small, spread out communities on the road system, most of the rural sites are remote and only accessible by small aircraft or boat. Most students in the Alaska Native communities are predominantly from a single cultural background, displaying a variety of language phases from novice monolingual to fully bilingual and fully English as the first language. Urban teachers struggle with large class sizes and diverse classrooms, while rural teachers often struggle with multiage classrooms where possibly only one student forms a grade level. Mismatches between the culture of the teacher and that of the students are commonplace.

Starting with the mentoring model developed by the New Teacher Center, supported by a partnership between the University of Alaska and the Department of Education & Early Development, ASMP trained mentors in 2004 to begin mentoring early career teachers (ECTs)—defined as educators in their first or second year in the teaching profession. From the beginning, modifications were necessary to properly serve Alaska’s ECTs; the California model asked mentors to meet face to face with new teachers about one hour each week. In Alaska, where most sites require mentors to fly to ECTs’ schools, they work together face to face once per month for about half a day. Mentors maintain weekly contact with their ECTs through distance-delivery methods that work best for the mentor and teacher. This typically includes email, Skype audio or chat, instant messaging, and sometimes telephone or video conferencing.
Although logistical considerations were the primary modifications at the start of the project, the true metamorphosis has occurred by using technology to conduct rich and meaningful mentor and teacher forums. Our evolution continued as ASMP integrated a research team to evaluate and guide the program, as well as to further research teacher retention and student achievement. Implementation of ongoing mentor professional development sessions on cultural values as revealed through an introspective process is the newest modification.

Friday Forums are bi-weekly distance-delivered professional development for mentors. Practice with data collection, problem solving, and risk-free role-playing compose the core of the curriculum. ECT Expansion Forums provide ECTs the opportunity to network with teachers in similar situations. These forums provide fundamental support in strategies to create an effective classroom environment and engaging instruction for students, among other areas related to professional teaching standards.

The research team focused heavily on guiding program changes at the beginning of the project gathering data through focus groups with mentors and online surveys of mentors, ECTs and site administrators. Once we were able to implement the ASMP mentoring model with fidelity, research turned to investigating the goals of improving teacher retention and increasing student achievement. Studies have provided promising results and suggestions for continued refinements and new research. Through action research of veteran mentors, data serving as feedback for principals were gathered and analyzed. ASMP collaborates with other education groups throughout the state especially in regards to results from the online surveys conducted yearly with ECTs, mentors, and site administrators.

The most recent adaptation focuses on the mentor professional development in cultural values and working in Alaska’s diverse communities. Philosophically, this ongoing session is intended to support mentors and ECTs in developing quality educational strategies by establishing authentic relationships that promote learning by self assessing one’s values, attitudes and beliefs that come into play when working with students and adults from diverse cultural or value settings. The goal contains three parts. (1) Mentors will identify and acknowledge our own values, beliefs, and attitudes that contribute to our personal worldview. (2) Mentors will support ECTs’ reflection and articulation of their personal values, attitudes, beliefs and professional practices regarding their use of strategies to recognize, respect and incorporate student diversity as an integral part of instructional content planning and delivery. (3) Mentors will support ECTs in making learning relevant for all students through instruction that supports students in connecting curriculum content knowledge with their culture, life experiences, and interests.

This session reports on the seven-year history of the project, with a focus on the adapted components of mentor training and research explorations. Implications for teaching in rural or remote locations, indigenous education and the use of technology will be shared.
IS THERE A CONNECTION BETWEEN PRINCIPAL VISIBILITY AND STUDENT ACHIEVEMENT?

Abstract: A survey was distributed to teachers in 25 different high schools across New York State. The data consists of 161 useable responses from teachers who participated in the study. The results show that 27.9% were from high-need, low-achieving schools, 31.9% were from high-need, high-achieving schools, 22% from low-need, low-achieving schools and 18.0% from low-need, high-achieving schools. A One-Way ANOVA was performed to evaluate the differences among the four school categories (high- and low-need, and high- and low-achievement schools) and teachers’ perceptions of school principal visibility. The results indicate a significant difference regarding the perceptions of school principal visibility among the groups. The findings indicate that high achievement (in both high-need and low-need schools) is associated with the visibility of the school principal. Post Hoc analysis showed significant differences within high-need schools and level of achievement. The researchers concluded that the more interaction a school principal has, the higher student achievement will be. The researchers further discussed the importance of the impact of principal visibility on student achievement.
Introduction

Purpose of the Study

The purpose of the study was to examine what contributes to high- and low-achievement schools and determine what leadership practices contribute to increased achievement. This is especially important in schools that are high- and low-need in terms of resources. Effective leadership skills and continual improvement can contribute to achievement in schools. This paper seeks to explore whether the visibility of the school principal differs among high-need, low-need, high-achievement, and low-achievement schools. The study builds upon the prior research of Fulton (2009) who examined teachers’ perceptions of principals’ instructional management behaviors.

Theoretical Framework

There has been much literature written on what influences student achievement. The following research was reviewed pertaining to school success, (high-achievement, low-achievement), visibility, and principal leadership within schools.

Johnson (1985) wrote of a study conducted in a Connecticut elementary school, to determine if there was a relationship between the effect of the school administrator’s visibility on the staff and student body. The researcher found that the principal’s effectiveness as an administrator was enhanced by maintaining high visibility, communicating clearly and frequently with others, supporting his/her staff, and developing positive personal contact with individual students. In addition, Andrews and Soder (1987) identified an effective principal as one performing within four high levels, namely: resource provider, instructional resource, communicator and visible presence in the school.

Gibbs (1989) observed that effective principals share the following three actions: 1) communicate and monitor reasonable expectations to the staff; 2) conduct frequent, substantive classroom observations; and 3) actively participate in the instructional program. Within these commonalities observed by Gibbs, there are at least nine attributes relating to the principal’s ability to lead an effective school. For the purposes of this study in assessing visibility, the researchers will focus on three attributes that address this topic including: creating high visibility and accessibility, making frequent classroom visits and being adept at parent/community relations.

Gougeon, Hutton and McPherson’s study (1990) determined that teachers who had frequent interaction with the principal viewed this frequency as positive power on the part of the principal. Their study further stated that the more visible the principal was in a school, the higher his/her perceived level of communication was. This contributed to effective principal behavior, namely, frequent use authority and positive power, and less frequent use of negative power. Visibility of the principal also infers accessibility of the principal. Chance (1989) notes that “A successful administrator should arrive at least 40 minutes early, stay an hour late, and maintain high visibility in the cafeteria, teacher’s lounge and school hallways.” Too often school leaders get caught-up in paperwork and operations behind the desk. Whitaker (1997) agrees that often principals fail to realize that important school business is found in the classrooms, hallways, playgrounds, and cafeterias, and not in the school office.
Hallinger & Heck’s (1998) review of research from 1980-1995 explored the relationship between principal leadership and student achievement. They wrote that, “The principal’s role in shaping the school’s direction through vision, mission and goals came through in these studies as a primary avenue of influence.” They continue that “The general pattern of results drawn from this review supports the belief that principals exercise a measurable, though indirect effect on school effectiveness and student achievement.” They also mention that the state of this research is still evolving and recommended future research into the paths through which the effects of school outcomes are achieved, specifically within and between school analyses.

The findings of a study conducted on a junior high school campus in the Midwest that evaluated the visibility of the principal as an influence on behavior of students, revealed that the increased level of visibility resulted in decreased student disciplinary referrals (Keesor, 2005). Ruder’s research (2007) determined that the visibility of the principal is important to students experiencing a problem or issue. Visibility lent itself to students feeling that they had someone in charge who could be of help to them in time of difficulty. Ruder wrote of the principal’s role: “Being less visible erodes a school’s climate and may have students wondering if the school really has a principal”. One of the key ingredients to the success of urban schools as cited by Viadero (2010) is that principals should have an attitude that embraces the students, teachers, staff and parents, tying the school to the community.

Visibility is clearly an element of effective school instructional leadership behaviors as noted in the literature.

Data Gathering and Methodology

For the purposes of this study, the data collected by Fulton (2009) was used. His study investigated the principal instructional leadership behaviors on Hallinger’s (1987) Principal Instructional Management Rating Scale (PIMRS) as related to school need, school achievement, years of experience as a teacher, and years working with the current principal. The survey instrument included a 5-point Likert scale with responses that ranged from 5-“Almost Always”, 4- “Frequently”, 3- “Sometimes” 2 -“Seldom” and 1- “Almost Never”. A total of 2,200 surveys were distributed to high school teachers across New York State in 25 different schools. The surveys asked teacher respondents to describe their principal’s instructional leadership behaviors. Teachers from high- and low-achieving, and high- and low-need high schools in New York State participated in the original study. See Appendix A in Fulton (2009) for survey questions. The data considered useable for this study includes 161 of the surveys administered to teachers.

High schools were first categorized utilizing New York State’s similar school categories. In Fulton’s study, data were collected from the New York State Education Department (NYSED) for all 1,063 public high schools in New York State. Each school was categorized by its need resource capacity (high, moderate and low-need), and three-year mastery percentage average.

The New York State Education Department categorizes each high school using a code called Need/Resource Capacity (N/RC) Code. High schools are assigned an N/RC category based on their N/RC Index. The Need/Resource Capacity is defined as the index that measures a district’s ability to meet the needs of its students with local resources. It is calculated by dividing a district’s estimated poverty percentage by its Combined Wealth Ratio in New York State (New York State Education Department, 2005). The index is a measure of a district’s
ability to meet the needs of its students with local resources, and is calculated by dividing the district’s estimated poverty percentage by its Combined Wealth Ratio.

Student Mastery is defined as the designation given to students by New York State to signify whether student performance demonstrates a thorough understanding of the content expected in the subject and grade level. Mastery was calculated over three years using the percentage of students who scored 85 points or above out of 100 on the New York State Math A-Regents examination. Schools were categorized as either high- or low-performing. Starting from the highest mastery average and counting down, schools were considered to be high-achieving. Each high school was placed in ascending order numerically from the lowest three-year mastery average to the highest to categorize schools as low achieving.

Data Analysis

The researchers selected items from the original instrument that appeared to be related to the construct of visibility and formed a new group. A Factor Analysis was performed on the survey questions chosen by the researchers in this study, which confirmed that the items group together. Reliability of principal visibility was determined at 89.2% on the survey questions pertaining to principal visibility. The results of the Factor Analysis are in Table 1.

Findings

The descriptive statistics are listed in Table 2. The results were then analyzed using a One-Way ANOVA to evaluate the differences among the four school categories (high- and low-need, and high- and low-achievement schools) and teachers’ perceptions of school principal visibility. Analysis of the data revealed that 7.6% of the variance in achievement is accounted for in the Visibility variable (Table 4).

A one-way analysis of variance was conducted to evaluate the mean difference in the comparison between visibility within the four groups. The independent variable of school category contained four groups: High-Need (HN), Low-Need (LN), High-Achievement (HA), and Low-Achievement (LA).
The ANOVA was significant, $F = \frac{(3,160)}{} = 4.31$; $p<.01$. The strength of the relationship between the comparison of visibility of the principal and achievement as assessed by $n^2$, was .076 indicating a large effect (See Table 3).

Follow up using a Post Hoc Test was conducted to evaluate pair-wise differences among the means. The results listed in Table 4 indicate that there was a significant difference in the means between the groups that had high-need with low-achievement, and the groups that had high-need with high-achievement. The groups that were HNLA ($M=22.63$, $SD=7.500$) had less achievement when the principal was not visible, than those HNHA ($M=28.50$, $SD=9.06$).

* $r^2$ Squared = .076 (Adjusted $r^2$ squared = .058)
A Post Hoc Analysis was run to explore the differences between HNLA and HNHA. The results are in Table 4. With low-need schools, there was no difference. However, there is a strong difference in visibility between high-need schools and achievement. The Mean difference in the high-need, low-achievement schools is due to higher visibility on behalf of the school principal. The Post Hoc analysis shows a significant difference between high-need schools and level of achievement.

Table 4 indicates that when the principal is visible, the high-need, high-achievement ($M = 28.50, SD = 9.06$), schools score higher on achievement than in high-need, low-achievement schools ($M = 22.63, SD = 7.50$) schools as indicated in Table 2.

Implications

Educational Importance of the Study

This study examined high school principal visibility within high-and low-need, and high-and low-achieving schools (school category) to gain a clearer understanding of what contributes to a high-achieving school in terms of the visibility of the principal. The results show that when the leader is visible, achievement is higher. The findings in this study can be used to review current leadership practices in both high-need and low-need schools. Effective leadership is especially required to meet the challenges of current economic times when all resources are becoming limited.

Effective instructional leadership behaviors on behalf of the principal can improve achievement where money cannot. In order to guide schools through turbulent economic times, instructional leaders must “do more with less.” Being visible, and maintaining high levels of interaction, can improve achievement even in schools with a smaller amount of resources. This coincides with the review of the literature that maintaining high visibility and accessibility contributes to school achievement. Recommendations for future studies include examining the other effective behaviors are mentioned in Fulton (2009). The implications of these findings may be that plans for leadership training should include behaviors that increase principal visibility, and thereby school achievement. Furthermore, an examination of principal visibility
can be examined in schools with low socio-economic status to improve their achievement without requiring expensive additional resources.

ABSTRACT

In this workshop, we share the methods, thematic outcomes, and materials to of our RWG collaborative project. The RWG experience was designed over the course of two years by Student Affairs and Academic Affairs faculty to help improve the levels of cultural competency of our students at our Predominately White College (PWI). Our interactive presentation will focus on the successful implementation and evaluation of two cohorts of college students that participated in the RWG. RWG is a four-phase, 2 credit experiential course targeted to sophomore and junior students. Phase one is a retreat, a 4 day intensive living experience where participants engage in challenging discussions involving topics of power, privilege, race, gender and religion. The experience bears some resemblance to the pop culture Music television program “Real World”, popular with our current generation of students. Phases 2 and 3 occur concurrently. Phase 2 deliberately connects students’ newly acquired cultural knowledge and skill sets to a targeted academic course(s). Phase 3 is the learning community that guides and supports the cohort in the connecting course as well as explores additional topics in ableism, xenophobia, and student as change agent. Phase 4 is actualization of the RWG experience in the form of a service learning experience. In a 250 standardized item analysis of pre and post assessments of RWG participants, 100% of majority and minority students improved their levels of cultural competency. This project was supported by grants in 2009 and 2010 from the New York State Provost’s Office for Diversity and Educational Equity and Bringing Theory to Practice.
Using “TASKSTREAM” for Success:  
Passing the Performance Assessment for California Teachers  
For Candidates in Secondary Education  

Nathan T. Avani PhD

San Francisco State University  
1600 Holloway Avenue  
San Francisco, California 94132  

In 1998 the California legislature passed SB 2042. SB 2042 legislated sweeping reform in teacher education, including a requirement that every teacher credential candidate pass a state-approved high-stakes exit exam (Hafner & Maxie, 2006; Sandy, 2006). All institutions that credential teachers in the state of California were given two options; follow an assessment model developed by the CCTC, California Commission on Teacher Credentials along with ETS, Educational Testing Services, or a model created through the leadership of Stanford University and a consortium of both public and
private California Universities. This model was called the Performance Assessment for California Teachers (PACT: www.pacttpa.org) (Sylvester, Summers & Williams, 2006).

The PACT is currently alive and well in the Department of Secondary Education at San Francisco State University. Since the assessment became high stakes in July 2008, the Department of Secondary Education has helped usher over 275 single subject credential candidates’ through the PACT process. We have had a ninety plus percent success rate in the number of candidates passing the assessment upon their first submission. This success however, did not come easy and is the result of years of collaboration and cooperation among secondary education faculty and content specialists from multiple departments across campus. This paper will describe our journey and identify the duties associated with the PACT with the impact on the individuals involved in our teacher preparation program. In addition, our selection of the web-based instructional resource TaskStream and the timely support supplied by Taskstream personnel will be highlighted as a crucial aspect in the success of full implementation of PACT and our candidates being able to create high standard PACT teaching events. The user friendliness of this system and, specifically, the troubleshooting and navigational support given to our TASKSTREAM Manager was just superb!

To begin, we must give credit to the already established collaborative culture that existed within the Department of Secondary in working with our content specialist colleagues housed in departments all across campus. Even before the full implementation of SB 2042, we enjoyed a professional and collegial relationship working with what we call our ‘C & I faculty’ (Curriculum and Instruction). These faculty are pedagogical content experts responsible for
providing our single subject credential candidates two semester long methods courses. The two courses scaffold the skills and dispositions required for a credential candidate to be able to create and enact curriculum that makes specific content accessible to all their present and future students. The C&I and SED faculty were continually collaborating on determining the appropriate credential courses that would provide the content and support for the TPE’s (Teacher Performance Expectations) as required by SB 2042 (Hafner & Maxie, 2006). This constant collaboration was supported by multiple meetings, both formal and informal. Two C&I faculty, Math and Science, housed in the Department of Secondary Education provided the needed leadership in bringing all C&I faculty from around the campus together for joint program development and alignment.

Prior to the statewide implementation of the PACT, and after determining how the TPEs would be embedded programmatically, the combined faculty worked to develop an in-house assessment system. This process demanded joint decision-making and agreement in the development and use of common rubrics for embedded signature assignments across all courses and content areas. And yes, the signature assignments were agreed upon only after many, many meetings, discussion and compromise! In 2005 SED and C&I Faculty agreed to a single capstone assignment with a uniform rubric for assessment. This capstone assessment, the Candidate Assessment Portfolio (CAP) was built from the embedded signature assignments completed by a candidate throughout all coursework. Each single subject credential candidate submitted to the Department Chair a three-ring notebook that contained all his or her signature assignments and artifacts associated with identified competencies for various TPEs. These notebooks were stored in a locked room and
could be accessed only through a sign in procedure with the Chair’s Administrative Assistant. This CAP assessment and storage/retrieval system lasted for only three years. It became obvious from the first year that a digital system is desperately needed. We created our own digital portfolio assessment system and called it “i-CAP” (Internet Based Candidate Assessment Portfolio). We were very pleased with this as our summative assessment process/product only to find that the PACT would be required by law for any candidates entering a credential program after July 2008. Out went the “i-CAP”. We had to start all over again and re-engineer our assessment system to support the PACT, with the added challenge to have a system/product that granted access to a statewide consortium of trained scorers!

Room Containing CAPs
The PACT Era

PACT (Performance Assessment for California Teachers) is a consortium of teacher preparation programs at 30 universities, 1 district internship program, and 1 charter school network. These institutions have joined together to develop and implement an authentic teacher performance assessment. Successful completion of a CCTC approved teaching performance assessment will be required by all credential candidates in order to earn a California Preliminary Multiple Subject or Single Subject Teaching Credential.

The teaching performance assessment, in our case the PACT, consists of a Teaching Event and Embedded Signature Assessments (ESAs). Multiple Subject (elementary) candidates complete three additional Teaching Event tasks so that they are assessed in each of the core content areas (literacy, mathematics, history-social science, and science) taught in elementary schools. The Teaching Event measures the Teaching Performance Expectations (TPEs), which are teaching standards for California student teachers. The customized ESAs, which measure selected Teaching Performance Expectations, are developed by each program.

Candidates in the single subject credential program at San Francisco State University complete the teaching event during their spring semester in the credential program. A submission date in early April is set and posted on the Department web page. Candidates are also given this deadline date by their lead PACT instructor/SED PACT coordinator. All single subject candidates submit their completed teaching events, which include video and artifacts – such as student work samples - through uploading all components of his or her
completed teaching event to the TASKSTREAM web portal. This web portal and process will be explained in a later section of this paper.

**Making it work!**

A set of Department policy statements had to be agreed upon by the faculty early on in our PACT journey. Several of these policies are below:

*All tenured/tenure track faculty will be actively involved in the support of all single subject credential candidates in completing the requirements for the PACT.*

*All tenured/tenure track faculty that hold a credential will be trained as a PACT scorer.*

*All lecturers teaching credential courses will be actively involved in the support of all single subject credential candidates in completing the requirements for the PACT.*

*All lecturers that hold a credential will be trained as a PACT scorer.*

*All University Supervisors will be actively involved in the support of all single subject credential candidates in completing the requirements for the PACT.*

*All University supervisors that hold a credential will be trained as a PACT scorer.*

Every faculty member in the Department of Secondary Education holds a single subject teaching credential. All have been a public school teacher at some point in their professional career. Our faculty members’ actual classroom experience certainly helped in their understanding and implementation of the PACT and how to best support future teachers to reflect deeply on their own practice through the teaching event. Being credentialed also enabled each faculty member to be trained as a PACT scorer. The Department Chair, who is
also a faculty member in the Department, holds a teaching credential in History/Social Science and is trained as a scorer. Our Director of Field Services is also a trained PACT scorer. Everyone in the Department has a role to play in the PACT. Our goal was to create an inclusive community encompassing the PACT and our candidate’s success. Even our administrative assistant to the Chair had a role to play. He took care of all the room scheduling for scorer training, meals, parking vouchers, and honorariums - and he processed all necessary paperwork for these various items. The bottom line was that we needed to be there for our candidates. Since the PACT was “law” we needed to make sure that our candidates were prepared to do their best when the time came for them to complete the teaching event and submit it for scoring.

The single subject credential program at San Francisco State University is a two-semester program starting in the fall semester. Our application deadline for fall admittance is in February. Our candidates go through a comprehensive admission process including a small group interview. The admission process concludes with a new candidate orientation held in May and candidates placed with master teachers/school sites by the end of June. Most candidates are ready to begin both their student teaching and University course work in August when both the public schools start up and fall semester at the University begins. Our candidates are concurrently engaged in credential courses and student teaching during both semesters. Our credential program melds theory and practice. Candidates stay with their assigned master teacher until the end of the public school calendar, usually sometime in late June. It is important to note that although the University semester ends in mid May, candidates are still student teaching until sometime in June. If a candidate does not pass
the PACT in their first attempt, active student teaching until the end of June can prove extremely valuable if remediation is required.

Single subject credential candidates are enrolled in one of six cohort classes (SED 751). Each of these cohort classes is lead by a PACT leader/faculty member. Candidates stay with this cohort of candidates and the same PACT leader/faculty member for both semesters - the duration on the credential program. This PACT leader becomes the point person for the candidates regarding any problems/questions they may have regarding the PACT. A faculty member in the Department also serves as the PACT coordinator. This individual works with all instructional faculty in making sure, from a curricular point of view, that all courses are providing both the content and support each candidate needs. All PACT questions/concerns are channeled to the PACT Coordinator. Since the PACT Coordinator is also a PACT Leader/SED 751 instructor, he is on the front lines with his colleagues in working with the candidates with the PACT.

Currently, over 165 candidates are enrolled in our 2010-2011 single subject credential program.

The Department Chair serves in the role as TASKSTREAM Program Manager.

Given the large number of faculty and credential candidates in our program we needed a PACT/Teaching Event submission process that would allow for the following key requirements:

1. Digital access to the teaching event
2. Storing of the teaching event
3. Manipulation of the teaching events for scoring
4. Retrieval of the teaching events at any time
5. Management of scorers
6. Data manipulation for report generation
7. Communications with candidate during the scoring process
8. Data security/confidentiality

Since we already had a digital assessment system (i-CAP) the above requirements were easily identifiable. Our PACT Coordinator and Department Chair researched a number of digital assessment portfolio providers. Presentations were given and free access to various potential service providers were obtained. One such provider was TASKSTREAM (www.taskstream.com). The PACT Coordinator and Department Chair were impressed with a number of the TASKSTREAM features. One of most importance was it “friendly” user ability for candidates and scorers. The fact that it was also being used by a number of other high education institutions was of value for potential exchange of scoring services. Our Chair contacted TASKSTREAM and a red carpet dialogue was started. Free accounts were established as well as training. Our Department Chair took on the role of TASKSTREAM Program Manager and was the contact person for all and any communications regarding TASKSTREAM.

Our 165 single subject credential candidates represent all academic subjects, English, social science, math, science, and the following special subjects referred to as physical education, world languages, art, and music. The Department of Secondary Education has three independent programs that enroll candidates in these credential areas: A program for regular candidates, an Intern program, and an off campus program called
BATC Bay Area Teacher Center. It was important that the TASKSTREAM system recognized these different programs and allowed candidates to identify themselves with the appropriate program they were enrolled in. This would allow for data analysis specific to each program in addition to aggregate data. Working with a client services support person from TASKSTREAM, we created our TASKSTREAM program infrastructure to allow the candidate to enroll themselves in any one of the following programs below:

* Art Teaching Event – BATC
* Art Teaching Event - Intern
* Art Teaching Event - Regular
* DEMO -PACT Teaching Event - History/Social Science
* English-Language Arts Teaching Event - BATC
* English-Language Arts Teaching Event - Intern
* English-Language Arts Teaching Event - Regular
* History/Social Science Teaching Event - BATC
* History/Social Science Teaching Event - Intern
* History/Social Science Teaching Event - Regular
* Home Economics Teaching Event - Intern
* Mathematics Teaching Event - BATC
* Mathematics Teaching Event - Intern
* Mathematics Teaching Event - Regular
* Music Teaching Event - BATC
* Music Teaching Event - Intern
* Music Teaching Event - Regular
* Physical Education Teaching Event - BATC
* Physical Education Teaching Event - Intern
* Physical Education Teaching Event - Regular
* Science Teaching Event - BATC
* Science Teaching Event - Intern
* Science Teaching Event - Regular
* World Languages Teaching Event - BATC
* World Languages Teaching Event - Intern
* World Languages Teaching Event – Regular

Once the TASKSTREAM infrastructure was in place TASKSTREAM provided detailed information sheet regarding how to enroll in TASKSTREAM and how to register under one of the above credential program areas. Our Department Chair went to every credential cohort class and conducted an orientation to TASKSTREAM and provided each candidate with the information they would need to both enroll and register appropriately. This TASKSTREAM orientation was not meant to be comprehensive. It provided the initiation into the system and each candidate was encouraged to explore the system and become familiar with its components and the PACT sections. Each of the PACT Leaders would incorporate PACT/TASKSTREAM activities into their course activities. Candidates paid a user fee for having access to the TASKSTREAM portal and the section specifically designed for the PACT.

During the fall semester candidates were guided by their PACT leaders through the PACT standards and what would be expected of them in providing evidence of having achieved the various standards. Technical aspects such as uploading artifacts from their teaching, i.e., lesson plans, student work, grades test, etc…. as well as video clips of their actual student teaching. Trips to our computer labs were scheduled and technical support provided. With the April deadline date in front of them, we all worked together to both meet this deadline and for successfully passing the assessment.
In utilizing the TASKSTREAM system candidates would respond to on-line prompts and provide appropriate artifacts/video clips and either prior to the deadline or on the deadline date they would hit the “submit” button and their PACT/Teaching Event would be logged in to the TASKSTREAM system. An automatic message, “You have successfully submitted your Teaching Event” would be sent to the candidate. As candidates submitted their teaching events only our Department Chair/TASKSTREAM program manager would have access to their work and know the candidate name associated with each teaching event. As teaching events were submitted, they would be registered under each appropriate program area.

Each of our academic/special subject content areas has a lead scorer. This individual is responsible for determining the scorer for each teaching event in their content/special subject area. Each scorer would not know the name of the candidate associated with the teaching event they were responsible for scoring. However, should they know the individual by chance when they review the video clips, they would inform their lead scorer and an exchange would be made for them to score a different teaching event. The list of scorers and the name of the candidate to be assigned to that scorer is given to the TASKSTREAM program manager. The TASKSTREAM Program Manager then sends an email to the scorer with just an identification number for each teaching event they will be responsible for scoring. Scorers are given two weeks to score and to submit the score back to the TASKSTREAM Program Manager. The score is not given to the candidate. If during the scoring process any scorer experiences any irregularity they contact the TASKSTREAM Program Manager who consults with the PACT Coordinator in determining how to resolve or
accommodate the irregularity. Some examples of such irregularity’s are:

- *Video clips not working*
- *Files not opening*
- *Documents mentioned yet not present*

For consistency and keeping track of the various irregularities the TASKSTREAM Program Manager is the individual who contacts the candidate - not the scorer. This is also to maintain the confidentiality of the scorer. Should a teaching event need to be double scored the TASKSTREAM Program Manager coordinates this process with the Lead Scorer. The score from this review is also reported back to the TASKSTREAM Program Manager. The TASKSTREAM system makes all this possible. Everything from submitting the teaching event, scoring, documentation of the evaluation, communication to lead scorers, scorers, and candidates, reporting evaluation results, and the ability to manipulate and analyze the data is all through the TASKSTREAM system. Candidates also have access to the TASKSTREAM MENTOR 24-7. They just email TASKSTREAM MENTOR with their problem/concern and someone from TASKSTREAM gets back to them within 24 hours.

Although scorers are given two weeks to score the teaching events assigned to them, because of the need to double and triple score, four weeks is the norm for getting a final score. Final scores---including pass/fail and a numeric score for each of the twelve elements of the teaching event being scored, including comments from the scorer if provided, is sent to all candidates on the same day/time. Any teaching events still under review are noted and a email to the candidate indicating that their teaching event is still under review is sent. It’s important that final scores are available far in advance of
the end of the academic year and the end of the public school year. Early returning of scores will allow candidates who did not pass the time they may need in order to re-submit their teaching event entirely or the section/part identified as failing, while the semester is still in progress and the public schools still in session. This becomes especially important should the candidate need to submit new video clips of their teaching. Candidates who need to re-submit a teaching event or have remediation are assigned a PACT mentor.

This individual works with the candidate and coordinates the re-submission and scoring of the new work with the TASKSTREAM Program Manager.

We could never accommodate or manager the large number of teaching events that are submitted and need scoring if it weren’t for the TASKSTREAM system. TASKSTREAM has made the process easy and non-threatening for all users, regardless of their role in the process. As the TASKSTREAM Program Manager, whenever I needed assistance it was just a phone call or email away. TASKSTREAM Client Services have been their when needed. Quick turnaround in problem solving and in making any adjustments in the overall TASKSTREAM system to accommodate any unique needs on our part.

The TASKSTREAM system provides the TASKSTREAM Program Manager with the ability to produce various reports based upon the data created by candidates in their programs. You will recall earlier in this paper a listing of the various programs candidates can be associated with. Reports can be generated for each of the different programs as well as reports reflecting aggregate data. These reports
can be generated by program and/or by academic/special subject area. Having this ability allows for various program administrators the ability to review their program specifically and make decisions for program improvement. We can also look at this data by academic/special subject area therefore, allowing us to see what areas in particular need improvement.

Each LEAD Scorer is given a set of data sheets with analysis of their academic/special subject area. The LEAD Scorer uses this data/information as a form of professional development for their scorers. All LEAD scorers come together with the PACT Coordinator and TASKSTREAM Program Manager to review data and to consider any program changes/modifications that may be needed.

SUCCESS!

The success of our PACT program is owed to many individuals. Especially our candidates, who for two semesters craft and build a PACT teaching event that will be evaluated and determine if they have met the competencies required of them by the California Commission on Teacher Credentialing. The faculty for all that they do in guiding the candidates in their credential courses. Our PACT Coordinator, who provided the necessary overall curriculum leadership and the navigation of the daily PACT operations. And finally, the TASKSTREAM Program Manager who performed the critical role of coordinating the submission/scoring, retrieval, and data management of all teaching events being scored.
Without the services provided by TASKSTREAM, we would not have been able to implement and manage the PACT process and document the degree of success we have achieved.

Although teachers and parents are often urged to work cooperatively to best support children’s success in school, much has yet to be discovered about specific processes and practices for this partnership to best promote children’s ability to think creatively, systematically, and deeply about complex issues. The focus of our study, therefore, was to examine the manner in which qualitative variations in parenting and teaching styles (authoritative, authoritarian, permissive) are associated with variations in academic, social, and linguistic outcomes of 5th grade children, a pivotal transitional year. Specifically, we examined the effects of parents’ and teachers’ authority style on children’s linguistic competence, behavioral competence at school, creative problem-solving in science, interest level in science and overall achievement in the 5th grade.

Approximately 50 children from 5 classrooms were individually interviewed about their parents’ and teachers’ level of control, expectations, and nurturance. Children were also interviewed about their interest in science. Pairs of children then worked together on a tower-building problem-solving task to examine their communication and cooperation with each other. Data about children’s behavior and academic performance were collected from surveys filled out by their teachers.

Preliminary analysis of the results show children from authoritative households tend to maintain control of the materials and task in general during the paired problem-solving task. Children from authoritarian households tend to follow the lead of their partner during the task. We are currently analyzing children’s communication patterns during the paired problem solving task as well as the influence of teachers’ authority style on behavioral, academic, and linguistic competence. Results of this study will lead to a new perspective to inform educators and their efforts to develop children’s academic abilities, creative thinking, and communicative competence. With this study’s focus on how parent authority style interacts with various instructional methods, educators and parents will be better equipped in developing ways to partner together for their children’s success.
APPREHENSION AND MOTIVATION AMONG DUAL LANGUAGE PEERS IN A SPANISH-ENGLISH AFTER-SCHOOL PROGRAM

Abstract

This study explores how English Learners and Spanish Learners perceived their self-regulated interpersonal language exchange and their perceptions about their learning process. And while there is considerable research about adult language learning connections between motivation, self-efficacy as well as ability and confidence, more research in the area of second language learning can reveal how these factors contribute to language learning motivation in younger learners. Findings from transcription and analysis of 12 English and Spanish sessions reveal how students go through three specific stages—Language Apprehension, Language Initiation, and Language Acquisition—which reflect their confidence in their ability to speak and be understood by their peers.

Key words: Dual language, motivation, confidence, anxiety, self-efficacy
Newcomers often find themselves isolated linguistically and culturally from mainstream peers. Some of this isolation can come from the school environment as well. When newcomers are placed in a mainstream classroom, they have an inability to respond to others who do not speak their native language. So, they continue to be an outsider until they achieve the basic ability to communicate and feel like they belong. As a result, they may lose their desire to learn. Integrative group orientation can provide the motivation to learn. Establishing positive classroom cultures and classroom norms only contributes to language learning and inclusion (Dörnyei & Maldarez, 1997). While this could apply to explicit or purposeful ways of teaching and learning language in classroom settings through dialogues or other forms of practice, it is more relevant in terms of language practice that naturally emerges through social interaction within speech communities (Dörnyei and Maldarez, 1997; Dörnyei & Scott, 1997; Hymes, 1974b).

Dual immersion programs are excellent vehicles for promoting and inspiring language learning and acquisition; however, access is limited due to the availability of such programs. According to the Directory of Two-Way Bilingual Immersion Programs in the United States, as of February 22, 2005, there were 312 programs nationwide that utilized English and the minority language 50% of the time and were content-driven. These types of programs are generally limited to the elementary grades (Howard & Sugarman, 2001). In addition, Gandara (2000) notes that in an environment where anti-bilingual initiatives pass, such as California Proposition 227, there has been a reluctance to implement dual language or native-language maintenance programs (Gandara, et. al., 2000).

Moreover, language learning has often been considered a dull process by many who have learned a second language such as Spanish in high school which generally has a grammar-based
focus. Administrators could help create speech opportunities via speech communities which may be socially motivating to English Learners who have the opportunity to interact with mainstream peers in the language as “resources” versus liabilities (Teaver, 2005).

**Theoretical Framework**

The study of motivation in language learning has focused primarily on college student experiences. Even so, this prior research provides a basis for understanding key factors that motivate learning in younger language students. There are several explanations of motivation. Dörnyei (2000) notes that:

> [...] most researchers would agree that motivation theories in general attempt to explain three interrelated aspects of human behaviour: the choice of a particular action, persistence with it, and effort expended on it. That is motivation is responsible for why people decide to do something, how long they are willing to sustain the activity, and how hard they are going to pursue it. (p. 520)

Other researchers have also noted preference, persistence, and effort in terms of the problems that need to be solved, as well as the length of time students are willing to personally invest are factors in how motivated students become in achieving their goal (Maehr and Meyer 1997). Motivation of this type is often linked to purpose and a desire to gain knowledge. Additionally, researchers also note that volition as well as choice in controlling contextual situations can lead to learning ownership which only adds to a student’s sense of self-efficacy or the belief in their ability to learn (Liem, Lau, Nie, 2008; Pintrich, 2004; Schunk, 1990).

Eccles and Wigfield (2002) have captured most of these ideas in one model. In brief, they note student’s motivation and self-efficacy to learn is based on (1) cultural milieu in which the learning situation occurs, (2) student perception of the socializer’s beliefs and expectations
about behavior and academic success, (3) student goals within the program and their expectation of success; and (4) whether student goals are proximal, specific, and challenging, (7) student affective reactions and memories, as well as (8) the “subjective task value” for students.

Beyond the notion of the social environments or milieu, expectations of success, effort, and time on task (Eccles & Wigfield, 2002; Dörnyei, 2000) students become motivated when they are committed to self-regulating their learning process and can initiate strategies to achieve their goals. Crucial research by Zimmerman (1989) reveals “Self-regulated learning strategies are actions and processes directed at acquiring information or skills that involve agency, purpose, and instrumentally perceptions by learners” (p. 330). Self-regulated learners initiate actions, reflect on their situations, monitor their progress, and determine how well they perform within the context of their environment. Much of their self-efficacy is based on how they perceive their ability.

Their ability to perform is linked to their sense of self-efficacy and can often be linked to their confidence, or lack of confidence which can sometimes expressed as anxiety or apprehension. Confidence in one’s ability or self-efficacy has also been described as a salient sense of self (Csizer & Dörnyei, 2005) or ability attribution (Liem, Lau, & Nie, 2008) or confidence in their language achievement (Clement, 1980). In other words, having a high confidence in their ability to learn a language makes a difference in their performance. Dörnyei and Csizer found that greater amounts of language contact promoted increased self-confidence in language ability as well as motivation to learn the target language.

Is anxiety the inverse of confidence or the sense of a salient self? While confidence appears to be a factor in motivation, anxiety might also be as well. Additional research findings reveal how anxiety can impede learning. Gardner, Masgoret, Tennant, and Mihic (2004) utilize
the term “state anxiety” to explain a state anxiety emerges in particularly distressful situations. Krashen (1983) brought up the issue anxiety at a time when researchers began to look at language beyond behaviorism and rote learning. Language became less a study of grammar and grammar correction and more of a focus on communicative competence and authentic language practice. Krashen theorized language students would perform much better if placed in low-anxiety environment. Students have an “affective filter” which learning language as they feel distressed about their learning and can almost shut down. Keeping this in mind, teachers need to create a positive and inviting environment with comprehensible input to promote and motivate language learners. Making language more comprehensible for students with less focus on correction, places more importance on the practice of language without the reprimanding effects of performance measure. This type of situation is less distressing, students can calm down, the affective filter is lowered, and now they can begin to absorb knowledge.

While Krashen and Terrell (1983) made inroads in the affective ways of learning and Cummins (1984) spoke about the importance of basic interpersonal communication oral language skills, few had attempted to measure the more affective aspects of language learning. Fundamental research by Horwitz (1986) provides a basis for validating what Krashen and those in the sociological and psychological sciences fields have theorized about anxiety and its effects on learning. After in depth review of a number of text anxiety and communication apprehension measurements and gaining data from counselors who worked with apprehensive language learners, Horwitz found that foreign language anxiety was related to the ability to learn and gain proficiency in a second language.

Younger students involved in this case study experienced language apprehension in ways that were similar to the Horwitz (1986) study. Horwitz is an essential read for understanding how
anxiety, motivation, and what the participants in this study noted as *confidence*. It is within this context that the idea of confidence in a younger students’ ability to learn a language stemmed from a reduction in the anxiety. Thus, the following study reveals what English and Spanish learner peers affectively and cognitively experienced as they taught, learned, and communicated language with one another an alternative dual language program.

**The Setting**

The program took place in a math classroom from 1:30 to 3:00 pm on early-out Wednesdays and was supervised by the math teacher who did not intervene during language practice. Three dyads of English Learners and Spanish Learners met one and one-half hours every Wednesday for a period of two months. Students spent 15 minutes setting up, 60 minutes practicing language (language practice alternated between English and Spanish—30 minutes for each language), and 10-15 minutes for journal writing and closure in a math classroom directly from the researcher’s mainstream Spanish class. This format allowed Spanish Learners to leave their mainstream class once a week to practice language with the English Learners and still receive credit for the mainstream Spanish class.

**The Study**

The overarching research question driving this study is *how do these self-directed dual language learners perceive their language interaction?* Thus, this study focuses on how newcomers (identified as English Learners with less than two years experience living in the United States) and first-year Spanish language students (with at least six months in a Spanish course), identified by pseudonyms, interact and perceive their dual language situation. Of thirty-three students, five volunteered, and another, Helen, was asked to participate after initially
withdrawing her application. She agreed to participate. Thus, the English Learner-Spanish Learner dyads consisted of Sam and Leticia, Sylvia and Maru, and Helen and Teresa.

The following criteria allowed for analysis of language interaction between purposefully sampled newcomers (English Learners) and their mainstream counterparts (Spanish Learners)—the phenomenon under study. English Learners were selected if they (1) were Spanish-speaking, (2) had not lived in the United States longer than three years, (3) did not exceed intermediate scores on the California English Language Development Test (CELDT) or the Bilingual Syntax Measure (BSM), (4) had at least an 80% attendance rate (as their presence was needed in order to complete the study), and (5) volunteered in order to participate in the study. Spanish Learners were selected if they had taken at least six months of first-year Spanish, had at least an 80% attendance rate, and volunteered to participate in the study.

*Modes of Inquiry*

This case study explored how six middle school students between the ages of 12 and 14 who desire to learn language from their peers interacted and perceived their participation in this dual language program. The research is based on Patton’s (2002) framework for qualitative case study and, in this case, two months of fieldwork is used to describe a single alternative dual language program and the interaction of three dyads of language learners. Using “multiple methods” triangulation, a variety of data was collected from journal entries, interviews, taped peer interaction, and researcher field notes that corroborated emerging stages and corresponding themes (Patton, 2002, p. 248).

The participants wrote weekly *journal responses* based on “guided” questions and statements such as, (1) *Tell about what happened when you tried to communicate with your*
language partners today; (2) How did you feel about your communication today?; (4) What kinds of strategies do you and your partners use to help each other learn English or Spanish?

All journal responses and reflections were typewritten and organized chronologically on a spreadsheet to garner an idea of the types of corresponding themes that emerged between all data pieces as noted below. Interview questions were based in part on the journal questions that were developed to provide richer information about their language practice. Responses to the questions were transcribed verbatim. Patterns and insights emerged using cross-case analysis as the researcher “grouped together answers from different people to common questions,” (Patton, 2002, p. 440). These interviews focused on student experiences during their language sessions. Participant responses were then organized and categorized according to similar answers as well as patterns based on verbatim quotes.

While interviews provided in depth information about the participants and their perceptions, the video- and audiotapes and their transcription provided opportunities for the researcher to enter the participants’ world. Each interactive session was taped from beginning to end. At the end of the program the tapes were transcribed verbatim. Verbatim quotes tie information from various interviews and student journaling sources that serve to enhance interpretive validity of this case study (Johnson, 1997).

Findings

What emerges for this combined data is a theoretical model that is faithful to the program under study and represents the stages that unfolded as well as the challenges participants faced. Based on data from taped observations of their social interaction, journals, and interviews, three stages became apparent: Language Apprehension, Language Initiation, and Language Acquisition.
These stages will be discussed within the context language practice that was identified as one of three major themes that emerged during the students’ language interaction. It consists of two subthemes: structured language practice and conversations. Structured language practice refers to student-led academic language practice with specified boundaries. The boundaries were based on structured games to help students practice vocabulary (e.g., hangman and concentration). Structured language practice in the form of participant-initiated language arts games and assessments provided boundaries for the language learners and helped reduce their anxiety about learning language with peers they did not know and did not yet trust. Their creation of structured language practice in terms of games such as hangman and concentration allowed them to learn within a particular context without creating high cognitive demand. It is this type of language practice that predominated during Language Initiation. Structured language practice tended to precede conversational practice.

Conversations or conversational practice refers to authentic language communication without structure or a fixed purpose that lasts for at least 10 exchanges between partners. It is conversation for the sake of conversation. This type of interaction was more open-ended and cognitively demanding as students had to search for words and could not rely on game-play to restrict and create boundaries for their language practice. Conversational practice meant taking risks with language that is relatively new to the participants and tends to increase participant anxiety. However, this type of practice also sheds light on student language application and their perception of their own language acquisition. As they mentioned in their journals and interviews, when they became more comfortable and familiar with their language partners and they became more confident communicating in the second language, they became less apprehensive and began to engage in conversations. Conversations for most of the students
began in the latter periods of Language Apprehension, but became more evident during Language Acquisition.

The following data from videotaped observations of student interaction, journals, and interviews provides a clearer picture of three language stages as well as insight into students’ determination to scaffold their own learning through structured language practice in the form of game-play and assessments, before could generally engage in conversations of 10 exchanges or more. What emerges from this combined data is a theoretical model that is faithful to the alternative dual language program under study and represents the stages that unfolded as well as the challenges the participants faced when learning one another’s language.

Language Apprehension

When participants went through the Language Apprehension stage, they experienced a lack of confidence in themselves, their language learning and teaching ability. They were frustrated by their inability to communicate in the target language. Students who expressed their excitement about participating in the alternative dual language program became hushed as soon as the cameras rolled. Students who had been only given an orientation about appropriate behavior and the ability to use any resources they liked had all come with little to support their language interaction. So, they sat and stared at one another. Long pauses of silence ensued between feeble attempts to communicate. All students wrote or talked about their lack of “confidence” in their language learning or teaching ability. Confidence as noted in The American Heritage Dictionary (2000) is defined as “firm belief in one’s powers, abilities or capacities.” These students were not confident yet, but were apprehensive. At this stage students did not utilize structured language practice, and their attempts at conversational practice were pretty much futile.
Helen and Sylvia write of their inability to speak and feelings of awkwardness. Helen writes of her first encounter, “A few times we would just sit there and wait for the other person to talk. I can’t imagine what 30 minutes will be like when I was at a loss for words in just 15.” Sylvia concurs, “I forgot a lot of things I knew [from Spanish class]…I guess it was kind of hard for me because I’m more used to writing in Spanish instead of speaking it.”

Despite references to misunderstanding, apprehension, and lack of confidence, all students shared a sense of optimism: “Leticia was very understanding and tried her best to communicate…I know after a while, we will be more comfortable with Spanish,” writes Sam.

So, at this stage students realize their folly: the lack of resources such as textbooks and dictionaries, and no strategies to speak of to engage in any type of language communication left them feeling apprehensive and uncomfortable. Realizing they would have the encounter the following week, students returned with more resolve and solutions for their awkward language communication.

**Language Initiation**

Once the cameras were set up, peers were looking at their alternative dual language partners with some anxious expressions. Dörnyei and Maldarez (1997) state:

They must deal with people they hardly know. They are uncertain about what membership in the group will involve, and whether they will be able to cope with the tasks. They observe each other and the leader suspiciously, trying to find their place in the new hierarchy. They are typically on guard, carefully monitoring their behaviour to avoid any embarrassing lapses of social poise. (P. 68)

Students were uncomfortable with the pauses and lapses of silence that translated into language awkwardness and a sense of inadequacy during Language Apprehension. In order to
avoid the cognitive demand, the sound of silence, and the lingering embarrassment of not being able to communicate, which they so greatly desired, they began to initiate assessments and game-play.

This type of structured language practice allowed for pauses and wait time to answer questions verbally or in writing. Students avoided the apprehension and anxiety of having to come up with language immediately. They could think about the language and respond when they could. As they began to play games, little bits of their personalities manifested as well, and they could laugh and joke a bit with the card games, pretend they were cheating and have a good laugh. Students were no longer focusing on their anxiety or their inability to communicate. It was the fun that game play brought forth that allowed them to move to cognitively more demanding tasks such as authentic conversational practice.

All students share their increasing confidence with one another and their optimism for positive language progress and outcomes. Helen notes that they are more relaxed and less stressed. She explains, “We are a little more confident in talking. We also know what to expect.” Teresa echoes her increased confidence and perceives some language progress as well during this stage, “I felt very comfortable because we talked about fun things. I think I’ve improved a little.”

Whether there was a question about the language program or what they did, all students reported that structured language practice in the form of game-play dominated most of their language interaction during the time they worked in pairs. For instance, at the outset of the program Leticia notes that she and Sam played games 70% of the time and talked 25% of the time (although this does not add up to 100). For them, playing was useful since they were not always able to understand one another. In the middle, she says they lowered their game play to
60% and increased conversations by 40%. Leticia also recounts her experiences and how structured language practice became a kind of “stepping stone” from learning how to say things to engaging in conversation:

Well, in the beginning when I entered, I didn’t know much English. Well, in the end we all played cards, talked, and played. It was different each time we met. Hangman, spelling, and the cards were how we learned to say things. (Leticia, interview)

With the lack of vocabulary, language conversation can be riddled with misunderstandings. It became easier for students to use games and other strategies (such as visuals) to learn vocabulary especially when full-blown exchanges seemed to be outside of what Vygotsky (1988) would term students’ “zone of proximal development.”

They cognitively understood their dilemma and thus resorted to structured language practice. If they could not communicate fluently, then they would communicate by other means. In doing so, they, unexpectedly, scaffolded their learning experience with their partners through structured language practice.

**Language Acquisition**

Because of the steps taken by students to problem solve or initiate language, it was as if they had forgotten about their anxiety. Confidence was a word that kept emerging from their journals, and in their interviews. Students noted their increased confidence in their language ability in their journals and interviews. Confidence then became a way that they measured their ability to understand their peer when speaking in the target language. According to journal notes, interviews, analysis of tapes, and field notes, the dyads initially experienced low levels of confidence during the first stage. However, once students felt successful during their structured
language play during the Language Initiation stage, they began to make conversational attempts and their confidence increased. This increase in confidence continued throughout the Language Acquisition Stage as well.

1. Confidence (Increasing) – participants more comfortable, more confident
2. Language Practice – Structured Language Practice (games, tests, etc.), or (b)
   Conversations (10 exchanges or more)
3. Frustrations and Misunderstandings – not being able to communicate, off-task behaviour
4. Strategies – to thwart misunderstandings by using visuals, code-switching, translation or other scaffolds
5. Perceived Learning/Acquisition – participants believe they have learned language or understand better than before
6. Key:  J = Journals, I = Interviews, AT = Analysis of Tapes
7. *SLP - Structured Language Practice (although some attempts at conversations made, generally less than 10 exchanges occurred)

As their confidence in their language ability increased during language practice when they could play games and engage in quizzes. They could focus on language practice and were not as intimidated to talk. Sam and Leticia engaged in conversations of 10 exchanges or more earlier than the others and actually reached the stage of language earlier than the other two dyads. Therefore, having the ability to postpone language practice through structured language practice was a relief for students who were not ready for conversations. During this stage they appeared on tape to be less concerned or anxious about their practice.

Interviews during this stage revealed some students became metacognitive about language practice and conversational ability. Sam noted how conversational practice is important since an expert language peer can help another immediately when one makes a mistake, but more importantly, as a teacher promoting conversational practice with your peer, “you have to learn how to adjust your language for your student.” According to Sam, in order to make language more accessible, you need to use games and adjust the level of your words: “You
think, ‘Oh, you can’t just talk to them you know, because they can’t understand and they can’t just make up another game.’ It’s hard. You just have to like adjust the words, right here to the—” [Sam is interrupted by a student during the interview] but continues to without skipping a beat:

Like in Spanish you can use the words you already know, even though the grammar is not correct, you know they’ll understand it. You know because like you say ‘dog hungry.’ Well you know it’s not right but they understand it. You can let them do easier stuff. It’s just hard to pull it back [the language you normally would speak] because you want to be like, ah! Just understand!

Sam not only talks about slowing the conversation rate, lowering the level of words within the zone of proximal development for the language partner, but also lowering the topic level as well. “Do things that you think they’ll understand…You know what words they can start learning and after we do kind of repetitious stuff, they’re learning it over and over and over.”

Thus, while structured language practice as well repetition was an important aspect of language learning and advancing language, other factors determined whether students engaged in conversations. For instance, students became highly engaged when conversations centered on familiar topics related to school, friends in school, and their families. At one point toward the end of the program, Leticia, Teresa (whose partner was absent that week), and Sam engaged in a fast-moving conversation. And, although Leticia changed the topic abruptly and even changed the context, Sam was able to keep up with their conversation which includes episodes of code-switching. Sam said he finished the mile in eight minutes and 30 seconds, but jests with Leticia about her time: 15 minutes and 30 seconds.
L: Corrida jarabe. [Runs like syrup.]

S: Teresa, clase [class] de Evans?

L: Uh huh. (Leticia answers.)

S: No!

L: Yes!

S: Estas muy mal que no? [You are very bad, aren’t you? (For not running fast he insinuates.)]

L: Que no, que no. (Leticia mocks him.)

S: Oh, third period.

L: Uh huh.

S: Oh.

L: Forty, numero [number (as in the numbered spot she stands on in P.E.)].

S: Si todos [yes everyone], ah.

L: Si se entiende, verdad? [“Yes, he understands, right?” she says to Teresa.] Y con el ingles, pero nos entiende [and us with the English, but he understands (she says in a surprised voice).]

While this is not a fluent conversation by any means, this is the type of language that emerged between the speakers during the short period of time they were placed together and code-switching supported that communication. Thus, this example brings forth the idea of engagement and application of language despite very low language competency levels. Students do begin to acquire language via comprehension as Leticia noted in this conversation, or in terms of the vocabulary and verbal language that increased between dyads. Furthermore, students began to gain a sense of that salient self
and rise to the occasion because of their self-confidence (Csizer & Dörnyei, 2005).
Thus, while students noted their own perception of language acquisition, comprehension,
and believed that they were better able to apply what they learned as cited in journals and
interviews, the videotapes also revealed language advancement and acquisition in terms
of increased comprehension as with the case of Leticia and Sam.

Discussion

The alternative dual language program provided students with an opportunity to be self-
driven and, at times, to become metacognitive about their learning situations. Students appeared
excited about the program and maintained their motivation which was based primarily on
volition—participants elected to be in this program to learn language; positive direction at the
initial outset of the program—high expectations, program norms, a sense of cooperation and
support; and, self-regulated learning experiences which led to ownership of the classroom which
fostered integrative respect and acknowledgment.

In terms of volition, “Those students who do seek [inter-ethnic] contact have a priori
more favourable attitudes towards that group and towards learning its language than those
students who do not” (Clement, Gardner, & Smythe, 1977, p. 212). Helen did not initially want
to participate but agreed to prior to the beginning of the program. And, while she appeared
initially motivated to participate, her enthusiasm waned while other group members maintained
their desire to participate in the program. Thus, volition, being able to elect or choose to
participate in a program appears to be important in understanding students’ ongoing motivation.

Bandura (1997) notes that in order to break down social mores and accepted or condoned
discrimination, certain barriers have to be removed. In the alternative dual language program,
peer languages were given equal status. All participants engaged in language interaction once a
week on Wednesdays for two months. Language sessions alternated between Spanish and English each week. The entire language session lasted approximately 90 minutes—15 minutes for set-up, 60 minutes of alternating language interaction, and 10 minutes at the end of the session to complete journal entries. So, while the language practice benefitted both the English learners and Spanish learners, the English learners had been perceived on equal footing in this scenario.

Dörnyei and Maldarez (1997) note the importance of reinforcing positive direction and explicit expectations that help make a program successful. Students were given specific reinforcement about the positive nature of the discourse as well as behavioural expectations. While the teachers noted how fun and engaging the program was they also framed the program in such a way that students would understand their roles as self-directed teachers who would be responsible for helping their peers gain knowledge.

The researcher was recognized as the facilitator. Therefore, students came up with their norms, materials, for teaching collaboratively, and personalizing their physical environment so that they had “ownership of the classroom.” Peers were given the opportunity to reflect and resolve initial language problems and were expected to come up with positive solutions via group collaboration. Students brainstormed various strategies such as language games and quizzes. And while each dyad was separate, there was a sense of group order in which all of them would collaborate or help the other out in terms of ideas, setting up cameras, and sharing resources. This set the tone and the social structure that prevailed throughout this case study which Dörnyei notes as “intermember relations and group norms" (Dörnyei & Maldarez, 1997).

This inclusive and cooperative speech community allowed English Learners to be valued for their cultural and linguistic capital (McCollum, 1999). The alternative dual language
program gave them the opportunity to become teachers, tutors, or guides for mainstream students who wanted to learn Spanish. There was language exchange, and definitive high regard for English Learner peers who were recognized as visible and expert members of the group of alternative dual language participants (Clement, Gardner, Smythe, 1980; Clement, Gardner, Smythe, 1977).

Thus, this study revealed that socially, culturally, and linguistically different middle school peers who come together in a dual language setting have opportunities to overcome the reproductive hierarchy established in society. They identified and valued the members of their community as their friends (Clement & Kruidenier, 1983). Students became curious about one another and during their authentic language interaction develop seeds of friendship, and, at the same time, develop pride in their knowledge of their native languages.

**Implications for Teaching**

The research presented in this study touches on the idea of communication anxiety and how it can impede language learning growth, “[…] some people are anxious about language learning independent of processing deficit and that such anxiety reactions can interfere with language learning” (Horwitz, 2000, p. 256).

This study also reveals how increasing confidence in language learning appears to be linked to ability and decreased apprehension or worry. Students who positively perceive their learning process lower their affective filters and are ready to receive and retain more information from their language partners. While students in this study continued to have language difficulties and deficits, they were undaunted by them in their belief that they would overcome these obstacles and improve.
Language teachers need to provide students with ways of learning language that lower this anxiety and at the same time provide students with opportunities to authentically communicate. Whether we are teaching language-based tasks, or providing dual immersion opportunities for students, we must take measures to ensure that language learners “feel” good about language learning. In other words, we need to help develop their confidence in their ability to learn. In this scenario, language learning peers were placed together to learn language. They were to learn autonomously with little or no intervention from teacher/researcher. In taking on this responsibility, they discovered ways that would help them take the focus off their inability to understand and began language initiation techniques in terms of activities such as games and quizzes. Additionally, their anxiety became lower as they developed friendships with their peers and realized that it was a safe environment. While the language learning was autonomous, the teacher/researcher did provide rules that would set a positive tone for the language learners (e.g., no put downs, working to help one another learn language).

A change needs to occur in language teaching in which we are utilizing our resources such as our English Learners who may have a background in various languages to support the teaching and learning of foreign languages at all grade levels. Secondly, English Learners need to be equally provided with opportunities to practice language. An alternative dual language program emerges as one solution for providing a low anxiety environment which furthers authentic language practice and increases communicative competence.
Apprehension and Motivation Among Dual Language Peers

Emotional Intelligence and The Servant Leader: A Literature Review

Tobi Falzon

Pepperdine University

September 8, 2010
Abstract

An emerging construct of leadership, known as servant leadership, has begun to appear with greater frequency within the body of leadership literature. Robert Greenleaf (2003) describes the servant leader as one that possesses a natural desire to serve and the ability to create positive change in a transformational manner. Although there has been a considerable amount of research presented in support of servant leadership over the past four decades, many consider this approach to be unrealistic and lacking in empirical validity.

The following paper explores the main facets of servant leadership and emotional intelligence. This is followed by an examination of the existing literature regarding the possible connection between servant leadership and emotional intelligence. While there is a substantial amount of research pertaining to the relationship between emotional intelligence and various forms of leadership, such as transformational leadership, the review of the literature revealed a minimal amount of research regarding the relationship between servant leadership and emotional intelligence.
Servant Leadership

“Anyone wanting to be a leader among you must be your servant.” – Jesus of Nazareth

Following two decades of imprisonment, Nelson Mandela was released from prison and addressed the South African people: “I come to you as your humble servant” (Mandela, 1991). Three years later, in 1994, he became the country’s first democratically elected president. During Mandela’s twenty-seven years in prison, he worked tirelessly and under miserable conditions, to help create a democratic South Africa (Brown & Hort, 2006). His legacy is often described as one of great sacrifice, a man possessing a magnanimous spirit who readily forgave the injustices against black South Africans (Brown & Hort, 2006). The story of Mandela’s life continues to be shared throughout the world; while scholars, practitioners, and students alike reflect on his leadership style and years of service.

The purpose of this literature review is to examine the body of research that exists regarding the idea of a leader as first and foremost a servant. The literature pertaining to the possible connection between servant leadership and emotional intelligence will also be explored. According to Riggio and Orr (2004), the term “leadership” is most often associated with one who strives to obtain power or influence. The idea of servant leadership, however, provides an alternative view of leadership in which the leader focuses solely on the follower and refrains from a concern for the attainment of authority (Greenleaf, 1977). Greenleaf (2004) describes the servant leader as one who is driven by a sense of duty, purpose, and deeply held values; which ultimately stems from an overall awareness and knowledge of the self. However, despite the growing body of literature regarding servant leadership, many remain skeptical about the validity and staying power of this paradigm (Bowie, 2000).
Servant Leadership

A relatively new approach to leadership, referred to as servant leadership, continues to gain attention and popularity (Block, 1993). While the term is somewhat contemporary, the various practices of servant leadership have existed for hundreds of years in almost every culture (Nyabadza, 2003). Following his reading of Journey to the East, Robert Greenleaf (1970) formally presented the servant leadership model. The inspiration was derived from a character in the book, named Leo, who began the journey as a servant only later to emerge as a noble leader. Many years later, Greenleaf (1977) proposed an alternative way of viewing leadership based on his belief that the United States was undergoing a leadership crisis:

The servant-leader is servant first. It begins with the natural feeling that one wants to serve, and serve first. The conscious choice brings one to aspire to lead. That person is sharply different from one who is leader first, perhaps because of the need to assuage an unusual power drive or to acquire material possessions. For such it will be a later choice to serve--after leadership is established (p. 13).

One of the main tenets behind Greenleaf’s servant leadership is that a leader should refrain from preoccupation with holding formal authority. Based on this notion, the leader is not superior to the follower; rather, the two work in unison toward a common purpose. Leaders serve as models, provide enrichment, and simultaneously offer support and development for their followers. The constant focus of the leader on the cultivation of others allows the follower to become more independent and knowledgeable (Greenleaf, 1970, 1977). Servant leaders work with a sense of altruism by always putting the needs of others first and demonstrating a high aptitude for empathy (Greenleaf, 1977). Walker (2003) explains that most leadership theories are behavioral in nature; however, servant leadership is based on a leader’s values and principles.
Despite the continued interest in servant leadership, however, the model has been criticized for promoting a perceived passive nature, seeming idealistic, and an inapplicability of the theory to multiple environments. Additionally, servant leadership has been characterized as tenuous, unsophisticated, and impractical (Bowie, 2000). According to Stone et al. (2004), servant leadership is merely an element of transformational leadership, as opposed to being a separate leadership method. This point is contrasted by those who claim the two theories are distinct and that servant leadership places greater emphasis on the emotional well-being of followers, while the primary focus of transformational leadership remains on organizational goals (Graham, 1991; Smith et al., 2004).

**Characteristics of Servant Leadership**

Barbuto and Wheeler (2006) contend that the characteristics displayed by the servant leader include: wisdom, altruism, humility, development of others, promotion of autonomy in others, emotional restoration, delegation of power, the desire to serve, and stewardship. Numerous researchers have stated that two of the most significant characteristics of a leader are empowerment and service (Greenleaf, 1977; Bennis & Nanus, 1985; De Pree, 1989; Kouzes & Posner, 1993; Block, 1993). Several others also include service or serving others as a crucial aspect of leadership (Farling, Stone, & Winston, 1999; Russell & Stone, 2002). Laub (1999) identifies six defining characteristics of servant leadership: (1) the servant leader values people and develops others, (2) the servant leader models behavior, (3) the servant leader builds communities and relationships, (4) the servant leader displays authenticity, integrity, and accountability, (5) the servant leader demonstrates leadership and clarifies goals, and (6) the servant leader shares leadership responsibilities and delegates effectively.
Spears (2004) emphasizes that servant leaders have a holistic approach to work, share decision-making responsibilities with their followers, enhance feelings of community, and most importantly, promote helping others. In Servant Leadership, Spears (2004) notes, “servant leadership is a long-term, transformational approach to life and work-in essence, a way of being-that has the potential for creating positive change throughout our society” (p. 8). Taking into account Greenleaf’s view of servant leadership, Spears (2004) devised what he believed to be the ten essential characteristics of the servant leader:

1. **Listening** - Though leaders are often identified by and valued for their decision-making and communication skills, they must also give special attention to listening in order to understand others. Active listening enables the leader to articulate and execute the will of the group effectively.

2. **Empathy** - Possessing an enhanced ability to relate to others, the empathic leader intuitively senses and perceives what others are thinking and feeling. People have an innate need to be accepted and the servant leader strives to bestow appreciation on others based on their individual talents.

3. **Healing** - Servant leaders contribute significantly to the development and revitalization of organizations. They understand and empathize with life’s adversities, acknowledge their potential to help others heal, and communicate to others that they are not alone.

4. **Awareness** - The self-aware leader fully acknowledges his or her strengths and weaknesses. Acute self-awareness enables the leader to possess a thorough awareness of others. Awareness allows one to comprehend complex ethical issues and to examine situations with a more complete view.
5. **Persuasion** - A reliance on persuasion as opposed to coercion is a major hallmark of the servant leader. The goal is to achieve consensus when making decisions that affect the group. The servant leader avoids the use of formal authority.

6. **Conceptualization** - Servant leaders are able to view the grand scheme of things. While they do not ignore the importance of everyday activities, servant leaders take a conceptualizing perspective and perceive interrelationships among the pieces.

7. **Foresight** - Leaders defined by this quality are insightful, proactive, and anticipative. The servant leader often possesses the ability to instinctively anticipate the probable outcomes of decisions through careful observation of the past, and assessment of present realities.

8. **Stewardship** - At the very core, servant leadership is defined by serving the needs of others for the benefit of society. In a similar manner, stewardship represents the careful management of something entrusted to the one’s care. Servant leaders take responsibility for their organizations; however, Greenleaf believes that both leader and staff are responsible for sound stewardship.

9. **Commitment to the growth of people** - Dedicated to the continual growth and development of people: professionally, personally, and spiritually. Servant leaders possess a nurturing spirit and believe that all human beings hold a great capacity for learning.

10. **Building community** - The increasing influence of technology on society and institutions creates the need for community building. Servant leaders aim to identify methods for building and creating communities among individuals. They recognize that developing organizational cultures based on shared concerns is critical.
Overall, the characteristics and behaviors of servant leaders are largely defined by a concern for others without self-interest (Laub, 1999; Johnson, 2001). Johnson (2001) asserts that the strengths of the servant leadership paradigm lie in the altruistic features, awareness of the self, and simplistic nature of the theory.

Servant Leadership Applied

Based on the characteristics mentioned above, Spears (2004) explains that servant leaders see the value of every individual within an organization and seek to create a sense of community. The emphasis on community derives from Greenleaf’s belief that this environment allows one to gain individual strength, experience feelings of appreciation, and develop trust in others. In order to generate this type of atmosphere, servant leaders focus on the growth of employees and strive to eradicate inequalities that are present in the organization (Graham, 1991). Working within the organizational setting, the servant leader gradually bestows more authority onto others and in turn accepts less formal control and power. Furthermore, numerous organizations have incorporated the idea of leader as servant into their culture, philosophy, or mission statement (Greenleaf, 2003; Spears, 2004). This includes, but is not limited to businesses, universities, non-profits, churches, and health care companies (Greenleaf, 2003).

Measurement of Servant Leadership

There has been a significant effort to define and measure servant leadership over the past two decades (Graham, 1991; Akuchie, 1993; Spears, 1995; Farling, Stone, & Winston, 1999; Bass, 2000; Polleys, 2002; Sendjaya & Sarros, 2002; Barbuto & Wheeler, 2006; Avolio, Walumbwa, & Weber, 2009). During this time, numerous researchers have attempted to create a framework for the servant leadership paradigm: Graham (1991) developed a generalized framework for servant leadership; Akuchie (1993) studied the biblical origins, Farling, Stone,
and Winston (1999) introduced a hierarchical framework, Bass (2000) compared servant leadership to transformational leadership, Sendjaya and Sarros (2002) reviewed the philosophical aspects of servant leadership, Polleys (2002) differentiated servant leadership from other models, Joseph & Winston (2005) examined the connection between organizational trust and servant leadership, and Washington et al. (2006) explored the values of the servant leader. The body of research is vast; however, the amount of empirical research pertaining to servant leadership is limited, and scholars continue to search for a uniform framework (Barbuto & Wheeler, 2006).

Servant leadership remains broadly defined and several assessments of the model currently exist (Avolio, Walumbwa, and Weber, 2009). In an attempt to further operationalize servant leadership, for example, Russell and Stone (2002) divided servant leadership into two groups or types of leaders, defined as accompany and functional attributes. Accompany attributes are labeled as listening skills, communication skills, credibility, competency, support for others, and the ability to guide or teach. Functional attributes include honesty, dependability, empowering others, trustworthiness, dedication to service, appreciation of others, setting the example, and a visionary perspective. Due to the fact that the servant leadership paradigm continues to possess such wide-ranging definitions, empirical validation remains a challenge. The body of conceptual research continues to grow; however, researchers have been unable to agree on one paradigm for accurately measuring servant leadership (Barbuto & Wheeler, 2006).

**Servant leadership questionnaire (SLQ).** One attempt to validly measure servant leadership, the Servant Leadership Questionnaire (SLQ), was developed by Barbuto and Wheeler in a 2006 study. Based on their findings, Barbuto and Wheeler (2006) contend that these five characteristics are empirically distinctive: wisdom, persuasive mapping, organizational stewardship, emotional healing, and altruistic calling. This assessment tool includes a 23-item
questionnaire, based on five characteristics that were drawn from 11 possible servant leadership attributes. The study revealed that servant leadership was correlated highly with organizational effectiveness and leader-member exchange characteristics as opposed to transformational leadership attributes. This result is in alignment with Burns (1978) assertion that servant leaders focus on serving their followers, while transformational leaders place greater emphasis on organizational outcomes.

**Servant Leadership Inventory (SLI).** The Servant Leadership Inventory (SLI), developed by Longbotham (2007), was designed to evaluate the seven qualities of a servant leader based on Patterson’s (2003) model: humility, altruism, vision, trust, agapao love, service, and empowerment. Longbotham created the SLI as a substitute for the Servant Leadership Assessment Instrument (SLAI) due to the inventory’s limitations (Rennaker, 2008).

**Servant leadership behaviour scale (SLBS).** Utilizing the body of literature, Sendjaya, Sarros, and Santora (2008) designed the Servant Leadership Behaviour Scale (SLBS) as a means to operationalize and measure servant leadership. The thirty-five-item questionnaire consists of six observable behaviors: transforming influence, transcendental spirituality, responsible morality, covenantal relationship, authentic self, and voluntary subordination (Sendjaya, Sarros, and Santora 2008). While the researchers recommend further empirical studies that measure servant leadership, they believe that the strength of the SLBS assessment tool lies in the methodological approach, sound measures, ease of use, and the validity. According to the authors, “The SLBS may represent a significant contribution to the servant leadership literature, filling a void that has long been subject to anecdotal evidence” (Sendjaya, Sarros, & Santora, 2008, p. 418).
Human factor model (HF). Based on their review of the literature, Page and Wong (2000) developed an instrument designed to measure servant leadership based on four spheres of leadership: relationship, personality, task, and process. The conceptual framework of Page and Wong’s instrument is based on Adjibolosoo’s (1995) Human Factor Model (HF). The Human Factor model was intended to study the effects of organizational behavior on economic development. Page and Wong’s (2000) tool has been criticized due to the lack of scale reliability tests and factor analysis; however, the instrument demonstrates potential for training leaders (Dennis & Winston, 2003). For example, educators may choose to use this tool for establishing the subject matter of leadership curriculum. Further research with this model is recommended utilizing both empirical and qualitative data (Dennis & Winston, 2003).

Servant organizational leadership assessment (SOLA). The Servant Organizational Leadership (SOLA) instrument provides an assessment of servant leadership behaviors that are demonstrated by leaders within an organization (Laub, 1999). Considering that servant leadership is a “shared” form of leadership, the tool is neither limited to nor intended for upper management, and may be administered to any member of a group. The instrument measures perceptions of servant leadership based on Laub’s (1999) six characteristics: providing leadership, sharing leadership, displaying authenticity, building communities, developing people, and valuing people. The overarching goal of the SOLA was to create a channel for increased communication as well as to provide an environment of learning within the organization (Laub, 1999).

The Constructs of Servant Leadership

Based on Patterson’s (2003) theory, Dennis & Bocarnea (2005) conducted a study designed to create an instrument that measures the constructs that come together to represent the
concept of servant leadership. Patterson’s theory of servant leadership defines the leader’s behaviors in the form of constructs: altruistic, trusting, empowering, serving, visionary, humble, and acting with agapao love (2003). This theory was born from Patterson’s idea that current leadership theories fail to account for the values displayed by leaders, such as altruism. Dennis and Bocarnea (2005) assert that Patterson’s theory provides a “platform for more specific research by defining the values on which servant leadership is based-values that she refers to as the component “constructs” of servant leadership” (p. 601). While the instrument measures five of the seven servant leadership factors, the tool fails to accurately measure service and altruism, and therefore requires further research in order to confirm construct validity (Dennis and Bocarnea, 2005).

**Empirical Validity of Servant Leadership**

The lack and unreliability of empirical support for servant leadership continues to be a topic addressed by researchers (Washington, Sutton, & Field, 2006), while several others continue to gather support for the field (Sendjaya & Sarros, 2002; Dennis & Winston, 2003; Russell & Stone, 2002), and there is no consensus that any one model accurately describes the servant leadership construct. Bass (2000) believes that the immense philosophical basis for servant leadership provides the opportunity for continued research. In order for the theory of servant leadership to be legitimate, however, it must describe specific behaviors of these leaders (Sendjaya & Sarros, 2002). Washington, Sutton, and Feild (2006) emphasize that empirical validation is deficient, particularly with regard to the roles of specific characteristics in servant leadership. This is a problem to be remedied as the leader’s characteristics have a direct impact on followers and organizational performance (Russell, 2001).
Recommendations for Servant Leadership Research

Two central themes are found across the various definitions of servant leadership. The first being the focus on the leader-follower connection, and the second theme is the focus of the leader on the follower’s needs. Greenleaf (1970) proposed that followers might eventually become servants themselves as they become freer, healthier, wiser, and more autonomous. Similarly, Sendjaya, Sarros, and Santora (2008) propose that the altruistic nature of servant leadership may be a factor in the follower’s positive outlook. Based on these notions, Barbuto and Wheeler (2006) contend that research opportunities exist for determining the degree to which servant leadership increases emotional well-being, autonomy, and organizational astuteness. Additional areas for opportunity would be studies that address the possible connection between servant leadership and organizational effectiveness, positive organizational outcomes, or employee engagement (Barbuto & Wheeler, 2006).

Organizations that are in need of a “selfless” leader may benefit from the ability to empirically identify a leader that is authentic and altruistic (Sternberg, 2003). The altruistic behavior of the servant leader is thought to benefit the follower, and operating in a cyclical manner, the follower then becomes the contributor to servant leadership. To this end, further study recommendations have been made for the Servant Leadership Behaviour Scale (SLBS) by examining the relationship between Organizational Citizenship Behaviour (OCB) and servant leadership characteristics (Sendjaya, Sarros, & Santora, 2008). The concept of OCB is defined in the following way:

Scholars argue that when servant leaders exemplify such behaviours as articulating a shared vision with which followers can identify, setting a personal example, appealing to commonly shared values, demonstrating concern for the
welfare of their followers, and engaging in moral dialogue, they are likely to engender followers’ affect and trust in the leader. As a result, followers will be encouraged to engage in discretionary behaviors directed towards other individuals and, to a lesser extent, towards the organization (Sendjaya, Sarros, & Santora, 2008, p. 419).

While this area remains unexplored, Pekerti et al. (2007) proposed that the participation of a follower in OCB would have a positive influence on the leader’s self-image.

Barbuto and Wheeler (2006) believe that the precursors to servant leadership offer empirical opportunities. These include mental capabilities such as motivational factors, openness to experience, and emotional intelligence. Additional antecedents may also include situational variables, such as childhood experiences, education, or previous contact with servant leaders (Barbuto and Wheeler, 2006). While evaluating mental capabilities proves to be extremely complicated (Anastasi & Urbina, 1997), Sendjaya, Sarros, & Santora (2008) maintain that further studies measuring the psychometrics of servant leadership will contribute to validation of the paradigm.

**Emotional Intelligence**

What is emotional intelligence? The idea began to emerge in the early twentieth century and was referred to as “social intelligence.” According to Thorndike (1936), social intelligence refers to one’s ability to engage socially and understand others. Many decades later, Howard Gardner developed the theory of multiple intelligences, which is comprised of both intra- and interpersonal intelligence. The term “emotional intelligence” (EI), created by Peter Salovey and John Mayer, was not formally introduced until 1990. The theory of emotional intelligence is based on the notion that certain individuals possess the ability to effectively regulate their
emotions as well the feelings of others. Emotionally intelligent people are defined by Mayer, Salovey, & Caruso (2008) as “individuals that have a greater capacity than others to carry out sophisticated information processing about emotions and emotion-relevant stimuli, and to use this information as a guide to thinking and behavior” (p. 503).

Five years after Salovey’s and Mayer’s introduction of the term emotional intelligence, Goleman (1995) published the book called Emotional Intelligence, and contributed to the increasing body of research regarding the social facets of intelligence (Gardner, 1983; De Sousa, 1987; Salovey & Mayer, 1990). Goleman identified emotional intelligence as a crucial component of successful relationships, both personally and professionally. The book gained widespread attention and served as a catalyst for the utilization and incorporation of emotional intelligence principles into professional environments (e.g., Goleman, 1998).

In recent years, there has been a considerable outpouring of literature regarding the topic of emotional intelligence (Matthews, Zeidner, & Roberts, 2002). As a result, some theorists have publicly made clear the differences between the earlier and later models of emotional intelligence (Mayer, Salovey, & Caruso, 2008). Overall, the disparities between the three main models of emotional intelligence are significant with regard to theory and the defining characteristics. Mayer and Salovey developed the first model of emotional intelligence in 1997, known as the four-branch model.

The four-branch model of Mayer and Salovey (1997) addresses the interplay and complexity of emotion, reason, and intelligence. This model focuses on intelligence as a primary factor with emotional intelligence as a secondary factor. Emotional competencies are the cornerstone of Goleman’s (1998) competency model, which defines emotional intelligence as a combination of abilities that contribute to leadership performance. Finally, the Bar-On model
(1997) defines emotional intelligence as the understanding of oneself and others, in addition to
the ability to adapt to and manage environmental demands.

Mayer, Salovey, and Caruso (2008) refer to the Bar-On Model and Goleman’s
Competency Model as “mixed models” due to the inclusion of emotion-related attributes with
unrelated qualities. The Salovey and Mayer Model, on the other hand, is referred to as an ability
based model, which views emotional intelligence as an actual form of intelligence (Downey, et
al., 2006).

**The Mayer and Salovey Model**

Mayer and Salovey believe that emotional intelligence consists of a set of abilities that
allow one to enhance intelligence through a process of reasoning with emotions. The model
purports that emotional intelligence can be validly tested and utilized (Cobb, 2000). The ability
to perceive an emotion accurately is viewed as a basic lower level skill; while the ability to
manage emotions effectively is described as a high level skill. These skills provide the
framework for the four-branch model hierarchy and “include the abilities to: (a) perceive
emotions in oneself and others accurately, (b) use emotions to facilitate thinking, (c) understand
emotions, emotional language, and the signals conveyed by emotions, and (d) manage emotions
so as to attain specific goals” (Mayer, Salovey, & Caruso, 2008, p. 506). A formal assessment
tool, known as the Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT), was designed
to measure the four-branch model (1997).

**The MSCEIT Instrument**

The purpose behind the MSCEIT assessment tool was to develop a test that measures
emotional intelligence in a similar fashion to those used to evaluate psychometric intelligence
Eight tasks are separated into four categories that are designed to identify intellectual abilities: perceiving, facilitating, understanding, and managing emotions (Salovey, 1997). Mayer, Salovey, and Caruso (2008) assert that the ability-based approach is the most accurate way to measure emotional intelligence because assessing mental abilities entails asking pertinent questions and evaluating the answers based on a standard of correctness. The Mayer and Salovey Model emphasizes the emotion-process framework, while mixed model approaches, such as the Bar-On and Goleman Models of emotional intelligence add several attributes (e.g. trustworthiness, empathy, and innovation) to the ability model (Goleman, 1998).

**The Bar-On Model**

The Bar-On Emotional Quotient Inventory (EQ-i) was developed in 1997 by Reuven Bar-On, a clinical psychologist, and was the first instrument on the market. The term Emotional Quotient (EQ) was originated in his 1985 doctoral dissertation as a means to describe social functioning and emotional intelligence. Viewing his model as an overall measure of psychological well being, Bar-On (1997) asserts that the emotionally intelligent individual can articulate feelings, manage daily challenges, and relate to others. Specifically, "emotional-social intelligence is a cross-section of interrelated emotional and social competencies, skills and facilitators that determine how effectively we understand and express ourselves, understand others and relate to them, and cope with daily demands" (Bar-On, R., 2005, p. 3). Bar-On’s model of emotional intelligence consists of five components, both interpersonal and intrapersonal, that include numerous competencies and skills (2000). The model also highlights the areas of functioning and assessment in the (EQ-i).
The Bar-On assessment tool has been criticized for being a self-report measure and for the broad definition and mixing of mental and non-mental abilities, “although the model included emotion-related qualities such as emotional self-awareness and empathy, into the mix were added many additional qualities, including reality testing, assertiveness, self-regard, and self actualization” (Mayer et al., 2000, p. 506). Caruso et al. (2002) also asserts that the model lacks discriminant validity due to the significant correlation with personality. However, Bar-On (2005) defends the construct validity of the model, evidencing numerous studies that demonstrate the domain overlap of emotional intelligence with the EQ-i assessment tool (2005).

**The Goleman Model**

Goleman (2000) views IQ as a static measure, remaining relatively unchanged throughout life, while he conceptualizes emotional intelligence as something that can be developed at any age with practice. Goleman’s model of emotional intelligence was originally based on the Salovey and Mayer (1990) Model; however, Goleman’s model places less emphasis on standard intelligence quotient. Goleman (1995) asserts that emotional intelligence is equally important and significantly more influential than standard IQ. In other words, emotional intelligence is a necessary component of an individual’s high performing intellect (Goleman, 1995).

In 1997, Goleman and Richard Boyatis designed a self-report measure known as the Emotional Competency Inventory (ECI). The assessment tool was intended to articulate one’s capacity for a given number of competencies. The construct for Goleman’s Model was originally divided up among five categories, which included empathy, and was later minimized to four clusters or fundamental capabilities: self-awareness, self-management, social awareness, and social skill (2000).
While Mayer, Salovey, and Caruso disagree with the mixed model approach of combining social competencies with emotional intelligence abilities, Goleman’s interpretation has achieved widespread popularity and spawned several new approaches on the topic (Caruso et al., 2002). The assertion made by Goleman (1995, 1998) that emotional intelligence can be helpful in all aspects of life is one of the main reasons for the tremendous amount of interest surrounding the topic. Goleman describes emotional intelligence as the effective management of both self and relationships (2000, p. 80). Goleman maintains that emotional intelligence is equally beneficial when utilized in home and school settings; however, the majority of applications and literary outpouring have been directed toward the workplace and organizational effectiveness (Goleman, 1998; Cherniss, 2001; Cartwright & Pappas, 2007; Blank, 2008; Druskat & Wolff, 2001).

**Emotional Intelligence and Organizational Effectiveness**

A significant increase has also been witnessed in the amount of research regarding the importance of emotional intelligence within the workplace (Goleman, 1998). Emotional intelligence has been identified by Goleman (1998) as an integral component of organizational success, a desirable quality in leaders, and a fundamental part of organizational management and effectiveness. In order to survive the complex business environment, Goleman (1998) believes that emotionally competent organizations will have a competitive edge in the workplace. He asserts that, “the emphasis on flexibility, teams, and a strong customer orientation, is a crucial set of emotional competencies that is becoming increasingly essential for excellence in every job and in every part of the world” (p. 29). According to Druskat, Sala, and Mount (2006), research indicates that Goleman’s ECI competencies can be learned and translated into organizational success.
Despite this increasing amount of literature relating emotional intelligence to organizational effectiveness, there is a significant amount of disagreement on this matter. Research has begun to explore the effects of emotional intelligence on organizational performance; however, further studies are required to determine the effectiveness of emotional intelligence on organizational performance (Druskat, Sala, & Mount, 2006; Lindebaum, 2009). Overall, there has been an increase in focus on emotional and social skills within the organizational setting, resulting from current research in positive organizational behavior (Luthans, 2002).

**Servant Leadership and Emotional Intelligence**

The connection between emotional intelligence and servant leadership remains to be validated in the literature; however other theories of leadership-charismatic and transformational-are indeed influenced by a leader’s level of emotional intelligence (Waddell, 2009). Furthermore, the emotionally intelligent leader seems to be the channel for organizational effectiveness, communicating vision and building successful relationships with employees (Ashkanasy & Dasborough, 2002). Spencer (2007) asserts that emotional intelligence is an essential component of servant leadership, particularly with regard to one’s ability to demonstrate empowerment. Parolini (2005) posited that based on the servant leader’s focus on the needs of the follower, a relationship would be found between servant leadership and emotional intelligence. However, a minimal amount of research exists regarding the connection between servant leadership and emotional intelligence (Winston & Hartsfield, 2004; Parolini, 2005; Spencer, 2007; Irwin, 2007; Van Staden, 2007; Vidic, 2007; & Waddell, 2009).

Despite the small body of evidence, positive relationships have been identified. A positive correlation between servant leadership and emotional intelligence has been identified by Winston
and Hartsfield (2004), Vidic (2007), and Van Staden (2007). Winston and Hartfield’s study found a connection between the two variables; however, “there appears to be relative application of emotional intelligence to the servant leadership concept, although it is not clear if emotional intelligence is specifically tied to servant leadership or just leadership in general” (2004, p. 5). Overall, additional research is needed in order to confirm the initial findings.

Conclusion

The body of research continues to grow for both servant leadership and emotional intelligence. While both paradigms are labeled as contemporary, spanning only the past four decades, the review of the literature revealed that significant efforts have been made to measure and define these constructs. While emotional intelligence has been definitively linked to other forms of leadership, further research is recommended to confirm the relationship between servant leadership and emotional intelligence. Additional research is also needed to identify the possible effects that the two paradigms have on organizational effectiveness.

Proposal Submitted for the Hawaii International Conference On Education
Literature Review

Although much of the data used to demonstrate gender differences in mathematical ability may be confounded by failing to control for such important variables as the difference in the number and type of mathematics courses taken by males and females and the higher dropout rate for males, research finds that when these two variables are controlled, males surpass females in demonstrated mathematical ability at around grade seven (Conlin, 2003; Kenshaft, 1990; Maple & Stage, 1991). Furthermore, the size of the discrepancy increases each year thereafter.

Choosing not to study mathematics beyond the minimum high school requirements is a path that many girls choose (Clewell, Anderson, & Thorp, 1992). There has been a trend of successful female student-leaders who have led to the term “the new gender gap” (Conlin, 2003). This has misled many to believe that the mathematics gender gap has been eliminated. However, the percentage of women entering college and master’s programs has continued to rise, except for in the fields of engineering and computer science. Male participation in mathematics after high school is far greater than females’ (Simon, 2000). Furthermore, females are less likely to think they are proficient in mathematics and are more likely than males to experience math anxiety (DeHaven & Wiest, 2003). This factor of attitude towards mathematics and self-image is significant when one considers that girls are making the decision not to proceed in mathematics during the adolescent stage of development when many females of their decisions are based on feelings (Gilbert, 2001).

According to Kenshaft (1990), there are three possible reasons for the lack of gender equity in mathematics. These reasons include societal customs, educational
Mathematics and the Gender 3

customs, and family customs. There are many misconceptions and beliefs that exist in society that may contribute to the inequity. The first is an impression that mathematics is “unfeminine” (Clewell et al., 1992; Kenshaft, 1990). Some girls fall into society’s view that mathematics is a male domain and females do not belong. Society suggests that males will do better in mathematics (Kenshaft, 1990). The second custom in society is the opinion that mathematics is difficult (Clewell et al., 1992). Some girls may accept this view and decide that the amount of effort necessary to do well in mathematics is not worthwhile. Many students do not perceive mathematics as useful in their future careers (Wiest, 2001). There is certainly a shortage of female role models in mathematics and this has an impact on course-taking patterns (Kenshaft, 1990). A final societal custom is that females are socialized early to be more affective and more service-oriented and less analytical and quantitative in their career interests (Clewell et al., 1992).

The American education system is constantly developing and updating to fit the latest research trends. Some customs have developed silently and have allowed inequities to enter mathematics classrooms (Kenshaft, 1990). Learning styles have been a large area of research over the past decade, which have drawn attention to the inequities in mathematics classrooms. It has been suggested that females tend to enhance objective knowledge by using intuition and self-understanding to give such knowledge personal relevance, whereas the male model establishes “truth” by objective, dispassionate methods (Clewell et al., 1992). If this is the case, then the traditional methods of teaching mathematics are beneficial to the male students and contributing to the inequity. These traditional methods include drill and practice where conceptual understanding is not greatly valued (Ladson-Billings, 1997; Simon, 2000). Another area of education that
contributes to the inequity is the career center. Many counselors fail to make female students aware of the vast range of occupations in which mathematics is either necessary or very useful (Clewell et al., 1992). Counselors often do not encourage female students to enroll in advanced mathematics courses believing that the classes will be too difficult for the female students or that the classes will be unnecessary for their future. A final educational custom within the mathematics classroom is the amount of praise, interaction, and higher-order questioning teachers give to students. According to research, male students receive more praise, have more interaction with teachers, and are asked more higher-order questions in mathematics classes than female students. Also, favorable comments towards females tend to be about neatness and favorable comments towards males tend to be about ability (Kenshaft, 1990).

The impact of family is similar to the impact of society on gender equity in mathematics, but the family has a much more personal effect on girls’ attitudes and decisions (Simon, 2000). Parents tend to view mathematics as less important for their daughters than for their sons (Clewell et al., 1992). In general, sons receive more encouragement, support, mathematical games, and mechanical inquisitiveness from their families (Kenshaft, 1990). These factors can lead to boys being more assertive, innovative, and investigative. Female play tends to be more stationary with little interest in understanding the physical world or building special concepts. In many families, the father is regarded as better at mathematics (Conlin, 2003).
Research Objectives

The proposed research has a three fold aim. First, the proposed research will investigate the attitudes towards mathematics of male and female youths and the background experiences of female adults who have mathematics related careers such as engineers and scientists. Second, the proposed research will foster recommendations that can encourage female students to take more mathematics classes and increase female involvement in mathematics related activities. Finally, the proposed research will expand the literature on gender and mathematics.

Proposed Methodology

The proposed research will be a qualitative research plan involving a focus group of no more than 10 male students (high school and college) between the ages of 15 and 25 who have an interest in mathematics, 10 female students (high school and college) between the ages of 15 and 25 who have an interest in mathematics, 10 female students (high school and college) who have a dislike or no interest in mathematics, and 10 adult females who have a mathematics related career. Each group of participants will participate in a focus group which will ask questions related to the participants’ attitudes, past experiences, and present involvement with mathematics.

Expected Outcomes

According to past research, it is expected that the female students who dislike or have no interest in mathematics will express the belief that mathematics is a male oriented subject, that it is too hard, and they will have a higher rate of math anxiety than their male counterparts. The females who have mathematics related careers will express
that they always had an interest in mathematics and never had any anxiety towards the subject and that they learned mathematics in a nurturing environment.

Human Physiology is a branch of science dealing with the physical mechanisms and the biochemical functioning of intricate living systems. It also integrates other branches of biological sciences (biophysics, biochemistry etc.), laboratory experimentation as well as medical applications. Thus, it has been a conceptually challenging subject for many students at the post-secondary level of education [1]. The Human Physiology online course (online PSL course) offered by the Department of Physiology at the University of Toronto (www.physiology.utoronto.ca) was developed to provide this course material, from knowledge to application, in a more flexible, accessible and self-directed framework for students. The course is entirely online, with 51 didactic video lectures, virtual laboratory experiments and several sources of online course support (virtual tutorials, lecturer accessibility via email and a discussion board available 24/7 to students).

This study aimed to assess the correlation between student performance and collaboration as well as online support (student sample from six completed sessions of the course, N=255). Initial research looked at the statistical correlation between student grades and online activity (number of posts on the discussion board). Then a student survey was issued to provide us data on the students’ sense of community, level of support received and the impact on their personal performance in the course.

The student population of the online PSL course was found to be extremely diverse as well as motivated and career oriented. The course had students who are pre-healthcare (e.g. nursing, physiotherapy etc.), pre-graduate school students, teachers, and mature students looking for career advancement. Thus, many of the students in the course were seeking strong achievement and performance in the course. However, there were also many challenges for some of the online students. Some have had no prior science background, some had language difficulties (international students), some were working to support a family and some even faced challenges with the online technology. Early investigation of the learning tools and online teaching features of the course showed that students of the online PSL course have found it helpful to discuss and learn the subject with their classroom peers collaboratively to overcome many of the aforementioned challenges. Students also demonstrated the significant impact on their grades due to support from their peers, lecture instructors and teaching assistants (TAs). However, initial results of the study do not show a direct correlation between student activity and performance due to differences in student learning styles. From extensive student surveying, it was discovered that some students with lower participation levels still benefited from the peer collaboration as they would read other student comments on the discussion board to facilitate their learning and resolve difficult concepts, resulting in high grades. However,
some students who also had lower online activity but poor scores often could have benefited from greater participation to learn from other student discussions. Some students who had high levels of activity and strong resulting grades had benefitted from the collaboration via discussion, clarification from peers or helping other students to improve their own understanding and retention. Finally, some students who had high levels of activity but still performed poorly often demonstrated a complete lack of understanding of course material.
Report on Issue Related to Teaching:  
Cultural Competence and P. A. Students: Learning to Care For and About Gay Patients  
Andrew Case, MS, RPA-C  
Clinical Assistant Professor  

The training of medical practitioners has historically focused on technical knowledge and skills instead of focusing on cultural competency, ignoring human elements such as treating the whole patient and understanding the role of socio cultural factors such as race, class, gender, religion and sexuality in patient treatment (Feldman & Christensen, 2008). In my work as a medical practitioner in hospitals and medical offices, I have encountered many instances of either insufficient cultural knowledge or cultural insensitivity displayed by doctors nurses, PAs, and hospital staff. Such occurrences can negatively impact patient treatment and undermine the relationship between patient and practitioner (Dogra & Karnik, 2004).

Currently, I work as a professor in a Physician Assistant (P.A.) department at a small private college in Buffalo NY, teaching, among other things, a behavioral medicine class. This role as a teacher-practitioner has afforded me the opportunity to work with P.A. students and helping them develop an understanding of the role socio cultural factors play in patient behavior and patient care. This presentation will address the portion of my behavioral medicine class where I focus on sexuality and the care for homosexual patients. Research shows that medical practitioners either lack or ignore information on the particular needs of gay patients (Bonvicini & Perlin, 2003). These oversights occur for a number of reasons ranging from inexperience to discrimination and can result in serious consequences for gay patients, including avoiding seeking medical care (Harrison, 1996).
In this presentation I will detail my philosophical and pedagogical approaches to helping my P.A. students understand the needs of gay patients. I will discuss my students’ reactions to this work and reflect on my effectiveness in addressing this serious issue as I work to best meet the needs of my students and their future patients.

Immigrant parents' perspectives of school transition for children with developmental disabilities.

The cultural and linguistic backgrounds of families impact their understanding and perspective on disability. In addition, cultural and linguistic differences between home and school affect the amount and type of communication between the school and family systems. The transition from preschool to kindergarten represents one such context to study the experiences of immigrant families of children with disabilities. Moreover, children come from a variety of different programs (inclusive and special needs) and their transition from these programs can affect their school adaptation. The proposed study will included interviews from immigrant parents whose children have been identified as having developmental disabilities. They will describe their perceptions and experiences of school transition, their understanding of their children’s difficulties, what resources they have access to through their preschool setting (special needs or inclusive) and how the transition to kindergarten is experienced by them and their children. The parents will be interviewed at three time periods: (a) at the end of the preschool year as they are making the transition to kindergarten, (b) after the first report card (November) and (c) at end of the kindergarten year. The interviews will be designed to uncover families’ communication with agencies and the transition practices that are in place in the school setting (Rous, Myers & Stricklin, 2009). For this presentation, transition practices and activities will be focused on preparatory activities such as, program visitation, instructional activities and the use of community resources. Parental perception of the quality of care and the impact of the disability on their lives (parental stress) will also be assessed (King, Kertoy, King, Law, Rosenbaum & Hurley, 2003). The Adaptive
Behavior Assessment System-Second Edition (ABAS-II) (Harrison & Oakland, 2003) will be used to measure the children’s developmental skills including communication, daily living, socialization, and motor skills and the severity of the child’s needs will impact on the family (Stein & Jessop, 2003). Results will be interpreted from a socio-cultural perspective.

6. Abstract:

To develop adaptation pedagogy as a consistent intentional teaching strategy among preservice and inservice teachers, teacher educators need to consciously connect and ground it to relevant theory and best practice in the areas of teacher efficacy, teacher learning, teaching for social justice, working with diverse learners, and language, literacy, and academic language development and even brain-compatibility. It must reflect the dynamic interaction among the learner, the teacher, and the classroom context and place reliance on the role of teacher reflection in making instructional decisions.

Adaptation pedagogy is not just a process of knowing and making relevant and appropriate plans for English language and special needs learners to make subject matter comprehensible, engage and support students in learning, and create effective environments for learning. The teacher engaged in adaptation pedagogy is not only knowledgeable of subject matter content and aware of the social, economic, linguistic, and cultural factors that affect learning; he/she also recognizes the need for students to acquire a deeper understanding of the instructional material in order to make it relevant to their lives. As teachers make instructional adaptation to provide English language and special needs learners access to academic curriculum and instruction, they are serving as advocates for equity, positive behavior, caring connections, resiliency, students’ background knowledge, and effective learning for its diverse students. Subsequently, through careful attention to the needs of these diverse students and how to engage them productively in a complex academic learning environment, English language learners and
students with special needs become connected participants to the classroom culture and active
users and consumers of the curriculum.

This presentation will demonstrate how adaptations can be planned before the
presentation of the lesson, during the lesson, and after the completion of the lesson. Effective
adaptation strategies for English language and special needs learners in this presentation are in
three categories: classroom organization adaptation, instructional presentation adaptation, and
activating student motivation and response adaptation (Lalas & Solomon, 2007). The presenters
will attempt to show that making adaptation is not just a mechanical process of listing and
matching adaptation activities with certain student weaknesses but a conscious decision-making
process that involves a deep understanding of the societal factors that influence academic
achievement and the dynamic interplay among the teacher, the student, and the classroom
context in the learning process. It involves figuring out what the students can and cannot do and
their level of comfort in recognizing their individuality, working with others, problem-solving,
demonstrating knowledge, and reflecting on their own learning. It is indeed a pedagogy –
adaptation pedagogy – because it drives teachers’ commitment to their students and their
learning, respect and care for their well being, advocacy for their future, and support for their
academic challenges.

   **Functional Movement: A Comparison of the Effects of Yoga Versus Core Stability Training**

   Each year $61.2$ billion dollars are lost due to common pain conditions in the US workforce (Stewart, Ricci, Chee, Morganstein, & Lipton, 2003). In order to combat such issues the Functional Movement Screen created by Gray Cook has been utilized to investigate the cause of such conditions. The purpose of this tool is to identify functional asymmetry in movement patterns in order to improve muscular function, performance, and prevention of injury. The screen is a test comprised of seven fundamental movement patterns that require a balance of mobility and stability (Cook & Burton, 2002). Once imbalances are identified, specific corrective exercises are prescribed to help the individual. Participation in yoga and core-stability training has been shown to promote many health related fitness aspects.
(Cowan, 2009), however, little is known as to whether yoga can be used as a corrective measure for functional movement specifically, also, if it is a better choice in increasing functional movement than core-stability training.

**Purpose**

The purpose of this study is to assess the functional movement of individuals who participate in yoga versus individuals who participate in a core stability-training program to determine whether yoga participation results in greater functional movement.

**Methods**

One section of a weight-training course and intro to yoga course will be utilized to conduct the study. The intentions of the study are to determine if FMS scores increase with specific activities. The yoga course will be carried out as normal, but students in the weight-training class will be intervened by four specific core-stability exercises. A pre-test/post-test design will be utilized to evaluate the functional movement of each participant. All participants will be measured using the FMS and individually instructed on how to perform the Deep Squat®, Hurdle Step®, In-Line Lunge®, Shoulder Mobility®, Active Straight Leg Raise®, Trunk Stability Push-Up®, and Rotary Stability®. Testing will be completed after the 2nd and 6th week of class.

**Benefits/Knowledge Gained**

The functional Movement Screen attempts to pinpoint weak links in movement patterns and alleviate them. The goal therefore is to coordinate exercise programming to correct the weak areas found during screening. When this is accomplished the individual will have greater movement and efficiency, which will lead to improved performance and a decrease in injury potential.

It is theorized that Yoga may assist in increasing functional movement and improve overall efficiency in movement. Therefore, suggesting that Yoga could supplement or even replace the corrective measures suggested by the Functional Movement Screen.
Development of a Tool for Producing Foreign Language Contents with Audio Synchronized Text Highlights

Abstract

With more and more elementary schools in Japan facing the problem of figuring out how to introduce foreign language education to their pupils without the help of a designated language teacher on campus, there is an immediate need for tools to help teachers create digital contents for foreign language learning that can be easily shared across many classrooms. Although the majority of current elementary school teachers are not trained for foreign language teaching, many of them have limited access to a foreign language teaching assistant who could help them create recordings of a native speaker’s pronunciation of words and story-reading. In this work, we propose a system that would allow users to combine the story-reading text of a story with a separately prepared audio reading recording into a single digital page and automatically add text highlights synchronized with the audio to help develop young children’s foreign language listening skills using multimedia technology on computers.

Introduction

As opportunities for working in a global environment increase, the first exposure of foreign language education in Japan’s compulsory school system has started to move up from the junior high school classrooms into the upper grades of primary school. In some schools, preparations have already progressed to start pushing foreign language studies into the curriculums of even lower primary school grades. Especially for younger children, the ideal environment for developing listening and speaking skills for a foreign language would include
access to a native speaker of the language on a regular basis, but this is not feasible in Japan.
A variety of computer based materials have been developed on the market to fill the void and
assist Japanese teachers suddenly thrust into the position of introducing foreign languages to
their students, but assembling for-a-fee tools for a classroom is also not feasible. Many public
schools have limited access to a foreign language teaching assistant who visits schools in
rotation a few times a year, but this results in only a very limited number of lessons per year
with a native speaker. Since large classes, which meet with the foreign language teaching
assistant for sometimes less than an hour per visit, can hardly allow each student time to
practice speaking and listening closely with the instructor, we propose in this work a system
for helping teachers to create their own digital contents which can combine story text with the
voice recordings of a native speaker to produce a type of read-along book or “kamishibai” (large
flipcards for storytelling popular with children in Japan) presentation for computers (Fig. 1).

Figure 1. Overview of text highlighting content generation system.

The development tools selected for this work are based on the Silverlight Framework and
Visual Web Developer Express 2010 tools from Microsoft. The resulting digital contents can
be viewed one page at a time using a mouse click operation easily handled by elementary
school children.
Synchronization of Text and Audio

The general approach for synchronizing the text highlighting feature with the audio contents is to analyze the audio data at a binary level to find blank quiet spots in the reading (Fig. 2). Words and phrases that are pronounced in a run-on style cannot be distinguished word for word with this method, but the initial experiments using audio recordings of various lengths and speeds indicate that a sufficient number of blanks can be detected in a typical story reading sentence and the progression speed of the highlighter bar can be adjusted using software to fit the beginning and end of each sentence.

Figure 2. Text highlight generator automatically searches for blank quiet times in story reading sentences for controlling the progress of the text marker bar.

Although specialized tools currently exist to produce text highlighting materials, the level of expertise needed to use them is usually quite high. The goal of our system is to develop a simple interface that can be easily used by elementary school teachers with just a few file selection operations.

System Design and Evaluation

To produce the read-along “kamishibai” style flipcard digital book, teachers will prepare the story text, audio reading file, and an optional image file for each page. On a simple PC window menu shown in Fig. 3, teachers can browse through the local hard disk to specify the files they wish to use.
Figure 3. File selection window for specifying the audio reading file, story text file, and optional image file to be used in producing a read-along “kamishibai” style digital page.

Pressing the [RUN] button will activate a program for analyzing the audio reading file for blank quiet times as described above and automatically determine how to synchronize the progression of a text highlighter bar to be displayed in the story text area (see example in Fig. 4) to match the speed of the audio reading and help children read along when the audio is played.

Figure 4. Sample output of audio synchronized text highlighting digital story page.
By collaborating with teachers at local elementary schools, we will use the prototype described above to verify the usability of the proposed system. In particular, we want to check the amount of time required for a beginner user to produce a short read-along digital “kamishibai” piece and the portability of the contents to various types of computers and digital players. The prototype version of the audio and text synchronization program is designed to process short audio files of about five seconds (one sentence) each and will be tested with a variety of audio reading samples including male and female voices, different accents, and reading speeds.

Attitudes of Career and Technical Educators toward Diversity in the Classroom

Cecelia Thompson and Dale E. Thompson
University of Arkansas

Career and Technical Education teachers need to relate to many cultures to better understand the growing diversity of school populations. “By 2010, 40 percent of learners in classrooms will be children of color, while the teaching population will remain about 85 percent white and female” (Hill-Jackson, Sewell & Waters, 2007).

Basic Skills, like reading and writing, are not the world’s greatest problems. “They result from people in the world—from different cultures, races, religions and actions—being unable to get along and to work together to solve the world’s intractable problems” (Banks, 2004, p. 291). Our children should develop multicultural literacy and be able to view knowledge from diverse perspectives.

Research indicates that heterogeneous groups perform well when diverse backgrounds and perspectives are appreciated. Creativity and problem solving improves. Minority viewpoints stimulate creative solutions (Canas & Sondak, 2008).

Teachers need to recognize and celebrate classroom diversity and teach for acceptance. “If teachers pretend not to see students’ racial and ethnic differences, they really do not see the students at all and are limited in their ability to meet their educational needs” (Ladson-Billings, 1994, p. 33).

Culturally-relevant teachers see themselves as part of the community and strive to give something back to the community. They make connections between the community and national identity. They believe all students can succeed and see teaching as helping students discover the knowledge they bring to the classroom. (Ladson-Billings, 1994)

Gross (1993) recommends that educators

- recognize any biases they may have absorbed
- treat students as individuals, respect students for who they are
- rectify language that may exclude or demean groups
- be sensitive to terminology that refers to specific ethnic or cultural groups
- determine the classroom cultural climate
- be informed about the culture of groups other than their own
- have confidence in the ability of students, don’t protect groups of students
- select materials that are free of stereotypes
- design a inclusive curriculum
- recognize that students may not be familiar with cultural references
- use diverse people as guest resources
- give assignments and assessments that allow students to draw on their diverse backgrounds and special interests.
In family and consumer sciences classes there are many opportunities to address diversity in the curriculum.

In child development and parenting classes, teachers can discuss how cultural beliefs and values influence almost every aspect of child rearing. How parents talk to children, touch them, dress them, and conduct routines vary according to culture. It is important to teach “there are many equally valid ways to raise healthy children who thrive in the world. Professional knowledge and experience are important, but we must never forget how much we can learn from the families we work with.” (Gonzalez-Mena & Pulido-Toblassen, 1999)

Purpose of the Study

The purpose of this study was to compare attitudes toward diversity of career and technical educators and education students living and attending schools in communities with different levels of multiculturalism.

The Diversity Awareness Profile (DAP) by Karen Stinson (2007) was administered to career and technical educators and students in Hawaii, Virginia and Hawaii. This self-assessment instrument is designed to help adults develop a view of their behaviors as they interact with peers and colleagues at school and work as well as participate in the community. The instrument measures primary, secondary and organizational dimensions of interaction with diverse individuals. The instrument was first published in 1991 and revised in 2007.

The primary dimension of the DAP includes age, gender, mental/physical ability, race, ethnicity and sexual orientation. The secondary dimension includes religion, education, thinking style, working style, marital/dependent status, geographic location, language, values, class, military status and appearance. The organization dimensions includes role in company, function, level, location, tenure, credentials, previous job, work experience, business unit and industry specialization.

Scores from the instrument fall into a diversity awareness spectrum that includes naïve, perpetuator, avoider, change agent and fighter. The spectrum helps participants assess how free of bias, prejudice and discrimination their behavior is.

Naïve people do not realize they exhibit biased behavior. They accept stereotypical statements as fact and do not comprehend biased behavior. The author of the Diversity Awareness Profile did not indicate a score for this category, because she believes naïve offenders don’t realize the impact of their behavior.

Perpetuators are indicated as a score of 24 to 47. A perpetrator is aware of their biases and offensive behavior. They continue with derogatory comments and actions even though they are aware of hurting others.

Avoiders are indicated by a score of 48 to 71. Avoiders are aware of their biases, but they try to say nothing when others are inappropriate. This is perceived as acceptance of bias.
Change Agents scores range from 72 to 83. They are aware of biases and realize the harm of acting on those biases. They try to help others understand and avoid bias.

Fighters score between 84 and 96. People in this category are willing to confront others they perceive as offenders. They may have a reputation for challenging others to the point that people may discount what they say and avoid them.

After administration of the questionnaire, the participants discussed possible learning experiences that would help others gain insight into their attitudes and behaviors toward others.

Results of the Study

<tr>
<td>Fighters 11</td>
</tr>
</tbody>
</table>

The majority of undergraduate students who participated in the study indicated that they were change agents as they interacted with others who were different from themselves. Almost half of the graduate students in this sample identified themselves as fighters. They were willing to be confrontational in situation where others were exhibiting bias. However, almost a third of the graduate students rated their actions as avoiders and chose to be silent in uncomfortable situations where others were expressing or acting on their biases. The mean scores for both undergraduate and graduate students fell in the category of change agent.
Table 2

*Summary of Career and Technical Education Teachers*

Career and Technical Education Teachers—Hawaii
n=9
M 83.3
Highest score 93
Lowest score 54
Avoiders 2
Change Agents 0
Fighters 7

Career and Technical Education Teachers—Virginia
n=4
M 86.25
Highest score 90
Lowest score 79
Avoiders 0
Change Agents 1
Fighters 3

The scores of Career and Technical Education Teachers were significantly higher than those of undergraduate and graduate students. The mean scores of both groups of teachers fell in the category of fighter. Both groups of teachers were employed in schools with diverse student populations.

**Discussion**

None of the participants scored in the categories of naïve or perpetuator. Since all of the participants were at least juniors in college or teachers with at least one college degree, they appeared to be aware of indicators of bias and tolerant of diversity. Other studies have shown negative correlation between formal education and prejudice. (Wagner & Zick, 1995; Guthrie, King, & Palmer, n.d.; Cothern, 2009)

It appears that undergraduate and graduate students score significantly lower than teachers on the DAP, an instrument designed to self-assess if a person’s behavior is free of bias. This may be the result of life-experiences and age. Both have been identified as affecting tolerance (Cothern, 2009). However, in this study it is more likely the result of the teachers working with a diverse student population.
Recommendations for Teacher Education

It is important to provide teacher education students with opportunities to examine their attitudes about diversity in the university classroom and as they participate in student teaching. The participants in this study identified the follow activities as appropriate for learning about diversity.

How diverse is my community?

A community will reflect the diversity of the people who live there. There will be small grocery stores and restaurants that provide foods preferred by a particular ethnic group. There will be churches with services in native languages. There will be agencies that serve specific groups within the community. Identify businesses and agencies that cater to specific groups within the community by searching the local Chamber of Commerce website, telephone directory, and asking the public school students about their favorite place to shop and eat. Students can work in groups of two and then compare their list with other students. As a class, describe the community resources that serve diverse populations.

Evaluating Classroom Materials

As a class group, evaluate one example of teaching materials used in a classroom. Examine the materials to determine if it incorporates a broad perspective of age, race, gender, and ethnicity. Determine if there are stereotypes depicted in the materials. Find examples of how diversity is addressed. Develop a rubric for evaluating other curriculum materials.

People are Like Lemons (or Apples or Potatoes)

The purpose of this activity is to discover that people are often similar on the inside. Give a lemon (or apple or potato) to each student. All them time to examine the lemon carefully. After a few minutes, collect the lemons. Ask the students to find their lemon in the pile. Most will recognize their lemons at once.

Next, ask students to describe how they recognized their lemon. They will describe the size, shape, color and surface features. Collect the lemons again. Peel the lemons. Ask the students to identify their lemon. This will lead to a discussion about how the lemons look alike on the inside.

(adapted from Stern-LaRosa, 2001)

Masculine and Feminine Speaking Styles

Men and women communicate in different ways. Rate yourself on a scale with often, sometimes and never for each of the following ways of communicating. Mix up the masculine and feminine items. Follow this activity with a discussion of how confusion can result from masculine versus feminine styles of communication.
The following statements describe masculine-style talk.
I talk to assert my ideas.
I don't like to discuss personal information.
I don't mind competitive discussions.
I like to give advice or explain how to solve a problem.
I don't mind interrupting others to make my point.
I believe each person is on his or her own, responsible for being heard.
I try to outshine others.
I show my confidence by being assertive.
I think talking should convey information and accomplish goals.

The following statements describe feminine-style talk.
I use talk to build rapport with others.
I like to share information about myself and learn about others.
I like to talk with others on an equal footing.
I like to show understanding and empathy when I talk to others.
I like others to know that I understand their feelings.
I ask questions so others will elaborate.
I like to show interest in others’ ideas.
I want people to know that I care about what they say.
I believe that details and interesting side comments increase my connection with others.

Beirut, Omar Beyhum Street,
Arab Open University Main Building, 3rd Floor.

E-mail: hkkhatib@aou.edu.lb; hayatkhatib@hotmail.com
Combating Intertextual Muddling and Plagiarism in Open Learning
By Dr Hayat Al-Khatib
Associate Professor of Linguistics
Arab Open University - Lebanon

The advances of technology, the ease of access to print and the increase in multimodal communication has led to hetroglossic and intertextual scripts in academic dialogue. Caryle et al (2006) attribute to Bakhtin his views that “the representation of multiple voices is an elemental necessity of authentic prose” and that, all texts and discourses partake excerpts from different-languages and resonate with “many-voices”. Heteroglossia and polyphony, in Bakhtin’s views, are the basic conditions that are unavoidable in any text (Bakhtin, 1982).

In the plethora of research and academic dialogue, acknowledging intellectual ownership emerge as a concern resulting from abundant intertextuality in academic dialogue (Irwin, 2004; Griffig, 2006). Academic panels, researchers and professional discourse communities confirmed the need to reinstate codes of good academic practice, specifically in relation to intertextuality and academic discourse.

Plagiarism has become epidemic at both ends of academia; at lower university levels as well as post doctorate research. Several factors contributed to the spread of the malpractice: academic conditions and restraints governing promotion and demotion in tenure linked to publishing, time restriction and the prescribed tasks that need to be completed, the existing academic and professional load from the world of work, discrepancy in different cultural perception in relation to intertextuality and plagiarism and finally, insufficient awareness campaigns on the subject at different academic levels.
The Arab Open University – Lebanon is one of the academic bodies that identified problems in intertextuality and pioneered a project to solve them. Conducting an intensive awareness campaign on what constitutes plagiarism and ways of avoiding it constituted the initial phase of the project. Multimodal methods were used to draw attention to the seriousness of the malpractice and its ethical and academic repercussions.

At the second phase, interactive software was developed that included tutorials on problems in intertextuality, plagiarism and proper quoting and citation methods. The tutorials were followed by training and testing interactive exercises with feedback that reaffirm concepts of good and malpractices.

At the third phase come sets of measures and penalties that conform to levels of identified problems in intertextuality and the intentional flouting of the codes of good practice in academic discourse amounting to serious plagiarism.

The project fulfills three dimensions in academic attempt to combat plagiarism: raising awareness, training and testing to establish comprehension of the concept and penalties. It is hoped that compatible research on the issues raised can benefit from the Arab Open University- Lebanon project and that attentions is drawn to the seriousness of the problem so that institutions can join efforts and adopt consistent measures to combat it.
Introduction
Problems of intertextuality and plagiarism have been identified as serious by academics and institutions all over the world. Caryle et al (2006) affirm Bakhtin’s views that “the representation of multiple voices is an elemental necessity of authentic prose” and that, all texts and discourses partake excerpts from different-languages and resonate with “many-voices”.

Access to online material is increasing concerns that web pages are making plagiarism easier to accomplish in the absence of academic integrity and student commitment to honour codes as they aim at passing averages (Lincoln, 2002, Mc Cabe et al, 2002, Gilgoff, 2001, Scanlon, 2003, Richardson, 2004). The advances of technology, the ease of access to print and the increase in multimodal communication have led to a plethora of hetroglossic and intertextual scripts in academic dialogue.

Heteroglossia and polyphony, in Bakhtin’s views, are the basic conditions that are unavoidable in any text (Bakhtin, 1982). In research and academic dialogue, acknowledging intellectual ownership emerges as a concern resulting from abundant intertextuality (Irwin, 2004; Griffig, 2006). Academic panels, researchers and professional discourse communities confirmed the need to reinstate codes of good academic practice, specifically in relation to intertextuality and academic discourse.

Plagiarism is underlined as epidemic at both ends of academia; at lower university levels as well as post doctorate research. Several factors contributed to the spread of the malpractice: academic conditions related to restraints governing promotion and demotion in tenure linked to publishing, time restriction and the prescribed tasks that need to be completed, the existing academic and professional load from the world of work, discrepancy in different cultural perception in relation to
intertextuality and plagiarism, and finally, insufficient awareness campaigns on the subject at different academic levels.

Since the early millennium, campaigns have targeted the problem of plagiarism with heavy penalties recommended and imposed, amounting to expulsion from the academic institution. Societies and cultures, however, differ in their perception of plagiarism and the seriousness of unreferenced but integrated academic property. Resorting to plagiarism detection software to identify and tag cases of plagiarism is costing universities money and time and transforming faculty to detectives instead of educators. In addition to problems associated with the application of detection software, revolutionary programmes warn of the possibility of innocent students getting tagged (John Barrie – creator of *Turn It In* in Green, 2000).

Awareness campaigns on what constitutes plagiarism, how prevalent it is and its impact on images of dishonesty, integrity and honour for students are advocated amidst rising numbers of alleged incidents among some of the best universities including Harvard and Yale (Hickman, 1998). Boston University filed law suits against eight term paper companies for corrupt practices including selling plagiarized work (Hickman, 1998). Education Digest (2001) flags out the problem of internet plagiarism, the abundance of websites selling term paper of the ensuing legal quandary. Newsweek (2001) presents statistics on the growth in academic dishonesty in the light of 122 student plagiarism investigation at the University of Virginia. Academic institutions responded by purchasing plagiarism detection programmes and incurring heavy penalties on caught cases. While traditional universities are sounding the alarm the problem in open and distance learning is even worse.
The problem in open and distance learning
Open and distance learning rely on cyber communication and facilities of uploading and downloading material. As such, interaction involves more electronic dealing and is more prone to scenarios involving intertextuality and plagiarism. Richardson (2004) argues that the problem of academic dishonesty including plagiarism, has not been sufficiently addressed. Gilgoff (2001) associates the impact of the internet on the willingness of students to commit plagiarism. The Chronicle of Higher Education charts tabular increase in the number of alleged plagiarism and cheating cases at Amherst College in Massachusetts in what is becoming an academic problem of epidemic proportion.

Educationists called for deterring measures that include raising awareness on the gravity of plagiarism as a crime of theft of academic property. Students’ honour codes were devised to emphasize integrity in students in higher education and establish codes of conduct in research and academic writing.

The case study
The Arab Open University is an academic institution operating in seven Arab countries through the Open Learning system. Minimal face to face tutorials are imposed, following the rules and regulations of Arab ministries of higher education. The AOU adopts courses and materials from the United Kingdom Open University. Recent statistics (2008) identify student body to exceed 35,000 enrolled at its seven branches. Students’ work is monitored by British external examiners at the end to every semester.

In the initial period of operation, 2002 – 2007, concerns were associated with ways of maintaining standards in the English language of expression in the works of students in specific regions. Moreover, external examiners highlighted the importance of an electronic learning management
system in open education to display tutorial outline, support notes, discussion forums, information and guidance online and facilitate uploading assignments and downloading feedback. Foundation courses were introduced and IT support was given to students to facilitate their use of the electronic learning management system. Tutorial outline, course information, resource sites, uploading facilities, were included in the system.

The following period of operation (2007-todate) featured growing concerns with plagiarism. In one report of an external examiner (Lee, 2009) the problem was associated with the weak expression of students who have fewer academic writing skills (section B, item 2). The examiner comments, “there is a tendency to lift material… from Wikipedia and other sources” (Lee, 2009).

Another examiner related the problem to poor or altogether absent referencing. Unacknowledged sources alarm tutors to take measures and constitute another aspect of plagiarism. Bygrave (2009) observed that weaker students relied on outside sources, sometimes repeating sections word-for-word without referencing and without putting the material into useful argumentation.

Quotations without referencing and the absence of in-text documentation and end of text list of references were highlighted (Bygrave, 2009). The report also included cases where assignments have been “assembled” from web-sources and caught when electronically submitted through plagiarism detection software, where they were given a mark of zero (Bygrave, 2009).

The Arab Open University – Lebanon is one of the academic bodies that identified problems in intertextuality and pioneered a project to solve them. Conducting an intensive awareness campaign on what constitutes plagiarism and ways of avoiding it constituted the initial phase of the project. Multimodal methods were used to draw attention to the seriousness of the malpractice and its ethical and academic repercussions.
At the second phase, interactive software was developed that included tutorials on problems in intertextuality, plagiarism and proper quoting and citation methods. The tutorials were followed by training and testing interactive exercises with feedback that reaffirm concepts of good and malpractices.

At the third phase come sets of measures and penalties that conform to levels of identified problems in intertextuality and the intentional flouting of the codes of good practice in academic discourse amounting to serious plagiarism.

Intertextuality and Plagiarism

Plagiarism in the case study has been identified at multiple stages of intertextuality with:

1- Wholesale lifting of material

2- Copy/paste from Web sources

3- Absence of in-text documentation

4- Unreferenced quotes

5- Absence of end of text list of references

Later assessment and student interviews helped group the above into two categories:

A- Inadvertent plagiarism

B- Plagiarism
Bakhtin’s *heteroglossia*, when “each discourse is crisscrossed by several other discourses” need to be systematized and to follow set ground rules. For unintended cases of polyphony in intertextuality, awareness campaigns of instruction on plagiarism and measures to avoid it were instated. At the other end, penalties compatible with recurrences of incidents or level banding of courses were introduced.

A tutorial explaining what constitutes plagiarism (see appendix A) was posted on the electronic university management system and channeled to all course platforms in such a way that all students would have to notice it when first activating their electronic accounts. Measures were taken to ensure that students would not be able to navigate to any site until they acknowledge understanding the tutorial and express their readiness to sit a plagiarism identifying test (see appendix B). The plagiarism test was made available on the electronic university management system from the start of the semester. No penalties were introduced for failing the test unless the student was apprehended of plagiarism.

The test comprised of a number of exercises where students are asked to identify a reproduced text from an original source, whether plagiarized or not. When replying, students receive electronic feedback on whether their answers are correct or not and explanations of the errors in their answers. Students with correct answers are able to move to the following level. Students with incorrect answers receive feedback explaining why their answers are wrong, with the overall aim of reaffirming the correct principles and practices at the testing level, after the initial introductory tutorial. Navigation to the following level is only permitted after the student confirms that they have read the feedback. The test will reorganize exercises differently at every approach so that students do not retain the order of exercises and feedback when repeating.
At the end of the test a failure notice would be displayed in cases of inability to recognize plagiarism, asking the student to study again the plagiarism tutorial and re-sit the test. A note of congratulation is displayed for the student who has correct scores on all answers, hence demonstrating understanding of the malpractice of plagiarism and knows how to avoid it.

In cases of successfully passing the test, students were asked to send a confirmation to the registry and the Exams Department declaring that they have fully understood plagiarism and know ways to avoid it, and that the student understands that the university has a strict policy on plagiarism and implements penalties amounting to failing the course in cases where plagiarism is detected.

**Disciplinary Measures**

The Centre of Excellence for Quality Assurance at AOU-Lebanon and the sub-committee of staff tutors compiled a set of disciplinary measures for implementation after conducting awareness campaigns and introducing students to examples of plagiarism.

For new students at level one courses, incidents involving plagiarism are dealt with at Faculty level through grade deduction and electronic tracking of the student record. Automated message is sent to the offender explaining the offence, the penalty incurred in terms of grade deduction and warning the student of future tracking. Once apprehended of an act of plagiarism, passing the plagiarism test becomes mandatory before the student can access his account.

For offences at level two courses or recurrence of a previously warned case, referrals to the disciplinary committee take place where the offender is called and officially warned. Documents related to the disciplinary committee warning are signed by the student and copies are kept in the student file at the Registry. The student’s records are updated with the new offense and the
plagiarized work is allocated zero. Passing the plagiarism test is made mandatory before the student is able to access his electronic account.

Plagiarism at level 3 courses or recurrence of plagiarism after warning from the disciplinary committee results in a series of measures compatible with the referred case and ranging minimally from allocating zero on the course, to allocating zero on the course in addition to academic probation, or in more severe cases expulsion from the university.

Applicability and results
Figures obtained from the University Management System (UMS) for the first semester of Fall 2008 - 2009 and the second semester of Spring 2008 - 2009 and following the piloted study revealed a drop in the cases of plagiarism in the two major programmes of Information and Telecommunication and Business administration, which in total embrace 90% of AOU – Lebanon student body.

The results point to the limited success of the project in controlling the level of plagiarism.
Figure 1
Cases of plagiarism in relation to programme of study

Statistics obtained from AOU – data base administrator
Fall 2008 – 2009
Cases of plagiarism in relation to programme of study

Statistics obtained from AOU – data base administrator
Spring 2009

In Fall 2008, caught cases of plagiarism were
The overall figures dropped in Spring from 20% to 11% in ITC and from 4.5% to 3.4% in Business studies. The figures, however, indicate higher cases in ITC than in the Business studies in both semesters, pointing out to a relation between ITC and ease of access to plagiarism.

Conclusion

Advances in technology and sciences have brought the globe into computer screens through the web, making accessible an unlimited wealth of knowledge with untamed methods of using it. Intertextuality and polyphony are features of every discourse bearing witness to such advances. The problem is how to tame such a process and lay down rules for academic paraphrasing, quoting
and referencing in intertextual discourse, to associate its use with more credentials rather than making it a source of blame.

The project fulfills three dimensions in academic attempt to combat plagiarism: raising awareness, training and testing to establish comprehension of the concept and penalties. It is hoped that compatible research on the issues raised can benefit from the Arab Open University- Lebanon project and that attentions is drawn to the seriousness of the problem so that institutions can join efforts and adopt consistent measures to combat it. Punishment and deterrent measures can be influential in decreasing attempts at plagiarism however awareness campaigns can bring a belief in principles of honesty and integrity and can bring about commitment to honorable codes of practice among students in higher education.

Appendix A  
Tutorial on Plagiarism

What is Plagiarism?

Plagiarism is when you use someone else’s ideas in your writing without acknowledging your source. Plagiarism has many forms:

- Copying in part or full from anyone, including friends, classmates, and internet sources.
- Copying word-for-word without using quotation marks and not citing the source.
- Paraphrasing by replacing few words or rearranging sentences and not citing the source.

How Can You Avoid Plagiarism

- **When quoting word-for-word**
  
  Quoting: Quoting means copying parts of the text for the purpose of presenting the author’s actual words. Quoting should be used inside quotation marks, followed by citation of its source. Failure to provide citation will be interpreted as plagiarism, even if the source is in your bibliography.
  
  To avoid plagiarism use quotation marks “ ” to frame the quoted text and cite the source in the text after the quote, using standard format of author’s surname, initial. (date of publication), title of the work, name and location of publishers, page numbers. of the material you are borrowing.

- **When paraphrasing**
  
  Paraphrasing should not include the words of the original text nor follow the same sentence structure. Paraphrased information should be accompanied by citation in the text after the paraphrased section, otherwise it will be interpreted as plagiarism even if the source is in your bibliography.
  
  To avoid plagiarism: use your own words to produce the ideas that you read and avoid using statements in the original form without putting them in quotes. Again cite the reference at the end of the paraphrased section.

- **When summarizing**
  
  Summarizing procedures short version of an original text and preserves its main ideas. Summaries do not need to follow the same order as the original text. Failure to provide citation will be interpreted as plagiarism, even if the source is in your bibliography.
  
  To avoid plagiarism: summarized sections need to be accompanied by citation of the source material. Direct quotes in the summary should be used whenever incorporating word-for-word material, with citations at the end of the quoted section.

- **Checkpoint:** Do we need to cite sources on everything written?
  
  The facts that are known by most people do not need documentation as they constitute common knowledge and are not owned by a specific author.
**Penalties of Plagiarism**

Plagiarism is an act of theft of intellectual property and academic institutions are applying severe penalties to students whose works are plagiarized. These can range from discounting the work to failing the course.

Now take the plagiarism test to demonstrate your understanding of the concept of plagiarism and ways of avoiding it.

----- I understand the concept of plagiarism and am now ready to take the test.

○ This is plagiarism
○ This is not plagiarism

___________________________________________

Feedback: This is plagiarism because:

1. The writer only changes a few words and phrases or changes the order of the original sentences.
2. The writer does not cite his source for any of the ideas and facts.

sample

Exercise 2
“Evidence of anti-social behaviour is observed in the school yard as children try out Kung-Fu-style movement on others. The concern is voiced by psychologists who say that players become desensitized to violent behaviour and hence consider that conflicts are resolved through superior violence” (Polias in Coffin, 2004).

Polias warns that children are becoming more involved in aggressive behaviour that includes trying out dangerous physical movements on their friends in the playground. Psychologists interpret the emerging pattern as resulting from the understanding of children that increased fighting ability is the key to solving conflicts. (Coffin, 2004, p.128).

Feedback: This is not plagiarism because:

1. The writer accurately reproduces the information of the original source using own wording
2. He cites the source at the end of paragraphing.
Appendix C

Failure and Success Notices

Student declaration

Failure Notice
Sorry you need to study again the plagiarism tutorial to take the test. You do not know how to avoid plagiarism and cannot complete your assignment uploading.

Success Notice
Congratulations. You passed the plagiarism test. You need to apply what you have learnt in all your written work. Penalties for submitting a plagiarized work may amount to failing the course.

Now read and approve the declaration below.

* I declare that I fully understand the concept of plagiarism and know how to avoid it by paraphrasing and citing my sources when using other people’s ideas or using direct quotes for word-by-word borrowings and citing the author.

Introduction

In this work, we propose a system for guiding Japanese university students through a series of remedial training units for reviewing the English vocabulary material learned in junior high school. From the late 1990s, the compulsory school system in Japan from elementary to junior high school experienced a shift in style from a cramming education to a more relaxed style of education in which almost a third of the previously used curriculum was cut and periods for integrated study were introduced. In universities across Japan today, an ever widening range of English language background of incoming freshmen is becoming more and more apparent and it creates a challenging task of adequately placing students in a fixed number of English class levels in college. Particularly in a technical university, many students need remedial training before they can participate in courses for reading and writing technical papers in English, but without being able to dedicate staff or class periods for this, many universities and researchers are investigating e-learning methods as a solution.

One of the main problems of this approach, however, is that since many of these types of learning materials require students to direct themselves in a self-study for topics that often require repetitious drills, it is important to develop a system that can help students stay on track and on schedule to be able to complete the prescribed training required for adequate remedial education.

Study Units and Story Completion System

In this work, we introduce a story completion format for helping self-study remedial students track their progress. For each section of work that is cleared, a piece of a story is opened to the user and the graphical representation of progress along with the feeling of anticipation for finding what happens next is used in combination to help students return to the drill contents repeatedly until the unit is completed.

In the prototype of this work, we focused on the vocabulary learned by first, second, and third year junior high school students in Japan. The words are divided into small sets and students use a flashcard type of animation (Fig. 1) to quickly review the words and test how well they remember the meanings of the words using an online test.

With a passing score on a test, the corresponding piece of a story is presented to the user as shown in Fig. 2. By dividing the prescribed remedial training materials into daily or weekly units which can be organized into story...
Prototype Design and Evaluation

We are currently developing approximately 56 training units for the self-study remedial system in this work to help Japanese university students review nearly 2000 English vocabulary words introduced in their junior high school curriculum outside of their regular English course load.

In the Fall 2010 semester, we will test a prototype of the system to find out how effective the online flashcard and quiz system is in helping students to: 1) study the vocabulary units independently outside of the classroom and 2) complete the prepared units despite the repetitious nature of the drills.

In order to make it easy for instructors to tailor the contents of the training units for their students in the prototype system, we use simple text files for organizing the word lists and stamp card stories. A log of the progress of each student will be recorded automatically and instructors can view the log information for their classes from a homepage as shown in Fig. 3.

Periodic English vocabulary tests and evaluations of how long students are able to continue self-study work with the prototype system will be used to judge the usefulness of the digital flashcard and story completion training units as extracurricular remedial study materials.

The Role of Service Learning in Enhancing the College Experience

Service Learning is a multistep process of learning in which academic goals are accomplished through community service or nonprofit organizations. Service learning allows students the ability to discover problems within their community and to take immediate action. The type of action includes a five step process called the Procedural Model of Problem Solving (PMOPS). The PMOPS process consists of: analyzing the problem, generating and exploring possible solutions, evaluating those solutions, choosing the best solution, and implementing the solution.

While taking a Group Decision Making class in the Communication Department at Western Kentucky University, the purpose of the project was to determine how Mammoth Cave National Park employees could raise awareness to a multicultural demographic for the National Park in Cave City, Kentucky. The group collaborated with the Executive Director of Friends of Mammoth Cave. Friends of Mammoth Cave is a nonprofit organization that works in cooperation with the National Park Service to fund projects and programs that protect, preserve, and enhance the natural and cultural resources and the visitor experience of Mammoth Cave National Park.

Service learning projects are powerful tools that can provide skills to students in real world scenarios. When service learning projects are properly generated, students learn a variety of characteristics such as leadership, responsibility, confidence, marketing and promotions, communicating effectively, and scholarly knowledge.

Abstract
It is said that Sweden has in the last three decades become more multicultural or heterogeneous as pertains to ethnicity, races, languages and even religions due to increased migrations from different countries and continents. With the coming of immigrants it is said that Sweden is challenged by such a change. Schools as arenas of learning are one of the areas that are often mentioned as feeling this flux of pupils of none Swedish descent. Yet school has the onerous duty in educating all pupils regardless of their class, gender, ethnicity, race, colour and disabilities. Hence availability and accessibility of schools with the slogan of “en skola för alla” (“a school for all”) is given in a democratic country where education is seen as a democratic social right. Pupils are expected to gain relevant knowledge, experiences and approaches for long life learning as responsible citizens. The question, however, is whether all pupils experience these opportunities equally? From mass media and some research we hear the lamentation of immigrant children not performing well in schools. Politicians also echo this from time to time.

In this paper I make a critical analysis on what type of research on areas of inclusion and exclusion in schools as pertains to pupils of immigrant descent have been carried out in Sweden. What are the focus and perspectives? What do this research from critical stand points reveal? Does ‘othering’ and constructions of pupils based on ethnicity, religion and race exist? What are the consequences of such constructions? Other specific questions are: What are the aims and objectives of such studies? What are the theoretical and methodological underpinnings? What is the focus or subject of study? How are critical concepts such as immigrants, ethnicity, race, cultures, and religions used by researchers? How critical are these researches, in other words, what do they contribute with? Are researchers involved in critical research for change or are they involved in producing and reproducing pupils and students of immigrant descent as the other?

It is necessary, in my opinion, to make a critical appraisal of research in this area in order to learn from others who have researched in this area and to see if there are any research findings that can be relevant for teacher education and also to find any wanting areas for further research. As a teacher educator, I am often faced with the question of how well we prepare student teachers in meeting the needs of all pupils in a fair interplay where inclusiveness as opposed to exclusion prevails or is the norm. This concern is even more relevant in how and when to use research findings in teacher education. In this aspect my concern is also to see what type of education is given to student teachers. The attempt is also to analyse any research on teacher education as pertains to teaching in multicultural classrooms.

My paper should be read as a literature review report leading to further research in the area of teacher education.

Internationalizing Teacher Education:
FATITI, an Exchange Program for Teachers-in-Training

Abstract

The Franco-American Teacher-in-Training Institute, a teacher exchange program designed to internationalize teacher preparation and professional development, assessed the impact of the program on its participants: teachers-in-training, mentors, teachers, students, schools and families in the community. It has proven effective in promoting the development of educators who are more self-assured, have greater confidence, and a wide range of pedagogical skills; understand well two complex educational systems (French and American); are more culturally sensitive; have acquired a second language and use that knowledge to teach students who are linguistically different; have the ability to teach an increasingly diverse student population; and are more capable of preparing responsible national and international citizens.
Why should we consider bringing a teacher (in training) from another country to teach in our schools?

Why should American teacher candidates or beginning teachers take time to teach in another culture?

Obviously, or so we have been told, our world continues to become more interconnected and our society more pluralistic. Merryfield (2000) claims that many teachers are not prepared for this new global era. For these reasons, we believe it is essential for teachers to develop global competencies and dispositions to meet the increasingly divergent needs and expectations of students, families and communities in preparing citizens for the 21st century. Previously considered a “lofty” goal, international or global education is becoming part of state or national standards for both K-12 learners and teacher education. However, teachers are ill-trained to impart internationalized content (Merryfield and White, 1996).

It is easy to assume that teacher exchanges could serve the purpose of internationalizing the educational setting. Just the nature of exchange brings one culture into contact with another culture, resulting in the awareness of other cultures and the potential development of intercultural awareness and understanding.

Since 2007, the Franco-American Teachers-in-Training Institute (FATITI) program at the University of Akron has documented the internationalization of teacher preparation and of teacher professional development through teaching exchanges and noted the emergence of global perspectives that results when bringing together two cultures in an academic setting. The results, often cited by educators who advocate a
more international teacher education curriculum as advantages of participating in such a program, include the improvement in self-assurance, confidence, and flexibility (Douglas & Jones-Rikkers, 2001; Quezada, 2004); pedagogical skills and a better understanding of the American and French educational systems (Moseley, Reeder, & Armstrong, 2008); cultural sensitivity (Heyl & McCarthy, 2003; Kushner, Carim, 2004; Landis, Bennet and Bennet, 2004); the ability to teach an increasingly diverse student population (Blair, 2002; Longview, 2009); the ability to prepare responsible national and international citizens (Laubscher, 1994; Longview, 2009); and the ability to acquire a second language and to teach linguistically different students (Coleman, 1998; Hopkins, 1999; Jurasek, Lamson, & O’Maley, 1996; Pellegrino, 1998; Adamowicz-Hariasz and Colville-Hall, 2008).

Global education has been defined as learning that encompasses problems and issues that span international borders and “the interconnectedness of systems – cultural, ecological, economic, political and technological” (p.165), learning that extends to appreciating culturally different neighbors, perceiving the world through their eyes, and realizing that all individuals of the world share similar needs and desires (Tye 2003,). The Longview Foundation defines global competence as “a body of knowledge about the world regions, cultures, and global issues, and the skills and dispositions to engage responsibly and effectively in a global environment” (2009, p. 7).

This paper will demonstrate how FATITI impacts U.S. and French teachers-in-training, based on their own perceptions and supervisory observations, with increased self-assurance, confidence, and pedagogical skill; improved understanding of the American educational system and the national French education system; increased
cultural sensitivity as measured through the IDI (Intercultural Development Inventory); the ability to teach an increasingly diverse student population and to prepare responsible national and international citizens; ability to acquire second language skills and to teach those students whose first language is different; and development of leadership skills.

The Institute

FATITI is an exchange of U.S. and French pre-service and beginning teachers. This opportunity to spend 3 months teaching in Northeast Ohio, or to teach in France, promotes collaboration between teachers at an international level, encourages them to use best practices for teaching, and helps them become globally-minded teachers who impact student learning in ways that insure students’ participation in the interconnected world arena. In addition to the exchange, FATITI fosters the creation of an international community (Colville-Hall and Adamowicz-Hariasz, 2010) and presents an immediate and direct internationalization of some of Northeast Ohio’s schools where French participants teach, collaborate with and greatly influence American mentor teachers, their colleagues, and their students.

Funded by the U.S. Department of State and the French Ministry of Education, FATITI is a product of collaboration of the University of Akron, the CDIUFM (Conference of Directors of the University Institutes for Teacher Education), the U.S. Embassy in Paris and the Franco-American Commission.

The aim of FATITI has been to create through a teacher exchange more internationally-minded teachers, that is, teachers who seek to learn from educators living in cultures in other parts of the world, teachers who understand how to interpret events through multiple perspectives, teachers who become agents in this global age through
partnering with teachers and classes in another country. The analysis of data collected as part of the evaluation process of this program advocates that teaching experiences in another culture enriches both the teachers in the exchange as well as the community.

The FATITI program goals are to:

- Promote acquisition of knowledge, cross-cultural experience, problem-solving skills, and flexibility,
- Advocate the necessity of global agents who work to find better solutions to universal educational challenges,
- Foster development of productive, engaged and critical citizens,
- Encourage citizen diplomacy, dispelling naïve cultural stereotypes,
- Advance professional growth and development in teaching research and service in international and cross-cultural education.

The evaluation tools to measure the progress of the participants in terms of the program goals include follow-up evaluations after each component of the program (seminar, cultural visits and teaching practicum), journal prompts, individual teaching evaluations, and debriefing sessions. Other sources of data include reports, anecdotal information, personal correspondence and administrative notes. Analysis of these documents builds a strong advocacy for internationalizing teacher education programs. The evidence collected suggests that U.S. schools benefit from teachers candidates who, by teaching abroad, develop a global perspective about the discipline they are teaching and the world in which they live. Students and educators, unable to go abroad, benefit from interaction with educators from another culture to broaden their horizons and to acquire an understanding of the world’s interconnectedness.
Self-assurance, Confidence and Flexibility in U.S Teachers in France

U.S. participants (pre-service teachers in social studies, math, English, French and Spanish) attend a three-day orientation at UA, participate in a three-week linguistic, cultural and pedagogical seminar in France, and a 9-week practicum in schools throughout France. This intensive intercultural experience requires them to closely examine their own assumptions about instruction, to question pre-existing stereotypes in order to “learn who the French really are, without the stereotypes” and to find ways of acquiring knowledge in different locations. Participants discovered that knowing other countries and cultures was as important as the teaching component and found it “interesting to live among people in a foreign country and adapt to see their perspective of the world and of world events.” Others mentioned personal thoughts felt by most:

• I feel like I have the chance to open up doors for my students and expose them to different cultures and parts of the world.

• I find that I have lots of stories that I can share and lots of resources and ideas from my teaching experience....”

• I think flexibility is essential for success in an endeavour such as this. Teachers everywhere have to be flexible, the job demands it. Each student and each day of teaching is different. Flexibility allows one to adapt to this. Teaching in a different culture only makes flexibility more important because there are so many more unexpected circumstances that can arise. That said, a teacher’s expectations of proper behaviour and effort on the part of their students should be pretty rigid, so that the students know what is expected of them everyday in class.
• I've found that my experiences have helped so much in teaching. I'm able to tell students about my personal experiences living in a different culture and give students real life up-to-date information about the lives of people in another country.

**Understanding the American and the French educational system**

Following a seminar that provides comprehensive information about the host educational system and three months internship in that system, both the French and American participants feel that they have gained a great deal of insight into the host system. They exchange techniques, borrow ideas, and develop opinions based on this experience and return with a better understanding of how the host culture educates their youth.

Americans in France express their thoughts:

• It is pretty similar to what I have seen in US schools. The teachers here seem to be in a similar transition from teacher- to student-centered lessons, although perhaps US teachers are a little farther along in this regard.

• I have learned a great deal about the French educational system and in turn, a great deal about the U.S. system. This experience reinforced my notion that U.S. education has a long way to go to bring its population up to par in social studies teaching.

• The school's classrooms are austere. There are tables with enough room for two students each. The teacher must leave his/her personal items in a locker in the teacher's room since each class is taught in a different room. One of the rooms she teaches in has been decorated with flags and other personal items. Teachers do not receive a budget for school supplies. All must come from their personal funds.
Additionally, teachers within a department have no meeting time to communicate or plan. There are meetings maybe once or twice a year.

- They [students] must stand when an adult enters the room. The students lift one finger in order to be called on.
- Students here are more independent than American students.

**Pedagogical Skills from France for U.S. participants**

Participants observe, then adapt to the learning environment in which they are assigned. As such, they acquire new perspectives on teaching and learning and find ways to adapt this new pedagogy to their knowledge base.

- I will definitely use more documents within the classroom. I will, of course, use examples about French life and culture to teach my content. I also plan to use photos I took to teach (both pictures of historical landmarks, architectural structures and cultural activities, such as strikes).
- I don’t think I’m going to waste my time with multiple choice, fill-in, and T/F tests ever. When my future students have an exam, they are going to have to write. It will take less time to prepare, more time to grade, but be much more valuable for student learning to assign written tests rather than “objective” tests. Social concepts that are important cannot be quantified in 25% guesses or anything of the sort. I’m interested in teaching kids higher-order thinking skills and this is one way I plan on implementing a French pedagogical idea into my classroom.
- I have freedom to teach as I would in the US and provide suggestions to my mentor teacher. She already has spent time abroad so I believe it has influenced
her style and personality. She does less lecturing than most French teachers I have heard of or seen.

**Cultural Sensitivity and Ability To Teach**

**An Increasingly Diverse Student Population**

The Intercultural Development Inventory (IDI), a statistically reliable and cross-culturally valid instrument to measures intercultural sensitivity, was used to assess both French and U.S. participants (Hammer, M.R., Bennett, M.J. & Wiseman, R. 2003). The IDI results reveal an average increase that is well above that reported by American students studying abroad who participated in the Georgetown Consortium Project. That project, which gathered statistics from 1156 students participating in 62 different study abroad programs, showed an average gain in the intercultural development of students participating in programs of similar length (13-18 weeks) of 2.33 points on the IDI scale. Among FATITI participants, the gain in the group mean was 4 points for the French students with a 13 point gain for the U.S. group. Qualitative data also support the development of cultural sensitivity among participants:

- I feel very comfortable and understand the French people, their way of thinking and way of life. I was dining with a friend the other day who has just moved here and all his reflections on cultural shock made me laugh. They were all true but somehow I have grown accustomed and no longer notice the things he was talking about.

- There is always room for growth and I felt coming into this program I had a high awareness of other cultures and cultural differences. By living in another country
I have been able to finally witness these differences first hand and experience them, which will only make me understand other cultures more thoroughly.

• I attended concerts with my friends, listened to new types of music, went to festivals and ate new types of foods, and I have learned more than I ever could have imagined. I have debated politics with people from Switzerland, the war in Iraq and Afghanistan with people from France, and have been welcomed by everyone I have met.

• It's also given me experience teaching students of a different culture than my own which in turn has helped me teaching students here of different cultures.

Ability of U.S. Participants To Acquire Second Language Skills And To Teach Students Whose First Language Is Non-English

The immersion experience facilitates one’s ability to acquire a second language. There are complications, of course, difficulty in meeting native speakers, however, the attempt to provide support for language development on both sides of the Atlantic has benefitted participants. Pre and post-OPI (Oral Proficiency Interview) scores marked linguistic progress for all participants with increases in scores from their 3-month immersion experience. Data collected over the 4 years is consistent in showing how the exchange experience supports second language acquisition. In addition, participants express their own thoughts on the topic:

• I take training classes at the IUFM with four German girls who live within the same apartment complex, and speak French with them all of the time. I prefer to
surround myself around them because they have impeccable French and I am forced to speak the language.

• When I go shopping, I use my French, but sometimes it's very frustrating when those who I interact with (employees of stores, cashiers) can identify that I'm a native English speaker and immediately switch to speaking in English with me.…

• It's really difficult sometimes to express myself to the fullest extent or try to interact with others if I can't put all of the words together.

• I speak in French with my host mother and another French student that lives with us every night at dinner. This has been very good for my language acquisition. I also speak French a good bit when I travel independently, and that has gone pretty well so far.

• I don't really get to speak much French because most people want to speak English with me.

**Improvement In Self-Assurance, Confidence And Flexibility in French Teachers in the U.S.**

Over the 4 year experience of FATITI, French participants noted the ways in which FATITI helped them improve their: 1) knowledge about U.S. culture and society which they will be able to take back to their classrooms in France; 2) English language abilities; and 3) content and pedagogical knowledge. Based on survey and interview data, participants generally felt the program helped them develop in all three areas, which, many noted, would make them better teachers and help them become more engaged in the world. In addition, participants also noted how the development of cultural and
linguistic knowledge increased their confidence and ability in both the culture and the classroom.

Developing new pedagogical ideas and skills, in terms of content and methods, is a major goal of the program. Between 85% and 90% of the participants agreed or strongly agreed that the experience “Provided [them] with a broader, more global perspective on professional practice” which may help address the long-term goal of developing global citizens who will work to create mutual understanding between the two countries. In addition, over 70% of the French participants agreed or strongly agreed that the experience “Provided [them] with useful information and ideas [they] will be able to apply to their future classroom.”

Common themes in the survey consisted of
• the difference in the student/teacher relationship in the United States.
• new pedagogical methods that participants wanted to take with them back to French classrooms.
• “take up the challenge of teaching to students from another culture and another language than their own
• to be able to teach in different and more difficult condition the ones I have in France.”
• development of oral skills in U.S. vs. writing skills in France

Participants noted they would return to France with a new understanding of the student/teacher relationship and would try to change the ways they related to their students. Examples that typify the responses of participants’ reflections, such as the use of cooperative learning and in-class formative assessment practices, related to the
acquisition of pedagogical knowledge. In their reflections, most participants noted that they had achieved the goal of being able to teach in different and more difficult (because of the language and culture barriers), felt more prepared to deal with the diversity they would see and face in their future teaching.

Instructional techniques to be “imported” were noted by a French science teacher, “There are two instructional techniques that I will use when I am back in my school in France:”

**A review sheet.** “The review sheet of the main points of a chapter, done with the students a few days before the test: it allow the teacher to focus on the most important facts he wants the students to learn; it gives students opportunity to ask questions on what they didn’t understand ; it makes students more responsible because with the chapter review and a few days to review it at home, they have no excuse if they don’t have a good mark.”

**Group projects.** “For some chapters, it’s no worth trying to teach the students the scientific knowledge: it’s too boring and hard for them, so they don’t learn anything. On that topics, it’s better to have the students involved in a project as studying boring historical documents.”

Another science teacher talked about his discovery of the U.S.’s approaches: "algebra-based physics" and "analyse-based physics" which are two different ways to teach physics that, even if they may exist in the French educational system, are not as clearly "established" as they are in the US schools. I have also discovered a third way to teach physics for weak students which is "conceptual physics" which is teaching physics with no mathematics.
Ability Of U.S. Participants To Acquire Second Language Skills And To Teach Students Whose First Language Is Non-English

Linguistic progress was noted by pre and post-OPI (Oral Proficiency Interview) scores in which all of the teachers-in-training showed increases in scores from their 3-month immersion experience. The three facets of the program that contributed to their increased capacity in English: working in the classroom (both at the university and in their host schools); living with a host family; and participating in cultural events and excursions. In Year Four, as in previous years, participants scored in the Intermediate to Advanced levels on the OPI, with seven participants improving three points over the course of the program, and one participant improving four points. Many participants noted being “satisfied about [their] progress in English” and over 95% of the interns agreed or strongly agreed that the experience helped improve their English language skills. Most participants noted how important the immersion experience was in helping them do this, both immersion into the school setting and immersion in with a host family. For example, over 95% of participants agreed or strongly agreed that the home stay experience “Provided [them] with an opportunity to practice conversational English,” something that most thought was extremely beneficial in helping them meet their linguistic goals.

Program Extension - Social Studies Teacher Workshop

In Year Two, the first three-day workshop on teaching and collaboration for social studies teachers was to establish and promote international collaboration between teachers of the two cultures. Four history-geography teachers from France conducted the
workshop along with their mentor teachers with the goal of sharing best practices for history and geography instruction. Workshop objectives included: (1) examine, compare and apply strategies for using primary source documents, (2) develop inquiry-based lessons, (3) foster students’ ability to become better writers and critical thinkers, (4) examine and apply strategies for teaching geography, (5) create globally enhanced lessons, and (6) examine possibilities and challenges of planning and implementing an educational exchange. Local area social studies teachers attended to witness the use of primary source documents and “six ways to think about documents from text sources to audio clip” as well as a series of lessons on spatial discontinuity as it relates to geography.

Local teachers benefitted from both theoretical and practical knowledge of teaching their subject in innovative ways. They saw it as a way for students to have meaningful work, one that enables them to make connections between the course content and their personal life and/or experiences, and helps students develop critical thinking (process) and writing (articulation) skills. Overall, all participants found the workshop to be informative, collaborative and practical.

In Year Four, a second two-day FATITI Social Studies Workshop for local area teachers and teachers-in-training presented by two returning French teachers who completed their second year in the classroom prompted a list of incredible highlights from sharing pedagogical experiences at the international level that is hard to meet under other circumstances. American teachers found the most useful things gained from the workshop to be:

- Different ideas and methods from France with I can use to make my lessons
better.

- A better understanding of education in another country.
- Giving students the tools to help them be critical thinkers by using primary documents and writing.
- Integrating primary source documents, higher order thinking questions (such as those involving synthesis), and more writing into lessons
- Case studies, primary documents in testing.
- Cultural differences. It helped me to reflect on how I could incorporate primary sources and more writing into my classroom.
- To be more international in my perspective.
- Enjoyed learning about differences between cultures. Learned how to incorporate primary sources into my lessons more effectively.
- Interchanges between teachers regarding classroom environment.
- This showed me the vast amount of documents available.
- Incorporation of primary source documents into assignments and assessments
- Different strategies I can use in my classroom-sources, testing, etc.
- Using primary source documents to intro, teach and test.
- Interesting ways to use primary documents and purposeful.
- Lesson design for using primary sources in a multi-step lesson.

Talking about the “opportunity to learn a different approach to teaching from a different national perspective,” local teachers found the presentation made by the two French history teachers very informative and well-done, cited “excellent examples of
practical teaching resources,” and “learned a great deal about how to use different primary sources in geography” as well as social studies. It was the “personal experience and expertise” of the two French history teachers, the “opportunity to speak with and learn from colleagues from France.” that was so compelling in the “discussion about different perspectives on a variety of cultural and educational issues”, about “French schools and culture and a variety of perspectives on both educational systems.” They also enjoyed, “learning the similarities/differences between the education of France and U.S.”

**Mentor Teacher trip to France**

In June of Year Four, FATITI sponsored a professional workshop for American mentor teachers that focused on educational comparisons and sharing of best practices through classroom visits in France. Through this opportunity, Akron-area teachers gained both theoretical and practical knowledge of teaching their subjects in an innovative way. Five Social Studies mentors and four Physical Education teachers were selected to participate in the workshop through an application process. Day trips to various schools and classes in Orleans, Nantes, Onzain and Bagneux (just outside Paris) enable us to visit establishments where former participants teach or that have hosted U.S. participants. The remainder of the trip, the mentors stayed in Paris where they visited the city and had a reunion dinner with over forty former French participants from Years 1-4. Through this professional development workshop, the U.S. teachers had an opportunity to gain new ideas for teaching/mentoring as well as to strengthen the international networks established through the program. The overall benefit from this extension was to learn what FATITI’s long-term impact is on the French participants. In addition, it served as a springboard to bring U.S. and French teachers together in France in an international
arena, to share in a discussion of best practices and other important pedagogical issues and concerns.

**Conclusion**

Over the past four years, French and American participants in the Franco-American Teachers-in-Training Institute demonstrated growth in their linguistic and cultural knowledge; their ability to function professionally in diverse educational settings; improvement in self-assurance, confidence, and pedagogical skill; improvement in understanding of the American educational system and the national French education system; increased cultural sensitivity; ability to prepare responsible national and international citizens; and the ability to acquire second language skills and to teach those students whose first language is different.

Each year, each group was given extensive opportunities to learn about and to become an active participant in their “new culture,” and were provided with the supports that helped them become comfortable and successful. During their internship they learned first hand about family and community in their new setting, the philosophy of education that influences the schools, different pedagogy, alternative teaching methods, and a variety of styles for interacting with students and colleagues. Through the experiences provided by FATITI, they also learned that they have the ability to function as a professional and that sharing professional knowledge and beliefs is an important part of a cross-cultural community of learners.

Data showed that teachers-in-training from both cultures have developed greater effectiveness in instruction, management, and assessment through examination of a culturally different pedagogy and through their experience in a culturally different
classroom. We also have evidence demonstrating growth in “worldmindedness’ among the U.S. participants, and while the French participants have not yet taken the IDI survey, we can determine from their written comments that they too have developed an increased awareness and sense of the importance of global connectedness and sharing (Merryfield, Tin Lao Yo, and Po, 2008). Therefore, we believe all participants are better equipped to be global change agents, agents who will continue to network in order to find solutions to improve learning outcomes for their students.

Additional benefits were derived by the U.S. mentor teachers and area teachers, as well as by the school community in general. Surveys completed by the mentors and university supervisors reflected an extremely high degree of satisfaction with the teaching competence of the program participants, the cultural interchange, and the opportunities they had for professional growth during this experience. Local teachers who participated in the social studies workshop and mentor teachers who went to France to visit schools praised the opportunity to observe and share teaching strategies and to engage in conversations with teachers from a different culture. Mentors, teachers and supervisors also commented on the positive and broadening influence this exchange had on the school community. The exchanges at all levels were judged to be a win-win experience for all. Clearly, the FATITI program organized by the University of Akron offers a far-reaching and multi-layered international experience that fosters intercultural awareness, global knowledge, interpersonal skills and attitudes necessary in the 21st century. We hope it will serve as a model for internationalizing teacher training and professional development.

PERCEPTIONS OF SCHOOL ADMINISTRATORS AND SOCIAL WORKERS IN RURAL, SOUTHEASTERN NORTH CAROLINA

Dr. Judi Haberkorn, Assistant Professor, Department of Social Work, Ohio University
Dr. Carol Higy, Associate Dean, School of Education, University of North Carolina at Pembroke
Ms. Tamikka Gilmore, Graduate Assistant, Department of Social Work, University of North Carolina at Pembroke

As the needs of children within school settings are constantly changing coupled with higher testing requirements at all levels of government, many parents, teachers, and school personnel are asking “Who is the school social worker”? Something that according to Allen-Meares and colleagues (2000) as cited by (Agrestra, J., 2004), society has become engrossed with. Research has shown that school social workers are not highly valued by school administrators because school administrators are not clear on the role of school social workers (Tower, 2002) as cited (Agrestra, J., 2004). Today, the challenges of school social workers are complex and challenging. School social workers are viewed as auxiliary personnel in a setting whose primary function is not of formal classroom instruction, but providing social services (Dane & Simon, 1991). School principals have an intrical role in schools. School principals determine the power to either reject or support services that the school social workers offer to the students in the school (Hsiao-Wen Wagng, 2003). With the passing of the Individuals with Disabilities Act of 1975 (P.L. 94-142), school social workers responsibilities would now include completing social histories, the use of both group and individual therapy to counsel children and their families, seek resources within the community, facilitate home adjustment, and work with the home and school environment (Humes & Hohenshil, 1987) as cited by (Agresta, J., 2004).

It is the aim of this research study to investigate the perceptions and attitudes of intern school administrators toward school social workers and pre-service school social workers perceptions and attitudes toward administrators in southeastern rural North Carolina. The intent of this study is the hope of increasing communication between professionals to better serve the needs of students in an ever-changing society. It is imperative to have a cohesive and structurally sound school staff because the school and the family are central places for the development of children (Constable, R., 2008). To help students achieve greater success in schools, school social work has become a profession that works with children who are marginalized either economically, socially, personally, or socially to make the student’s education process effective (Constable, R., 2008).

The research will result in several strategies for building a stronger sense of community between school social workers and school administrators during pre-service courses. The strategies will then enable the student’s education process to be more effective in southeastern rural North Carolina.
FOSTERING CREATIVITY IN TIMES OF CHANGE:

HOW DO TRANSFORMATIONAL LEADERS IN THE ENTERTAINMENT INDUSTRY FOSTER CREATIVITY IN THEIR FOLLOWERS, AND WHAT CAN LEADERS IN OTHER INDUSTRIES LEARN FROM THEM

By:
Farnaz Tabaee

Pepperdine University
April 20, 2010
ABSTRACT

In today’s rapidly changing business environment, organizations are under tremendous pressure to become and remain competitive. In the era of knowledge workers, for many organizations, the ability to originate novel ideas and products is their most important competitive advantage. Ultimately, leaders are responsible for organizational survival by effectively cultivating this creative potential of their human capital in spite of all the changes. Transformational leaders are best at fostering the creative potential of their followers. For organizations in the entertainment industry where innovation is the end product, fostering an environment conducive to creativity and innovation can mean the difference between success and failure of the company as a whole.

The purpose of this research is to explore the way in which transformational leaders in the entertainment industry foster creativity in their followers. In addition, the ability of employees to be creative within a transformational environment will be studied. The purpose of the study will be addressed by exploring the questions, “What techniques do transformational leaders in the entertainment industry use to foster creativity within their followers?” and “how is creativity and innovation manifested by employees in the entertainment industry who work for transformational leaders?” In addition, we will discover “how can these leadership techniques be developed in leaders of other industries who need to foster creativity in their followers?”

In this study, we will explore quantitative survey research data and statistical analysis, searching for underlying leadership techniques in addition to measuring employee creativity which when combined facilitate organizational innovation and individual creativity. We will also explore qualitative research through interviewing twelve prominent transformational leaders in the entertainment industry to investigate their leadership characteristics and their secrets to success as a leader in spite of the tremendous competition and pressures their industry faces today.
Sought in this study will be common leadership themes and patterns of leaders in the entertainment industry that could provide valuable lessons to leaders of other organizations in the future facing the same challenges and competitions.

CHAPTER 1. INTRODUCTION

Introduction to the Issue

According to Ensher, Murphy, & Sullivan (2002), in the next decade, 65% of all workers will be contingent employees, freelancers, outsourced workers, or contract specialists. Every day, more than 2.5 million temporary employees go to work for one of the 90% of U.S. companies that use temporary staffing services, and this number will only increase as organizations attempt to cut more costs to survive the internal and external business pressures (Berchem, 2005). This forecast makes understanding leadership effectiveness in organizations where the majority of employees are contingent, extremely crucial. The entertainment industry is the second largest industry in the world, outdone only by aeronautics industry, and is the number one producer of U.S. exports (Ensher et al., 2002). The entertainment industry is far from the more traditional organizational structures of many organizations who are primarily comprised of full time employees. Entertainment industry mainly relies on portable knowledge and skills of freelancers, part-timers, project workers and other types of contingent workers for its operation.

In the era of knowledge workers, the ability to originate novel ideas and products are crucial for determining an organization’s future survival. Leaders are responsible for effectively cultivating the creative potential of their human capital in spite of all internal and external changes and competitions. Transformational leaders can provide the necessary direction, innovation, inspiration to lead their followers to implement the necessary changes (Bass, 1985). For organizations in the entertainment industry where innovation is the end product, fostering an
environment conducive to creativity can be the most influential factor for organizational success, thus making the entertainment industry a good general reference for studying leadership challenges and effective leadership practices of the future.

Significance of the Study

The significance of this study stems from four factors affecting the organizations of today and the future, and consequently leadership effectiveness in those organizations. Those factors include the increasing presence of contingent workers in the future, the position of the entertainment industry in the world, its specific organizational structure, and lastly, the increasing need of the organizations of the future on transformational leadership that fosters innovation. Sought in this study were valuable lessons learned from the entertainment industry’s transformational leaders that can be applied to other organizations facing the same challenges today and in the future.

Purpose and Research Questions

This study will explore how the transformational leaders in the entertainment industry foster creativity in their followers. In addition, the characteristics and ability of employees to be innovative within a transformational environment will be studied. The purpose of the study will be addressed by the following questions:

1) What techniques do transformational leaders in the entertainment industry use to foster creativity within their followers?

2) How is creativity and innovation manifested by employees in the entertainment industry who work for transformational leaders?
3) How can these leadership techniques be developed in leaders of other industries who need to foster creativity in their followers?

CHAPTER 2. REVIEW OF LITERATURE

Leadership

Through the years, practitioners and researchers have tried to define and conceptualize leadership. Looking at the available literature on leadership the common element seems to be that leadership is an influence process (Northouse, 2010). Integrity and trustworthiness also seem to be a common thread amongst the definition of effective leaders of the 21st century.

To influence others, both one’s followers and those outside that circle, will indirectly build leadership character, and without maintaining integrity and trustworthiness, the capability to influence will soon disappear (Maxwell, 1998). To be a leader, one must have followers who recognize the value of the leader’s contribution and choose to follow him/her (Kragness, 1993). To be successful in an organization, leaders need to inspire outstanding performance from their followers towards the mission and goals of the organization. To be successful, leaders must have the effective leadership style for the environment in which they operate.

The effective model of leadership in the 21st century has been through a major shift. In the latter years of previous century, organizations needed strong management to ensure the stability, efficiency, and control of the organization. Today, leaders are needed who can bring about change and innovation in response to the constant turbulences in the environment such as the global competition, technology, and limited resources (Osborn, Hunt, & Jauch, 2002).

Leadership is a complex phenomenon, related to variables such as changes in societal values, implementation of organizational change, the impact of stress on employees, and the overall development of leadership understanding by itself (Higgs, 2003). Therefore, the
FOSTERING CREATIVITY IN TIMES OF CHANGE

qualifications for effective leadership have also shifted toward more of an ethical and transformational style of leadership, with much more emphasis placed on the significance of developing leaders within an organization. Hence, it is imperative that we study what transformational leadership entails and how it relates to leaders in the entertainment industry.

Transformational Leadership

Researchers and practitioners have developed a great number of leadership theories and approaches over the years. Leadership approaches range from autocratic leadership, to democratic leadership, to servant leadership to name a few. Other leadership theories developed by researchers and practitioners include the great man theory, path-goal theory, and leader-member exchange theory (Northouse, 2010). This paper focuses on a range of leadership styles from transformational leadership to transactional leadership. In addition, we will discuss how prevalent we found the transformational and transactional leadership styles in the sample of leaders we interviewed from the entertainment industry and its implications on their followers’ creativity and innovation.

The transformational leadership model covers a wide range of leadership styles. At one end, there is Laissez-faire leadership, which is a style of leadership that assumes individuals are motivated by internal forces and should be left alone to complete their work. The next point in the continuum is the transactional style of leadership where members agree to obey their leader totally when they accept a job. The leader is very clear about what is required and expected from the team members. In exchange for members’ work and compliance, members get paid, and depending on their performance, there is a promise of reward or a threat of punishment. The focus on transactional leadership is on short-term tasks. Although this style of leadership is needed in organizations to get the job done, it is not a recommended approach long term as it
does not motivate or inspire members for a higher goal the way transformational leadership does (Avolio & Bass, 2002).

Transformational leadership is the end point of this leadership continuum where leaders inspire and motivate followers to work toward a mutually rewarding goal (McLean & Weitzel, 1991). According to Bass (1994), transformational leadership is defined in terms of how followers trust, admire, and believe in the leader and the type of effect the leader has on the followers. Bass identified three ways in which leaders transform followers: increasing their awareness of task importance and value, getting them to focus first on team or organizational goals, rather than their own interests, and activating their higher-order needs.

According to Bass and Riggio (2006):

Transformational leaders are those who stimulate and inspire followers to both achieve extraordinary outcomes and, in the process, develop their own leadership capacity. Transformational leaders help followers grow and develop into leaders by responding to individual followers’ needs by empowering them and by aligning the objectives and goals of the individual followers, the leader, the group, and the larger organization. Evidence has accumulated to demonstrate that transformational leadership can move followers to exceed expected performance, as well as lead to high levels of follower satisfaction and commitment to the group and organization. (p.3)

Bass (1998) wrote that authentic transformational leadership is based on the following four components:

**Idealized Influence (also known as Charismatic Leadership)** – Transformational leaders are role models. They are well respected, admired and trusted. Followers describe them in terms that entail extraordinary capabilities, persistence and determination. These leaders are
willing to take risk and are consistently relied upon to do the right thing and display high moral standards.

**Inspirational Motivation** – Transformational leaders embody the term “team spirit” in the way they show their enthusiasm and optimism. They provide both meaning and challenge to the work they do. They create an atmosphere of commitment to goals and communicate a shared vision.

**Intellectual Stimulation** – Transformational leaders encourage creativity and innovation. They foster an atmosphere in which followers feel drawn to think outside the box. Public criticism is not part of their leadership style.

**Individualized Consideration** – Transformational leaders act as coaches. They respect their followers’ individual desires and needs. These leaders are considered to be good listeners, and have very personalized interaction with their followers. Followers of these leaders move continually toward developing their higher potentials.

In addition, transformational style of leadership is based on three moral aspects: the moral character of the leader; the ethical values embedded in the leader’s vision; and the morality of social ethical choices and actions that leaders and followers engage in together.

According to Burns (1978), the authentic transformational leader is undoubtedly linked with higher order values. Burns emphasized that true transformational leaders are those who are sensitive to the needs and motives of their followers.

**The Entertainment Industry**

According to Ensher, Murphy, & Sullivan (2002), in the next decade, 65% of all workers will be contingent employees, freelancers, outsourced workers, or contract specialists. In the mid-1980s, there were approximately 100 temporary employment agencies in the United State,
while today, there are more than 15,000 hiring in excess of 11 million individuals each year (Berchem, 2005). Every day, more than 2.5 million temporary employees go to work for one of the 90% of U.S. companies that use temporary staffing services, and this number will only increase as organizations attempt to cut more costs to survive the internal and external pressures (Berchem, 2005). This forecast makes understanding leadership effectiveness in organizations where the majority of employees are contingent, extremely crucial.

The entertainment industry is the second largest industry in the world, outdone only by the aeronautics industry. In addition, the entertainment industry is the number one producer of U.S. exports (Ensher et al., 2002). The entertainment industry’s structure is far from the traditional hierarchical organizational structures of many traditional companies which rely mainly on full time employees. The entertainment industry mainly depends on portable knowledge and skills of freelancers, part-timers, project workers and other types of contingent workers.

The ability to originate novel ideas and products are crucial for determining an organization’s survival. Leaders, ultimately, are responsible for cultivating this creative potential among their followers. In the entertainment industry, where innovation has to be a certainty, creating an environment conducive to creating original ideas can determine the organization’s future, making the entertainment industry a reference for studying effective leadership practices of the future.

Creativity and Innovation

Although creativity and innovation has been used somewhat interchangeably for the purposes of this study, there seems to a difference between the two. Creativity is defined as “the production of novel and useful ideas” while innovation is defined as “the implementation of creative ideas within an organization” (Ramus & Steger, 2000, p.606). It is imperative that
leaders in organizations learn how to make the most out of each employee’s creative potential in order to bring innovation to the organization (Tierney, Farmer, & Graen, 1999).

Transformational leaders’ positive and trusting relationship with their followers can create a prime environment that fosters creativity, essential to any organization in the 21st century. Leadership influences are substantial in creating a positive environment, primed for success in a creative field such as the entertainment industry. This influence is shown clearly in the quote from Hughes et al. (1999):

Perhaps the most important point leaders should remember is that their primary role is not so much to be creative themselves as to build an environment where others can be creative. This is not to say that leaders should be uncreative, but rather that most innovations have their roots in ideas developed by people closest to a problem or opportunity (i.e., the workers). (p. 251)

It has been proven through research that transformational leaders are vital to fostering creativity and innovation in their followers (Howell & Avolio, 1993). Therefore, due to the importance of innovation to organizational survival, by studying the transformational leaders in the entertainment industry, we can begin to see how leaders in any industry can enhance their followers’ creative potential.
CHAPTER 2. METHODOLOGY

Participants

Protection of Human Subjects

Twelve participants will be selected based on their extensive experience (over 8 years) as a leader in the entertainment industry. An interview protocol consisting of 7 open-ended questions will be used. All participants will sign a consent form to allow their names, organizations, and their interview content to be used as part of this study. The informed consent will ensure that participation is voluntary, and that the participant has the right to withdraw at any part of the interview, that there are no known risks to the participant. It will also state that confidentiality will be maintained, and the results of the study are available for the participant’s review at the completion of the study.

It is the policy of Pepperdine University that all research involving human participants be conducted in accordance with accepted ethical, federal, and professional standards for research and that all research be approved by one of the University’s Institutional Review Boards (IRB). This study meets the requirements for exemption under the federal regulations (45 CFR 46 - http://www.nihtraining.com/ohrsite/guidelines/45cfr46.html) that govern the protection of human subjects. The exemption at 45 CFR 46.101 (b)(2) is for research involving survey or interview procedures or observation of public behavior. Any disclosure of human subjects’ responses outside the research could place the subjects at risk of criminal or civil liability or be damaging to the subject’s financial standing, employability, or reputation (Pepperdine IRB, 2007).

Leaders who agree to participate in the interview will be given the informed consent and will be asked if the interview can be recorded and if the content can be used for the purpose of
this research. In the consent form, participants will also be asked if their identities and names of their organizations can be revealed in the study. Risk to participants in the study is minimized since if the participants do not consent to having their names and organizations used, their identities and the name of their organizations will be replaced with a generic title. In addition, the identity of participants will only be known to the researcher and this information will be destroyed at the completion of the study.

Interviews will be taped and later converted to MP3 files and saved on Compact Disks (CDs). Content of the interviews will be transcribed. Transcriptions, coding sheets and CDs will be kept in a locked cabinet at the researcher’s residence for five years. All other records will be destroyed after the completion of the study.

**Research Methodology**

The research methodology is an exploratory pragmatic approach with an emphasis on qualitative data through the interviews, which will be triangulated with descriptive statistics and quantitative data from the Multifactor Leadership Questionnaire (MLQ) and Kirton Adaptation-Innovator (KAI) Inventory. By utilizing the MLQ, we will determine the transformational leader’s constructs, and by allowing the leader’s followers to be assessed using the KAI framework, we will be able to determine their creative style, and then form an association with the leader’s leadership characteristics gained through the responses to the interview questionnaire.

**Interview Questionnaire**

The 7 interview questions are open-ended allowing the participants to freely express their thoughts while responding to the questions. The interview is a highly subjective instrument of
selection. Therefore, it has the lowest reliability and validity as compared to other instruments. The validity of interviews if high because the same researcher is interviewing the participants. The reliability of interview is high because we will provide the participants guidelines as to the purpose of our interview, the consent form, and the research questions. The responses to the interview questions will be recorded (if permitted), and will then be transcribed, themed and coded. The themes and data will be synthesized and studied within the framework of the research questions.

**Limitations**

There are two limitations that are recognized in this study. The first limitation is that the researcher as the instrument brings some bias into the research, although measures will be taken to limit and reduce the bias as much as possible by having others review the same data. The second limitation has to do with the location of the research being only the United States with a nonparametric sample. Therefore, the findings of this research cannot be generalized to apply to a larger population or internationally.

**Instrument**

**Characteristics of Leaders Interview Questions**

The following interview protocol will be used for all twelve participants:

1. How would you describe your leadership style?
2. How do you foster creativity and innovation within your employees and your teams?
3. Do you adjust your leadership style based on different employee’s creative styles? And if yes, how?
4. What abilities do you value in your employees?
5. What challenges do you face in your day-to-day dealings with your employees?

6. Describe to us your decision-making process. For example, when your staff brings to your attention a problem, how do you go about selecting a solution?

7. What is your motivation to lead? Why did you want to assume a leadership position?

**Multifactor Leadership Questionnaire (MLQ)**

The most commonly used gauge of transformational and transactional leadership is the Multifactor Leadership Questionnaire (MLQ), which has been developed by Bass and Avolio (1990). It provides a distinction between how the leaders see themselves as opposed to how others see them as a leader. MLQ measures transformational, transactional, and laissez-faire leadership styles along with the variables of satisfaction with the leader, leader's perceived effectiveness, and willingness to put forth additional effort. The MLQ instrument will also be used to explore the first research question of how the individual transformational leader’s characteristics were related to fostering creativity in their followers.

The MLQ 5X form was developed in response to construct validity criticisms of the MLQ 5R survey (Bass & Avolio, 2000). Utilizing 14 samples with 3,786 respondents, the MLQ Form 5X was tested for replication of the confirmed six-factor model of relationships using fit indices generated by LISREL, confirmatory factor analysis, and chi-square difference test to support construct validity and reliability (Bass & Avolio, 2000). In addition, “the latest version of the MLQ, Form 5X, has been used in nearly 200 research programs, doctoral dissertations and masters theses around the globe over the last four years” (Bass & Avolio, 2000, p. 2).

The data will be collected through a self-administered survey instrument distributed to both the leader and to the followers. The MLQ - Form 5X measures five transformational
FOSTERING CREATIVITY IN TIMES OF CHANGE

factors, three transactional factors and one non leadership factor. Permission to use the MLQ Form 5X will be obtained from the authors.

Kirton Adaptation-Innovator (KAI) Inventory

To measure the creative performance of the followers, we will utilize the Kirton Adaptation-Innovator (KAI) inventory. As verified by Riley (1993), KAI remains to be a reliable instrument for measuring creative performance. Kirton (1978) offers a measure of creativity in the continuum of either adapters or innovators. According to Kirton (1978) both innovators and adaptors are creative, but in dissimilar ways. Adaptors are creative within a smaller range. Hence, an adapter would seek improvements to the current organizational practices, not necessarily attempting to change them altogether. On the other hand, innovators allow creativity to flow within them more freely, not bound by existing procedures or limitations. According to Kirton (1978), an ideal team needs to have employees of both mindsets, meaning employees who desire substantial change (innovators), and employees wishing to improve existing organizational practices minimally (adapters). To score KAI, individuals first respond to statements by indicating their agreement level on a scale of 1-5 which results in scores in a range from 32-160.
Conclusion

This study will explore how the transformational leaders in the entertainment industry foster creativity in their followers. In addition, the characteristics and ability of employees to be innovative within a transformational environment will be explored. Sought in this study will be common leadership characteristics of leaders in the entertainment industry that could provide valuable lessons to leaders of other organizations in the future facing the same challenges and competitions.

We will determine the transformational leader’s constructs using the MLQ, and using the KAI framework, we will be able to determine the followers’ creative styles, and form an association with the leader’s leadership characteristics gained through the responses to the interview questionnaire. A pilot study of two selected leaders will be conducted to review potential shortcomings in the design of both the interview and the instructions given for completing the survey instruments.

LITERATURE REVIEW PAPER:

HR LEADERSHIP AND TRANSFORMATION
WHY A HUMAN RESOURCE TRANSFORMATION IS NEEDED, HOW TO LEAD THE TRANSFORMATION, AND WHAT LEADERSHIP SKILLS AND COMPETENCIES ARE NEEDED FOR SUCCESS

Farnaz Tabaee

Pepperdine University
March 8, 2010
Abstract

In today’s rapidly changing business environment, organizations are under tremendous pressure to become and remain competitive. In the era of knowledge workers, for many organizations, human capital is by far their most important competitive advantage. Human resources (HR) has the largest impact on directing a strategic organizational change which would focus on hiring, retaining and developing an organization’s human capital. In order to transform human resources into executive management’s true strategic partner, HR professionals need to develop the necessary leadership competencies to align human resource strategy and organizational mission and purpose. Up until now, human resources has not been very effective at delivering on this promise of strategic human capital development. To position the HR function as the leader of the organizational success forces many organizations to require a major HR transformation. Without it, many companies would not be able to survive. This paper will discuss how to lead an HR transformation, and what leadership skills and competencies do HR professionals need to be effective in implementing this transformation within their organizations.
HR LEADERSHIP AND TRANSFORMATION

Introduction

The common question in the business community is how human resource leaders can truly become part of the organizational leadership (Lawler & Mohrman 2003). In many organizations, the human resources profession is viewed as a transactional and administrative function with no strategic impact on leadership in the organization. As a result, both the business and its employees suffer (Kent, 2002).

Much debate among the field of human resources has been focused on how human resource leaders can become more central to the inner circles of organizational leadership (Lawler & Mohrman, 2003). As Ulrich and Brockbank (2005) point out, “HR professionals are uniquely well placed to help current leadership produce the next generation of leaders by establishing leadership brand, assessing the gaps in the present leadership against this brand and investing in future leaders.” Developing HR leaders through emphasis on leadership competencies is critical to achieving a strategic HR function (Walker & Vosburgh 2003).

According to Ulrich and Brockbank (2005), “Effective HR leaders align their departments with the organizations they serve and match their resources with business requirements. At the top, HR needs to help make the whole corporation greater than the sum of its parts and to implement practices that support corporate strategies, build shareholder value and shape the corporate image. At the business unit level, HR needs to focus on strategic objectives, identifying and serving target customers, creating wealth in the marketplace and delivering an employee value proposition.”

This paper will discuss what leadership skills are necessary to transform the human resources function into the viable and value-added organizational entity and a strategic partner in the 21st century. We will discuss why a human resource transformation is needed, define what leadership skills and competencies are imperative in achieving this transformation, and what
steps must be taken by HR professionals to transform their function into executive management’s strategic partner.

**Why a Human Resource Transformation?**

In the past 50 years, the field of Human Resources (HR) has been through several major transformations. From being known as industrial relations to personnel to human resource management, the function has evolved and adapted itself in order to assist organizations in the management of people; and it’s time for another major transformation (Rothwell, Prescott, Taylor, 2008). Human resource departments in all organizations must shift their focus from merely a transactional and tactical function to a more transformational function in order to truly become the strategic partners of their organizations.

Several factors have contributed to the urgency of this transformation. The speed of technological changes, the rapid growth of the knowledge economy and the knowledge worker, increasing globalization and fierce competition and continuing cost containment in a down economy, have forced organizations to re-evaluate how they do business (Rothwell, 1998). The traditional administrative and transactional roles of human resources have become inadequate to address the human resource requirements of the 21st-century organizations. Executive management now requires that human resource professionals to develop the leadership capabilities to align human resources strategies with the organizational strategy and deliver improved organizational capabilities (Brockbank & Ulrich, 2003). Despite this increased strategic HR emphasis, Human resources in many organizations fall short of the expectations as a full strategic business partner.

Why is HR unsuited to fulfill its important strategic role? Keith Hammonds (2005, p.1) writes “Let’s face it: After close to 20 years of hopeful rhetoric about becoming „strategic partners” with a „seat at the table” where the business decisions that matter are made, most
human-resources professionals aren't nearly there. They have no seat, and the table is locked inside a conference room to which they have no key. HR people are, for most practical purposes, neither strategic nor leaders.” In his article, Hammonds continues by stating why HR must be strategically positioned to the business: “In a knowledge economy, companies that have the best talent win. We all know that. Human resources execs should be making the most of our, well, human resources -- finding the best hires, nurturing the stars, fostering a productive work environment -- just as IT runs the computers and finance minds the capital. HR should be joined to business strategy at the hip.”

Hammonds goes on by stating why HR fails to be strategically aligned with the business: “Instead, most HR organizations have ghettoized themselves literally to the brink of obsolescence. They are competent at the administrivia of pay, benefits, and retirement, but companies increasingly are farming those functions out to contractors who can handle such routine tasks at lower expense. What's left is the more important strategic role of raising the reputational and intellectual capital of the company -- but HR is, it turns out, uniquely unsuited for that."  

Unfortunately, this sentiment regarding HR is shared among more CEOs, managers and employees that we care to admit. So what should HR be doing to transform its role and image? And what competencies does an HR professional must possess in order to be a full participant in the strategic leadership of an organization? What leadership skills are needed to successfully transform HR into a strategic and value-added function within an organization? To answer these questions, we must first define what leadership is and what skills it entails.
Leadership

Through the years, practitioners and researchers have tried to define and conceptualize leadership. Looking at the available literature on leadership the common element seems to be that leadership is an influence process (Northhouse, 2010). Integrity and trustworthiness also seem to be a common thread amongst the definition of effective leaders of the 21st century. To influence others, both one’s followers and those outside that circle, will indirectly build leadership character, and without maintaining integrity and trustworthiness, the capability to influence will soon disappear (Maxwell, 1998).

To be a leader, one must have followers who recognize the value of leader’s contribution and choose to follow him/her (Kragness, 1993). To be successful as an organization, leaders need to inspire outstanding performance from their followers towards the mission and goals of the organization. Historically, human resource professionals have been struggling to be considered the true strategic partners of executive management. To be successful, HR professionals need to have the effective leadership style for the environment in which they operate. A transactional or transformational leadership style would deeply affect the success of HR professionals in leading the organization in the 21st century.

Proactive, capable leadership is required to institute a strategic HR function in any organization. In addition, HR professionals at all levels must fully grasp the business climate to best align their roles and priorities with the organizational objectives. Developing human resource leaders through emphasis on leadership competencies is critical to achieving a strategic HR function (Walker & Vosburgh 2003). Through vision, leadership development, and follow through, the HR function will gain the credibility needed for organizational success and strategic alignment.
HR LEADERSHIP AND TRANSFORMATION

Transactional and Transformational Leadership and HR

What do HR professionals need to do to be a true strategic partner in their organizations? They need to increase their business knowledge, including an understanding of how every aspect of human resources affects other functions strategically, in addition to understanding what leadership style works best for them in the field (Wells, 2003). This paper will discuss what leadership skills are necessary to transform the human resources function into the viable and value-added organizational entity and a strategic partner in the 21st century. We will discuss the range from Transactional to Transformational leadership and how that could apply to human resource professionals.

Researchers and practitioners have developed a great number of leadership theories and approaches over the years. Leadership approaches range from autocratic leadership, to democratic leadership, to servant leadership to name a few. Other leadership theories developed by researchers and practitioners include the great man theory, path-goal theory, and leader-member exchange theory (Northhouse, 2010). This paper focuses on a range of leadership styles from transactional leadership to transformational leadership. In addition, we will discuss how human resource professionals can utilize these leadership styles to transform HR into a true strategic partner in their organizations.

Transactional and transformational leadership models are two models of leadership that cover a wide range of leadership styles. At one end, we have Laissez-faire leadership, which is a style of leadership that assumes individuals are motivated by internal forces and should be left alone to complete their work. The next point in the continuum is the transactional style of leadership members agree to obey their leader totally when they accept a job. The leader is very clear about what is required and expected from the team members. In exchange for members’ work and compliance, members get paid and depending on their performance, there is a promise
of reward or a threat of punishment. The focus on transactional leadership is on short term tasks. Although this style of leadership is needed in organizations to get the job done, it is not a recommended approach long term as it does not motivate or inspire members for a higher goal the way transformational leadership does (Avolio & Bass, 2002).

Transformational leadership is the end point of this leadership continuum where leaders inspire and motivate followers to work toward a mutually rewarding goal (McLean & Weitzel, 1991). According to Bass (1994), transformational leadership is defined in terms of how followers trust, admire, and believe in the leader and the type of effect the leader has on the followers. Bass identified three ways in which leaders transform followers: increasing their awareness of task importance and value, getting them to focus first on team or organizational goals, rather than their own interests, and activating their higher-order needs.

Bass (1998) wrote that authentic transformational leadership is based on four components, idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration. In addition, it is based on three moral aspects, the moral character of the leader; the ethical values embedded in the leader”s vision; articulation; and program; and the morality of the processes of social ethical choice and action that leaders and followers engage in and collectively pursue.

According to Burns (1978), the authentic transformational leader is undoubtedly linked with higher order values. Burns emphasized that true transformational leaders are those who are sensitive to the needs and motives of their followers.

Research proves that transformational leadership, when compared to transactional leadership, is more strongly correlated with lower turnover rates, higher productivity, and higher employee satisfaction (Hater & Bass, 1988). Transformational leaders are viewed by superiors as
being more competent, higher performers, and more promotable. So the same qualities in a transformational HR leader will produce these positive organizational results.

Studies have also been conducted linking HRM, transformational leadership, and organizational outcomes. According to Weichun, Chew, and Spangler (2005) “both leadership and HRM are valuable resources for organizational outcomes and competitive advantage. As predicted, human–capital-enhancing HRM fully mediates the relationship between transformational leadership and absenteeism and partially mediates the relationship between transformational leadership and perceived organizational outcomes.” This is further evidence that the combination of transformational leadership and strategic human resources have positive effects on individual and organizational performance.

In the report titled, “What Makes a Good HR Leader? Leading Now, Leading the Future: What Senior HR Leaders Need to Know”, Human Resource Management (SHRM) identifies eight leadership skills essential for HR business leaders of the 21st century. Looking at these eight leadership skills, one can see the correlation with the characteristics of transformational leaders, leading us to believe that transformational leadership in HR may be just what is needed to keep HR a value-added function in an organization. According to SHRM, these eight leadership skills include:

1. Knowledge of business, HR, and organizational Operations
2. Strategic thinking and critical/analytical thinking
3. Leading change
4. Effective communication
5. Credibility
6. Results orientation/drive for performance
The study also found ethical behavior to be a pivotal leadership quality for human resources professionals. HR leaders can demonstrate ethical behavior through their actions, judgment in decision-making, and leadership in their organizations. “Successful senior HR leaders consistently show executives in the C-suite that they understand the broad operations and processes driving business, “advised SHRM president and CEO Laurence G. O’Neil. “Equally important is the ability to explain the role of human capital issues and solutions in the context of broader business operations linking finance, operations, and marketing.” (HR Focus , p8)

So where do we start? How do we know what to transform HR to? What competencies are needed for the HR professional to be transformed into executive management’s true strategic partner? And how should the transformation take place? What should HR be prepared to do exactly? To answer this question, we must first define exactly what an HR transformation means.

**HR Leadership and Transformation**

HR Transformation is “a radical effort to change, rethink, reinvent and reposition HR”s role in the organization” (Rothwell, Prescott, Taylor, 2008). Ulrich’s definition of HR transformation is more comprehensive, it states, “A true HR transformation is an integrated, aligned, innovative, and businessfocused approach to redefining how HR work is done within an organization so that it helps the organization deliver on promises made to customers, investors, and other stakeholders.”

Each organization must uncover the necessary changes that would bring about the desired results. According to Rothwell, we must first pay close attention to how the world of business is changing and then design strategies for HR transformation to deal successfully with these
overarching changes. Although HR Transformation can be different for each organization, the basic concept remains the same. It is a radical change and repositioning of the function of human resources.

HR professionals must also possess the leadership skills and HR competencies required to succeed as a strategic business partner. Eichinger and Ulrich (1996) summarized their findings from interviews with executives as follows: "Individual members of the HR team are not strong enough or credible enough personally, to help HR succeed, much less the business."

Dave Ulrich, one of the pioneers in leading HR practitioners to thinking strategically, asserts, “HR professionals often focus entirely in the function of HR rather than externally on what customers and investors need HR to deliver. If HR professionals are to truly serve as business partners, then their goals must be the goals of the business. Transforming HR professionals into business partners isn't an end in and of itself; it's the means to a strategic, business-oriented end." Ulrich proposes a four phase model for HR Transformation as follows:

**Phase 1: Business Context: Build the business case.** (Why do transformation?) HR transformation begins with a clear rationale for why transformation matters. **Phase 2: Outcomes: Define the outcomes.** (What are the outcomes of transformation?) This phase clarifies the expected outcomes from the transformation. This is where both transactional and transformational leadership skills can be utilized. What should happen because we invest in HR transformation? The outcomes of HR transformation as the capabilities of a firm or the intangibles that an investor values.

**Phase 3: HR Redesign: Redesign HR for a Transformation.** (How do we do HR transformation?) HR transformation requires change in HR strategy around departments, practices, and people. **Phase 4: HR Accountability: Engage line managers and others.** (Who should be part of the HR transformation?) HR transformation requires that many people
participate in defining and delivering the transformation. This is where a transformational leadership approach of utilizing influence can be very effective. This phase focuses on transferring ownership to line management and on strategies for building HR’s capability to create sustained change (Ulrich, 2009). The model is shown below:

![Four Phase HR Transformation Model](image)

Figure 1: The Four Phase HR Transformation Model (Ulrich, 2009)

Organizations must adapt, and not adopt, this model to their specific business climate (Ulrich, 2009). This model can serve as a great outline for any HR leadership and transformation effort. It ensures that the right questions are asked and that the answers are acknowledged and acted upon for the change efforts to yield the desired results.
So how can we adapt the HR leadership and transformation model to any organization? According to Ulrich, “In any transformation, the pieces come together in milestones, activities, and outcomes. Milestones represent what should be done; activities define how it is done; and outcomes monitor how to tell if it has been done well. Utilizing a transactional and transformational leadership style will ensure that there is a vision for followers to uphold and that they know exactly what needs to be done.” He continues, “The milestones are presented in a linear way, but they are unlikely to happen strictly sequentially. The timing of the transformation may vary according to your culture, the changes you anticipate making, the resistance you expect to encounter, and the level of support you have from the broader organization. But when you understand and adapt the 13 milestones, you will be more successful in your transformation. It may be tempting to skip some of the milestones, but if you do, you will probably have to backtrack and consider the missing milestones in order to make progress.”

Just like any other model, the details of the milestones are the key to its success as a whole. Ulrich describes the 13 milestones which phase by phase outline the process of leadership and transformation. Ulrich explains that Phase I, or the Business Context phase, has the following milestones: “Milestone 1: Formally acknowledge that an HR transformation initiative would be of value.” How do we do that? Ulrich recommends that we must, “determine that the timing is right for an HR transformation by affirming that business conditions are conducive to it, that HR could offer more value to the company, and that senior line leaders would be supportive of the effort. This determination is likely to come from observations about the business and from conversations with other business leaders.”

According to Ulrich, milestone two of Phase I consists of creating your transformation team. Once you form your team, milestones 3 will be to define, assess, and prioritize the new business realities that necessitate HR transformation and change where under the direction of the
new HR transformation team, an assessment is made of the business realities facing the organization (Ulrich 2009). Once the business case is made, in milestone 4, this complete business case for doing HR transformation must be communicated with the key stakeholders of the transformation.

Phase II, or the outcome phase, starts with milestone 5 where an organizational capabilities audit must be done to identify the top two to four capabilities required by the business strategy (Ulrich 2009). Once the top capabilities have been identified, Ulrich continues to Milestone 6 where the organization must operationalize the key capabilities and state them as the outcomes of the HR transformation so that they can be measured and tracked (Ulrich 2009).

Any HR transformation will certainly affect the key stakeholders of the organization and a great leader will ensure that all stakeholders see the value in this effort. In milestone 7, Ulrich asks us to ensure that we “show how accomplishment of these capabilities will benefit employees, line managers, customers, investors, communities, and other stakeholders.” During this step, an HR transformation stakeholder map can be prepared that shows the value of the HR transformation for each stakeholder (Ulrich 2009).

Next is Phase III, which is the HR Redesign Phase, where the transformational leadership skills plays a pivotal role, in milestone 8, Ulrich recommends us to “create an HR strategy statement: who we are, what we do, and why we do it.” Having a clear HR strategy and being clear about who they are or the vision of the HR organization, what they do or the proposition, and why they are valued places HR on the road to strategic positioning with the organization as a whole (Ulrich, 2005).

Once an HR strategy statement has been established, Ulrich recommends milestone 9 where we “shape the HR organization with clear accountabilities for centers of expertise,
embedded HR, operational HR, shared services, and corporate.” Ulrich states, “there are five general areas of responsibility or channels in which HR professionals might work:

• Service Centers
• Corporate HR (HR Oversight)
• Embedded HR (Strategic Business Partnering)
• Centers of Expertise (HR Expertise)
• Operational Execution

Your HR transformation team can define the expectations of each of these five areas as appropriate.” Once these areas of responsibility have been determined, it is important to create a plan on how these different groups will work together. This leads to milestone 10 in which Ulrich writes “Audit HR practices to prioritize those that will align with strategy, integrate with each other, and be innovative.” Without proper alignment, HR will not be able to prioritize and assign resources where it is most needed and where it adds the most value (Ulrich, 1996 & Ulrich 2007).

In addition to transformational leadership skills, other HR competencies are needed for a successful transformation. In milestone 11 where Ulrich states you must “define what makes an effective HR professional in terms of role, competencies, and activities.” This milestone is of utmost importance since without having the right skill, knowledge and abilities of the HR professionals, the best of intentions for an HR transformation will result in its failure. The HR competencies are ultimately the determinant of the success of any HR transformation.

Other HR Competencies Needed for Transformation

There is much discussion in various literatures regarding what competencies HR professionals need to be effective. The Society for Human Resource Management (SHRM) in
conjunction with RBL Group and the Ross School at the University of Michigan have come up with a complete HR Competency Model. “This study has been conducted five times over the past 20 years and provides the most comprehensive global empirical review of the HR profession. Over the lifespan of the study over 40,000 Hr professionals and their line management associates have been involved” (Johnson, 2009). They advise every HR professional to make personal commitments to upgrade actions, roles, and competencies. In their book, “HR Competencies: Mastery at the Intersection of People and Business” authors Ulrich, Brockbank, Johnson, Sandholz, Younger define the HR competencies not just as knowledge that HR professionals must possess, but the ability to use this knowledge effectively act on what they know. They depict HR Competencies as shown below: (Ulrich, Brockbank, Johnson, Sandholz, Younger 2008)

Figure 2: HR Competency Model (Ulrich, Brockbank, Johnson, Sandholz, Younger 2008)
This model suggests that HR professionals must embrace competencies dealing with people and the business. A summary of the six HR competencies are shown below (Ulrich, Brockbank, Johnson, Sandholz, Younger 2008):

**Credible Activist.** The HR professional is both credible and active. This means that an HR professional must not only be respected and listened to in the organization, but also must have an impact by offering viewpoints and positions and taking a seat at the executive table without having to be asked.

**Culture and Change Steward.** The HR professional is also an organization development and change management expert. The skills needed are not only being able to assess culture and shape it, but also plan, facilitate, and manage major change initiatives within the organization.

**Talent Manager / Organizational Designer.** The HR professional is both a talent manager and an organizational designer. Talent management ensures that today’s and tomorrow’s talents are selected, developed, and rewarded with a succession planning process in place. Organizational designer shapes the communication and collaboration within the organization and ensures that the talent can thrive within the organizational structure and system.

**Strategy Architect.** Ulrich, Brockbank, Johnson write “Recently, the distinction between strategy formulation and execution has become increasingly blurred--the implementation of strategy is as important (if not more important) than the strategy itself. Because implementation is driven heavily by measurements, rewards, staffing, training and communications, HR is central to effective strategy implementation.” The HR professional has a vision for the future of the organization and needs to implement the strategy according to that vision (Ulrich, Brockbank, Johnson 2009).
Operational Executor. The HR professional administers the operational aspects of managing people and organizations including hiring, benefits, payroll, and training and development ensuring that policies and procedures are adhered to.

Business Ally. HR professionals understand the business of the organization fully and participate in the success of the business by effectively responding to external customers, business climate changes, and stakeholder expectations. (Ulrich, Brockbank, Johnson 2009).

Once HR professionals are clear as to the knowledge, skills and abilities they must possess, Ulrich points us to the milestone 12 which is to ensure that the HR professionals possess the competencies required “and invest in HR professionals to make sure they have the abilities to deliver on the transformation.”

This leads us to Phase IV of HR transformation, or the Accountability phase, and milestone 13, which according to Ulrich is making sure that “the transformation team is staffed by the right mix of people and engaged in the right activities.” It is critical that the HR transformation team is made up of individuals with the competencies required who can lead, starting from planning, designing, implementing and following through on all the activities from inception to conclusion to ensure a successful HR transformation.
Conclusion

Human resources professionals have the responsibility of strategically hiring, retaining, and developing human capital and ensuring the success of their organizations. For most organizations, this means HR leadership is to transform their function and combine the success of the organization’s business and its people. Just as any major organizational change, an HR transformation can benefit from effective leadership, and proper planning, management, oversight, and implementation. An HR transformation would not be complete without HR professionals who can lead this effort, and who possess the right competencies ensuring that they are their executive management’s true strategic partners positioning the organization on the path to everlasting success.

Future Research

Numerous studies have been conducted regarding styles of leadership, and their effectiveness. On the other hand, there has not been an investigative study examining the relationship, specifically, between leadership styles and human resource professionals (Kotter, 1991; Kouzes, 2003; McNamara, 1999).

The aim of this study was to compare six years of data collected to establish the learning gains made by participants who carried out guided-inquiry activities with those participants that carried out open-inquiry activities while participating in the field component of the “Field Course Experiential Learning Model” as part of a Penn State University field course in Costa Rica. The overarching questions were: If the field course, Environmental Science and Conservation Biology: A Field Study in the Biodiversity of Costa Rica, is run identically except that guided-inquiry activities are replaced with open-inquiry activities in the prescribed field work, will participants report higher gains in knowledge, skills, and conceptual learning? Additionally, how has this field study experience affected the participating teacher’s instructional practices, and how do these effects compare between the guided-inquiry and open-inquiry groups? A sample population (n=66) was surveyed following their field course experiences and the guided-inquiry teacher group (n=56) survey results were compared to the open-inquiry teacher group (n=10). Participant responses were then coded via constant comparative coding process. The survey responses were then triangulated with journal responses and post-trip questionnaire responses and reflections and artifacts such as videos, presentations, journal entries, etc. for the purposing of supporting and validating the findings of this study. Although, the data analysis is in progress, initial results suggest that open-inquiry experiences have had a positive impact on teacher’s knowledge, skills, and conceptual learning. In addition, the open-inquiry experiences have helped the teachers feel more comfortable utilizing open-inquiry in their classrooms and has sparked the teachers’ creativity in their lessons.

Identifying Criteria for Redesigning Learning Environments for the Next Generation of 21st Century Students and Teachers

Abstract

This theoretical paper is a work in progress that discusses results from a literature review and practitioner observations that investigated the question, Given the vast changes in technology, social interactions, the environment, and international events, how do we redesign learning environments to meet these changes for the next generation of both students and teachers in the 21st Century? The research objective was three-fold: 1) to unveil the most prevalent practices driving the need to create new learning environments, 2) identify conditions that support innovations in the redesign of learning environments to address 21st century reform in pedagogy and new educational organization designs and 3) advance the conversation on the posited question. Methodology was a qualitative literature review, which included an electronic Web and library review. The expected outcome included expanded understanding of six research themes to advance research on this important question and the role of six related phenomena.
Conceptual Framework

Effective leaders in complex organizations must be able to make optimal use of domestic and worldwide knowledge networks and their access to limitless information. Leaders must begin to make unprecedented efforts to address the fundamental origin of relationships between educational and societal problems to guide decision-making and solutions for designing new learning places for students and teachers. Being an effective leader in a complex educational organization requires a leader to be a skillful learner and have the ability to drive decision-making to ensure the change process involves multiple stakeholders and diverse goals, objectives and needs. While there are many leadership theories that describe leadership styles and practices, our focus is on the leader’s responsibility to provide appropriate learning and instructional settings conducive to learners’ needs for the 21st Century. I cite following as a profound perspective about the significance of the problem being addressed in this paper.

The older model of higher education, more appropriate to the industrial age, is centered on its providers, who are presumed to know everything there is to know about a subject, and who transmit it to fairly passive students seated in a classroom, at a time convenient to the instructor, listening to the instruction for 45 hours during the course of a semester. Students who spend this time in seat, multiplied by 40 courses over a period of 4 or more years, are granted a B.A. degree. The new demands of the knowledge-based economy require a transformation of this model to one in which education is centered on the student as learner, who needs to develop the capacity to search, select and synthesize vast amounts of information into coherent knowledge (Dolence, 1995).

Among the most pivotal leadership theory within the conceptual framework for this conceptual paper is that of Peter Senge, who is credited for creating the theory of the learning organization that emerged in his renowned work in 1994, *The Fifth Discipline*. In this pivotal work he describes a systems thinking approach to organizational management, development and sustainability based on long-term solutions vs. quick fixes. Leaders can no longer rely on quick fix solutions of the past in new technological environments. Senge’s theory and the relationship to the primary question is discussed in further in this paper (Senge, et al, 1998; Senge, 1994; Senge, 1990). He provides this guiding definition of a learning organization.
According to Peter Senge (1990: 3) **learning organizations** are:

…organizations where people continually expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning to see the whole together. [http://www.infed.org/biblio/learning-organization.htm](http://www.infed.org/biblio/learning-organization.htm)

**Effective Leadership in Complex Educational Institutions**

![Conceptual Framework]

Figure 1 Conceptual Framework.

**Statement of the Problem**

The problem of leadership taking on more responsibility for redesigning new learning environments is complex in today’s educational leadership, policy and practice environment. Previous studies linked to other educational leadership research in the field address the problem but not always from a systems leadership and management point-of-view.

*Limitations.* An existent research limitation in this paper is linking new educational leadership skills, qualities and philosophies to a hypotheses or research objectives to theory. Also, still to be considered is how the final hypotheses will emerge in relation to the research design to study the evolving questions about criteria for guiding new professional development guidelines to prepare educational leadership and management.
Identifying Criteria for Redesigning Learning Environments

professional as 21st Century leaders with the capacity to lead designing new learning settings, especially distance learning.

**Goal and Purpose Statement**

This paper aims to expand understanding about theoretical and practical underpinnings and implications involved in developing a solution-oriented model for creating new or modernizing traditional learning environments. The anticipated outcomes for this work-in-progress is a well-developed, concise, and clearly defined problem statement that will lay the foundation for advancing the conceptual framework and/or collaborative research project to continue this research agenda. The purpose is to share information and expand understanding about gaps in knowledge about criteria that is necessary to consider when redesigning learning environments for the next generation of 21st century students and teachers.

**Research Questions**

The primary question in this review draws heavily on the literature to examine the issue, “Given the vast changes in technology, social interactions, the environment, and international events, how do we redesign sustainable learning environments to meet these changes for the next generation of both students and teachers in the 21st Century?” Secondary or supporting questions include:

1) What are some of the most prevalent practices driving the need to create new learning environments,

2) What are the conditions that support innovations in the redesign of learning environments to address 21st century reform in pedagogy and new educational organization designs and

3) How do we advance the conversation on the posited questions in this study?

**Methodology**

**Traditional or Narrative Literature Review**

The primary method for preparing and writing this paper was a qualitative interpretive framework that incorporated the traditional or narrative approach. Secondary methods included the experiential and observational knowledge of the researchers. According to Cronin, Ryan, and Coughlan (2007), this type of
review critiques and summarizes a body of literature and draws conclusions about the topic in question. The body of literature cited in this paper is made up of relevant studies and knowledge that address the primary and secondary questions on the topic Evaluating Criteria to Consider When Redesigning Learning Environments for the Next Generation of Students and Teachers. The researchers were selective in the material it uses in this paper, although the criteria for selecting specific sources for review may not always be apparent to the reader due to the complex interrelationships embedded in the topic. However, the researchers found this type of review useful in gathering together a volume of literature in on this topic area, summarizing and synthesizing it.

**Purpose.** The purpose of this paper is to provide the reader with a comprehensive background for understanding current knowledge and highlighting the significance of new research about the complexities for leaders involved in redesigning learning environments for the next generation of teachers and learners.

**Grounded Theory:** In this research, the presenter theorizes that systems thinking and sustainability are the new learning tools for 21st century leadership in the complex (learning) organization. The examination of the question is pursued via a synthesis of research on the topic question of this investigation. Findings are embedded in the discussion throughout the paper, followed by a brief summary and conclusion. The primary question provides insight about this very complex issue that we set out to investigate. Other anticipated questions will be based on theory, past research, experience, and need to expand on the primary question. These questions will direct the future research methodology; their inclusion in this conceptual paper at this stage helps to links the research problem with the methodology later. The emergent questions will direct everything that will be done as this research idea progresses. A team approach will be used to ensure questions are accurate and focused to the main or final research problem. The research questions will be designed to specifically direct the research, instrumentation and the type of analyses that will be conducted to further establish reliability measures for this research.

**Objectives.** The research objective is three-fold aiming to: 1) unveil the most prevalent practices driving the need to create new learning environments and 2) identify conditions that support innovations in the redesign of learning environments to address 21st century reform in pedagogy and new educational organization designs and 3) advance the conversation on the posited question. Methodology was an integrative literature review, which included an array of resources such as an electronic Web and library review to support data collection and reporting for this paper.
Preliminary Literature Review

This literature scan identifies major literature that supports and validates the topic question. It also focuses on areas that offer support for new research, offers an opportunity to analyze and synthesize past research in the context of the present problem being examined in this research. This conceptual paper attempts to provide a glimpse into previous research to plant seeds in the mind of the reader, while suggesting more information is needed to fully exhaust discussion on the topic. This paper is based on a wide-range literature and web reviews that is condensed into a summary of key points. The literature is presented in six themes that emerged as conditions for changing learning environments to address 21st Century educational needs of the next generation of students and teachers. The emergent themes from the research about some conditions required to redesign new equitable learning environments are 1) provide better services for teachers and students 2) invest financially in new technologies 3) identify theoretical framework(s) for curriculum and instructional development 4) educate leaders on new approaches for decision-making 5) articulate a clear vision for change and 6) Utilize social-networking technology to enhance opportunities for learning and educational equity.

Figure 2: Literature Map
Discussion

Provide Better Services

More than a decade ago, Adens, Sybouts & Wess (1998) at the end of the millennium, these researchers describe in the idea of the “blossomed university” that emerged from a population growth that for the first time in history outpaced the world’s capacity to give people access to universities. Adens, et al. (1998) believed that a sizeable new university would now be needed every week merely to sustain current participation rates in higher education. Since 1998, we have learned that as education and training become more important to citizens as life long learners, education is becoming a more attractive business opportunity for entrepreneurs — many looking to partner with public schools, colleges and universities and others desiring to provide a full alternative. Dolence and Norris (2001) in their provocative book "Transforming Higher Education: A Vision for Learning in the 21st Century", estimated the amount of learning required by every information-age worker by the year 2000 will be equivalent to 30 credit hours every seven years or a master’s degree every decade. In 2010 we are experiencing this unprecedented flood of online masters degrees in every field of study.

21st Century business venture leaders have recognized this need for rethinking learning and instructional settings and is now providing distance learning experiences to permeate the educational systems with new learning places and designs. One has only to look at the programs provided by the Drexel Online, University of Phoenix, Motorola, Xerox, Nova and many other corporate universities to note what might be termed competition from the private sector. These factors should make traditional education providers who are thinking about entering the distance learning arena more conscious of student needs or face the possibility of private profit oriented providers taking a large portion of the popular education and training experiences and federal funding from tradition providers.

With an increase in the number of colleges, community colleges, and universities offering distance education classes there is an exponential increase of people, including taking distance education classes. In
addition, with the growth of educational opportunities for students at a distance from the campus, student support systems for global learners must be developed for these distant students and students with disabilities. The Aden’s group research found three services that are needed include: timely student feedback, on-site support, and access to library materials; if these services are offered they will contribute to successful distance learning experiences.

The surge in development of distance education technologies and programs is bringing new paradigms that represent the rapid changes and challenges occurring in our educational, economical, societal and technical support systems. Given these changes and the poor employment outlook, most people are expecting to become lifelong learners more dependent upon formal learning environments than was the norm in previous generations. The literature clearly suggests that while most initial formal learning may still be traditional educational experiences in a classroom with an instructor from early childhood into high school; later formal learning experiences may not always be possible by gathering groups of learners and instructors together in one location.

The difficulties related to grouping learners often begin when specialized learning experiences become too costly to be provided in small high schools and later when family and job responsibilities as well as financial constraints confine learners to situations far away from traditional learning experiences. For most people, continued education and training are part of maintaining their employment situation, necessary to change or enhance job opportunities, prepare for a new job when a current one is lost, or for personal gratification.

Today’s nontraditional or distance students respond to most of the same principles of learning and have similar social and physical needs as students in a campus setting. Therefore, secondary and post secondary institutions choosing to provide distance learning experiences must be prepared to provide student support services of equal quality to both campus and distance students.

When students are interacting with learning experiences, it is vitally important they have consistent access to quality and current library resources. Leaders must visualize students at a distance as having the same needs as students in a campus setting. Courses that are offered frequently in the same distant locations may warrant the purchase and placement of duplicate library and media resources in the library or support service area at the distant locations. Cooperation among local libraries and college libraries will be very important as
Identifying Criteria for Redesigning Learning Environments

Education continues to go global, especially in regard to interlibrary loan services. These services need to be supported by e-mail addresses and fax numbers allowing service to students in hours convenient to both students and teachers.

Specialty publisher partnerships are another means to provide students at a distance with access to a variety of information resources. Instructors using these services identify resources needed to complete the learning experience and the publisher negotiates with the copyright holder for the clearances and costs to use the material, which is then compiled, printed, and purchased by the student. Large amounts of printed material can also be placed in database and sold to the student on membership basis in a more compact form such as e-books.

The Legislature as well as administrations, faculties, and support staffs of K-12 districts and postsecondary institutions must change their concept of campus from physical locations scattered about the State to that of a statewide campus with various K-12 districts, community colleges, colleges, universities, and corporate universities providing instructional services across this vast campus (Phillipo, 2007). All these groups must at least recognize this development and/or embrace, cooperate, and support it with reallocation of existing resources and possibly new resources. These groups along with the students matriculating on the extended campus need to prepare for a steep learning curve and a number of new problems as technologies continue to merge. Adens, et al. (1998) forecasted these problems will emerge in this century but will be remedied. As leaders grow in knowledge, they will be required to provide for the extended campus; this is not a question of "if it will occur", it is a question of "when it will occur". If education reform is to be the transformative influence that it can and should be, more needs to be invested in education and the investment needs to be distributed more effectively (http://education.illinois.edu/newlearning/learning-investment.html).

Invest Financially

These are extraordinary economic times, requiring an enormous economic stimulus to avert recession sliding into depression. These times provide cause for public investment in education on an unprecedented scale. Historically, many government-created economic stimulate have left little to show. Tax cuts or tax rebates feed into increased personal consumption, but this is not like investment in human capital or in physical capital, which also have a supply-side effect and increase productivity and output later. Wars provide a boost to industry and employment, but also leave no manifest legacy of increased productive capacity. Expanding roads may
mean increasing private transport infrastructure, which aggravates energy costs and dependencies—and in any event, they may not be needed with the rise in telecommuting, cheaper person-to-person telecommunications, digital delivery of formerly physical content, and better public transportation. By comparison, there are few public infrastructure investments as evenly distributed and with as high a total return and tangible public value than investment in human capital formation through basic and higher education (http://education.illinois.edu/newlearning/learning-investment.html).

Education, however, also needs to use resources more effectively. It is estimated that schools are used for only 13% of available hours in the year. In fact, the length of the school day, and the number of days in school per calendar year, are quite low in the U.S. in relation to most of the other OECD nations—one reason perhaps for the underachievement of students in the US as measured in international tests. Instead, schools need to become seven days per week, 7-11 resource, and a focal point of community life in a knowledge society. This is to just to consider the way we use the physical resources of the school. Similar observations, however, could be made of the school’s human resources. Teaching to the middle of the class, where some learners are bored and others lost, is hardly efficient—customized learning is more efficient. And why does the ratio of learners to teachers need to be so consistent, when today’s learning environments could span a broader range, as needed, from one teacher to one learner, to one teacher to a great many learners? Peers or more advanced learners can perhaps do a lot of the work of teachers, to the benefit of both amateur teacher and learner. However, this requires a reconfiguration of the physical plant of the school, into new and more flexible spaces reflecting a wider range of person-to-person learning relationships. The question of resource use goes to the very heart of the business of education. Higher productivity in producing desirable education outcomes might mean we can pay teachers much better and get better value for that pay (http://education.illinois.edu/newlearning/learning-investment.html).

The ‘more investment’ argument can also rest on a personal case. The personal case is this: invest now and you will reap the rewards later. But for this personal case to work, it has to be more directly personalized. At the moment, there is a less than perfect alignment between learning investors (parents under financial pressure from multiple sources or aging local tax communities) and learning dividend recipients (children and future generations of productive workers). Onerous loans create a personal disincentive. Government grants can
produce distorted effects by favoring the already-privileged and elite institutions
(http://education.illinois.edu/newlearning/learning-investment.html).

The evidence shows individuals benefit directly from education in the form of receiving a higher income. If and when you benefit, you should be directly responsible to return a portion of that benefit for the public good. One solution would be to replace loans with an income taxation surcharge in which people repay the cost of their post-compulsory education if and when they reach the average income. Low paid professionals will never pay; those not working will not pay so long as they are not working. There will be additional benefits whether an individual repays the cost of their education or not, and that is the external benefit to the society and future generations, a benefit that would otherwise not be obtained because private families will invest too little (http://education.illinois.edu/newlearning/learning-investment.html).

It may be possible to add additional incentives that come from non-monetary private benefits to the individual and broader systems of reward for generating external social benefits. Considerable thought has been given in recent years to the economics of what is called ‘social production’, or non-market production that benefits others in the society, such as the unpaid contributions to open source software, to the authorship of Wikipedia, to the enormous community volunteer sector. This has sometimes been called a ‘reputational economy’, where people work to gain the non-monetary recognition of others (http://education.illinois.edu/newlearning/learning-investment.html).

In his radio address on the economy (Saturday, December 6, 2008) President-elect Barack Obama said “to help our children compete in a 21st century economy, we need to send them to 21st century schools.” Further, he stated, “my economic recovery plan will launch the most sweeping effort to modernize and upgrade school buildings that this country has ever seen. We will repair broken schools, make them energy-efficient, and put new computers in our classrooms.” No part of economic recovery plan is more important than rebuilding the infrastructure of American education (http://education.illinois.edu/newlearning/learning-investment.html).

Too many of America’s children go to school in overcrowded buildings with leaky roofs, faulty electrical systems, and outdated technology, all of which compromise their ability to achieve, succeed, and develop the educational skills necessary to compete in the knowledge economy of the 21st century. A well developed economic stimulus plan that places education at the core of rebuilding America’s infrastructure is
n necessary for the nation to achieve the kind of high quality learning environment appropriate for the 21st century (http://education.illinois.edu/newlearning/learning-investment.html).

We have known for over a decade many educational systems are fundamentally inadequate to prepare people to compete in the knowledge economy of the 21st century. At the end of the 20th century several studies reported that America’s school infrastructure was in poor condition and lacked the capacity to create an environment where children could be properly educated and prepared for the 21st Century. Recognizing that the studies in general relied too heavily on anecdotal evidence and also presented different methodological problems, the General Accountability Office (GAO) in 1995 conducted a study that could used as a basis for determining the condition of the nation’s education infrastructure. The GAO disseminated its study to House and Senate committees and to all members of Congress. Congress passed the Education Infrastructure Act of 1994, in which it stated, “Improving the quality of public elementary and secondary schools will help our Nation meet the National Education Goals.” Despite these efforts, through good times (the budget surplus of 2000) and bad times (the current market crisis) the infrastructure of American schooling has remained almost a state and local responsibility, with virtually no help from the federal level. Given the current budget deficits among the vast majority of the States, local governments will continue to defer vital infrastructure needs from year to year due to lack of funds. A high-quality learning environment is essential to educating the nation’s children for the 21st century and the nation’s only option for a modern infrastructure in through a federal infrastructure recovery plan (http://education.illinois.edu/newlearning/learning-investment.html).

Identify Theoretical Framework (s) for Curriculum Decision-Making

Before leaders in technology education are able to identify a theoretical framework upon which a curriculum is to stand, they must first grapple with two opposing views of the purpose of technology education – education for all learners or career/technical education. Dakers (2006) identifies two opposing philosophies that can serve as a framework for technology education, both inspired by ancient Greece, with the works of Descartes and the birth of positivism. Later reappearing in Pascal’s writings of the mathematical mind, and finally with Rousseau in the mid 1700s, the theoretical arguments of academic verses vocational were established in education, and thus concluded that the overall purpose of education was to make a man (human being) or a citizen. This dichotomy of views is referenced here to make explicit the underpinnings of a theoretical framework for technology education. The position that the authors take in this dichotomy of views is
Identifying Criteria for Redesigning Learning Environments

one that embraces the best of both views by teaching technology education to all students to foster technological literacy while at the same time addressing the needs of a workforce seeking to compete in a global economy according to Kelley & Kellam (2009).

The conceptual underpinning of the proposed philosophy of technology education is founded on the ideas supported by the works of Woodward (1894), Dewey (1916), and Warner, Gray, Gekbracht, Gilbert, Lisack, Kleintjes, et al. (1947), each of whom proposed that technology education is for all learners. That is, they believed that technology education should equip the learner with necessary knowledge, skills, and abilities in the context of technology, and to live, function, and work in today’s technological society. Furthermore, the authors embrace a pragmatist view, also known as experimentalism, which has been promoted through the progressive and reconstruction movement of the late 19th and early 20th centuries. Pragmatism supports the notion that knowledge is gained through problem solving, it places great emphasis on critical thinking and reasoning, and it seeks to solve the world’s problems with an open mind (Scott & Sarkees-Wircenski, 2001). Moreover, the authors support technology education with an engineering design focus as a vehicle for fostering technological literacy while simultaneously developing the skills needed to work in a global economy. A review of some of the recent commissioned reports on preparing a workforce ready to compete in a global economy uncovers lists of necessary job skills that are also technological literacy skills (Committee on Prospering in the Global Economy of the 21st Century, 2007; National Center on Education and the Economy, 2006) stated Kelley & Kellam (2009).

Developing technological literacy goes far beyond providing vocational skills and making students “technically savvy”; it is focused on understanding how technology has changed our world and how we live in it. Michael (2006, p. 56) adds that technology education should prepare young people to cope in a rapidly changing technological world; enable them to think and intervene creatively to improve that world; develop skills required to participate responsibly in home, school and community life (citizenship); help them become discriminating consumers and users of products; help them become autonomous, creative problem-solvers; …encourage the ability to consider critically the use, effect, and value dimensions of design and technology (technological awareness or literacy); it is our belief that technology education, with a focus on engineering design, is as beneficial for students who want to become attorneys, physicians, accountants, business managers, clergy, and writers as it is for future engineers according to Kelley & Kellam (2009).
Kelley & Kellam (2009) states that Jacobson and Wilensky (2006) suggest that young learners can handle complex systems thinking even at the middle school level. They suggest using a constructivist approach to learning, a philosophy of learning based upon foundational works of Dewey (1930), Piaget (1985), and Vygotsky (1998). Jacobson and Wilensky wrote: “A central tenet of the constructivist or constructionist learning approach is that a learner is actively constructing new understandings, rather than passively receiving and absorbing ‘facts’”. They believe that this method of learning can increase students’ understanding of complex systems as well as be more interesting, engaging, and motivating for students when assigned authentic problems studied within cooperative learning environments according to Kelley & Kellam (2009).

Notice that the constructivist teaching strategies suggested by Crawford, Wankat, Becker, and Bransford et al. emphasize the critical importance of context for effective teaching and learning. Contextual learning as described by Borko and Putnam (2000) is situated, distributed, and authentic. They suggest that all learning should take place, or be situated, in a specific physical and social context to acquire knowledge that is intimately associated with those settings. Borko and Putnam also advocate that for transfer of learning to occur, students must be provided with multiple similar experiences allowing an abstract mental model to form. Hanson, Burton, and Guam (2006) proposed contextual learning as a key strength for technology and engineering education programs, allowing for transfer of knowledge from core subjects. Additionally, they suggested that contextual learning is a key concept in helping technology education align with No Child Left Behind and providing learning opportunities for students to become prepared to work in a global economy. The context of learning is also essential in designing a solution to an ill-structured problem. Glegg (1972) suggested that the context in which a solution will be applied is not only an important design consideration but also critical to learning design. Teaching engineering design must be done within a context that is authentic according to Kelley & Kellam (2009).

Wicklein (2006) and Daugherty (2005) endorsed engineering design as an ideal platform for addressing the standards for technological literacy (ITEA 2000/2002), while also creating an instructional model that attracts and motivates students from all academic levels. Today’s workforce requires job skills that move beyond excelling in the basic core subjects (Grasso & Martinelli, 2007). A national employer survey identified desired job skills needed in today’s workforce. Today’s jobs “…require a portfolio of skills in addition to academic and technical skills. These include communication skills, analytical skills, problem solving
and creative thinking, interpersonal skills, the ability to negotiate and influence, and self-management stated Kelley & Kellam (2009).

**Educate Leadership on New Approaches to Decision-Making**

Complex systems approaches, in conjunction with rapid advances in computational technologies, enable researchers to study aspects of the real world for which events and actions have multiple causes and consequences, and where order and structure coexist at many different scales of time, space, and organization stated Kelley & Kellam (2009).

“In short, systems thinking is about synthesizing together all the relevant information we have about an object so that we have a sense of it as a whole” (Kay & Foster, 1999, p. 2; Senge, 1994). Mapping out the complex issues of a system by reducing the system down to its parts and studying the relationships within those various parts is a process that leads to a better understanding of the system. Furthermore, tensions may be identified that will likely emerge when a new approach to the system is taken. Failing to understand that these tensions exist and that the system contains these complex relationships, will likely result in a poor, inappropriate design. It is critical to understand that these relationships impact the entire system and the manipulation of one relationship, in turn, affects the entire system Kelley & Kellam (2009).

Kelley & Kellam (2009) reported that Biologist Lewis Thomas wrote: “When you are confronted by any complex social system, such as an urban center or a hamster, with things about it that you're dissatisfied with and anxious to fix, you cannot just step in and set about fixing with the hope of helping. This realization is one of the sore discouragements of our century…you cannot meddle with one part of a complex system from the outside without almost certain risk of setting off disastrous events that you hadn’t counted on in other, remote parts. If you want to fix something you are first obliged to understand…the whole system” (Thomas, 1974, p. 90).

Bar-Yam (2002) confirmed this dogma by making the case that the ability of science and technology to expand human performance through design is dependant upon the understanding of systems and not just the components that lie within that system. The insights of complex systems research and its methodologies may
become pervasive in guiding what we build, how we build it, and how we use and live with it. Possibly the most visible outcome of these developments will be an improved ability of human beings aided by technology to address complex global social and environmental problems, third world development, poverty in developing countries, war and natural disasters (Bar-Yam, 2002, pp.381-382) according to Kelley & Kellam (2009).

Frank (2005) makes a strong case for a systems approach for technology education. He pointed out that, traditionally, engineering and technology education used a bottom-up instructional approach, one that attempts to determine and deliver all the knowledge and skills needed by compartmentalizing the subjects: a separate math course, a physics course, statistics, etc. Frank proposed a different approach. Based on the systems thinking approach, what follows is a proposal for a way to teach technology and instill technological literacy without first teaching the details (for instance, electricity basics and linear circuits for electronics, or calculus and dynamics basics for mechanical engineering) stated Kelley & Kellam (2009).

Kelley & Kellam (2009) reports that the premise to this approach is that complete systems can be studied conceptually and functionally without needing to know the details, a top-down approach. A top-down approach focuses on characteristics and functionality of the entire system and the interrelating subsystems. This approach to teaching engineering design addresses issues raised by some that suggest teaching engineering design in technology education excludes some students who have not had, or lack, an aptitude for upper level math or science. A top-down approach also provides a feasible solution to high school courses with students enrolled at various stages of learning, for example, freshmen and seniors in the same class. These issues are of great concern when suggesting that technology education with an engineering design focus is for all learners.

Shepherd (1998) shares the benefits of project-based learning for technology education that include student engagement, increased motivation, and increased multidisciplinary knowledge, to name a few. His findings are congruent with others who have found through research that students who experienced project-based learning in a real world setting had significantly higher scores on the Cornell Critical Thinking Test compared to students in traditional instruction (Kelley & Kellam, 2009).

Articulate a Clear Vision for Change

In an educational field such as technology education that has been accused of poorly communicating a clear mission (Wicklein, 2006); it appears appropriate to consider a new theoretical foundation for the field.
Moreover, as new demands arise for educational programs that will equip the next generation of workers who are trained to survive and thrive in a global economy, a new philosophical framework for technology education may be needed. In this article, the authors have attempted to provide a philosophical framework for technology education that holds true to some pedagogical approaches that are at the heart of the success of technology education (contextual learning, problem-based instruction, and project-based instruction), while at the same time embracing new philosophies of learning and thinking (constructivism, engineering design, and systems thinking). The current literature is clear about the type of workers needed for today’s global economy (Pink, 2005; Friedman, 2005; National Academy of Engineering, 2004; National Academy of Engineering, 2005; Woods et al., 2000). If technology educators determine that their purpose is to help prepare students to live and work in this global society, then these educators should consider carefully defining a philosophical framework upon which to build a new curriculum. The authors wish for technology educators to consider the proposed framework as a foundation for technology education as it has much promise in preparing students to function in today’s technological society said Kelley & Kellam (2009).

**Utilize Social Networking Technology to Enhance Opportunities for Learning and Educational Equity**

Every day, many students are spending countless hours immersed in popular technologies—such as Facebook or MySpace, World of Warcraft, or Sim City—which at first glance may seem like a waste of time, and brain cells. But these genres of technologies—Social Networking, Digital Gaming, and Simulations—deserve a second, deeper, look at what’s actually going according Klopfer, Osterweil, Grff, & Haas (2009).

Have you heard of the above before? Your students have, and they almost certainly have strong opinions about them. You don’t need to be a teenager to use or understand these technologies, or to use them in your classroom. Market research data indicates that many a normal, middle-aged adults uses these technologies with frequency. The fact is, you can be 17, 35, or 60, and when you begin to engage with them and observe what’s really going on, you can begin to see that these technologies are more than just entertainment. These technologies are already demonstrating how they impact the way we think, learn, and interact—and they are also demonstrating the tremendous potential they have in these areas as well stated Klopfer, et al. (2009).

According to Klopfer, et al. (2009) the emergence of social networking technologies and the evolution of digital games have helped shape the new ways in which people are communicating, collaborating, operating, and forming social constructs. In fact, recent research is showing us that these technologies are shaping the way
we think, work, and live. This is especially true of our youngest generations—those arriving at classrooms
doors, soon to be leaving them and entering the workforce and society-at-large.

Games and simulations have been a key component of training doctors and military personnel, but
even businesses such as mining companies use games about a mining company in outer space to teach its
employees about processes. Although that may seem a bit “off the wall,” the fact is major corporations, the
Department of Defense, and the medical community would not use these tools if they were not highly effective.
Although these examples are mainly centered on training purposes, there are deeper educational benefits to
digital simulations and games. Yet leaders in educational institutions have been reluctant to embrace these
technologies (Klopfer, et al., 2009). Likewise, where schools have often shield away from giving students an
online identity in a digital networking platforms to increase opportunities for learning, professional
organizations are leveraging networking technologies to increase collaboration, knowledge-sharing, and
production amongst their employees. Public education has been impeded by the security and other potential
dangers of employing social networking technologies.

Technology can have a reciprocal relationship with leaders and teachers. The emergence of new
technologies pushes educators to understanding and leveraging these technologies for classroom use; at the
same time, the on-the-ground implementation of these technologies in the classroom can (and does) directly
impact how innovative technologies continue to take shape. While many new technologies have emerged
throughout history, so has the cry for educators to find meaningful ways to integrate technologies into the
classroom—be it the typewriter, the television, the calculator, or the computer. And while some professional
educators may have become numb to this unwavering ‘call’—and for good reason—it is crucial to consider that
the excitement over games and social networking goes beyond business and industry “crying wolf” to
measurable and observable outcomes at some point in the implementation. Evaluation must play a key role in
determining what works and what does not work, but this should not thwart experimentation.

Indeed, those previous technologies have a powerful place in instruction and the classroom; but
without them, strong lessons and learning objectives can still be achieved. With these more recent technologies,
we think educators should take the call, even if only on a trial basis.

Of course, as a result of these assaults on formal education, those in the “outside world” are often
quick to pounce on educators and the way education is (perceived to be) conducted in U.S. classrooms. This
Identifying Criteria for Redesigning Learning Environments

bandwagon perspective has become a mounting dialogue, charging the field of education with the imperative for a revolution—radical transformation of its system and practices. While it is clear that education is no different from the other sectors in its need to adapt and modify to our transforming world, it is also clear that many educators currently already implement excellent teaching practices and are able to skillfully create dynamic learning environments. Access to technology alone will not make an effective learning environment, leader or teacher.

However, attacking educators’ current practices combined with the lack of acknowledgment of current best practices only hinders the growth of the education sector (Pittman 2008). There are countless educators who are masters at their craft, currently employing an array of exceptional instructional strategies. Lauding and building upon these strategies is critical to effective growth in the education sector in order to bridge the aforementioned divide. Attending to this end of the technology-teaching relationship has the additional benefit of helping to shape emerging technologies that are most effective for building student cognition and teachers instructional strategies. In the next section, Ghanem Al Bustami (2010) shares his research on what educational leaders and teachers can do to facilitate effective programs and training students to become future leaders in the workplace, including education.

How we can develop our students, teachers to become leaders? (Al Bustami, 2010)

Big Ideas for Better Schools: Ten Ways to Improve Education by Developing Leaders

Ideas for preparing leaders to develop a more systemic approach to improve support redesigning learning environments for students, teachers, schools, and communities:

1- Engagement: Project-Based Learning – Self Initiatives

Students and Teachers go beyond the textbook to study or to teach complex topics based on real-world issues, such as the community needs, education, health or water quality in their communities or the history of their town, analyzing information from multiple sources, including the Internet and interviews with experts. Project-based class work is more demanding than traditional book-based instruction, where students and teachers may just memorize facts from a single source. Instead, students and teachers utilize original documents and data, mastering principles covered in traditional courses but learning them in more meaningful ways. Projects can last weeks; multiple projects can cover entire courses. Student work is presented to audiences beyond the teacher, including parents and community groups.

2- Connect: Integrated Studies

Multi and different perspectives studies should enable students and teachers to reach across traditional disciplines and explore their relationships, like James Burke described in his book Connections. History, literature, and art can be interwoven and studied together. Integrated studies can help students
and teachers to increase and expand their investigation using many forms of knowledge and expression.

3- **Share:** Cooperative learning
   Leaders need to learn how they can create and support others to work together on project teams, students and teachers need to learn the skills of collaborating, managing emotions, and resolving conflicts in groups. Each member of the team is responsible for learning the subject matter as well as helping teammates to learn. Cooperative learning develops social and emotional skills, providing a valuable foundation for their lives as workers, family members, and citizens. These are the most important personal leadership characters.

4- **Expand:** Comprehensive Assessment
   Assessment should be expanded beyond simple test scores to instead provide a detailed, continuous profile of student and teachers' strengths and weaknesses. Teachers, parents, and individual students can closely monitor academic progress and use the assessment to focus on areas that need improvement. Tests should be an opportunity for students to learn from their mistakes, retake the test, and improve their scores.

5- **Coach:** Intellectual and Emotional Guide
   The most important role for teachers is to coach and guide others, students need to learn how they can do this through the learning process, giving special attention to nurturing a student's interests and self-confidence. Teachers can spend less time lecturing entire classes and more time mentoring students as individuals and tutoring them in areas in which they need help or seek additional challenges; this will develop their confidence and self-trust.

6- **Learn:** Teaching as life style, not only a job!
   Preparation for a teaching career should follow the model of apprenticeships, in which novices learn from experienced masters. Student teachers should spend less time in lecture halls learning educational theory and more time in classrooms, working directly with students and master teachers. Teaching skills should be continually sharpened, with time to take courses, attend conferences, and share lessons and tips with other teachers, online and in person.

7- **Adopt:** Technology
   Technology can improve almost every aspect of school, modernizing the nature of curriculum, student assignments, parental connections, and administration. Online curricula now include lesson plans, simulations, and demonstrations for classroom use and review. With online connections, students can share their work and communicate more productively and creatively. Teachers can maintain records and assessments using software tools and stay in close touch with students and families via email and voicemail. Schools can reduce administrative costs by using technology tools, as other fields have done, and provide more funds for the classroom.

8- **Reorganize:** Resources
   Resources such as time, money, and facilities must be restructured. The school day should allow for more in-depth project work beyond the 45-minute period, including block scheduling of classes two hours or longer. Schools should not close for a three-month summer vacation, but should remain open for student activities, teacher development, and community use. Through the practice of looping, elementary school teachers stay with a class for two or more years, deepening their relationships with students. More money in school districts should be directed to the classroom rather than the bureaucracy.

   New school construction and renovation should emphasize school design that supports students and teachers collaborating in teams, with pervasive access to technology. Schools can be redesigned to also serve as community centers that provide health and social services for families, as well as counseling and parenting classes.
9- **Involve: Parents**

When schoolwork involves parents, students learn more. Parents and other caregivers are a child's first teachers and can instill values that encourage school learning. Schools should build strong alliances with parents and welcome their active participation in the classroom. Educators should inform parents of the school's educational goals, the importance of high expectations for each child, and ways of assisting with homework and classroom lessons.

10- **Include: Community Partners**

Partnerships with a wide range of community organizations, including business, higher education, museums, and government agencies, provide critically needed materials, technology, and experiences for students and teachers. These groups expose students and teachers to the world of work through school-to-career programs and internships. Schools should enlist professionals to act as instructors and mentors for students.

### How do we get students and future teachers in leadership positions?

Professionals see leadership potential in students and struggle with how to tap into that potential and get them into those key leadership positions. Each student is different in how should approach hem-her about taking on leadership roles. Many students will take the initiative on their own to pursue leadership positions on campus or in their college. Others however, need a little push. With some students all it takes is simply mentioning some of the leadership opportunities available. These students will usually take this and run with it. Often these may be the students who did not know about the opportunities or just needed a small amount of support from an external force to push them to pursue leadership opportunities. Many students on the other hand need a lot more support than just a mere mention. Some students need to directly tell them that they should pursue a position because they would be successful at it. Then to stay on them repeatedly reminding them and reassuring them that they can successfully fill that position.

### Once they are ‘in place’, what do we do with them?

Once we have our students with leadership potential into those leadership roles that we knew they could learn and grow from what do we do to develop that leadership potential? We can challenge a student too much and cause a huge blow-up at an inopportune moment. We can push our students to think outside of hem- herself and social circle. We can realize that we have been pushing their way too hard. While we knew that they have amazing leadership potential and were going to be great leaders.

On the other hand, we cannot provide too much support for our students causing them to get lazy and too comfortable either. By the time we can realize that simply supporting this student’s ideas and endeavors wasn’t enough, they just need to feel free, can do, can decide, and being leaders.
Finding Balance

How do we find the balance between challenging and supporting our students? We don’t want to push our students so hard that they simply shut down but we don’t want to support them so much that they don’t try to do better either. We can give them some questions-problems - which a plant seed into their minds helps a lot. One, you are not telling the student directly that what they’re doing is right or wrong. Two, once they ponder the question for a little while they’ll most likely come up with an answer similar to what we would have suggested but because they’ve come up with it on their own and it’s their idea they’ll be more accepting of it. The key is to pose the question so that we have a slight push in the right direction. Questions like: Do you think you should check with the rest of your committee about this first? Have you considered A, B, and C? What if you did such and such instead? These questions are non-threatening but challenging. Each student is going to respond differently, and the key is to learn what works with your students and tailor our style to them.

It is often hard to find out what does and doesn’t work with our students. Some students need and like more challenge than others. Some students need a lot more support in the beginning until they get comfortable with their leadership role. It is up to us as professionals to get to know our students and learn what’s going to work best for them. Each student is going to be different; it’s simply a matter of us adjusting our advising/supervising style to be most beneficial for our students.

Preparing the future leaders for school as organizational development

A. Background and objective

Based on the vision of the organization, a leadership development programs must develop to help build a pool of resources available for the leadership positions. Broad deliverables identified were:

a) Necessary competencies and mindsets to operate in a deregulated, competitive education and schools environment.
b) Necessary competencies and mindsets to operate in upstream and downstream energy achievements.
c) Necessary competencies and mindsets to operate in a growing multinational enterprise.

B. Target group

Leaders must identify our target group in order to develop the several levels of leadership with the needed skills and competences.

C. Need Analysis

A details Needs Analysis should happen in two stages:
The first stage involved a detailed analysis of strategic challenges, competency requirements and training needs requirement based on in-depth interviews with the students – future teachers.

The second stage involved research with global education schools and faculty having extensive experience and exposure to leadership and management development programs in education and school leadership.

D. Design

Academic structure must includes programs to develop research skills, teaching strategies, communication skills, counseling and executive education, This program must design to impart competencies at three levels:

- Frameworks and concepts in the educational and instructional leadership.
- Exposure to international standards and practices.
- Advanced concepts in leadership that would address the future organizational needs such as professional development, curriculum development, and student’s assessment and evaluation procedures development.

E. Delivery

The first phase focuses on providing general leadership competencies to create a common and shared language and understanding.

The second phase to build on strategic and leadership skills. Based on feedbacks, participants can also provide extensive one on one coaching from senior teachers- students professionals.

The third phase focused on advanced concepts leadership for teaching and education, with issues like instructional supervision, curriculum, technology, assessment, community services.

F. Facilitation and follow-up

While the classroom learning is important, visits to global organizations and institutions and interactions with the education and leadership experts and analysts can generate enormous learning, the same must be translated into implementation at workplace.

G. Evaluation

The individuals and groups should assessed through their project preparation and presentations, peer reviews and personal interview with a panel of experts from and outside the organization. High performers in the programs need to be identified. Further learning paths and career opportunities also need to be derived from the exercise.

H. Way forward

To continue the learning process beyond the programs, suggestion and new up-dates ideas need to provide groups of participants – cross-functional strategic projects over a period of time. This serves three purposes:

a) Solve organization (school) problems.
b) Provide a platform for continuous strategic learning.
c) Identify and groom high performing leaders and teams in this process.

Summary and Conclusion
Many researchers and educators now advocate for an evolution in educational practices and approaches to instruction, which not only align with the processes and operations of the world outside of school, but also leverage the emerging power and potential of these new processes. It is critical that education not only seek to mitigate this disconnect in order to make these two “worlds” more seamless, but of course also to leverage the power of these emerging technologies for instructional gain and technologies.

As we blossom toward new directions by rethinking and redesigning learning environments to meet the changes for the next generation of both students and teachers in the 21st Century, this research review provides two conceptual directions, one for process and the other implementation (Al Bustami, 2010) of key practices. These topics are suggested to support the changes that were examined and presented in this report and further research and dialogue. Although these suggestions are by no means exclusive or exhaustive, they are just a few of the ideas that need to be included in the rethinking process and then implemented in the planning directions to help both the students and teachers meet the challenges of education in the 21st Century.

A Project Presented to faculty of the Graduate
School of Saint Louis University in Partial
Fulfillment of the Requirements for the
Degree of Doctor of Education

2009
PROJECT ABSTRACT

The purpose of this project is to link current research with actual qualitative data. The study used data collected on 446 Missouri school districts that all have met the criteria of being a public K-12 school district and had reported all five achievement areas that were being compared. The five areas of student achievement that were being compared were a district’s average ACT score, percentage who attended college after graduation, graduation rate, and the Math and English parts of the Missouri Assessment Program (MAP) test. The choice was made by the team to create a ranking system of the school districts, since one did not currently exist in Missouri, using the most recently reported data in school years 2005-2006 and 2006-2007. Schools were designated a category of a top 20% school, a neutral school or a bottom 20% school. The goal was to find the differences in the attitudes and actions that may have caused a change in the overall student performance of the top 20% schools compared to that of the bottom 20% schools. Throughout the research, the project team consistently found Eight Quality Standards that can be used by school board members for effective change. The Eight Quality Standards of effective change were used in designing the research questionnaire to show if any major differences in the top and bottom 20% group existed. The questionnaire and numerous face to face interviews throughout the state produced numerous findings of effective change which included but were not limited to; engaging the school board in the vision for the district, including as many stakeholders as possible in critical decisions, and using achievement data to improve and enhance your school district’s curriculum. All of these areas if implemented are not guarantees for success but were found in the majority of the high achieving districts in Missouri. This project will
provide current research and suggestions for how school board members can positively impact student achievement in their local school districts, as well as to lead to future research in the area of school board governance.
Title of the submission: Cultural Influence and Relevance in the Classroom: Will High-Stakes Testing Lead to the Demise of Culturally Relevant Teaching

Cultural Influence and Relevance in the Classroom: Will High-Stakes Testing Lead to the Demise of Culturally Relevant Teaching

Objective of presentation

Two primary objectives were explored during the presentation. First the presenters discussed cultural influence in the classroom from the perspective of the students – the persons who are supposed to benefit from educational reform and innovation. The results of a mixed method research study that explored the perspectives of adolescent students regarding culture and cultural influence in the classroom was shared. A second objective was to further the discussion about the appropriate and effective classroom use of culturally relevant materials and teaching during an era of high stakes testing and accountability.

Significance of the content and process
The purpose of the research study that was shared was to gain insight into the role of culture in the classroom. The researchers invited the sixth grade teachers and principal of a large innercity elementary school to collaborate in the study with the goal of utilizing the results to enhance student achievement in an era of high-stakes testing through better teacher preparation and development that might lead to a culturally pluralistic approach to diversity in schools.

Abstract of Presentation

An essential part of ascertaining the current status or degree of one’s understanding about cultures in general is investigating and comprehending the role of culture in the public school classroom. At a time in which statewide exams and intense accountability seem to overshadow the assorted needs of a diverse student population, a concern for determining to what extent cultural influence may still exist in the classroom lead to a mixed method study that sought to engage the voices of urban sixth graders in order to provide insight into their perspectives of culture in the classroom. In the same way that students have significant understanding about their heritage cultures and languages, they also possess substantial knowledge about their own cultural and linguistic experiences in and expectations for the public school classroom. Culturally and linguistically diverse students frequently experience a curriculum that reflects little of their culture and language, causing them to sense that they are not invited to participate in the total school experience. If they are to enjoy any aspect of social justice and become active participants in a society that promises liberty for all, educators must discover what elements will facilitate an accepting and supportive environment where each student feels valued and academic achievement is enhanced for all.

Consistently, the responses of the current study participants revealed a request for recognition that was two-fold in nature, both as a symbol of understanding on the part of teachers as well as an aspect of inclusion in the classroom. Of particular interest was their strong wish for educators to be knowledgeable of their cultural traditions and celebrations in the hope that this would translate to the inclusion of aspects of their culture, language, and history to be invited into the curriculum. Ovando, Collier, and Combs (2006) have noted that linguistically diverse students possess specific needs, including being accepted by teachers and peers, the invitation to participate, and seeing themselves reflected in the curriculum. Thus, the same message emphasizing the importance of culturally relevant teaching may be derived from the responses of the students as well as researchers. Yet the assumption on the part of experts in the field that
culturally relevant teaching has been discussed for so long a period of time that surely it is being implemented serves to diminish the need to continue the debate and the dialog. In fact in an age of devotion to exams as proof that learning has taken place, many educators and schools have elected to do away with individual cultural observances in favor of an end-of-year-cultural talent show of sorts. The practice rarely leads to a yearlong atmosphere of cultural pluralism and incorporation. It may be argued that omitting cultural diversity from the curriculum does not make it disappear from reality, nor does its absence serve to facilitate improved test scores.

As students and teachers experience increasing diversity within public school classrooms in the United States, more knowledge and understanding of cultural influences and the impact of diversity issues on teaching and learning is needed. While concerned educators have frequently considered the manifestations of culture in the classroom, young students have seldom been asked about their understanding of culture or cultural elements. Teachers are expected to become more knowledgeable of cultural issues in teaching and learning while also becoming better able to address the educational needs of students’ diverse ethnic, linguistic, and academic backgrounds. A valuable resource for cultural insights is the students’ voice, yet educators frequently report that they are receiving a mixed message regarding the use of culturally relevant teaching. On the one hand, research points to this type of teaching as a valid tool in facilitating success in the classroom for diverse students. On the other hand, teachers indicate that the message from administrators is that there is no time for attending to the affective aspect of education through culturally relevant instruction because of the urgency of high-stakes testing. Thus, it would appear that the demands of the test take precedent over the needs of the students.

**Purpose of the Study**

The researchers value the voice of students and utilized the information gathered in this study to collaborate with participating sixth grade teachers to create culturally sensitive pedagogy in order to enhance academic achievement. The results of the study were used to inform teacher education and professional development.

**Participants**

The participants of the study include sixty-eight sixth graders from one inner-city elementary school in a large, southwestern city. The students are primarily of a lower socioeconomic status. Of the 800 students who attend the school, 94% are Latino and over 50% are English Language Learners (ELLs).
Methodology

Both quantitative and qualitative methods were employed to analyze, interpret, and describe the participants’ responses on a survey created by the researchers. The survey included Likert-type as well as open-ended questions. Survey questions were based upon a prior component of this study that included ninety suburban, middle school students. A multi-genre approach was used to collect classroom assignments including analytic writing, narrative vignette, and poetic and artistic transcription. The data were analyzed for emerging themes that informed the researchers in forming the survey.

The study focused on the following research questions:

- How comfortably do the student participants interact with others from different cultures?
- What impact does the teacher have in shaping cultural knowledge?
- How does the teacher inhibit or promote the celebration of diverse cultures?
- What do the students think all teachers should be teaching about diversity in the classroom?

Responses to survey questions were analyzed for emerging trends from the Likert-type questions. The open-ended questions were interpreted for potential themes. After the data were collected and analyzed the researchers worked with the school principal and participating teachers to further consider and interpret the implications of the students’ perceptions of culture in the classroom.

Findings and Implications

Responses to the qualitative portion of the study point to several key findings. First, the teacher plays an important role in establishing a welcoming, supportive atmosphere and in protecting students from misinformation and stereotypes perpetuated by educators who lack knowledge regarding the diversity of their students’ experiences and backgrounds. Nieto (2004) writes in support of this finding. In addition, students commented that they want teachers to know that difference does not mean “bad.” The students frequently noted that they want teachers to be knowledgeable of the cultural values and beliefs that are reflected in their celebrations. Students indicated their desire for the teacher to help them understand more about themselves and others.

The participants’ responses demonstrate a need for culturally relevant teaching to be included in the classroom. Students indicate their desire for culture to be explored, not repressed, in school even when preparation for high-stakes testing requires much of the school day. Implications for further study include exploring the impact of culturally relevant teaching on the preparation of students for rigorous high-stakes exams. In addition, this study as well as the original research
project should be replicated in other educational settings and comparisons of student responses in the various types of settings should be evaluated for consistency.

The information that was provided as well as the research design was straightforward. The resulting knowledge may serve to enhance the education of students at all levels. Session participants were able to critically reflect on the meaning of the students’ responses and to further the dialog about excellence and equity through multicultural education.

Abstract

Meeting the needs of the non-traditional students on the Wild Horse Desert involves identifying and addressing the educational needs of graduate students who live in the expansive South Texas area. These non-traditional students are likely to be the first in their family to seek a college education. They are also typically entering graduate school, after they have finished an undergraduate degree, and started a career, and/or a family. All of these can cause difficulty when they seek a graduate degree. Some drive as much as 120 mile to attend a class, and the 120 miles to return home. This article is intended to review each of these concerns, based on survey research, their impact on the students, and our attempts, as counselor educators, to meet their educational needs.

Abstract

This holistic approach to wellness examines each of three areas included in an integrated concept of optimum health and wellness (Myers & Sweeney, 2008) …mind, body, and spirit. Each of these component parts is grounded in the theories of philosophy and theology, as well as mental health and medicine. Each part is explored individually in this article using the metaphors…faith, hope, and chocolate. This article is intended to review each of these elements in the research of the respective fields, and provide evidence to encourage a “positive state of well-being” (Myers & Sweeney, 2008).

Abstract: Poster Session 1854

Pythagoras without walls: Moving mathematics outdoors.

The more real world experiences students in the classroom can have with things they learn in class, the better the concepts are understood. College students studied the application of the Pythagorean Thereom in the outdoors and found that environmental educational experiences improved learning. These successful activities are shared in this poster session.

ABSTRACT

The lack of successful leadership in urban charter schools has resulted in a leadership crisis, the lack of ability to transform schools, and low student achievement. This study sought to identify characteristics and behaviors of successful urban charter school leaders that can be linked to student academic achievement. This study was similar to the previous studies that identified leader characteristics attributing to their success; however, the purpose of this study was to identify characteristics and behaviors specifically of successful urban charter school leaders. Participants were Ohio urban charter school leaders with enrollments of more than 200 students, grades 4-8, with a 60% or higher poverty rate. Successful leaders were those who have achieved and sustained a school rating of effective or better for more than 3 years while comparison leaders were those of like demographics that have not achieved or sustained an effective rating, as identified by the Ohio Department of Education. This study was a qualitative exploratory multiple case study with an inductive approach using interviews and observations of 3 successful charter school leaders and 2 comparison leaders in Ohio to identify emerging themes. Open and axial coding was used throughout the data analysis process. Seven themes emerged that identified common characteristics and behaviors of successful leaders that were minimally present or completely absent in comparison leaders: Consistent navigation, holistic focus, shared mindset, mission alignment, resourcefulness, shaping and sustaining culture, and selection and development of people. If action is taken on the outcomes of this study, social change will occur by minimizing the urban charter school leadership crisis, transforming schools, and significantly raising academic achievement.

DEDICATION

This dissertation is dedicated to my parents for supporting me through each endeavor in my life. As a memorial to my mother, I would like to say thanks for the desire she had that I receive the education she was not able to get. In honor of my father, I would like to say thanks for his continued support through everything in my life.
ACKNOWLEDGMENTS

To my family and friends, thanks for handling the extra load of responsibility and allowing me to focus on this study and wanting me to achieve success. Without you, this would not have been possible.

To Charles McElroy Ph.D., Laura Lynn Ph.D., and Walter McCollum Ph.D., thanks for all you have done to help me persevere and reach this destination.

To my editor Jill, thanks for the great insight and all the hard work you put forth to meet deadlines and to write with excellence.

To my dog Max, thanks little buddy for sitting with me for hours of writing without complaint.

To Oprah, thanks for reminding me to live my best life.

CHAPTER 1:
INTRODUCTION TO THE STUDY

This study sought to identify characteristics and behaviors of successful urban charter school leaders that can be linked to student academic achievement. Previous studies of Collins (2001) and Gray and Streshly (2008) identified characteristics of leaders that attributed to their success. Although the Collins study was conducted in the business sector, Gray and Streshly argued that findings could be transferable in order to discover what the best leaders do, regardless of the industry they work within. Covey (2004) also argued for the need to transfer learning from the business sector to education in order to accelerate progress. Miles and Huberman (1994) emphasized that there are broad requirements for establishing a theoretical framework and that it could be determined by the subject’s ability to outline items studied and the relationships among them. The Collins and Gray and Streshly studies provided a preliminary background and outline. This study will be conducted much like that of the previous studies mentioned with a focus on successful leaders of urban charter schools.

The lack of successful leadership in urban charter schools has resulted in an increased leadership crisis, the lack of ability to transform schools, and low student achievement. The purpose of this study was to identify characteristics and behaviors of successful urban charter school leaders. The outcomes in this study were compared with the Gray and Streshly (2008) study to determine if the same variables emerge and if any new characteristics existed that had not been mentioned. Successful leaders selected for this study were those working in schools with an enrollment of more than 200 students,
including grades 4 through 8, with a 60% or higher poverty rate and a sustained effective school rating or better in the state of Ohio for more than 3 years. Comparison leaders selected for the study were also those working in schools with an enrollment of more than 200 students, including grades 4 through 8, with a 60% or higher poverty rate and who have not obtained an effective school rating or better in the state of Ohio for any of the last 3 years, or have not sustained an effective rating or better for a period of 3 consecutive years.

This inquiry was a qualitative exploratory multiple case study with a theoretical framework and an inductive approach. Focusing on identifying characteristics and behaviors that are attributed to the success of leaders of inner-city charter schools, the process involved both observations, and semi-structured interviews. The criteria for selection of the study were based upon specific demographics of Ohio Charter Schools from the Ohio Department of Education.

The theoretical framework for this study begins with a foundation based upon the results of Collins (2001) in good-to-great companies and is built upon with the Gray and Streshly (2008) study of characteristics of highly successful principals in good-to-great schools. Current research and theories are used in the chapter 2 literature review to explain any related concept to potential variables or outcomes in the study. Poverty is explored to illustrate the impact that it has on schools and potential leadership strategies used to meet needs. Leadership concepts related to demands of the 21st century and school reform efforts are explored. The history of school reform that includes the charter school movement is recounted to create a picture of the journey leaders have taken over
time that may impact current practices. Because of the emphasis that school leaders must put on positive and immediate action to break the many negative cycles, critical issues faced by minorities are highlighted. There is a focus on the need to prepare students to compete in a global economy and the ability of leaders to adapt to a changing world. Finally, recent success in leadership is underscored for the purpose of comparison with the outcomes of this study.

Background of the Problem

The charter school movement is a new phenomenon birthed in the early 1990s and designed to provide public school innovation and school choice options. Gray and Streshly (2008) described the modern school leader as relatively new and emphasized that little information is available that describes what the best school leaders do that makes them successful. In this researcher's quest to discover further studies similar to that of Collins (2001) and Gray and Streshly (2008) that involve the components of inner-city charter school leaders, a dearth of information was found. However, reports from the U.S. Department of Education on successful charter schools are published annually (2004). These reports have emphasized that successful leadership is an overwhelming factor attributing to school success.

There is a need to identify characteristics and behaviors of successful urban charter school leaders that can be linked to student academic achievement. Successful leaders of inner city charter schools are rare due to unique challenges such as the same funding as other public schools and school facility access (Palmer, 2007). Palmer noted that state funds allocated for the school based on the number of pupils enrolled is
typically not enough money to address facility needs along with costs for personnel, curriculum, and instruction supplies, as well as various other needs. Many schools begin by converting existing buildings into schools unless they have access to private funding through partnerships with the business sector.

According to Jacob (2007), schools serving inner-city students face a more daunting task preparing children from disadvantaged neighborhoods to be productive citizens. Urban schools contain high percentages of students living in poverty, which presents different challenges for these leaders than those who lead other schools. Even though the needs of these students are greater than those of higher socioeconomic levels, urban school programs tend to receive less funding than the other schools do, which causes a greater disparity between them (Jacob). Charter school needs are also unique in that more responsibilities are required of their leaders than are required of the leaders from traditional schools. These responsibilities range from management and reporting to teaching in a classroom (Booher-Jennings, 2006). Finally, the researcher’s intention was to study the characteristics and behaviors of successful inner-city charter school leaders and not the schools themselves, though school ratings were used to identify successful leaders (school rating data from the Ohio Department of Education).

Some effects of the lack of leadership success are (a) increasing leadership crises, (b) lack of ability to transform schools, and (c) low student academic achievement (Palmer, 2007). This qualitative exploratory multiple case study sought to identify characteristics and behaviors of successful leaders directly linked to student academic achievement that is not exhibited in unsuccessful leaders.
Problem Statement

The lack of successful leadership in urban charter schools has resulted in an increased leadership crisis, the lack of ability to transform schools, and low student achievement. It is important that characteristics attributing to leader success in inner-city charter schools be identified in order to facilitate the leader selection and development process. This study should contribute to the resolution of the problem by improving the selection and development of successful inner-city charter school leaders who will ultimately raise student achievement and transform schools.

Purpose of the Study

The purpose of this qualitative exploratory multiple case study was to determine the characteristics of successful inner-city charter school leaders in the 21st century. This study explored characteristics and behaviors attributed to raising student achievement for successful inner-city charter school leaders by comparing the findings of leaders that have sustained success with others who have not. Demographics and identifying concepts and themes that emerge were analyzed and compared to past literature to see if they resonate with what has been found in other settings. New concepts and themes that emerged were identified as new variables needed for successful urban charter school leaders.

Research Questions

What characteristics and behaviors are exhibited in successful inner-city charter school leaders that relate specifically to student academic achievement? What new
characteristics and behaviors are exhibited that were not mentioned in the previous Gray and Streshly (2008) study?

Theoretical Framework

The theoretical framework includes the path-goal theory of motivation in which the leader serves as a coach for constituents in achieving organizational goals. This theory is based on the premise that the leader modifies his or her style of leadership based upon the needs and perceptions of the followers (House & Mitchell, 1974). The four basic styles utilized were supportive, directive, participative, and achievement oriented leadership styles, yet the focus of the study was more on the application of this theory than its explanation.

Leaders identified in the studies used as a premise for the present study demonstrated the ability to work within the path-goal theory framework. The foundation of this study was based upon the results of Collins (2001) and the outcomes of Gray and Streshly (2008). Both of these studies identified leadership characteristics that can be attributed to sustained success. There are specific leadership characteristics for leaders of good-to-great companies that Collins described as level 5 qualities. The leaders who possess those characteristics can guide a business to sustained success. Specific leadership characteristics aligned with the outcomes of good-to-great companies are what Gray and Streshly discovered in good-to-great schools. These characteristics cause principals to be highly competent in facilitating continued school achievement. Furthermore, what Fullan (2005) described as characteristics and behaviors of the new
theoretician are aligned with the responsibility requirements of the urban charter school leader.

The framework for this research was built upon the studies of Collins (2001), Gray and Streshly (2008), and Fullan (2005) to determine specific characteristics and behaviors that successful inner-city charter school leaders exhibit that can be attributed to school transformation and increased student academic achievement.

Nature of the Study

This study was a qualitative exploratory multiple case study with a theoretical framework and an inductive approach. In a process involving observations and semistructured interviews, the focus was on identifying characteristics and behaviors that can be attributed to the success of leaders of inner-city charter schools.

Successful leaders selected for this study were those working in schools with an enrollment of more than 200 students, including grades 4 through 8, with a 60% or higher poverty rate and a sustained effective school rating or better in the state of Ohio for more than 3 years. If there were more than three leaders who meet the criteria for successful inner-city charter school leaders, they were chosen randomly. Comparison leaders selected for the study were also those working in schools with an enrollment of more than 200 students, including grades 4 through 8, with a 60% or higher poverty rate and who have not obtained an effective school rating or better in the state of Ohio for any of the last 3 years, or have not sustained an effective rating or better for a period of 3 consecutive years. The public data provided by the Ohio Department of Education
relating to the number of students enrolled in urban charter schools, the percent of the poverty rate, and the school rating were used as criteria for selecting participants.

During the process of data collection and analysis, this researcher engaged a fellow doctoral student familiar with inner-city charter schools, which allowed for two sets of data comparison for validity purposes. There were two stages of data collection: observations and interviews. The process of open coding took place by both researchers at each stage of data collection and compared. In order to connect related concepts or themes, the two researchers used an axial coding process.

The first stage included observations of the school leaders engaged in various contexts and activities. During these time segments, two researchers observed inner-city school leaders in action and record their observations. Examples of activities that were observed are included in Appendix A. The second stage of data collection was the interview stage. Prior to the interview stage, this researcher had asked participants to complete the questionnaire that is reproduced in Appendix B, which provides insight into the background and perceptions of the leaders. After the demographic questionnaire was completed, the interview began.

During the interview stage, this researcher asked a series of 12 questions that are listed in Appendix C. These 12 questions sought to identify characteristics and behaviors attributed to the success or lack of success of the leaders. The interviews were semistructured and flexible with an open framework, thus allowing for two-way communication for extensive exploration and an opportunity to place emphasis on the perspectives of the interviewees. The interview was recorded and notes were taken on a
laptop computer as a backup for the recording. If clarification or additional information was needed, the school leaders were questioned again in order to obtain the necessary information.

In this study, there was an emphasis on the perspectives of the interviewee during the interview process. The same process was used to find patterns in the stories of the highly successful principals interviewed in the Gray and Streshly (2008) research. Interview questions selected for the study had been modified from the Gray and Streshly study on good-to-great schools. These questions had been tested for reliability and validity in this study and are included in Appendix C.

Concepts and themes that emerged throughout the observation and interview process were analyzed and compared with the findings in the Gray and Streshly (2008) study. New concepts and themes not existing in the previous study were noted as new variables needed for successful urban charter school leaders. The outcome of this study should impact social change, as it will serve to help others in the field interested in the selection and development of successful urban charter school leaders. This research was conducted with prior permission of the school district and is in compliance with the requirements established by Walden University regarding the use of human beings in research. Letters of consent were secured from the participants involved in this research.

Definition of Terms- use oxford dictionary

Change agent: People who can make a difference in the lives of children. (Murray and Harlin (2006).
Case study: A process in which subjects are explored in depth over a sustained period of time involving a variety of data collecting procedures (Creswell, 2003).

Charter school:

A charter school is a nonsectarian public school of choice… The “charter” establishing each such school is a performance contract detailing the school's mission, program, goals, students served, methods of assessment, and ways to measure success. … The basic concept of charter schools is that they exercise increased autonomy in return for accountability for both academic results and fiscal practices to several groups: the sponsor that grants them, the parents who choose them, and the public that funds them. (Charter school,” www.uscharterschools.org)

Add definition for effective

Reliability: Consistent results for any test or experiment (Creswell, 2003).

School leadership:

Leadership is a process of influence leading to the achievement of desired purposes. Successful leaders develop a vision for their schools based on their personal and professional values. They articulate this vision at every opportunity and influence their staff and other stakeholders to share the vision. The philosophy, structures and activities of the school are geared towards the achievement of this shared vision. (Bush and Glover, 2003, qtd. in “School Leadership: Concepts and Evidence, Summary Report, Spring 2003,” http://ncsl.org.uk/de/media-84d-76-school-leadership-concepts-and-evidence-summary.pdf).

Assumptions

It was assumed that participants would allow researchers to observe them as they engage in their daily work as normal without enhancing or staging characteristics and
behaviors in any way. Participants would not view their participation in this study as a public-relations opportunity and would only share the information they view as positive or staged observations. Participants would be willing to reveal what they perceive as both positive and negative aspects of their knowledge base, characteristics, and skills. It was assumed that participants would be knowledgeable in the areas queried. They would exhibit the ability to reflect on characteristics and behaviors objectively that have positively and negatively impacted student achievement and overall school success. Answers to the interview questions attached in Appendix C would be answered honestly and openly. Information would not be hidden or kept secret. Finally, the researcher planned to identify each variable indicated in every observation and interview that is attributed to increased student achievement according to the views of the participant.

Scope and Delimitations

This was a qualitative exploratory multiple case study with a theoretical framework and inductive approach. This study took place in the state of Ohio but can be applied to inner-city charter schools in any state. Five leaders of inner-city charter schools were selected for this study. Three of the leaders were selected based upon the criteria for successful inner-city charter school leaders. Two of the leaders were selected based upon the criteria for comparison inner-city charter school leaders. These leaders were observed in action during daily activities and selected events by the researcher. Examples of observations are included in Appendix A. These leaders also completed a demographic questionnaire included in Appendix B, and were interviewed based upon 12 interview questions included in Appendix C.
The public data provided by the Ohio Department of Education relating to the number of students enrolled in urban charter schools, the percent of the poverty rate, and the school rating were used as criteria for selecting participants. Leaders selected for this study were those working in schools with an enrollment of more than 200 students, including grades 4 through 8, with a 60% or higher poverty rate and a sustained *effective* school rating or better in the state of Ohio for more than 3 years. Comparison leaders selected for the study were those also working in schools with an enrollment of more than 200 students, including grades 4 through 8, with a 60% or higher poverty rate, and have not obtained an *effective* school rating or better in the state of Ohio for any of the last 3 years, or have not sustained an *effective* rating or better for a period of 3 consecutive years.

**Limitations**

The study took place in the State of Ohio in which charter schools have only existed since 1998. There are more than 300 charter schools in Ohio but many of them have not been around long enough to measure appropriately according to the state school rating system (school rating data from the Ohio Department of Education). For the first year of a school’s existence, public information about achievement results are not available in order to allow the schools a 3-year time period before being evaluated by the State Department of Education. Schools that are being measured in the current study have existed at least 6 years but the data reviewed for the study are based upon a snapshot of 3 years and are dependent upon the conditions existing during this period of time. This
researcher did not utilize circumstantial or situational variables observed in the study that exist only within this snapshot but those that are applicable to Ohio.

Significance of the Study

Some effects of the lack of successful urban charter school leadership are (a) increasing leadership crises, (b) lack of ability to transform schools, and (c) low student academic achievement. Positive social change will occur if the findings of the study are used to inform the process of leadership selection and development. This research can be utilized professionally to recruit inner-city charter school leaders who possess specific traits. Efforts can also be made to create professional development programs tailored to meet the needs of charter schools or inner-city organizations throughout the nation. This research will generate positive social change in selecting and developing strong inner-city charter school leaders, which will impact all stakeholders within organizational school reform efforts. Such an impact within organizations in these areas of high need can be so powerful that the mission to close the achievement gap will ultimately be accomplished.

Summary

As educational systems advance into the 21st century, successful leadership is a key concern for inner-city charter schools. This researcher conducted a qualitative exploratory multiple case study with an inductive approach to build upon the research of Collins (2001) and Gray and Streshly (2008) to identify which characteristics and behaviors that successful leaders of inner-city charter schools have that unsuccessful leaders do not possess.
This chapter has provided an introduction along with the background of the problem, the problem statement, the purpose of the study, the research questions, theoretical framework, nature of the study, definitions of terms, assumptions, scope and delimitations, limitations, and significance of the study. Chapter 2 is a critical assessment of peer-reviewed research articles on charter schools, leadership, inner-city issues, and school improvement. Chapter 3 explains how the qualitative method was used to identify specific characteristics that attribute to the success of inner-city charter school leaders in the 21st century. Chapter 4 provides the demographic results in the semistructured interviews and a discussion of the relationship between the research questions and the findings. Chapter 5 presents a conclusion, implications, and recommendations drawn from the literature review, the study methodology, and the data.
CHAPTER 2:
LITERATURE REVIEW

Introduction

The theoretical framework for this study begins with a foundation based upon results of Collins (2001) in the study of good-to-great companies and builds upon this with the Gray and Streshly (2008) study of characteristics of highly successful principals in good-to-great schools. Current research and theories are used in this literature review for an explanation of any related concept to potential variables or outcomes in the study. Poverty is explored to illustrate the impact it has on schools and potential leadership strategies. Leadership concepts related to demands of the 21st century and school reform efforts are explored. The history of school reform including the charter school movement is illustrated to create a picture of the journey leaders have taken over time that influences the way leaders lead. Critical issues faced by minorities and those that work with minorities are highlighted because of the emphasis that school leaders must take positive and immediate action to break the many negative cycles existing in society. There is a focus on the need to prepare students to compete in a global economy and the ability of leaders to adapt to a changing world. Finally, recent successes in leadership are underscored for the purpose of comparison with the outcomes of this study in chapters 4 and 5.

In business and social sectors across the United States, the lack of solid leadership has reached a crisis point. The social sector includes the education field, where urban schools face formidable challenges in finding competent leaders (Kozol, 2005). Kozol
argued that the nation is failing inner-city students and highlighted the differences in expectations, funding, and overall programming between suburban and urban schools, emphasizing the need for leaders to make serious changes in order to prevent a lost generation. Truscott and Truscott (2006) highlighted the term urban became common only after World War II when the middle class left the cities for the suburbs and many rural citizens moved to cities for jobs and opportunities. As the middle class left the cities, poor people, often African American, populated inner cities due to low housing costs hence the birth of urban education (Truscott and Truscott). Szente (2006) highlighted the inner-city challenges of poor academic achievement, behavioral problems, and issues with personnel, students, and families that are not as common as the issues found in the more affluent urban schools and those in the suburbs or rural areas.

Payne (2001) identified the unique needs of children and families who live in poverty and who specifically require leaders who have a greater understanding of those needs. Graseck (2005) argued that administrators should not overlook their nurturing, supportive, even ministerial role. Challenging behaviors of all kinds derive from unmet needs of belonging, mastery, independence, and generosity (Brendtro, Brokenleg, & Van Bockern, 2002). According to Marshall (2000) maladaptive behaviors are addictive and students are destined to engage in misconduct repeatedly until the cycle is broken. Massey, Szente, and Stewart (2005) emphasized that one means of addressing the needs of failing schools in federal reform efforts has been to create charter schools, especially in high need areas of the inner-city.
According to Andrews and Rothman (2002) the charter school movement affected less than 1% of children a decade ago but now. Just as is true for inner-city schools, charter schools have to have unique leaders with specific abilities (Wohlstetter & Smith, 2006). Operational challenges exist in charter schools that are not common to that of public or private schools (Wohlstetter & Smith). Charter schools have an agenda to partner with other organizations and resolve systemic issues through creative methods (Wohlstetter & Smith). The focus of this study was on leaders of inner-city charter schools that have achieved and sustained success for more than 5 years. The outcome of the study was to identify characteristics needed for inner-city charter school leaders in the 21st century. Many changes that have occurred in the past few decades require leaders who exhibit the ability to ensure that organizations can achieve greatness and sustain it.

Articles, Research Documents, and Journals

The literature review demonstrates the background of issues related to the research question by breaking down potential variables that may affect the outcome to include: (a) school reform efforts, (b) inner-city student issues, (c) charter schools, and (d) leadership characteristics known to contribute to the success of organizations. This research study used relevant books, journals, and research documents. The search terms that the researcher used were: charter school leaders, urban AND charter schools, inner city charter schools, urban school leaders, educational leadership, effective charter school leaders, successful charter school leaders, as well as successful charter schools AND leaders. No refereed studies were located that emphasized characteristics of inner-city charter school leaders that attribute to their success. Such studies are needed to guide
21st-century leadership preparation programs and aspiring school leaders serving this demographic.

**Education in the 21st Century**

The same answers resound that have always existed when parents and educators are asked what they want for children. They want these students to reach their potential, to love learning, to have more opportunities, to be happy, and to thrive as always but they have to acknowledge that the world has changed. Jacob (2007) asserted that recent technological advances have made it increasingly difficult for those with anything less than a college degree to find a job that offers a living wage. Even manufacturing and other blue-collar jobs require knowledge of algebra and sophisticated reading comprehension. Now schools must provide an education that used to be only for a select few (Jacob).

Merrifield (2005) argued for the need of more school specialization to increase productivity and creating better matches between students and educators. A better match between students and educators is especially important to older children who are developing specific interests and to children with special needs. Merrifield argued implementation of more specialization in a competitive education industry would diversify schools and drastically change the practice and use of standardized tests due to its usefulness.

Political and social changes have opened the world to new opportunities and technological advances have connected the world like never before (Friedman, 2007). For instance, Friedman argued that advances in fiber optics will soon allow cables to carry all
printed material in the world in seconds via a single cable. Most people on the planet have embraced the fast moving changes. Students have become hyper communicators through text messaging, among other means, for they were born into a digital world (Friedman). Technological tools have become extensions of the student brain, but technology is only part of the changing world (Friedman).

Researchers questioned if the nation is making as much of the opportunity to move education into the 21st century as many other countries are. Ravitch (2007) emphasized that our public education itself is obsolete and that other countries are overtaking us and we are losing the global competition because of our public schools. Friedman (2007) argued that in a flat world, a nation's greatest resource is its educators. It is their responsibility to prepare students for the changes of the day. In a report on strengthening schools for the 21st century, U.S. Secretary of Education Spellings (2007) noted that the nation has made great progress through the No Child Left Behind Act of 2001 (NCLB) in closing the achievement gap, but there is much more work to be done. In a U.S. government report on the need to change schools to compete in a global economy Spellings also emphasized:

We must make our high schools more rigorous and encourage students to take more advanced math and science classes. Employers today need workers with "pocket protector" skills-creative problem-solvers with strong math and science backgrounds. Whether children want to be auto mechanics or cancer researchers, they must have these skills. (U.S. Department of Education, 2007)

Friedman (2007) emphasized rather that students need advanced knowledge skills, access to digital tools and the ability to use them, access to vast amounts of information, and the desire to be lifelong learners. Students of the 21st century need to be able to
communicate, collaborate, and create in order to understand and embrace the world in which they live (Friedman). The U.S. has begun to make changes in education to lay the foundation of the future, and now has a clearer understanding of what is needed and how to access to information about students in schools (Friedman). Expectations have been raised for students, but too many students are not getting the knowledge, skills, or access to resources that they need to compete globally (Friedman).

The U.S. Department of Education (2007) reported that out of a hundred students entering ninth grade, only 79 will graduate from high school and 21 will receive a college degree. These numbers are even smaller in high schools with large populations of poor minority students. Not all students have access to the technological tools of the future (Wohlstetter & Smith, 2006). Friedman (2007) argued that action can be taken to improve the state of education in the United States. He emphasized the need to focus on appropriate education to access the new middle class jobs and to think globally. Education must continue to build on the foundation of clear standards, quality instruction, quality assessments, and shared accountability. Stakeholders in the educational arena have sought out solutions to problems for 21st century schools.

Some educational researchers claimed the answers lie in specific school reform efforts that create competition among educators and stop the monopolization of schools, such as the school choice movement (Duncan, 2006) known as the Charter School Movement. NCLB indicated that the answer is to hold teachers more accountable for a given expected amount of progress for each student each school year. Elmore (2006) and Brown (2006) found resolutions in selecting and developing school leaders for 21st-
century challenges. Ambach (2006) claimed that the solutions reside in allocating resources to the preparation of leaders for high need areas. Jentz and Murphy (2005) claimed that educational leaders fail to reveal their lack of knowledge or ability to handle situations, so there is a need to create a platform in which they can reveal confusion in order to learn and grow organizations.

Kelley, Thornton, and Daugherty (2005) claimed the answers to be in the ability of educational leaders to develop a positive school climate. Payne (2005) argued that educators need to understand the true definition of poverty and to have strategies to meet the needs of the students and families in order to achieve success in schools. Collins (2001) identified organizations that have sustained success largely due to the characteristics of their top leaders. Gray and Streshly (2008) utilized the outcomes in the Collins study to test their application to successful school leaders and found complete alignment, except highly successful school principals exhibited the critical ability to build relationships with faculty.

Preparation for the Demands of the 21st Century School Leader

Elmore (2006) argued that school leaders are not adequately prepared for the needs of the 21st century and that the nation must rebuild a system for the preparation of school leaders. He stated that the design must be based on four principles: (a) everything should be anchored in the instructional core of schooling, (b) systemic problems require systemic solutions, (c) professions have practices, and (d) powerful practices require strategies. He explored leadership preparation programs and the need to rebuild them. Elmore asserted the current process of certification and licensure has contributed to the
“catastrophe of education” He expressed that higher education institutions focus more on making money than the outcome of the student’s education and its implication in the student's life. For example, in many teacher preparation programs, the institution does not focus on helping the student become a certified teacher of quality. Institutions are concerned with enrolling students for any coursework that takes them through the process of earning a higher degree, but are less concerned about whether the courses are preparing these young men and women for challenges of the current decade for urban schools (Ambach, 2006). In order to combat these problems, Elmore highlighted specific principles that could shape the work of new leadership preparation programs.

Elmore (2006) argued for specific core instructional programming as the first principle of leadership preparation programs. He said that selecting school leaders should be based upon their experience with handling current demands and their ability to multitask, be multidimensional, and have a wide knowledge base of instructional practices. According to Elmore, to be able to manage themselves, time, money, and other issues early on and assume a leadership role, individuals must have experience prior to engaging in such demanding responsibilities.

The second principle indicated is that systemic problems require systemic solutions. Fullan (2005) explored this concept as tri-level systemic reform, meaning that systemic problems exist at all levels and must be resolved with the involvement with all stakeholders. Elmore (2006) focused on tri-level systemic reform regarding leadership preparation and certification programs. He argued that districts should be allowed to run their own training and certification programs and universities should not have a
monopoly on certifying administrators. Local control would enable strong connections to actual practice. States would license private providers and local districts, breaking out of the mold of existing institutional practices.

Elmore (2006) noted, unlike other industries, that education does not have certain practices that are understood by all stakeholders. He established a third principle to emphasize the need to set up specific practices in educational leadership. According to Elmore, one way to improve the practice of educational leadership is to monitor entry into the profession by controlling access to the knowledge base where educators can demonstrate mastery of a body of knowledge in the practice of that knowledge. The only organization that has addressed this problem is the National Board for Professional Teaching Standards (NBPTS). This organization established specific standards that encompass all elements of the teaching practice (NBPTS, 2008). Harlin (2005) argued that the National Board Certification process can serve as a professional development tool especially in low-achieving or hard-to-staff schools and that this has been an underutilized resource.

To earn national board certification, teachers must go through a 1-year process in which they demonstrate their effectiveness by videotaping classroom exercises and completing a portfolio that proves success in each standard. Teachers who go this route get nationally certified and become known to the profession as instructional experts. Elmore used the NBPTS organization as an example to demonstrate that a similar process can be used for educational leadership. The fourth principle established by Elmore (2006) is that powerful practices require strategies. These practices involve specific skills and
knowledge used in the development and execution of a plan or overall design. Rather than a list of dos and do nots, the fourth principle involves a way of operating that effectively engages all players in a system where everyone has a role. They are all aware of the direction, the objectives, and steps to be taken to achieve a specific goal and are involved in every part of the process. Environments that operate from the fourth principle would be engaged in proven strategies as opposed to just any teaching strategy. Although experimentation is welcomed, the end result of high student academic achievement and effective practices must be achieved by all.

Educational leaders play a variety of roles. They are superintendents, central office personnel, principals, assistant principals, and so on. These leaders also assume a variety of titles because of the creation of the unique roles based upon innovative school programming designs (Fullan, 2005). In the last 2 decades, as these new roles and titles have become more common, charter schools have become a means of dealing with 21st century approaches to education (Finn & Kanstoroom, 2002). Researchers are concerned about the abilities of the school principal, the top operations leader of the school, including Brown (2006), who addressed their role and the importance of specific training to help them to be more prepared to tackle the challenges of the day. The first thing she suggested was the need to raise admission requirements for leadership preparation programs to attract the right people with proven leadership qualities as well as at least four years of teaching experience. Letters of recommendation from various educational stakeholders would be included as proof of what the applicant has done to raise student academic achievement.
Like Elmore (2006), Brown (2006) emphasized the need to rethink required coursework. Rather than the current theoretical knowledge based courses, courses for administrative preparation programs should be based more on realistic situations. Not to suggest that theory should be eliminated, but only as it relates to 21st century reality such as the need to read and interpret data as a strategy for improving student academic achievement and the ability to analyze situations and make instructional decisions.

Administrative candidates also should be given ample field experiences providing opportunities to observe and to participate in actual work environments as well as being assigned a mentor. Brown (2006) believed in the need to broaden the learning experience for leaders outside of university settings by involving them in realistic work environments in such a way that will develop leadership skills and allow for the opportunity to reflect on and use their new knowledge. Some researchers believe that not only do educational leadership preparation programs in general need to revamped overall, but that leaders who work in high poverty areas need to be targeted (Nehring, 2007). It has been proved that these leaders experience the greatest challenges and thus need to have the most experience and best abilities (Ambach, 2006).

School Reform in the Past 2 Centuries

In the past 2 centuries, school leaders have been faced with school reform efforts. Nehring (2007) argued that over these 200 years, school reform efforts to provide thoughtful schooling have come up against common challenges that are embedded deeply in culture. These forces are described by the author as the six conspirators. They work together to tear good schools apart in unrecognizable ways. The conspirators tend to (a)
view schools as factories, (b) allow community fears to drive school activity, (c) impose plans that look great from above and make little sense at ground level, (d) crash promising innovation, (e) exhibit the tendency of schools to say yes to all legitimate requests, and (f) promote favored groups to the detriment of others.

Schools have been based on the factory model of the industrial age. Ayers and Klonsky (2006) highlighted Chicago's troubled public schools and 60 of the large corporations that ended up taking them over. Known as the Chicago Renaissance Project, 100 new charter schools in neighborhoods were created across the city over a 6-year time period to provide new school options in areas of poverty and overcrowding. Nehring identified these circumstances as a manufacturing metaphor and emphasized that the danger posed is in not recognizing that the intellectual and social development of children are more complex than the production of goods. The more that the practices of factory-like environments are implemented, the more the necessary conditions for true learning are diminished.

Fear has served as a means for causing people to act in both positive and negative ways from the past to the present. Nehring (2007) cautioned against using fear for school governance impulses and reactive forms, described by him as the fear factor, arguing against imposing plans without knowing the effect they will have on the environment. An example of what not to do is highlighted by Nehring as the standardized testing mandates. To those at the top leadership level, it appears that testing would serve as a means to report hard work and punish those who do not work hard. Those who work in every day school environments understand that such actions lead to frustrated students...
who become uninterested in learning and lose opportunities to learn a wealth of
information in the curriculum had it not been tested. This dangerous way of thinking
brings about unintended consequences that contradict educational missions, described by
Nehring as the view from the top.

Nehring (2007) argued against the danger in public education of utilizing
systematic bureaucracy to tire the innovative. Eventually people become exhausted with
sustaining innovation when it goes against the grain of the system or if it exists in a long
term combative mode. He differed with the need to assess new programs based on
effectiveness rather than how they fit within the system and described this conflict as the
grand interlock. Schools are designed to serve the public but have become too
accommodating to interest groups. Nehring disagreed with the tendency for schools to be
all things to all people and cautioned that attempting to do so would end up
accomplishing nothing. This accommodation is described as the politics of appeasement.

Many groups are favored to the detriment of others even within school systems in
the different parts of a state. Nehring (2007) highlighted the disparity among school
funding allocations in Massachusetts in different towns. He noted that some towns had
received $5,000 per child more than other towns had received. This has been true for
other states as well (Nehring). Higher income areas receive preferential treatment when it
comes to school funding allocations. Schools in these wealthy areas receive more per
pupil than those in areas of poverty even though the allocation comes from the same
source (Nehring). The danger of this disparity is that those who were advantaged become
