Abstract

Using Trade Books to Enhance Content Areas: Literacy across the Curriculum

Monica Wong-Ratcliff
Texas A&M University – Kingsville
monica.ratcliff@tamuk.edu

Teachers in today’s classrooms are confronted with pedagogical challenges. One of the challenges is the emphasis on the basics, namely reading and math skills, which results in less instructional time spent on other subjects including science and social studies. Subsequently, teachers need to search for ways to improve their time management skills. One way to do this is to capitalize the excellent resource of utilizing trade books to enhance content areas across the curriculum.

Picture books have been used as a social studies resource since the last century and the number of children’s literature with direct curriculum applications has increased in today’s classroom. There are several reasons why children’s literature is selected over the content area
One of the prohibitive disadvantages of using textbooks in content areas is that they are written for one specific reading level. In addition, sometimes textbooks are just not appealing to students, particularly struggling readers. Between grades 3 and 5, where students are in the beginning stages of reading to learn, the students’ reading ability gap widens. Nevertheless, using trade books makes it possible to have books at different readability levels available in the same classroom. The teacher may select more difficult ones for a read-aloud, and students are given a choice. Struggling readers often find informational trade books more appealing because not only are there colorful pictures, but also the content is mature with an easier reading level.

In this workshop, the presenter will suggest ways of how trade books can facilitate skill instruction in various content areas. The presenter will use a fictional book to demonstrate how to use children’s literature to integrate English Language Arts and Social Studies by conducting a series of hands-on learning activities. Moreover, inter-disciplinary activities will be presented. Further, each participant will also receive an information packet pertaining how to use trade books to enhance content areas in elementary grades.
Leadership Characteristics to Turn Around Underperforming Schools

Abstract- Poster Session

The objectives of this poster session are to indicate the challenges and solutions that principals of underperforming or failing schools face in attempting to turn them around into positive, safe and productive places for children. Increasing external pressure via legislation and regulatory shifts on school leaders and school systems to create productive places for children not historically well served in America has resulted in an increasing number of schools being identified as “underperforming” or “failing.” The yardstick for making this determination largely rests on test scores. The latest effort is the Obama Administration’s Race to the Top which continues a long line of federal attempts to reform schools.

Objectives for this session include:

- Selecting Change Models: What Works
- Standards “Yes”: Standardization “No”
- School Leaders Can’t Do It Alone: School System Leadership Matters
- It Takes Activist Leaders to Turn Around Schools
- It Does Take a Village: Bridges to Larger Communities and Social Networks

This session is built on the data base from Leadership on Purpose: Promising Practices for African American and Hispanic Students (Papa-Lewis & Fortune, 2002, Corwin Press). The poster session will present current data from the original schools in that study who were over 50% African American and Hispanic students while performing at the top tiers of California’s academic index.

Traditional models of leadership using outdated ideas of management will not turn around underperforming or failing schools. Leaders who turn schools around have to be “complete” principals, ones who are moved by data and by matters of the heart. Social justice requires an activist leader. This study will sketch out a portrait of such a leader and indicate how prospective leaders can assess their own readiness to undertake the challenge of turning around an underperforming or failing school.
Participants will understand the context of educational policy and practice issues which confront principals in turning underperforming and/or failing schools into viable educational entities:

- examine the preponderance of the dimensions of schooling as found in current demographics, school problems and failure, including common characteristics of turn-around schools
- emphasize the dimensions commonly found in Race-To-The-Top legislation and the Reauthorization of the Elementary and Secondary Education Act (ESEA)
- review the extant turn around models which exist: technical, political, economically based, social justice models including economics and cultural capital,
- delineate the common best practices from the multitude of models, including those from professional organizations and accreditation bodies; and finally,
- discuss the role of social justice as currently being developed to create compassionate and caring leaders who can successfully work across racial, gender, ethnic, special needs and religious boundaries
Inspirational Technology Leadership for School Improvement

Abstract- Poster Session

Global education and technology have altered the landscape of what learners know and how they learn, and it is critical for K–12 and university faculty to understand the new educational terrain. The focus of this poster session is for school and university personnel to envision and facilitate the use of technology in the digital world that is ubiquitous to our students.

Much of what we see happening in schools and universities focuses on the management of technology. Principal and teacher preparation programs often cover technology (and technology leadership) lightly, if at all, and rarely extend beyond the most basic skills (i.e., word processing, spreadsheets, and database use). The theme of this session is that effective technology leadership has more to do with teaching pedagogy and human relations and much less to do with technology itself.

The mission must now include designing and implementing new strategies to help teachers and students recognize, understand, and integrate technology with teaching and learning in the classroom. The mere presence of hardware and software in the classroom does not ensure meaningful learning for students. We are beyond the point of deciding whether or not we will accept technology in our schools. The crucial task at hand is to decide how to implement this technology effectively into instruction.

Specifically:
- Participants will examine model teaching and inspirational learner centered leadership characteristics
- Participants will examine the social, cultural, legal aspects of technology
- Presenters will provide examples from student to program evaluation perspectives of digital leadership
- Presenter and participants will discuss the implications of policy and practices intended to develop technology leadership

The presenters will focus on information that is critical for K-12 leaders and university faculty to understand the ever evolving educational terrain. The poster presentation will attend, in the broadest sense, to technology standards, data-driven decision making, and visionary, courageous, and creative leadership in this digital environment. As well, attention will be focused on what technology leaders should know as they expect their classroom teachers to teach.
Secondary Agricultural Education Teachers Competencies Regarding the IEP Process

A paper proposal submitted to the 9th Hawaii International Conference on Education
January 4-7, Honolulu Hawaii

ABSTRACT

Agricultural teachers have been involved in the individual education plan (IEP) process at their prospective schools. The initial review process, annual review and implementation of the IEP require the agricultural teachers’ knowledge and involvement. Although agricultural teachers have been involved in all aspects of the IEP process, the implementation of the IEP requires extensive knowledge and understanding of the impact of the IEP on the student with learning disabilities. Although special education is provided for agricultural education teachers in some states, not all states provide special education. The increase of students with IEP’s over the years has resulted in an increase in students enrolled in agricultural programs. As a result, the knowledge possessed by the agricultural education teacher to implement the IEP to ensure that adequate services are provided to the student has become more important. All agricultural education teachers are legally responsible for the implementation of the IEP for students enrolled in their program; therefore, it is necessary to determine if all agricultural
teachers should receive training to adequately provide the necessary service to the student with special needs.

This descriptive correlational study will determine if differences exists in the agricultural education teachers’ competencies toward the IEP process based upon the specialized education received in special education classes and/or workshops. The purpose of the study is to determine and compare the competency levels of secondary agricultural education teachers in Pennsylvania and North Carolina toward the IEP process. The research questions that will guide the study are: 1) Is there is a difference in the competency of secondary agricultural education teachers who receive special education coursework or workshops and secondary agricultural education teachers’ who do not receive specialized training in special education? 2) What is the impact of special education coursework and workshops on the competency level of the secondary agricultural educators toward the IEP process? 3) Would special education coursework and workshops benefit all secondary agricultural education teachers?

The findings from this study will be useful to those involved in planning and implementing special education training as well as teacher preparation programs. This study will include a sample of secondary agricultural education teachers employed during the 2010-2011 academic year in the Commonwealth of Pennsylvania and the state of North Carolina. Participants will be asked to respond to a mailed questionnaire in the areas of professional role and development competencies, instructional role competencies, knowledge related competencies, and student leadership and organization competencies. The expected outcome of the study is the definitive answer in the attitude of secondary agricultural education teachers toward the IEP process who receive special education coursework and workshops and the secondary agricultural education teachers who do not receive special education coursework and workshops.
Professor to Chair and Beyond- Academic Higher Education Leadership

Abstract- Poster Session

Objectives

There is very little written that really deals with the daily challenges of someone in higher education administration. What typically happens is that it is someone’s turn to be chair. If that person is reasonably successful (often with only minimal training), they may get meaningful assignments or an opportunity to be a unit Director or Associate Dean. Some fortunate few get an internship or fellowship under the tutelage of a practicing administrator. Again, if fortunate, the mentor is good. Otherwise, the individual learns administration the way someone else does it, good or bad. As well, turnover and movement in academic administration is rampant with more and more individuals given administrative responsibilities with little or no idea of the expectations or pitfalls.

The life of any academic administrative officer of a university is extremely complex. Many enter administration having been a good faculty member, a good department chair, or having led a university project. Often the transition from faculty to administrator is difficult with many not succeeding (leaving) or worse staying and performing poorly. This presentation is intended to give some practical guidance to those contemplating such a job.

While following the tenets of organizational theory (the individual and the sociological aspects), this poster session is intended to be a hands-on approach to the challenges of university academic administration. The session objectives include:

- the knowledge base of higher education leadership;
- respond to popular ideas such as leader vs. manager; and,
- a practical discussion of key topics faced by university administrators from department chair to positions of Director, Associate Dean, Dean and beyond

Over the years, faculty moving to the ranks of administration were somewhat facetiously seen as moving from the light that is faculty to the dark that is administration. The accusation usually stemmed from observation of administrators who were poorly prepared for the rigors of leadership or the skills required of good managers.
The poster session will be led by two seasoned administrators who served as faculty then moved to positions including program coordinator, Assistant Vice Chancellor, Graduate Dean and Provost/Vice President for Academic Affairs.

Topics include:

Avoid Crossing to the Dark Side
Being a Chair: It’s More Than Just Your Turn
Deans: The Face of the College
Ethical Decision Making: Who are You When No One is Looking

Being a chair of a department often sets the stage for the future administrator from two perspectives. First, is it right for you? Are you a good leader, a good manager? Are you cut out to be an administrator? As well, are your leadership//management skills visible to others; faculty, Dean, VPs? Will they be able to support you if you decide to go on?

The complexities of leadership and management skills of a Dean are as varied as they are numerous. Advocacy for a college must be weighed against the goals of the University as a whole. Collegial relationships with individual faculty members cannot collide with strong assessment of curriculum or quality of faculty teaching, scholarship and service.

Ethical standards need not be a casualty of the decision making process. Politics, power and privilege are value-based issues that the leader must consider in their sense of self. The central core of leadership is ethics.
Empowering care in the inner-city classroom: Teacher high expectation and student high achievement measured by the district-wide tests

Soung Hwa Walker, Ramona High School Riverside, CA.
Deron Walker, Ph.D. California Baptist University

This paper provides a narrative account that describes how a first-year teacher’s empowering care in her mathematics classes in an inner-city high school, located in Southern California, contributed to better student learning and helped raise district-wide test scores. The purpose of the article, chronicled from a practitioner’s point of view, examines how teacher beliefs that “all students are capable of learning,” operationalized concretely in terms of empowering care, enabled students to achieve impressive academic performances as measured by the district standardized tests during the 2009-2010 school year. Most of all, the authors argue that empowering care with high expectation can positively influence students’ academic success not only in math but in other subject areas as well. The authors further contend that especially among inner-city or at-risk students (e.g. low achieving, ELL, socio-economically disadvantaged, or special education students, etc.), teacher high expectation coupled with empowering care can be the key element to maximize student learning. Finally, through applying the research methodologies of narrative inquiry and conversation analysis to interpret the data recording the astonishing academic performances of students during one first-year teacher’s experience, this study focuses on how students from impoverished neighborhoods started to believe in themselves. As a result, these students demonstrated that they could improve their learning in Algebra I and consistently perform better on district tests, outperforming other classes at their school and other schools within the district.

Ramona High School’s 2009-2010 annual theme, “Through new eyes you are more than you imagine,” emblazoned on the new faculty shirts, brought a smile to new teacher Soung Hwa Walker’s face and suggested to her that maybe she was starting her math teaching career in the United States at the right place and time. In addition to the catchy new slogan, S. Walker felt a positive connection with her new principal from her hiring interview, where the latter expressed a firm desire to the former to reach out to low achieving students. The principal’s vision for reaching low achieving students resonated well with S. Walker’s prior experience of teaching English in South Korea. It also provided an encouraging sign of institutional support to her as a new faculty member who was interested in implementing “enabling [empowering] care,” a concept she had become acquainted with the year before during her combined master’s degree / teacher credential program at the University of California, Riverside.

During her master’s degree / teacher credential study, S. Walker explored research specifically focused on preparing teachers to meet the rather stringent challenges of state-level test-based accountability resulting from the No Child Left Behind (NCLB) Act. One of S. Walker’s mentoring professors John Wills and his colleague Judith Haymore Sandholtz (2009) defined the basic tension that California public school teachers often face in the era of test-based accountability that may have a constraining impact upon their classrooms: namely, the tension between teacher professionalism and centralized standardization of curriculum and instruction.
According to Wills and Sandholtz (2009), even in the most ideal educational settings, teachers must negotiate this tension between professionalism and standardization as school administrations increasingly believe that “uniformity [of goals, curriculum, teaching methods, and assessment] offers the most straightforward way of providing equality of educational opportunity” (p. 1069). As opposed to systems where teachers make decisions at the classroom level, a standardized approach seeks to centralize efforts to reform curriculum and instruction with pacing guides and collaborative efforts at departmental meetings to unify content. The overall goal would be to ensure that content taught in all classes matches the substance of state and local tests and that students who move from one school to another would be taught the same content.

Meanwhile, teachers are trying to employ an individualized pedagogical approach based on professionalism that emphasizes their own expertise and judgment to make decisions at the classroom level that are relevant to their own diverse and unique classroom environments. Wills and Sandholtz (2009) reported that this professionalism has defining characteristics “based on theory, mastery of knowledge base through extended specialized training, a high degree of autonomy in performing tasks, and a code of ethics that guides behavior” (p. 1067). It is important for teachers to be able to apply their own theoretical knowledge in classroom practice in an autonomous manner because of the rich diversity in their classrooms and uniqueness of each environment and the challenges it presents that “preclude formulaic solutions” (National Board for Professional Teaching Standards [NBPTS], 1996; Wills & Sandholtz, 2009). Essentially, teachers must be somewhat freely permitted to draw upon their own specialized knowledge and use their professional judgment to determine how to meet the rich diversity of their students’ needs concerning what and how to teach because research has identified teacher expertise as the most important factor in determining student achievement (Darling-Hammond, 2000; NCTAF, 1996; Wills & Sandholtz, 2009). Teachers impact student performance more powerfully than program variables (Hawley & Rosenholtz, 1985; Wills & Sandholtz, 2009).

In a similar vein, an overly centralized or standardized approach tends to “emphasize transmission of information,” where “knowledge is considered to be a fixed body of information that is transferred from teacher or text to the student” (Good & Brophy, 1994). The teacher, then, becomes more manager than facilitator while classroom instruction grows more teacher-centered as opposed to student-centered and increasingly didactic rather than interactive. Thus, Wills and Sandholtz recommended a new type of professionalism which they called “constrained professionalism” that attempts to balance the needs of implementing a standards-based curriculum without reducing teacher effectiveness and demoralizing teachers by undermining their professionalism and encroaching upon their autonomy with an overly hierarchical and centralized standardization (one-size-fits-all approach) to curriculum and instruction. For the purposes of this paper, while pressures toward standardization were present, S. Walker enjoyed a reasonable amount of opportunity to cultivate her professionalism and exercise a sound degree of autonomy in her classroom. This room that her principal graciously provided her within the curriculum, even as a new teacher, to exercise autonomy within constrained professionalism by applying the standards and receiving collaborative departmental support combined with freedom to make alterations to materials and methods to make them her own allowed S. Walker to implement empowering care with her students and enjoy remarkable success as a first year teacher in the American public school system.

Building upon the work of Annette Hemmings (2006), enabling care may be defined as the ideals associated with a “communitarian moral order” (p. 139) that fosters a sense of community and the type of individual character that encourages school actors to „respect one another, treat
each other as equals, but never stray too far from the idea that they are first and foremost a class, a community of learning’” (Rosario, 2000, p 30). Hemmings (2006) contrasted the concepts of “enabling” and “disenabling care” at the urban Central High School whose students were 81% Black with most living in poverty (p. 139). Some acts of enabling care included a “huge dose of TLC” --- tender loving care ---- put in concrete forms such as calling parents, tracking down absent students, counseling troubled kids, and even providing clothes, transportation and other physical needs as well. As one staffer told the author, “We hug ’em, not slug ’em” (p. 141).

Ironically, the same school staff that provided such enabling care also provided disenabling care simultaneously in many cases by watering down classroom standards for achievement and proper behavior that suggested to students that the school “did not care about the students as capable learners” (Hemmings, 2006, p. 141). Most teachers at the high school greatly reduced the sources of knowledge for students, just taught from the textbook, even then eliminating massive portions of content, and resorted to mundane methods such as fill-in-the-blanks worksheets, rote memorization and answering questions from the back of the book. Moreover, such teachers often held minimal standards for their students and allowed students to socialize, laugh out loud or put their heads down during class time. One teacher explained her “loose standards” were needed to make the classroom “as pleasant as possible” so students would not drop out of school. In her own words, “

I used to feel guilty about the loose standards but then I came to the realization that these kids, you know, the kids in the neighborhood won’t come unless you make things as pleasant as possible. Parents don’t push them so if kids come it’s because they want to (p. 142).

It is somewhat understandable that this faculty member tried hard to keep the students happy and in school given the high dropout among minorities, especially when they feel discriminated against ----- as many of these students clearly did. Nevertheless, loosening up standards was not an appropriate approach in this context to say the least. Even students themselves complained about it. As student advocate Amber explained,

They try to be cool with the kids so that classes are comfortable. They get buddy, buddy and lower the standards so that classes are a joke. Even advanced placement classes are a joke. They have pretty much written kids off even though they’ll tell you they haven’t. Kids know what is going on and it really bothers them. They don’t like being treated like that. (p. 142)

Amber even went so far as to try and petition the school insisting that lax teachers do a more professional job. Thus, the students themselves wanted a high degree of professionalism from teachers, student-centered instruction and a rigorous curriculum that would make them proud.

A long line of educational research, in fact, has delineated how structural forces, school-level practices and students’ responses to the aforementioned have all contributed to systematic passdown of privilege to white and wealthy children and disadvantage to impoverished children, especially those of color (Bordieu and Passeron, 1990; Bowles & Gints, 1976; Fordham, 1996; Fordham & Ogbu, 1986; MacLeod, 1995; Oakes, 1985; Ogbu, 1978; Rist, 1970; Roscigno, 1998; Rosenthal & Jacobsen, 1968; Solomon, 1992; Willis, 1977). Nevertheless, much of the prior work on institutionalized patterns of perpetuating disadvantage for minorities and poor students has centered on lower teacher expectations that have contributed to a tragic “self-fulfilling
prophecy” where student self-esteem and self-efficacy have been damaged, contributing to reduced motivation. In response, teachers have often given less challenging school work (Farkas, 1996; Farkas et al, 1990) as was true at Central High in Hemmings” study (2006). Diamond, Randolph, and Spillane (2004) reported that this leveling of school-based expectations for certain minority or low income students is rooted in institutional hierarchy and can become “embedded” in schools. These authors also argued that these low expectations could be mediated if school leaders engaged in practices designed to increase student responsibility for student learning.

Method

For the purposes of this paper, Soung Hwa Walker (S. Walker), math teacher at Ramona High School, and her husband Deron Walker (D. Walker), associate professor and teacher-trainer in Modern Languages and Literature at California Baptist University, both in Riverside, California, employed a qualitative, case study approach, utilizing the method of narrative inquiry, to analyze S. Walker’s success in raising student achievement, as measured by test scores, in her first year of American school teaching at Ramona High School in Riverside, California. Connelly and Clandinin (2006) described the use of narrative inquiry succinctly:

Arguments for the development and use of narrative inquiry come out of a view of human experiences in which humans, individually and socially, lead storied lives. People shape their daily lives by stories of who they and others are and they interpret their past in terms of their stories. Story, in the current idiom is a portal through which a person enters the world and by which their experience of the world is interpreted and made personally meaningful. Viewed this way, narrative is the phenomenon studied in inquiry. Narrative inquiry, the study of experience as story, then, is first and foremost a way of thinking about experience. Narrative inquiry as a methodology entails a view of the phenomenon. To use narrative inquiry methodology is to adapt a particular narrative view of experience as phenomena under study. (p. 47)

Connelly and Clandinin (1990, p. 4) further say of stories and people: "People by nature lead storied lives and tell stories of those lives, whereas narrative researchers describe such lives, collect and tell stories of them and write narratives of experience." Through the transaction of learning from each other, the researcher and participant can begin to understand specific experiences within the context of stories told and retold in community. New understandings about the content and context of a situation can begin to open up possible new imaginings for future stories to be lived.

The teacher S. Walker and the educational researcher and teacher-trainer D. Walker continued their fourteen year marriage-long conversation on professionalism in education and simply extended the ongoing narrative to regular, almost daily discussions of S. Walker’s new experiences as an experienced English teacher from South Korea making the transition to her first year of teaching math in America at an inner-city school in Riverside, California. In combination with narrative inquiry and systematic conversational analysis regarding the teaching situation, the teacher / researchers employed the Riverside Unified School District’s first and second semester Benchmark Assessments for Algebra I for 2009-2010. It is through the lens of this narrative inquiry and discourse analysis that the raw data of the Benchmark Assessments for Algebra I are examined in this paper.
Building upon prior research on teacher expectations and enabling (empowering) care and a year of professional academic discussions on the issues surrounding the experience, S. Walker and D. Walker will argue that within the context of a mostly supportive professional environment, S. Walker’s (enabling) empowering care made the difference in raising her students’ test scores to a surprisingly significant degree, among the leading scores in the district in Algebra I. The term empowering care will be used in place of enabling care because the authors feel that enabling care can be too easily confused with the type of loose standard care provided in Hemmings’ (2006) discussion of disenabling care.

With encouragement from her principal and edification from a solid teacher-training program, S. Walker set out to implement empowering (enabling) care at Ramona High School in Riverside, California in the fall of 2009. In the following sections of the paper, S. Walker and D. Walker will summarize the data results of the standardized tests and the conclusions drawn from the authors’ attributions for the success S. Walker encountered in her teaching. These attributions came from an analysis of the raw test data, interpretation of the data using narrative inquiry and discourse analysis and comparison of the results of the data analysis with source support from prior literature review in the field.

**Results**

In the tables below comparisons are made between S. Walker’s students’ average (mean) scores for Algebra I versus those of both Ramona High School and the Riverside Unified School District (RUSD). The first table presents comparisons between S. Walker’s students’ mean scores (Semesters 1 & 2) and those of her school and district. The second and third tables present comparisons between S. Walker’s students’ performance levels compared to RUSD for semesters one (Table 2) and two (Table 3), respectively. Finally, Table 4 illustrates the comparison between S. Walker’s students’ performance levels and those of other Ramona High School Math Department teachers.

### Table 1. RUSD Algebra I Average (Mean) Scores 2009 - 2010

<table>
<thead>
<tr>

<td>(N = 83)</td>
</tr>
</tbody>
</table>

In Table 1, the data clearly shows that S. Walker’s Algebra I students on average scored significantly higher than both their peers at Ramona High School and the Riverside Unified School District (RUSD) on the district’s first and second semester Benchmark Assessments for Algebra I for 2009-2010. In the first semester, S. Walker’s students averaged 52.89% compared to 45.97% for Ramona High School and 44.07% RUSD overall, respectively, on the standardized assessment. While S. Walker’s students scored lower in Semester 2 on average on the Benchmark Assessment for Algebra I, that trend carried throughout the district. In Semester 2, S. Walker’s students once again scored significantly higher (46.01%) on the average when compared to students at Ramona High School (40.45%) and RUSD (39.43%) on the standardized exams.

In Table 2 a comparison is made between S. Walker’s student performance levels and those for RUSD, based on the RUSD Benchmark Assessment for Semester 1 2009 Algebra I. Succinctly stated, a significantly greater proportion of S. Walker’s students were classified as Advanced or Proficient, based on the standardized assessment, than the proportion of students qualifying in those categories for the entire district. In fact, S. Walker had three times the percentage of Advanced students (6% - 2%) and nearly double the proportion of Proficient students (27% - 15%), compared to those found throughout the district. Equally important, on the other side of the spectrum, the data reveals that S. Walker had only around half the proportion (22% - 41%) of students whose standardized scores classified their performance as Below Basic, again, according to district results. Moreover, S. Walker did not have any students scoring in the performance range deemed Far Below Basic in Semester 1 while 6% of RUSD students performed at the Far Below Basic level in the same term.

</table>

In Table 3 a comparison is made between S. Walker’s student performance levels and those for RUSD, based on the RUSD Benchmark Assessment for Semester 2 2010 Algebra I. Once again, performance levels fell throughout the district in the second semester during spring 2010. In Semester 2, neither S. Walker nor RUSD recorded any students performing at the Advanced level. Nevertheless, once more S. Walker witnessed a significantly higher proportion of students (more than three times the percentage) scoring well in the Proficient (28% - 8%) performance range. Meanwhile, S. Walker also had a significantly lower proportion of students scoring at the other end of the spectrum in the Below Basic (28% - 45%) category and a slightly lower proportion of student performances falling into the Far Below Basic (12 – 13%) range compared to the entire RUSD on the Benchmark Assessments.

In Table 4, a comparison is made between S. Walker’s student performance levels and those for other Ramona High School math teachers, based on the RUSD Benchmark Assessment for Semester 2 2010 Algebra I. Unfortunately, data for between teacher comparisons was not available for Semester 1, but as demonstrated at the district level, the authors believe the results would prove similar to Semester 2. In the Advanced performance category, only one teacher at Ramona High School recorded 1% of students attained this level. No other teacher had any students in the Advanced range on the Algebra I Benchmark Assessment. However, S. Walker had 29% of her students to achieve standardized test scores that classified their performance as Proficient. This proportion of Proficient performances was more than double the level of all other math teachers at Ramona High School in math. In fact, the percentage of S. Walker’s students that reached Proficiency more than tripled the level of 4 of 6 of the other teachers in the department and exceeded the overall percentage 29% - 10% on the Benchmark Assessment.

On the other end of the spectrum, S. Walker’s percentage of students who were Below Basic was only 28%, which was the best performance in that category (lowest level) in the department. S. Walker’s 11% of students that were Far Below Basic was nearly identical to the department’s overall 10%. More poignantly, when the worst two categories of Below Basic and Far Below Basic were combined, one can see that 39% of S. Walker’s students fell into one of those two categories, or nearly two of every five students. While that rate may be far from ideal, it compares rather favorably to the rest of the department. For instance, only one other teacher of seven had a lower percentage (15%) falling into those two bottom categories of performance. Conversely, two of the seven teachers witnessed more than half of their students falling into the two bottom categories (53% and 57%) while three others had at least two of every three (67%, 68% and 69%) students reach these depths of performance lows. In fact, the whole department saw 56% of students score Below Basic or Far Below Basic on this assessment.

**Discussion**

The data clearly demonstrates that S. Walker by all standardized test measures had a very successful first year experience of teaching math at Ramona High School in Riverside, California. Succinctly stated, S. Walker’s students, on the average, scored significantly higher than the school or district average. Moreover, S. Walker had significantly more students classified as either Advanced or especially Proficient than most other teachers in her district,
many with far more experience than her in teaching math in California. Equally impressive, S. Walker had significantly fewer students fall into the lower categories of performance known as *Below Basic* and *Far Below Basic*.

Frankly speaking, D. Walker the researcher and teacher-trainer and S. Walker the practitioner were quite surprised by both the Benchmark Assessment standardized test results and by the way S. Walker’s students responded to her as a first year teacher at Ramona High School. While S. Walker had previously taught English in South Korea for about five years and was not new to teaching, she had never previously taught in the United States before 2009 nor had she taught math anywhere. Thus, it was believed by both authors that S. Walker would have a steep learning curve in adjusting to American public schools, especially in an inner-city environment like Ramona High School in Riverside.

It was out of this concern for S. Walker’s professional development that prompted D. Walker as a researcher and teacher-trainer and S. Walker to embark upon this journey of narrative inquiry and conversation analysis as both working spouses and professional educators. Throughout the 2009 – 2010 school year, S. Walker and D. Walker regularly discussed what the former was experiencing in the classroom in terms of adjusting to teaching load (5 classes of 35+ students each), bonding with faculty in her department, approaching her classroom in a student-centered fashion, and handling the challenges of disciplinary issues. Despite her prior teaching experience, S. Walker seemed overwhelmed at first; there were many challenges to overcome. Although S. Walker had received encouragement from her principal upon hiring and had bonded with peer faculty well, many challenges remained: how to care for exceptional and struggling students with such large class sizes, how to make cultural adjustments to not only American public schools but also an inner city environment like Riverside, and how to handle students that frequently seemed resistant to new teachers at the school. In fact, several of S. Walker’s colleagues had expressed the concern that a significant number of students at the school took pride in hazing new teachers and even occasionally trying to get rid of them.

Despite the many formidable challenges that lie ahead, S. Walker felt genuinely privileged to have the opportunity to build into the lives of young Americans and impart to them a difficult but important subject, math. While there were, of course, many teaching strategies and math methods that S. Walker could not wait to try out on her students, what both D. Walker and she agreed upon at a fundamental level was that ultimately teaching is relational. Thus, the challenge as both S. Walker and D. Walker saw it was for her to connect with students on a personal level. As the old cliché goes, “people won’t care what you know until they know you care.” Therefore, no matter the classroom strategies, techniques, and materials employed, S. Walker decided to embark upon a course of imparting empowering care (based on “enabling care”) as discussed in the beginning of this paper. Through many conversations in the personal narrative over the course of the school year and even the summer, S. Walker and D. Walker regularly discussed how this empowering care was being implemented and what the results were. Upon reflecting on the success of S. Walker in making a valuable contribution toward boosting test scores at her school and in her district, both S. Walker and D. Walker firmly concluded that implementing empowering care made the biggest difference in her teaching effectiveness. Some of the keys or the main principles of the empowering care (See Table 5) employed and recommended by S. Walker will be explained further in this section of the paper.

**Personalized Instruction**

Personalized instruction is the cornerstone to empowering care: everything else comes from there. Despite having inhibitingly large classes, S. Walker took many proactive measures to personalize class instruction. She learned all student names within the first two weeks of class and made it a point to call on students by name when asking questions. S. Walker not only used student names in asking questions but did not easily give up on struggling students who were reluctant to answer questions, “Saying, I don’t know.” Even when other students would say, “Mrs. Walker, she said she didn’t know,” this teacher would hang in there and encourage the student with “You can do it” and wait for the student to respond who needed extra time. While some students struggled and initially showed frustration, over time, they began to appreciate that S. Walker did not give up on them but kept high expectations for them, believing in them when they sometimes did not believe in themselves.

In addition, S. Walker took an interest in students’ personal lives and their families. Even as an educational researcher and teacher-trainer believing in personalized instruction, D. Walker was often surprised during the conversations he had with S. Walker to the extent that S. Walker asked students about their families and personal lives. Often, when a student would be struggling or misbehaving in class, usually a result of difficulty with the subject and feeling disconnected, S. Walker would ask the student, “How is your mother doing?” Maybe she would ask, “How’s your daddy?” Students would often be surprised, sometimes perplexed. Not many teachers had ever asked them such questions before. However, once they got over their initial shock, students might respond, “I haven’t seen my dad in a while” or perhaps indicate some other problem at home. S. Walker would then try to comfort the student by saying something encouraging to them. More importantly, S. Walker could now comprehend her student’s academic struggles or behavioral acting out a little more, and students came to understand that she genuinely cared about them as well.

One more example of personalized instruction in the interest of empowering care concerns S. Walker’s approach to grading. Typically, most math teachers use Scantron sheets to grade quizzes and tests due to the time and energy-saving convenience involved. While it is perfectly reasonable for math teachers to use the easier approach, S. Walker insisted in grading all of her quizzes and exams by hand, not even using teaching assistants which may have been provided to her. More as her husband than as a researcher, D. Walker wondered why she did this. According to S. Walker, she felt it was necessary for her to use the exam results not only as an objective measure of progress but also as a means for understanding each student’s process. Exam errors enabled her to identify areas where she could intervene in their process and help her students improve. In other words, if S. Walker did not personally grade the tests, she would feel
less able to render the personalized process-based instruction and empowering care she felt would be necessary to optimize instruction and provide each student with the best learning context.

Practical Purpose

S. Walker tried to build upon personalized instruction by providing purpose to students as a means for delivering empowering care. One can certainly not assume that in an inner-city school such as Ramona High School in Riverside, California, where many students come from poor and broken homes, that motivation and purpose in math learning are automatic. Neither is it easy for teachers to provide purpose for all students, especially with an abstract subject. Nevertheless, S. Walker found it helpful to build upon her efforts to get to know each student and provide personalized instruction. S. Walker’s knowledge of students could help her to inspire them to use success in Algebra I as a step towards reaching their goals. One student who struggled, for instance, was interested in becoming a nurse. S. Walker motivated him with purpose by pointing out that not only was Algebra I necessary to advance through the high school curriculum and go to college but also to nurse training as well. Students, who may not necessarily enjoy math as a subject or even understand the purpose for taking it, can be more inspired to do well if they can see how success in the class will help them to achieve their personal goals.

Practical purpose can be provided in pragmatic terms as the aforementioned examples illustrates. However, it can also be inspired in a more idealistic sense in clearly and explicitly communicating to students that teacher expectations for them will remain high. Frequently, S. Walker would provide inspirational message through video clips from motivational speakers such as former NCAA and NFL football coach Lou Holtz. In a similar vein, she would also post inspiring print messages around the classroom, again, to keep expectations high and show students her belief in them.

Positive Feedback

Providing positive feedback is an essential part of delivering empowering care to students. It all starts with providing purposeful praise. S. Walker made it a point to lavish praise on students for giving correct answer or for trying their best. Her verbal praise and encouragement empowered students to speak out in class more frequently and engage in the learning environment in a more personalized fashion. In addition to verbal praise, S. Walker also encouraged students with affixing stickers to their quizzes and tests: one sticker if they scored 85% and two stickers for 90% or higher. She often heard students enthusiastically asking each other, “Man, how many stickers did you get?”

Another mode of positive feedback in S. Walker’s class was food. She fed her students both intellectually and physically. Students received pizza parties as an incentive not simply for doing well on tests but for making a lot of effort in class. In addition to the pizza parties, S. Walker gave her students “fortune brownies.” Similar to a fortune cookie, S. Walker put small pieces of paper with inspiring messages into a foil which she used to wrap the brownies. The messages were not really fortunes but positive messages to students such as “You are smarter than you think!” S. Walker gave students these “fortunes” soon after starting the term (without the brownies) and just before taking exams with the brownies. S. Walker observed that her students often kept these simple, complimentary messages of inspiration in their folders for many weeks after receiving them. In fact, S. Walker often provided food to hungry students who
frequently came to school without having eaten properly at home. She commonly gave hungry
students some healthy snacks. Students came to realize that the pizza, brownies, and other
snacks were being provided by their teacher at her own expense of time and energy, her
expression of empowering care to them.

**Implications**

Teacher such as S. Walker realize that teaching is above all things relational in nature. Thus,
while teaching standards-based curriculum is important, it is of even greater importance to
connect with students through the demonstration of empowering care towards them. S. Walker
was able to provide such empowering care to students because she drew upon past teaching
experiences and pedagogical research. Furthermore, she was fortunate enough to have a
principal who encouraged her to develop her professionalism by showing empowering care to
the students. Such institutional support can be important if not vital for teachers in their efforts
to provide their students with empowering care.

According to Wills and Sandholtz (2009), state-level test-based accountability can
negatively impact classrooms and degrade teacher professionalism when the positive effort to
teach a standards-based curriculum increasingly becomes confused with a misguided effort to
implement an overly simplistic “one-size-fits-all” standardization of centralized curriculum.
Classrooms can be negatively impacted and teacher professionalism degraded because teachers
may not be allowed to make their own decisions concerning curriculum, teaching methods, and
authentic assessments---including portfolios. The resulting highly rigid instructional approaches
can limit students” participation in their learning process, which also inhibits the quality of a
argued that the high school juniors in her article were not promoted to cultivate high level
thinking in history classes: “the students sat in classes passively, very rarely voicing an opinion
or asking a question, no research required” (p. 318). She further pointed out that “all information
in the course was reduced to lists of facts, brief descriptions, chronologies of presidents, laws and
court decisions” (p. 317). When centralized curriculum becomes required, class lectures tend to
be tightly controlled by not encouraging students in “questioning their institutions” (p.317).
Often, the teachers” primary concern may deviate toward covering the materials without
students” interruption.

While one might argue that centralized curriculum and uniformity of instructional strategies
help provide equal learning opportunities for students, scholars have found that teachers need to
differentiate classroom teaching to support all students” best learning (Katz,1999; Ladson-
Billings, 1997). Although teachers want to engage in more “student-centered instruction”
(Cuban, 1993, p. 6) in their daily classroom teaching, rigid standardization of curriculum and
instruction often drives teachers to mainly focus on student test performance. Teachers working
within such a professionally confined and rigid system may over-emphasize practicing test-
taking strategies, including “how to properly bubble in test answers, or how to eliminate wrong
answers” (Wills & Sandholtz, 2009, p.1078).

As strong focus on accountability through high-stakes testing often creates teaching
dilemmas through over-centralized emphasis on standardization of curriculum, teachers often
become too limited in exercising academic freedom, an important part of the teaching profession.
Primarily due to the obligation of following the centralized curriculum, teaches can lose the
autonomy necessary for creating instructional strategies to meet different students” educational
needs. It is vital for teachers to value all different students” educational needs and provide for
them accordingly. Showing respect for the various cultures in class is a sign of teachers” care, recognizing all students “as worthwhile individuals” (Phelan, Davidson, and Cao, 1992, p. 698).

In a more nurturing classroom environment, where empowering care is provided, students tend to engage more in class discussions and finish their class work more consistently because they feel that their teachers care about them. However, overly-standardized test-driven instructional approaches often prohibit the opportunity for teachers to adequately consider diverse students” educational needs simply because they feel obligated to use the canned-materials from the departments following the pacing guides. According to Phelan et al (1992), students want to be acknowledged as valuable individuals by their teachers. Students want their teachers “to recognize who they are, to listen to what they have to say, and to respect their efforts” (p. 696). One student quoted in Phelan et al. (1992) elaborated,

The class I’m getting an F in, he seems like he doesn’t really actually pay attention to anybody in particular in class, it’s just a whole class, and this is math..... So I don’t know what he really actually means. He doesn’t look at me.... (p. 696)

Thus, it is easy to see how perceived teacher indifference to individual student needs can result in disconnected relationships between students and teachers, which may be harmful to individual students. In teacher-centered classrooms where teachers are pressured to get results on standardized tests, such disconnected relationships can easily form. When educators feel constrained and find difficulty being creative with their teaching practices because of the pressure to immediately raise test scores, students may be treated more like numbers than properly valued individual learners.

While understanding that state-level testing may be an important part of the assessment process, over-emphasis on centralization of a standardized curriculum for uniformity in test preparation in schools can create a negative impact on teacher practice and student learning. Consequently, students may be drilled to perform well on their standardized testing. Without recognizing an individual’s special circumstances such as lack of English proficiency and disciplinary behaviors, a hostile classroom atmosphere may be created between teachers and students. The underlying tension between teachers” agendas and students” needs often may inhibit teacher efforts to cultivate the kind of healthy relationships with students that can come from application of empowering care. As administrators and policy makers try to reform schools by ensuring that standards are met, providing centralized curricula to promote students” immediate learning outcomes with accountability in the form standardized tests represents an overreaction to problems in education. In short, this type of „test-driven‟ classroom instructions often does not serve the best interests of all students” learning needs (Wills & Sandholtz, 2009). Rather, a system that encourages teacher professionalism and enables teacher to employ empowering care with their students does.

Journaling and Journeying Toward Academic Excellence in Intercultural Rhetoric

Deron Walker, Ph.D., Associate Professor, California Baptist University
dwalker@calbaptist.edu

June Ying Guan, graduate student, California Baptist University

electronic journaling has already been established as a helpful tool in facilitating successful contrastive rhetoric-oriented writing instruction for second language learners. It has been used to provide English as a Foreign Language (EFL) Chinese students with models of English academic essays written by native English speakers and a forum for discussing salient features of English academic writing and how these features may differ from the conventions of expository writing used in their Chinese first language (Xing, Wang, and Spencer, 2008). In addition, whether electronic or in the form of in-class freewrites, journaling has also been known to build fluency among writers, reduce anxiety concerning the writing process, provide much needed opportunities for stress-free writing practice, and allow writers the unique opportunity to explore and develop their own voices as writers. Thus, it would seem that journal writing would be a useful pedagogical tool to employ in second language writing classrooms to facilitate the second language learner’s acquisition of the writing conventions of the target language and culture. Therefore, this paper seeks to combine synthesize the research on journaling with existing pedagogically-oriented research on the journey toward facilitating intercultural rhetoric-oriented writing instruction for the express purpose of empowering second language writers to compose better English academic essays.

This paper synthesizes recent pedagogically promising findings in intercultural rhetoric and travels further down the instructional road to more fully explore what journaling can add to the didactic journey. After years of controversy and hypercriticism from expressivists and postmodernists, contrastive rhetoric has redefined itself as intercultural rhetoric with refined methods and a more clearly defined pedagogical mission (Walker, 2008, 2010). While this redefinition of contrastive rhetoric to intercultural rhetoric remains a work in progress, certain principles of intercultural rhetoric have emerged to help reconfigure the field so it can move forward or reorient itself in a decidedly pedagogical direction (Walker, 2010), which was the field’s original purpose (Grabe & Kaplan, 1996; Kaplan, 1988). Some of the features that help redefine contrastive rhetoric as intercultural rhetoric, especially in East-Asia, would include: less text-focus and more experimental design in research, ethnography as a salient feature and a more inclusive dialogue between English scholars in the West and East–Asia (Connor, 2008; Walker, 2010). Succinctly stated, the redefining of the field and continued interest in improving second language writing research and practice has led to a recent resurgence in intercultural rhetorical research, especially true in East-Asia (China, Japan, and Korea). In the last decade several pedagogically promising research studies in teaching intercultural rhetoric have been successfully performed (Walker, 2006; Xing, Wang & Spencer, 2008; Yoshimura, 2002).

**Journaling Benefits to L1 and L2 Writing**

Briefly, it should be noted that journaling began as a way to help native English speakers, especially struggling writers, with some of their writing issues such as creativity, fluency, anxiety, higher order thinking skills, and inability to fully express themselves. In fact, two of the major writing problems that have been identified in rhetoric and composition research in the last generation have been "writer-based prose" (Flower, 1979) and the need to "invent the university" for freshman native English speaking writers (Bartholomae, 1985). These are truly developmental writing issues. Concisely stated, Flower coined the term "writer-based prose" to refer to the inexperienced writer’s egocentric tendency to leave out important details when writing an essay because s/he often falsely assumes that the readers will understand what s/he means without further elaboration. The second problem is similar in scope. In Bartholomae’s article, teachers / professors need to "invent the university” for students because the types of academic, expository writing that they are typically asked to do in college and the standards to which they are held prove somewhat foreign to them, as from another culture, the culture of academia. In a nutshell, journaling can help students with the invention process of coming up with ideas in prewriting, exploring themselves more and understanding their own writing processes on a deeper level, thereby reducing anxieties which may help them overcome writer's block. These same benefits for L1 writers can be even greater for L2 writers who struggle with vocabulary, grammar, and rhetorical awareness of the expository style of the L2.

In fact, the word “journal” has origins in the French word *jour*, meaning “day.” One meaning for the word “journey” can equal the amount of traveling that a person can do in one day. Thus, the word journaling may literally represent a “daily writing about one’s journey” (Schiwy, 1996). In this way, journal writing can serve as a means for recording thoughts, experiences and insights as one reflects upon them. As Janet Emig (2008) suggested, writing can be a mode of learning, a voyage of self-discovery. Journal writing can play an important role in that reflective process of self-discovery in helping students to reflect and generate ideas. Journal writing comes in many forms but we will discuss two examples here: freewriting and dialogue journals.

In order to help students relax, build fluency, express themselves better and find their own voices as writers, Elbow (1998) recommended freewriting as a “teacherless classroom” where students would write the message in the bottle without fear of heavy-handed error correction. This expressivist approach to writing often empowers students by emphasizing and promoting the flow of ideas and meaning of text rather than focusing on form. Therefore, many students find freewriting to be “liberating,” a chance to pour out their hearts and bare their souls without fear of criticism. Elbow even suggested keeping a freewriting diary (journal) as a regular practice to facilitate writing production and skill growth. Freewriting can be implemented in many ways in a writing class to foster personality growth, writing skill development and in a more guided way to facilitate thought on given topics of class discussion.

Journal writing has been used in many writing classrooms in American public schools and colleges and universities with both native English speakers (NES) and English as a Second Language (ESL) students. It has been demonstrated to promote authentic learning, reflective practice and interactive engagement (English & Gillen, 2001 Peyton, 1993, 2000; Peyton & Reed, 1990; Peyton & Staton, 1993; Reed, 1993). English and Gillen (2001) viewed journal writing as a reflective practice which allows an individual to think through what happens in life. This reflective process is how many people make sense of their experiences.
Furthermore, research has suggested that journal writing can provide an opportunity for developing second language literacy by engaging in language in meaningful and authentic contexts (Orem, 2001). In addition to freewriting, another useful type of journal is the dialogue journal where teacher and student both write responsive journals to each other and maintain an informal and friendly dialogue that often carries many of the same benefits of freewriting but also helps to build rapport and mutual understanding between teacher and student. Peyton (2000) identified three specific benefits of dialogue journals: extending contact time teachers have with learners, facilitating language learning and assessing a learner’s needs and progress. Orem (2001) indicated that dialogue journaling stresses communication rather than correctness. Therefore, the pressure on students to write is often somewhat alleviated. While this is good for the first language writer, it is even better news for the second language writer who may struggle with more anxiety in attempting to negotiate the many pitfalls present in writing in a second language and culture. This paper will specifically discuss the potential benefits of journal writing in combination with other research-based techniques of second language writing instruction to enhance East-Asian second language writers’ writing fluency, comprehension of intercultural rhetoric and multi-cultural identity reconstruction.

Journaling & Writing Fluency

Lack of writing fluency is one of the major problems second language (L2) writers face in academic writing. To know how to help L2 writers improve their writing fluency, it is important to know what defines the criteria of fluency and the many factors that cause this problem. Writing fluency is usually described as a temporal phenomenon and defined as the number of words and structures accessed in a given time period (Wolf-Quintero, Inagaki, and Kim, 1998). It has been widely studied in the past from various perspectives such as linguistic and cognitive perspectives. Therefore, the criteria used to determine writing fluency varies among different study groups.

Similar to speaking fluency, the rate of production is one of the most frequently used criteria to determine fluency. Schmidt (1992), distinguished language proficiency from fluency while discussing second language (L2) speaking fluency. He pointed that proficiency deals more with the language accuracy, grammatical complexity, and context appropriateness while fluency focuses on the rate of text production under a temporal condition. Therefore, fluent writers can produce a greater amount of words than struggling writers under the same time limit. Fluency in this paper, as mentioned in the beginning, is defined as the number of words and structures accessed in a given time span. That means the criteria to determine writing fluency is the rate of language production. This was also the criteria Yoshimura (2002) used in a study on intercultural rhetoric in Japan.

After establishing a working definition of fluency as rate of language production, one may wish to find the causes for the fluency difference between fluent writers and struggling writers. Studies have been conducted from three main perspectives: linguistic perspective, cognitive perspective, and second language perspective. Typically, the results show that increased writing experience indicates the improvement of writing quality. Likewise, faster writing rates often indicate a higher writing quality. Van Houten et al. (1988) found a correlation between increased writing rate and the increased rate of story quality by independent judges. The author also recommended freewriting to assist writing fluency because it can provide a safe mode where
students do not receive the imposed interruptions and pressure to meet all writing functions concurrently. Peter Elbow strongly advocates freewriting to increase student writing fluency:

When you write quickly...as in freewriting, your syntactic units hang together. Even if you change your mind in mid-sentence...you produce a clear break. You do not try to plaster over two or three syntactic coherence and verbal energy which gradually transfer to your more careful writing. (pp.16-17)

Freewriting was recommended by Elbow as "the easiest way to get words on paper and the best all-around practice in writing that I know"(p.13). Elbow also believes a person will improve his/her writing more through freewriting and sharing than through any other activities described in his book. Elbow suggested experiencing "fast writing without worrying about organization, language, correctness, or precision"(p. 26) before revising, so the writer would maintain their own voice.

When using the increase in fluency as an indicator, one should keep in mind the distinction between calculating the rate at which students are actually writing and the rate of writing during a designated time period. For example, Parker, Tindal, and Hasbrouk (1991) had middle school students with learning disabilities write for 6 minutes on four different occasions in a 6 month course. As a result, students showed a steady increase in the quantity of word production. However, 90% of the students finished writing before the time was up. While some teachers might worry that increased rate would come at the cost of writing quality, improvements resulted both in writing fluency and quality.

Hillocks (1987) stressed that "the research on the composing process indicates that writing is an enormously complex task"(p.710). He organized his review around six writing teaching methods, which are broad categories: grammar; models; sentence combining; scales; inquiry; free writing. Hillocks found that all these approaches except the grammar method were associated with improvements in writing quality. In addition, "a heavy emphasis on mechanics and usage (marking every error) results in significant losses in overall quality"(p.74). An exclusive and limiting focus on any one method seems problematic. Obviously, writing is not merely about the quantity. Writing quality is the final purpose of writing to learn. Teachers can then apply as many effective strategies as possible to help students improve L2 writing skills.

Other obstacles might stand in way of second language writers' improvement such as the transition from first language (L1) to second/target language (L2). Writing in one's mother tongue can already be quite a demanding task that requires both language abilities and general (metacognitive) abilities, all of which are in a constant interplay. Writing in a second language (L2) is even more demanding because some of these constant abilities may possibly be less well developed than in one's first language (L1). For instance, linguistic knowledge of the L2 may be limited, and the accessibility of this knowledge may be less rapid or automatic.

To better understand the many challenges L2 writers might face in their writing, it is important to first comprehend the process of writing. Writers need to have certain resources available when writing. Chenoweth and Hayes (2001) distinguish three levels in their description of the writing process: a resource level, a process level, and a control level. Linguistic and general knowledge compose the resource level. These resources are called upon for process at the process level, such as translating and revising. The control level contains a task schema consisting of the task goal and a set of productions "that govern the interactions among the
processes" (Chenoweth & Hayes, 2001, p.84). At the control level, other kinds of knowledge resources such as writing strategies might be summoned.

The importance of linguistic knowledge is that it helps establish fluent access to words, phrases, and grammatical structures can lower the cognitive processing load for a writer. This access can thus enhance the writing process and possibly the quality of written text (Chenoweth & Hayes, 2001). Given the situation of L2 writers, this is even more relevant for their writing. Differences in the degree of fluency among L2 writers can be larger due to the differences in L2 exposure, instruction, and language learning aptitude. Difficulties in fluent access to words or grammatical structures in L2 writing will burden the working memory and thus hinder the writing process as well. These difficulties can greatly affect students’ writing fluency and quality of the text. Assumingly, the contribution of these fluency variables to overall writing proficiency will be even larger for L2 writing than for L1 writing. The L2 writer may spend too much time on retrieving the vocabulary or sentence structures to attend to text development or writing strategies, such as organizing the text.

In the context of writing, linguistic fluency is defined as the efficient access to a rich linguistic knowledge base and retrieval of (provisional or transcribable) utterances (Van Gelderen & Oostdam, 2002). Thus, the ability to perform varied linguistic operations – producing a variety of word combinations and sentence structures – is an essential characteristic of writing fluency. This definition implies that internal mental processes determine fluency. This means that linguistic fluency facilitates not only the attention writers spend on meaning making but also the reviewing process at large, since they are able to access necessary linguistic tools for repair. From this perspective, writing and linguistic fluencies differ from each other while the linguistic fluency can enhance writing fluency.

Concluding from the research on writing fluency, teachers of L2 writers, in particular, need to give students as many opportunities as possible to practice writing. This way, processes such as lexical retrieval can become more automatic. Secondly, studies also shows that for the less experienced writers, the writing process was frequently interrupted by revision. This suggests that teachers should guide students to practice effective writing strategies, such as the strategy of "write it down, even if flawed, and revise it later."

Lay (1982) found through her study that the Chinese students relied on L1 when having trouble retrieving a word in English for writing. They would first write that word in Chinese, and then switch back to English to finish writing and complete their thought. Afterwards, those students went back to those words and looked them up in their dictionaries. One student in Hall's (1990) study, when stuck searching for the best word, would write down a close approximation of the word she wanted and underline it, thus flagging it so that she could easily come back later to substitute a word she considered more appropriate. This way, writing fluency can be promoted among second language writers as they allow the ideas to be generated and transcribed with fewer interruptions from the revising. Journaling, either in the form of freewriting or dialogue journaling can play an important role in motivating students to practice writing in a very non-threatening and often interesting manner.
Journaling & Intercultural Rhetoric

Ethnography

Almost twenty years before Connor (2004) suggested using ethnography as a way to employ more sophisticated methodology in contrastive rhetoric research, Liebman (1988) turned two freshman writing classes, one native English Speaking (NES) and one English as a Second Language (ESL), into ethnographers in training. Liebman’s classes explored “whether different communities have different rhetorics, and if so, how they differed” (1988, p 7) by doing five formal writing assignments on intercultural communication that included a summary of Kaplan’s (1966) article and a second paper either supporting or critiquing his views. Liebman’s study provided contrastive rhetoric its most succinct definition as “the study of how rhetorical expectations and conventions differ among cultures” (p. 6).

Interestingly, Liebman commenced her study with a healthy dose of skepticism about the field of contrastive rhetoric stating that she began the ethnography with a “negative view toward contrastive rhetoric” (p.16). Although Liebman apparently set out to disprove the tenets of contrastive rhetoric, her views seem to have transformed as the student-ethnographers discussed Kaplan’s ideas and their own on culturally-driven rhetorical differences in academic expository essay writing in their essay papers, class discussions and teacher-conferences with Liebman. By the end of the semester, Liebman concluded the study with the ability to see contrastive rhetoric as “a powerful and informative concept” (p. 16).

The student ethnographers in this study reached mixed conclusions that neither confirmed nor denied the tenets of contrastive rhetoric conclusively, but seemed to enlarge all participants’ vision of it, as it had Liebman’s. Many students, however, were supportive of Kaplan’s (1966) ideas. Most notably, it is interesting that all three Japanese students in Liebman’s (1988) study confirmed the indirectness of Japanese rhetoric. All three students indicated that indirectness was taught in Japanese, attaching it to Japanese notions of politeness. One student, Junko Tanaka, elaborated, “[The Japanese] prefer to be modest and polite, what we call the old-fashioned way” (Liebman, 1988, p. 10). These cultural and historical explanations of Japanese academic writing conventions were consistent with what researchers have said about Japanese (Hinds, 1983, 1987, 1990; Yoshimura, 2002), Chinese (Matalene, 1985; Shen, 1989), and Korean (Eggington, 1987, Walker, 2006, 2008) compared to American English conventions of academic rhetoric.

Nevertheless, students did not unequivocally support Kaplan’s work (1966) but expressed some feelings of ambivalence about Kaplan’s conclusions. One student, Kazumi Mase, summed up the complexity of the topic well:

My first idea [when reading about Kaplan] about linguistics was that a person that doesn’t speak a language can never understand the structure of that language. However, as I’ve done my research I understand that my idea about the language was wrong. Although I’ve been speaking Japanese more than twenty years, I had never noticed that Japanese was such an indirect language until I researched it by myself. (Liebman, 1988, p. 11)

This is the type of response that I have often heard over the years whenever discussing the topic of intercultural rhetoric and speaks to why it is important to allow students to become
ethnographers and study the principles of contrastive rhetoric research and the artifacts of writing for themselves. Students or educators often become angry if they believe their languages or cultures are criticized or stereotyped, especially by “outsiders” who may not speak their languages. Notwithstanding, if engaged in lengthy, thought-provoking student-centered examination and discussion, many students will acknowledge, even appreciate that important differences do exist between the different rhetorical communities (Walker, 2005, 2006). These rhetorical differences not only hold implications for our audience preferences for writing styles but the differences in audience rhetorical expectation often lead to interference in reading comprehension as well (Chu, Swaffar, and Charnay, 2002; Eggington, 1987). Interestingly, many Arabic students agreed with Kaplan that their rhetoric was full of parallel structure as Kaplan (1966) had suggested of the Middle East, using the Biblical proverb as an example. One of Liebman’s (1988) Arabic students attributed this parallelism and coordination of ideas to the influence of the Quran on his writing.

Conversely, many students voiced at least some disagreement with Kaplan (1966) in some way: half of the ESL students and two-thirds of NES students dissented to some extent. Liebman (1988) indicated that many of these students basically agreed with Kaplan but took exception to some of his methods and ideas. Largely, the students’ criticisms are similar to those voiced by Kaplan’s (1966) scholarly critics contending that his original ideas concerning contrastive rhetoric were over-generalized, too simplistic, product-centered, and more indicative of ideal rather than student writing.

It also seems noteworthy that significantly more NES students were critical of Kaplan (1966) than ESL students. This is often the case among educators, too. It is often the ESL teachers who are most skeptical and critical of contrastive rhetoric theory (Walker, 2005, 2006; Yoshimura, 2002). ESL teacher skepticism and the NES student skepticism in Liebman’s (1988) study may derive from being exposed to many different language and culture backgrounds in the same class so that L1 rhetorical patterns are difficult to identify and even harder to try to comprehend. Such skepticism may also be attributable to American ethnocentric thinking in that Americans have been described as overestimating individualism in themselves and others (Kohls, 1995). Furthermore, criticism of contrastive rhetoric has also been recently attributed to a heavy influence of postmodernist thinking (Atkinson 2004; Connor, 2004; Walker, 2008) that treats generalizations of culture with great suspicion.

At last, although the results are mixed, Liebman (1988) stated that even though she began the ethnography with a “negative view toward contrastive rhetoric” (p.16) that she concluded the study with the ability to see contrastive rhetoric as a “powerful and informative concept.” (p. 16) Despite allowing her own perspective to creep in, for so many of the papers do reflect her opinion” (p. 16) Liebman (1988) concluded that the students in her classes had benefited substantially from this ethnographic approach to their writing classes and the further sharing of their ideas in teacher conferences. Liebman’s method of employing ethnography and teacher conferencing would significantly influence my own quasi-experimental classroom study of contrastive rhetoric-oriented writing instruction many years later (Walker, 2004, 2005, 2006).

The potential for journaling to be combined with ethnography should be obvious to even the casual server. Students in Liebman’s study could have used freewrites to reflect on their observations of rhetoric in their writings and those of peers, record their thoughts on Kaplan’s research, or express intercultural insights gained as a result of their study. Electronic discussion board-type journaling could be used to generate interactive discussions of intercultural rhetoric in model essays, responses to intercultural rhetorical theorists, or again to compare intercultural
ideas of good writing. Finally, dialogue journaling could be used for teachers and students to have an interactive discussion on issues of intercultural rhetoric.

**Teacher Conferencing and Peer Response**

Sixteen years after Liebman (1988), I conducted a quantitative study of 65 university level students in six English Grammar and Composition courses at Handong Global University in South Korea (Walker, 2004, 2006). This study reinforced the ethnographic approach—not by studying artifacts—but by holding interactive, contrastive rhetoric-oriented discussions in teacher conferences and peer response sessions. This study found that contrastive rhetoric-oriented writing instruction rendered in teacher conferences and peer response groups helped lower-level Korean university writers make significantly better improvements in their essay writing when compared to their control group peers, who only received contrastive rhetoric-oriented writing instruction through classroom lectures, discussions, and written feedback on essays. My study of contrastive rhetoric teaching methods for EFL university students established that 1) contrastive rhetoric instruction, taught even through the traditional composition methods of lecture and written feedback on essays (control group), can help students write better English academic essays; 2) contrastive rhetoric-oriented use of specific composition techniques such as teacher conferencing and peer response activities in tandem can significantly increase the improvement in students’ English academic essay writing, especially for lower level English composition students (Walker, 2004, 2005, 2006).

This study’s main contribution is the finding that contrastive rhetoric-oriented writing instruction can be an integral part of a writing curriculum, especially when traditional lecture and written feedback are reinforced with innovative teaching techniques such as teacher conferencing and peer response. It is important to note that this effect bears great significance since it was the low level students, those needing improvement the most, who received the greatest benefit from the teaching treatment. The implication of this finding is even more noteworthy because a vast majority of ESL/EFL university level writing students may indeed enter their undergraduate writing courses as low level writers, as was true in this study (41 of 65 subjects). Succinctly stated, contrastive rhetoric-oriented writing instruction reinforced by teacher conferencing and peer response activities could be helpful to a majority of second language writing students in many contexts (Walker, 2004, 2006).

Research on teacher conferencing informs us that teacher conferences make great forums for facilitating student higher order thinking, building struggling students’ confidence, and reinforcing principles of English rhetoric taught in the classroom (Carnicelli, 1980; Jacobs & Karliner, 1977; Oye, 1993; Patthey-Chavez & Ferris, 1997; Walker, 2004, 2005, 2006). Whether it is the native English speaking (NES) college freshman (Bartholomae, 1985) or the second language writer who has difficulty adjusting to the culture of American-style college education, one-on-one, “non-direct” discussions (Rogers, 1994) with students about their writing in teacher conferences can help students to internalize writing principles and apply them to their own writing through social interaction (Newkirk, 1995; Patthey-Chavez & Ferris, 1997; Vygotsky, 1978). Thus, the forum of teacher conferencing is an ideal place for students to receive sound, individualized attention and advice about their papers and also learn to make their own rhetorical decisions regarding what would be the best way to present their ideas to a given audience.
The potential for journal writing to facilitate intercultural rhetorical study of writing are clear: they can be used to either plan an interactive conference employing non-direct instruction or as a reflective assignment. Journaling could take the form of a dialogue format, to let the teacher know what the most helpful and unhelpful elements of the conference were. Journaling plus teacher conferencing could also be used in combination with peer response and ethnography to increase the effect.

Peer Response

A substantial portion of existing research in contrastive rhetoric (Kaplan, 1966; Lieberman, 1988; Ramírez, 1991; Walker, 2004, 2005, 2006) multiculturalism (Dunn, 1997; Ladson-Billings, 1994; Ravitch, 1990), and cooperative learning (Kagan, 1992; Ladson-Billings, 1994; Slavin, 1987) suggests that the types of small group discussions found in peer response activities may increase audience awareness of and sensitivity toward cross-cultural issues. It stands to reason, then, that such increased awareness of and sensitivity toward cross-cultural issues would enhance students' understanding of audience and their proficiency in making sound rhetorical choices. Better rhetorical decision-making would then lead to improved academic writing, perhaps both in the first and second language. Notwithstanding, while there is a wide consensus in the field of composition among researchers and practitioners concerning the merits of teacher conferencing, the issue of peer response, especially in ESL/EFL writing, seems much more complicated and controversial.

Some scholars have been quite positive about the potential advantages of peer response (Mendonca & Johnson, 1994; Mittan, 1989); others have been more cautionary (Carson & Nelson, 1994, 1996; Connor & Asenavage, 1994). The Mendonca and Johnson study (1994), however, involved graduate students, not the typical undergraduate composition students that are of the greatest concern in this study. Connor and Asenavage (1994) noted in their own study that peer response had minimal impact on the revisions of the essays of the college freshmen they examined. Of even greater concern to ESL/EFL writing instructors, especially those working with East-Asian students, is the finding that student responses to peer response activities in collectivist cultures such as Chinese, Japanese and Korean has, in many cases, ranged from lukewarm to hostile (Carson & Nelson, 1994, 1996).

Notwithstanding, the incorporation of peer response activities into the writing curriculum has become increasingly more common and popular in recent years, even in East-Asia. The underlying theoretical justification for this growing trend seems to be based on the Vygotskian concept that social interaction helps the student to internalize knowledge. In composition, for instance, this Vygotskian notion has found manifestation in Bruffee’s (1986, p. 774) assertion that “new ideas are constructs generated by like-minded peers.” In other words, the Vygotskian idea that social interaction helps students to internalize knowledge fits well with the composition instructor's goal to increase audience awareness among student-writers through the creation of authentic discourse communities discussing and internalizing appropriate standards of academic writing.

When peer response activities work well they offer students more opportunities to explore ideas and exercise higher order thinking skills, take a more active role in their learning, and become more adept at negotiating and expressing their ideas (Mendonca & Johnson, 1994). Peer response activities may also enable students to gain a greater sense of audience through peer feedback, hone critical thinking skills needed to analyze and revise writing, and gain greater
confidence in their own work by observing, first-hand, the difficulties that other students are having with their own writing.

On the other hand, Carson and Nelson (1994, 1996) have found that students from collectivist cultures may respond differently, seeing peer response activities as either unhelpful or even intimidating. In collectivist cultures, it has been often observed that students may tend to give only positive feedback in order to keep harmony in the group and avoid embarrassing a group member, especially one senior in status. Another limitation found in peer response activities is that students who are unsure of what they are doing tend to make only surface corrections to the papers they review and offer few, if any, helpful suggestions regarding rhetoric or content (Leki, 1990). This conclusion concurs with Connor and Asenavage’s (1994) disappointing finding that little revision came from peer comments (5%) in their study.

In my own experience, peer response sometimes works well, and at other times it does not (Walker, 2004, 2005, 2006). I have found in my own classes that peer response works much better when a lot of time and energy is taken to set it up. Students respond better when instructors thoroughly explain the expectations of the peer response activity; inform students of the benefits of doing peer response; outline the role of students as friendly coaches giving advice (not as overbearing teachers); explain why both positive and corrective comments are helpful to their peers; admonish peer reviewers to go beyond making surface corrections; help students be immersed into the activity by teaching them to prioritize feedback; and provide students checklists that explicitly state clear criteria for good writing. It also helps to allow students to be introduced to peer response by initially working on neutral papers, ones that do not come from their peers. This allows students to gradually adjust to the idea of critiquing more easily.

Journal writing could be used to enhance the effects of peer response. First, peer response must be carefully introduced to students so that they know why they are reviewing the papers of their peers, what benefits they should receive from the activity, and how they should proceed with it. They could write a reflective journal such as a freewrite or a dialogue journal to get them to reflect upon the purpose of peer response. Also, students could be asked to write a reflection on their experiences with peer response as to whether they thought they were being helped with the activity as well as why or why not. As a dialogue journal this could become part of an ongoing discussion between teaches and students as to how class activities could be improved.

**E-Learning: The Cutting Edge**

These days everyone wants to incorporate technology into the classrooms to facilitate better classroom instruction. Not surprisingly, technology has great potential to raise cultural awareness as it brings people together. Xing, Wang, and Spencer (2008) investigated the potential impact of e-learning on raising overseas students’ cultural awareness and creating an interactive learning environment to improve the rhetorical composition of Chinese English as a Foreign Language (EFL) students. The researchers defined five features of “contrastive” rhetoric. These five areas included (with East-Asian style appearing first in the pairings)

1. **Inductive v. Deductive (Delayed Thesis)**
2. “Start-Sustain-Turn-Sum” v. “Introduction-Body-Conclusion”
3. **Circular v. Linear (Topic Sentences and Changes)**
5. **Explicit Discourse Markers (Transitions)**
Simply stated, the researchers contend that East-Asian when compared to American-English style academic writing 1) features a delayed thesis statement; 2) turns more to unrelated subjects or other angles than proceeding in a linear fashion; 3) contains fewer topic sentences but incorporates more topic changes; 4) employs more metaphor and 5) uses fewer transition markers. Xing, Wang and Spencer (2008) studied 90 Chinese students with 15 English university lecturers including 60 doctoral of philosophy students (Ph.D.) at Harbin Institute of Technology (HIT) in China. Thirty students were put into an experimental group and thirty into a control group. Thirty remaining students were undergraduate Chinese language studies students who provided a baseline for identifying rhetorical features in Chinese. Students in both experimental and control groups received four hours of English language instruction per week. In addition, the experimental group students used the e-course for supplementary writing instruction. Primarily, students in the e-course could gain awareness of and proficiency in the various rhetorical styles by viewing models of essays using Chinese and English rhetorical patterns and obtaining advice from tutors and other students on their writing via electronic chat rooms and bulletin boards.

The results of the study demonstrated that significant differences existed in the rhetorical styles between the Chinese and UK writers (instructors). The Chinese doctoral students in both experimental and control groups improved their rhetorical proficiency on essays significantly in the study. The control group with conventional writing instruction improved in two of four areas (number of paragraphs and position of thesis paragraph) while the experimental group improved in three of four areas (two aforementioned plus number of discourse markers) although there were limitations in the e-learning course in availability of materials and limited opportunities to be online with native speakers. Thus, intercultural rhetorical instruction applied through the e-learning environment appeared to facilitate higher rhetorical proficiency in the target language of English for the Chinese doctoral students.

This study reflected the power of journaling better than any other for intercultural rhetorical studies. This study used a type of journaling in electronic discussion boards where students compared and reflected upon model essays, critiqued each other’s writing rhetorically and frequently discussed the differences between rhetorics, interculturally. Moreover, students benefitted by this application of e-journaling. The power of this effect might be multiplied if combined with other effective composition techniques such as teacher conferencing and peer review, maybe even more so if journaling was employed with those activities as well. Needless to say, such journaling does not need to be exclusively electronic. Similar journals could be given as in-class activities as well.

**Journaling and Multicultural Identity Reconstruction**

The last stop on the journey for a second language writer would be to form a mature and enlarged sense of self with a reconstructed identity that fully comprehended the thinking and writing processes of both cultures. Speaking of intercultural rhetoric, the writer would be able to fluently make well reasoned choices concerning rhetorical style to suit the purpose of the writing and needs of the given audience as well as satisfy the desire for self-expression. Building upon ideas from intercultural rhetorical studies, this section explores the final frontier, the relationship between writing and identity among ESL students. An old Chinese says goes, “Wen xiang shi ren,” which means one might know a person so well that without even looking they could
recognize them by their fragrance. Figuratively speaking, this is a good description of the relationship between writing and a person, more precisely the individual’s identity. Being transplanted in a completely new environment, second language writers almost inevitably encounter challenges in many aspects of their life and study. Ullman (1997) states that immigrating to a new country affects a person’s social identity and requires a readjustment in various areas of individuals’ life.

Thus, to better adjust to the new circumstances, it is a necessity for ESL students to construct a new, more enhanced, self-identity through their communication, negotiation, reflection, and emergence in the community. English teachers of international students are obviously one of the influential people that can make an impact on those students. Creating a community of writing practice, where students feel safe and free to express themselves, communicate with, negotiate, cooperate, and even challenge each other, can help students construct a new self-identity to better assimilate into the culture. Naturally journal writing can provide that safe place and help empower students to negotiate the new environment in which they write more effectively and comfortably.

To further explore the relationship between identity and writing, it is important to look at how identity has been defined. From a sociolinguistic perspective, Norton (2000) described the word ‘identity’ as ‘how a person understands his or her relationship to the world, how that relationship is constructed across time and space, and how the person understands possibilities for the future’ (Norton, 2000, p. 5). Ivanic (1998) proposed that identity emerged as a result of social interaction and affiliation to a particular community (Ivanic, 1998, p. 12). Further, she discussed that identity development involved the conflict and confrontation of individuals with the powerful impact of dominant ideologies and discourses.

Norton (2000) portrays the relationship between language and a learner’s identity as reciprocal. Language helps construct an individual’s identity; in return, the learner’s identity constitutes his/her language. According to Norton, an individual’s identity development is a continuous process to which language contributes. Shen (1989) supported these views on how her own identity had changed through her own writing experiences. She stated that she had a mixed self identity when first starting writing for her ESL class in the United States. The concept of indirectness and conservativeness she was taught in China when expressing oneself was very much in conflict with what was expected by his ESL teacher in the United States. In America, she was supposed to speak up concerning her own opinions and be more direct and explicit. Thus, Shen was confused in the beginning, and she even felt an initial sense of loss of her identity. Shen’s case clearly illustrates how her old self-identity composed of her writing and how that writing was confronted by the expectation required from a different identity.

Sandra Lee McKay and Sau-Ling Cynthia Wong (1996) proposed that L2 writers establish their changing identities within specific conversations and multiples discourses. Ivanic confirmed this point of view by stating, “Self should not be conceived of as something to be studied in isolation, but as something which manifests itself in discourse” (Ivanic, 1998, p.18). Gee (1990) argued that identities are tied to language and correlated with particular discourses. Sarup (1996) also proposed that identity is constructed “in and through language” (p.47). This statement again conveyed the message that identity should be studied within one’s discourse. In other words, a piece of writing is not merely a text, but rather partly contains who the person is.

The identity construction process begins from communication, negotiation, and editing to revision, when the writer finally remakes the self. As time passed by, Shen (1989) initially went through a process of denying herself by completely accepting the new, enhanced, hybrid identity,
reconstructed in combination of the old Chinese self and a new Westernized self obtained through writing (Shen, 1989, p.466). This example perfectly demonstrated how writing can reflect, penetrate, and help shape a person’s self-identity.

Beebe (1984) argued that ESL’s language learning is not only a sociolinguistic process but also a psycholinguistic process; this learning process involves the transformation and assertion of the learners’ cultural identity. That means, the learners may choose to accommodate to the speech of their audiences, conform to norms, negotiate identity via linguistic choices to express him- or herself. Recent empirical studies has documented more about the interrelatedness of second language (L2) acquisition and identity formation (Kanno & Applebaum, 1995; Norton, 1997, 2000, 2001; Norton & Toohey, 2001; Pierce, 1995). Research in these studies all agreed that the experience of learning a new language is also the experience of identity construction, transformation, and negotiation.

To achieve a full participation of ESL students in writing and constructing their coherent identities, teachers can choose to utilize journal writing both in class and through online discussion. An online community can be created for students to communicate and write, given some students are more conservative and shy. On-line discussions can help relive students from the pressure of face-to-face interactions (Cooper & Selfe, 1990; Harasim, Hiltz, Teles, & Turoff, 1995; Herring, 1999; Jonassen, Davidson, Collins, Campbell, & Haag, 1995).

In essence, identity construction and negotiation among ESLs is a complex and layered process. ESLs cannot merely acquire a new language and its writing rhetoric through rigid memorization, but rather practice to learn and build themselves a coherent identity in a new environment. Wenger proposed that working together toward a common goal is an ideal environment for learning. Goals could be achieved, had learners had a sense of community and respect particular opinions (Wenger, 1998, p. 214).

It is important for students to practice and learn together as a community; teachers should create such a writing environment for them to grow and excel in their potential. Communities enable their members to enhance the understanding of learning both now and in the long run. Studies show that imagined communities enable their members to connect their current actions and identities to their future visions, which provides a legitimate reason and motivation for their tasks and activities. Journal writing can be an essential part of that practice opportunity forming a discourse community to build writing fluency, cross-cultural rhetorical awareness and a reconstructed multicultural identity. When combined with other techniques in intercultural rhetorically-oriented writing studies, such as ethnography, teacher conferencing, peer response, and electronic discussion boards, the old traditional journal can become an even more formidable tool for empowering second language writers.

Abstract:

STARS: Students and Teachers Achieving Reading Success
A school district-university partnership

The purpose of this poster session is to demonstrate how the S.T.A.R.S. program (Students and Teachers Achieving Reading Success) was created to meet the guidelines from IRA for reading specialist candidates. This collaborative project between the university and the local school district was designed and implemented to provide field experiences for graduate students, while providing instruction for struggling elementary-aged readers. This initiative provided a model for other university and school districts to provide low-cost instruction for elementary students during the summer months.

In collaboration with the local school district and the nearby university, STARS was created. Elementary students had instructional experiences with informational text; graduate students would provide the resources, strategies, and instructional methods during the program to meet their requirements in their coursework. Both the school district and the university benefitted from this collaborative, however, the elementary students made the greatest gains in literacy development and performance.
Title
Andragogical-Pedagogical Orientation and its Implication for Law Enforcement Training

Authors
Yvonne Hunter-Johnson and Dr. Waynne James
University of South Florida
yohunter@mailusf.edu and wjames7846@aol.com

Abstract
The training academy of any law enforcement agency serves as the educational platform for personal, professional and academic development of law enforcement officers. It is imperative that the training provided is reflective of best practices to enhance learning, curriculum design, educational policies and instructional techniques compatible with the educational orientation of their learners. This study utilized the Student Orientation Questionnaire (SOQ) to analyze the educational orientation of law enforcement officers and its relationship to rank, years of service, academic background, age, gender and its implication for training. Activities would include identifying learners’ educational orientation.
Case Studies of Teachers’ Implementation of Formative Assessment in a Networked Classroom

**Introduction**

In this paper, we report on the implementation of formative assessment in a networked classroom by two seventh grade teachers. The two teachers participated in a research study of implementing formative assessment in a networked classroom using the TI-Navigator System and graphing calculators. They participated for two years of implementation as part of Project FANC\(^1\), a three-year research study funded by the National Science Foundation. The goal of the research study was to investigate the use of formative assessment in a networked classroom as it affects middle grades student learning of algebra concepts. In particular, to study the effects of teachers using formative assessment with the TI-Navigator System\(^2\) for two years and compare them to the effects of teachers using formative assessment for one year after receiving professional development in formative assessment the first year.

Black & Wiliam (1998a) defined “formative assessment” as “all those activities undertaken by teachers, and/or by their students, which provide information to be used as feedback to modify the teaching and learning activities in which they are engaged” (p. 7). When using formative assessment, the teacher provides specific feedback rather than only grades to students. The feedback can be oral or written comments addressing what students have done well or have not done well with suggestions for how to improve. Moreover, self and peer assessments are highly recommended formative assessment strategies because they can help students to develop the habit of reflection and to become more aware of the learning goal, learning gap, and how to close the gap (Black et al., 2004). Evidence has shown that formative assessments, if appropriately implemented in teaching, can produce substantial learning gains for students at different ages and across different subjects (Black, Harrison, Lee, Marshall, & Wiliam, 2004; Black & Wiliam, 1998a; 1998b; Wiliam, Lee, Harrison, & Black, 2004). As straightforward as it may sound, in reality, formative student assessment has proven difficult to implement (Ruiz-Primo & Furtak, 2006; Shavelson et al., 2006; Yin, 2005). One of the challenges is that

The views expressed in this paper are the views of the authors and do not necessarily represent the views of the National Science Foundation.

\(^2\) TI-Navigator™ is a networking system developed by Texas Instruments that wirelessly connects each student’s graphing calculator to a classroom computer.
many formative assessment strategies take too much time to be used practically (Black & Wiliam, 1998b). For example, it is time-consuming for teachers to create lessons with planned formative assessments, and it is almost impossible for teachers to provide specific feedback on each student’s work, especially with a typical teaching load of four to six classes daily, with 20 to 30 students in each class.

In *How People Learn* (National Research Council, 1999), classroom networks were suggested as one of the most promising technology-based education innovations for transforming the classroom environment. Some early findings demonstrate its potential to overcome one of the greatest hurdles to improving classroom assessment: the collection, management and analysis of data (Roschelle, Penuel, & Abrahamson, 2004). While feedback loops in the regular classroom are very slow, classroom networked technology has the capability to provide rapid cycles of feedback to improve ongoing activity in real time. Using the TI-Navigator System, what students know and can do is easily assessed and anonymously displayed. Students can enter and send their responses to the teacher computer and teachers can easily send questions, and receive, organize, and display students’ answers, so that the interaction between the teacher and students and among students is greatly facilitated. Four functions of TI-Navigator System are particularly helpful for formative assessment implementation: (a) Quick Poll—allowing teachers to immediately collect and display all the students’ responses to a question; (b) Screen Capture—allowing teachers to monitor individual students’ work progress at anytime; (c) Learn Check—allowing teachers to administer quick and frequent formative assessments and provide timely feedback; and (d) Activity Center—allowing students to work collaboratively to contribute individual data to a class activity.

The teachers in a study by Owens and colleagues found that students in TI-Navigator classes were perceived to be more responsive to individual learners’ needs, more focused on knowledge building and assessment, and more community centered (Owens, Demana, Abrahamson, Meagher & Herman, 2004). However, although the teachers obtained information about student’s knowledge, they did not necessarily change their instructional procedure based on the information obtained. The researchers found stronger evidence for technology implementation than for change in instruction. (Owens, Pape, Irving, Sanalan, Boscardin, & Abrahamson, 2008). Because classroom observations found that teachers did not make full use of the potential of the connected classroom for formative assessment in the study by Owens, et al, it was important to design the Project FANC Professional Development (PD) model around a framework for formative assessment when using TI-Navigator. The case studies reported in this paper give insights into how teachers’ views of students, assessment and technology, their pedagogical practices, and their mathematical content knowledge for teaching, among other factors, influenced their implementation of formative assessment in a networked classroom.

The participants were divided into two groups, called FA and NAV, and all teachers were provided with laptop computers, LCD projectors, Elmos, and a classroom set of TI-73 calculators at the beginning of the project. During the first summer, the participants in the NAV group received TI-Navigator Systems and received PD using the TI-Navigator for
formative assessment while the FA participants received PD in formative assessment only. Each group participated in five follow-up sessions during the first school year as well as received coaching visits from project staff. During the second summer, the NAV participants received continued PD in using TI-Navigator with more of a focus on formative assessment, while the FA participants received TI-Navigator Systems and PD on using the TI-Navigator for formative assessment. Additional follow-up sessions for the combined groups continued through the second year as well as continued coaching.

Data sources for the case studies were background information provided by teachers, classroom observation field notes, notes from coaching visits, focus group and individual interview videos, writing prompts, and the Learning Mathematics for Teaching assessment. While case study data were collected for 10 participants, we have chosen to report on two participants, Ms T and Mr. R., because of distinct characteristics they have in common. Both teachers 1) were relatively new to the profession, 2) taught in schools with approximately 900 students using a form of block scheduling, 3) were comfortable using technology, 4) handled technology issues well, 5) had positive experiences with using TI-Navigator, and 6) have good classroom management. In addition, their entire mathematics departments implemented TI-Navigator, in part, as a result of Ms T and Mr. R.’s participation in Project FANC. There were also differences in the two teacher’s backgrounds and the manner in which they implemented formative assessment using TI-Navigator as well as other differences that are reported in the descriptive case studies that follow. As the multiple sources of data were analyzed both with individual teachers and across the group of 10 teachers in the case study, the following categories emerged as a means for reporting similarities and differences that could be applied to Ms T’s and Mr. R.’s implementation of formative assessment using TI-Navigator: Context, Experience with Project FANC, Classroom Management, Comfort level with TI-Navigator, Mathematics Content Knowledge, View of Students, Pedagogy, Discourse, View of Assessment, Use of TI-Navigator, Technical Issues, School and Collegial Support, Professional Growth, and Looking Back/Looking Forward.

The Case of Ms T

Context
Ms. T is in her 30s and had one year of teaching experience in middle grades mathematics when she became a participant in Project FANC. She began teaching after attending a Teach for America Program summer institute to be an elementary teacher. She expected to teach at the elementary level since she was trained to teach third grade in the Teach for American institute. However, there were no elementary teaching positions when she came to start teaching in Hawai‘i, so she was asked if she wanted to teach mathematics or English. She chose mathematics and was given the position as an eighth grade teacher at a middle school five days before the start of school. In her second year she moved to 7th grade because the school loops and teachers follow their students from 7th grade into 8th grade. Ms. T teaches in a middle school with approximately 900 students in an economically disadvantaged community with 66% of students qualifying for free and reduced lunch, 24% English Language Learners, and 10% Special Education.
The ethnic majority is Filipino, with minority populations of Samoans, Native Hawaiians and other Pacific Islanders. The school has a large immigrant population, qualifying many students as English Language Learners who do not speak English as their first language. The school has not made Adequate Yearly Progress (AYP) and they are an Americas Choice school. Forty percent of the students were proficient in the past year with 11% exceeding, 30% meeting, 17% approaching, while 44% fell below.

Ms T’s background provided her with interest and expertise for using technology in her classroom.

My undergraduate background degree was in Mass Communications with a specialization in Computing and a minor in Human Complex Systems. Both of my academic disciplines had an emphasis in technology, which has affected my approach to solving problems in my classroom.

There are several computers in the back of Ms T’s classroom and the classroom is equipped with a Smartboard. On the sideboard there are progress charts of each of the periods that track student preparedness for class (coming with planner, uniform, homework done and ID around neck).

**Experience with Project FANC**

Ms T was assigned to the NAV group, therefore participated in PD on formative assessment using TI-Navigator and received the Navigator System during the first summer PD. The second summer she participated in PD that focused more on formative assessment in a classroom that has a TI-Navigator System. Ms T said her first year of teaching, which was prior to her participation in FANC, was a total disaster, "I had no training and it was totally on-the-job training." As part of the Teach for America program, she entered the University of Hawai‘i’s 'on-the-job training' master’s program in teaching with an emphasis in secondary mathematics. She received a master's degree and secondary mathematics certification after two years of teaching. She also had a mentor from the University of Hawai‘i coming in to help her. Ms T said the second year was a lot better after receiving training as a part of Project FANC the summer after her first year of teaching, “And I think it was a lot better because the training the grant gave me was the best training I had out of Teach for America, University of Hawai‘i’s Master’s program, America's Choice and the schools training because it was the most mathematics-based."

After the first summer PD, Ms T was so excited but said, “I could not remember everything we had done cause we learned so much.” She said the coaching visits helped her remember how to use some of the features of Navigator. At the completion of FANC, Ms T felt really good and put herself at an 8 on a 1 – 10 scale for using TI-Navigator. However, she thinks she can implement more, “If we had time to collaborate and learn, I could be better and could bring it up to a 10, but I still feel hesitant especially on Learn Check.” She feels there is so much on the TI Activities Change website that she would like to learn about and think about where it fits into the curriculum. She said, “I still feel like there is more out there that I have not explored.”
Classroom Management
As students come into Ms T’s classroom they go to the front of the room to get calculators from the wall caddy, take a hub and connect the calculators without any direction from Ms T. She reminds students that their role as an audience is to pay attention and ask questions when they see something that they do not understand.

Ms T organizes lessons around ‘I Can’ goals, which are based on benchmarks, to introduce an overall structure of the class to the students. She created an ‘I Can Toolkit’ with the strategies of self-regulation in student friendly language to ‘guide students’ metacognitive practices’. She works on ‘cultivating a classroom environment that promotes self-sufficient learning’. In observation field notes it was stated that, ‘Ms T’s classroom management is exemplary. She seems to run a student-centered classroom although it is clear that she is directing all classroom activities and conversations. The classroom environment is generally relaxed’.

Mathematics Content Knowledge for Teaching
Ms T’s content knowledge for teaching was assessed using the Learning Mathematics for Teaching assessment developed by the University of Michigan. Her score on the pretest was 97% while her posttest score was 89%. She has also passed the Praxis Content Knowledge test in Mathematics for secondary certification.

Although Ms T used multiple representations in her lessons she tended to move quickly among representations such as a tables, graphs, and equations during her first year. Her pacing improved the second year and she was able to limit how much was appropriate to present to students in the allotted time.

Ms T was trying to be mathematically accurate, but was not always sure of her information. For example, in one instance Ms T said, ‘I don’t think diameter is a dimension…it is a measurement.” During a lesson on measures of central tendency, she defined the median as the middle number rather than defining it as middle of the distribution of the data with half above and half below.

View of Students
After Ms T’s first year of teacher she said that she wanted her students to become better self-regulators so she designed an I Can Toolkit that outlined the stages of self-regulated learning. The title of her master’s paper, Teaching Students to Self-Regulate Their Learning, reflected the focus she was placing on self-regulation. A poster on the front board outlined these stages and the class reviewed each step of the I Can Toolkit and modeled the expected behaviors.

• I can identify the goal of each problem.
• I can monitor my progress as I work.
• I can check my answer.
• I can re-read the question and use my own resources before getting help.

Ms T saw an algebra teacher that was talking about 'I Can Algebra' and she borrowed from that system. The algebra teacher had a blog spot where he had mini lessons and practice problems that she incorporated into her classroom instruction. During the Focus
Group Session following completion of the first year of FANC, Ms T reflected on the changes she had made.

I felt the big shift this year was in general taking the gateway to knowledge out of my hands and putting it into the students hands because before all 90 of my students had to come through me. Unless they were in class or coming through me they had no way to access the knowledge. The website and doing that way of formative assessment was like putting it into their hands.

Ms T said, “I challenged my students to check the accuracy of their answers by trying to represent their answers in multiple ways and going back to plug in their solution.” She also wanted her students to help each other more. She described what she does to help make this happen.

I ask them, “Have you tried yourself? Have you asked your partner before you ask me?” I want them to ask their neighbor. If I showed them once I guarantee someone in their group remembers so they should be asking before they ask me. I am trying to give them the tools to help each other.

Ms T said she specifically uses formative assessment with TI-Navigator to help inform students of their progress, “My thinking was that if students knew their needs they could then self-regulate their mistakes.” She says her students are excellent at using the graphing calculators, and the technology enabled meaningful participation from all her students. During a compliment activity that Ms T did in her classroom, students were thanking each other for helping them when they had troubles with calculators or Navigator issues or if they did not know what screen they were suppose to be on. In talking about the activity, Ms T said, “It was good that they thought people helped them out and it wasn't always me. It was their neighbor.”

Ms T mentioned that she was not sure how students did on the FANC student assessment but noted scores on the Hawai‘i State Assessment for her first year in FANC took a huge leap especially for her lower students. The students in her second year of the project started out better with two high classes and they could explain more and do higher-level thinking. There was more discourse, with students taking charge more and arguing and using mathematical terms. The one lower class did not seem to grow as much and she attributed that to furlough Fridays (During this year, students in Hawai‘i did not have instruction on 17 Fridays due to the financial crisis). She said she has learned that, “ It is hard to know if every individual gets everything every moment. I have allowed things to develop over time more where not every individual gets everything everyday.”

Interestingly, after the first year of using TI-Navigator Ms T observed that boys were more engaged by the technology whereas in her first year of teaching she really felt that the females in her class were outperforming the males.

I don't know if that is like middle school or what but the boys seemed like this is something they could relate to more. Not that the girls did not take to it cause they definitely did but I think I saw my male students rise up to that level of engagement and be like equally into the conversations and into the math.
Pedagogy
During observation and coaching visits Ms T demonstrated that she was very comfortable and efficient in using technology. She said she was so excited to get the Elmo and projector because she hated teaching with just the white board marker her first year. She said that was not the way she learned. When she was in middle school, all students had laptops in the public school and she was in a laptop program.

Teachers had projectors and Elmos and college teachers had them. I was educated in the beginning of technology coming into schools and came here and felt like I went back in time as now I only had a whiteboard. I was so excited to get technology cause this is more the style I felt more comfortable with in teaching. I was passionate about implementing technology in daily routines with my students.

Ms T wanted to have computers in her classroom so she sought out donations from an insurance company and other sources to buy some computers to place in the back of her classroom. She believes that students can access knowledge whenever they want and can use Google to learn about any skill they want. She noted that using the technology was not the same as completing investigations in class.

I wanted to help my students the first year, prior to FANC, but it was on my time and I felt like I was the gatekeeper to knowledge. I would hold study sessions when I had time on concepts I chose. I wanted to put the keys in their hands and have them access knowledge. I wanted computers so got donations from First Insurance and some other people so I was able to get computers. I thought with the computer you can access any knowledge anytime so you could use Google for whatever skill you want to learn. Not that it is the same as trying to investigate it in class but making your class more hands-on and investigative and group work is awesome but it is not going to hit every type of learner. So if a learner can do things on their own they can use the computers. I wanted my class to be group work so there is a lot of group work in class. If they are more of an individual learner, OK, that is on the website. If they want to go and practice and do things on your own or look up things they can do that. I wanted to get it paced on your own so that was why I was getting all the technology.

Ms T broke the standards down into ‘I Can” skills and then made a website so that her students could work on them at lunch, after school, or at home on their own time.

They could try to go back and relearn it, rewatch the video, do practice problems and show me they have been trying to relearn it on their own. If they still have problems I can help them or they can take it to someone else. They can come with a partner.

In addition to using PowerPoint to present lessons, Ms T also uses the online National Library of Virtual Manipulatives to demonstrate concepts. Students then use the virtual manipulative website on the computers in the back of the room to further explore concept being studied.

View of Discourse
Ms T’s classroom discourse has changed since she began teaching and she credits her participation in FANC for some of that change.
The grant made me realize that you have to have students talking and sharing their thoughts every 10 minutes or you are losing them. If I don't hear their thoughts or what they are thinking for a while then I might not realize they are not getting something. So the more I can hear from them the better and Quick Poll is a really good way to hear from them quickly.

She said that her first year of teaching, prior to FANC, was ‘super-traditional’ and she had rows of desks. Students were not working together and she had behavior problems. She contrasted her first year with how her classroom has changed.

The first year students just said let's ask teacher and I would tell them. Now I try not to tell them or say what students can say. I know my kids know a lot and they can either argue it out or come up with it if I give them the opportunity.

With the Navigator System, Ms T’s classroom setup has shifted to tables and she allows the students to talk more. She said, “I allowed them to present their ideas more. It is a lot better when they talk more cause they teach each other. There are 10 teachers in the room instead of one.”

She has also changed the way she handles homework. She asks students for suggestions of homework problems they want to go over in class, assigns problems to groups and then asks them to present their work on the Elmo. She says the classroom is ‘more of a talking classroom.’ Discussions are changing over time and she is especially focusing on the dialogue between students. Ms T has sentence starters posted on the front of the room that are divided into three parts: 1) The Problem [I was trying to find…], 2) Your Process [I did…because…] and 3) Your Answer […]which makes sense because…].

I started using sentence starters to help students have the words to start sharing their thoughts and putting the time into that to really develop that among students so they were able to have intelligent discussions among themselves. I could remove myself from the discussion and have them asking each other questions and having them share and explain in more detail. They have a list for when you are presenting because I felt students were always going up and saying their answer. I wanted that to be the last thing they said. I wanted them to talk about what they were looking for, what they did, and the last thing they could talk about was what they got. So it was giving them a context for what they were going to present.

Students were also provided audience sentence starters such as 1) I agree or disagree with you because…, 2) What do you mean by…, 3) I see how you did this, and 4) I did it a different way. She asked them to use them because ‘sometimes people will be presenting and then nobody is doing anything’.

It is because they all agree but no one is raising their hand to say I agree with you so I am just kind of pushing students to say something. Everyone's responsible and it helped, too, when I started doing sentence starters to have students write it down and then say it so they have a bit more time to process. They knew what they would say cause they are so stage fright so ‘shame to talk’. I am working around that and trying to pull them out a little more because discussions are so rich and people benefit from them. I was having a hard time getting those discussions started outside of me because I can always be the one to push it but I would like it to come from the students more.
Ms T says she loves it when her students argue about mathematics and drew parallels to what she experienced during the PD provided by Project FANC.

It was cool because we would always do it in our trainings and, even with all these people that know a ton about math, people still have disagreements. I enjoy it when my students can argue and disagree. It is so empowering for them to have a voice.

### View of Assessment

When talking about how her ideas of assessment were formed, Ms T said that letting go of grading and formative assessment came from Project FANC. She also said that using the Elmo came from the project since during the PD teachers came up and shared and she also viewed videos of other teachers using it to have kids talk more. Ms T noted that, “Even if you get the equipment it doesn't mean you know how to use it.” She had visited the high school that her students will attend and saw that all the teachers had Elmos but she did not see any students using them.

During Ms T’s first year of teaching she said, “I did more of a traditional quiz or a test with a lot of benchmarks in it and just modeled after other people.” She said her students viewed their grades as some magical formula and they did not understand where their grades came from. So in her second year of teaching when she was a participant in FANC, she changed the way she assessed. Ms T assesses her students on 24 different benchmarks, written as I Can Statements, on a scale of 0 – 4. They have to get a three or four to pass. Students have to pass twice to get mastery and their grade is how many skills they have mastered out of how many benchmarks were assessed. She has multiple versions of every benchmarks assessment so she may give two in class and then the other three are available for make-ups. On any day, students may be working on all different skills. Ms T has developed a process to check that students have been practicing on their own before they retake assessments. They can do practice problems or watch lessons on videos, but they need to show her that they have been trying to relearn it on their own. She feels that the first time students may not have been ready but, now that they have done reviews and used the concepts in other contexts, students are really a lot better at understanding the material. Students take the make-ups at lunch or after school. Ms T said that the students are more motivated because they are responsible and in control. As soon as they retake the assessment she updates their grades and they can check them on the computer and see it right away.

Ms T uses a standardized item bank to draw from because although she thinks the Connected Mathematics textbook is excellent and really investigative, she believes that some of the tasks are not up to the standard of what the state is asking. She takes problems from the item bank or more open-ended problems from the back of the book to construct assessments.

The assessment may be a constructed response or one in which they have to think creatively. Maybe I will give two, where one is like a quiz form and one is a project. Those are the only things I count in their grade. So for three weeks they are doing all the things that are not in their grade and they are still doing it so it wasn't about the grade. Now we do tons of things that are not in their grade and
they are still doing it and they are engaged. If the activity is engaging enough they will do it because it is exciting to them and it does not need to be in their grade. Ms T said that this change for assessments totally changed the time constraints that she had.

We will do stuff in a set time in class. But as long as a student wants to come back and keep on retaking various assessments for that skill, they can. I saw a lot of students at any of the quarters or at the end be really successful with things we did at the beginning because we had reviewed and they had seen them on homework. So it really made me understand that students totally learn on different times and having a set date when everyone has to know this by this date is not developmentally appropriate for all students. Just making that available to them almost makes everything we do in the whole year formative because we always were learning from our mistakes. Even on those assessments that were more summative, the students could still learn. They could still retake assessments and they could still be forming a concept throughout the year.

Changing the way she did assessments changed Ms T’s understanding of assessments in general because ‘everything kind of became a formative assessment where they were always forming the concepts and I just allowed that to take place and they took that seriously’. She said students took it upon themselves to make up things that they missed even if it was on a quiz she was going to go over in class.

Ms T said that the Navigator System was one piece that influenced her change in assessment. Previously, she would walk around and see what everyone had on their paper, however other students in the class could not see what she was able to view. Ms T said that with students submitting data in Activity Center all students in the class could view all of the data.

It is like taking the power out of my hands and giving them the view that I have. I wanted to inform my students instantly so I could empower them to be the agents of change. Ms T talked about a time when she collected student’s first attempts at solving an inequality that she sent out in a Quick Poll and allowed students to have reflection time. She did not identify their misconceptions or tell them the correct answer; she simply encouraged them to go back and reflect on their answers for accuracy. She asked questions like, “Does your solution meet all the conditions? Have you tested your answer?” Then she waited. After the wait time, she collected second attempts and noticed that the number of correct responses jumped from eight to fifteen students.

I believe that my students, regardless of their achievement level, have the potential and ability to use mistakes as learning opportunities. In English class it seems like students get lot of opportunities to edit their work, but in math students get an answer wrong and then have to practice what they learned on new problems without having a chance to re-do the exact same problem. With the TI Navigator system I have been able to give more feedback and allow students an opportunity to re-do the problem after they evaluate it.

When students gave correct answers, Ms T went on to ask them how they knew. When students said that ‘it was obvious’, she continued with asking them how they could prove it
Comfort level with TI-Navigator
Ms T felt that the Navigator System was ‘awesome’ but that there was a lot of information to learn during the first summer PD. In addition to learning the technology, 7th grade mathematics was new to her as well. Learn Check is the feature of Navigator that she did not use very much the first year since she was not sure where to fit it into the curriculum. She used Quick Poll for a lot of different things.

It was too hard to do Learn Check. I was kind of going through it with the students. I did not know much about 7th grade math let alone how to implement the technology because I never taught 7th grade before. But students loved the calculators right away.

Ms T uses Quick Poll to hear from her students, “If I don’t hear their thoughts, I need to hear from them and Quick Poll is easy way to hear from them quickly.” She also uses Quick Poll to collect homework answers, opinions on things, for an interest question about what they would be doing for the day and to see if students agree or disagree on various things. Ms T uses Quick Poll most of the time for right at the moment questions although sometimes it is planned to start the lesson. Ms T also used Screen Capture and uses the Activity Center for collecting data when they are doing representations so they do not have to spend so much time collecting the data.

Using TI-Navigator
Ms T said that in her first year of teaching, she had a false perception of what her students understood because of the discussion of the stronger students or students she would call on.

I would get this feeling like they know it. Using TI-Navigator shows me a real clear picture of who does not get it and what are they coming up with. It is not just for me, but also to make it apparent to the whole class so they can all benefit. Because my higher students get it, they may not have the opportunity to see misconceptions and where that might have come from. When students submit a line in Activity Center and one is off, there is an opportunity for the higher students to look at why it would be off. It is another formative assessment tool for someone who is always getting it to look from another perspective what could have gone wrong. It is a way to expand their mind and their view of things.

In an interview, Ms T talked about a lesson in which she used the Activity Center to collect data from her students and then had them make box and whisker plots. Students were given a list of data about 100 students and how many movies they watched per week. Students were asked to start with a sample size of five. They were told to randomly generate five numbers between 1 and 100 with the calculators to choose their sample. Students created box and whisker plots of their data on their calculators. Screen Capture on TI-Navigator was used to display what each student’s box plot looked like with their samples of five. When the captured screens had variations based on who was in the sample, they did sample sizes of 10 and then 25 out of 100. Ms T displayed the students’ box plots so they could see how they were different or similar. As they moved from a sample of five to 10 and then 25 their box and whisker plots started looking like each other. They could see that there was a larger variation when the sample size was small and closer to each other with a larger sample size. Then they did all 100 and the box plots
were captured with Screen Capture so students could see how that with 25 it was similar to the representation of 100 but with five it was difficult to make interpretations. Ms T found the Screen Capture feature of Navigator invaluable for this lesson.

It was great to have screen capture for that lesson. You can see that on your own but for some students, just by chance, their first one with a sample size of five might have been similar to the real one. But some students were way off so they could see that with a super small sample size you are not always going to get the same results. They could tell that because suddenly they saw everybody’s up there at the same time whereas if you just make your own you could be misled. It was easy for students to compare and they started making the connections on their own by actually doing it. I don't think I could have done that without spending a lot of time by hand if I did not have the Navigator system. It was really cool!

Ms T conducted an action research project in her classroom as a requirement for her Master’s Degree at the University of Hawai‘i. In her paper she stated the one of the purposes for her research was to explore how to use the technology in her classroom to address the needs of her students.

Students were able to self-regulate their answers when they saw their shortcomings and resubmit corrections. For each concept assessed with the TI Navigator system, I tracked students’ initial responses and follow-up data to look for improvement in the formative process. In all of the instances where data was compared between first and second attempts, there was an increase in the number of correct answers in the second attempt. Not only did the number of correct answers improve between first and second attempts, it also improved over a series of follow-up questions that practiced the same skills. That means students were not only learning from their mistakes on problems they evaluated, but they were getting better at the skills as they practiced. I saw my struggling students pick up on the process the higher students were modeling. Evaluating the data gave me a deeper understanding of how formative assessments could actually be used to help students ‘form’ concepts. The TI-Navigator system served as a great tool for checking progress because it allowed the whole class to see all of the responses. There were key formative moments that took place during our class discussions in response to the data.

Ms T also sees the limitations of TI-Navigator.

Sometimes I feel the Navigator System helps that everyone gets it but sometimes I feel it is more class based because students may just jump on board with what is going on because now all the information is out there. I try to figure out how not to disclose too much too fast. Sometimes a student has this misconception that comes out when they are sharing and another student has a question and that is like a really rich experience. But if you put it all up with TI-Navigator first, the student that had the misconception might not be willing to share anymore, because she or he realizes she or he is outnumbered or sees other answers and decides to change it and not know why. I have had to pull back on the timing - know when to have class discussion and have individuals share their ideas before they look at what class thinks I have students do writing activities of the trends they saw and have people share out at the end.
Technical Issues
Ms T said she wanted to ‘hop in’ and get started but she did take the time to have every student practice. In reflecting on the first year of using Navigator, she noted that it was important to have students do all the things they can do to troubleshoot. After teachers in the NAV group received the new model of access points and TI-Navigator software, the number of communication errors eased. However, Ms T had to reinstall TI-Navigator to get the Activity Center to work properly. She also had a charging bay that sometimes did not charge. Like other teachers in project FANC, Ms T did occasionally have calculators that needed to be reset by removing the backup battery. Probably the most bothersome technical issue was when the projector bulb burned out, and even though the projector was under warranty, the company said that the number of hours for which Ms T had used the projector was more than normal use. That was because Ms T uses the projector and Elmo everyday and the TI-Navigator most days.

During one of her lessons Ms T posed the following question, “If you put 60 chocolate chips in an bowl and make a dozen cookies, will each cookie have five chips?” She wanted to use Activity Center’s frequency plot to simulate the problem, but the projector was not talking to the computer even after restarting. A colleague from her department was observing her so she was so ‘bummed out because it would be so much better on the computer with the Navigator’. Ms T described how she has learned to troubleshoot and asks herself, “How else can we do this if we don't have this at this exact moment when you are planning on doing something.”

School and Collegial Support
Ms T said that she is, “Happy to be in her job.” She has been working with the department chair at her school, who also was a participant in the NAV group, to encourage administration and the rest of the mathematics department to integrate technology into their classrooms. She presented her findings to her colleagues at her school in order to ‘encourage teachers to rethink their formative assessment practices and how they support learner independence’.

The entire mathematics department at Ms T’s school has recently been involved in additional PD on using TI-Navigator for formative assessment. This has provided her with an opportunity to work more closely with her colleagues. During the PD meetings, she has taken a leadership role to impact the direction of the work as well as share lessons she has used with TI-Navigator and the ways she used it for formative assessment. She has commented on how this PD was so good for their school and that it provided an opportunity for the department to talk about mathematics, which they had not often done.

Professional Growth
A statement that Ms T made indicates her intense desire to grow professionally, “Instead of just being on the receiving end of research and teacher trainings, I was excited to take an active role in my own professional development and classroom.” She definitely did take an active role in her own professional development by the enthusiastic way she approached implementing formative assessment with TI-Navigator. As a result of the
manner in which she implemented technology Ms T was asked to be a member of the instructional team for a summer STEM workshop on TI-Navigator.

Ms T’s professional growth was influenced by a several different factors since in addition to being a participant in FANC; she was enrolled in the Teach for America program, which led to a Master’s Degree from the University of Hawaii with secondary mathematics certification. While Ms T felt overwhelmed having so many things to do, she also felt very appreciative for the opportunities.

It all happened at the same time. All the pieces needed to be there for me to try all things I wanted to do. I was fortunate because everything happened at once for me so I changed as a teacher all at once because of a lot of different factors.

The two main problems around which Ms T built her master’s degree paper were: a) students are rarely taught to regulate their own learning and this affects their ability to become independent people and b) formative assessments are not utilized to their fullest potential as opportunities for students to monitor their progress. Her professional growth was definitely affected by the process of seeking solutions to these problems.

The systematic inquiry and reflections definitely improved my teaching practices. I documented my students’ behaviors thoroughly in a way I had never done before this study. With each new intervention, my intense introspection spurred new ideas that became a stimulus for change in my classroom. I grew a lot in this experience, and even though the impact of my study is currently small, my own changed mindset could have an immense impact on my classroom in the future. This study gave me a greater understanding of how I could emphasize independence in my lessons over the course of an entire year.

Looking Back/Looking Ahead

Ms T said she was sad when Project FANC ended because she liked working with everybody and she respects them and looks up to them as professionals. She mentioned one participant in particular whose school she would like to learn more about and the direction they are taking their mathematics instruction.

Ms T continues to be involved in the PD opportunities that are available to her and has expressed her strong interest in developing self-regulated learners.

I truly have a desire to see my students achieve and think on their own so I hope to continue to grow in this area as I contemplate where to draw that support line in each activity we do. It is tough as the teacher to get used to turning over the ‘lead role’ to students and taking on more of a ‘supporting role’ to let them shine.

Summary

Ms T’s desire for using technology in her teaching and belief that students should have ready access to knowledge with technology came out clearly in the data. While presented with challenges her first year of teaching, she fully took advantage of the opportunities Teach for America and enrollment in a master’s program gave her. However, she felt that the professional development she received from Project FANC was most influential.
There are several common themes that run through Ms T’s case study that can be seen in her view of students, view of assessment and use of TI-Navigator. Ms T wanted her students to become self-regulated learners and she orchestrated her assessments and used TI-Navigator to move students in that direction. The design of the I Can Toolkit, changing her assessment method, and providing a means for students to monitor their progress all put more responsibility on the students. The TI-Navigator played a large role in helping students self-regulate their learning because they received immediate feedback.

**The Case of Mr. R**

**Context**
Mr. R is in his 30s and had three years of teaching experience in middle grades mathematics when he became a participant in Project FANC. Both of his parents were teachers and he commented that his father was strong in mathematics. Prior to participation in Project FANC, Mr. R was in his current teaching position for one year. His colleagues view him as the ‘tech’ person. The middle school where Mr. T teaches has approximately 900 students of which 34.5% qualify for free and reduced lunch, 9% Special Education and 6% English Language Learners. The school met Adequate Yearly Progress (AYP) for the general student population with 46% proficient. However only 23% of the Special Education population was deemed proficient by the NCLB standards so the school is in restructuring. The school has a diverse student body with 29% Filipino, 26% Hawaiian or Part-Hawaiian, 15% Caucasian and 11% Japanese along with smaller numbers of other ethnicities.

Mr. R attended K-12 schools in the Pacific islands and received his undergraduate degree at the University of Hawai‘i at Hilo with certification in elementary and middle school education. Mr. R’s classes have approximately 27 students. His classroom is equipped with at Smartboard and his classroom is well laid out with posters, calendars, progress chart and agenda.

**Experience with Project FANC**
Mr. R reported attending seven professional development programs prior to participating in the FANC PD. He was assigned to the FA group, which focused on formative assessment strategies the first year and then received a Navigator System with accompanying PD the second year. Mr. R commented on his first impressions of the FANC PD.

In the beginning it seemed like it was the same thing I have heard in my college classes. When we got more depth into the FA - Where are we going? What do we do now? - the PD helped me see that formative assessment is not just a pop up quiz but more in depth on addressing the misconceptions. More like thinking as student yourself … how would students approach certain problems and be prepared with questions to address students thinking.

When asked to write about one aspect of FANC that impacted him the most, Mr. R said, “One specific aspect that stood out for me was the opportunity provided for any project
member to share ideas/teaching strategies during the follow-up sessions.” He felt that he learned about different approaches to teaching concepts that he was able to apply to his own classroom. This opportunity helped him work with different skill level students on the same concept using different approaches.

Classroom Management
Mr. R relies on a timer as a tool for class management and he has said, “I love the timer.” He said feels that time goes by really quickly when everyone is engaged and this is a way to keep track of time. In the focus group session he described his use of warm-ups to ‘use the 77 minutes that he has more successfully’. He uses warm-ups on the basic skills to have students working by the time the second bell rings. Students who are engaged and know the answers are given the opportunity to come up an do a quick multiple choice question or write their answers on the board.

Reflecting in the focus group after the first year, Mr. R noted that sometimes he finds himself rushing.

I have seen that a couple of times I am rushing myself and then I give in and give up and just say, “Ponder it.” Then I move on. I see the tendency for them to fall back on the yes and no answers and I accept it because I am forgetting about time. I then go back with a redirection approach and ask, “What would you think about it?” That gets them discussing it.

Consistency is important to Mr. R as he expressed concern that he was not consistent enough sometimes. Some days he would have warm-ups, while other days he would choose to spend more time on a lesson and not do warm-ups. The students would come up and ask, “Where’s our warm-up and I feel bad.”

As Mr. R was discussing getting ready to use the Navigator System after the second summer PD, he also focused on consistency with the technology.

You have to have it set up and ready to go and be on top of it at the beginning of class. Even if you take 5 – 10 minutes into your period just doing things you were supposed to do five minutes before, it is going to take up a lot of time. You are going to have to deal with ‘mine’s not on’ and other small things so just consistency is the thing.

Mr. R’s students sit at tables in groups of four. His classroom is quiet and organized with very little off-task behavior. Students seem comfortable with the teacher and with each other. They know the routines Mr. R expects them to follow. For example, during the second year when Mr. R had a Navigator System in his classroom, students picked up their calculators and hubs and were logged in and ready when class began. During the second year, he used both the Smartboard and TI-Navigator as class management tools.

Mathematics Content Knowledge for Teaching
Mr. R is certified to teach elementary and middle school levels. He scored below 50% on the content knowledge for teaching on the Learning Mathematics for Teaching Assessment pretest and increased to 74% on the posttest after two years as a participant in FANC. Mr. R has said he still needed to work on coming up with questions to have students using higher-level thinking.
I am still at that stage where 'I don't know' and then I get so antsy I end up giving the reason why. The student goes 'yeah, that could be the reason why'. But that's what I said and maybe you are only agreeing with me now so I am still challenged with coming up with leading questions. I can kind of see the misconceptions that students have. But I am not good at asking them why and being ready with the responses they provide and going from there to see if I can go into more depth or just say ‘let's move on’.

Mr. R said that when he lets the students take risks he runs into the problem of not understanding some of the representations they are providing.

I sometimes have to stand back and ask, “Where do you think they're coming from? Is this right, or is this wrong?” I already have a mindset of what the correct answer is and what my way of solving it would be. I know there are different ways. It is just when I run into that then I run into a brick wall and I do not know how to walk around it. Then I pull the students aside and tell them, “I want you to know that you are right but I have a hard time explaining to you why it is correct but it is a different way of looking at the correct answer.”

It takes an insightful teacher to have this kind of introspection and demonstrates that he is growing professionally.

**Pedagogy**

Mr. R tells his students at the beginning of the year that a lot of the learning is going to come from them and from communicating with each other.

I am there to facilitate discussions and make sure you are on the right track - answer questions that you as a group can't answer. At times when I need your attention these are the three words I will use, Stop, Look and Listen. I am thinking of changing this to Pause, Look, and Listen so students do not think it is the end of the opportunity for them to finish their work. I just need them to pause and listen so they won’t miss out on anything that is important. Then they can continue working on where they left off.

Mr. R described the manner in which he uses ‘redirection’ questions with his students.

You have to be prepared to have those redirection questions to be able to put in their terms. They want to answer but they do not understand what you are asking them. They want to think about it. I have learned from a few other students. I adopted some of the questions the higher-level groups were asking each other. That helped me with the lower level students because this was coming from a student and they could better understand their version than my version of the same question.

It was observed that Mr. R is very efficient in his use of time and engages with his students in a variety of ways during a class period. As an example, during one observation he monitored students’ work on their projects, held student conferences, and then introduced and supported a task on how perimeter and area change with scaling. He gives the students very clear instructions and visual models/cues. He builds in multiple opportunities for students to complete their work. Field notes from observations over two years have reported changes indicating that Mr. R has gone from being an overly cautious, novice to a calm, practiced teacher.
**View of Students**

Mr. R said he treats his students using the same concept that was used in his own home as he grew up, “We gave respect to elders and when you earn it, they give it back.” Therefore he ‘gives students back’ if they show respect to him.

Once I see students give me the opportunity to stop them as a teacher and have them look at me and listen then I make sure I return that favor to students in the classroom and almost always outside the classroom. I am not just some authority figure in my classroom and when I go outside I don't know who they are.

Mr. R wants students to feel part of the classroom and he said that he wants to build a relationship with students beyond being their mathematics teacher, “I will listen to you whether it be questions about school or we can extend that and I can be an adult you are comfortable talking to within school if you need somebody.”

Being a second language learner, Mr. R tells the students that he has a hard time explaining himself. Therefore he feels that he can relate to his English language learners and ‘their way of thinking’. He feels he can understand when students say, “To me this is right, how can it be wrong.” He tells his students that it doesn't necessarily mean if he provides them with a tool that they have to use this tool to be correct and illustrates this with a story.

I can give you a bunch of nails and tell you to take this hammer and this is the only tool you can use to put these nails up there. But you are someone who learned to use a rock to put nails in the wall. If you use that rock and still get that nail on the wall then you did what I asked you to do. You just used a different tool. It may take longer than I thought and it would be easier by giving you the hammer but you still got the job done.

**View of Discourse**

Mr. R sets the tone of the classroom for students to be held accountable for contributing to a positive environment. Students who understand concepts more easily are expected to help those who are having difficulty so that they can keep up. He tries to apply Hawaiian values to his teaching.

There is always someone who is more superior to you in some way. You never know in what way a person could be better than you so don't think of yourself as superior over others. Always consider that there is something that the other person can do better than you can and be respectful.

Mr. R is a strong believer in establishing the expectation that students share knowledge instead of the teacher directing them every time. For example, when students have an assignment to complete as a group, he suggests he might randomly choose a paper to grade. He would ask the group if they would be satisfied to have that paper represent their effort. Then he moves away from the group to see if student leaders emerge who will help others.
View of Assessment

Mr. R said his view of assessment has changed and now sees the ideas behind formative assessment. Prior to FANC he had viewed formative and summative assessments as quizzes versus tests. He would give small quizzes on one or two benchmarks and then a final test that grouped everything together. As a result of FANC he learned about the uses of formative and summative assessments and why you would want to have formative assessment and how it can benefit his students.

I was one of those kids that gave the wrong answers and never knew why I gave the wrong answers or what I could do to change. Nobody asked me why I viewed it that way. Now I get a chance to understand that if I address this one problem I see from this one student, it can bridge a whole gap and bring them to where I want them to be by simply asking them, “Why were you thinking this way or what made you provide this as your answer.” I need to address misconceptions and understanding that formative assessment is more than just a quiz, see where the students are and what I need to reteach. Formative assessment goes into depth on misconceptions and why students think this way. Then how can we address it so that we are all on the same page?

Mr. was observed using individual student conferences to address student misconceptions. He seemed to have a very clear idea of where students were in their thinking when he called them up to conference, using their quizzes to give them feedback on their progress.

Comfort level with TI-Navigator

During a focus group held the professional development in the second summer, Mr. R said he was glad that he was pushed into running one lesson.

It helped me come up with my own little shortcuts so I kind of have a better understanding. If I want to prepare something for a short QP I know what I need to do to make it successful. I know what I am comfortable with so far.

Troubleshooting is going to the biggest thing. I am learning a lot of good knowledge but I am going to have to dedicate some time during the summer to really go in and set it up.

After participating in PD on using the Navigator the second summer on using the Navigator System, Mr. R reported that he felt he was a 9.5 on a scale of 1 to 10. He and a colleague at his school who was also in the FA group worked together during the PD so he felt comfortable going into the school year. When asked where he would rate himself after a year of using TI-Navigator, Mr. R said he was a 10 at using the system.

But at coming up with questions to have students using higher-level thinking I am still at a 6 or 7. I am still working on how to view the problem from students' perspective so I can talk more about the misconceptions rather than just the right answer and talking about why a student would give this as an answer instead of 'here are the correct answers'.

Mr. R feels that he is very comfortable with setting up and using the system as a whole group discussion.

It is real easy to use. It is easy to set up. It just takes time each morning to come in and get everything set up and opened so you are ready to collect from the class.
with Class Analysis. That way it is always there for you because if you try to start up the program during class it is going to take forever.

During the focus group session, Mr. R agreed with other FA participants that they thought having all the technology at once like the NAV group did would have been difficult. He added that at the beginning he just used the TI-73s for a reward because they did not want to shy away from the four-function calculator that can be used on the state test and that the ‘TI-73 has a lot of different functions’.

Using TI-Navigator

When asked what aspects of the Navigator System he uses, Mr. R said that his choices depended on the benchmark he is trying to cover. He commented that he had not been very comfortable using Activity Center until third quarter when the class worked with linear functions, graphs and tables. He said his colleague “showed me a lesson that tied into that and how to use that from being a simple warm-up and then tying it into a whole class activity and using the results as a means of discussion in class.”

Mr. R said he tended to use Learn Check (LC) frequently, both as a LC file and a Quick Poll (QP), because, “You can type more into a LC file and send it as a QP rather than using the QP itself. After walking around and noticing that is where the QP comes in.” He said he repeats the process throughout his periods so he is more comfortable by the ‘second day’s first class than first class on the first day’. He uses students’ questions as his ‘leading questions’ for the whole group or uses students’ responses from other classes to challenge students’ thinking.

I will say that someone from another class said this or disagrees and then ask, “What do you think was his approach?” It helps sometimes to clarify things for them and I am not always telling the yes or no as the teacher.

When teaching a lesson on ratios and proportions Mr. R gave students a map and asked them to use the scale from the map to set up proportions to find distances from point A to point B depending on what was on the worksheet. He said that using LC allowed him to assess students’ understanding.

So when we go into Class Analysis and we look at the answers and I see two different setup proportions but still marked as being correct, I would use that discussion as why these two look different when one has miles on the top and cm on the bottom or another has cm on the top and miles on the bottom. Why are they still being considered correct answers? The discussion went really well and students noticed that it was important to use units to identify measurements from the map to be consistent within the proportion.

Technical Issues

When asked what technical issues there had been using the Navigator System, Mr. R took some time to think and did not note any immediately. He then mentioned the importance of clicking on the file that you are sending or collecting, on the TI-Navigator home screen. By clicking on the file it will show the students who received the file or the students from whom the file was collected in Class Analysis. At first, he did not know why student icons were different colors when he was collecting Learn Check files with Class Analysis. But now, when he does not get everyone's responses, he has a way to
check which students’ files were not collected. He was concerned that if this were a
graded activity, he would not have everybody's results. When he uses the Navigator
features to check for sending and receiving results he is able to ‘just going over to
student's calculator and make sure they are online’.

He also reported that at times when he opened TI-Navigator, the access point was not
recognized so the hubs were not connected. Therefore one day he had to trouble shoot
what to do instead of what he had on the board. He said that he had to ‘fall back on using
the Elmo’. He did not know how to fix the problem but then his colleague told him that
all he had to do is just restart TI-Navigator. Mr. R reported that he had called the support
line for TI-Navigator at various times when he had questions.

School and Collegial Support
Mr. R works with a collaborative faculty and describes the faculty as a ‘healthy group’
because they respect each other’s views and are open in seeing where the other is coming
from. Mr. R works with his colleague who is also in the FANC project and sees that they
think very differently from each other. When they sit down and work out problems they
discuss where they think the students will have misconceptions and their different
approaches.

We saw it was easier when the two of us would plan and then we do have our own
approaches. She saw I was doing things she would usually do and then she was
doing things I would do. We are not on same page but still understanding what the
main thing we were going for even if our approaches were different. My
colleague has been very open with understanding that I may not take it in depth
with my set of students as she would with her students and she is OK with that.
She knows that I think that it is good enough for my students to move on with that
understanding versus she where she wants to go. I do everything that is manual
labor and she does everything that needs the thinking part and I have never had a
complaint.

Mr. R’s school is just entering restructuring and he feels that he can provide some
assistance since he had previous experience working in a restructuring school.
What I learned from my colleagues in my former school is that if we stick
together as a department and as teachers everything is going to be fine. I see the
pressure on our own administration right now. They are overwhelmed that we are
going through this and see the state is asking them to do things. I see them
balancing and trying to be fair with everyone cause even our scheduling next year
is not looking the same. I will be teaching an eighth grade class next year so will
have some of my own students again.

Professional Growth
Mr. R feels very fortunate to be at his school and paired with his colleague.
I challenge myself to do the same way she approaches things because I know it
works really well. If I can challenge them and I know what example to use, I don't
have to come up with one myself, I can just use what she does.

He also went back to his college textbooks for ideas.
I go back and read up on the middle school mathematics books I got when I was going through the program. One of the books I have addresses misconceptions and why kids may answer certain ways and what possible backgrounds they may be lacking to help them get to where you want them to be.

**Looking Back/Looking Ahead**
Mr. R has taken a leadership role in his school for integrating the use of technology, and in particular the TI-Navigator. As a result of his students’ enthusiasm, a parent working for an economic development non-profit organization visited his classroom. The non-profit purchased Navigator Systems for the rest of the mathematics department and provided funding for professional development.

I had a very great experience and am glad that it is actually not over as we get to continue it. I am very excited and look forward to helping my own colleagues and sharing with them what I have learned from this program. Since a lot of them are overwhelmed with the tech side, I am happy that I will be helping them be more comfortable. My other colleagues see that I am comfortable setting up and being the tech person so I have been asked and I have always been willing to help them out. I want them to be comfortable and happy with this because I think they will benefit once they start using the program in their classroom. It is definitely better than I when grew up with the textbook. We were told to turn to page so and so. Here are some examples. Do 1 - 150 for homework and I will see you tomorrow. If you want, you can check the answers in the back.

**Summary**
Mr. R’s view of assessment changed as a result of his participation in Project FANC and he now sees how uses of formative assessment can benefit his students. He still struggles with formulating questions to move students to higher-level thinking. He believes that learning should come from the students and he asks them to be accountable for contributing to all students’ learning. Mr. R strives to have an environment of mutual respect and to build relationships with his students beyond the classroom.

It is important to Mr. R to be able to share ideas and his collaboration with a colleague greatly influenced his implementation of formative assessment using TI-Navigator. While he felt very comfortable setting up and using TI-Navigator with few technical issues, it was the planning he did with his colleague that set the direction for lessons.

**Discussion and Conclusions**

Ms T and Mr. R were in different PD groups that met in different locations during the first summer and for follow-up sessions. During the second summer PD, the two groups met in the same building, however they attended different PDs held in separate rooms. During the school year, the follow-ups combined the two groups and that would have been the first time the two teachers would have had any opportunity to talk with each other. However, while Ms T and Mr. R did participate in the follow-up sessions together, they did not tend to share with each other directly.
Both Ms T and Mr. R have successfully implemented formative assessment using TI-Navigator in ways that are consistent with their expressed views of students, discourse, pedagogy and assessment. There were identifiable differences between the two teachers in their view of students. Ms T wants her students to become better self-regulators of their learning and discussed ways of taking the gateway to knowledge out of her hands and putting it into students’ hands. She uses formative assessment with TI-Navigator to inform students of their progress so students could self-regulate their mistakes. Ms T noted that the features of TI-Navigator that allow the whole class to input data or view are important formative assessment tools for both her and her students.

Ms T encourages students to help each other and tries to give them some tools to facilitate that. She asked her students to represent their answers in multiple ways, check the accuracy of the work and ask members of their group for help before they ask her. Students demonstrated that they value this help by complimenting each other for providing help with the technology when they needed it.

Mr. R wants his students to feel part of the classroom and he wants to build a relationship with students beyond being their mathematics teacher. He puts emphasis on understanding his students and offers them respect in return for the respect they show him. He tells them that they do not necessarily have to use the tools he has provided to be correct. Mr. R holds his students accountable for sharing their knowledge with each other and to help those who are having difficulty so they can also be successful. He reminds his students that there is always something that another person can do better than he or she can. In fact, Mr. R listens to the questions the higher-level groups asks each other to help him with questions for the lower-level students. Mr. R noted that while he is very comfortable using TI-Navigator, coming up with higher-level questions when using it for formative assessment is a challenge.

While Project FANC was a good experience for both Ms T and Mr. R and provided a means for professional growth for them, they described this growth in different ways. Ms T’s growth was on a fast track as she had just entered the teaching profession as a Teach for America Fellow, was enrolled in a master’s program and was new to the field of education. The mathematics-based PD of FANC was highly valued by Ms T and the technology that she received allowed her to implement instructional strategies and assessments that integrated the technology. She was able to design her research study for a master’s degree around using TI-Navigator to help her students self-regulate their learning in mathematics. Reflections on her teaching practices spurred new ideas and impacted her implementation of TI-Navigator for formative assessment. After two years of implementing TI-Navigator, Ms T described how she used all the various features of TI-Navigator for formative assessment. She also gained an understanding of ways formative assessments could help students learn concepts better. Ms T noted that she now understands that learning develops over time and not every student will get everything everyday.
Mr. R followed a traditional track to becoming a teacher and had three years of experience in education when Project FANC began. Therefore, much of his growth was building upon or modifying previous knowledge about teaching and learning. He had attended previous PDs and expected the FANC PD to be similar to other experiences. However, he quickly realized that implementing formative assessment could really benefit his students. Since Mr. R had established a style of teaching and had been implementing formative assessment in his classroom for one year, he focused on using the Navigator System with the consistency he feels he needs to maintain in his classroom. Through the sharing of ideas by other Project FANC participants, Mr. R was able to incorporate different approaches into his teaching. However, the admittedly biggest influence came from his teaching colleague who was also a participant in FANC. They planned lessons together and discussed their approaches to implementing their lessons. They each brought strengths to the table with one of Mr. R’s strengths clearly being his comfort level with using TI-Navigator. His primary use of TI-Navigator for formative assessment has been Quick Poll and Learn Check and indicates that he is still working on the formulating good questions.

Both Ms T and Mr. R are using the experiences they have had with implementing formative assessment using TI-Navigator to help enrich experiences for the teaching colleagues who now all have Navigator Systems in their classrooms. Sharing what they have learned will benefit both students and teachers in both their schools.

Implications

Case studies can provide us with a closer view of the factors that influence implementation of PD experiences. As can be seen in the cases of Ms T and Mr. R with the implementation of formative assessment using TI-Navigator, multiple factors were involved in how that implementation was realized in their classrooms. Some of these factors were a result of the PD experience while others came from previous or simultaneous events in their professional lives. When interpreting results to explain the success or lack thereof of professional development, using mixed method methodology to include both qualitative and quantitative analysis should provide a better picture than either used separately.

6. ABSTRACT:

Background/Purpose: GeauxHeart Baton Rouge was a community outreach project aimed at improving access to health care and reducing health disparities in The Greater Baton Rouge community for residents who are especially susceptible to cardiovascular disease but may have limited resources or access to seek preventative care. Cardiovascular disease (CVD) takes a disproportionate toll on many racial and ethnic groups that have higher rates of CVD and related risk factors. Yet, these populations face more barriers to CVD diagnosis and care, receive lower standard of treatment and experience more serious health outcomes than their white counterparts (Bonow, Grant, & Jacobs, 2005). Numerous factors such as income and education, genetic and physiological factors, access to care, and communication barriers are linked to these disparities (Yancy, et al. 2005). This project seeks to bridge the disparity gap by offering free risk factor status assessments and utilizing services and educational materials from the American Heart Association (AHA) programs such as Power to End Stroke and Search Your Heart. The purpose of this community service project is to develop and implement a collaborative community outreach program aimed at promoting healthy lifestyle changes and reducing health disparities in communities that face serious health problems with limited financial means to seek preventative care.

Subjects: Five hundred forty-four male and female subjects between the ages of 21 and 70 were recruited from the Greater Baton Rouge area to participate through a number of health fairs conducted at community and faith-based facilities with predominant socio-economic disparity participants.

Methods: This project consisted of two phases. Phase 1 - Participants were invited to attend one of the "GeauxHeart Baton Rouge" health fairs conducted at local community or faith-based centers. After completing an informed consent, the participants deemed eligible to take part in the health fair activities completed a
short healthy lifestyle lecture (educational component), completing questionnaires and preliminary cardiovascular health-risk screenings. The health history questionnaire and body composition (heart rate/blood pressure; blood glucose; cholesterol; body fat index) measurement values were obtained to establish each subject's cardiovascular risk level and to provide initial risk reduction and health promotion information (diet; exercise; community resources, etc.). The cardiovascular risk level was determined by a medically accepted algorithm to identify low, moderate, or high risk of cardiovascular disease. The algorithm criteria was based from classification systems established by the American College of Cardiology (ACC), American Heart Association (AHA), American College of Sports Medicine (ACSM), and the New York Heart Association. High and moderate cardiovascular risk subjects were then identified and invited for optional participation for additional follow-up testing in Phase 2. Based on information gathered from the questionnaires and health risk assessments, participants deemed at moderate-to-high risk for cardiovascular disease (ACC/AHA/ACSM guidelines) were contacted and offered free clinical testing (ankle-brachial index and 12-lead ECG exercise treadmill test) conducted by qualified personnel at Louisiana Cardiology Associates as part of Phase 2 of this project. Exclusion criteria for Phase 2 were inability to walk on a treadmill, pregnant, and individuals with contraindications to exercise testing (ACC/AHA, 2002; ACSM, 2006).

**Results:** Of the 544 subjects participating in the project, 116 subjects met the inclusion criteria for Phase 2 follow-up free clinical testing. A total of 50 subjects accepted the invitation for additional testing (8 subjects did not show up for testing). From the Phase 2 testing, nine subjects (2% of the total subjects) were recommended by the attending physician for additional consultation due to abnormal or health status findings.

**Conclusions:** Baseline data from this project provided much needed evidence about the cost-effectiveness of conducting community-based cardiovascular risk assessments and the clinical value of follow-up exercise testing in members of healthcare disparity populations. Additional longitudinal studies are needed to investigate the long-term efficacy of the medical history questionnaire and health risk assessment algorithm developed by the investigators to cost-effectively identify cardiovascular high-risk subjects.

Transformative Learning & Subject Matter Experts

Abstract: This paper explores the potential transformative learning experiences of subject matter experts collaborating with instructional designers during e-learning course development. Particularly, is there a disorienting dilemma within the context of the instructional design process as a catalyst for shaping transformation? If so, what does the transformation look like?

There is a growing momentum on education mediated by computer technologies, or e-learning service delivery. The development of e-learning service delivery requires an instructional designer who applies instructional design principles to developing content area. The instructional designer analyzes the goals, needs, and characteristics of the learner to understand the instructional situation. Then, it is the instructional designer’s responsibility to build the subject matter content, provide guided practice and assessment of the content area all of which is completed without having content expertise. While reading textbooks or reference materials on content area may be helpful, instructional designers talk to experts in the content area, known as Subject Matter Experts. Subject matter experts are generally busy people and optimizing instructional designer and subject matter expert time can prove challenging during the process of eliciting sufficient information so that the instructional design process can proceed.

Subject matter experts are the content area specialists in a particular field of knowledge. They may be an academic from a college or university, a business person, a health care provider, a military expert, trades or industry person or a medical or legal professional. One of the functions of the subject matter expert in what Keppell (2001) refers to as the Content Production Process is to provide accurate subject area content during the design process. The subject matter expert has two roles: to provide a clear description and explanation of the content area, and to assist the designer in conceptualizing, clarifying and verifying the content (Keppel, 2001, p. 3). Keppel’s (2001) own work as an instructional designer has enabled him to “interact with over forty-six subject matter experts in the gas and oil industry in Canada from July 1993 to July 1994. Content areas included cementing, acidizing, fracturing, coil tubing, pipeline pigging, hydrostatic testing, vehicle inspections and nitrogen” (Keppel, 1991, p. 602). It is the role of the instructional designer is to shape the content for the audience. However, the subject matter expert is a major factor in determining the success or failure of the project (Keppell, 1991, p. 602).

A review of the literature on the instructional designer and subject matter expert procedure revealed a topic largely dominated by Keppell (1997, 2000, 2001) who promotes the Content
Production Process (CPP) for assisting instructional designers in eliciting and conceptualizing unfamiliar content from subject matter experts. Keppell’s (1997, 1999, 2000, 2001) research and the literature at large is void of a voice from the experience of the subject matter expert’s point of view of the content production process. In considering the theory of transformative learning and how it may have applications on the subject matter expert experience, the following literature review is provided.

Transformative learning theory (Mezirow, 2000, 1991) has been around for over 25 years and has become the most researched and discussed theory in adult, higher and continuing education. “It is a theory that is partly developmental, but even more it is about where learning is understood as the process of using a prior interpretation to construe a new or revised interpretation of the meaning of one’s experience in order to guide future action” (Mezirow, 1996, p. 162). Recent studies are raising questions about the research trends in transformative learning theory, what new understandings may have been discovered and the role of experience, critical reflection and relationships in the transformative learning process (Taylor, 2007, p. 174).

A study by Taylor (1997) endeavored to build on Mezirow’s (2000, 1991) transformative learning theory by investigating the literature about perspective transformation. The literature provided much to support Mezirow’s (2000, 1991) theory yet suggested a need to reconceptualize the process of transformation and recognize the influence of context as being a catalyst in the process. Recommendations identified the minimization of the role of critical reflection and the increased function of other ways of knowing. Other ways of knowing, or unconscious knowing sheds light on an aspect of the learner that is outside of the learner’s consciousness and not easily defined (Taylor, 1997, p. 14). Taylor (1997) determined that:

Transformative learning needs further study to provide a greater understanding of the varying nature of the catalyst of the learning process (disorienting dilemma), the significant influence of context (personal and social factors), the minimization of the role of critical reflection, an increased role of other ways of knowing, and the clarification of the definitional outcome of a perspective transformation. (p. 16)

Ten years later, Taylor (2007) reexamined the various purposes, settings and methodologies that had surfaced in the previous literature supporting Mezirow’s (2000, 1991) construction of transformative learning and its relationship to self-development and pursuit of autonomy. Noting that a shift, had occurred from identifying transformative experience in various settings and stages of transformation, towards making sense of the factors that shape the transformative experience; preceding research had continually focused on critical reflection as essential to transformative learning. Taylor (2007) identified new concerns over a lack of discrimination regarding critical reflection which appeared to assume that all forms of reflection were significant (Taylor, 2007, p. 186). The more recent research by Taylor (2007) calls for a need to explore more informal settings for transformative learning (Taylor, 2007, p. 174).
Regardless of the insufficiencies, a number of significant findings emerged from Taylor’s (2007) study. It appears that the recognition of knowledge change among some participants was not sufficient for a transformation to reach fulfillment; other factors needed to be in place. Factors like ongoing support to act on the new understanding, as well as guidance to put the new understanding into practice (Taylor, 2007, pp. 186,187). Progressions are required to ensure that individuals have the necessary skills to act on their new understanding. Questions raised in the previous research concerning an individual’s responsibilities regarding the transformative learning experience and the role of relationships in the transformative process continue to linger (p. 187).

Gagne & Medsker (1996) believe that learning is a reasonably enduring modification in individual capacity to learn that is not attributed merely to the progression of development. They argue in favor of critical reflection and reorganizing meaning to arrive at a more discriminative understanding of one’s experience (Mezirow & Associates, 1990, p. xvi). A more discriminative understanding of one’s experience having stemmed from a disorienting dilemma which proceeds to critical reflection toward perspective transformation which the individual ultimately acts upon (Roberts, 2006, p. 100).

Roberts (2007) looks at the effects of disorienting dilemmas induced by adult educators on their learners and the impact on learner performance. Adult educators induce disorienting dilemmas by exposing the limitations of the learner’s current knowledge. This has different effects on learners depending on the learner’s personality, experience, personal issues and the nature of the disorienting dilemma. When a learner’s current beliefs, values and assumptions are questioned, the learner may become angry, argumentative and/or defensive. They may begin to resent the instructor or feel angry, especially if, or when they are shaken by unexpected feedback. Some learners may feel humiliated resulting in feelings of shame which may lead to guilt and even trigger depression affecting all areas of the person’s life (Roberts, 2006, p. 101).

In the event a disorienting dilemma is induced by an adult educator on a learner, a complex love-hate relationship may develop on behalf of the learner toward the instructor. This may result in symptoms such as a decrease in punctuality, absenteeism, reduced participation in class; a general withdrawal during which time the learner may question their decision to pursue education. Some learners may drop the class, the program, or change their career (O’Sullivan, 2002). The reaction of the learner is contingent upon the effect of the disorienting dilemma and how the learner handles it (Roberts, 2006, p. 102).
Some learners may navigate the disorienting dilemma through discourse with others. Cranton (1994) notes that the essence of the discourse varies on the personality of the learner. Some learners may engage in a rational discourse realizing their disconnect experiencing a paradigm shift, exploring new options, a different course of action resulting in their development of transformation. Alternatively, when the essence of the discourse is negative, it may debilitate the learner’s performance resulting in an inability to function (Roberts, 2006, p. 102).

The theory of transformative learning and the role, or presence of a disorienting dilemma may have a minimal, devastating or no consequence at all in the communicative and collaborative process between a subject matter expert and instructional designer during course content development for e-learning service delivery. However, if the premise of transferring course content knowledge to a web based learning platform is contrary to the subject matter expert’s own personal values and beliefs about facilitating learning, they may struggle to come to grips with the transference of their knowledge creating a disorienting dilemma which may be acted out against the instructional designer in one way or another. If, on the other hand, the process of transferring course content knowledge aligns with the subject matter expert’s own values and beliefs about facilitating learning which creates delivery options for learners, there may be a positive relationship with the instructional designer and the presence of a disorienting dilemma not apparent.

Dodson (2009) examined participant’s approaches to resolving critical life events which may be considered disorienting dilemmas. Her purpose was to gain insight into the approaches that were utilized in the resolution of disorienting dilemmas. Findings from her research revealed that factors such as the acceptance of the dilemma, the nature of the dilemma and a variety of emotions played significant roles in changing or not changing perspectives and negotiating disorienting dilemmas. Results also concluded that no transformations were sudden or immediate. Some of the participants reported it took anywhere from a month to six years to even begin processing and resolving their disorienting dilemma. Dodson (2009) also found that most transformations were “modified” and not a total transformation as participants continued to sustain many of their preconceived ideas (Dodson, 2009, p. ii - iii).

Is it possible then for Mezirow’s (1991, 2000) theory of transformative learning, specifically the presence of a disorienting dilemma to play a role, or have implications for the relationship between an instructional designer and a subject matter expert? This study proposes to examine the subject matter expert’s experience working with an instructional designer during the content production process of developing computer mediated learning technology. The research will pose the following questions:
1) What are your experiences working with an instructional designer during the content production process?

2) Did your relationship with the instructional designer play a role? If so, explain.

3) Was there a disorienting dilemma at any time during this process? If so, explain. Do you know what precipitated the disorienting dilemma?

4) What was your response to the disorienting dilemma?

5) Do you think that the disorienting dilemma (If identified) will have any effect on your practice/career? If so, explain.

6) Was there anything you would identify as personally transformative that resulted from the experience? If so, explain.

7) Did you learn anything about yourself as a learner, or about your area of expertise that you did not know before? If so, explain.

8) Does (did) this experience change anything about your practice as you return to your respective career?

Method:

The proposed methodology of research will be snowball and strategic sampling. Expected outcomes are that all subject matter experts will identify useful strategies for communicating and collaborating with instructional designers. Some subject matter experts may identify a disorienting dilemma occurring during the content production process, however, some may not. It is also expected that some interview participants will identify a shift in perspective regarding their own professional practice, while others may not. From the data collected I hope to gain greater understanding of the subject matter experts experience working with an instructional designer developing multimedia learning tools. The results of the data collected will provide useful information for future training and professional development for both instructional designers and subject matter experts.

Furthering a College-Going Culture in Secondary Schools: A University-School-Community Partnership Reports

By Betty J. Alford, Ph.D.
Stephen F. Austin State University
Box 13018 SFA Station
Nacogdoches, Texas 75962
balford@sfasu.edu

In year four of the East Texas Gaining Early Awareness and Readiness for Undergraduate Programs (GEAR UP) project, the project leaders sought to strengthen a college-going culture in the ten partner districts in order that the mission of GEAR UP of increasing the number of low socioeconomic students who access and succeed in postsecondary education would be attained. Because the project leaders recognized that achieving both access and success in postsecondary education for students requires ongoing, interconnected actions, multiple systemic initiatives were employed. These systemic initiatives were designed to meet the project objectives. Specifically, the initiatives were designed to increase the rigor in classes and increase student participation and success in advanced level classes; to provide outreach and support to students to enter and perform successfully in the classes for on-time graduation with fewer absences; to increase the number of students who will graduate under the Distinguished Graduation Plan, and to increase parents’ knowledge of the importance of challenging courses, of the steps needed for college access, and of the requirements for financial aid.

The initiatives occurred within a local context and were designed to meet the unique needs of each individual campus through a carefully designed implementation plan. The designers of the yearly campus intervention plan included a GEAR UP coordinator and the campus GEAR UP council which included the principal, key teachers, the counselor, a parent, and a student. An advisory council of business and community partners provided input on the merit of the project’s work and recommended additional ways to meet project goals. All activities of the East Texas GEAR UP project were designed with the goals of achieving sustainability and systemic change as guiding forces for the work of the project. The East Texas GEAR UP project sought to serve as an integral part of the campus in meeting local district goals rather than as an isolated, add-on activity. The project leader connected the project with supporting initiatives, such as, the State of Texas Closing the Gaps in College Readiness campaign and the local P-16 Council for Angelina and Nacogdoches counties. Also, the project leader recognized the importance of principal leadership as a key factor in strengthening a positive campus culture of high expectations for all students. Therefore, focused leadership institutes for principals were an integral part of the university-based professional development. Distributed leadership was very important in this school improvement effort. Therefore, individual institutes for counselors, for GEAR UP council members, for student leaders, and for the community were held. Each event was carefully evaluated to discern next steps. The GEAR UP special projects coordinator, the GEAR UP principal investigator, and the project director met regularly to review overall project data and to determine next steps.
Primary components of increasing college readiness includes developing intellectual openness, inquisitiveness, analysis; reasoning, argumentation, and proof; interpretation, precision and accuracy, and problem solving as well as strengthening content knowledge, developing academic behaviors, such as, time management, and study skills and increasing college knowledge (Conley 2007). In improving the academic performance of students in the East Texas GEAR UP project, increasing student access and success in rigorous, advanced level classes was a primary intervention. An important part of improving access was developing dual-credit, concurrent enrollment classes, and Pre AP and AP classes. For example, one partner school added an option of nine dual credit classes from no dual credit classes that were offered. The high schools are strengthening the additional dual credit, concurrent, and AP courses to assist students in attaining 12-18 hours of college credit before they graduate. Attaining college credit while in high school can serve as a motivating factor for students to attain a college degree. For example, students in one partner high school are taking college algebra in high school. A teacher shared her enthusiasm for this initiative stating, “It has been an absolutely wonderful experience for us and for the students. The professor, our school’s graduate who teaches at SFASU, has gone out of his way to check on the students to ensure mastery of algebra.” A teacher added, “The whole program has gone above and beyond expectations.” Teachers enthusiastically reported that enrollment in AP classes has grown. New courses have been added, such as, Pre AP Algebra I, Pre-AP anatomy and physiology and AP history. A partner school council member also shared, “At the middle school, we now offer Pre AP in all four core subjects and are in conversations to create a plan whereby every student takes an upper level course.”

A part of improving the academic performance of students has been providing faculty development to increase teachers’ knowledge and skills in teaching Pre AP and AP courses. Another part of increasing students’ academic preparation has included providing support. A teacher explained the merits of a geometry Pre AP preparation camp that was provided at Angelina College by Angelina instructors with business and community support, stating, “College visits or some type of summer program make a lot of difference.” With 100% attendance every day, and with the districts providing transportation to the college each day, students were able to move into geometry Pre AP upon successful completion. This pilot camp then served as a model for a one day math camp that was provided during the school year for the remaining GEAR UP partner schools.

Improving Academic Achievement

An administrator stressed that three elements are particularly influencing the improvement of students’ academic achievement. These elements are professional development for the teachers, strengthening the academic foundation of students, and building positive relationships with students. This administrator pointed out that it is not enough simply to add advanced level classes. Students must be encouraged to take the
classes; teachers must gain skills in teaching diverse students’ advanced level content; and structures, such as, advisory groups must be designed to ensure that students develop positive relationships with adults. In a partner school, for example, each teacher is assigned an advisory group of nine students. A teacher explained, “We meet with them, check their grades, and try to offer a helping hand.” Other campus partners are seeking to overcome the anonymity of a large high school through an advisory group for all students. One partner campus further provided support for positive relationships with students through a high school Achieving via Individual Determination (AVID) class for students.

With the focus on the preparation of students for the rigorous challenge of advanced level classes, access to the classes has increased. In all partner schools, the numbers of students taking the advanced classes has increased. Overall, the participation of enrollments in advanced level course in the East Texas GEAR UP Project has increased from 8,970 enrollments in 2007-2008 to 11,004 enrollments in 2008-2009. An integral part of encouraging more students to take the advanced classes is that schools have open enrollment for the Pre AP classes. Building a strong foundation and a pipeline to the dual credit, concurrent enrollment, and AP classes has been instrumental in improving the academic performance of students in the GEAR UP cohort. A high school teacher who was very pleased in the results being achieved in her high school of increased numbers of students taking advanced level classes commented, “I am extremely proud of our school, because for a small school, we offer many AP and concurrent courses as well as offering Angelina College courses at night.” As she further noted, “Our enrollment is up in all of these classes, and I think that’s due to GEAR UP. I really do.”

Administrators and teachers emphasized that improving the academic performance of GEAR UP students would not have been possible without professional development. Enriching professional development opportunities were provided, such as, AP training, participating in the College Board Forum, visiting another school to gain ideas on strategies to implement in a summer academy, attending subject specific conferences, such as, the state conference for the advancement of science.

*Increasing educational expectations of participating students*

Key initiatives in increasing the educational expectations of partner students included targeted student interventions as well as having all students take the PSAT and participate in a math intensive day at Angelina College. Targeted interventions at one partner school included implementing an English course for Hispanic males that targeted Hispanic males to prepare them for the Pre AP and/or the Gifted and Talented Program. The targeted intervention resulted in half of the class members moving into a Pre AP class and half into a gifted and talented program that included two AP classes. As a teacher shared, “This intervention has been a big success.” Another targeted intervention has been provided for female African American students. In this English class, the girls studied female African American writers. The teacher credits the GEAR UP program with being “instrumental in allowing us to come up with flexible programs that are working to increase the number of minority students taking Advanced Placement
classes.” Also, GEAR UP has helped to provide a robotics program for students that, as a teacher reported, “Is helping students to see the relevance of higher academics, such as physics and advanced math.” The students are learning academic content but also key cognitive strategies of problem-solving and working as a team.

The Role of College Visits and College Fairs

College visits have also served as an integral part of increasing the educational expectations of students. During year four of the East Texas GEAR UP project, multiple college visits with small groups of students have been provided to further enrich the whole class college visits that the students participated in during 7th and 8th grade through GEAR UP. An e-mentoring initiative was provided to two GEAR UP campuses. In this intervention, university students who were preparing to serve as secondary teachers were paired with 10th grade students. Topics were explored, such as, “What is the best way to prepare for college, and how is financial aid attained?” At the end of the semester, the high school students who participated in the e-mentoring group project visited SFASU for a program of activities that included the opportunity to meet their mentors in person and participate in class activities. The success of this e-mentoring project was shared through a DVD as a Texas GEAR UP Promising Practice. The DVD was filmed by the State GEAR UP project and was provided to all high school in the state of Texas through the State’s GEAR UP website. A teacher shared the students’ enthusiasm, “On the trip to SFASU, the students were very excited because they were able to e-mail a student from SFA then meet the mentor in person. They were really excited about having a mentor. They didn’t want the program to end.”

Encouraging all students to attend the College Fair with recruiters from multiple universities, colleges, and the armed services was also cited as highly beneficial for students. In addition, a part of increasing expectations for college for students has been requiring students to keep portfolios of their high school accomplishments. Service learning has been stressed. Students are encouraged to document service activities as a resource when they later are completing college application forms. As a teacher stressed, “We have provided nice portfolios where the GEAR UP students can document service. That way, when students are applying for college or even completing job applications, they will have the information to list.”

Follow-up to Four Year Plans

Providing follow-up to four year plans has also been an important step in increasing educational expectations of participating GEAR UP students. As a counselor stressed, “I’ve been conducting follow-up interviews with students about their four year plans, and based on college and career goals, I have changed students to more rigorous classes.” Parents are included in the four year plan discussions.
Improving student and family knowledge about postsecondary opportunities

A part of increasing student and family knowledge about postsecondary educational opportunities has included parent-student meetings to discuss PSAT results and AP Potential scores, mailing newsletters focused on college to parents, mailing a 9th-10th grade Planning Guide to parents, hosting student and parent meetings, strengthening GO College and Career Centers in the high schools. Teachers and administrators pointed out that the population of individuals 25 or older with bachelor degrees in the region is low. A teacher explained that all students are not interested in the PSAT until the scores arrive. Then, through parent meetings and individual discussions with students of ways PSAT scores can prepare the student for taking the SAT or ACT as well as helping to identify targeted areas, students’ interest in the test increases.

Multiple Forms of Communication

The GEAR UP newsletters and 9th-10th grade Planning Guides that are mailed home in Spanish and English were cited as wonderful forms of outreach to families. However, personal conversations were also cited as an important aspect of parental outreach. As an administrator praised the GEAR UP coordinator,

I’d like to give our GEAR UP coordinator a lot of praise for our successes in communicating with parents and teachers. She loves GEAR UP, and I think she is inherent in our success. I’m very proud of the job she does and how much she promotes GEAR UP in the community as well as the school district.

This praise was repeated concerning the work of the GEAR UP coordinators on each of the campuses. Providing personal follow-up with students and parents on students’ academic progress has helped both students and families to understand more fully how to prepare for postsecondary education. A council member shared a comment that was representative of other partner schools’ successes in increasing communication about postsecondary education with parents:

I would add that we have seen great results from our communication with parents. We get compliments from parents on our teachers’ communication with parents and on the value of our website. We’ve provided strong communication to the parents that has really given them good information to use so that they can help their children take the right courses and schedule the right courses to be prepared.

A high school administrator shared the benefits of communicating the PSAT results with parents in helping them understand their child’s score report and ways it has served as a tool for SAT or ACT preparation.

Innovative titles for parent meetings have been used, such as, Cookies, Cokes, and College night. Ongoing communication has occurred. As a GEAR UP coordinator explained,

I send their progress reports and report cards home. If a child is having a problem, I am on the phone with parents. We try to encourage parents to attend meetings on scholarships at schools. Our superintendent shared information about college preparation on the phone call-out system that automatically calls all parents.
Indicators of Success in Parental Outreach

An indicator that parents are receiving the messages about college preparation is the statement by a teacher, “I’ve heard students in the GEAR UP program say, ‘My mother is now going to college.’ We have raised expectations for the students and parents. The project is having a deep impact.” Another partner district teacher stressed, “There is a sense of pride among minority parents as increased numbers of minority students are taking Pre AP. Taking these courses is serving as confirmation that the students can go to college.” Another partner school council member emphasized, “We are required to contact at least 30 parents a six weeks. We’re discussing the child’s progress with parents on a regular basis.” The teacher admitted, “I’ve done a much better job of communicating with parents, because I’ve been forced to. But, you know what? I’m happy.” A teacher from still another partner district shared a positive result of targeted outreach by stating, “We had 70% of the parents come for a meeting of the African American girls’ English class.” He further added that many of the parents also requested a reading list of the literature written by African American authors that the students were reading. Another council member from another partner school emphasized that including parents on college visits and hosting AVID family workshops are “very valuable.”

The Strength of Community Partnerships

Results in working to improve high school graduation and college-going were strengthened through community partnerships. The East Texas GEAR UP Project partnered with Top Ladies of Distinction to host a community wide effort to share the importance of preparing for college as part of a special program during Martin Luther King week. This project resulted in over $16,000 in matching funds through the volunteer efforts. The GEAR UP partner, Top Ladies of Distinction, worked closely with the GEAR UP special projects coordinator to implement this program. Enlisting the support of community partners, such as Top Ladies of Distinction and churches, is another way the project is working to improve high school graduation.

Linking with External Initiatives

The East Texas GEAR UP project partnered with Sky Ranch in providing an opportunity for students to attend a Leadership Camp where students gained leadership skills as well as goal-setting strategies and knowledge of college preparation. These students have, in turn, assisted other students in understanding the steps needed for college admission through panel discussions and through the GO Centers at the high schools. The Go Centers are part of the State of Texas College for Texans campaign to provide increased numbers of students with college and career information as a strategy in increasing the college-going rate in Texas.
**Working to Meet External Performance Measures**

The East Texas GEAR UP partner districts have worked to meet the Annual Yearly Progress (AYP) status. The final AYP results for Year Four have not been received. For Year Three of the GEAR UP project, six of the ten districts met AYP. All districts have worked hard to meet the goals of AYP for Year Four. Results will be forthcoming. For the State of Texas Academic Excellence Indicator System (AEIS), one district received the academic rating of Recognized and the remaining nine districts received the academic rating of Academically Acceptable. Each of the districts have aligned curriculum, implemented plans to improve attendance, and targeted specific subject area needs through a sustained process. The East Texas GEAR UP project works in concert with the districts as a collaborative partner with a clear alignment of GEAR UP goals and AYP and AEIS goals to prepare students for graduation and for college.

**The Success of Talented and Caring Teachers**

The teacher is the primary determiner of student learning in a school and second to this influence on learning is the principal’s role (Leithwood, et al., 2005). The principal serves as the catalyst in creating a school culture that focuses on improving learning of all. The East Texas GEAR UP councils reiterated the importance of quality teachers in influencing the success of the GEAR UP project. Administrators stressed that having high quality teachers who care that students achieve to high levels is making a difference. As one administrator shared,

> I think our biggest strength and what helps us the most is our teachers. They push. They provide everyday attention to their lessons to make the activities interesting. They encourage the students to come for tutorials and stress that we are here for a purpose and that is to improve each student’s life and to help students become leaders.

Another partner school council member shared, “The teachers are phenomenal. We care about our students very much. We take our jobs very seriously, and we care about each other.” Another campus partner stressed, “We have great teachers. There are a lot of teachers that really care about the students and try to set high expectations for them to do their best.” Another campus partner shared,

> Our teachers are expecting more. The teachers that are using the AP teaching strategies are seeing more success and interest from the students. The interest generates success. It is changing the campus atmosphere. The students seem to be excited to be in class. To me, that’s what increasing academic performance is all about.

The school administrators are also influencing the ongoing commitment to a vision of helping all students to prepare for some form of postsecondary education.

**The Success of Distributed Leadership**

Distributed leadership by all members of the GEAR UP councils and by community leaders further adds to the success of the GEAR UP partnership. As a teacher stressed,
“We promote preparing for college all the time, and the students listen.” The ongoing emphasis on college preparation is expanding horizons of students that continued to grow. As a teacher expressed, “We were offering one physics class. Now, we’ve expanded physics, and we now have a robotics team, and other clubs have come from this. The wave of one opportunity strengthens other opportunities.” The project allows the flexibility to design special strategies to meet campus needs with a multiplying effect. Another teacher added that she had seen the benefits of the GEAR UP initiative in her regular classes:

I implemented the AP world history course at the request of my administrator last year. The rigor was more challenging than some student expected, and I actually raised the rigor in my regular classes. I’ve seen success stories in my regular classes as my tests are now strictly essay and students are rising to the challenge.

Another teacher added, “We are providing students with opportunities and avenues to think about ahead of time.” Another teacher stressed, “The rigor and involvement of my older son who is in the GEAR UP cohort is influencing my younger son.” She said, “He sees what his older brother does and has decided to do what he is doing. It’s more work on me, but it is good work.”

The Success of the School-Community College-University Partnership

The partnership with Angelina College and SFA is also credited as a part of the project that is having great impact. The partnership provides a structure for sharing ideas and collaborative planning on ways to meet the goals of the GEAR UP project. Teachers note that the synergy of an entire project joining together for initiatives, such as, college visits “is really helpful for the GEAR UP students to see others also involved in this project.” The partnership also stimulates idea-sharing of successful strategies yet allows the flexibility to design specific strategies to meet campus needs.

The Success of Professional Development Opportunities

The professional development opportunities were also cited as an aspect of the project that has great impact. A representative comment of teachers was, “I think the professional development that teachers have received has enriched our program.” The teacher further clarified, “When you go to a good conference or workshop, you gain knowledge that you bring to your classroom, and your enthusiasm trickles down to your students. It helps put rigor in all your classes.”

The Success of University-Based Initiatives

Other aspects of the East Texas GEAR UP project that are highly successful are the university-based initiatives, such as, tutoring and e-mentoring. As a teacher explained, “The tutors that we have provided valuable college information to students.” The project has “afforded the opportunity for success,” explained another teacher, “because all of us had some things we wanted to implement, but the GEAR UP project brought us all to the table. It gave us a vehicle to get things accomplished.” As an administrator shared,
It’s not just my vision. It’s everybody’s vision sitting here at the table, and that probably speaks volumes more than anything. We have a concerted effort, and we’re all on the same page about that. We believe in developing whatever we think will help make our students successful. That, more than anything, I think is the success of our program.

A teacher of another partner campus stated,

The GEAR UP program is strengthening students and, in return, is strengthening our schools. This project, because of the mentoring programs and the way it set up, gives an opportunity for all students to get noticed. As teachers, we’re seeing strengths of students we might not have seen before. This program makes us look at every student, not just a few.”

The Success of College Outreach

College and university tours, campus panel discussions by college students, and tutoring and e-mentoring, according to a council member, “give the students a connection with college-aged students” and are credited as primary successes in demystifying college and helping students to see themselves as future college students. College experiences, such as, robotics classes and geometry camps on college campuses have particularly been effective in increasing students’ aspirations for postsecondary education according to council members. Council members commented that students went on college visits on Saturday which points to the high level of interest. Council members reported that students who never had pictured themselves on college campuses are now in welding programs or nursing assistant classes at the community college. As another administrator shared, “Until we started the GEAR UP project, our students had a limited number of things that they believed they could do. I think they have now had some experiences and opportunities that have changed their outlook of the future. I think we have definitely expanded some horizons.” Another representative comment of a teacher was, “I think more students will be participating in AP courses as a result of the awareness from GEAR UP. GEAR UP has provided a way to make our students aware of what’s out there.” Another partner school teacher added, “Every year our classes get more intense. We put more rigorous assignments into them. We want students to push themselves to raise the bar higher.” Another teacher shared, “We expect every student to do some form of postsecondary education after high school, and they know it.”

The Success of Enrollments in Advanced Level Courses

The addition of Pre AP and Advanced Placement, dual credit, and concurrent classes and encouraging more students to participate in the advanced level classes have been successful initiatives in preparing students for the rigorous requirements of college level courses. As a teacher shared, “We are preparing our students so that they won’t go to college as a freshman and drop-out by Christmas due to lack of preparation. These initiatives are helping students to expand their knowledge of choices for careers and postsecondary preparation. Targeted interventions, such as, the English class for Hispanic males and the English class for African American girls’ at a partner school are credited as strong successes in meeting an identified need to increase minority
participation and success in advanced level classes. A teacher noted the success of opening access to advanced level classes to all students. As she stated, “At one time, students were in the AP courses because of who their parents were.” This comment supports the research of Noquero (2005) who found that low income parents were less likely to question their child’s schedule because of limited knowledge in navigating the high school experience as a step in the journey toward college. Now, the partner schools are using AP potential, analysis of TAKS scores, PSAT results, and classroom performance to identify students for participation in the advanced level classes. As one teacher shared, “I had a student who made C’s every six weeks, but ‘blew the top-off’ the TAKS test. I saw this and said, ‘There’s an AP student.’ We had another student in regular English who was from a tough situation who we talked to and said, ‘You are capable of much more. We can see that.’ At semester, we moved her into an AP class, and then we got her involved in UIL academic events. We told this child who had attendance issues, ‘You’re going to do this. There’s no excuse.’ Now, she is all smiles walking down the hall. We looked not only at the child but also at the data behind the child.” A department chair at another partner school shared a similar story by stating that one student had not even passed TAKS, but they knew he was very capable. Through the support of the Hispanic male English class section, he has not only passed the TAKS test but is now in a Pre AP class.

The Success of an Increase in Parents’ Expectations for College

The change in some parents’ expectations for students was a success that was noted even though parent involvement was also cited as a continuing challenge area. The newsletters to the homes and personal contacts are having an impact, though there is still a need to continue the effort.

The Success of Expanded Special Initiatives

Other aspects of the GEAR UP program that have had a strong impact on students’ preparation for college include expansion of college and career centers on campuses, tutoring for students who need extra help, guest speakers, and leadership institutes for students, such as, the SKY Ranch Leadership Development Camp with an emphasis on college preparation. As an administrator stressed, “We have expanded opportunities. I think just creating more of a college-going culture is paying off, and some of the other classes are seeing the advantages, too.” Another partner school teacher shared that benchmark test scores were greatly improved and that the tutorials were really helping students. Partner schools were increasingly providing the tutoring as part of the school day so that students who work or engage in extracurricular activities could access them.

The Success of a Strengthened College-Going Culture

Achieving results by the students in partner schools were primary successes of the grant. As a teacher shared, “It is becoming automatic to say to students, ‘When you go to college or to trade school, not if you go to college.’” Another partner school teacher emphasized, “Our primary success has been the light coming in students’ and parents’
eyes that we have gone above and beyond to make postsecondary education information available and to reinforce that education doesn’t stop at high school. A strength has been the unity and understanding of postsecondary education that has increased for students and parents. Other parents are asking, ‘How can my student be part of GEAR UP?’ Our success is spreading.”

Barriers or problems encountered in administering the grant and ways barriers have been addressed

A change process occurs over time, not as a single event but as a process that is characterized by incremental steps with challenges as well as successes (Fullan, 2008). Sustained leadership is vital in facilitating a change process for a systemic change effort and is characterized by support from administrators, counselors, or coordinators for a district as well as campus level educators (Duffy, 2005). Seeking ways to prevent the challenge of competing priorities is important in maintaining a focused school improvement effort (Fullan, 2008).

Transitions in Leadership

In the fourth year of the East Texas GEAR UP project, the barrier of transitions in campus and district leadership has presented a challenge. As one superintendent shared, We have a new counselor and a new superintendent this year, and I know other schools have experienced this in GEAR UP. Getting everyone up-to-date on what we have been doing through year four of the project is a challenge. We seek to meet the challenge through communication, making sure that everyone knows what we’ve been doing and what’s been successful.

Changes in personnel have presented a challenge for the GEAR UP project. Ways this challenge has been addressed was through on-site district meetings with the project director and project leaders, particularly, with new administrators, counselors, or coordinators for the district. GEAR UP leadership institutes were designed to clearly meet project objectives, and a Leadership Manual pertinent to the project was provided to all participants. Responsibilities of the GEAR UP councils regarding project planning, implementation, and documentation of GEAR UP and matching funds were discussed as listed in the GEAR UP Leadership Manual. Individual meetings with persons responsible for the expenditures and matching documentation for each district were also provided. Attendance at the leadership institutes was required for council members as was attendance at the partnership’s monthly GEAR UP meetings. The meetings provided an opportunity for dialogue and data analysis in addition to information that was shared by outside consultants. Careful selection of consultants to specifically advance the East Texas GEAR UP goals and objectives was provided. For example, Vivian Lee, a consultant from College Board’s National Counselor Initiative, served as a presenter of information regarding the need for increased student participation and success in advanced level courses as a prerequisite to success in college. In addition to locally designed leadership institutes, teams from campuses participated in other professional development opportunities that were pertinent to GEAR UP, such as, the GEAR UP
Capacity Building Workshop. An advisory council meeting of business and community leaders as well as school superintendents was held bi-annually to further an understanding of progress toward GEAR UP goals as well as to understand ways that GEAR UP and the P-16 Council for Angelina and Nacogdoches counties could work together to achieve the mutual goals of preparing more students for postsecondary education.

GEAR UP coordinators were required to meet with the GEAR UP councils and the superintendents to reach consensus on the plans. These opportunities for dialogue and collaborative planning provided an opportunity for new personnel to gain an understanding of the GEAR UP goals and objectives and to understand the campuses’ progress to date in meeting the goals. Ongoing dialogue and communication served as a means for strengthening buy-in of all new project personnel. GEAR UP coordinators were required to offer professional development for all new grade level teachers to help each teacher to gain an understanding of GEAR UP goals, objectives, and interventions. In one district, a change in leadership resulted in a request by the district to withdraw from the project. The district was the smallest district in the collaborative with a cohort class of 40.

Lack of College Awareness

A second barrier reported by GEAR UP councils in some of the partner schools was a lack of college awareness by parents and community members. With the number of adults over 25 with a bachelor’s degree at 13% for our region, many of the parents may not have the knowledge of the steps that are needed in preparing for postsecondary education or an understanding of ways to receive financial assistance in achieving a college degree. As a GEAR UP council member shared,

We have been going through the educational process through the GEAR UP partnership to bring that wall down of lack of understanding of the college and financial aid process, tearing down those barriers that restrict students from attending college and letting the parents know that college is attainable and accessible.

Newsletters mailed to parents in English and Spanish, meetings at various times for parents, Planning Guides provided in English and Spanish about the steps for college preparation in the 9-10th grades, and personal outreach were ways the barrier of lack of understanding of the college admission process was addressed with parents.

For some parents, gaining an understanding of the importance of students taking advanced level courses was a challenge. Counselors, administrators, and teachers shared information with parents that more important than the students’ overall grade point average is the students’ success in rigorous advanced level classes to students’ later success in college as Adelman (1999), a U.S. Department of Education research analyst, emphasized in the report, Answers in the Toolbox. A teacher shared, “Changing the mindset has been a barrier.” However, the teacher also added, “Parents are beginning to realize that when we say college, we are also referring to some form of postsecondary education.” Sharing information with parents about community college, technical school,
certification programs, and the military has also helped parents grow in understanding of the options possible for students.

On the parent survey 91% reported a belief that their child would attend college. However, 23% were not sure their child could afford a four year college and 7% listed probably not or definitely not in response to whether their child could afford a four year college. GEAR UP campuses shared information about scholarships and financial aid with parents through increased outreach efforts. As a GEAR UP council member expressed,

A lot of students and parents think if they don’t have the money that their child is not going to be able to go to a college, university, or trade school. We are seeking to open the doors to postsecondary education and to let students and parents know that lack of money is not an excuse not to go to college.

Sometimes parents have not encouraged students to plan for attending college because their financial resources were limited. GEAR UP educators have met with parents to encourage them to stress the importance of postsecondary education. A teacher stressed, “The Hispanic parents do care, but sometimes the boys want to help financially.” She reported that she calls the parents, and together, they encourage the student to stay in school. Another teacher stressed,

Some students have a mindset that when they graduate, they should go to work as opposed to if I graduate, I’ll go to college and get a better job than I could get at the mill. We are working to break the barrier of the first child in a family to go to college by communicating more often with the parents.

Conflicting Priorities on Time

Another barrier that was reported by GEAR UP council members was the barrier of conflicting priorities on time. In this age of high stakes testing and accountability, finding time to provide tutorials in school so that students would come to the sessions and time to take students on college visits when students also needed to be in class sessions as part of the instructional process was difficult. Teachers expressed a concern, “Wonderful ideas are shared, and it would be wonderful if we could implement them, but we still have to teach school and help students to pass Texas Assessment of Knowledge and Skills (TAKS). Finding time is difficult.” Time to schedule students in activities, such as, college visits and Leadership Camps was difficult. Also, council members reported that students’ work schedules make the rigorous expectations of homework in advanced level classes difficult for some students. Preventing students from working more than the 20 hours a week that is recommended as the maximum work schedule for high school students is difficult. Council members reported, “Most of the students we have work at part-time jobs. That limits what we do after school and on Saturdays.” To respond to this challenge, in school tutoring has been moved from after or before school to within the school day by many of the partner schools. Another way a campus partner reported that support is being provided for the student is through establishing student study groups. A teacher reported, “Study groups have been established for the Pre AP and the AP students. Some of the students are really getting excited about this opportunity. They have a time before school that they meet.” For some students who attended activities,
such as, Sky Ranch Leadership Camp, teachers reported that students talked through issues and learned ways to be leaders, but it has been difficult to schedule follow-through. However, teachers reported that the Sky Ranch opportunity was very beneficial in stating, “We try to make contact with each student who attended Sky Ranch. We do have a pep rally scheduled that the students will plan.” A counselor added that she is able to draw upon this positive experience when the students experience problems from a counseling standpoint. Time to offer concurrent classes and also allow students to remain active in extra-curricular and co-curricular activities has led to an 8-period day with shorter class sessions. Pre AP and AP teachers reported in some partner schools difficulty in having time to provide extra help during the class session. Before or after school tutoring is being provided on these campuses. A teacher proudly reported,

Recently, a student said, ‘I’m proud of myself. I chose attending tutoring instead of visiting with my friends, and I’ve not made anything less than a B on homework, and on tests, I’ve made all A’s. I’m proud of myself.’

The teacher added, “We are teaching students to make right choices.” Scheduling the advanced level classes so that the student do not have to make difficult choices of participating in co-curricular activities or advanced level courses are being addressed by encouraging students to take some high school courses in middle school or summer school to gain flexibility in their high school schedule.

**Students’ Lack of Motivation**

Council members also reported that lack of students’ motivation to set long-term goals was a challenge. Designing engaging lessons, communicating the message of the benefits of postsecondary education to a student’s future financial success or life, and demystifying the college experience were ways that GEAR UP campuses have sought to increase student motivation to achieve postsecondary education. These efforts are achieving positive results as the GEAR Up survey of 10th grade students that documents 87% of GEAR UP students are planning to attend college with 6% planning to attend trade school.

**Need to Increase Minority Low-Income Student Participation in Advanced Level Classes**

The need to increase minority students of low income backgrounds’ participation in advanced level classes led to analysis of access to advanced level classes providing special forms of outreach or interventions, such as, the AVID program implemented by one campus partner and an English class for Hispanic males provided by another campus partner. Parents’ nights when information was shared only in Spanish were held to target a growing Latino population in sharing information about college. Newsletters and planning guides in Spanish were also provided. Personal one-to-one outreach to minority low income students to participate in advanced level classes was provided by teachers, counselors, and administrators. Counselors, teachers, and administrators reported that data analysis of TAKs scores, PSAT results, and the AP Potential report has assisted in identifying additional students who would benefit by participating in advanced level classes. Teachers communicated, “We feel like a C in AP or Pre AP chemistry is worth more than an A in regular chemistry.” Parents and students are informed that study
groups will be formed to assist students in these classes. One partner school even provides neon bracelets that say, “Advanced Placement,” to allow the students to pass in the halls to a study group meeting.

**Failure to Take Steps to Attend College**

A barrier that exists nationally in middle school is that 95% of the students say that they plan to attend college but they fail to take the steps needed for preparing for college (Mau & Hitchcock, 2000). GEAR UP councils have combatted this barrier to college enrollment by requiring all 10th grade students to take the PSAT and by providing sessions where the scores are interpreted. Plans are being made for the hiring of a college coordinator at Angelina College who will ensure that all students complete the common college application for Texas and complete the FAFSA. Campuses are providing multiple sessions for FAFSA and college admission processes.

**Lack of Course Rigor**

Another barrier to preparing for college has been the lack of rigor of high school courses. Teachers have attended professional development to strengthen the rigor in classes. In addition, all AP syllabi have been submitted to a College Board audit to verify the level of rigor of the courses. As more rigorous content is added, some students are not rising to the challenge. A teacher stressed, “We need more vertical alignment and communication of expectations in the lower grades so that students aren’t surprised how rigorous the courses are.” This need is being addressed through vertical team meetings and the curriculum alignment process.

**Utilization Evaluation**

The theory of change that the evaluation plan was based upon of utilization evaluation emphasized that the primary purpose of evaluation should be to strengthen the attainment of goals, determining areas of strength to build upon and areas of weakness to strengthen. The context of the project is in rural East Texas, a partnership of 10 partner districts, each exceeding a student population of 50% low income students; a community college; a university; and community and business partners. Inputs of the project included the project participants; GEAR UP councils; partner school students,’ faculty and administration; the university steering team; an advisory council; and partner representatives. The primary components of the initiatives included whole cohort interventions to strengthen a college-going culture with increased student access and success in rigorous classes; targeted interventions, such as, mentoring and tutoring; parent and student outreach and support; data analysis to encourage on-time graduation and high student attendance; local campus plans; and overall GEAR UP initiatives. Outcomes for students, teachers, administrators and parents were analyzed through multiple data sources. Primary data sources included a parent and student survey, focus group interviews with GEAR UP councils, professional development evaluation forms, Academic Excellence Indicator System campus results, transcriptions of GEAR UP council meeting discussions, and specialized intervention evaluation, such as, tutoring
logs, e-mentoring evaluations and logs, community project evaluations, and leadership institute evaluations.

Evaluation Data Sources

The evaluation team identified four primary areas for project evaluation: (1) student progress and achievement and the impact of each project activity on these outcomes; (2) quality and impact of professional development activities for teachers; (3) effectiveness of project management; (4) the extent to which project activities meet stated goals and objectives. The team utilized formative, summative, and quantitative/qualitative evaluation strategies to ensure the impact of the project strategies and activities. Data collection was based on the goals, outcomes, and measurable objectives for the project. The project director and principal investigator were responsible for reviewing and communicating to all staff and partners the baseline data against which project effectiveness was measured. Focus groups were used to collect qualitative data to evaluate the effectiveness of the strategies and for preparation of this annual report.

Analysis of the Data

Ongoing analysis of the data was facilitated through providing campus data on student participation and success in advanced level courses, accountability data, and parent and student survey results for discussion during leadership institutes, campus council meetings, and advisory council meetings. In addition, the university steering team of the project director, the special projects coordinator, and the principal investigator engaged in ongoing study of the data to discern important next steps. For example, evaluation data from each institute’s evaluation were used in planning the next leadership institute. The evaluation data led to targeted professional development for the project in year four of a leadership institute for GEAR UP councils, for administrators, and for counselors. Evaluations of conferences attended contributed to the selection of speakers and the format of the Leadership Institutes. Parent and student survey data were analyzed using SPSS software, and comparisons between the first survey results and the present results were analyzed for the overall project and per campus.

Continuous Response Loop

A continuous response loop for evaluation was established through monthly coordinator’s meetings to give all partners the opportunity to provide input into the ongoing development and expansion of the project, based on their observations and experiences. The feedback and central coordination for assessment ensured that evaluation activities were articulated and communicated to all project participants.

A Shared Understanding and Commitment to the Goals

A shared understanding of the purpose, rationale, and processes of the innovation are essential if an innovation will be sustained (Fullan, 2007, Hargreaves, 2007). Open collaboration and dialogue can assist in the endeavor to promote systemic change as
policies, practices, and processes are reviewed to discern important next steps (Duffy, 2005). The East Texas GEAR UP districts, campuses, community college, university, and community have achieved substantive gains in the number of secondary students from low socioeconomic groups who are participating in advanced level courses in secondary school and preparing for postsecondary education. Duffy (2005) argues that campus reform alone is insufficient for successful school change processes as policies and practices at the district level can work against campus initiatives. Both the district and campus need to be working to achieve a shared vision for sustainable reform to occur (Duffy, 2005). In the East Texas GEAR UP project, the GEAR UP focus has been communicated and implemented from both the district and campus levels. That the project is not an isolated, add-on project intensifies the assurance that the activities and outcomes will be sustained over time. The project is viewed as a way of meeting district and campus goals and is characterized by facilitative, collaborative leadership. The partnership studies data through an ongoing process of improvement in order to meet the GEAR UP goals and objectives. It is noteworthy that the goal of achieving systemic change is frequently communicated through group meetings, written materials, and individual conferences. That GEAR UP partners were encouraged to implement design practices and processes to achieve systemic changes at the local level rather than a pre-set mandate of one method of implementation for all campuses has encouraged the needed buy-in for the goals and activities that will ensure that they are sustained over time. The community involvement has reinforced the need for the project and provided a web of support to sustain the project’s activities.

Practices and Processes that Influenced Sustainability

In this project, practices and processes that were evident through analysis of the evaluation data of reasons the project activities and outcomes are likely to be sustained over time include:

- GEAR UP goals were an integral part of the district and campus goals.
- Sustained leadership by individuals who ‘walked the talk’ was provided.
- Continuous quality professional development has been provided through the project.
- Districts and campuses have studied their performance data and survey results, targeted needs, and continually designed programs to meet the needs.
- Flexibility has been provided through the project to design activities to meet local needs.
- Changes were made as part of a school reform effort not through a mandate of a program, but through embedded changes that strengthened access and support for advanced level courses, that demystified college, that provided professional development, and that increased parents’ and students’ knowledge of the steps for college admission and financial aid.
- A structure of collaboration and a network of support has been provided to the partner schools.
• The project has worked in concert with similar initiatives, such as, the university P-16 Council that was funded by the State of Texas to create a synergy and a shared understanding of the needs.
• A process of continual planning, implementation, evaluation, and assessment has characterized the project’s activities.

Ways Systemic Changes were Fostered

Systemic changes that have occurred are further illuminated through the following partner comments:

I think that, as far as sustainability of the Advanced Placement program, the teaching strategies will be there for as long as these teachers stay with the district. The availability of the advanced courses, such as the dual credit and AP courses is going to remain as part of the partnership with the community college and university. I think instructionally, the systemic change of greater opportunities for advanced level courses will remain.

The benefits of the systemic change of increased knowledge and skills were reinforced by another teacher:

I think that the professional development that the teachers have received has enriched our programs. When you go to a good conference or workshop, you bring back ideas to your classroom, and your enthusiasm does trickle down to all students. This also helps put rigor in all the classes. The tutors also enrich our students and that gives them even more ammunition to strengthen students’ academic preparation and to be ready for college.

Additional Initiatives that will Sustain

College and career centers. Another council member commented that the enhanced college and career centers are another systemic change that will remain. The systemic change of strengthening a college-going culture through ongoing communication of the benefits of postsecondary education with outreach and support to parents and students was also discussed. As a teacher explained,

When I first started teaching in East Texas, in this county, the students thought they only had one or two choices. They could either go to college or they could go into the logging woods. I think they are now seeing that there are choices for them. When they’ve attained additional education after high school, if they remain in our community, this will be good. Then, their children will have this different view of the importance of postsecondary education.

Another teacher emphasized that data are now analyzed in seeking students to participate in advanced level classes rather than providing obstacles to admission to these classes through policies or practices. This systemic change in mindset of encouraging rather than limiting students’ access to advanced level course work was cited as a systemic change that will sustain.
Support for students. Teachers commented that support will continue to be provided in school, such as, study groups, advisory periods, and tutoring. As a council member emphasized,
“We already have documentation that these students have moved to this step, and we’ll just build on that. We certainly won’t take a step back.” Another teacher added, “I can’t really see us saying, “Oh, you know what? These advanced classes are just too hard. Let’s just go backwards and not do any of that. I think that’s probably the most positive thing that GEAR UP has created. It’s been exciting to see it.” Still another council member reinforced, I think the resources of GEAR UP have allowed the school to establish an attitude among the employees and the students of higher level projections for higher level education. That attitude will maintain because the practices and processes are in place. GEAR UP has established a mindset by the teachers in the classroom. This will sustain.

A GEAR UP administrator stressed,
Until we started the GEAR UP program, there were a very limited number of things that many of the students really believed they could do. I think now they’ve had experiences and opportunities that have changed their outlook on what their future will be. They have siblings coming behind them, so I can see GEAR UP’s influence as a longer lasting impact.

Ongoing practices that were strengthened. Some practices were begun even before the GEAR UP project began, but the way they will be implemented is a change that will sustained. An administrator explained,
We had given PSAT before GEAR UP began, but we have made improvements in the number of students who are taking the test. We have developed a College Center that will sustain. Our curriculum writing in all four core areas will be a lasting change. We are checking more closely to see that the curriculum is being taught and that students are mastering the curriculum. All of these things are sustainable and are going to continue as a systemic change even when the grant is over.

Increased communication. Increased communication with parents through enhanced websites, principal newsletters, monthly newsletters, and one-on-one conversations is a systemic change that will sustain. In short, a council member commented,
We try to give information to the parents about strengthening the college-going culture and really give them good information to use so that they can help their children take the right courses and be prepared. Taking the SAT or ACT and the PSAT tests are yielding positive results. There’s no doubt that we will continue to stress this.

Conclusion

Raymond Paredes, the Texas Higher Education Coordinating Board Commissioner of Education, in a recent College Board conference address, stressed the importance of rigor and academic support for a student’s successful preparation for college. As students
transition to high school, taking rigorous courses as part of the Recommended or Distinguished Graduation Plans prepares them for the next steps of postsecondary education after high school. Adelman (1999), in a research study entitled “Answers in the Toolbox,” identified that the rigor of courses a student takes in high school matters more than the student’s grade point average or class rank in the student’s later success in postsecondary education. Success in rigorous courses in high school is also important for a student’s success in careers. The Undersecretary for the US. Department of Education, Sara Martinez, in speaking to GEAR UP teachers, counselors, coordinators, and administrators emphasized that 90% of the fastest growing jobs in the United States require postsecondary education. Keith Johnson, Lockheed Martin General Manager, in a GEAR UP advisory council meeting reinforced the need to prepare students to a high level through a local comparison by stating, “The careers of today are not going to look anything like the careers ten years from now in this changing job market.” He further elaborated, “For example, an electrical engineer ten years ago isn’t doing many things an electrical engineer is doing today. The jobs are different. On paper, they are both electrical engineers, but, in reality, what they are doing is different.” In this global economy characterized by change, learning how to learn will be vitally important.

The East Texas Gaining Early Awareness and Readiness for Undergraduate Programs (GEAR UP) project seeks to assist students in understanding the vital connection between academic preparation and careers. As a superintendent stressed in a GEAR UP advisory meeting, “What we’re trying to do is to show our students that education brings about more choices in life.” The GEAR UP project schools have worked hard to strengthen the academic preparation of students, such as, encouraging participation in Pre Advanced Placement, Advanced Placement, and Dual Credit courses. However, just as rigorous coursework is influential in student’s later success in college and careers, support for success is also vital. The partner schools are providing that support through encouraging students to seek help, if needed, through the school’s tutoring services that are provided, through parent and student outreach, and through GEAR UP partnership initiatives. The East Texas GEAR UP program provides college campus visits, tutoring, and mentoring to ensure each student’s success in the transition to postsecondary education and to careers. Students in the East Texas GEAR UP project are experiencing both rigor and support in high school as a step to success in the transition from high school to college and careers.

By Year Four of the East Texas GEAR UP project, the number of enrollments in advanced level courses increased 46% from the baseline number which more than doubles the final project goal of a 20% increase in enrollments. The increase of 1,937 total enrollments for Year Four represents a 93% increase in the number of minority students who were enrolled in advanced level classes from the baseline number and exceeds the 20% increase that was projected to be achieved by the end of the GEAR UP project. The increase from a baseline of 2,149 to 4,177 enrollments of low income students in advanced level classes represents a 91% increase in enrollments by Year Four rather than the 20% projected growth by the end of the project. Increased numbers of students are taking college level courses in high school through dual credit courses,
concurrent courses, or AP courses. 93% of the 10th grade students were completing algebra by the end of 10th grade. Only 11 students did not progress to 10th grade in the GEAR UP cohort, and targeted assistance is being provided to these students for credit recovery through programs, such as, Plato, A+ Odyssey, and Virtual High School courses.

For the parent survey, with a 79% return rate, 37.4% of the parents stated that they had knowledge of the courses their child needed to take in high school to prepare for college up from 14% who expressed having this knowledge in 2006. This increase in knowledge is a 23.4% increase and exceeds the benchmark increase of 10%. In the 2006 parent survey, only 10% of the parents had received any information about the availability of financial aid to help pay for college. In the 2008 survey, 16% of the parents acknowledged that they knew of the availability of financial aid. In summary, the East Texas GEAR UP project is meeting and exceeding project goals and objectives. Through sustained and focused efforts characterized by strong leadership, students’ preparation for college is being strengthened as well as their preparation for adult life.
The Diffusion of Geographic Information in Taiwan’s Senior High Schools

Jinn-Guey Lay\textsuperscript{a}, Yu-Wen Chen\textsuperscript{b}

1. Introduction

Geographic Information System (GIS) developed in North America in the late 1950s. With the gradual popularity of computer technology, the concept of applying computers to illustrate maps and to process geographic information began to emerge. However, early application was only limited to few governmental departments and academic institutions. In the 1980s, geographic information industries gradually took shape. Companies created packages that include a number of GIS software, allowing the functions of storing, searching, and demonstrating data. These packages were broadly accepted by governmental agencies and universities, facilitating the application of GIS. After the 1990s, geographic information further spread to industries, high schools, primary schools, and even to normal citizens. With the advent of the 21\textsuperscript{st} century, global positioning system (GPS) and information networks enable GIS to have an even wider outreach to normal citizens in various parts of the world (Bednarz and Ludwig, 1997). Google Maps and Google Earth are quintessential examples of this advancement.

Such development also triggers policy-makers and educators to ponder the utilities of teaching GIS in K-12 education. GIS may allow students to know how to analyze geo-data, offering them new ways to think and explore our world (Drennon, 2005). In traditional geographic education, teachers tended to confine themselves to conventional maps and pictures in textbooks for their teaching. GIS provides alternative potentials for students to know about our world. It is also beneficial for those students who enjoy learning through visual stimulation (Kerski, 2003). In the US, for instance, geographic information techniques were included into the K-12 geographic curriculum in 1994, and were recognized as basic abilities which citizens need to have in our modern time.

In Taiwan, the emergence and gradual development of geographic information education in high schools is itself a process of innovation diffusion. Universities are breeding grounds for the ideas to introduce geographic information to high school geography teachers and pupils. Through various communication channels and social networks, such ideas gradually spread to high schools. The crux of this paper lies first of all, in examining the current status of GIS diffusion among high school geography

\textsuperscript{a} Professor, Department of Geography, National Taiwan University, Taiwan. Email:jglay@ntu.edu.tw

\textsuperscript{b} Postdoctoral researcher, Department of Politics and Management, University of Konstanz, Germany. Email: ma2089752@hotmail.com
teachers in Taiwan, and secondly, in discussing the diffusion mechanisms at work in a wider social network context. Understanding the process of diffusion can then direct us to know what prompts and what hinders the diffusion, enabling us to provide useful suggestions for GIS-promoters to adjust and improve their strategies in the future.

The structure of this paper is as follows. In the second section, we introduce recent development of the geographic information in K-12 education in Taiwan. We seek to place the diffusion of GIS among high school teachers in the context of networks that these teachers are embedded in. We believe this network perspective has been poorly understood in current literature, but it is necessary because GIS adaptation and utilization occurs in specific contexts in practice. In the third section, we specify our questions. The fourth part is about our method and data. We introduce a number of ongoing projects initiated by the first author to critically evaluate the diffusion of geographic information in Taiwan’s K-12 education. As some projects are ongoing, we do not have complete sets of data yet. However, we provide some preliminary findings that would allow us to have a broader picture of the development in Taiwan in section five. Our empirical finding confirms that the network approach, which we laid out in the second section, is indeed necessary for comprehensive understanding of GIS diffusion in Taiwan. In the concluding section, we will highlight what will be completed in our continuous research.

2. GIS Diffusion in K-12 Education

Geographic information came into prominence in Taiwan’s high school geography education in 2006 when a large portion of hours were added for learning GIS in the standard curriculum. Take the 10th grade geography course as example, among the 36-hour teaching in one semester, 1/3 is about cartography as well as concepts and applications of geographic information. Geography is compulsory in the 10th and 11th grades courses. This means that all high school students in Taiwan are equipped with basic GIS concepts. This new geography curriculum immediately leads policy-implementers and educators at the front line to ponder some foreseeable challenges. The main obstacles are as follow:

First of all, concerning the hardware and relevant facilities, there need to be sufficient numbers of modern computers in high schools. Next is the question of software. Commercial GIS software is highly complicated and professional. It is not easy to learn in short time. Even high school teachers have learned it, applying it in their own teaching constitutes another task. Hence, it is better that schools have personnel who can provide technical assistance to facilitate the application and maintenance of relevant software and hardware.

Thirdly, there is lack of time for teachers to get familiarized with GIS and to design GIS-based curriculum (Bednarz and Audet 1999; Meyer et al., 1999; Kerski, 2003).

Fourthly, there is deficiency of educational training for teachers. Most teachers first
get to know GIS through on-the-job training, while trainees rarely have the chance to learn GIS before they become formal teachers. If during the period as trainees, teachers do not have solid GIS training, they need to compensate this part in their career later (Bednarz and Audet, 1999; Kerski, 2003).

The challenges of time and resources could be incrementally tackled with governmental supports. It is, however, not facile to improve teachers’ capacities in short time. Some scholars have pointed out the difficulty arises from how geography teachers regard the utilities of GIS (Meyer et al., 1999; Kerski, 2003). Some teachers might just treat GIS as map-generating tools. They use GIS to create blank maps for teaching. Some treat GIS as a tool to collect and organize data as well as to facilitate regional comparison (Bednarz and Ludwig, 1997). The way teachers perceive the value and importance of GIS varies. So is their level and scope of interest and engagement in applying GIS in their teaching.

The above obstacles have been confirmed by scholars studying GIS promotion in countries such as the U.S. We have also envisioned similar struggles facing GIS-promoters in Taiwan. One of the main purposes of this paper, as will be shown in our analysis, is to understand the obstacles facing GIS-promoters in Taiwan. In addition, we intend to add one theoretical perspective to this topic, that is, the factor of “networks” in GIS diffusion. Geographic information system is a new knowledge and technology. It diffuses among members of a society. The popularity of a new technology or concept usually goes through a process of innovation and diffusion. A network perspective is necessary because diffusion usually occurs among certain “agents” (e.g., teachers, policy-makers) who are linked together in a social context (Anderson and Jay, 1985). Adoption and utilization of GIS cannot be understood outside this context. Essentially, we surmise a relationship between how teachers are embedded in a social network and their level of GIS use. If the aforementioned challenges of resources and time can be solved, we must further ask whether GIS can be more widely adopted if teachers are in a more highly nested network for them to stimulate greater use of GIS.

3. Research Questions

As we aim to understand the current status of GIS education among high school teachers in Taiwan, explore the obstacles for its implementation and further propose suggestions for policy-makers, we need to answer these questions:

(1) How many teachers use GIS in teaching in Taiwan? How do they use GIS and how frequent do they use it?

(2) What is the relationship between teachers’ GIS application and their personal attributes, educational backgrounds, school locations, and personal networks? Do teachers living in urban and rural areas show variations of engagement in terms of attending GIS workshops?
(3) Who provide GIS training workshops and teaching resources in Taiwan? Where do they locate?
(4) How do teachers get to learn about GIS training opportunities and obtaining teaching resources?
(5) What are the factors that would influence teachers to obtain GIS resources? What are the obstacles?
(6) How do teachers use social networks to exchange information on GIS learning activities?

4. Method and Data
We have a number of projects aiming to answer our research questions. Each is in a different stage of research development. First of all, we have conducted a survey on GIS training activities for high school teachers in Taiwan. The design of our questionnaire is inspired by Baker (2009), Kerski (2001) and Kerski (2003). Their surveys target problems facing teachers in American high schools, including software, hardware, time, educational training and the factor of pupils, etc. Since the first author has been involved in promoting GIS education in Taiwan for years, the first author tried to adjust the questionnaire for Taiwan’s conditions. The final version of the questionnaire includes four sections: 1) basic information of the teachers, 2) school facilities, 3) GIS utilization in teaching; 4) teachers’ self-evaluated GIS abilities and experiences.

Taiwan’s Ministry of Education has sponsored the first author to organize on average ten to twelve nationwide workshops for high school geography teachers annually. Among Taiwan’s 1,400 high school geography teachers, around 350 of them have attended in the ten workshops held in 2008. The research team directly gleaned the data by inviting participants to complete the questionnaire during the workshops. In this paper, we will focus on presenting some preliminary findings of this data. The analysis is in the fifth section of this paper.

Secondly, we plan to carry out a census on all 1,400 high school geography teachers in Taiwan. The questionnaire investigates two main aspects: backgrounds of teachers (e.g., graduation school, years of teaching experiences, gender, characteristics of their schools) and GIS teaching activities (e.g., present teaching mode, usage of GIS facilities, and GIS demands). We will phrase our questions in ways that can let us capture both the attributes of the respondents (i.e., attribute data) and the relationships among the respondents (i.e., relational data). Relational data is particularly important because it allows the mathematical measurement of the relationship between our agents, and can help us visualize the network(s) our respondents are nested in. We are still at an early planning stage of this project, and we expect to distribute the questionnaires in 2011.
Thirdly, after we finish the survey analysis, we will have in-depth qualitative case studies of the experiences of some teachers. This includes the interviewees’ social networks, as well as their motives for participating in GIS workshops and for learning GIS.

5. Analysis
In Taiwan, there are in total 484 high schools, including vocational schools at the parallel level. 336 did not have any teachers participating in workshops. Among the remaining 148 schools, 84 had once, 27 had twice, 16 had three times, and 21 had more than four times of their teachers showing up in GIS workshops. National Taichung First Senior High School in central Taiwan had their teachers attending workshops 19 times, rendering this school the most active school engaging in GIS training in 2008.

Figure 1 shows the number of teachers attending GIS workshops in 2008 from each school. Teachers locating in remote area (e.g., eastern Taiwan) appear to be less active in attendance. However, we notice that even for those living in Taipei city, many did not take part. This implies that the accessibility of transportation or living in urban/or remote regions cannot completely account for teachers’ attendance in GIS workshops. Figure 2 shows the difference of teachers’ attendance ratio in each county.

To explain the variation of attendance manifested by Taiwan’s high school teachers, we might have to consider the aforementioned “network” approach. It is likely that in the nascent stage of GIS promotion, teachers who are not highly embedded in the promotional networks set up by the government are less informed of relevant GIS training activities. Also, it is possible that teachers with fewer connections with other colleagues are less informed of relevant GIS activities, so they tend not to show up in workshops.

For instance, in the greater Taipei metropolitan area, the most active teachers are the so-called seed teachers selected by the government and their schools to assist GIS promotion. They naturally form a network where they can share the latest information of GIS training activities and GIS resources. Apart from these seed teachers, other geography teachers in Taipei are less active in attending workshops.

A similar pattern can be observed in Taichung. Because Taiwan’s Ministry of Education has assigned National Taichung Girls’ Senior High School to be the hub of promoting and facilitating geographic education in Taiwan, teachers in Taichung are relatively more active in attending GIS workshops. We surmise this is related to the relatively mature network among geography teachers in Taichung, which allows them to spread information of GIS development faster than teachers in other parts of the country.
Although teachers in eastern Taiwan tend to show less degree of participation, they are still more active than those from the rural counties of western part of the
country (e.g., Miaoli, Yunlin). We postulate this might be due to the top-down policy of the government to let Hualien serves as a sub-center of GIS promotion in eastern Taiwan. Teachers in the rural part of the western, such as Miaoli and Yunlin, however, are not well-connected to any promotional channels because most of the workshops were held in the urban areas of northern, central, and southern Taiwan (i.e., Taipei, Taichung and Kaoshiung respectively). They are hence less active in attending workshops.

In our survey, we also attempted to understand where these participants learned about GIS workshops in 2008. The majority actually received the information from governmental announcements which were passed on to schools. A large number of participants also learn the information from the main GIS promotion website hosted by the Department of Geography at National Taiwan University (http://gisedu.tw), which is essentially a cooperative result of the first author and the Taiwan government. From this statistics, we learn that the top-down promotion approach led by the government and universities in Taiwan play a leading role. But as illustrated above, there appears to be a lot of room of improvement in terms of participation rate and outreach. Educational efforts to change teachers’ practical behaviors in adopting GIS have faced limits. What we can be sure of is that top-down selection of seed teachers and promotional (sub-) hubs can foster the formation of different kinds of social networks and information networks at various local levels. Teachers who are more embedded in any of these local networks tend to be more informed of relevant activities and hence have more likelihood to join GIS workshops. In a way, this pattern is logical and suits into our common-sensual understanding of how innovation technology would normally diffuse in modern times.

6. Conclusion

This 2008 survey allows us to understand the general participation of GIS workshops among Taiwan’s high school geography teachers. The pitfall of this survey is that it only generates attribute data for conventional statistical analysis. This data does not contain any relational data for social network analysis, although we do notice that networks among all agents (e.g., government, universities, seed teachers, hubs) play a role for GIS diffusion. We will add questions that can gauge relations among agents in our next nationwide census among the 1,400 high school geography teachers in Taiwan in 2011.

We believe that it is necessary to delve into the aspect of “networks” in our continuous research because as laid out in the beginning of this paper, we expect that our research can have an impact on policy-making and implementation. Effective promotion in the form of incentives cannot be developed without a better comprehension of the ways in which GIS are introduced in various learning settings. This paper consolidates our belief to further explore the usefulness of the network
perspective in studying the GIS diffusion process among high school geography teachers in Taiwan.

Paper Abstract:
Until 1941 when Pearl Harbor was attacked by a Japanese task force, the interest of Korea was forgotten, or intentionally ignored, even by the United States Government, as well as other countries. For all the historic events which had taken place in the peninsula over the intervening years, there existed no foreign policies toward Korea except Japan's dehumanizing colonial ones.

The U. S. military personnel in Korea tried to replace Japanese educational system in Korea with an American-type educational system. They faced many difficulties in applying their educational thought to the Korean educational setting because Korea had a seriously upset economic, political and social situation during the USAMGIK era. The Koreans faced a chaotic economic, political and social period during the USAMGIK era. They also did not have the capacity to solve the long standing problems of their economic political systems.

Especially, there were still a lot of remnants which admired highly Japanese Imperialism and nationalism in history education but had to remove as soon as possible in released Korea. Korea should throw away the Japanese distorted history and find out the way how to stand by itself and learn the right Korean history in order to be international people. U.S. Military Government, 1945-1948 thought that American Social Studies was the best solution to solve these problems.

They set the goals for the removal of the vestiges of Japanese Imperialism in history education and started to emphasize the concept of ‘the Citizen’ instead of ‘the Nation’.

It is appropriate to briefly analyze domestic political situation and the international relationship in order to examine the American influence on Korean educational thought during the period of U.S. Military Government, 1945-1948.

Korean education was, under the specific conditions produced by the U.S. Military Government, practiced in the context of interactions with the international and national situation. Education proved to be one of the most successful civil affairs activities, during the USAMGIK era, although no radical changes could be made within the short three year period, Korean leaders tried to reexamine their educational problems in light of the economic, political and social chaos.

They began to assimilate new educational knowledge and techniques, while also reviving ancient Korean traditions. They started to make new textbooks of Social Studies. But in spite of all these trials, the civil activities and the concept of ‘the Citizen’ were not familiar to Korean who have lived in Confucian culture and have experienced without their own history for 35 years during the period of Japanese occupation. It goes without saying that there were a lot of problems including the type of Social Studies, textbooks and curriculum when Social Studies in school was introduced at first in Korea. It has been a long time until it settled down in Korea.

Development of Authentic Listening Materials for College Students in EFL Learning

Cindy Y. Chung
LTS, Department of Linguistics, University of Oregon, Eugene, OR 97401
Email: cindy@uoregon.edu or tingya83@yahoo.com

Abstract- Most of the educators in Taiwan are more concerned about the English capabilities of students based on students’ poor performance in recent TOEFL and TOEIC tests. EFL education has been regarded as one of the most important courses in students’ freshman years, so that the development of ESL courses has been diversified. This study demonstrates the findings of a survey from first year college students relating to the listening class that they were taking. In the regions around the world which are devoid of native English speakers, listening and speaking are the most difficult, yet least developed, skills. One needs to listen well in order to speak well, a general rule for good discipline in every language. Current literature, surveys, and interviews suggest that using authentic listening materials in the class may enhance students’ language learning in comparison to the use of textbooks only for EFL teaching purposes. The detailed processes of selecting, and designing activities for authentic listening materials are introduced in this paper through a literature review, needs analysis conducted with ESL teachers and students, criteria for selecting materials, lesson plans, and sample activities. To achieve this goal, a sample course in listening has been suggested for college freshmen in Taiwan through the introduction of authentic listening materials, as well as practical learning strategies for the students themselves. The design of this portfolio includes a sample collection of authentic listening materials that will serve as supplementary materials for the textbook Impact listening 3 (Harsch & Wolfe-Quintero, 2001). These listening materials were taken from a wide variety of media. Students need to demonstrate productive tasks as a way to assess their listening comprehension. The designed course aims to provide sample authentic materials and provide activities that will serve college students’ diverse language levels and interests. It will not only raise teachers’ awareness of the importance of adapting authentic listening materials in the class, but also be able to present samples of engaging materials and activities for practitioners of EFL teaching.

Keywords - authentic material, listening comprehension, EFL education, ESL

1. INTRODUCTION

Like most of the non-native English speaking countries in the Asia-Pacific rim, English has long been one of the required foreign languages in Taiwan, starting from middle school until college, but most of the instruction conveyed in classes is focused on grammar acquisition rather than the other important skills such as listening comprehension, oral presentation, comprehensive reading, etc. Standard written tests are given mostly to test students’ grammar competence mostly. English listening and speaking practice are extremely insufficient, and many students’ oral performance is unsatisfactory as a result.

Most college students believe that their lack of progress in English is due to the fact that English is no longer a part of the required curriculum after their freshman year. Over the years of their undergraduate study, majors in every field, they lose the ability to practice and develop their English skills. Campbell and Zhao (as cited in Wu & Wu, 2008) commented that traditional methodologies such as memorization, recitation, and translation, kill students’ motivation and overwhelm them with over-drilling. In addition, question-and-answer drilling does not help students to facilitate language in a communicative way, but instead only makes students passive learners. Authentic materials, however, are mainly produced for native speakers and not specifically for teaching purposes. They not only provide a wide range of vocabulary, genuine practice, and linguistic richness, but also are more intrinsically motivating (Wu & Wu, 2008). Therefore, authentic materials provide interesting alternatives in traditional classrooms, where drilling takes the fun out of English learning.

On the other hand, while listening has not always been considered to be a pivotal part in English language learning, gradually its role has been increased in foreign language acquisition (Joiner, Adkins, & Eykyn, 1989). The ability to master English listening greatly enhances one’s foreign language learning. Benson & Hjelt (1978) said that understanding oral messages serves as a prerequisite in communication, and receptive skills, such as listening and reading, play an important role in students’ acquisition of competence. Therefore, developing English listening skills to achieve communicative competence is just as important as developing other aspects of English language learning.

Traditionally, grammar-focused English classes alone are not enough to provide students with many of the necessary communicative skills, especially in Taiwan. In an EFL setting, where learners have less access to authentic conversation and culture, how can they develop and sustain their English learning comprehension beyond the classroom? Tsai (as cited in Wu & Wu, 2008) suggests that creating a learning environment with culture essence will help students to learn English fluently and effectively. Authentic materials are no doubt mandatory supplementary materials in EFL curricula. Wu and Wu (2008) argued that an authentic learning environment is the most vital factor in promoting the English language in Taiwan.

Therefore, the purpose of this study is to highlight the importance of using authentic texts to better help Taiwanese students’ English language competence in a natural way by supplementing a variety of genuine, real-life listening materials.
such as videos, broadcasts, and movies, etc. The materials presented in this project will range from use with intermediate to advanced level English learners. However, these materials can be modified to work with learners at different levels.

II. LITERATURE REVIEW

A. Authentic materials

Authentic materials are defined as those that are “genuine or real”, unedited texts, the purpose of which is to achieve communicative competence (Long & Harlow, 1988). According to Herron and Seay (1991), “authentic” means speech that is delivered by native speakers with context that mirrors the target culture. Moreover, authentic texts are described as “live” texts that will enhance students’ learning by emphasizing communicative competence, with the target culture presented naturally (Herron & Seay, 1991). The best example of this type of material is authentic video. Authentic videos provide the most current linguistic resources, contain a wide variety of accents, and show people’s behaviors and ways of thinking within the target culture (Sherman, 2003). Texts that are designed specifically for English teaching have different focuses than authentic texts as we can see from Table 1.

B. Current practices in the field

Students in an EFL environment do not have much access to natural English in their daily lives. With today’s advanced technology improvements, information exchange has become easier than ever. Several educators throughout the Asia-Pacific region implemented different media of English teaching, such as internet (Liu, 2005), computer-assisted language learning (CALL), authentic materials chosen from different media sources (Sinha, 2009), etc.

Authentic materials are raw materials. Teachers still need to make some modifications while also selecting topics that best suit their learning objectives. Some difficulties that learners may encounter include unfamiliar discourse, vocabulary, speech rate, and linguistic features. For many reasons, the instructor’s role is very crucial in the selection of effective authentic listening materials. The materials need to help students feel a sense of accomplishment (Joiner et al., 1989).

In short, the current English curriculum in Taiwan strives to provide students with as much exposure to real life English as possible. Authentic listening materials can help to supplement the insufficient amounts of natural speech in an EFL classroom. Through examining current good practices in the use of authentic listening materials in the class, we may learn how effective they can be in enhancing students’ learning in a natural way.

III. NEEDS ANALYSIS

The data collection was to obtain sufficient information concerning the development of appropriate authentic listening materials. For this purpose, three different groups of participants were involved: two EFL college instructors in Taiwan, one ESL college instructor from the American English Institute (AEI) at the University of Oregon (UO), and EFL students in Taiwan. One classroom observation was conducted at the AEI to observe how a teacher can utilize authentic listening materials in real teaching scenarios.

The questionnaire was administered to several engineering major students in a top-ranked university, via online responses. Many interesting points that came out of this data analysis have served as good suggestions for this material portfolio, Table 2. First of all, ESL/EFL teachers and EFL students expressed their beliefs, including the need to listen to authentic listening materials in, and beyond the classroom. Some students perceive authentic materials as difficult, so teachers can utilize some pedagogical strategies such as group work and handouts with more scaffolding to help students get used to authentic listening materials. As for their interests in authentic materials, the top three choices were entertainment, sports, technology, with their favorite genres being movies and television episodes. Other topics, such as news, art, accents, and jobs were based on one EFL teacher’s syllabus. Some factors that hinder the students from comprehending the English programs are as follows (from the highest to the lowest factor): too much unknown vocabulary, the speed in which the speech is delivered, slang, accent, and lack of exposure to English programs.

From the interview with the ESL instructor at the AEI, and the classroom observation, I have come to the conclusion that using a textbook along with authentic materials promotes an effective listening class. I have decided to use a textbook as a primary source, with authentic materials as supplementary materials in this portfolio.

Based on these teachers’ and students’ points of view on authentic materials, this portfolio aims to supplement a text with outside listening materials that are fun and will motivate students to achieve better comprehension levels of authentic English.

IV. DEVELOPMENT OF SAMPLE MATERIALS

The goal of this portfolio is to collect authentic listening materials that will serve as supplementary materials for the textbook Impact listening 3 (Harsch & Wolfe-Quintero, 2001). This textbook was chosen because one of my interviewees is currently using this book in her listening class, and it includes a variety of topics and many activities that I find valuable. As stated in section 3, the teachers who are currently using authentic materials in ESL/EFL settings, and the college students who responded to the online questionnaires, all believe that authentic materials can enhance overall listening comprehension. Using authentic listening materials has its advantages that textbooks cannot provide. Valdman (as cited in Larimer & Schleicher, 1999, introduction p.1) said,

“Communicative ability, both in the productive and receptive modes, can be attained only if learners are exposed to a variety of authentic oral and written texts illustrating a broad range of genres and pragmatic situations.”

Most of the resources chosen are from different types of media, and students need to perform productive tasks, not just
receptive listening. The following material collection aims to select sample authentic materials and provide activities to meet students’ diverse language levels and interests. Although the tasks are designed for high-intermediate level students, practitioners in this field could also adapt and modify these materials to meet their needs.

A. Criteria for selection of materials

Findings from the literature review and needs analysis have shown that there is a need to use authentic listening materials in the classroom. Guidelines that were taken into account for this portfolio were as follows:

- Materials used are genuine, unedited (the language in these materials will not be simplified), and reflect life-like conversations.
- Materials that will motivate students’ interests in language learning.
- Materials level of difficulty to meet diverse level learners’ needs, and
- Activities aim to enhance learners’ communicative competence.

The types of materials included in this portfolio mainly correspond to the interests and suggestions of teachers and students. The teachers suggested the following topics: relationships (roommate problems), technology, and business. Some topics that the students showed interest in were entertainment, sports, and technology, with their favorite genres being movies and television episodes. Other topics such as news, art, accents, and jobs are based on one EFL teacher’s syllabus. She mentioned the importance of using authentic materials to introduce different accents to the students. Technology is embedded in the unit on news, as students and teachers all suggested this topic. It is hoped that the materials and activities presented here will develop students’ fluency in authentic listening. Nation and Newton (2009 p. 163) provide a fluency checklist that I have included as part of my criteria for text selection:

1. Are the learners interested in the message?
2. Are the learners easily able to understand the message?
3. Is the message coming to the learners at a rate that stretches the fluency of the learners?

Taking the above criteria into consideration, the interest level of materials, along with communicative activities, were the two most dominating principles in the selection of materials and activity design.

B. Organization of the material

Materials and tasks are sequenced from simple to complex. The source/link of each authentic material will be provided to the students. Teachers can find these materials by pasting the URL link into a web browser, or putting the title of each material into the Google search engine. The topics are based on the students’ interests and teachers’ suggestions, as was mentioned. The tasks are mainly focused on real world communication, as well as developing listening fluency, and group work is utilized for a majority of the materials. Some individual work has been designed to help students build their bottom-up skills.

The textbook Impact listening 3 does not sequence from easy to difficult in terms of content or listening tasks, so I have to move the textbook units around, with the units in this portfolio sequenced based on task difficulty (easy to difficult). The units in this portfolio, Table 3, are the same as the sequence of each activity. The demonstration shown in Tables 4 and 5 shows how to proceed with the lectures using Unit 5 as an example, and also how to test the students’ capability of learning.

V. Conclusion

The materials developed in this portfolio are just one of many typical examples, with an attempt to provide EFL college learners more exposure to authentic English. In Taiwan, and other EFL countries that have few native English speakers, listening and speaking are the most difficult, and yet least developed skills in a language classroom. Studying English for more than six to ten years, but not being able to communicate well, is a frustrating yet common, problem among EFL learners.

This portfolio is designed to improve Taiwanese college students’ listening proficiency by supplementing authentic listening materials along with an existing textbook. It is hoped that English teachers in Taiwan can take the initiative to introduce and use authentic listening materials, along with textbooks, in order to help students achieve fluency and accuracy in language learning.

Through researching authentic listening materials, and creating activities to correspond to textbook materials, I have some suggestions for teachers who want to take this path in their teaching. First of all, one needs to consult with an experienced teacher or work with co-workers. Talking to teachers who have extensive experiences in using authentic listening materials will give novice teachers a good start. Second, one needs to make sure the chosen materials match the course objectives and learners’ levels. Fun materials are intrinsically motivating, but do not guarantee efficient learning; on the other hand, a difficult lecture might not motivate learning, either. Good materials are what motivate good lesson plans. Third, searching for materials is not a waste of time. The searching process is very time-consuming, but almost all materials can be utilized in different contexts later. Finally, teachers can make efficient use of their students’ resources. Teachers usually introduce authentic listening resources, but it is not necessarily the teachers’ job alone to provide materials. Teachers can assign students to listen to English programs and report to the class as part of their homework. Teachers can also collect the materials that the students presented in the class, using them to improve future classes.
Acknowledgments

The author would like to thank Profs. Robin Rogers and Nancy Elliott for their guidance during the course of this work.

Together @ a Distance Research Report Executive Summary

We discussed how a course on igloo building could be structured between Moodle, Elluminate and the use of the LOR as a warehouse for the resources. We discussed the value of video recording the Elders demonstrating how to determine snow quality to have it available to others as well as the supporting Inuktitut terminology. We discussed how Elluminate® could be used as a tool to bring the students together from different parts of the Arctic to share how this is done and what words are used in their region. The value of recording, saving, reusing and sharing these resources through e-learning had the Elders very excited (Elders, personal communication, Feb 2010).

Mr. Speaker, I believe online learning will help us develop and make new courses and learning resources available to adult learners across northern Canada. Online or as it is better known, e-learning, will help us share our culture, maintain our language, and increase our ability to participate in the world economy by helping to improve literacy levels and teaching essential skills to adult learners (Tapardjuik, 2009).

Introduction

The Together at a Distance project was a three year (2008 – 2010) project aimed at developing e-literacy skills for adults in Inuit Nunavut (homeland) across the Canadian Pan Arctic. It was funded through a grant from the Canadian federal government’s Office of Literacy and Essential Skills of Human Resources and Skills Development Canada (HRSDC) and was led by the Nunavut Department of Education with support of the Northwest Territories, Nunavik, and Nunatsiavut. As the leading quotations above illustrate, this project had strong support from both the Inuit Elders as well as the Territorial Government as both groups recognize that “it is critical that Aboriginal communities continue to explore ways of adopting and using learning technologies to avoid falling deeper into a “digital divide” (Greenall & Loizides, 2001, p. 1).

A collaborative design model, based in the principles of Inuit Qaujimajatuqangit (IQ) which involved Inuit Elders, adult Inuit learners and northern educators not only informed the Together at a Distance project but provided the framework for the six online workshops that were created. The content of the first two online workshops introduced e-learning and
examined how to effectively take an e-learning course from the perspective of Inuit adult learners. The additional four online workshops examined in more detail how to facilitate, teach, adapt and design e-learning. These online workshops were targeted at educators, community access point facilitators or trainers whom would be working with, or creating content for Inuit adult learners.

As part of the collaborative design model employed in this project, meetings were held with adult educators, content experts and the Elders from the Arviat Department of Education Office. Six pilot sites (Taloyoak, Arctic Bay, Nain, Iqaluit, Fort Simpson and Rankin Inlet) were solicited from the various geographical areas in the north with each agreeing to host a pilot. The pilot consisted of face-to-face workshops that focused on introducing adult Inuit learners to the online workshops. These were conducted in six locations across the north to nine different audiences by members of the project team. Eighty-six (86) adult Inuit learners participated in these workshops with 15 participants being in the “trainers/facilitators” target audience group and 71 representing the broader “adult Inuit learner” target audience group.

Each face-to-face pilot workshop was a minimum of two days in duration with one being conducted synchronously via Elluminate (Fort Simpson, NWT). A facilitators guide was created for use at the face-to-face pilots to ensure consistency of message as well as technical support protocols. Data collection included a 46 item online survey at the completion of W2 which addressed the content of W1 and W2 as well as a separate 46 item online survey at the completion of W4, focus group interviews, and individual reflections captured in the individual participant online journals.

The survey questions covered the following broad areas depending upon the workshop: (1) general demographic information, (2) motivation, (3) e-learning and digital literacy skills, (4) awareness of e-learning opportunities, (5) online workshop design, (6) Inuit Qaujimajatuqangit (IQ), (7) awareness of facilitation and workshop preparation skills of e-learning design and delivery. These areas were developed from a review of the literature, the research questions and the design philosophy informing this project.

Two websites were created to support the project: (1) an online portal (www.togetheratadistance.ca) and (2) the Moodle site (www.ndlp.ca). The online portal was created as a web-based access point for the online workshops and additional tools and resources that participants identified as useful throughout the pilots. Links were provided to the Moodle version of the workshops from the portal as well as to download the web-based stand-alone option that was created for each of the online workshops. All project content was made available free of charge via the Together at a Distance portal and additional communication materials were created including quarterly e-newsletters as a way of increasing awareness of the project.

There is a long standing tradition in the North of effective action-based, community-based research and its ability to drive policy development. As a result, a participatory, inquiry based action research framework guided the research conducted on this project. Using this research
framework created space for the project team to (1) directly involve and build on existing relationships with the Elders, northern educators, and content experts; (2) ground the project design model in IQ, and (3) to remain dynamically responsive to the online learning experience and associated needs of the adult Inuit learners provided to them via the pilot workshops.

**Design Assumptions**

There were several online workshop design assumptions that informed the creation of the online workshops. These included the: (1) need to ground the online workshops in Inuit Qaujimajatuqangit (IQ); (2) use of a social constructivist instructional design paradigm, (3) role of a supportive learning community, (4) varied audience characteristics (5) need for content integrity, (6) requirement for interoperability to maximize learner access to the content. These key components evolved from discussion with the Elders, the adult Inuit educational community, past experiences of project team members and applicable best practices in the field of online learning. The project recognized that best practices for southern online learning may be different than those required when designing for a northern adult Inuit audience and as such, the collaborative design model was essential to ensuring relevance.

*Inuit world view has gone from learning from the family, from the community and then from the world in a matter of few years. During this short or nonexistent transition period; methods, timelines and best practices are usually the last topics considered. This is usually due to the urgency of people's needs; using the analogy of the fisherman, fish is given to the population, without teaching them how to fish for themselves.*

*It is good to take an inventory of best practices and what methods can produce the best outcomes. It is even better to identify and set values, standards and principles that are meaningful to the target group instead of imposing a set of standards from another group (Suluk, 2010).*

This report examines and discusses the research findings that emerged from the Together at a Distance project across the six pilot sites.

**Research Questions**

This research project initially began investigating the following two areas:

1. The change in access and awareness of literacy opportunities for the Inuit population in NWT, Nunavut, Nunavik and Nunatsiavut as a result of the Together at a Distance online workshops on e-learning.
2. The capacity for facilitators and trainers to prepare adult literacy e-learning in the Pan-Arctic as a result of their participation in the Together at a Distance online workshops.

However, the recursive nature of the project design model provided opportunities for a further refinement of the research/project goals while the project was developed and implemented. The revised research goals include the above as well as the following:
1. The relevance of IQ to the online learning experience of the adult Inuit learner (including learner, facilitator, designer and teacher).
2. The functional and instructional design requirements of e-learning for the adult Inuit learner to enhance accessibility and relevance.
3. The support for the development of mastery and an individualized toolset of resources and tools for future real world application.

**Research Findings**

While there were 86 participants in the pilot workshops across the six locations, only 52 online surveys were successfully completed due to intermittent connectivity when the surveys were being completed which resulted in transmission errors. Of the 52 participants that completed the W1/W2 online survey, 58% were female. This is consistent with the demographics of the populations in the pilot communities as well as the target groups that were represented in the pilots; predominantly education and municipal government. 73% of participants were under the age of 39 which is again consistent with the demographics of the Inuit population (ITK, 2008). The majority (50%) had completed grades 10 – 12 with 15% having completed Grades 7 – 9; 13% having completed a University Bachelor’s degree and 12% having completed a College Diploma. The majority of the 52 participants were full time or part-time students (65%) with others working for a municipality (17%).

In terms of their level of comfort with technology, 73% of participants had never taken an online course before but the majority of participants rated their comfort level with technology prior to participating in the online workshops as somewhat comfortable (46%) and very comfortable (25%). This increased to 83% after their participation in the online workshops. When asked their comfort level with e-learning prior to participating in the online workshops, 27% rated themselves in the uncomfortable or very uncomfortable categories. When asked to rate their comfort level after participating in the online workshop, 84% rated themselves as being comfortable, an increase of 13%.

The following themes emerged from the data; (1) motivation, (2) e-learning and digital literacy skills, (3) access to e-learning opportunities, and (4) IQ and Online Workshop Design. They are briefly discussed below with more detail provided in the body of the full report.

**Motivation**

When asked whether their motivation to pursue further e-learning opportunities had increased as a result of their participation in the online workshops, 54% said “yes” with an additional 31% rating it as “somewhat” and 7% rating it as “no”. The following commentary provides a sense of the features and aspects of online learning that the participants found meaningful.

“There is more to it than I was expecting – I feel that this is something that could be beneficial for a lot of people living in this area” (Survey Respondent, 2009/10).

“Yes, especially if I can further my education without leaving my community” (Survey Respondent, 2009/10).
E-learning and Digital Literacy
The following definitions were used in the Together at Distance project for these two terms.

**E-learning** encompasses all learning that takes place online, including distance learning and lifelong learning, facilitated by an e-teacher or on your own.

**Digital Literacy** is the ability to locate, organize, understand, evaluate and create information using digital technology. It involves a working knowledge of current high-technology, and an understanding of how it can be used. Digitally literate people can communicate and work more efficiently, especially with those who possess the same knowledge and skills.

When asked what specific continuous learning skills had improved as a result of their participation in the online workshops, participants indentified the following: (1) develop a learning plan (60%), seek out learning materials and resources (44%), apply new knowledge and skills (44%), recognize individual learning style (38%), learn from past experiences and apply lessons learned (29%). The use of the learning plan for many was a new tool to add to their continuous learning toolkit and several commented on its value beyond the online learning application.

“[the learning plan] makes me plot down what I have to do” (Survey Respondent, 2009/10).

When asked whether their digital literacy skills had improved as a result of their participation in the online workshops, 87% said yes.

**Awareness of E-Learning Opportunities**
The majority of participants (94%) felt that their awareness of other e-learning opportunities available to them had increased as a result of their participation in the online workshops. Several of them commented on how valuable it was to learn about both the various e-learning opportunities as well as the different technology such as Skype®, the Inuktitut fonts and the Living Dictionary in the focus group discussions.

“Now [I am] thinking what options can this lead to, what can I now achieve. [I] didn’t know about the possibilities before” (Focus Group Participant, Fort Simpson, April 2010).

**IQ and Online Workshop Design**
There were two aspects to theme of IQ and the design of the online workshops: (1) IQ as the guiding philosophy for content presentation and meaningful connections and (2) the structure of the online workshops themselves as it contributed to the end user experience. Participants were asked to comment on whether the workshop design which included the IQ focus was valuable and why. 94% found it to be valuable and commented that it was “simple and
understandable – especially with the Elders involved” (Survey Respondent, 2009/10). Several participants found it to be “an excellent overview of the different technologies that can be used...step by step headings made the design user friendly” (Survey Respondent, 2009/10). They also commented that “the information provided was easy to find” (Survey Respondent, 2009/10).

In keeping with the design philosophy described above, a variety of multi media were used to convey the content. The majority (64%) of the participants found that the pictures, stories and vocabulary supports encouraged them to learn more and was motivational. 77% of participants felt that the inclusion of Inuit Qaujimajatuqangit (IQ) assisted in their learning while 83% of the participants identified the inclusion of the Elders comments to be important in their learning.

“the topics were from actual people and there was even real Elders so it was pretty convincing” (Survey Respondent, 2009/10).

With respect to the actual structure of the online workshop and the associated end user experience, the following themes emerged from the survey data, focus group discussions and participants online journals; (1) page layout and structure, (2)navigating embedded content, (3)volume of text on screen, and (4) language level. The design and development process responded to these emerging themes through iterative structural and instructional revisions over the course of the project.

**Feedback on W4 – W6**

The audience that was initially the target for W4, W5, and W6 were to be adult Inuit learners who had taken on an educational role in their current work setting as either a facilitator, trainer or community based educator. However, due to logistics and availability, this was not the audience that was able to be secured for the pilot workshops. Three participants at the Arctic Bay pilot (2009), seven participants at the Iqaluit pilot (2010), four participants at the Rankin Inlet pilot (2010) and one participant at the Fort Simpson pilot (2010) explored the content of W4, W5 and/or W6. For the most part, those who completed W4, W5 and W6 were participants in the Northern Teacher Education Program (NTEP) who were preparing to teach in the face-to-face K-12 classroom. Five of the participants in W4 were Arctic College faculty and one participant was an Member of the Legislative Assembly (MLA).

In keeping with the participatory nature of this project, all W4, W5 and W6 participants were directly asked to provide feedback on how to make the online workshops more effective for the intended audience. As with other feedback gathered through the project’s participatory and iterative design model, the Together at a Distance project team honored the feedback from W4, W5 and W6 participants by directly applying their feedback to the actual design and structure of the online workshops.

**Awareness of Facilitation and Workshop Preparation Skills for E-Learning Design and Delivery**

Several participants in W4 commented on the value they found in the various checklists and tool sets that they were able to download, print and take away for their toolkit. Many used
their online self-reflective journals to remind themselves of the need to print or download specific checklists to use when working with students in their face-to-face teaching.

“Remember to consider literacy skills, make a list of support systems both technical and educational, download and print checklists... print module 5 checklist” (W4 Participant Online Journal, 2010).

The majority of W4 participants found the content to be very valuable and applicable to their face-to-face teaching. One of the instructors at Arctic College who completed W4 stated “I am going to use some of this (W4) content in my pedagogy class next term. What is presented here is the basis of good teaching” (D. Fraser, personal communication, Feb 2010).

Many participants in W4, W5 and W6 commented that they would be using the skills they acquired in W4 to seek out e-learning teaching and facilitating opportunities to further develop their skills. One participant was interested in setting up an online course to support her learners at a distance across the various Arctic College sites.

**IQ and Online Workshop Design**

For the majority of W4, W5 and W6 participants, the inclusion of IQ as a design philosophy was identified as valuable. For some participants who were non-Inuit, the IQ module that addressed the foundational components of IQ was instrumental in their understanding of the concepts associated with IQ. As several W4 participants expressed, their experience with W4 provided them with alternative ways of conceiving how online learning could be created. For many Inuit participants, this included incorporating videos, pictures and Elder stories throughout the learner experience.

“As Inuit are the most dominant populations within the north so I think it is fair that we are most represented. But I think that I am biased when saying that because I am an Inuit myself” (Rankin Inlet Focus Group Participant, 2010).

“(workshop) content was both relevant and meaningful and all information was new. Elders’ comments were interesting” (Focus Group Participant, Fort Simpson, 2010).

As mentioned above, the W4, W5 and W6 participants were asked directly to provide comment and feedback on readability, language, errors and omissions or additions that they felt would make the online workshop experience stronger for the intended end users. Several participants provided detailed feedback and corrections to grammar, spelling and use of language and these were incorporated into the subsequent versions of W4, W5 and W6. An example is provided below:

“under Kinds of e-learning in the Case Study description it talks about a housing project case study that is online. It does not have a link to this. Perhaps the link should be added” (W4 Participant Online Journal, 2010).
Other feedback from W4, W5 and W6 participants was that the design of the workshops was “clear and straightforward” (Iqaluit Focus Group, 2010) and with the addition of the worksheets and checklists, “valuable and will use them again to guide participant learning” (Focus Group Participant, Fort Simpson, 2010).

**Key Findings**

Based on the experience of the pilots conducted with the Together at a Distance online workshops, a variety of key messages emerged from the survey data, the focus group discussion, the participants self-reflections and online journals, the facilitators observations and discussions with participants. These are summarized here. In the full report they are discussed in more detail and where appropriate, aspects of the Government of Nunavut 2010 Report Card are used to illustrate the connection between the work done in this project and potential ways it can be leveraged to address the areas of improvement identified in the GN Report Card.

**Key Finding 1: Holistic Design Model**

It was through the design, development, delivery and implementation of the online workshops and the collaborative participatory approach taken in both workshop design and delivery that the holistic design model (Figure 1) emerged. As depicted in Figure 1, the design model is grounded in IQ and supported by a technical infrastructure and policy directive. It is dependent upon the creation of a community of learners and a supportive learning environment. The three-pronged supportive learning environment (social/emotional, technical and academic support) is achieved through the use of a blended or hybrid model of delivery.

In order for the community of learners and a supportive learning environment to be fostered and maintained, adequate funding for a collaborative content development approach across a continuum of learning (K-post-secondary) and teacher training and professional development is required. These two elements are facilitated through the technology toolkit which includes a learning object repository (Sirlauq), a learning management system (Moodle) and a synchronous tool (Elluminate). They result in the ability to provide differentiated content, individualized learning paths and community-based support to meet unique learner needs. Inherent in the design model is the support for the development of the competencies in language and literacy. The goal of the holistic design model is to assist in the attainment of learner mastery.

*Figure 1: Holistic Design Model – C. Armstrong & E. Childs (2010)*
Key Finding 2: Learner Support

The data from the Together at a Distance project highlighting learner support is consistent with the best practices in the field of e-learning (Bale et. al, 2005; McMullen & Rohrback, 2003; Palloff & Pratt, 1999), which identifies learner support as critical to the success of e-learning initiatives. In the context of the Together at a Distance project, learner support had three key aspects: (1) social/emotional, (2) technical and, (3) academic. These three aspects were supported in and by; (1) the community, (2) the design and structure of the online workshop, and (3) the ownership the student was required to take for their own learning path.

In this context, community is defined as those person(s) who supported the learner to be successful in the online workshops. This may have been the CAP instructor, the high school teacher, the spouse that was encouraging, the auntie who took the children so that the learner was able to devote time to their online workshop, the employers who were supportive, the online facilitator, the technical support, the Elders etc. This community based support approach was modeled in the content of the workshops and their delivery was based on best practices in e-learning that identify that “the most crucial support is facilitation at the locale where the students do their work” (Bale et. al, 2005. p.26).
The opportunities that e-learning provided with respect to differentiated instruction, individualized learning, and multiple learning pathways facilitating learner choice meant that in the T@D online workshops the content level did not need to be lowered. Instead, students were supported to develop and build mastery through the learning process. The Elders saw distributed learning as a mechanism that was able to provide real world application and the necessary learner supports required for the acquisition of competency. At the same time, it was also able to reinforce the values of IQ and the express of lifelong learning.

They appreciated that the content was not dumbed down and that students are encouraged and scaffolded toward understanding and competency. They also noted that students must take ownership and responsibility for their learning path as well (Elders, personal communication, Feb 2010).

Key Finding 3: Move from E-Learning to Distributed Learning
Through the experience of the Together at a Distance project, it became evident that there is a real need to expand beyond the concept of e-learning in the north so that the term does not limit the possibilities. The holistic design model proposed allows for a broadening of the concept of e-learning to one of distributed learning (DL) in that it extends into a blended model of learning and the integration of technology mediated learning supports into the regular classroom, the online classroom and wherever the learner is located in order to support learning that is independent of physical space and time. The inclusive nature of DL is captured in the following definition:

_Distributed Learning (DL) is not just a new term to replace the other 'DL,' distance learning. Rather, it comes from the concept of distributed resources. Distributed learning is an instructional model that allows instructor, students, and content to be located in different, non-centralized locations so that instruction and learning occur independent of time and place. The distributed learning model can be used in combination with traditional classroom-based courses, with traditional distance learning courses, or it can be used to create wholly virtual classrooms" (Saltzberg & Polyson, p. 10).

As illustrated above, DL enriches, expands and enhances the learning opportunities provided in regular, online and mobile learning environment. Learners in a DL environment have greater control over how, when and where they learn which increases their responsibility for their own learning. Education providers are, in turn, able to create inclusive learning environments that maximize learning opportunities (Bowman, 1999).

One area for inclusivity that is often not supported in the North is within the classroom, both in a blended community based model and through hybrid integration. Moving from the concept of e-learning to one of DL allows for the inclusion of many more learning environments than just the traditional face-to-face school setting. In reviewing the Government of Nunavut Report Card recommendations, there appears to be the potential to address several of them using a DL approach informed by the holistic design model.
Next Steps

Based on the data and experiences of participants in the Together at a Distance online workshops and the holistic design model proposed, there are some real opportunities available to the north with respect to distributed learning. There are numerous examples of DL implementation projects that illustrate that one of the direct contributing factors of success of DL is the funding and policy commitments made to support it (Latchem & Hanna, 2001). The north has the potential to support the implementation of the holistic design model and associated DL components in an integrated, thoughtful manner. Jurisdictions that have not had this opportunity to thoughtfully consider the implementation of DL have experienced limited success.

Based on the experience of this project, the data, and the literature informing best practices in DL (Driscoll, 2002; Moore & Kearsley, 2005; Oblinger & Hawkins, 2006), the next steps to be taken in order to support further opportunities for DL in the north include the following:

1. Apply the holistic design model to guide policy, fund program development and ensure implementation planning for DL in the north.
2. Move from e-learning to distributed learning (DL). Lever the experience of this project, the policy, and the technical infrastructure into more opportunities to bridge the gap from e-learning to distributed learning and foster the creation of multiple technology mediated learning environments within both online and regular classrooms.
3. Lever the existing infrastructure which includes: (1) the LOR (Sirluaq), (2) the LMS (Moodle), (3) the synchronous tool (Elluminate) and, (4) the increasing bandwidth opportunities within the educational system to implement DL across the north.
4. Explore collaborative content development opportunities between the northern K-12 and post-secondary systems using common toolsets (Sirluaq, Moodle, Elluminate).
5. Ensure IQ and critical pedagogy continue to inform any future content development.
6. Create a mentored, supported, facilitated experience for the current online workshops to proof the model
   a. Have facilitated, synchronous opportunities for educators to engage with the online workshops created in this project.
7. Create the opportunity for content creation and sharing.
   a. Develop a new online workshop that focuses on the blended learning approach within the regular classroom and discusses how to create and use technology mediated learning environments effectively with learners. The workshop will focus on the use of the LOR (Sirluaq) as a central access tool for content creation, delivery and repurposing as well as the other components of the common toolset described above.
   b. Include all current T@D online workshops in the Sirluaq learning repository. W1 and W2 for Nunavut students and W3, 4 and 5 in the Professional Growth section of the LOR. The Sirluaq will fully display the IMS content package version of the workshops in a similar way to how Moodle displays the workshops.
8. Develop facilitated, supportive online learning communities that support the work of all stakeholders and act as the connection between these group (learners, educators (k-post-secondary, DEAs).

Based on the data and experiences of participants in the Together at a Distance project, the mode of learning is one that the majority of participants found useful and there is a general motivation and interest to participate in further online learning experiences. Using the holistic design model guide policy, fund program development and ensure implementation planning for DL in the north is the first step to building on the momentum generated by this project.

“I just like the idea of e-learning, this way in the future people can stay in their home communities and take e-learning to educate others” (Survey Respondent, 2009/10).

“I hope this will be used here at the college in the future because I hate leaving my mother in law who needs our support, this way e-learning will be useful for people like me who are family helpers and need to stay home to do work” (Survey Respondent, 2009/10).

6. Abstract and/or full paper  
   **Abstract:**  
   The Framework Agreement (FA) First Nations Virtual Resource Centre(VRC) is a national initiative to move the capacity building, training and development associated with First Nations Lands Governance under the Framework Agreement into the online environment and as a result, make it more accessible for all. The Virtual Resource Centre is one component of the larger Capacity Building, Training and Professional Development Strategy (CBTPD) that has been ratified by all 61 signatory FA First Nations in Canada. This workshop will introduce participants to the CBTPD Strategy and its supporting components including the Virtual Resource Centre and associated certificate program in Lands Governance. Workshop participants will be able to examine the certification program and associated online courses, explore the various tools, resources and online social networking capabilities of the VRC and discuss its Year 1 implementation.

   By way of background, in signing the Framework Agreement on First Nations Land Management (Framework Agreement) legislation in February of 1996, the signatories – Canada and 13 originating First Nations (FN) - could not have imagined the challenges posed by their commitment to support training
and capacity development for First Nation signatories. Subsequent to the Framework Agreement taking effect, as First Nation communities ratified and implemented their Land Codes, they quickly realized that existing land management training strategies were inadequate. Little emphasis on the needs arising out of “governance” responsibilities, for example, was given in existing training, with no consideration for Chiefs and Councils and their communities. As part of a well-rounded, comprehensive and inclusive CBTPD strategy, the FA FN Lands Advisory Board’s Resource Centre launched the Virtual Resource Centre (VRC) in 2009. It is a completely customizable online learning environment for Framework Agreement First Nations across Canada and is comprised of a series of online tools, courses and resources as well as a socially networked online community that aim to support Lands Governance Directors as they work with their FN through the Land Code process and into the operational stage of managing their own FN lands. The result of the VRC is an interesting mix of a Web 2.0 personalized “it’s all about you” learning environment filled with online tools, resources, content and links, together with an active online community fostering discussion and dialogue across Canada for Framework Agreement First Nations Lands Governance Directors, their Chiefs and Council and their Communities. Effective implementation strategies and data on end user uptake and usage of the VRC will be discussed. In addition to the VRC, work has now begun on the Level 1 online courses for Lands Governance Directors as part of the certification program for the FA FN in Lands Governance and initial course design decisions and implementation considerations will be examined with workshop participants.

6. ABSTRACT:

**Background/Purpose:**
The purpose of this project, funded by Edwards Lifesciences, was to develop and implement a collaborative community service outreach program. The aim was to promote healthy lifestyle changes and reduce health disparities in communities with populations at higher risk for cardiovascular disease (CVD) with limited financial means to seek preventative care. The research-service learning activities associated with this project were carried out in two phases over five semesters (18 months). In Phase I, 16 health fairs targeting underserved populations were conducted in faith-based, community, and Council on Aging centers in the Greater Baton Rouge area. As a result 544 individuals received preliminary CVD health-risk screenings, including a medical history evaluation, vital sign checks, glucose and cholesterol measures and body composition assessments. In addition, an educational presentation based on the American Heart
Methods:
Prior to participating in the project, all students were required to complete in-service trainings and provide appropriate documentation related to professional procedures and ethical issues surrounding research data collection, patient medical records, administration of clinical tests, medical emergency response and dissemination of healthy lifestyle information. The trainings and certifications included: NIH Office of Extramural Research Certification, OSHA blood borne pathogens training and proof of Hepatitis B vaccination, CPR certification and AHA ambassador training. In addition, students received advanced training for skill proficiency in clinical test administration which included: a Bruce protocol treadmill stress test, 12-lead ECG monitoring, ABI, vital sign checks (HR, BP), total cholesterol and glucose measures, body mass index, and obtaining accurate medical and family health history information. Students were required to submit reflection papers on their internship and service learning experience at the end of each semester.

Results:
This project contributed to the academic and professional development of graduate and undergraduate kinesiology students. As a result, two graduate students received full-time funded assistantships and were able to complete their master’s degree with thesis. Two full-time undergraduate internships were supported that resulted in employment with renowned clinical facilities; one as a research study coordinator at a biomedical research center and the other in cardiac and vascular ultrasound at a women’s medical center. Across four semesters, a total of 32 undergraduate students that were enrolled in an independent research-service learning course participated in one or both phases of the project. An additional 38 undergraduate students had the opportunity to participate as part of their service learning component in their required kinesiology courses. Of those, the students enrolled in Introduction to Health Promotion (n = 27) were primarily engaged in Phase I, while students in Exercise Testing and Prescription (n = 11) participated in the Phase II clinical exercise testing. Reflection papers submitted by the students upon completion of their internship and service learning experience will be presented and discussed.

Conclusion:
Students developed critical thinking and problem solving skills, increased their scientific knowledge base and improved their ability to disseminate health information to at-risk populations in diverse settings. Students also learned to coordinate and access community resources and the importance of community engagement for at-risk populations. Moreover, current medical-based evidence and clinical skills were applied in a real-world setting. This project supports the research indicating that service learning and
community internships can enhance individual student knowledge and skills, strengthen an entire educational program while providing a valuable community service.

Abstract

Acknowledging the importance of parental influence on pupils’ academic motivation and achievement, this study aims to examine the relationships among pupils’ perceived parenting styles, attributions for math achievement, and math performance. The survey participants were 363 fourth to sixth graders from six elementary schools in southern Taiwan. They completed scales to assess their perceived parenting styles and attributions for math achievement. Subsequently, their grades for the upcoming math exam were also collected. Path analysis indicated that: (1) paternal demandingness, maternal demandingness, and maternal responsiveness had direct effects on pupils’ attributions for math achievement; (2) pupils’ luck attributions for success and failure had direct effects on their math performance; and (3) maternal demandingness had direct and indirect effects on pupils’ math performance, while paternal demandingness had an indirect effect on it. The implications of this study, based on the results, are subsequently discussed.

Keywords: perceived parenting styles, attributions for math achievement, math performance

Comparison of Characters with Disabilities Displayed
in Korean Folk Tales and Korean Contemporary Picture books

Soo Ok Yoo
Dept. Early Childhood. Special Education
WooSuk University
Soook@woosuk.ac.kr

The view of the general public has on disabilities or minorities has always changed with the times. Thus, commonly notions about disabilities vary not only depending on the era but also according a nation's political, economical, social and cultural conditions. Postmodernism, which first appeared in the 1960's and attaches great importance to the issues of difference and diversity, sparked a change in negative judgments on individuals with disabilities, women, minority races.

Since literature is an important medium by which the author shows his/her socio-cultural values and the current attitude of the public, literature has socio-cultural value in itself (Nodelman, 2001). Thus, even if it is not a quantitative measure, looking into and analyzing literature, which reflects society and contains socio-cultural values, can be a way to understand macro-systems such as socio-cultural values or social phenomena. While folk tale picture books reflect everyday life in traditional Korea, the settings of contemporary picture books give a description of contemporary. As a result, we can compare how folk tale picture books and how contemporary picture books depict characters with disabilities.

Through the use of content analysis, this study explored the interaction between characters with disabilities and characters without disabilities in Korean Folk tales and contemporary picture books. hoping to contribute to the selection of appropriate picture books for an understanding of disabilities in kindergartens and child care centers.

First, Unlike in Korean Folk tales, contemporary picture books displayed that characters with mental and physical disabilities interacted with friends, in addition to their families and village people.
Second, two type of characters with disabilities in contemporary picture books displayed more positive interactions than negative interactions compared to Korean Folk tales. While positive interactions was displayed 'helping' to characters with mental and physical disabilities in contemporary picture books, displayed 'receiving help' from characters with physical disabilities in Korean Folk tales. As negative interaction, Korean Folk tales picture books displayed 'hitting and expressing anger'. contemporary picture books displayed 'ignoring', 'ridiculing' to two type of characters with disabilities.

Third, compared to Korean Folk tales, two type of characters with disabilities maintained a more positive relationship with other characters in contemporary picture books. Consequently, it can be seen that expression of characters with disabilities are more positive and more desirable in contemporary picture books than in Korean Folk tales picture books. Clearly the fact that interaction in folk tale and contemporary picture books was different indicates the change of socio-cultural values in Korean society. It was partially due to two act of "The Special Education Promotion Act" and Special Education Act for the Disabled which was enacted in 1994, 2007 in Korea. Those represents the establishment of a friendlier atmosphere for individuals with disabilities in our society and this in turn has brought characters with better images to Korean contemporary picture books.

**Key words:** folk tales picture books, contemporary picture books, character with disabilities, understanding of disabilities
Clash of Theatre Training in Thailand

ABSTRACT

Currently there are two genres of Thai theatre existed in the kingdom. While the former is the traditional performing arts category which has been established in the country for more than 500 years, the latter is the imported Western modern theatre which has just arrived less than 100 years ago. On the one hand, the Thai original typed theatre is taught, passed on and preserved as a national heritage through the Ministry of Fine Arts and Thai monarch’s co-operation, on the other hand, the modern Western theatre is taught and practice in the university educational level and well-received among Thai middle-class.

As an art education, these two categories of theatre have possessed extreme opposite methods in philosophy of learning and teaching, art appreciation, and more importantly characteristics and attitudes on life and art from their artists.

This paper is an investigation of differences in philosophy of learning and teaching, and practice of Thai contemporary performing arts as an art education that reveals the various problematic facets of its artist, work of art and above all its ideology of education.
Clash of Theatre Training in Thailand

In the contemporary Thai theatre scenes, there is the encounter of two extreme opposite categories of theatre. The former is the traditional “presentational” style of dance-drama which is well-received from the majority of local Thais all over the country. The latter is the imported modern Western “naturalist” spoken theatre which is popular among the urban intellectual middle-class who receives the Western style of education. The confrontation of these two genres of theatre practice reveals the clash of theatrical ideologies, the performance training and art education. The traditional dance-drama although enjoys popularity among local Thais, is claimed to possess the “pause” in its development due to the lack of major transformation to the current globalized period. It seems old-fashioned and with the immense training methods of memorization and following the master techniques. It gives no space for new invention and creativity which is the core belief in the modern education. Hence, the traditional theatre presentation and its knowledge transfer is regarded as inferior to the imported theatre of realism type from the point of view of Thai urban middle-class who although possess the minority in numbers of population but with their excessive power in media and finance of the kingdom make them the most powerful group of members of the country.

This research is therefore to investigate into the characteristic of each theatre genres, their different methods and philosophies in training and presentation. It is an attempt to clarify the function of the specific knowledge transmission of each culture so as to portray the better understanding of the current clash and how theatre goers could go to each theatre presentation and enjoy both aesthetics equally without discrimination due to the apprehension of each theatrical world views and functions.

Thai classical and traditional dance-drama was influenced and originated from the adaptation of the “Nattayasastra” of the Indian classical tradition in which the basic dance alphabets were introduced by Indian dancers since the Ayudhaya period (500-700 years ago). This theatre practice is underlined by the belief of Theraveda Buddhism assimilated with Brahmanism-Hinduism and indigenous animism resulted in the three contemporary traditional theatre categories i.e. the popular local theatres, the court forms and the village animistic-influenced dance-drama respectively. Stories of performance are taken from the jataka (tales of a previous life of Buddha before attained Buddha hood), local histories, legendary tales and Sanskrit literatures (mainly
for the classical court theatres). Although there are few types of dance-drama in Thai traditional theatre, nevertheless, these performances share some unique common characteristics.

There are the well-rounded qualification of the actors, the usage of stock character, the form of presentation and the performance training. Firstly, in the traditional dance-drama only the classical court forms that much of the text is sung by the offstage professional singers so as to allow the performers to focus only on the refined dance movements, while the clowns of every theatrical type must be able to improvise witty dialogue spontaneously. Hence, it can be said that, the actors of traditional Thai theatres must possess various dimensional quality of the performer e.g. singing, reciting, dancing and improvising in which to be skillful and able to master these techniques require long-term training from an early age similar to ballet and sport training in the West rather than the modern Western theatre. Secondly, in terms of the usage of a set of characters, the three-person configuration is the principal source of the role types that dominate Thai traditional performance i.e. male (a hero), female (a heroine), and ogre or monkey or clown. The massive influence of the usage of three-stock characters can be found in the current practice of Thai television game shows whereas the employments of three masters of ceremony i.e. male, female, and comic personas are operated popularly. Thirdly, the presentational approaches is the foremost form of presentation in Thai traditional dance-drama in which graceful and sophisticated surreal dance gestures, exquisite and glittering costumes, and delicate singing are the key success of any troupes.

Last but not least, it is the most significant issue in this paper, the performance training. The survival of Thai traditional performance is a result of the successful and continuous line of teaching, training and the knowledge transmission from generation to generation. When Thai classical dance-drama was firstly originated, it was in the hand and supervised by the royal court. Later on, with the change of Thai political system from the absolute to the constitutional monarchy, there is the establishment of the College of Dance and Music under the government Department of Fine Arts. Currently, there are several branches of the College of dance and Music sprung up all over the country. The curriculum is designed to train and groom students to play one of the three major roles professionally and the process can start as early as at the secondary school level.
At first, student-actors spend at least half day in every weekdays in dance and music training in which the practice of the 66 basic gestures of the classical dance techniques are studied carefully. Each dance alphabet is related to either the gestures or movements of the gods or mythological beings e.g. “Thep Phanom” (gods in a worshipping gesture), “Phrom Si Na” (Brahman with four-faces). Correspondingly, students have to learn the basic drilling dance which are the slow dance movement (phleng cha) and the rapid dance movement (phleng reo). In order to be a professional actor, they have to master these two dances and repeat them daily in which even the current leading actors have to go through these drills to keep fit.

Next, students are selected for character roles on the basis of their physical appearance for example the role of male requires a dancer with a slender, tall and graceful figure, while the role of female requires a short, feminine and round figure, and the role of ogre requires a tall, strong, majestic and muscular body, or the role of monkey or clown requires a short, quick, round and lively figure. These special selected student-actors will receive further training by experts in these roles. Thai traditional dance-drama knowledge transmission is interplay between the teacher who demonstrated each movement and gesture, and the student who imitates the teacher as closely, accurately and carefully as possible. The key success of this performance training is to keep rehearsing and correcting every single detail of each dance movements as much as possible until it reaches perfection. Thus, the training is very strenuous and strict in which long hours of drilling sessions are being repeated everyday. In the final process when rehearsing for the new production, the leading actors would then be trained for the particular episode and learn how to interpret their stock character roles through the dance and gestures.

Unlike the notion of modern Western theatre, it seems that originality and creativity of an individual performer is completely ignored in Thai traditional theatre while the emphasis is on the mastery of dancing movement which is the complex codified use of the body. According to Brook, this is a characteristic of a “holy theatre” in which the ritual practice are its foundation and the connection with spirituality is over-empowered and dominated the main ideology (Brook in Allain 2006:131). Hence, the continuation of tradition is the primary achievement rather than the originality attainment.

The imported modern Western spoken drama arrived in Thailand 100 years ago by the Western-educated aristocracy, King Rama VI. At first it remained a
singly elitist enterprise, however, with the change of Thai political system and the founding of universities for higher educational purpose in the era of democracy, the Western modern theatre courses were gradually offered in several academic departments since the 1960s e.g. the performing arts, the fine and applied arts, and the English literature depending on its concentration of theatre practice. As a result, the major audiences, actors and theater troupe members are the educated urban Thai middle-class whom with the modern Western style of education they received in the university; they possess the search of individuality, freedom, creativity and originality as their stream of consciousness. Unlike the local Thais whose communality, group collectivity and tradition perpetuation is their core beliefs. Consequently, the modern Western theatre remains remote from the Thai national consciousness.

The modern Thai theatre is operated under the concept of theatrical realism in which the main performance training emphasizes on the psychological and emotional life of the character, justified motivations and the subtext. The psychological based acting system is developed by the Russian actor and director, Constantine Stanislavsky. He created a system of acting called “the Method of Physical Actions” (the Method), as a way to invent believable characters on stage on the basic concept of the actors transforming into another being before the audience’ eyes. His system element include the Magic “If”, the Given Circumstance, Imagination, Concentration, Truth and Belief, Communion, Adaptation, Tempo and Rhythm, and Emotional Memory. His primary aim is to make the actor as a “naturally creative” and “imaginative being” (Allain 2006:69). Stanislavsky’s acting process begins with the “self” of the actors in which they have to search into their own sub consciousness (emotional memory techniques) for a personal experience similar to what the character must conduct on stage. They, then use the ‘Magic If” to both wholly believe in all given circumstances the characters encounter on stage and to suspend from disbelief. In terms of the interpretation, in order to find the believable actions of the characters, one must find the true emotional motivation that stimulated inside the character’s minds. This method is to compartmentalize text into units and find the character’s objective for each unit. Nevertheless, these segmentations must be reconstructed and overridden by the character’s super objective providing a consistent “through-line”. This process is equivalent to the Western literature analysis course.

Currently, actor training in the Euro-American culture and Thai modern theatre focuses on 4 areas i.e. acting, voice, speech and movement. Training classes
are designed to encourage students to relax physically, vocally and psychologically so as to free body and mind instrument. With this full relaxation and complete consciousness, the transformation into the being of a character will be created as a result of the success of magic if.

It seems that the modern Thai theatre employs the super imaginative and intuitive sides of acting as its core knowledge transmission in performance training. In short, it focuses on psychology and the inner process of transforming into a character. The training style aims to create individual creativity in which student-actor centered is the compulsory format of education.

Taking the above into consideration, it seems that while the modern Thai theatre is on the Aristotelian model of acting based on mimesis and realism, the traditional dance-drama is on the presentational approaches where the theatrical illusion is the primary aim in its presentation. Such presentation focuses on the essentialism of “appearance” in which the surface does matter. Under the presentational approach, the core Buddhist teaching is revealed, since the impermanence governs the existence of all beings, “the central concept of theatrical presentation is, therefore, to manifest the illusion to the audience so as to reveal the “illusory” as an aspiration of art towards permanence” (Chetana in Polachan 2010:108). The presentation of surrealistic mode of theatre i.e. beauty of romance, worldly desires and senses are but illusory. It is to constantly remind the truth of impermanence to the audience and communal community, so as for them to detach emotionally from the event and thus their human emotional indulgence is limited and eliminated.

Under this circumstance, the usage of aesthetic idealism in traditional theatre as oppose to the theatrical realism in modern theatre serve totally different purposes to each of their audience. While the former is concerned with the sustainable being and longevity of the community and tradition in which spirituality as of the holy theatre is the core content which lies beyond and above the presentation. The latter is the naturalist theatre in which human psychological interpretation is its main concern due to the influence of modernity and individualism, and the central content can be found within the text in presentation. Thus, it is for the theatre practitioners, audiences, disciples and students to understand each concept of training and presentation prior to their involvement into each theatrical event. This is as each genre serve different purpose and stands on totally opposite working ground; the understanding of the
concept will eliminate discrimination and reveals the new acceptance of this encounter as the “variety” which presents different facets of Thai theatres.

Abstract

The purpose of this study is to investigate reading strategies of English as a foreign language (EFL) learners who arrive to the United States to pursue higher education when their first language is set. The subjects are two international graduate students from Taiwan. Several assessments, such as reading attitude interview, analysis of oral reading miscue, and observations of reading behaviors were administered to identify their reading strategies and needs. The result shows that the participants successfully adopted several useful reading strategies, such as applying their prior knowledge, predicting, and self-monitoring. However, they both ignored the expression and fluency as they read. In addition, they repeatedly made grammar errors, which are related to their first language experience. This research not only explored Taiwanese students’ strength and needs in learning English, but also provided useful suggestions for education in the field of TEFL.
**Introduction**

In today’s schools in the United States, the number of EFL student is steadily growing. In state like California, it is common to have students from more than seven countries in one classroom. Hwang (2001) indicates that many EFL students arrive to the States to pursue higher education when their first language is set. These students might be required to take International Students English Exam (ISE), a combination of conversational speaking, writing and English knowledge, if their TOEFL score is below 250. The result of ISE decides whether EFL classes are required. However, it is found that there is a missing link between EFL classes and regular academic classes. In order to successfully merge this ESL population into the mainstreaming setting, teachers need to understand these learners better, including their linguistic and cultural background information, beliefs in reading, and their reading strategies.

In this paper, we chose two international graduate students, Rose and Julia to administer reading attitude interview and miscue analysis. The two subjects were enrolled in a private university in California while the study was conducted. This activity investigated their reading behaviors and attitude through interview, reading aloud and our observation. The rationales of this reading activity are:

1. **Metacognition**

Rhodes and Shanklin (1993) specify that assessing metacognition help teachers to discover students’ perceptions of themselves as readers and the strategies they employ to solve the problems they encounter in reading. Research supports the important role of metacognition play in the reading instruction, especially for struggling readers.

2. **Miscues: windows into the reading process**
Wilde (2000) indicates the reason to learn miscue analysis is to better understand what readers are doing, which then help inform instruction. More specifically, miscues analysis help teachers understand what strategies readers are using and how effective those strategies are. Most importantly, reader’s miscues provide insight into how they integrate the language cueing systems during the reading process in order to construct meaning. The four cueing systems comprise of semantics, syntax, graphophonics and pragmatics. The quality of readers’ ongoing comprehending depends on their ability to use the four language cueing systems in an integrated way. Therefore, through miscues analysis, we will understand readers better.

3. Assessment in oral reading

Johnston (1997) suggests oral reading can be used to assess the kind of language processes taking place in the head of the reader. Although oral reading and silent reading are not the same thing, there is a sufficient similarity between the two to make analyzing students’ oral reading a usefully way to understand the way they process language when they read.

We believe that this oral reading activity helps reader to assess their metacognition and the process of reading in their head. It is valuable information for teachers to access students’ strengths and needs. Teachers can use it to plan instruction based on readers’ strengths. In the following section, we will explain the subjects and procedure in details.

Method

1. About the Subjects

In this case study, we assessed two international students’ oral reading. In the time of conducting this case study, Rose and Julia just recently arrived in the United States. They both enrolled in master’s program majoring in Computer Science. Before coming to the
States, they have studied English for more than 10 years in Taiwan. Like most international students, they were required to take ISE exam (International Student English Exam). They were taking ESL classes and regular graduate courses while this study was conducted. Through this activity, we examined Rose and Julia’s oral reading and drew their comments about their performance.

2. Process

a. Interview

At the beginning, we conducted an interview with Rose and Julia. The interview questions include their perceptions of themselves as readers and strategies they used in reading. Responses to these interview questions provide us profiles of the readers. Based on reader’s background, we chose two meaningful texts in adequate level, the first article is about China’s environmental issue and the second one is about parking problem around the university, which they attended.

b. Oral Reading Recording

We recorded Rose and Julia’s oral reading on these two articles separately. Before recording, we asked them to try their best to read and use their own ways to read when they encounter any difficulty. After reading, we asked them to talk about their comments of strategy used.

c. Miscue Analysis

We listened to what we recorded from Rose and Julia and coded their miscues. We then combined the data we have complied about their use of sentence structure, meaning, and phonics into a comprehensive portrait. This information helps us generalize about their strengths, strategies and needs. In the next section, we will discuss about what we found from Rose and Julia.
Results

In order to generalize Julia and Rose’s strengths, strategies, and possible future growth, we coded their miscues. In this section, we walked through the process of their reading and also made a comparison about their performance. Since the two articles are long, we coded only 40 sentences in first article, *Shrinking Treasures*. The following figures presented the data about their use of sentence structure, meaning, and phonics.

Figure 1. Julia’s result

Julia and Rose are comfortable readers. Coding their sentences, we saw that they either have no miscues, that miscues were insignificant, or they self-corrected. Although we see that they both had 35% sentences that were unacceptable in terms of grammatical structure, it
did not mean they did not understand the meaning of the sentences. They made grammar mistakes because they ignored the plural form of words and the verb tense, for example:

5. It is a dragon that just happen\(\textcircled{\text{5}}\) to be cloak\(\textcircled{\text{5}}\) in one of China’s most dramatic and accessible glaciers.

9. A few venture gingerly onto the glacier\(\textcircled{\text{9}}\) outer slopes, to slip and slide for souvenir snapshot\(\textcircled{\text{9}}\).

These errors might be too minor a syntactic problem to make the sentence as a whole ungrammatical. However, after finding that they both repeatedly making the same grammar errors, we decided to adopt a strict standard to make judgments because these grammar errors are related to their first language experience. There is a different grammar system between English and their native language, Mandarin. In Mandarin, there is no rule for plural and verb tense. Julia and Rose are adult English learners. Before they came to the U.S.A., their first language is already set. Although they have studies English grammar through grammar-based and audiolingual approaches in the past, they still unconsciously ignored these rules when they were asked to read out loud an English article. This situation is similar to Krashen’s hypothesis “the fluency in a second tongue cannot be learned; that is, conscious mastery of grammar and vocabulary does not prepare us to use the language for communicative purposes” (Crawford, 1999, p.123).

In addition to their performance in the syntax acceptability, we compared their profiles to understand how they differ from one another. In Figure3, we see Julia is a less effective reader than Rose. Julia made more miscues that did not make sense or that partially changed the meaning of the passage. For example, in sentence 7 and sentence 22, Julia’s miscues
changed the height of the mountain and also confused with the number of people who were affected by water shortages.

7. At 12,000 feet, many visitors carry small canister\(\Rightarrow\) of oxygen to avoid altitude sickness.

22. He says water shortage\(\Rightarrow\) are certain to become more severe in the region, affecting 300 million people, and a third of China’s population.

Finally, we analyzed their strategies for using graphphonic system. In this section, we found that when a word was completely unknown to them, they tended to attempt it with phonics. Rose is an advanced reader. She only made 7 miscues in using high visual similarity to connect the print and the sound. Comparing to Rose, Julia is a less effective reader. Julia made 19 miscues in using high visual similarity to connect the print and the sound. Obviously, she heavily relies on phonics and cannot pronounce the word right. It is consistent with what Sandra Wilde said “Good ones use- but don’t overuse- phonics, while weaker ones may rely too much on it” (2000, p.84).

Discussion

In order to understand both subjects’ reading strategies, we held a short conference with them and discussed about their performance. They both felt these two articles are not difficult because there are only a few new vocabularies and it is easy for them to connect their prior knowledge to the context. During reading, they used several self-correction skills and also relied on phonics to deal with new words. In addition, they both felt very confident in understanding the content of these two articles. With the purpose of providing a more detailed picture about their reading performance, we analyze their reading strategies as the following:
<table>
<thead>
<tr>
<th>Strategy</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>I. Prior knowledge</td>
<td>- They exhibited strong motivation in familiar content. They felt it is very helpful when she has background knowledge of the article.</td>
</tr>
<tr>
<td></td>
<td>- For example, the first article “Shrinking Treasures” is talking the global warming phenomenon in China. Although they were not familiar with the topic of global warming, the word “China” drew their attention. In addition, this article mentioned the movie “The Day After Tomorrow.” Since they saw this movie before, it was helpful for them to understand the context of the article.</td>
</tr>
<tr>
<td>II. Predicting</td>
<td>- Julia did not mention that she used this strategy before her oral reading.</td>
</tr>
<tr>
<td></td>
<td>- Rose told us that she is used to skim the topic sentences to find key words and predict the content before her reading out loud. It was helpful for her to understand the content and speed up her reading.</td>
</tr>
<tr>
<td>III. Self-monitoring</td>
<td>a. Skip over / Omission</td>
</tr>
<tr>
<td></td>
<td>- Yes, they both used this strategy, especially, when they met an unknown word. For example, they read “picture” instead of “picturesque” and omit “sque”</td>
</tr>
<tr>
<td></td>
<td>b. Sound it out</td>
</tr>
<tr>
<td></td>
<td>- Yes, they both rely on phonics to sound new words out. For example, when Julia saw the word “diasters,” she read “dizister.”</td>
</tr>
<tr>
<td></td>
<td>c. Substitution</td>
</tr>
<tr>
<td></td>
<td>- Yes, they both use the skill of substitution. For example, they both used “deep” to substitute for “depth.”</td>
</tr>
<tr>
<td>d. Reread / self-correction</td>
<td>Yes, for instance, when Julia saw the word “politicians,” she read “public, politic, polition.” When Rose saw “analyze,” she read, “ana, analyze.”</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>e. Insertion</td>
<td>Rose did not have this behavior, but Julia did it few times. For example, Julia inserted the word “and” before the comma of the sentence “affecting 300 million people, a third of china’s population.”</td>
</tr>
<tr>
<td>f. Transposition</td>
<td>They both did not have miscues in transposition.</td>
</tr>
<tr>
<td>g. Repetition</td>
<td>Julia seldom repeated her words or sentences.</td>
</tr>
<tr>
<td></td>
<td>Rose used this skill several times to check her reading.</td>
</tr>
<tr>
<td>h. Recognized high frequency words</td>
<td>Julia did not use this skill to help her reading.</td>
</tr>
<tr>
<td></td>
<td>Rose told us that she recognized high frequency words in context to clarify terminology.</td>
</tr>
<tr>
<td>Strategy</td>
<td>Comments</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>IV. Expression</strong></td>
<td>a. Voice quality (Tone and inflection)</td>
</tr>
<tr>
<td></td>
<td>• They both did not recognize the use of tone, inflection to attempt an expressive interpretation of the text.</td>
</tr>
<tr>
<td></td>
<td>• Their voice quality made little distinction for various characters and conveyed little feeling appropriate for the passage.</td>
</tr>
<tr>
<td></td>
<td>b. Speed, pace or rate</td>
</tr>
<tr>
<td></td>
<td>• About Julia’s reading, her pace is uneven with a mixture of conversational and slowed rate. Her rate does not correspond to the meaning</td>
</tr>
<tr>
<td></td>
<td>of the passage, and sometimes a monotone or excessively hurried speed is the result. Therefore, sometimes the meaning is impeded.</td>
</tr>
<tr>
<td></td>
<td>• About Rose’s reading, her pace is more consistent. However, she did not correspond her reading pace to the meaning of the text.</td>
</tr>
<tr>
<td><strong>V. Fluency</strong></td>
<td>The flow of their delivery</td>
</tr>
<tr>
<td></td>
<td>• Basically, they read with some appropriate pauses, stops, starts, and signals for transitions, although they sometimes paid little</td>
</tr>
<tr>
<td></td>
<td>attention to punctuation.</td>
</tr>
<tr>
<td></td>
<td>• Comparing to Rose, Julia’s reading contained more noticeable choppiness with pauses and breaks at unexpected time. Meaning and</td>

<tr>
<td></td>
<td>expression were affected.</td>
</tr>
</tbody>
</table>

**Conclusion**

According to transactional theory, reading is the process of constructing meaning through the interaction among a reader’s existing knowledge, the information suggested by the print on the page, and the social context (Lenski & Nierstheimer, 2004). It involves mapping the available information onto an appropriate schema which is already stored in a reader’s memory. Readers’ background knowledge, interests, linguistic abilities, and abilities to apply reading strategies are all important ingredients that will affect the outcome of the
reading event (Lenski & Nierstheimer, 2004). A successful reader should be able to use the textual clues to derive these schemata from his/her past experience to construct meaning. He/she should also have the ability to apply strategies to control over what and how he/she read.

Therefore, based on the theory and our findings, we would like to conclude Rose and Julia are both comfortable independent ESL readers because they adopted several useful strategies, such as applying their prior knowledge, predicting, and self-monitoring. Among these strategies, prior knowledge and predicting are particularly important for ESL learners because the strategies can help them to integrate new information into their existing conceptual framework of their native language, cultural background, and knowledge of texts.

In addition, they showed evidence of integrating three sets of cues (syntax, semantics, and meaning) and graphophonetic system. During the reading process, they predicted, confirmed and self-corrected. As an ESL adult learner, pronunciation could be a problem for reading out loud. We found they were able to rely primarily on phonics to pronounce the unknown words and kept going ahead. Sometimes their pronunciation might not be correct, for instance, Julia usually created non-words for unfamiliar words. However it still worked in the context of the sentence. We also have noticed that Rose and Julia kept making grammar errors of using plural and verb tense. The interesting point is that they were both unconscious of these errors and did not make any correction. This result might be due to the influence of their first language.

Finally, we found they both ignored the expression and fluency as they read. Tone, inflection, speed, pace, and punctuation are important elements of oral reading. While a
reader pays attention to these elements, it is usually easier for them to catch the meaning of the context. We encouraged them using these strategies to enhance their comprehension.

Julia and Rose both have just arrived in the U.S. for two months for the time of this case study. Some studies suggest older ESL learners may have phonological problems and they also might experience a long, gradual decline in their aptitude for acquiring other aspects of language (Crawford, 1999). However, based on our results, both of them are already strategic ESL readers. We believe if they can keep self-monitoring their reading behaviors and improving their reading strategies, ultimately they will be successfully merged into the U.S. classroom setting soon.

Comparing Preservice Teachers View of the Importance of Understanding Fractions With Their Ability to Adequately Explain Solutions to Word Problems Involving Fractions

Travis A. Olson  
*University of Nevada, Las Vegas*

Melfried Olson  
*University of Hawai‘i at Mānoa*

**Introduction**

This paper builds upon work conducted with students in grades 5 – 8 and preservice elementary, middle and high school teachers (Olson & Olson, 2010; Sjostrom, Olson & Olson, 2010) concerning reasoning and explanations provided for fraction word problems. It was observed that fifth-grade students, while lacking knowledge of algebraic computational strategies including the ability to use ratio and proportion, still were able to solve word problems involving fraction concepts related to such computational strategies. These fifth-grade students made use of models and the meaning of the words and structures within the problem to arrive at appropriate solutions. However, students in grades 6 – 8, even after more formal instruction in fractions and ratios did not apply their knowledge successfully on these same problems. (Olson, Slovin, and Zenigami, 2009; Olson, Zenigami, and Slovin, 2008; Slovin, Olson & Zenigami, 2007.)

The results associated with examining preservice teachers’ facility with these problems are mixed (Olson & Olson, 2010; Sjostrom, Olson & Olson, 2010). The preservice teachers were given the same questions with the added condition to explain their reasoning as they would to someone who would struggle with algebraic methods. In other words, they were to explain the solution to the problem in a manner that would be effective in the context of working with fifth-grade students. Most preservice elementary teachers were not able to actually solve the problems, much less provide a satisfactory explanation. In general, preservice secondary teachers were able to solve the problems, but their ability to explain without algebraic symbolism did not appear to be consistent with their ability to solve the problems.

**Theoretical Perspectives**

Ma (1999) documented the differences between the ability of elementary teachers in the United States and elementary teachers in China to either compute an answer to a division problem or to construct a representation, either verbal or visual, that was conceptually correct for a given division situation. In both cases, the teachers in the United States performed worse than teachers in China and worse in comparison on the second situation than the first.

When one examines the work completed in rational numbers and proportional reasoning, topics that are often discussed are mathematical analysis, notational systems used, clarifying constructs, distinctions between ratios and rates, and similarities and differences between fractions and rational numbers (Lamon, 2007). In particular, Lamon argues that studies in the field have come to a temporary standstill, and outlines a new research paradigm that includes reconsidering pedagogical content knowledge and continuing the conceptual analysis.
Specifically, Lamon (2005) provides insight into her view on research on rational number understanding and proportional reasoning as follows:

One of the most compelling tasks for researchers has been to discover how instruction can facilitate the joint development of rational number understanding and proportional reasoning. By deeply analyzing mathematical content, children’s thinking, and adult thinking, we have begun to understand some of the knowledge that contributes to the development of these critical concepts, operations, and ways of thinking. Helping children to develop a deep and broad understanding of the rational numbers as well as the ability to compute with them and to reason flexibly with them is not as easy as merely teaching a unit on each of the interpretations. It is much more complex than that! There are a number of central core ideas that must be addressed.” (p. 8).

Lamon lists these ideas with connections between every pair: reasoning up and down; rational number interpretations; measurement, quantities and covariation, relative thinking, sharing and comparing, and unitizing. Moreover, Lamon notes that these are a minimal set of topics for students to understand and engage in prior to high school. Furthermore, she indicates that “Research in which children were given the time to develop their reasoning for 4 years without being taught the standard algorithms for operating with fractions and ratios, produced a dramatic increase in students’ reasoning abilities, including their proportional reasoning” (p. 10).

In our experiences, when students and teachers attempt solutions for word problem involving fractions where the problems might involve multiplication, division, or ratios depending on the perspective one takes when attempting a solution, students and teachers are able to apply algorithms but cannot describe why such algorithms are conceptually sound. In their work, Cramer, Wyberg, and Leavitt (2007) offer support for experiences such as ours, “Many middle school students are able to apply the algorithm for multiplying fractions, but most are unable to describe the reasons why the algorithms work. Fewer are able to make sense of the division algorithm” (p. 533). Cramer, Wyberg, and Leavitt also note that while students are able to make connections between models, images, and symbols for addition and subtraction problems, “Developing mental images related to multiplication and division of fractions proved to be much more complex” (p. 535).

Furthermore, Kieran (2007) reports that, “Generating equations to represent the relationships found in typical word problems is well known to be an area of difficulty for algebra students” (p 271). However, there is little work done in examining how children make use of modeling to solve these problems if they cannot represent the ideas with algebraic notation, including the use of ratio and proportion relationships to solve these problems. Cramer, Wyberg, and Leavitt (2007) indicate that, “State and national assessments measuring fraction, decimal, and percent understanding has consistently shown that students struggle to learn these concepts in a meaningful way. Perhaps as educators we have underestimated the complexity underlying working with these numbers” (p. 534).

In her extensive look at teaching fractions and ratios for understanding, Lamon (2005) thoroughly outlines and categorized an immense collection of fraction and ratio problems. She discusses different structures related to multiplication, division, and ratio situations and thoroughly compares and contrasts the different representations. Yet in all the examples
provided, Lamon has few, if any, specific problem situations where the comparisons demand ratios involving fraction – to – fraction.

In the problems examined in this article, we focused on problems for which drawing a linear model could be helpful, although other models of even verbal reasoning could suffice. Although the fifth-grade students had used a curriculum rich in solving problems using a linear model, the choice to include these problems was made because a linear model was most often the model of choice from those fifth-grade students who could solve these problems. In framing strategies for solving problems, Ni (2000) discusses the use of number lines, including the difficulties students have in conceptually understanding the meaning and representation of a rational number. Specifically, Ni states that, “the graph representation of a given algebraic problem is not necessarily less abstract than the equation for the problem” (p. 140). In particular, we argue that it is necessary to understand the ways in which teachers view algebraic symbolism as inherently more abstract than other forms of abstractly representing a given algebra problem, similar to the point made by Ni. In other words, our guiding concern is that we argue that if secondary preservice teachers largely view algebraic symbolism as the pinnacle of intellectual capacity in algebra classrooms, then they need the facility to assist those students struggling with such abstractions as well as fraction concepts and computations in any way that fosters meaningful conceptual understanding. Consequently, the focus of this study revolves around attempting to arrive at an initial understanding of the way in which secondary preservice teachers alternatively conceive of fraction problems, without resorting to simple algebraic symbolic manipulations. This examination of preservice secondary teachers’ understandings is an area that we maintain has woeful lack of research on which teacher educators can provide meaningful interventions at both the preservice and in-service levels.

Gilbert and Coomes (2010), in discussing a problem similar to the ones discussed in this article offer the following argument:

Any reasonably numerate adult should come up with an answer to this task. Teachers, however, not only must be able to answer this question correctly; the tasks of teaching require that they must also understand and interpret multiple approaches to the same answer. (p. 421)

We suggest that in addition to the argument provided by Gilbert and Coomes, teachers must be able to conceptualize multiple ways to solve the problem so they can help students who might struggle with a formalized approach to a problem.

In this paper, we document both the work of preservice secondary teachers (PSSTs) on four fraction worded problems, compare their ratings of the effectiveness of their solutions to the rating of the explanations given by the authors, and also examine these preservice teachers’ ratings on five questions related to their beliefs regarding the importance of fraction computation, conceptual understanding of fractions, and use of models and representations when working with fraction problems. The research presented in this paper extends prior work in four ways: 1) it provides examinations of ratio and proportion situations through fraction word problems, 2) it provides examinations of the ways that these problems are done with models and reasoning rather than computation, 3) it provides for explorations related to how preservice teachers are able to explain solutions to these problems with models and reasoning, and 4) it draws comparisons between the ratings that PSSTs give to their explanations and the ratings of their explanations by the rubric we used.
Methodology

The same four problems from Olson and Olson (2010) were used, and the rationales, with a few modifications, underlying the choice for specific problems are as follows:

1) Problem 1 is referred to as a “common numerator” problem. We maintain that if a student understands the inherent 1-1 correspondence between the numerators, the problem can be reconciled simply by examining numerators. While common denominators are useful in solving problems, we often do not investigate problems where use of common numerators is helpful in determining a solution. Furthermore, the remaining problems can also be solved with a common numerator strategy.

2) Problems 2, 3, and 4 are similar in structure in two important ways. First, they each can be modeled algebraically as $a \cdot x = b$, or $a \cdot x = b \cdot y$ where $a$ and $b$ are known values described in the word problem. Second, the first fraction mentioned in each problem has 2 as a numerator. We were deliberate in using fractions with a numerator of 2 because children appear to use models to reach a solution more effectively when division by 2 is involved. We were interested if the prospective secondary teachers would be able to effectively model their solutions and felt these problems might be easiest to model.

Problem 3, while similar in structure to Problems 2 and 4, is more like the form $a \cdot x = b \cdot y$. Furthermore, the way the Question 3 is asked changes the thinking needed to find a solution. In Questions 2 and 4 the solution is requested for $a = 1$, while in Question 3 the solution is requested for $b = 1$.

3) The structure of Problems 2 and 4 seems to suggest that a linear model matches the actions of the words. If a number line is an effective way to understand fractions, then perhaps prospective teachers would be able to use a linear model to answer the question.

4) Explanations of models used to solve problems 2, 3, and 4, often use the idea that the first thing to be done to solve the problem with a model or reasoning is to divide by the numerator of one of the fractions and then multiply by the denominator of the same fraction. That is, effective modeling of the solution to these problems can help explain why “invert and multiply” makes sense when dividing fractions. (p. 88 – 89)

The same set of four problems from research conducted in the previous year was used with two modifications. To determine student beliefs related to understanding fractions, fraction computation, and being able to use models to explain reasoning when working with fractions, a survey with five questions was created. These questions were to be answered before the work on the problems and again after completing the work on the problems. The specific prompt and statements related to a Likert-type scale for this survey are presented in Table 1.

The four problems given to the PSSTs, as well as the directions are given in Table 2. The oral directions during administrating the problems emphasized the need to provide a solution by using models and sense making. Additionally, the written directions provided on the handout were as follows: Please do each page in sequential order, do not skip pages. The directions for providing your solution to the fraction problems will be at the top of Page 3. Please follow the
directions to the best of your abilities. Please make sure you provide your “effectiveness” rating at the bottom of each page after providing your solution to the problem on that page.

Each problem was on a separate sheet of paper, with room to solve the problem. After answering each question, each PSST was asked to rate the effectiveness of their explanation. The rating was on a five-point Likert-like scale. The effectiveness rating data were obtained to gain information regarding PSSTs views on how they felt they responded to the prompt to engage a student who struggles with algebraic representations and symbolism. This information is presented in Table 3.

Data were gathered from PSSTs at two institutions of higher education in southwest United States. The PSSTs were enrolled in courses on the methods of teaching mathematics during the fall semester 2010. Forty-five minutes were allowed for the completion of the assessment, largely because we previously found that twenty minutes was sufficient for students.
in grades 6 – 8 to complete two problems. Importantly, as will be discussed later in this paper, the time we allotted was evidentially not adequate for many PSSTs to complete every aspect.

As in prior work, for each problem we examined the work for correctness of answer, type of model used, and explanation provided. The coding used for these components is described below:

- Explanations were coded using the explanation rubric from the State of Illinois extended response format (Illinois State Board of Education, n.d.). The explanations included written explanation of the rationales and steps of the solution process. Justifications of each step were examined. Though important, the length of the response, grammar, and syntax are not the critical elements of this dimension. The rubric used in coding explanations is given in Table 4 (see following page).

- Answers were coded 0-no response, 1-incorrect, 2-correct.

- Types of Models were coded 0-no model, 1-linear, 2-linear area, and 3-area model. While it is usually easy to classify a model as linear, classifying a model as area versus linear is not always so clear. We use linear area as a model that has components of area but for which we infer the thinking was linear. (Slovin, H., Olson, M., and Zenigami, F., 2007; Olson, Zenigami, and Slovin, 2007; and Olson, Slovin, Zenigami, and Okazaki, 2007)

The code linear was only used for line or line segment representations.

### Results

In this section we present and share observations related to the results of coding student answers, explanations, models used, and effectiveness ratings; discuss models used when correct answers and level 4 explanations were given; and compare answers and explanation levels to

Note. Not all code numbers (i.e., 1, 2, 3, 4, 5) were used for each aspect of this table (i.e., Answer, Explanation, Model, and Effectiveness). Cells with non-applicable codes are denoted with “--".

a three students used two different models
b one student circled both 1 and 2
c only 16 students answered this question and only 10 provided an effectiveness rating
d only 12 students answered this question; one student used two different models, and only 10 completed the effectiveness rating.

Several observations are noteworthy from the data in Table 5:
1. No problem was answered correctly by every PSST.
2. Only on Problem 2 were more than 50% of the explanations at the highest level, 4.
3. The percent of level 4 explanations for Problem 3 was lower than for the other questions.
4. The effectiveness rating for Problems 3 and 4 were lower than for Problems 1 and 2. The effectiveness ratings for Problem 2 matched more closely the explanation code than in other problems.
5. The use of a model was less for Problems 1 and 3.
6. While not seen in the data above, there were only four PSSTs who correctly answered each problem and only one who answered correctly and received a 4 for explanation on each problem

The coding for models of those who answered correctly for each question is provided in Table 6. From these data, there are noteworthy observations. In particular, those answering correctly on Problem 1 used an area model most often. These PSSTs used both an area model for the paint and for the square meter but no one used a double number line model, which might have proven successful. Some manner of a linear model was used most often for Problem 2. However, this is not surprising given that the problem somewhat suggests distance in both uses of fractions. The use of models in Problem 2 might be one reason that the effectiveness rating for this problem matched the explanation rubric better than in the other Problems. The fact that only two people solved Problem 3 with an explanation rated as 4 likely indicates that the PSSTs could not conceive of how to model this problem.

*Note.* Not all code numbers (i.e., 1, 2, 3, 4) were used for each aspect of this table (i.e., Answer, Explanation, and Model). Cells with non-applicable codes are denoted with “--”.

Observations that we arrived at through examining the data that are provided in Table 7 are as follows:

1. Students were most successful with Problems 2 and 4 (answer correctly with an explanation of 4) each year.
2. Students were least successful on Problems 3 and 1 (answer correctly with an explanation of 4) each year. The authors continue to be surprised at the difficulty PSSTs have in explaining the answer to Problem 1. The ‘natural 1 – 1 correspondence’ implied in the question would indicate that a solution for that problem could be quite easily explained, but the data do not support this.
3. Problem 3 is the most difficult problem each year in spite that Problems 2, 3, and 4 are similar with the numerator of one fraction being 2. However, in problem 3, any modeling involves operating on the other fraction. It was interesting that one student, who answered Problem 2 correctly with an explanation of 4, wrote that he/she should be able to solve Problem 3 the same way, but could not do so. However, he/she was able to solve Problem 4 in the same way.
4. The differences between the percentages who answered correctly and those who received an explanation of 4 were greater in 2010 than in 2009. This is most likely due to increased verbal emphasis to justify reasoning in 2010.

Due to several students not being able to work all problems, many did not complete the post survey. Average pre-rating, post-rating, and difference between post- and pre-rating are given in Table 8. While there was no meaningful difference in the averages on three of the question, the PSSTs did rate both prompts 3 and 4 much lower on the post-rating. That is, after working on the problems, PSSTs were more in agreement with the belief that it is important to be able to accurately provide a model or representation for situations involving fractions. It is also...
worth noting here, and elaborating on in the following section, that the PSSTs showed less disagreement with the importance of computing fractions quickly.

**Discussion**

The results given above have several implications for teacher education. The Common Core State Standards for Mathematics (2010) (CCSS) expect students to have computational competency, conceptual competency, and to employ standards of mathematical practices. In particular the authors of the CCSS provide a Grade 6 expectation for ratio and proportion in that students should be able to, “Use ratio reasoning to convert measurement units; manipulate and transform units appropriately when multiplying or dividing quantities” (p. 42).

Clearly then, an important question is, to what extent are teacher educators, and teacher education programs preparing teachers to help students meet these requirements, particularly in light of the compelling evidence presented in this paper that PSSTs have difficulty modeling the situations to help students who lack facility with algebraic symbolism and have difficulty obtaining a solution in situations involving fraction concepts and computation? We argue that it is imperative for preservice teacher education programs to challenge PSSTs to connect fraction computational competency and fraction conceptual understanding; that is, challenge PSSTs to
provide explanations that use modeling and wording of problems to scaffold students in developing solution strategies and conceptual understandings.

We maintain that working with PSSTs who often approach a fraction problem with algebraic symbolism and reasoning, rather than understanding the nature of and relationship between fractions in the problem, is crucial. The lack of facility to effectively, and with relative speed, represent fraction problems involving ratio, proportions, and unknown quantities becomes an issue when the students with whom PSSTs work in a 9th grade pre-algebra or algebra class have difficulty with solving algebra problems involving multiplication and division of fractions. Our current concern that underlies this study, as well as what we view as important avenues for future research, relates to whether PSSTs will be able to provide multiple representations that include modeling, or compare and contrast modeling and multiple representations to facilitate students learning of these mathematical concepts. We maintain that it is essential to prepare PSSTs to address these issues, which likely means that a more cooperative effort of those involved in the preparation of the PSSTs is necessary so PSSTs do not enter teacher education courses on the methods of teaching secondary mathematics with an inability to explain, model, and communicate their mathematical understandings at a higher level than demonstrated by the work outlined in this paper. In part, we strongly argue that the role of instruction in undergraduate mathematics classes must be adjusted to value, encourage, and emphasize deep mathematical thinking, connections, and reasoning that, along with methods courses, allow for PSSTs to develop more robust mathematical understandings related to facilitating the development of students’ mathematical knowledge at a higher level than solely algorithmic. As one PSST in our study noted in the space made available for comments, “I hope there is a class where I learn to teach this.” It is our firm conclusion that, although such discussions are important in methods courses, the deep mathematical knowledge needed for such discussions must occur in mathematics courses for PSSTs taken prior to such secondary methods classes.

Abstract
Since English has become the global language, learning English in early childhood has, accordingly, become a prevalent trend in Taiwan. In order to examine the practice of preschool English education, the data on self-reported questionnaires were gathered from 192 registered preschools in southern Taiwan. The subjects of this study are preschool teachers and administers. Data obtained were analyzed using descriptive statistics. The main findings are discussed in the following areas:

1. The differences of English education in different preschool education models
2. The quality of early childhood English teachers
3. The quality of early childhood English textbooks and materials
4. The difficulties of conducting English education programs from preschool administers’ perspectives.

Suggestions based on the data analysis will be made as references for promoting qualified preschool language education.

6. Abstract
   The production of English sentences constructed from multiple clauses by native/non-native speakers was examined in order to investigate how they realize the phonetic representation. We focused on complex sentences that contain syntactically ambiguous structure and need reanalysis for comprehension.

   Native speakers of English and Japanese students produced sentences under the following two conditions; (1) at the normal speed with the natural prosodic features for speakers, and (2) with the prosodic variation on speech speed, with pauses, voice intonation or pitch changes for easier comprehension.

   Some prosodic features that might lead to foreign accents or non-fluency reveal as follows: (a) Japanese student took much longer time and in the narrower pitch range to articulate English sentences than the native speakers. (b) While the native speakers tend to insert the pause either at the syntactic boundary or before the emphasized word, the Japanese EFL learners insert the pause by every word. The results derived through these comparisons suggest that further training in speaking for Japanese EFL learners would be necessary.

   Keywords: articulation by native/non-native speakers, phonological features, pause, foreign accentedness
Pedagogical Implications from Phonetic Characteristics of English Sentences Articulated by Japanese EFL Learners

1. Introduction

Former researches investigated that the prosodic information affects native language (L1) sentence processing. The appropriate prosodic information enhances sentence processing such as accessibility to vocabulary, sentence comprehension or processing time at the first stage of listening (e.g., Cutler & Norris, 1988; Kjelgaard & Speer, 1999). In the second language (L2) sentence processing by Japanese learners of English as a foreign language (Japanese EFL learners), the prosodic information such as the existence of pause or intonation change played an important role as well as in L1 speech processing (e.g., Sugito, 1996, etc.). On the other hand, the data we obtained provided some evidence that Japanese EFL learners might not be able to utilize the prosodic information when processing English syntactic ambiguous sentences (Hirai, Ikuma, & Yokokawa, 2010).

The results from our previous research in Hirai et al. (2010) showed that the sentence processing by the EFL learners at the intermediate level might be constrained not only by the limited syntactic and semantic information, but also by the limited perceptual ability of phonological features, or that the EFL learners might fail to integrate information of “sound” and “script.” If Japanese EFL learners at the intermediate level fail to process syntactic and semantic information and acoustic clues in total, how do they realize the phonetic representation when they articulate English sentences? In what way is learners’ production acoustically different from those of native speakers? If learners could not take advantage of the phonetic clues when listening to L2 sentences, they may not perceive a natural manner of articulation for native speakers in the first place. If the acoustic features by native speakers of English, and the difference between the utterances by Japanese EFL learners and native speakers would be described experimentally, it can be beneficial for speech education in L2 instruction.
Purpose of the Present Study and Research Questions

The purpose of the current study is to examine how L1 and L2 speakers express some acoustic clues that they think facilitate the listeners’ processing. We focused on the production of English sentences constructed from multiple clauses, especially, complex sentences that contain syntactically ambiguous structure and need reanalysis for comprehension. Those are called syntactic garden path sentences. For instance, the sentence below is an example of syntactic garden path sentences.

*Whenever his aunt sings the songs are beautiful.*

*When written, a comma could be inserted between “sings” and “the songs” in order to avoid confusion.*

Listeners or readers can go syntactic processing for the subordinate clause starting with “whenever” through either “sings” or “the songs.” In the case when the first verb of the sentence “sings” is understood as an intransitive verb, the processing of the first clause (the subordinate clause starting with “whenever”) is complete at this point (“Whenever his aunt sings”), and the second clause (the main clause) starts from the noun phrase “the songs.”

On the other hand, in the case when the first verb “sings” is taken as a transitive verb, the processing of the subordinate clause continues until “the songs,” the object noun phrase of the verb “sings” (“Whenever his aunt sings the songs”). However, the rest of the sentence “are beautiful” cannot be a clause, and listeners or readers have to reanalyze the syntactic structure as the first clause is complete at the intransitive verb “sings”, and the noun phrase “the songs” is not the object of the verb but the subject of the second clause.

Syntactic garden path sentences may be articulated with some prosodic clues to avoid misunderstanding. In Hirai et al. (2010) it is found that Japanese EFL learners might not be able to utilize the prosodic information when processing English syntactic ambiguous sentences. However, the acquisition of the L2 phonetic information was not questioned.

In our study, the production of English sentences constructed from multiple clauses by Japanese EFL learners was examined to investigate how they realize the phonetic representation. The data produced by the native speakers of English were also collected to supply the baseline.
2. Methods

Materials

Five stimulus conditions are developed with the syntactic garden path sentence at the core; four target conditions and one group of filler sentences. Fifty-four sentences were used in total, and examples from each condition are shown in Table 1. See Appendix A for all the sentences used in the current study.

</tbody>
</table>

Sentences in Condition (a) are syntactic garden path sentences, as they are called typically. In the syntactic explanation, the subordinate clause proceeds to the main clause, and the verb of the proceeding clause is intransitive and does not have an object noun phrase. Because the proceeding clause ends earlier than the case that has an object noun, it is also called “early closure.”

Sentences in Condition (b) are variations of the Condition (a). The difference between Condition (a) and (b) is the transitivity of the verb in the subordinate clause. In this condition, the verb needs the object noun phrase, and two noun phrases appear after the verb of the first clause, unlike Condition (a). Those sentences are called “late closure”
because the proceeding subordinate clause ends at last with the noun phrase after the verb. For this condition, the sentence structure does not cause any syntactic confusion, so listeners or readers do not need reanalysis.

A set of sentences in Condition (c) is another variation of Condition (a). In this condition, the main clause proceeds to the subordinate clause, and the subordinate clause has an intransitive verb. For this condition, again, syntactic reanalysis is not needed.

A set of sentences in Condition (d) is, too, another variation of Condition (a) in terms of the transitivity of the verb in the subordinate clause, and the order of the main and subordinate clause. In this condition, the main clause proceeds to the subordinate clause like Condition (c), on the other hand, the subordinate clause has a transitive verb unlike Condition (c). For this condition, syntactic reanalysis is also not needed.

Lastly, Condition (e) is a set of filler sentences that are not used for acoustic analysis. There are various sentences containing a relative clause, a contact clause, or a tag question, etc. that may result in all different acoustic production. We make sure all of the sentences do not need syntactical reanalysis.

Each sentence was made to be composed of an almost equal number of words, and even an equal number of syllables as well. The overall average of the number constituting a sentence was 9.20 words, and 12.0 syllables. The details are given in Table 2.

Participants

Twelve native speakers of American English (6 males and 6 females, ranging in
age from 19 to 21 years old) and thirteen Japanese university students (7 males and 6 females, ranging in age from 20 to 22 years old) were participated in this study. Native speakers were undergraduate students, and had never lived in Japan before. All of them came to Japan for about a few month as exchange students for Kyoto Seika University.

The Japanese students were undergraduate students or graduate students majoring in various areas such as English education, educational psychology, cultural studies, and so on. All of them were attending a lecture offered as one of the teacher training course for English education. Each was asked to answer a questionnaire on foreign language learning experiences, proficiency on English language, experiences living abroad, and so on.

**Procedure**

Native speakers of English and Japanese university students produced garden path sentences under the following two conditions; (1) at the normal speed with the prosodic features that speakers to be natural, and (2) with the prosodic variation on speech speed, making some pauses, voice intonation or pitch changes for easier comprehension. Speakers were instructed to utter sentences that clearly demonstrated each of these conditions. The detailed directions are in Appendix B.

We made four lists, and the order of total of 54 sentences randomized in each list. One participant reads one of the four lists.

Recordings were made in a quiet room individually, and utterances were digitized at 16-bit resolution and 44.1 kHz sampling frequency. In this study, selected 12 sentences from each participant were acoustically analyzed using SUGI Speech Analyzer.

**3. Results and Discussion**

The difference between phonetic characteristics produced by native speakers and those produced by Japanese EFL learners reveals some characteristic prosodic features that might lead to foreign accents or non-fluency. First of all, the ratio between Japanese and native speakers of English by length of the utterance was more than one (ranging from 1.35 to 1.41), that is, Japanese EFL learners took a much longer time to articulate English sentences than the native speakers (Figure 1). Also, the utterance by Japanese students turned out to be in a narrower pitch range.
Figure 1. Comparison: Length of utterance.

</tbody>
</table>
Second, the duration of the pause at the syntactic boundary decreased or disappeared in the complex sentences whose main clause proceeded to the subordinate clause in native speakers (Table 3). Although the consistent downward trend was also obtained by the data of Japanese EFL learners, the pauses were not drastically diminished (Table 4).

Third, while the native speakers tend to insert the pause either at the syntactic boundary or before the emphasized word (Figure 2, or 3), the Japanese EFL learners insert the pause by every word (Figure 4). The data by one of the native speakers as shown in Figure 2 clearly demonstrate the expansion of the pause inserted. Some native speakers employed a different strategy to increase the intelligibility (Figure 3). Although the pause decreased or disappeared at the point of syntactic boundary under the cooperating condition, one particular word was articulated with some phonetic emphasis. However, Japanese EFL learners inserted several short pauses (Figure 4).

**Baseline condition**

**Cooperating condition**

*Figure 2. One of the characteristic features of native speakers: Under the cooperating condition, pauses are detected much more easily at the point of the syntactic boundary.*
Figure 3. One of the characteristic features of native speakers: Under the cooperating condition, one particular word (in this example, the word ‘beautiful’ at the end of the sentence) was pronounced with focus (marked broader pitch range and longer utterance length) and pauses are decreased or disappeared at the point of the syntactic boundary.

These results derived through these comparison suggest that there are some differences between native speakers of English and Japanese EFL learners in the realization of intelligibility for hearer, and that further training in speaking would be necessary for Japanese EFL learners in order to make their speech more natural.
Figure 4. Native speaker of English takes a clear pause between the main clause and the subordinate clause, however, Japanese EFL learners insert several short pauses, not only between clauses but also within the clause.

4. Conclusions and Pedagogical Implications

In this study, to examine the comprehension and articulation of the prosodic and phonetic features of English sentences by EFL learners, Japanese EFL learners and native speakers of English produced a variety of sentences in normal and in comprehensive style. In comparison with the native speakers’ articulations, some of the prosodic features of the Japanese might lead to foreign accentedness or non-fluency. First of all Japanese students took much longer time to articulate English sentences and did so in a narrower pitch range than the native speakers. The speed is one of the measurements in fluency (e.g. Riggenbach, 2000) and this might lead to foreign accents or non-fluency.

While the native speakers tend to insert the pause either at the syntactic boundary or before the emphasized word, the Japanese EFL learners insert the pause before every
word. For further studies, the characteristics of the unintelligibility by Japanese EFL learners will be figured out through listening experiments in which the native speakers of English were asked to judge the naturalness of the production of Japanese EFL learners. When it is revealed that the representations of intelligibility for hearers differ between native speakers of English and Japanese EFL learners, we, educators should know the reality and the characteristics, and can apply the result in an EFL teaching situation.

Acknowledgements

This paper is a revised and enhanced version of the authors’ oral presentation at the 50th Commemorative Conference of the Japan Association for Language Education & Technology held at Yokohama, Japan, on August 5th, 2010, and we are grateful to Professor Jun Arimoto (Kansai University of International Studies), Professor Junich Azuma (University of Marketing and Distribution Science), Associate Professor Katsumi Yamamoto (University of Marketing and Distribution Science), Dr. Midori Iba (Konan University), and Professor Tadayoshi Kaya (Gakushuin Women's College) for their constructive comments and suggestions.

Appendix A: Stimuli

Condition (a) Subordinate with an intransitive verb + Main clause (Early closure)
Whenever his aunt sings, the songs are beautiful.
Whenever Joe starts, these meetings are boring.
If Robert buys, those baseball tickets can be free.
If you study, these textbooks are relatively easy.
When David is babysitting, my children are happy.
Before the participant deals, the cards are shuffled.
When Mike fights, these boxers are always badly beaten.

Condition (b) Subordinate with a transitive verb + Main clause (Late closure)
Whenever his aunt sings the songs, they are beautiful.
Whenever Joe starts these meetings, they are boring.
If Robert buys those baseball tickets, they can be free.
If you study these textbooks, they are relatively easy.
When David is babysitting my children, they are happy.
Before the participant deals the cards, they are shuffled.
When Mike fights these boxers, they are always badly beaten.

Condition (c) Main + Subordinate clause with an intransitive verb
His aunt's songs are beautiful whenever she sings.
These meetings are boring whenever Joe starts.
Those baseball tickets can be free if Robert buys.
These textbooks are relatively easy if you study.
My children are happy when David is babysitting.
The cards are shuffled before the participant deals.
These boxers are always badly beaten when Mike fights.

Condition (d) Main + Subordinate clause with a transitive verb
His aunt's songs are beautiful whenever she sings them.
These meetings are boring whenever Joe starts them.
Those baseball tickets can be free if Robert buys them.
These textbooks are relatively easy if you study them.
My children are happy when David is babysitting them.
The cards are shuffled before the participant deals them.
These boxers are always badly beaten when Mike fights them.

Condition (e) Filler sentences

Suzan is the teacher whom my sister likes the best.
Nancy was the woman whom I talked to on the phone.
Japan is the country where he spent his childhood.
A cute dog was what I wanted for my birthday.
August is the month when a lot of people go abroad.
The teacher whom my sister likes the most is Suzan.
The woman whom I talked to on the phone was Nancy.
The country where he spent his childhood is Japan.
What I wanted for my birthday was a cute dog.
The month when a lot of people go abroad is August.
Susan is the teacher my sister likes the most.
Nancy was the woman I talked to on the phone.
Japan is the country he spent his childhood in.
A cute dog was the only thing I wanted for my birthday.
August is the month a lot of people go abroad.
The teacher my sister likes the most is Susan.
The woman I talked to on the phone was Nancy.
The country he spent his childhood in is Japan.
The only thing I wanted for my birthday was a cute dog.
The month a lot of people go abroad is August.
Which is the most crowded state in America?
Where did you go during the spring vacation?
You lied about your age by seven years, didn't you?
He is one of the greatest school counselors, isn't he?

May I introduce you to Mister Jones right now?
Appendix B: Instruction for the participants

Pattern (1) Read aloud naturally first, intelligibly second.
   Step 1: Read the sentences silently and let me know if you do not know the meaning.
   Step 2: [Natural]
      Read each sentence aloud naturally at a self-selected normal speaking rate.
      If you mispronounce or misread, read that sentence from the top.
   Step 3: [Intelligible]
      Read each sentence aloud in the way that you think it is much intelligible for listeners.
      Do not read sentences simply slowly or insert pause word by word.
      Imagine the situation when a native speaker of English is asked to say the sentence again by a native speaker of English.

Pattern (2) Read aloud intelligibly first, naturally second.
   Step 1: Read the sentences silently and let me know if you do not know the meaning. (same as Step 1 in Pattern (1))
   Step 2: [Intelligible] (same as Step 3: [Intelligible] in Pattern (1))
   Step 3: [Natural] (same as Step 2: [Natural] in Pattern (1))
AN INVESTIGATION ON THE EFFECTS OF MOVEMENT IMPROVISATION ON EMOTION IN PEOPLE LIVING WITH HIV/AIDS

HSU, FONG-CHANG; LEE, SZU-HSIEN T.; WANG, YUNYU

ABSTRACT

Dance serves many purposes and has various beneficial effects including psychological benefits. The inclusion of dance as a subject into the arts and humanities field of the Grade 1-9 curriculum guidelines in the beginning of the 21st century provided opportunities for primary and secondary students in Taiwan to experience dance and enjoy the benefits of such. However, population outside of this boundary often have less resource and opportunity.

Psychological disturbances such as low mood, anxiety and isolation are frequently experienced by individuals living with human immunodeficiency virus (HIV). They have to constantly deal with the disturbance with limited support. Such circumstance has been complicated further due to the better understanding of and treatment for the illness, and hence the increased life expectancy of individuals living with HIV. Dance, which has a strong element of expression and social interaction, may serve as a media to assist individuals living with HIV in dealing with these perturbations.

The present study therefore proposes an investigation aimed at examining the effects of dance on emotion in individuals living with HIV. Specifically, a workshop has been planned and is scheduled to start in February 2011. Ten HIV positive volunteers will participate the workshop with written informed consent. Once a week for a total of 12 weeks, they will experience their body, explore themselves and interact with other volunteers through movement and dance. Both quantitative and qualitative data will be collected before and at the end of the workshop. In addition, participants’ CD4 count will be looked at. It is hoped that the outcome of the study will support the use of dance in this particular population, provide a guide and suggestions for professional dance teachers who may be interested in working with individuals living with HIV, and stimulate future research on teaching dance in people with disabilities and/or in the minority.

For relevance, teaching structure, contents and evaluation will be emphasized in this presentation.

Abstract
Over the last 10 years there has been increasing recognition of the significance of early childhood education for children’s academic achievement and long term wellbeing. This recognition has coincided in many Asian countries with a concern about English language learning and teaching. Issues include whether, and if so how, to teach English as a foreign language to children prior to formal schooling. Different Asian countries have approached these issues differently, depending on social and cultural beliefs and values, and ideas about how young children learn. It is sometimes assumed that Chinese parents prefer an explicit teaching
approach, in contrast to more Western child-centred approaches. The aim of this paper is to
investigate whether these often taken-for-granted assumptions do accurately reflect the views of
Taiwanese mothers of preschool aged children. In Taiwan, English learning has been emphasised
by the Taiwanese government in several ways but is prohibited in preschools and kindergartens.
This study investigated Taiwanese mothers’ ideas about when young children should commence
English language instruction, and the most appropriate ways to teach English as a foreign
language to children under 6 years. The sample consisted of 647 mothers of preschoolers in
Tainan, Taiwan. The mothers responded to a questionnaire which surveyed their ideas about
how young children best learn to speak and write in English. The results suggest that highly
educated Taiwanese mothers hold what may be characterized as an “emergent language and
literacy” perspective, while mothers with less education are more likely to endorse an explicit
teaching approach. The findings indicate that there is widespread support for English teaching in
early childhood centres but that views about the best ways to teach English to young children
diverge in relation to maternal education. The findings have implications for early childhood
teachers who wish to understand the social and cultural context for children in their centres.
Biographical learning of ethnic and cultural diversity in a post war society
Structural and subjective dimensions of learning to produce new cultural and social experiences

Abstract
In my presentation I want to show some results of an ongoing university project with students from 8 different countries in Kosovo. It is an attempt to attach the approaches of biographical research to the processes of social transformation. We try to connect theoretical, social and cultural learning processes in the work with the students. Collected empirical data helps to learn the principles of qualitative research methods and this work brings the processes and the results close to their own life-worlds. In reconstructing the dominant patterns in (auto-)biographical narratives we can see the different historical periods and different stages of societal and individual development. In that sense, these seminars have a huge impact on the democratization process and the transformation of this post war society. The goal is to find out something about the many small daily steps which must be done, to create a kind of “normality” after the terrible massacres of an ethnical-territorially defined nationalism in former Yugoslavia. These steps can be very well reconstructed by narrations, by life stories, because personal experiences are naturally linked with social orders.

Introduction
This project is an attempt to connect the approaches in oral history with the processes of social transformation in Kosova. It tries to bring theoretical issues and approaches from oral and life history work into adult education research and practice.

The first goal is to establish a Life Course Archive in Kosova. Students of different faculties will do recordings of life-stories in different levels of the Kosovarian society. These interviews will secondly be transcribed and collected. In arrangement with the local partners at the university and at KODI (Kosovar Research and Documentation Institute) some of the interviews will be translated into English to use them as learning materials for the processes of interpretation with different groups. In these interpretation groups (with Kosovarian students and others from all over Europe) we try to (re-)construct the experiences and meanings of social changes from the perspective of life course, which can help to understand the individual possibilities in creating one's life in new social structures. The main points in this work are:

- How could Kosova people manage the many risky status-passages in their lives after the war?
• What kinds of transformation processes take place and what processes of memory and forgetting are necessary to manage these changes?

• What happens in these processes of „life-trajectories in social space“?  

The archived data material is at the moment used by students to learn the principles of qualitative research methods. It can also be served as a "pathfinder," or as a "store of ideas" in preparation for newly-planned investigations. The analysis of data which has already been collected may be carried out in the form of historical and culturally-related comparative studies. This archive should finally be a resource base for humanitarian and research projects to analyze the conditions and possibilities of social change. In reconstructing the dominant patterns in (auto-)biographical narratives we can see the different historical periods and different stages of societal development. In that sense, biographical research has a huge impact on the democratization process and the transformation of this post war society.

To understand the problems and the background of this ethnicity it is crucial to know something about this country. With the declarations of independence of Croatia and Slovenia in 1991 the breakdown of Yugoslavia began, 1993-1994 there was a war between Croatia and Muslims, 1998 the battles in Kososva started. After the air raids of NATO in 1999 Milosevic resigned in 2000 and since that year UN troops secure the peace in the country, which is still a part of Yugoslavia. Kosovo is under United Nations and NATO administration since 1999. The political status is still unclear and the economic situation is very bad. In recent days the European Union has sent clear signals that it is willing to grant eventual membership to western Balkan countries provided they comply with EU standards of democracy and human rights.

In all my activities in this country it is the goal to find out something about the many small daily steps which must be done, to create a kind of “normality” after the terrible massacres of an ethnical-territorially defined nationalism in former Yugoslavia. These steps can be very well reconstructed by narrations, by life stories, because personal experiences are naturally linked with social orders. Each individual story is connected with further stories, in which the collective history will be negotiated and reflected. The view on the biographical narration opens the possibility to analyze the concreteness of the “individual case” in the complexity of collective history. Life stories contain thereby a kind of a transition character, that’s why they can be used for the reconstruction of periods of political transformation. For example: In the individual story we can find very clear the national or mythological character of the Albanian people in Kosova. The collected narrations can also be read as narrative lines in relation to the (re)-interpretation of the past, in which lived life is fixed into history in the so-called collective memory in Kosova.

The Archive

Approximately 80 interview texts (all in Albanian, 34 in English) have been made anonymous, documented and deposited into a digital archive.  

Due to the sensitive nature of qualitative data, we prepared a detailed concept of anonymity and data protection (see Witzel 2004). The strategies of anonymization are based on the rule, that person-related details like names, addresses or places are erased when the interviews are transcribed in order to prevent the re-identification of the interviewee concerned. But there is still a big problem. Special analyses of interviews are hardly possible without an awareness of biographical details, and as a rule it is necessary to know the whole context since the structure of the narration forms a basic requirement for text interpretation. There remains the question of clarifying under which conditions qualitative data can be given to other researchers or interested persons for the purpose of their specific use. The following points should be agreed upon in a written contract (Witzel 2004):

• data may only be used for learning, research and humanitarian purposes

• data must not be passed on to a third party and must be stored in such a way that a third party cannot gain access,

• data must remain anonymous,

• person-related details may not be quoted or published, and

• notification of the end of the research project must be given and the data which has been made available must be erased.
The archive must check the process of making data anonymous by the researchers, but regrettably, we cannot formulate any general solutions for making qualitative data anonymous because such data is extremely heterogeneous in terms of the themes and areas of life already mentioned. The other question is under which conditions qualitative data can be given to other researchers for the purpose of secondary and re-analysis. The use of archived data for (re-)analysis and secondary analysis has many methodological and methodic advantages which have partially been put forward in connection with the tradition of quantitative methods (see Thompson 2000).

Stories and structures

Oral history projects want to look to recover the voices from below, the stories of individuals and communities whose lives have been hidden from history. Beyond these democratic aspirations and methods and the criticisms by traditional documentary historians is always a crucial methodological question, why individuals compose their memories in particular ways, and how the processes of remembering could be a key to understand the ways in which certain individual and collective versions of the past are active in the present. There is strong multivalence of individual memory and the plurality of versions of the past provided by different speakers (as well as different documentary sources). But the ‘distortions’ of memory could be a resource as much as a problem.

In recent years oral historians have become more interested in exploring the relationships between memory and subjectivity, and between collective memory and the processes of remembering. We are now more self-conscious about the distinctive character of oral testimony, and assert the theoretical and methodological values of the qualitative approach in oral history research.

Biographical self-reflections are attempts to find and make up stories, in which one can rediscover oneself and with which one can live. Creating an acceptable autobiography is part of the continuously ongoing process of identity building throughout life and up to death. This happens both in everyday life and in the process of learning and acting. Dealing with the subject’s world means in a constructivist view, that people are narrative constructors of their world. This focus does – firstly – not include that the ‘real world’ has no influence on this constructions, and, it does – secondly – not mean that our constructions have no impact on the ‘real world’. ‘Stories’ and ‘structures’ are dialectically inter-twinned and the way they need each other makes the world changing.

There is indeed a great deal to suggest that we spend a considerable part of our everyday’s existence within the horizon of ‘stories’. Stories constitute the unity of our individuality, but they are also intersubjective in character. Stories create the social contexts without which we could not live. Even historical description is essentially narrative because it conceives of historical events as elements within chains of events, in a quite unpretentious sense as ‘stories’. The future exists only within the horizon of expectations. To that extent, every successful historian is a ‘narrator’ – even if (s)he prefers (as a follower of the ‘école d’annales’) to deal with structural historical issues. The everyday narrator is also a ‘historian’. Even his/her ‘story’ is part of that universalist narrative that sets modernity apart from everything that went before. The everyday narrator, precisely in his function as a narrator, is a bearer of ‘structures’, because the narrative networks him with the social and historical lifeworld in which he takes part. Narrators need a kind of “lay concept” of the world in the sense of the everyday world or lifeworld, i.e. they cannot make use of narrative forms of description without referring at least intuitively to collectively available knowledge. ‘Stories and structures’ cannot be separated from each other (see Alheit/Dausien 2000, Egger 1995). Narrations are much more than mere subjective reconstructions of the ‘real world’. Methodologically spoken, they are the king’s way to understand reality, because the disposition to tell a story (or to interpret history) is always the perspective of the actor.

There is no other way to describe history, and particularly life history, apart from the form of a narrative. Paul Ricoeur has powerfully argued this in his books Time and Narrative (1984). However, this does, of course, not mean that the narrative is identical with real actions, events and things having ‘happened’ in the past. It says, there is a characteristic relationship, a structural similarity between things happening in the ‘real world’ and those that are told in a story. Even more complicated: the told story itself is, as you might say, a ‘physical’ part of the real world and has a certain impact on it. So again, and a bit more dialectical: As ‘history’ is not
understandable save in the form of a narrative, the narration as such ‘makes’ history. This relation will be clear and more concrete in the presentation of the findings of our project on biographies. Narrations are used in that context in much more than mere subjective reconstructions of the ‘real world’.

In the work with the interpretation groups it becomes transparent that the frame of reference which a narrative reconstruction of social reality represents, does not just imply a ‘system of rules’, but a biographical action perspective. Any remembering of an experience or event that must necessarily precede the narrative situation opens up not only a narrower or wider horizon, but also refers back to changes in the narrator’s self. An event worth to be remembered is obviously one that has left traces; it has marked the narrator and left behind an ‘impression’, altering the structure of his experience to a greater or lesser degree. “Any impromptu narration of one’s own experience is also a new remembering of this more or less unnoticeable process of change” (Schütze 1984, p. 82). This statement is of definite theoretical significance, because that each has to ratify this narrative plan in his narration. How these consequences unfold as a ‘cognitive frame of reference’ for narration in impromptu autobiographical narrative has been described detailed by Fritz Schütze. Schütze (1984) points out the ‘cognitive figures of impromptu autobiographic narrative’, with which he associated the following four phenomena: “Personifications of biography and events, in addition to the social relations existing or changing between them; chaining of event and experience; situations, life milieus, and social worlds as the conditional and orientational framework for social processes; and the total design of the life history.” (1984, p. 81)

Having said this, the narrator also needs, according to Schütze (1984, pp. 88ff), to select specific ‘linkage forms’ that condense to procedures (ibid., p. 88) - in addition to the presentation of himself and other important actors in her/his biography. Schütze considers four 'experiential attitudes' towards life history processes to be of particular theoretical relevance; these can be characterized as "systematic elementary aggregate conditions of the linkage of events in experience" (ibid., p. 93):

1. Biographical action schemes,
2. institutional patterns for life course procedure,
3. life ‘trajectories’ and
4. transformation processes (Schütze 1984, p. 92).

The collection of memories

To the conditions of human life belongs the organization of the past, the linkage of our being in the context of a history. We (re-)arrange ourselves, our experiences, within an “inner value map” which is in motion. This procedure of the development of values knowledge (Urteilsvermögen) can also be called education. Hans Joas describes the emergence of the values in his book “The Genesis of Values” (2001) thereby convincingly, how our value system doesn’t arise from rational-argumentative justifications, but from experiences, in which we were forced to leave normal conditions behind us and in those in which subjective experiences appear evidently as the good.

My remarks want to clarify how such self education potentials can be productive in the handling of crisis-experiences in the sense of biographical-orientated concepts. Even in educational contexts such learning processes are crucial (i.e. in the relation to the history of mentalities, to collective experiences or to culture). We have to deal with the different meanings of history, of life-stories (individually and collectively) because the “collection of memories”, of events, doesn’t produce meaning in itself. The “red line” of a story can be build by different “stones” of (what we call) memory. The space, in which memory can filled up with meaning is a highly stressed area, in which meaning is produced by different “voices” of culture, mythology or race and gender. These processes of “negotiation” are linked biographical educational processes in their historical, cultural and social contexts. In the reconstruction of these we can also find out, how our roots fix the possibilities of our routes into the future and also into the past. It is tremendous in the situation of Kosova, how these processes are underlined by the so-called collective memory in this country. Even all the historical suffering of this “fate community”, which is still alive in this country, produces extremely long memory cycles. The degradations and also the requirements from periods of long term repressions, make this memory-work so painful for everybody.

In our work with the students we try to widen the interpretation-possibilities of the past in a methodological-
ruled way. We work on different levels, e.g. in the concrete life story of a biography-holder, but we are also focused on the story of the Albanian people and the forms of their traditional memories. Our leading questions (among other things) are: How do the processes of the reference to the past reach into the production of the present? Which forms of memory produces which kind of present and future?

Narration was thereby never only used as reproduction of the past but also as production of new plots, new areas of historical experience and the horizons of expectation. In the concrete work with the interviews (and in many discussions in and outside of the university) we always came to the same question, how to cope with history and how to create and develop new possibilities and resources to handle the past. For almost every Kosovarian (students or interviewee) the same demands were important. They declare:

1. We want that the hidden truth of our suffering comes to the daylight. We want that everybody sees, what has been done to the Albanian people in Kosova for decades.
2. We want that there is a form of justice, which punishes the aggressors or at least gives them their responsibility for the done. We want an apology.
3. We finally want to have the right to live in a free country.

Many other points could be stated here, but these are the basic demands. In all the phases of our work we noticed again and again, how strong memory is linked to the structures of guilt and racism, of smashed and destroyed goals, which appear in no archives. And behind the collective and the individual suffering there lay obviously the economic tragedy which comes out of the inequality for many decades.

The empirical work

The following considerations are also linked to the possibilities of biographical learning in a project at a university. It concerns not only individual learning of isolated individuals, but also learning as transformation of experiences, knowledge and action structures in the life-course and in the context of the life-world. I call these therefore biographical learning in the sense of a phenomenological learning term. 25 students participated in the starting course at the university of Pristina (participants from in- and outside of Kosova; NL, USA, BUL, SLO, SLK, A, MOL). The main work was to learn the methodology of qualitative empirical social research (the technique of the narrative interview) and to establish several interpretation groups for the structural analysis of life stories.

After an expanded introduction into the principles of biographical research (see Schütze 1984, Egger 1995) and the Grounded Theory (Strauss/Corbin 1996) the students have been assigned to look for interview partners. The problem with the transcripts was arranged in that way, that in a first round all Albanian texts were translated (with the aid of a professional translator) into English to have a common basis for the work. Most of the students have not been familiar with the possibilities and the conditions of qualitative social research, so I had to figure out some points for the process of interpretation. One of the FAQs was about the truth of the story and the relationship between the story and the culture. I developed a small, easily understandable system which differentiates between the different text levels.
Texts can “produce” meaning on all these levels:

- The event and experience level represents the framework of the selected events in the narration. All the experiences and stories are used as constituent and essential parts of the live-story in the interview.
- On the level of individual interpretation it is the perspective of narrator, his/her language, the “inner landscape” of a person that characterizes the story.
- All these narratives are formed by institutionalized interpretation practices, which are grounded in cultural traditional and normative social orientations.

In the work with biographies the question about the truth, the actual correctness of told story emerged in every interpretation process persistently. Did the events, the narrated situations, the experiences actually take place how they were presented in the interview, or are they just a kind of fiction, half lied or expression of a permanent image management, which the biography-holder offers out of a special reason? This question about the truth can also be analyzed on different levels:

On the WHAT-level (it actually concerns the told events) this question can be answered quite pragmatically, because we can find out the events in the life process that actually happened, and this can usually be proofed on the basis of other narrations, other people or with the help of historical sources.

On the HOW-level it is quite different, because the production of the “inner landscape” doesn’t only depend on the external events, but also on the meaning of these actions and situations in the eye of the narrator. On this level it is important to reconstruct the “mechanism” of this “map”. So truth means here the subjective side of the facts, the individual structure of the story and not the historical truth.

On the traditional, cultural level, we have to find out the links between the individual story and the structural, the social area. The question about truth cannot be placed itself in classical correct or wrong patterns. It has to be seen as an intermediate form between the individual story and the social structure, between the social world and ideology. (a good example concerning these processes gives the novel 1984 by G. Orwell, in which he stresses the structure of reality. Things, feelings, which have no linguistic counterpart, doesn’t really exist). So our language is also a pool of words, terms and phrases in a cultural context.
These distinctions have a great impact on the processes of interpretation of life stories, because we want to analyze and reconstruct the relevance-system of the subjects. We want to see, how experiences in biographies are linked to the social structure. In a narrative interview the interviewees have to construct the horizon of the possible narrations for themselves. They have to decide, which topics or themes should (selectively) be narrated in which way. That’s why we have to follow these processes in the analysis of the texts. The hidden working control mechanism of the total view, the mechanisms of the selection of stories, as well as the topic frame of the narrator are significant for a single event. In the interpretation phase we work with abductive conclusions (see Peirce 1991). In the course of a sequential analysis we systematically follow the inherent sense of the narration. In a line by line analysis we open the text and find out categories, indicators, dimensions like Glaser and Strauss mentioned (see Strauss/Corbin 1996) in their coding procedure. In the following short cuts out of an interview I’ll present some interpretations out of our first workshop.

**Puzzles from an analyzed interview**

The interview begins with the words (lines 4 to 11):

> My name is V. H., I am from Pristina and I was born 1977. Life, what is life for a young man? I will start with the first steps of my childhood, speaking of my grandfather H. H., from whom I learned a lot in 1981 when I was 4-5 years old. I don’t forget the first Albanian riots. I remember as it was today when he told me about the Serbs. And later that how the Serbian conquest had come to its end and a war would be opened pretty soon I don’t forget that we were living a modest life with our father working to maintain the whole family.

The interview begins with a formal introduction in the sense of “normal-biography” of a young man. What is the life for a young man in Kosova? Which ways does he have to go? How are the individual and the political situations for a young man in generally? Which goals are regarded as worthy?

The interviewee finds his reference in the presentation of his grandfather, whom he designates with its full name. Not only the family relationship is here important, but also his relationship to a traditional old-established family in the region which he comes from. The fact that he mentioned the full name of his grandfather is for the students from Kosova an honest testify to the respect to his position in a cultural linked genealogy. At the same time he mentions the history of the Kosovarian people in general. The story of his childhood is related to the historical continuum of suffering and fear. The crucial words are: *I remember as it was today when he told me about the Serbs*. In this short sequence it is clear that he is tangled in an old story about the Serbian conquest and his role in the beginning of a new war. He connects his own experiences with the courageously history and the mythological conditions of Kosovarian citizens. There is a high emotional participation of the interviewee in this narrative. He describes a specific form of his enculturation with the grandfather’s message (that is in a way an
underlying subtext), which can have several meanings. On the one hand it is a kind of prophecy, which determines the way of the Kosovarian people in the Serbian culture of suppression. This prophecy could be regarded as a certain form of a social-historical concept for the conditions and possibilities of the individuals in this state.

At the same time encloses this “concept” also different recommendations for his actions in the future. The words of the grandfather become also as burden, which is also given to the young man on his own way, because he has to fight for the freedom of his nation. He has to fulfill the historical task, the historical mission of each Albanian linked to all levels of the mythology, genealogy and family. In the discussion of these interpretations with the students we work out the processes of this production of history and try to explain the different roles (like the graphic elaboration can show).

For the Albanian students it was very clear, that he could act just in one way to find out something about his role. He had to take over the role of a fighter, because enculturation means to carry the burden and to fulfill the story.

Similarly we proceeded with the second segment (lines 12 to 18):

My education was following it’s normally course until 1989 or 1990, when the protest started. Then I remember when the curfew began to be imposed, I remember that in front of our house just one minute past the curfew time, a neighbor of us killed a one right before our eyes. I don’t know how he could do it, he has been a retired member of at Serbian MUP but he killed a man.

Again the narrator begins with his orientation at the folio of normality, with a formal statement. The crucial date for the ending of his general education is linked to the deprivation of the living conditions of Kosovarian People. The curfews are finally the visible last step in the exclusion of normal life, the end of freedom of movement in society. The story of the murder is temporally settled one minute after the entry of such a curfew, which shows, how strictly and in inhuman the exclusion practices were handled in the eye of the interviewee. At the same time still another incident became painfully visible for him, because it was a neighbor that killed a man before his eyes, like it was nothing. For a long time we discussed this event in the group and we looked for interpretation folios. Finally the point that explains the act was reconstructed on several levels.

- First of all is the level of civil right, of the legally basis which determines the responsibility and the justification. This includes the topics of the state and the juridical system, the ideology in the political system.
- Secondly there is the part on the actor’s-roles which the students divided into four ranges: The ethnical part (the Serbian aggressor), the state function (the policeman), the human, ethical being and the social function (the neighbor).

For the Kosovarian students it was clear that the crime was committed in the sense of an ethnical cleansing. There was a big discussion with all the others about this interpretation. In this debate students could learn a lot
about the correlation between the concepts we have in our head and our acting in daily life, between the
dominant inherent concepts and our way to explain our daily life. If we think in ethnical concepts, we see
everywhere ethnical coded actions. In addition, Kosova is not only a post-Serbian but also a post-communist
society, but the fact of 40 years communism in this country doesn’t play any role in all the discussions. In the
analysis of this interview we finally tried to create different modes in interpreting this scene - at least
theoretically. The resistance of the Albanian students against this interpretation work was enormous, but in this
confrontation all students opened up a substantial learning field in handling own experiences in the processes of
understanding history. In this discussion about different historical folios of explanation the students came to the
question, when history actually begins. From which step in an ongoing story do I take my pictures to develop an
explanation? In these hours we had the possibility to expand a lot of insights in concreting and interpreting
history. In the processes of interpreting and in the discussion of the statements, the students got some important
emotional and also cognitive experiences, how history is “produced” and associated with a special kind of future.
This particularly comprehensible way could show the structure of the differences which make a difference in
looking to history. With this work we also had a good insight in the ethnical view of the Balkans states and the
“inner logic” of these communities.

That’s history. So what? Subjective dimensions of learning to produce new cultural and social experiences

These small pieces of our done work present the reconstruction of forms and meanings of ethnical and cultural
identity in the processes of a united Europe. We found on an empirical level the well known explosive field of
“national identity”. History, and the narration of one’s life story, could help to understand the dominating values
and goods of society. We learned to understand how our values and goals are linked to a superior story (called
mythology or ethnicity) and how they have to be “translated” and comprehend. What we call history is always an
interpretation of the past and the future, and can only be understood and reconstructed in the process of constant
translation between desires, conceptions, ideas, and scripts of people’s possibilities in their concrete life. From
Schleiermacher we can learn that this interpretation is an endlessly turning hermeneutic circle, which looks for
new ways, and which recognizes, that the given sense (however) is just a guide and no fixed point.
The work in creating this archive and the interpreting courses in Kosova has just began, but maybe it could
contribute to the fact that this hermeneutic circle doesn’t end and that the interpretation of our world will always
be open to discussion. For most of the involved foreign students it was clear, that the strong reference to
“concepts” (of ethnicity, gender, religion or also mythology) can be used strategically by regimes. In the
(ongoing) discussions the students found out, that their thinking is "cultural produced" in socio-historical
conditions. The scientific discourse in the research groups with its open debates and mutual criticism could help
to undertake the work of "objectivation of the subject who objectivizes". Out of this perspective we also
discussed, how the routes into the future could be build up without denying the roots of our living. This is a very
hard task to do. The processes of interpretation can help to show, that cultural differences are never only there,
where we believe to see them - they are already written into that point of view, from which we look into the
world. The reconstruction of the visible and invisible structures could sensitize the students for the linkage of the
individual story with the larger, structural perspective in society and ideology. Therefore this work of collecting
and interpreting stories in Kosova has always to do with one’s own perspective. Science is in that way not only
analysis of data and relations, but also a process, which helps to understand contexts, in which cultural, national,
ethnical or social styles unfold their meaning. Data and its relation to the real world are substantial, that’s why
the interpretation folios we worked out could try to comprehend also the special roles of social scientists. This
combination of sociological, oral historical and educational aspects become more and more important in the
processes of understanding how the analyzed narrations represent the conditions for the nowadays political
transformation in society. This work could outline these differences as a form of new possibilities in references
to the past. On the level of biographical experience such analytic distinctions can be combined with experiences.
Peter Alheit is fixing such processes in the term of biographicity (see Alheit 1993; Alheit/Dausien 2000). This
means a subjective dimension of learning which can produce new cultural and social experience. Biographic
learning can be successful in the linkage of social structures and cultural interpretation contexts. Educational processes like the one described here have also a personal, biographic sense apart from the strategic aspect. The mode of the treatment is however again culturally conditioned, which also could be seen clear in the workshop. There is a huge difference in the comparison between American and Southeast-European colleagues and students. Just a short example: If the American say, That’s history’, they mean usually that something is gone, which does not count any longer. If South-East Europeans define something as history they mean that it became now an absolutely important and indelible fact. Both aspects (or should I say coping strategies) of handling history have different and specific ways to deal with the past. The “So- What?"-Strategy of the Americans fades out the past of the present, only the view forward, the constant reference to the present and the future is here the driving force. The unavoidable view into the hard and violent paths of the past of the South-East Europeans narrows the view on the other hand on specific modes of the production of present. Both are in the long run forms of ideologies which structures history and connect present and future in a special way.

Stressing these topics with the Kosovarian students, again and again we always came back to the question about truth. In looking for other interpretations they always asked: How widely could the interpretation folio be stretched? How can the aspect of historical justice have its place in the interpretation? If everything is only a matter of interpretation, how can we talk about truth? Which consequences can be shown from the interpretations actually for the political changes in Kosova? And finally: How can this “scientific reconstructed truth” be able to avoid future disasters?

The answers to these questions are not lying only in the empirical data; they are also a part of the normative relations of these stories to the issues of nation, society, gender etc. The interpretation of these narrations could help to understand the fact that history is always written with a “structural ink”. Social science can help to understand these processes, but acting is quite a different thing.

The work to establish this archive is in progress. There is some work for an extension of this small data archive even with international co-operation to integrate experiences from other institutions and to bring together existing resources in Kosova. But it is not easy to create an archive which does not offer the services of data consultation, schooling, network and information provision for qualitative social research and qualitative management. The last six months we didn’t hear anything from the Albanian partners. The work with the students is fine, but the connection with the university stuff and the local authorities is often very strange and full of resistance. But: Social Change is, like the ethnologist Clifford Geertz mentioned, not a parade, which one can watches passing by. In the opposite: It’s a fight for Law and history, obedience and memory

An Analysis of “ISP” Items in Evaluations of Social Welfare Institutions for The Disable in Taiwan

Pi-chu, Yang
Ph.D. Student, Dept. of Special Education
National Changhua University of Education in Taiwan

The qualities of services of social welfare institutions for the disable are some good, some bad in Taiwan. One of improvements for the issue is evaluation. Because the clients of these institutions are people with disabilities, special education and service are related closely with the operation of these institutions.

I was one of members of the consultant committee for institutions at one county in the south of Taiwan. The committee’s consultant work includes five categories and I was responsible for “Professional Services.”

According to the above, this article will explore the sub-category of “Professional Services” – Individualized Service Plan (ISP), one area close to special education mostly. Firstly, I will discuss the meaning of ISP for the disable in the institutions. Besides, from both social work and special education viewpoints, the items for evaluation (consultation) will be reviewed. The contents of ISP for evaluation include basic format, parental involvements, service contents and assessment. At the end, the appropriation of the evaluation indicators and the practical difficulties will be analyzed.

Keywords: people with disabilities, institutional evaluation, ISP, IEP
The rights and benefits of people with disabilities are getting attention. More and more institutions offer services for people with disabilities. The qualities of the services are some bad, so consultation (evaluation) can be a good way to get better qualities. The services and training these institutions offer are to reduce the influence of disabilities to the disable in daily life. Furthermore, it is expected that these people can have a normal life and even contribute to our society. Nevertheless, due to the deficits and heterogeneity of these people, special education is needed and closely related to operation of these institutions. Because of differentiation of the authorities concerned, it is not easy for these institutions to offer appropriate special education to the disable. Under these circumstances, the provision of special education may be insufficient, so the whole operational system is worthy to contemplate.

I was one of the members of consultant committee for these institutions at one county in the south of Taiwan, whose services needed to be improved according to the previous evaluation results, or which had not got evaluated because the institutions had not founded more than two years. Most of clients in these institutions were mental retarded (about 90%-100%), except one had 79% and another had 82%. Besides mental retardation, some clients were multiple disabled, physical disabled or psychological ill.

According to the above, clients in these institutions were older people, and their disabilities were somewhat complicated. The opportunity for them to go back the mainstream society was very little. Because of their severity of disabilities, it was hard for families to take care of. Thus, they needed professional cares and equipment.

The consultation aimed to help these institutions improve their service qualities based on their strength and weakness. There were five categories for the consultation, and I was responsible for “Professional Services.”

Based on this, this article focuses on analysis of items on the “Individualized Service Plan” (ISP) in the “Professional Services.” An ISP is similar to an individualized educational plan (IEP) in the special education area, but it is not mentioned very often in related social welfare or special education laws in Taiwan. This article begins with discussion of the meaning of ISPs for the disable in these institutions. Besides, from both social work and special education viewpoints, the items for evaluation (consultation) will be reviewed. The contents of ISPs for evaluation include basic format, parental involvements, service contents and assessment. At the end, the appropriation of the evaluation indicators and the practical difficulties will be analyzed.
I. Individualized Related Service Plans for People with Disabilities

The definition of disability is physical or mental ill, and it needs medical care or therapy. As the time passes, it emphasizes on self-consciousness, life qualities and social supports for people with disabilities instead nowadays (Gathiram, 2006: 252~255). The services and demands of people with disabilities have become diverse. Providing effective and appropriate services and training for the disable and families are necessary. Thus, an ISP is established to fulfill this goal.

The origin of ISPs is from the case of Pennsylvania Association for Retarded Citizens v. Commonwealth of Pennsylvania in 1971. Also, in 1972 the case of Mills v. District of Columbia Board of Education expanded the Pennsylvania decision to include all children with disabilities (Hardman, Drew, Egan, 1999: 20). These two lawsuits forced American government to claim three principles for institutions servicing people with disabilities as the following:

1. Establishing objective assessment standards
2. Providing appropriate placement
3. Developing service plans based on individual demands

Amendments to the Individuals with Disabilities Education Act (IDEA) 1997 also pays attention on accountability, that is stressing on training effects in ISP (Hardman, Drew, Egan, 1999: 20~39). In Taiwan, the Rights Protection for People with Disabilities Act (2007) is written that individualized professional service system should be developed, and after assessment by professionals, the services should be provided based on the demands of people with disabilities.

Besides, Public Law 94-142(PL 94-142) also requires institutions or schools to include an individualized transition program (ITP) in the IEP for students no later than age 16 (Hardman, Drew, Egan, 1999: 23). In Taiwan, the Rights Protection for People with Disabilities Act (2007) and Special Education Act (2009) have requirements for ITPs, too.

The Individual Family Service Plan (IFSP) focuses primarily on children with early intervention (Minke & Scott, 1995). In Taiwan, referral centers or case management centers are responsible for intervention and other related services for the needed children and families.

The Individual Habilitation Plan (IHP) is related to IFSPs. An IHP is a service plan which aims to fulfill ISPs and IEPs, so it tries to integrate and coordinate institutions and professionals to promote services (Chou, 2000:236). According to this, the main function of IHPs is to coordinate different professionals toward services for people with disabilities. It is an indirect service rather than direct services to the needed. In Taiwan, although it is getting progressive, cooperation and coordination among different institutions and professionals still need more efforts today. So, IHPs
still cannot be put in practice very well in Taiwan because of lack of models of cooperation of institutions (Chou, Yang, Kao, Kuo, Wu, Liu, & Chen, 2000).

The Individualized educational plan (IEP), the most important individualized plan in special education, derives from PL 94-142 in 1975. The law stipulates that every student with special needs has an individualized plan. In Taiwan, the IEP has been required for students with special needs in the Special Education Act since 1997. Afterward, every student with special needs has his/her own lesson plans, which are protected by law.

Yet, what is the relationship between an IEP and ISP discussed in this article? The relationship is unclear. It is written in assessment comments from the social department of Ministry of Interior in Taiwan: “IEPs and ISPs should have accurate definitions according to their clients, clients’ age and training/learning targets (Social department of Ministry of Interior, 2002: 313). According to this, IEPs and ISPs have different concepts. Besides, the social department of Ministry of Interior in Taiwan also requires the unification of IEPs (ISPs and ITPs). ISPs and ITPs should not be separated from IEPs (Social department of Ministry of Interior, 2002: 300). An ISP is different from an IEP, but there are some overlaps between an IEP and ISP. However, the ISP is one of subcategories of “Professional Services” and there is no talk about IEP in evaluation standards. Is the purpose of the two comments for IEPs to criticize ISPs or imply that “Professional Services” also includes the IEP concepts? It is still an unknown question.

Either an ISP or IEP is made by a professional team. It is a kind of service or lesson plans made for people with special needs and based on their unique characteristics and demands. So these two plans are similar in nature. IEPs are for students at school, and school is the service center. Unlike IEPs, ISPs may include all types of learning, life care, medical services and so on. The client population of ISPs is bigger than that of IEP. No matter people with disabilities are going to school or not, they can receive related services under the ISP.

In Taiwan, the IEP is under the category of special education. It is a lesson plan for students with special needs at school. On the other hand, the ISP is under the category of social work. It is a care or lesson plan for the clients in the social welfare institutions for the disable.

In practice, the function of an IEP is mainly for evaluation of school, rather than teaching. Many teachers have a hard time to teach students according to their IEPs (Lee, 2002; Huefner, 2000: 195). An ISP provides guidelines for the teaching and services for the clients in the institutions. In practice, ISPs still cannot be fulfilled very well, either. There are many written documents for IEPs which can be good reference resources for ISPs.
II. An analysis of Consultation for Social Welfare Institutions for The Disable in Taiwan

There are five categories for the consultation, including: organization management, facilities and equipment, professional services, right protection, as well as improvement and creativity. There are also some subcategories under these categories. For example, the subject of this article—the ISP is one of subcategories of “Professional Services” as showing in figure 1.

As showing in figure 1, there were fourteen items in the ISP. The divided items were convenient for evaluation, but they were so complicated that it is hard for the teachers or social workers to work on ISPs as a whole. Rather, teachers or social workers tended to focus on individual items during the daily ISP process and self-evaluation. Lack of a systematic view of ISP process would result in difficulties of self-adjustment for these institutions. If workers in these institutions can have a whole picture in mind, the problem may be resolved.

There are some important concepts for the ISP process. Firstly an ISP is developed based on individual client’s demands. Every plan has its basic requirements and format which can be followed by workers in these institutions. Basic format of written document can be an assessment standard of the operation for these institutions. Besides, the core of an ISP is the content of service which relates to the learning and rights of clients in these institutions. To understand the abilities of clients and training effectiveness, assessment is necessary and it can also help teachers develop learning objectives and goals for the clients (Schopler, 19995: 8–9).

I try to make the ISP process clearer and easier for workers in these institutions to implement an ISP, so I divide fourteen items of ISP into four categories: Parental involvement, service content, assessment and basic format. As showing in figure 2, the left column is for parental involvement, the middle is for service content, and the right one is for assessment. Because every step will produce written documents, basic format is covered through the whole process.

We can classify fourteen items into four categories as following:

1. Basic format: “Develop ISP for very client every year”, “ISP is made and signed by the supervisor and all related professions”, and “Completeness of ISP”.

2. Service content: “Daily schedules follow the service plans of every client”, “Comprehensive transition (or referral) services for clients”, “Comprehensive transition (or referral) services for clients”, “Providing direct or indirect training and service based on the demands of clients”, and “Service plans include completed developmental area”.

2011 HICE Proceedings
Page 213
3. Assessment: “Have observations and records of clients before using formal assessment”, “Modify goals in ISP based on evidence and modification is signed by the supervisor/ notify parents or client about the modification” (also includes in “parental involvement”), “Adjust training strategies and goals based on the performance of clients”, and “Assess and modify objectives in ISP periodically”.

4. Parental involvement: “Parents or clients participate the discussion of ISP”, “Collect families’ expectation toward clients and develop the service plan based on this”, and “Modify goals in ISP based on evidence and modification is signed by the supervisor/ notify parents or client about the modification” (also includes in “assessment”),

The following are comments during the consultation according to the four categories:

(I) Basic format:
1. One of evaluation indicators was “Develop IEP for very client every year” and this indicator was based on the percentage of ISP development. Yet, what was the percentage? Did it refer to the number of ISP had been developed (for example: there were 20 clients in an institution, but only 15 ISPs were made. So the percentage would be 75%), the development of ISP items (for example: there should be five items made in an ISP, but only four items had been made. The percentage then would be 80%), or time span for ISP (for example: ISP for one year got better points than two years)? The standard was very confusing.

To solve this problem, the administrative agency can convey the related information through different seminars or workshops. Besides, evaluation committee may have viewed the percentage in various ways. Thus, before the formal evaluation, some seminars or workshops for the evaluation committee to promote important knowledge of evaluation are necessary.

2. One of restrictions for schools to implement IEP is some teachers do not know how to write IEPs (Fu, 2006). In theory, teachers should be familiar with development of IEP, but in practice, even some special education teachers have a hard time to develop IEPs.

One the other hand, According to Tao (2003: 39~53), many nursing and educational workers in these institutions in Taiwan are senior high school graduated, about 40%, and their specialty were diverse. The proportion for social or education major is not high, only about 37% in private management of public established institutions. The condition for the private institutions can be worse. So many nursing
Figure 1. Items in consultation (evaluations) of social welfare institutions for the disable in Taiwan

- Develop ISP for every client every year
- Daily schedules follow the service plans of every client
- Periodical meetings for teaching, case, and administration
- Comprehensive transition (or referral) services for clients
- ISP is made and signed by the supervisor and all related professions
- Completeness of ISP
- Professional provide direct or indirect training and service based on the demands of clients
- Have observations and records of clients before using formal assessment
- Parents or clients participate the discussion of ISP
- Service plans include completed developmental areas
- Collect families’ expectation toward clients and develop the service plan based on this
- Modify goals in ISP based on evidence and modification is signed by the supervisor, notify parents or client about the modification
- Adjust training strategies and goals based on the performance of clients
- Assess and modify objectives in ISP periodically

Issues to be discussed in this article
ISP process for clients in social welfare institutions for the disable in Taiwan
and educational workers in these institutions may not have related knowledge required. They may encounter the similar difficulties some special education teachers face.

These workers usually get related knowledge most from working experiences, pre-job or on-job training, which lacks of systematic knowledge and training. “What happens in public school classrooms is directly related to how well prepared a teachers to make a difference in a child’s life” (Linek, Raine, Fleener, Klakamp & Fazio, 2003:87). Besides enthusiasm, professional knowledge and abilities of nursing or educational workers in these institutions are essential. If the workers’ competence is questionable, the services and training of clients will also be impacted.

During consultation, I found the knowledge for ISPs of teachers in these institutions needed to be enhanced. Many of them had no idea on how to develop ISPs. Besides, some teachers in these institutions did not know how to performance assessment and set objectives and goals for the clients by ecological assessment. Therefore, teachers set up the objectives and goals by themselves regardless the abilities and demands of the clients. Although some teachers designed and performed ecological assessment for their clients, they did not set the ISP objectives and goals based on the results of assessment. ISPs usually did not correspond with the assessment, and ecological assessment lost its functions.

Most institutions would arrange pre-job and on-job training for nursing and educational workers (we also call them “teacher”) of their institutions. However, more than one teacher of these institutions said that the training was so theoretical, that they did not know how to apply it in practice. Besides, clients were highly heterogeneous. Sometime they did not know how to deal with different affairs of their clients. When these teachers got problems, they did not know whom they could ask for. Pre-job or on-job training should take these workers’ opinions into account. Training can be more practical rather than theoretical, and meet theses workers’ demands.

In addition to the content of training, geographic location is another issue. Institutions in cities have more resources than in rural areas. Therefore, workers of these institutions in different cities or areas may have different needs toward their work. Location of institutions should be considered while designing training for workers.

3. Another ISP indicator was “ISP is developed by the supervisor and related professionals and get signatures of them.” Institutions had high demands for medical services which was severely insufficient at the same time. Because short of budget, those institutions seldom had full-time medical professionals (such as doctors, occupational therapists or physical therapists), and many of them worked as
volunteers. These professionals were very busy and usually served these institutions on weekly or monthly basis. There were many clients who needed related medical care in these institutions, so the ratio for medical professional-client was very high. Because they did not go to these institutions and had to serve many clients, so these professionals might not be very familiar with every client in these institutions. How could they give proper advice for ISPs of these clients?

Furthermore, it was very difficult for various professionals to get together and discuss the condition for every client. Reviewing some ISPs of these clients, some of them did not have signatures of these professionals. Even though some ISPs had “completed” signatures of these professionals, according to a teacher’s narration, most of them were not signed on ISP meetings because these professionals did not have time to attend the meetings.

If it is possible, there should be someone to do the recording when these (medical) professionals (especially for doctors) are doing their job. Once the recorder gets problems, he or she can communicate with the professionals immediately. Afterward, these records can be a part of an ISP. Later, the information can be brought into discussion in ISP meetings. Then the professionals can review and modify the meeting report, and finally get it signed. This method may really meet the purpose to get these professionals to sign ISPs.

(II) Service content:
1. In practice, “Daily schedules follow the service plans of every client” may be a debatable issue. Activities designed for clients in these institutions could be classified as whole class, small group and individual. Teachers noted that some evaluation committee criticized that whole class and small group activities did not correspond with individual ISPs of clients.

   However, clients’ characteristics are various. It is hard to cover all individuals’ demands into a whole class or small group activity, but it still can have some leisure and entertainment functions. Furthermore, these activities can have long-term benefits to develop some skills of clients.

   In addition, to take individual demands into account, teachers can assign clients with similar abilities or ISP objectives into the same group. The lesson plans can be designed based on groups. Clients’ individual skills can be enhanced in an activity, too. For example, in a language art class, one client can concentrate on spelling, another can practice writing and the others can focus on other skills.

2. Teachers also talked about the difficulties on fulfillment of ISP objectives and goals. This may be improved by promoting teaching skills of teachers. Another problem is
“development of goals and objectives”. Most clients were old and severely disabled, so it was very hard for them to learn new skills. Besides, some clients had some challenging behaviors, such as disrupt in the class and reject to eat any food. Too many objectives and goals were not necessary for the clients. Yet, one teacher said: “If I don’t have many objectives and goals, the evaluation committee will think I don’t do my work well.” Another teacher also stated: “The supervisor in our institution also questions about our working attitude because the objectives are not many.” According to the above, it implied that some teachers, supervisors of these institutions or even evaluation committee agree that more ISPs were better. Is that really good for the clients? We should pay more attention on how much and what the clients have learned rather than the numbers of goals listed in ISP.

On the other hand, I also found that on goal or objective development, teachers often ignored the importance of enhancing skills of the clients. Schopler (1995:9) presents that enhancing the skills people have learned is an effective way for both children and adults to learn. Therefore, when developing ISP goals, teachers can choose from the skills the client familiar with but not proficient first.

3. Another reason for fulfillment difficulties of ISPs is loading of teachers. Because of tight budget and limited salary for workers, institutions usually do not have enough labors. So, the working hours of these workers are long and loading is heavy (Tao, 2003). During the consultation, I found teachers needed to do a lot of additional paper work besides taking care and teaching the clients. I also found some paper work was not necessary. For example, it was written in a record: “**(a client) was happy to go to a park today.” I asked the teacher why they did such paper work. According to the answer of the president of an institution, some institutions did such paper work, and they were afraid to lose points in the evaluation if they did not do this.

I can understand the reason the president said. Yet, if teachers need to take a lot of time to do paper work for evaluation, the time they spend for the clients will decrease. Is this the intention for evaluation? I think the answer is definitely “NO”. To avoid too much paper work that impacts the teaching and caring for the clients, it is a responsibility for the administrative agency to regulate the paper work the institutions need to do for the clients and evaluation.

(III) Assessment
1. Usually, institutions will design ecological assessment which becomes the basis of assessment and teaching as well as caring for their clients. Moreover, because of different demands and abilities of clients, some items in ecological assessment were
not fit with some of clients. Therefore, the evaluation committee would think the teachers did not do their work well or did not develop comprehensive lesson plans for the clients. Dressing oneself, for example, may not be necessary for a severe retarded client in bed all day. Under these circumstances, this issue can be brought into discussion in ISP meetings and recorded in the ISP.

2. To promote clients’ learning and make sure the performance, teachers usually use task analysis for teaching and assessment. In these institutions, teachers usually used this technique, but many related information and records were made by handwriting. Because management of records was not very well, teachers had to do many repeated work while developing ISPs. It is suggested to use computer and information systems to develop ISP, which can be very convenient and save a lot of time for teachers.

(IV) Parental involvement

This issue stressed on that parents participate in both development and modification of ISP. Many institutions replaced families as the “home” for the clients. Some parents might pick up their children to participate family activities for one or two days, but they were forced to send their children back to the institutions because of emotional problems. During the consultation, many teachers pointed out that parental involvement was disappointed. Some parents even though that their responsibilities were over after getting their children into the institutions. When the institutions tried to contact with parents, sometimes they would say that they had paid the fee, and did not want “disturbance” from the institution. Some “parents” were just relatives of clients, and they even expressed: “It is my bad luck because he (the client) only has me.” Some workers in institutions had tried very hard to persuade parental involvement in the ISP meetings, but the willingness of “parents” was still low.

Mostly, parents are the closest people for their children. The purpose of parental involvement is to promote correspondence of ISP to the client (Erwin & Schreiber, 1999). For many clients in these institutions, especially for the severe and extremely severe ones, they even did not have capacities to take care of themselves in daily life. Therefore, the institution becomes the real home, which they live, work and joint various activities. Even though they may go back their origin homes during some holidays, families are not close to and familiar with them. People know the clients best are workers in the institutions, not the family members.

Under these circumstances, what is the meaning to compel parents to participate in ISP meetings or other activities. Accordingly, it is considerable to replace that parents involve in and sign ISP to “inform parents and respect their willingness.”
IV. Conclusion and suggestions

Stufflebeam, D. L., an expert of assessment says: “The purpose of assessment is to improve not to blame.” Assessment is to find out the weakness of these institutions and try to get it improved. That is to say, is the improvement for these institutions (being evaluated) or other authorities (such as government)?

Documentation is always an important aspect in evaluation. The evaluated basis is from evaluation indicators which not have clear regulations for documentation. Workers in an institution may ask works in other institutions for reference. At the end, workers in this kind of institutions do a lot of paper work, not because it is necessary, but workers in other institutions do it and they are afraid of losing points because of that. It wastes much time of workers in these institutions and influence the qualities of training and caring for clients. As said before, it is the responsibilities for the authorities to set up the documentation or other regulations for evaluation, hold workshops to explain the format and expectations for documentation as well as regulations, and post them on related website for reference.

The Causal Relationship of Organizational Performance of Thailand Private Higher Education Institutions  
Tippaporn Mahasinpaisan, Ph.D.  
School of Communication Arts. Bangkok University

ABSTRACT

This paper was to study the influence of the transformational leadership, organizational culture, and knowledge management on organizational performance of Thailand private higher education institutions. The proposed causal model showed that relationship among transformational leadership, organizational culture, knowledge management, and organizational performance. A sample of 389 was randomly drawn from instructors of private higher education institutions under office of the Higher Education Commission. Data were collected by using questionnaires with reliability 0.98. Data analysis was descriptive statistics, and Linear Structure Relationship (LISREL) analysis.

The results indicated that transformational leadership, organizational culture, and knowledge management had direct influence on organizational performance, and transformational leadership, organizational culture have indirect influence on organizational performance through a mediating function of knowledge management; and the causal relationship model agreed with the empirical data. The model validation indicated that the causal model was fit to the empirical data with the goodness of fit statistics: chi-square = 28.68; df = 48; p = 0.99; RMSEA = 0.000; GFI = 1.00; AGFI = 1.00; RMR = 0.015 and LSR = 0.90 by the Unweighted Least Square method (ULS). This model could explain 55.00 percent of the organizational performance variance.

Keywords: causal model, organizational performance, private higher education
INTRODUCTION

Thai higher education has the clear direction to promote higher quality, efficiency, and effectiveness and to enhance national competitiveness in the regional and global arenas. Government has conducted a comprehensive retrospective of higher education performance and has laid out a new vision in the Second 15-Year Long Range Plan for Higher Education (2008-2022). This plan for higher education transformation covers all key aspects of higher education management, including administrative systems, teaching and learning, research promotion and higher education finance. Its main aim is providing citizens with the skills and capabilities necessary to raise national competitiveness.

The private higher education’s outcome tries to highlight changes in management paradigm, and the rise of strategic management which both can help education managers improve their organizational performance. While a knowledge-based revolution is taking place, it comes in a matching concept: knowledge management for organizations and the knowledge-based economy for Thailand. Both are part of a major evolutionary economic movement which is beginning to reshape the global economic structure, and knowledge management should be seen as one of the most concrete and important set of practices and policies than an organization can adopt, marking a significant step in an institution’s evolution toward becoming a global, learning organization that can survive in the knowledge based economy. This paper, therefore, is to study the relationship between educators’ leadership, knowledge management, and organizational culture and organizational performance of Thailand Private Higher Education Institution.

LITERATURE REVIEWS

The original formulation of transformational leadership theory comes from Burns (1978). At the core of transformational leadership is the concept of transformation, or change of the organization. According to Bass & Avolio (1998), they added that transformational leadership best reflects this change management and make clear the leaders’ characteristics. The first characteristic is that followers are driven by a moral need, the need to be champion, or the need to take a higher moral stance on an issue. Followers like to feel that a higher organizational spiritual mission guides their motives. The second need is a paradoxical drive for consistency and conflict. Transforming leaders must help followers make sense out of inconsistency. Conflict is necessary to create alternatives and to make change possible. The process of transformation is founded on idealized influence, inspirational motivation, intellectual
stimulation, and individualized consideration. The transformational leaders must attach a high value to knowledge, encourage questioning and experimentation through empowerment, build trust, collaboration and organization learning. Moreover, leaders need to focus on organizational culture that can be viewed as the sum total of beliefs, values, attitudes, and assumptions shared among its members. Organizational culture deals with planned change and transformation, and understanding its process has become extremely important in all institutions including colleges and universities (Keup, Walker, Astin, & Lindholm, 2001; Bollinger and Smith, 2001; Lee & Choi, 2003). Thus, organizational culture is then considered more important in the private higher educations institutions.

A process of knowledge management is based on the ability of all members of the organization to add value to the basic business processes through the creation, communication, codification, and coordination of both explicit and tacit knowledge stores (Nonaka & Takeuchi, 1995). Specifically, Nonaka and Takeuchi (1995) theorized that the flow of knowledge transitions from socialization to externalization, to combination, and to internalization, basically from the raw experience to understanding, then to categorization, and finally to the creation of personal mental models that transcend the experience. This link simply provides basis from which to grow new theories of leadership to help educators of the new knowledge organization turn implicit knowledge into significant organizational performance (Lee & Kim, 2001; Lee & Choi, 2003; Migdadi, M. 2005; Brachos et al. 2007; Lyons, 2008; Ho, C.T. 2009).

(Figure 1)
METHODOLOGY

Participants: This study was based on 389 samples who were randomly drawn from instructors of private higher education institutions under The Office of the Higher Education Commission. This study used multi-step sampling.

The research instrument was a questionnaire constructed from the adapted research. Once created, the instrument was checked by five education experts (IOC = 0.93). Next, the instrument was administered to a try out sample (N = 60) for the purpose of establishing reliability estimates (0.98).

The research instrument attributes used five-point Likert scales ranging from strongly agree to strongly disagree in 90 items.

Data were analyzed through descriptive statistics, correlation coefficient analysis, exploratory factor analysis, confirmatory factor analysis, and structural equation model analysis.
RESEARCH RESULTS

The mean of change leadership and organizational culture of private higher education institutions is high level. The mean of transformational leadership is high in terms of idealized influence, inspirational motivation, individualized consideration, and intellectual stimulation respectively, and the mean of organizational culture is high in terms of collaboration, learning, and trust consecutively. The mean of knowledge management and implemented results and organizational performance is moderate level. The mean of internalization is highest level, and socialization, combination, and externalization are at the consecutive level. (Table 1)

To conclude, the causal relationship among transformational leadership, organizational culture, knowledge management, and organizational performance in the private higher education institutions showed that the organizational performance variance can explain 55%, knowledge management is the mediating variable and has the positive relationship to organizational performance ($r = 0.79$). This analysis of structural equation modeling: SEM is fit to the empirical data. (Figure 2)

![Figure 2. The Causal Relationship Model: Path Analysis](image)
Result of hypothesis tests indicated that transformational leadership, organizational culture and knowledge management have direct influence on organizational performance. Transformational leadership and organizational culture have indirect influence on organizational performance through a mediating function of knowledge management. Also, causal structural relationship model among transformational leadership, organizational culture, knowledge management and organizational performance of Thailand Private Higher Education Institutions was conformed to empirical data with the goodness of fit statistics. This model could explain 55.00 percent of the organizational performance variance. The results supported the knowledge management researchers (Nonaka & Takeuchi, 1995, 1998, 2004; Davenport & Prusak, 1998; Lee & Choi, 2003; Deaedge et al., 1993; Migdadi, M. 2005, Tasmin & Woods, 2007) who emphasized that the concept of knowledge management in the organization can help develop organizational performance and increase organizational effectiveness in a concrete and sustainable way with the supporting factors to knowledge management process such as leadership, organizational culture, organizational structure, and information technology.

DISCUSSION AND RECOMMENDATION

Knowledge management is the educators’ tool that helps develop the decision making (Lyons et al., 2008) and organizational effectiveness by managing knowledge to be intelligent capital (explicit and tacit knowledge) and develop human’s potential according to Senge’s five disciplines of learning organization concepts (1990) which consisted of systems thinking, personal mastery, mental models, building shared vision, and team learning. The discipline is accordance to Nonaka & Takeuchi (2004) which stressed on dialogue and discussion that can lead to sharing, learning organization and eventually become the best practice of organizational performance which highlighted on four missions: students’ qualities, quality of research, academic services, and art and cultural maintenance.

Furthermore, leaders in the private higher education institutions have to work with various attributes such as strategic management, internal and external policies, life-long education, internationalization, new communications technologies, new functions involving with the development of knowledge-based society.
REFERENCES

Abstract

The purpose of this study is to examine how personal relationship (friendship and romantic relationship) is developed, to identify factors that affect friendship and romantic relationship, and to examine how friendship and romantic relationship can explain living behaviors shared with closed friends and romantic friends.

The present study undertakes a quantitative research of university students’ living behaviors in the private residence, Prathumthani, Thailand. A survey questionnaire was employed in this study with three hundred and eighty-four students living in the private residence nearby their universities.

The major issue investigated is the variables that aimed to scrutinize university students’ living behaviors in the private residence. Five variables (students’ lifestyles, friendship, romantic relationship, living behaviors shared with closed friends, and living behaviors shared with romantic friends) were studied. The researcher tested significance by using Pearson’s Product Moment Correlation Coefficient.

Finally, research findings revealed that friendship was likely to develop to romantic relationship, and there were positive relationship between students’ lifestyle and friendship, and students’ lifestyle and romantic relationship. Moreover, different types of personal relationship (friendship and romantic relationship) may not be able to explain the different living behaviors shared with closed friends and romantic friends.

Key words: friendship, romantic relationship, social penetration theory, participation

Introduction

The demand of students who wanted to study in the university increased while many universities in the city in Thailand were not able to serve all new students anymore. It was crucial for universities to expand their campus to other provinces not too far from the city. Due to the expansion, students themselves found some difficulties to go back and forth every day because the distance was farther, and the traffic was congested. They had to wake up earlier in the morning and come back home late. Also, they paid more expenses for their transportation. They were very tired, and parents started to worry about their children’s security and inconvenience. To alleviate their worries, parents began to look for the nearest accommodation which was the dormitory in the university or private residence outside the university. Many universities provided the dormitory, but it was still not sufficient while some did not. As a result, a lot of students had to stay in the private residence. Staying in the private residence could bring both advantages and disadvantages. Since students had more freedom after getting away from parents, and they met both same-sex and different-sex friends and communicated in terms of many topics. In terms of interpersonal communication, when they became friends, they were closer, and their relationship later could be changed. Social psychologists Irwin Altman and Dalmas Taylor (1973) initiated the relationship theory called “social penetration
theory.” The central idea of this theory is that every relationship – whether with a friend, a family member, a lover, or a co-worker- is in terms of two concepts: breadth and depth. Breadth has to do with how many topics are discussed with the other person. Depth has to do with how central the topics are to self-concept and how much topics are revealed. Relationships begin with relatively narrow breadth (few topics are spoken about) and shallow depth and progress over time in intensity and intimacy as both breadth and depth increase. Thus relationships develop incrementally as few to many topics, and superficial topics to intensely personal topics are discussed.

Students were at the age of teenagers who were excited to meet new challenges that might bring both desirable and undesirable behaviors. If they were close with opposite sex until the relationship was changed into romantic relationship, they would privately choose to live in their own world. According to communication privacy management theory (Petronio, 2003), it focuses on the establishment of the boundaries and borders that people decide others may or may not cross. For each relationship, people compute a “mental calculus” to guide them in deciding whether to share information with another person or keep it private, avoiding disclosure by engaging in the deliberate withholding of information. As a result, it is possible that students in the private residence will perform what they want to do even negative behaviors: hanging out until late night, drinking alcohol, taking drugs, having sexuality, etc. that might lead them to absenteeism, low responsibility, low attentiveness, low achievement, or incomplete study due to being retired, dead, or disabled.

**Objectives of the Study**

This study aimed to:

1. study the relationship development of students after having stayed in the private residence.
2. study the relationship between students’ lifestyles and friendship.
3. study the relationship between students’ lifestyles and romantic relationship.
4. study the relationship between friendship and students” living behaviors shared with closed friends.
5. study the relationship between romantic relationship and students” living behaviors shared with romantic friends.

**Hypotheses**

From the foregoing discussion, the following hypotheses are formed:

1. Students begin with friendship and gradually develop to romantic relationship after having stayed in the private residence.
2. Students” lifestyles in the private residence has a positive relationship with friendship.
3. Students” lifestyles in the private residence has a positive relationship with romantic relationship.
4. Friendship has a positive relationship with living behaviors shared with closed friends.
   Romantic relationship has no relationship with living behaviors shared with closed friends.
5. Friendship has no relationship with living behaviors shared with romantic friends.
   Romantic relationship has a positive relationship with living behaviors shared with romantic friends.
Significance of the Study
1. To stimulate university role of giving closer look at students in the private residence.
2. To encourage university to put an emphasis on communication network and communication activities with the private residence.

Definition of Terms
1. Private residence refers to the accommodation nearby the universities where the students rent and pay their fees.
2. Students’ lifestyles refers to individuals’ daily activities such as time to wake up and time to bed, days of staying in the private residence, number of closed friends, sex of closed friends, frequency of friends’ visit, group meeting, activities done during spare time, types of friends: same-sex and/or different-sex friends, activities doing with friends.
3. Friendship refers to the stages of how friendship was developed: role-limited interaction, friendly relations, moving toward friendship, nascent friendship, stabilized friendship, waning friendship, and repaired friendship.
4. Romantic relationship refers to stages of how romantic relationship was developed: individuals with particular needs, goals, and qualities that affect what we look for in romantic relationship, invitational communication, explorational communication, intensifying communication, revising communication, intimate bonding, and navigating communication.
5. Living behaviors shared with closed friends refers to helping each other to do homework or activities, revising textbook together, etc.
6. Living behaviors shared with romantic friends refers to hanging out in the late night, playing online game until late night, having sexuality, taking drugs and drinking alcohol, etc.

Limitations of the Study
The researcher collected questionnaires from the students in the private residence living nearby their universities, Prathumthani, Thailand. Students were studying in the second year to the fourth year. The first year students were not the sample in this study, and they had to live in the private residence at least one semester because they were adjusting themselves to study in the university. Also, at the time the researcher collected the data, students were still living in their private residence.

Methodology

Subjects
The subjects of this study were three hundred and eighty-four students who stayed in the private residence, Prathumthani, Thailand. In this study, the researcher got the sample from one hundred and two private residences.

Research Tool
Questionnaire was made by researching concepts and document to cover the studied variables. Extra care and caution was applied in constructing the questionnaire. The researcher made the closed-ended questionnaire which consisted of six parts which are 1) demographic data such as sex, faculty, and present year of study 2) student’s lifestyles in the private residence 3) friendship 4) romantic relationship 5) living behaviors shared with closed friends 6) living behaviors shared with romantic friends.
The Test Instrument
To ensure that the test had content validity, the questionnaire was checked and corrected by the research mentor. The researcher conducted the pre-test with fifty students in the private residence, and correction was made. Reliability of the questionnaire was tested by Coefficient Alpha of Cronbach. The result of reliability (α) was 0.93.

Research Procedure
The questionnaire which was administered with three hundred and eighty-four students in the private residence contained six sections.

The first section is the demographic data of the respondents: sex, faculty, present year of study.

The second section is students’ lifestyles in the private residence consisting of 14 items with 5-point Likert scale: frequently portray students’ lifestyles, often portray students’ lifestyles, sometimes portray students’ lifestyles, hardly portray students’ lifestyles, and never portray students’ lifestyles.

The third section is friendship consisting of 23 items with 5-point Likert scale: frequently have relationship with closed friends, often have relationship with closed friends, sometimes have relationship with closed friends, hardly have relationship with closed friends, and never have relationship with closed friends. Friendship development was developed by interpersonal communication researcher Bill Rawlins (1981, 1994).

The fourth section is romantic relationship consisting of 17 items with 5-point Likert scale: frequently have romantic relationship, often have romantic relationship, sometimes have romantic relationship, hardly have romantic relationship, and never have romantic relationship. Romantic relationship development was developed by interpersonal communication researcher Bill Rawlins (1981, 1994).

The fifth section is living behaviors shared with closed friends consisting of 7 items with 5-point Likert scale: frequently, often, sometimes, hardly, and never.

The sixth section is living behaviors shared with romantic friends 10 items with 5-point Likert scale: frequently, often, sometimes, hardly, and never.

Data Analysis
The collected data were analyzed using SPSS (Statistical Package for Social Science). Pearson’s Product Moment Correlation Coefficient was performed. The acceptable statistical significance level was set at .01 and .05.

To test Hypothesis One, the researcher used Pearson’s Product Moment Correlation Coefficient to investigate the relationship of independent variable (romantic relationship).

To test Hypothesis Two, the researcher used Pearson’s Product Moment Correlation Coefficient to investigate the relationship of independent variable (friendship).

To test Hypothesis Three, the researcher used Pearson’s Product Moment Correlation Coefficient to investigate the relationship of independent variable (romantic relationship).

To test Hypothesis Four, the researcher used Pearson’s Product Moment Correlation Coefficient to investigate the relationship of independent variable (living behaviors shared with closed friends).

To test Hypothesis Five, the researcher used Pearson’s Product Moment Correlation Coefficient to investigate the relationship of independent variable (living behaviors shared with romantic friends).
Research Findings

**Hypothesis One** predicted that students begin with friendship and gradually develop to romantic relationship after having stayed in the private residence. The hypothesis was supported. (Table 1)

Table 1: Pearson’s Product Moment Correlation Coefficient Between Friendship and Romantic Relationship

**Sig0.01

The results revealed a significant difference exists. There is a positive relationship at a low level (r = .334, p < .01) between friendship and living behaviors shared with closed friends. That means friendship and living behaviors shared with closed friends have the relationship in the same direction.

There is a positive relationship at a low level (r = .351, p < .01) between romantic relationship and living behaviors shared with closed friends. That means romantic relationship and living behaviors shared with closed friends have the relationship in the same direction.

**Hypothesis Five** predicted that friendship has no relationship with living behaviors shared with romantic friends. The hypothesis was accepted. Romantic relationship has a positive relationship with living behaviors shared with romantic friends. The hypothesis was rejected. (Table 5)

**Table 5: Pearson’s Product Moment Correlation Coefficient Between Friendship And Living Behaviors Shared With Romantic Friends And Between Romantic Relationship and Living Behaviors Shared With Romantic Friends**

**Sig0.01

The results revealed no significant difference exists between friendship and living behaviors shared with romantic friends (r = -.010). That means friendship doesn’t lead to living behaviors shared with romantic friends.

On the other hand, the results indicated a significant difference exists between romantic relationship and living behaviors shared with romantic friends. There is a
negative relationship at a moderate level ($r = -0.528, p < .01$) between romantic relationship and living behaviors shared with romantic friends. That means romantic relationship can lead to living behaviors shared with romantic friends in opposite direction.

**Conclusions and Recommendations**

The researcher intends to conduct a quantitative research concerning students’ lifestyles, personal relationship (friendship or romantic), living behaviors shared with closed friends, and living behaviors shared with romantic friends. As the results have shown, students’ lifestyles in the private residence can be the factor to develop students in the private residence from friendship to romantic relationship. The reason that they meet and do activities together, they are then easy to close to one another. As Wood (2008) mentioned that the two greatest influences on initial attraction are proximity or physical nearness and similarity. Also, Wood (2008) emphasized that the stages of relationship evolution do not just happen automatically. Rather, particular experiences and events cause relationships to become more or less intimate.

The result also revealed that different types of personal relationship (friendship and romantic relationship) do not lead to different living behaviors shared with closed friends and with romantic friends. To illustrate, friendship has a positive relationship with living behaviors shared with closed friends, and romantic relationship has a positive relationship with living behaviors shared with closed friends in the same direction. In this case, it can be explained that since romantic relationship is formed after friendship has been developed to a certain point. Then, friendship can become romantic relationship. Another result is that romantic relationship can lead to living behaviors shared with romantic friends in opposite direction, while friendship has no relationship with living behaviors shared with closed friends. This can be explained that the stages in romantic relationship are individual communication, explorational communication, intensifying communication, revising communication, and intimate bonding. At each stage moves, the relationship is gaining depth as the increasing amount of intimacy and happiness it typically embodies. They spend more or more time together, and they rely less on external structure such as movies or parties.

The results from the research can be applied to urge universities to give a closer look on students’ living behaviors in the private residence. Private residence is the environment which is the external factor that can have great influence on the students positively and negatively. In this case, different sex of students stays together in the same private residence, therefore, without knowing, it can probably bring misunderstanding and misperceptions in their communication. Communication of both sides may come from different backgrounds such as countries, ages, and organizational position (Coupland, Wiemann, & Giles, 1991) and gender (Maltz, & Borker, 1982).

Finally, the researcher would like to suggest universities to take the role as a facilitator to work proactively with the private residence by using communication network to build mutual understanding. Universities may often have meeting with owners of private residence near universities to share problems and solutions and do activities together. Meeting and doing activities can be two-way communication, that is, universities join with owners of the private residence, and owners of private residence join with universities. To sum up, universities and owners of the private residence can work successfully because of participation. Participation can be fulfilled because of cooperation, coordination, and responsibility. Participation is the heart of working together; cooperation is individuals’ intention to work together to accomplish the group goal; coordination is the time and sequential events which help activities or jobs finish
effectively; and responsibility is the commitment to work and build trust. The benefits will go to every party: universities, owners of the private residence, and community as a whole.

References

Elementary teachers must be resilient. They have to be. Elementary students almost unconditionally hold negative attitudes toward social studies and rarely understand the importance of social studies or its relevance to their lives (Zhao & Hoge, 2005). In addition, in the present era of accountability, high stakes testing, multiple lingual settings, and a growing diversity in their classrooms, elementary teachers have to be flexible, creative, and welcome change. They will try anything to get their students to learn, especially in a content area like social studies that gets such limited support as a result of little or no standardized accountability on the district, state, and national levels (Burstein, Hutton & Curtis, 2006; Hutton & Burstein, 2008; Smith, 2008; VanFossen, 2003).

This article discusses the importance of using the arts as an access strategy to help students learn social studies. Although the study and use of the arts in elementary school curriculum has been shown to increase academic achievement overall (Brouillette, 2010; Darby & Catterall, 1994; Eisner, 1999, 2000; Holzer, 2009), the arts in general have all but disappeared from the elementary school curriculum. Short of some cutting and pasting and working with construction paper, a disciplined, purposeful use of the visual and performing arts, from a standards-based perspective, is illusive at best to most elementary school teachers. Volk (1998) has demonstrated the multicultural links made by an intentional arts education. Eisner (2000) and others (Damm, 2006; Grallert, 2009; Holzer, 2009; Raymond & Broderick, 2007) continue to demonstrate the need for a comprehensive arts education, but teachers face the practical reality of accountability and assessment in curriculum other than the arts, suggesting that they ignore and ‘leave behind’ the arts altogether.

This article builds upon the work of Mishook & Kornhaber (2006) and Bresler (1995) who discuss the need for co-equal arts integration, where the arts and content area curriculum are taught for equally measured outcomes. In this way, the social studies and arts curricula that are being left on the shelves can be effectively taught in an integrated manner to enhance student learning and reclaim content that is being left behind (Burstein & Knotts, 2010). Mishook & Kornhaber and Bresler also discuss a subservient arts integration model, where the arts are used only as an access strategy for the content area curriculum that is the focus of assessed outcomes. Although they argue that a comprehensive, coequal arts education is clearly preferred over one that uses the arts solely as an access strategy to other content, we argue that any use of the arts can and does only enhance students’ understanding of the social studies content that it serves. Zhao & Hoge state “students have the greatest difficulty with abstract concepts related to time and place” (2005, p.219). So while we urge teachers to strive for a co-equal integration and equal assessment of both the social studies and arts curricula, we believe
that the use of the visual and performing arts in studying social studies content can only
enhance student learning, make concepts more real and relevant, and enliven engagement
and motivation in the elementary classroom (Jones, 2005). The use of the arts makes
those social studies concepts real and concrete; when students can see, hear, and touch
something from another time and place, or even merely representative of that time and
place, it helps to make their learning fun and challenging, but also concrete and context-
driven, and ultimately, more relevant to their daily lives.

Benefits of Aligning the Arts and Social Studies

The social studies curriculum is comprised of several social sciences including
economics, political science, history, cultural anthropology, philosophy, sociology, and
geography (National Council of the Social Studies, 1996). Of those, cultural
anthropology best lends itself to the integration of the arts. Many cultures express their
cultural norms through the visual-performing arts allowing a multifaceted view of inside
that culture. Culture, especially visual culture is “inherently interdisciplinary and
increasingly multimodal” (Freedman, 2003, p. 2). By integrating the visual-performing
arts, teachers tap into several strategies to help students make their own meaning of
socio-historical events. Using arts strategies can encourage open-ended thinking, “risk-
taking, critical thinking, and diligence” (Gullat, 2008, p.14). To encourage teachers to use
the arts with social studies, the elementary curriculum should be taught with a
multidisciplinary focus rather than piecemeal by subject area or time slot during the
school day. In the real world, concepts and skills are not used as discrete bits of
information but used as an integrative approach to solving real world problems.
Educators need to teach and model these integrative strategies with our children using an
approach they will likely use as adults in the workforce.

As part of a multidisciplinary approach, critical thinking skills are essential in helping
students analyze open-ended problems and situations in the social studies curriculum.
The visual-performing arts help enhance critical thinking skills by providing visual and
kinesthetic problems to consider from multiple vantage points. In the visual arts, several
researchers promote the use of aesthetic and critical inquiry to promote critical thinking
(Burton, Horowitz & Abeles, 2000; Housen, 2001; Lampert, 2006). While aesthetic
inquiry focuses on the exploration of the general nature of art, critical inquiry is more
specific to analyzing one piece of art (Lampert, 2006). Both inquiries propose to assist
students to use multiple strategies to solve and evaluate open-ended problems and to
consider various alternatives and multiple vantage points (Lampert, 2006). When
examining the social studies curriculum, these strategies in the arts are aligned with
similar strategies used in social studies inquiry. In fact, Levstik and Barton (2005)
advocate using observation, analysis, open-ended problems, and multiple perspectives in
learning history that aligns nicely with the same skills in aesthetic inquiry.

The following section outlines the use of the four visual and performing arts, discusses
cognitive and classroom benefits of each art form, as well as practical applications and
eamples for the elementary classroom.
Integrating the Visual-Performing Arts

Drama

Elementary teachers have noted a variety of benefits for their students after using various art forms to enhance the presentation of social studies curriculum. When students use drama and character portrayal to demonstrate their knowledge and skills, they develop self-confidence and gain a better understanding of the events they are enacting (Morris, 2001). Obenchain and Morris (2001) also found that the use of melodrama engages students in learning content, while addressing multiple perspectives, and making historical connections across time and space. This use of drama and melodrama allows students to engage with major historical figures that are representative of the period, as well as giving voice to the poor, women, and the disenfranchised in ways that social studies texts do not often offer (Hutton & Burstein, 2008; Morris, 2001).

Using the dramatic arts also provide students a multi-sensory approach to learning social studies content. Students must use imagination, risk-taking, and critical thinking in using all five senses to create a character within a historical time period or cultural context. Gullatt (2008) states, “dramatic activities provide opportunities to see, hear and create learning opportunities” (p.19). Therefore, students are using multiple intelligences to make sense of content. In fact, McMaster (1998) describes the benefits of using drama because it employs metacognitive strategies such as analysis and evaluation during the acting process. Using this process to make sense of complicated events such as the American Revolution provides students multiple ways and perspectives to make meaning of this historic period. For instance, students could act out what it might be like to sign the Declaration of Independence, knowing that to do so, to stand up for a potentially unpopular belief, might make them the target of hate and violence. This practical application to modern-day bullying and hate crimes has overwhelming relevance in modeling how to effectively participate in democratic dialogue in grade- and age-appropriate ways, and is developmentally appropriate way to get students critically engaged with the concrete and relevant issues of their time.

Music

Teachers use music in the classroom to raise awareness of multiple historical perspectives, and enhance understanding of history and culture (Taylor, 2008). The use of music has been found to enhance student understanding of folktales, fairytales, and building meaningful context (Kite, 1994). Music is multicultural and can be used to compare cultures across time and place (Elliot, 1995; Volk 1998). This consciousness-raising about the multiplicity of culture(s) allows students to value the customs, behaviors, and traditions of “others” (Waterbury, 1993).
In addition to raising awareness and providing context, the arts including music provides an alternative communication system for students to express what they know and feel. Multiple sign systems are alternative modes of communication used to construct meaning about new information (Berghoff, 1998; Gullatt, 2008). When children learn difficult concepts in social studies, music can provide one pathway to communicate their understanding besides the more traditional forms of speaking and writing. Creating and singing a song about the life of a child during the Gold Rush uses creativity as well as multiple intelligences to show content understanding. In this way, students gain a concrete understanding of what life was like in an alternate time period and make real and relevant connections to their daily lives.

Dance

Just as in music, dance employs an alternative communication system by using the non-verbal forms; the human body and facial expressions to make sense of content. Dance allows students to express emotions through use of their body while placing themselves in the context of a character, historical figure or everyday person. Dance, by nature, is interdisciplinary with the inclusion of rhythm, movement, music, dramatic arts, and even visual arts through use of line, shape, and form (Nunn, 2002; Volk, 1998). Students have the opportunity to use the creative processes while also attaching emotion to situations or events within the social studies curriculum. By using all senses, intellectual, emotional, and physical, the use of dance makes curriculum come alive in a unique way (Nunn, 2002).

In addition to communicating through the body, dance is multicultural. Every culture has movement or dance that represents a history or ideals about that culture. By learning dances of various cultures, students are expressing and practicing how that culture comes alive in physical form (Rovegno & Gregg, 2007). They can express how these cultures live and pass on their traditions, mythology, and folklore. Dance is one more lens students can use to understand social construction and values within various societies studied in the elementary social studies curriculum. Using dance and movement to enact the Westward Expansion, for instance, is one way that students can immerse themselves in content. Students can create dance movements to show the common daily activities of cowboys, families in wagon trains, and Native Americans and compile them in a ballet to demonstrate the events of people moving West in the 1800’s. This higher order task embeds social studies concepts in unique and specific ways (Brouillette, 2010; Holzer, 2009).

Visual Arts

Teachers also use various forms of the visual arts to enhance the teaching of social studies. In an extensive standards-based curriculum using the art of Rembrandt, Smith (2008) found the use of Rembrandt’s art helped to enhance learning about the National Council for the Social Studies (NCSS) themes of culture, and continuity and change. In addition, inquiry based lessons using Rembrandt’s art also raised issues and questions
about the relationship between the public and private lives of artists, making the learning much more higher order and context driven. The use of primary sources, artifacts, and hands-on objects has long been seen to enhance student learning by illustrating the stories of individuals and groups, offering relevance and context, and asking students to practice the processes of a historian (Morris, 2000; Raymond & Broderick, 2007). Beyond the text of children’s literature, well-chosen illustrations can also be used to make learning more intriguing and comprehensible to students (McGowan & Guzzetti, 1991).

The use of the visual arts in studying social studies content is a concrete and explicit tool to gaining multicultural perspectives (Volk, 1998). Using the visual art of a particular culture (i.e. masks, painting, pottery) brings that culture into the classroom in a visceral and tangible way that the text leaves in only two dimensions (Grallert, 2009). Having children engage with the art of a particular people or time period adds an element of context that allows them to ‘see’ the people through their own eyes. It is easy to use the benefit of technology and almost any museum’s website to bring art into the classroom. Many museums even have an artifacts lending program so that teachers can bring pots, baskets, jewelry and other cultural artifacts into a classroom. In this way, for instance, students can use the arts of a local Native American tribe to deconstruct what that culture might have been like (Why were the pots shaped in this way? What did the designs on baskets and/or the painting on pots attempt to represent for the people of that time?). Teachers can even use two dimensional reproductions of art from local museum sites, or reproductions of newspapers, or statuary from recent or ancient times to provide an opportunity for students to engage with the art of a period so that they might reconstruct what was important to people of the time period. In this way, students could compare ads from a modern day newspaper with ads form a newspaper from the turn of the 20th century to compare and contrast economic demands of the local area. This higher order task using concrete artifacts lends relevance to students as they see some of the same economic concerns transcend time and place.

**Conclusion**

“Social studies teachers should be encouraged, and provided with more opportunities, to learn new skills, methods, and teaching resources to engage students in life-related activities” (Zhao & Hoge, 2005, p. 220). The use of arts integration in the social studies curriculum is just such a method (Taylor, 2008). The use of the arts as a tool to study social studies concepts, helps students make connections, find more relevance to their daily lives, and enhances their understanding of major historical figures, as well as those more marginalized and disenfranchised communities throughout time and place.

The use of the arts as an additional pathway to social studies content helps better develop student understanding. Using the arts develops student understanding by providing concrete tools and access strategies, and often asks students to enact with or even create a tangible product; this connects students to the content in real, explicit, and relevant ways. Students can use the arts as a tool to demonstrate how they make sense of concepts, vocabulary, and content in social studies. Students make tangible gains in academic achievement (Brouillette, 2010; Darby & Catterall, 1994; Eisner, 1999, 2000; Holzer,
2009), and also make strides in critical thinking, open-ended problem-solving, and developing an appreciation for the perspective of others.

We urge teachers to strive for a co-equal integration and equal assessment of both the social studies and arts curricula (Bresler, 1995); in this way elementary teachers can reclaim social studies teaching that is being lost in the present era of high stakes testing and accountability of curriculum other than social studies. But we believe that any use of the visual and performing arts in studying social studies content can only enhance student learning, make concepts more real and relevant, and enliven engagement and motivation in the elementary classroom. The examples we provide here demonstrate that the use of the arts makes those social studies concepts real and concrete; students not only gain content knowledge, but also gain conceptual knowledge like perspective taking, problem-solving, and multi-sensory approaches to open-ended and critical thinking (Jones, 2005). When students can engage with an artifact, a song, a tool, or artwork from another time and place, or even merely representative of that time and place, it helps to make their learning fun and challenging, but also concrete and context-driven, and ultimately, more relevant to their daily lives.

Abstract

This study explored relationships among Play, Social Competence according to Leadership type of preschool children. Instruments were the Korea-preschool leadership scale (Lee & Choe, 2008), Korea-preschool creativity scale (Lee, Kim & Shin, 2002), Korea-preschool play inventory (Chi, 2007), Korea-preschool social competence scale (Pak & Lee, 2001) constructed by the researcher. Participants were 99 (boy 59, girl 40) form 214 kindergartners, in Seoul of Korea. Data were analyzed by correlation and ANOVA (post Scheffe analysis). These quadrants can be described as high leadership/high creativity (creative leader; popular child), high leadership/low creativity (independent leader; stubborn child), low leadership/high creativity (eccentric leader; inventive child), low leadership/low creativity (deficient leader; non-popular child).

Major results showed there were First; positive correlations among leadership of preschool children and creativity of preschool children (r=.54, p<.01). Second; Leadership type significant group differences were found in the play (F=86.94, p<.001); post-analysis results showed high scores of creative leader (popular child) and eccentric leader (inventive child) than independent leader and deficient leader scores. Third; Leadership type significant group differences were found in the social competence (F=35.98, p<.001); post-analysis results showed high scores of creative leader (popular child) than eccentric leader, independent leader and deficient leader scores.

In conclusion, this study creative leader (popular child) was better than the other leaders to play and social competence.
Title of the submission:
Relationship among the Preschool Children's Self-Regulation and Multiple Intelligences

Abstract

The purpose of this study was to explore the relationship among self-regulation and multiple intelligences of preschool children. Instruments were the Korea-preschool self-regulation scale (Lee, 2003), Korea-preschool multiple intelligences scale (Choe & Choe, 2003) constructed by the researcher. The Participants were 173 children (boy 86, girl 87) between the ages 4, 5, 6 and their mothers from kindergarten in Ulsan of Korea. The collected data were analyzed by t-test, ANOVA and regression analyzed.

The major results of this study were as follows; first, it showed that children's self-regulation ability was related with the sex difference, not with age. Second, there was sex difference in children's multiple-intelligence. Girls were higher in overall intelligences. Third, only interpersonal intelligence ($\beta=.503$, $p<.001$), spatial intelligence ($\beta=.210$, $p<.05$) and linguistic intelligence ($\beta=.216$, $p<.05$) were significant predictors on children's self-regulation ability.

These results could be used as stepping stone in developing preschool children's self-regulation program in near future.
ABSTRACT FOR CONFERENCE PROCEEDINGS

Using Targeted Professional Development to Improve Middle School Mathematics Achievement

The need to improve student achievement in mathematics, especially at the middle school level, remains a significant challenge for educational leaders and policymakers. Available research indicates effective math curricula must be coherent, emphasize essential math concepts, and be vertically and horizontally articulated and aligned. Implementing a standards-based approach to mathematics instruction is generally believed to be a key component in increasing student performance in mathematics.

The role of the teacher in implementing a standards-based approach to mathematics is paramount. Unfortunately, many of the individuals in the current teaching force did not receive the training and preparation needed to teach in a standards-based context where the focus is on the use of critical thinking, problem solving and inquiry. We cannot expect teachers to teach what they do not know and to use instructional models they do not understand. Consequently, the continuing professional development of our experienced teachers is a critical element in the transition to standards-based mathematics and, ultimately, the improvement of student performance.

In February 2009, Marshall University’s Graduate School of Education and Professional Development was awarded a $159,699 USOE Improving Teacher Quality Grant. This grant was designed to provide targeted professional development in standards-based mathematics for fifty teachers in grades 6-8 in six local school districts in rural central West Virginia. The professional development model included an intense summer institute in 2009, formal follow-up sessions held during the 2009-10 school year, and classroom follow-up visits and observations.

This paper will provide an overview of the project objectives, describe project implementation, and provide an analysis of the project evaluation model. Data on teacher performance, including changes in math concept knowledge and understanding of standards-based teaching strategies, will be provided. Student achievement data will also be provided. Finally, lessons learned will be presented and discussed.

Physical Education Teachers’ Epistemological Beliefs about Motor Learning in Japan

Takahiro Nagayama, Katsuro Kitamura, (Tohoku University, Japan)

Numerous attempts had been made by scholars to clarify teachers’ epistemological beliefs about knowledge and knowing. However, only few attempts had so far been made at physical education teachers’ beliefs about motor learning in Japan. That’s why the purpose of this study was to investigate teachers’ epistemological beliefs about motor learning. Two physical education teachers (1 junior high school teacher and 1 high school teacher) served as the participants for this study. In-depth, open-ended, semi-structured interviews were used to gather data. Interviews were focused on epistemological beliefs comprised five beliefs (Schommer, 1990), including source of knowledge, certainty of knowledge, organization of knowledge, control of learning, and speed of learning. Interviews were recorded and transcribed immediately after each interview. The interview data was regrouped using an inductive procedure for analyzing unstructured qualitative data. As a result, three categories emerged from the analysis consisted of 1) improving knowledge, 2) encouraging students to reflect collaboratively, and 3) developing responsive communities. Participants believed that knowledge was evolving. Therefore they always tried to improve their knowledge and adapt their knowledge to students’ knowledge. It was useful for them to develop responsive communities so that students could reflect on action collaboratively. In conclusion, Japanese physical education teachers believed that knowledge was complex, uncertain and students could construct knowledge by themselves through reflecting on action collaboratively.

E-mail: fen1012@hotmail.com
Type of Presentation: presentation
Content Area: ESL/TESL

This study explores how the vocabulary learning approaches Taiwanese college students adopt relate to their EFL reading comprehension performance as measured by the TOEFL test and vocabulary knowledge as measured by the VLT. 55 EFL Taiwanese college students participated in this study. Instruments of this study included a Vocabulary Levels Test (VLT), a Vocabulary Learning Strategies Questionnaire (VLSQ) and the TOEFL reading comprehension test. Statistical Package for Social Sciences (SPSS) was used to analyze the collected quantitative data and a focus group interview with 6 college students was conducted to cross-validate the quantitative results and to develop more in-depth insights into the quantitative data.

The result shows that there was a close relationship between the amount of strategy use and levels of success in language learning and that metacognitive strategies use and time were two most crucial factors which are strongly correlated with the two sets of
scores. The results suggest that metacognitive strategies, and some context-related strategies may be related to both vocabulary size and reading comprehension. Some mnemonic strategies, though they are related to a larger vocabulary size, seem to show minimal correlation with reading comprehension. Recommendations for more effective EFL reading instruction and vocabulary acquisition will be presented based on the findings.
A Study on Education on Intellectual Property from Economic and Ethical Perspectives

Masao Toyama

Faculty of Social Systems Science

Chiba Institute of Technology

masao.toyama@it-chiba.ac.jp
Abstract

Educating the consumer so that he or she understands the concept of intellectual property is important in order to protect intellectual property. Intellectual property is converted into a concrete form as a product. The manufacturer of a product has to bear variable costs based on the cost required to produce the product. On the other hand, the manufacturer of a product has to bear fixed costs based on the forecasted amount of sales of the product. In order to lower the price, the expected amount of sales of the products must be high. The price comprises the profit obtained by the manufacturer in addition to such variable costs and fixed costs. The consumer has to understand that the profit realized by the manufacturer serves as the capital for producing a subsequent new product. If the manufacturer does not obtain the required profit, the manufacturer may have insufficient capital for developing subsequent new products. In addition, educating consumers about the ethical aspects of intellectual property is also important.

Impact of State and National Policy on School Leadership Theory and Practice: Global Research on School Leaders in the US, UK, and China

As today’s technologies and communications systems allow the world to flatten and shrink before our eyes, we must reflect on our goals of schooling, especially tasks required and skills needed by school leaders to achieve those goals. The three-year research study underpinning this paper focused on current roles of school leaders, and the impact of state and national policy on school leaders and educator preparation faculties in the United States, the United Kingdom, and China. We reported these findings in order to highlight challenges facing educator preparation faculty, as we endeavor to develop educators who will be equipped with knowledge, skills, and dispositions needed to achieve goals of schools in a global society.

The researchers who conducted this study employed a two-phase design, consisting of both qualitative and quantitative research methods. In phase one, two investigators traveled to China, the UK, and schools in the US to gather data from practitioners and policy makers. The data were analyzed to identify international school renewal/reform best practices and their applicability. The investigators of the first phase of the study also aimed to define and describe the effectiveness of major educational reform policies from effective schools/systems in China, the UK, and the US.

In phase two of the study, the goal was to identify current roles and responsibilities of the assistant principal/deputy headteacher (AP) in China, the UK, and the US, as well as the preparation of AP’s to assume the future role of principal/headteacher. The researchers in this phase of the study used a researcher-designed questionnaire, which was distributed to administrators in China, the UK, and the
US. The sample for the study included 81 practicing principals/headteachers and assistant principals/deputy headteachers, who provided a unique perspective into current roles, responsibilities, and challenges of the assistant principal/deputy headteacher.

**Phase I: Global Policy and Practices Impacting Practitioners**

In phase one of the research project, the investigators gathered data relative to educational policies and practices to identify *best practices* in the US, UK, and China. *Best practices* were defined as those that practitioners and policy makers agree have resulted in positive school renewal/improvement, including student academic success and access to higher education, global competitiveness of students, recruitment and retention of teachers, impact of state/national testing schemes, and financing of schools.

The researchers used multiple data-gathering methods to examine a fundamental, commonly held strategy that is perceived critical for enhanced academic achievement at all levels—to simultaneously renew the schools and the education of educators with a focus on the increased educational demands required for successful 21st century citizens. To meet these demands, educators at all levels must ensure that policies and practices support a significant increase in the numbers and quality of students entering higher education. To carry out this renewal, improvements are required in a number of conditions in both schools and educator-preparation institutions.

The specific purpose of this phase of the study was to:

1. Identify international school renewal/reform *best practices* and their applicability.
2. Define and describe the effectiveness of major educational reform policies from effective schools/systems in the United States, the United Kingdom, and China.

The researchers conducted classroom observations in schools, conducted semi-structured interviews of state/national policy makers; and conducted focus groups of teachers, principals/headteachers, and teacher preparation faculty. These were conducted at multiple sites in the United States, England, Wales, and China. One major finding of the study was that all three countries are deeply involved in “school and educator preparation reform” based on the changing needs of students for the 21st century. Some of the many differences in process and policy are listed in the following findings from phase one of the investigation:

**Classroom Observations:**

- UK and US schools reflected primarily ‘student-centered’ instruction and curriculum models.
- China schools reflected primarily ‘teacher-centered’ instruction and curriculum models.

**Interviews and Focus Groups:**

- US schools reflected a ‘compliance culture’ driven by external mandates—NCLB along with other external policies/mandates govern behavior.
- UK Schools, that have adopted recent school autonomy polices, reflected a professional ownership and positive results for professionals and students.
China school/university personnel could verbalize the clear external broad education goals; however, they could not delineate external mandates related to ‘governing school/university leaders/teachers’ in their roles to meet the goals.

**Professional Voice:**

- UK and US school/university teachers and leaders expressed concerns that their voices are not being heard at the policy-making levels.
- China school/university teachers and leaders explained that they were valued as professionals and were allowed the flexibility to reach the broad educational goals set externally.

**Leadership Roles:**

- US school leaders perceived that their roles were ‘defined by their title/position.’
- China and UK schools perceived their roles are defined by their expertise and interest, with little attention to their titles.

The phase one findings, especially those related to professional voice and leadership roles, prompted the research to embark on phase two of the study.

**Phase II: Current Roles of Administrators in the US, UK, and China**

The goal of phase two of the research project was to identify current roles and responsibilities of the assistant principal/deputy headteacher in the US, UK, and China, as well as their preparation to assume the future role of principal/headteacher. A review of the literature indicated that assistant principals are often underutilized and undervalued in many schools. The literature review also indicated that the profession lacks a common understanding of how to best prepare and utilize assistant principals/deputy headteachers, as role ambiguity plagues the position. Because roles of the assistant leaders vary across
schools, leadership preparation faculty face many challenges in training and developing assistant principals who will be equipped with knowledge, skills, and dispositions needed to achieve goals of schools in a global society.

Roles, responsibilities, challenges, and preparation of all educators have never been more crucial to the success of education than in the 21st century flat world. In this current age of school accountability in the US with a focus on instructional leadership, one may assume that school principals/headteachers have moved to a more distributed model of leadership in which they share responsibilities with assistant principals. However, the question of whether assistant principals/deputy headteachers are sharing/assuming leadership roles in schools or merely performing management duties far removed from instructional leadership of schools is a valid one.

A search of the literature relative to the assistant principal/deputy headteacher produced scant results for US schools, and even less in the UK and China. This dearth of literature led to the creation of a researcher-designed instrument for the purpose of capturing the perspectives of assistant principals/deputy headteachers in the US, UK, and China relative to their roles, responsibilities, challenges, and preparation. The self-report instrument consisted of 11 items and a request for demographic information. The items required both open-ended and forced responses. For the US and UK assistant principals/deputy headteachers, the instrument was administered through SurveyMonkey©; however, due to language issues, for the Chinese deputy headteachers, the instrument was translated into Mandarin, distributed by a graduate assistant in China, and responses were translated back to English by the graduate assistant. The response of
81 assistant principals/deputy headteachers represented 36 assistant principals from the US, five deputy headteachers from the UK, and 40 deputy head teachers from China.

**Primary Roles and Responsibilities**

Undoubtedly, the assistant principals/deputy headteachers who participated indicated a wide range of roles and responsibilities. However, it was not surprising that almost half of the US participants (46.9%) listed one of their primary roles and responsibilities as student discipline, which is consistent with the literature. Of the US and UK participants, 92.6% reported being responsible for student discipline; however, no participant from China listed that responsibility. Other prevalent roles and responsibilities included the following: faculty/staff supervision; special programs coordination; and, student assessment and progress.

To provide insight into the roles, respondents were asked to indicate the frequency with which they participated in a number of leadership functions and responsibilities. From data analysis across all responses, the researchers found that assistant principals/deputy headteachers are provided opportunities to lead in critical areas, including planning, relationship development, and curriculum and instruction. However, leadership experience appears to be quite varied, with assistant principals/deputy headteachers having little leadership experience in budgeting/finance and politics.

**Time Allocation**

It was interesting that participants viewed the majority of their roles and responsibilities as being within the realm of leadership. However, when they were asked what percentage of their time was allocated for teaching, management, and leadership
duties, results contradicted this perception. US participants reported that 35% of their
time was dedicated to leadership responsibilities, while UK deputy headteachers reported
spending 42.5% of their time on these duties. In contrast, China deputy headteachers
allocated only 17.8% of their time to leadership.

In the area of management, assistant principals in the US reported spending 55%
of their time on management duties, while UK deputy headteachers reported spending
30%, and Chinese deputy headteachers reported spending 36.4% of their time on these
duties. On average, assistant principals in the US spend only 10% of their time with
teaching responsibilities, while deputy headteachers in the UK report spend 27.5% of
their time in the classroom. In contrast, deputy headteachers in China reported dedicating
the majority of their time, 45.8%, to teaching responsibilities.

Leadership Roles

Overall, there appeared to be a great deal of commonality in the roles,
responsibilities, and preparation among the US and UK assistant principals/deputy
headteachers; however, there was a vast difference in the two groups’ perceptions of their
role in the leadership of the school. Deputy headteachers in the UK generally perceived
their roles and responsibilities as being part of the leadership team and having a say in
decision making, especially as it pertained to their contributions. This may be due to the
manner in which their roles and responsibilities are determined. It was clear from the UK
participants that their roles and responsibilities were arrived at through a democratic
process and in collaboration with the headteacher, while assistant principals in the US
indicated that they were assigned duties. In the US, school governance is managed
through a more bureaucratic structure, with roles and responsibilities often dictated by the
school district with little input from the principal, and much less input from the assistant principal. What we did discover was that there is a great deal of ambiguity in the roles and responsibility of the US AP; specifically, ambiguity exists in how AP roles and responsibilities are defined, who defines them, and how they are being monitored. Unfortunately, there were no useful responses from Chinese participants, which may have been due to misunderstanding of the question, an unintended language translation barrier.

Challenges

In order to identify further the challenges faced by assistant principals/deputy headteachers, we asked participants how they could be better utilized in the leadership of their schools. Of the 34 US and four UK assistant principals/deputy headteachers who responded to this question, 14 (41%) indicated that they are being appropriately utilized in the leadership of their schools. Of the remaining 24 (63.1%), more than one third (34.3%) discussed the need to be more actively involved in instructional leadership. Additional factors were identified as being challenges. Several participants indicated that with a great deal of their time and energy dedicated to student discipline, they lacked the time to take on more leadership responsibilities in areas of interest. Not being part of the school leadership team and, therefore, not being involved in the decision-making process presented challenges to other participants. Almost 70% indicated seldom or never having opportunities to lead in the political arena, which could be a challenge in transitioning to the principalship or headteacher role. In addition, the lack of involvement in the budget process presented a challenge to other participants. Of the 37 (92.5%) China deputy headteachers who responded to this question, 14 (37.8%) indicated the need for more
professional development so that they could be better-utilized in their leadership role. Another 29.7% indicated that the ability to develop and foster an open line of communication between administration and teachers would be advantageous, while 18.9% indicated they would be better utilized if they had autonomy and authority to define their own responsibilities.

**Conclusions**

The two phases of this research project emphasized benefits of studying education policies and practice globally. By investigating policies and practices that are working through the lens of policy makers and practitioners, we understand the complexity of school reform both across cultures and schools. The authors presented findings from studies conducted over the past three years to highlight similarities and differences in policies and school practices from the US, UK, and China. Our goal was to explore challenges of the profession and to examine options that work. The options may have potential to contribute to development of leadership across cultures through a global understanding of how we work to improve schools for children of the 21st century.

What we found is that educators in school leadership positions, whether in the UK, US, or China, seek to lead improvements in their schools. While the Chinese educators hold a revered position, they desire more professional learning in leadership of schools. UK deputy heads, in schools that view themselves as autonomous, have opportunities to lead and participate in reform as leaders, rather than solely as managers. US assistant principals, while in a position of quasi-authority, often work in a culture of compliance, spending more time in management than instructional leadership. From the contradictions in responses from US AP’s, it may appear that they do not perceive
management as being different from leadership. While both management and leadership skill sets are critical in school administration, continual reformation of schooling requires leaders with vision, communication skills, and political savvy to negotiate the process of change.

Assistant principals in this study, while expressing the desire to serve as school leaders, do not feel they are trained nor given field-based experiences to develop political skills and strategies to deal with external constituent groups. While they appreciate serving in schools where principals distribute leadership responsibilities, AP’s as leaders-in-training need to be provided instructional leadership roles, if indeed they are to be the future school leaders. Not only do administrators in China desire more formal training in leadership, they need to be able to translate the broad educational goals in local schools for meaningful change.

Formal university training programs grounded in a commitment to partner with schools where aspiring leaders work can be instrumental in ending the ambiguity of the AP role by building consensus that the role is a leader-in-training role. The role misalignment that occurs between training/development of school leaders and reality of AP’s serving in clerical, management-type positions needs alignment. Educators willing to join the ranks of aspiring leaders are crucial in leadership succession planning, and well-planned alignment with training and actual practice will help fill a leadership void in this era of global school reform.

As current school leadership literature supports the paradigm of transformational leadership for reform, many university-based leadership preparation programs have embedded transformational leadership skills and dispositions in their training of
educators who aspire to serve as principals/heads. However, in schools where state and/or national mandates are perceived as the drivers of decisions and behaviors, both principals and assistant principals may be viewed as managers, rather than leaders. While China and UK school leaders perceived their roles as defined by their expertise and interest, US school leaders perceived that their roles were ‘defined by their title/position.’ For US AP’s, we found that the “title” often meant handling discipline and other management duties. School reform will require expertise and passion on the part of those within the school, so perhaps school leaders in China and UK are positioned for continual improvement, especially in schools where a culture of autonomy exists. In the US, schools seem to exist within a compliant culture, responding to federal and state mandates, which highlights the need for leadership to tap expertise and interest and encourage the entrepreneurial spirit of reform within the schools. In other words, less management and more leadership is needed at the school level in US schools.

This research was collaboratively supported by the College of Education of Georgia Southern University (GSU), Foundation-Aided Schools and Academies National Association (FASNA), the Specialist Schools and Academies Trust (SSAT), the International Networking for Educational Transformation (iNet), the Georgia Professional Standards Commission (PSC), and the SINO-American Consortium. We encourage the call for strong leadership across cultures, as the children of 21st century schools deserve best practices and policies to support their learning.
A Study on Parent-Child Relationship and Career Adaptability of College Students

irisli@ccu.edu.tw

Abstract

The purpose of this study was to investigate the correlations among parent-child relationship and career adaptability of college students. This study used “Parent-Child Scale” and “Career Adaptability Scale” as the survey tools to investigate those subjects’ basic information. This study selected 214 students from universities in Taiwan to participate a survey which has 49 questions. The obtained data was analyzed by descriptive statistics, t-test, one-way ANOVA, Pearson product-moment correlation and stepwise multiple regression analysis.

The main findings were summarized as follows:
1. The college students performed above the average on Career Adaptability Scale. The highest level was “Career Concern”; and the lowest level was “Career Control”.
2. The college students’ career curiosity, career confidence and entire career adaptability were different among grades. Lower grade students were better than higher grade students.  
3. Independency and higher interaction between parent and child are the most powerful factors to predict the career adaptability of college students.

Finally based on the main findings of my research, this study further provides some practical suggestions for college students, family education, school education and future studies.

The purpose of this paper is to design a new internship program for National Pingtung University of Education (NPUE) and to propose accreditation standards of “Professional Development Schools, PDSs” in Taiwan. In order to improve quality of a half-year extension internship for elementary teacher candidates, the researchers who are supported by NPUE from 2009 to 2010 investigate the possibility of reform of teacher candidates’ internship from a contract school model to a PDS model. The qualitative and quantitative research methods are applied in the research in order to establish a proper PDS accreditation system in Taiwan. The methods of a document analysis and a questionnaire survey are used complementarily.

Firstly, the accreditation standards draft is adapted from the original ideas of PDSs of “National Council for the Accreditation of Teacher Education, NCATE” announced in 2001 in USA. Secondly, according to the situations of Taiwan teacher candidates’ internship, the standards will be adjusted. Apply a questionnaire developed in good
reliability and validity into the research. There are about 1100 objects chosen from elementary teachers, elementary mentor teachers, and elementary school administrators to fill the questionnaires. The dimensions of the questionnaire about the PDSs’ standards are the goals, functions, operations, rewards system, and the models of School-University partnership. Then according to the research results, the authors analyze the application of PDSs to teacher candidates’ practicum period in Kaohsiung city, Kaohsiung and Pingtung County in Taiwan. Finally, the design of the accreditation standards of PDSs for NPUE and cooperation schools will be proposed and implemented according to the results and suggestions.

Title: Utilizing the ‘Competent Speaker’ form to evaluate student efficacy in oral presentations.

Abstract: Corporations and the business community recognize the vital need for oral communication skills in the workplace environment (Shafer, 2009). In fact, the Association of American Colleges and Universities produced a study which reported that “89 percent said they wanted more emphasis on ‘the ability to effectively communicate orally and in writing’” (Zernike, 2010). While a variety of courses across the curriculum help develop written communication skills, oral communication is frequently reserved for a public speaking class. With a new thrust of pressure to incorporate speeches and oral presentations into courses within the Education discipline (and in other areas across the curriculum) it becomes imperative to utilize a standardized and reliable measurement tool to evaluate student presentations (Dunbar, 2006; Quigley, 2002). This report will explore the uses for a few speech evaluation forms, most notably the “Competent Speaker” form created and tested by the National Communication Association, and discuss their application for faculty in the Education discipline.

Additional Notes:

This is a work-in-progress report and is designed to share the findings we have gathered from extensive research using this form within the Communication discipline and to solicit perspectives on its implementation within the Education discipline. Uses for the forms as well as benefits and drawbacks to their implementation will be discussed. Submitted as a paper presentation, it’s our hope that fellow panelists in the session, as well as attendees, can share their perspectives and experiences with evaluating oral presentations within the classroom from inside (and out) the Education discipline.

Sample evaluation forms will be shared for presentations in a variety of formats including individual oral presentations, problem-solving group presentations and utilizing technology among others. Below is a sample of these forms—the “Competent Speaker Evaluation” form.
**THE COMPETENT SPEAKER SPEECH EVALUATION FORM**

Submission for Hawaii International Conference on Education

Title: Identifying Intercultural Sensitivity Competencies through Focus Group Research

Topic Area: Adult Education

Presentation Format: Paper Session

Name of the Author: Melanie Wicinski, Alexis McLaughlin

Department: USF, Adult Education

Mailing Address: 19909 Ellendale Drive, Land O’Lakes, Fl 34638

Phone Number: 813-404-9759

E-mail address: mwicinsk@mail.usf.edu

Abstract:

Current Research on Intercultural Sensitivity is based mostly on self-reporting instruments. There is a lack of research on how other’s perceptions are related to true intercultural sensitivity competence. Focus group research will be conducted with non-US-native individuals to determine what competencies they feel visitors from the United States possess when visiting their respective countries-of-origin. The following four questions will be asked to determine what competencies exist:

1. Picture a person from the United States who visited your country and who you felt was interculturally sensitive. What qualities did he/she possess which made you feel he/she was interculturally sensitive?
2. What one quality was the most important in indicating intercultural sensitivity?
3. Picture a person from the United States who visited your country of origin and who you felt was not interculturally sensitive. What qualities did they possess which made you feel they were not culturally sensitive?

Due to the nature of focus group research, additional probing questions may be asked to clarify or expand upon ideas shared during group sessions. All sessions will be recorded, transcribed and evaluated to determine themes which may exist.

Title: Learning from the Land: Reflections on an Indigenous land-based graduate Program of Studies

Format: panel presentation

Presenters:

Ruth Bellegarde, EFDT, University of Saskatchewan  ruth_bellegarde@hotmail.com

Doris Camsell, EFDT, University of Saskatchewan  dmcamsell@gmail.com

Martha Half, EFDT University of Saskatchewan  m_half@yahoo.com

Dianne Miller, EFDT, University of Saskatchewan  dianne.miller@usask.ca

Objective: The presenters describe a land-based graduate program initiative taken up by the Department of Educational Foundations at the University of Saskatchewan. In this Masters of Education program, the courses are taught primarily by Indigenous faculty and from within an Indigenous paradigm with a focus on holistic learning. Several courses are taught in conjunction with First Nations or Metis communities. These “Land-based institutes” require the full and active participation of both faculty and students who live on-site in or near these communities for the period of the courses. Learning and teachings use the four quadrants necessary for complete knowledge with physical, spiritual, cognitive, and emotional experiences having an equal basis. Students have access to traditional knowledge holders and respect the cultural protocols of the particular community.

In this panel presentation, three graduate students and one university administrator reflect on their own learning experiences in this innovative program in conversation with diverse texts including oral traditions, published scholarly work from relevant disciplines, and the land itself. Here we explore the possibilities and challenges of a graduate program of studies that takes seriously the epistemic traditions of Indigenous peoples and right relation with the land including plants, animals, living peoples, and ancestral memory and yet is offered within a traditional Western academic institutional context.
LESSONS LEARNED:
School Culture and Climate Inside Higher Performing Schools, Culturally Responsive Schools

Lynn Turner Smith, Ph.D.
Bethune Institute
540 W. Maxwell Street
Lexington, KY 40508
Drlynnsmith1@yahoo.com

Abstract

Research shows that school culture and school climate drive performance and can serve as a bridge or barrier to student achievement and school improvement. This workshop will provide an overview of Bethune Institute’s Comprehensive School Culture & Climate Diagnostic Assessment and Transformation Process and how it supports schools in assessing and targeting 5 dimensions (Cultural Leadership, Physical Environment, Psychosocial Environment, Academic Environment, and Equity and Cultural Competence) for improvement. Results from our comparison study of the learning environment in higher and lower performing schools will be presented. Participants will identify key cultural practices found in higher performing, culturally responsive schools and what they do differently to engage and effectively serve their diverse student population.
Title: Testing EBASS-MOBILE: PDA approach to ecobehavioral classroom observation in support of RTI

E-mail address: ehpaik@kongju.ac.kr

Abstract:

The purpose of this proposed research is to test the use of an ecobehavioral observational measure conducted using a Personal Digital Assistant (PDA) that is under development at the Juniper Gardens Children’s Project. A PDA is a nonintrusive, palm-top computer running custom software designed to guide an observer’s data collection activities. The proposed study is a separate usability study planned by this author focused on pilot testing the beta version of the new Windows Mobile software system using the PDA. Research questions addressed include (a) product development as well as (b) empirical research questions regarding the sensitivity and construct validity of the measure for some aspects of RTI.

Abstract:
Very few empirical studies have addressed the effectiveness of communication interventions for young children with Autism Spectrum Disorder (ASD) in the last three decades. This systematic review synthesized 23 single-subject design (SSD) studies on communication interventions for young children with ASD from 1975 to 2007. Eighty-three percent of the (SSD) studies reported indirect and direct observations as their primary data collection method. Fifty-two percent of the (SSD) studies utilized multiple baseline design across subjects, target behaviors, responses, and descriptions. Fifty-eight percent of the (SSD) studies implemented reinforcements, thirty percent of the studies employed communication interventions, and sixty-one percent of the studies used alternative
interventions. Based on these findings, this article also offers recommendations for designing future research studies in communication interventions for young children with ASD.
Continuing Education of Unemployed Graduates: 
The case Study of Cyprus

Maria P. Michailidis*, Ria Morphitou and Soula Louca
School of Business, MBA Program, 
University of Nicosia, Cyprus

Abstract

Introduction
Graduate unemployment, which is the unemployment among individuals with a University/College degree, is at an escalating phase in most parts of the world. The National Association of Colleges and Employers survey of 16,000 graduating University/College students in the USA, (2009), showed that only 19.7% had jobs lined up for them. However this percentage included the increasing numbers of underemployed. Furthermore, an article in Business Week (2009) discussed the hazards of long term unemployment at the beginning of someone’s career. According to Eurostat data 2010Q1 the youth (under 25 years old) unemployment in Cyprus in June 2010 was at 19.7; and according to the same source, the unemployment rate for the 27 EU countries in June 2010Q1 was 20.3.

Numerous schemes are globally being put forward amid a worsening job market, in an effort to increase the employment prospects for those leaving education. One such scheme is further educating unemployed or underemployed graduates. This is one of the numerous measures taken by some countries in order to rescue the unemployed graduates.

This educational rescue measure was implemented in the Cypriot society through the financial assistance of the European Social Fund in collaboration with the Human Resource Development Authority of Cyprus (HRDA), the Ministry of Labor & Social Insurance, and the Cyprus Productivity Center. The program started late 2009 and will end late 2011, aiming at further educating the graduate unemployed, Entrepreneurship and Managerial Skills and intern making them more marketable.

Research Objectives
The present study aimed at examining the effectiveness of the educational program in terms of: (1) educational enhancement, and (2) increase employability of the unemployed (graduates) participants. This is an interim examination, as the total number of seminars, island wide is 16 and 8 have already been successfully completed.
Research Methodology
Participants were 224 unemployed graduates from 4 major cities in Cyprus, referred to the program from the local Unemployment offices. The program was composed of a total of 100 hours. The participants were given an hourly subsidy. Qualitative as well as quantitative research methodologies were used. Thus, four semi structured interviews were conducted and a survey instrument composed of seventeen, 5 points likert-type scale statements, followed by a comments section. These were administered to all participants to examine the levels of quality of the program and its impact on their increase possibilities of employability.

Preliminary Findings
The results of the study provided a good indication of the high satisfaction levels of the course and the ten seminars that composed it. The majority of the participants expressed the need for a longer course in terms of hours and specifically commented on longer seminars for several topics such as on Marketing, Human Resource Management, Labor Law, Computers. In general they all agreed that the program contributed greatly to the enhancement of their academic knowledge.

However, a great majority stated that they would have preferred hands-on experience on some issues, and suggested invited guests from the industry and specifically from those organizations who were in the search for new employees. Furthermore, surprisingly there were numerous comments for some type of an assessment at the end of the program, for example a final examination. Lastly, they were all very satisfied with the quality of the handouts given out and they strongly suggested electronic notes.

Additionally, there were numerous comments on how de-motivated they felt when entering the program as they were psychologically down due to their unemployment status, and how the program itself helped them boost their self esteem; as they stated it helped them improve their interpersonal communication skills, and also they expressed that they were leaving the program more hopeful and optimistic for successful employment opportunities. As these are preliminary results the authors do have (up to this day), data on the percentage of participants who were successfully employed after the completion of the program.

Originality/value
The paper contributes to the field of education and unemployment by investigating the issues related to unemployed graduate in Cyprus, where similar research is sporadic.
Keywords: Unemployed graduates, Adult Education, Continuing education of graduates

Abstract
In order to examine pre-service general education teachers’ levels of awareness and confidence in working with students with special needs, their ability to recognize characteristics of struggling students, and how to make appropriate and sophisticated adaptations to help students be successful in the general education classroom, a survey was developed that looked specifically at two questions: One, what is the extent to which pre-service general education teachers will be better able to recognize areas of academic difficulty so that they may be better able to make appropriate and sophisticated adaptations for students with special needs and two, what is the degree to which possessing knowledge on disability characteristics and making appropriate adaptations can enhance pre-service general education teachers’ awareness and confidence in working with students with special needs? In order to examine responses to open ended questions, a unique coding system based on Bloom’s Taxonomy and the work of Hoover and Patton (2005) was developed to look at the depth and breadth of responses. Findings and implications from the survey results will be discussed.
Title of the submission: A pilot study on the English communication skills needed during the internship of Computer Science students

A pilot study on the English communication skills needed during the internship of Computer Science students

1. Introduction

In a university in Hong Kong, in the Computer Science Department, students were required to take an English for Specific Purposes (ESP) course to prepare them for the communicative tasks needed for their placement in the sandwich year of their programme. Based on the recommendations of an accreditation body, students were required by their department to learn to write and engage in spoken activities related to five different business documents in this ESP course over a period of 13 weeks. The activities included writing an agenda and the minutes, conducting a meeting, writing a memorandum report, writing a letter, writing a proposal and giving an oral presentation. The packed contents of the course resulted in serious problems related to the design of the course, the tasks, assignments and teaching methods. As an initial attempt to solve the problems, a pilot study was carried out to explore the written and oral English communication skills needed in the internship of the Computer Science students so as to identify what to include and remove from the course in order to lighten it.

West (1994:1) defines needs analysis as identifying “what learners will be required to do with the foreign language in the target situation, and how learners might best master the target language during the period of training.” Dudley-Evans and St. John (1998:122) regard needs analysis as the “corner stone of ESP” and it leads to a “very focused course”.

A review of the literature shows that extensive needs analyses have been carried out in a large number of workplaces, such as industrial firms (Cowling 2006), banks (Chew 2005, Edwards 2000), as well as among textile clothing merchandisers (Li and Mead 2000). However, almost no studies have focused on the communication needs of the students in their internship.

The aim of this study was to find out (1) the communication needs of the students in a Computer Science programme in a university in Hong Kong during their internship and (2) how much of what was taught in the preparatory course for the students’ internship met their real communication needs during their internship. The information collected
can inform the course designer what to include in the ESP course when it is run in the next round to better meet the needs of the students.

2. Research Method

The Computer Science students needed to attend a Communication Skills Course on Computing I before they went for their internship and they had to attend a Communication Skills Course on Computing II when they returned from their internship. A convenient sample of seventeen students who opted to come for consultation of their major assignment in the Communication Skills course for Computing II was given a questionnaire to complete to identify the communication skills needed in their internship. Among these seventeen students, eight students were randomly selected for an interview to find out the posts they held and the difficulties that they faced in communication in their internship. Their opinions on whether what they learned in the Communication Skills Course for Computing I could meet their communication needs in their internship were also collected.

Frequency counts were made for the data in the questionnaires. To help present the results more clearly, the five categories on the 5 point scale in the questionnaire were combined into three. All interview data were tape-recorded, transcribed, tabulated and categorized.

3. Results

The questionnaire results and the interview results are reported below.

3.1 Questionnaire results

3.1.1 How frequently the students needed to write the following documents in English

The results can be seen in Table 1 below.

<table>
<thead>
<tr>
<th>Types of writing</th>
<th>Always</th>
<th>Often</th>
<th>Sometimes</th>
<th>Seldom</th>
<th>Never</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>
Table 1 shows that most of the students either always or often needed to write emails (94.12%) and reports (52.94%). No students always or often needed to write agendas.

### 3.1.2 How frequently the students needed to conduct or attend meetings in English

The results can be seen in Table 2 below:

#### Table 2  How frequently the students needed to conduct or attend meetings in English

<table>
<thead>
<tr>
<th>Meetings</th>
<th>Always</th>
<th>Often</th>
<th>Sometimes</th>
<th>Seldom</th>
<th>Never</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attend a meeting conducted in English</td>
<td>4</td>
<td>3</td>
<td>5</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>23.53%</td>
<td>17.65%</td>
<td>29.41%</td>
<td>23.53%</td>
<td>5.88%</td>
</tr>
<tr>
<td>Conduct a meeting in English</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>4</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td>5.88%</td>
<td>11.76%</td>
<td>23.53%</td>
<td>23.53%</td>
<td>35.29%</td>
</tr>
</tbody>
</table>
Table 2 shows that the percentage of students who always or often needed to attend or conduct meetings in English is below 50%. Slightly more student (41.17%) needed to attend meetings in English frequently than those who needed to conduct meetings in English (17.65%). However, generally speaking, it seems that oral English communication skills in meetings were not frequently needed.

3.1.3 The kinds of communication skills needed in their internship

The kinds of communication skills needed in the students’ internship are presented in Table 4 to Table 7 below.

<table>

</table>
From Tables 3 to 6, it can be seen that the kinds of communication skills needed by over 50% of students were only reading (64.71%) and writing (76.47%) emails and listening to English in meetings (58.82%). The other communication skills listed were not needed by most students.

3.2 Interview results

What will be reported below includes information about the posts that the students held, the difficulties that they faced in communication during their internship and their opinions about what to include in the Communication Skills Course that prepared them for their internship.

3.2.1 The posts that the students held during their internship

Among the eight students who were interviewed, five of them worked in banks and 3 worked in trading companies. The posts that they held in their jobs included:

- Student programmer
- Application developer
- Software engineering trainee
- Student placement in credit data department
- IT trainee in back office
- Support
- Student trainee
- Temporary Engineer

Their duties involved Information Technology (IT) duties and administrative duties. The IT duties that they needed to perform were:

- Programming
- Project development
- Testing
- Regression testing (When changes needed to be made to a large program, it was necessary to check if the previously finished parts would be affected by the newly changed parts and cause errors.)

- Documentation
- Support
- System Maintenance

Their administrative duties include
- Interdepartmental liaison
- Room booking
- Gathering and activities coordination
- Sending reminders to teammates

3.2.2 The difficulties that the students faced in communication

In reading, the major difficulty of the students was that they did not understand some of the technical terms.

In writing, five of the students reported that they had samples to follow when they were asked to write certain documents. Two of them sometimes referred to samples. However, one of them did not have any samples to follow at all. Sometimes they had to revise their work several times before it was accepted. They faced the greatest difficulty when writing to their managers because they did not know the appropriate style and tone to use.

In listening, they had a problem understanding westerners who spoke very fast and had strong accents. They became nervous and did not understand what was said to them when they were suddenly spoken to in English.

In speaking, they could not speak fluently enough to be understood properly and they particularly had difficulties with Social English when they needed to chat in English over afternoon tea.

3.2.3 What to include in the course that prepared the students for their internship

In writing, all students would like to learn how to write emails. They particularly wanted to know how to write formal emails and the differences in the format and language to be used when they wrote for different audiences.
In speaking, the students would like to learn the communication skills needed in talking with users and overseas teammates and in expressing their opinions in meetings. More practice in negotiations and giving oral presentations would be helpful to them.

They preferred a course that is more interactive and less technical.

4. Discussions

When the communication skills needed in the students’ internship as reported on in this study and the contents of the existing Communication Skills for Computing I were compared, it was found that the one major item missing in the course was the writing of emails. Because emails are so frequently used daily, there is often a false impression that the students have automatically acquired the knowledge about this genre which thus does not need to be taught. However, because even formal documents are frequently prepared within emails nowadays, there is an urgent need to include this component in the course. The greatest challenge is to help the students identify the differences between the format, language and style that needs to be used when the audience and the degree of formality of the emails are changed. Writing reports, participating in meetings and giving oral presentations are appropriate tasks to keep in the course. It might be helpful to add negotiation skills, support giving skills to users and Social English to the course. It seems unnecessary to teach the students how to write agendas, minutes, letters and proposals because these tasks are usually performed by staff members at the supervisory level in the companies. The students usually play the roles of junior staff in their internship.

Though the findings are interesting, it must be born in mind that this is a pilot study and the sample of subjects is small. The results can by no means be generalized. Nevertheless, the insightful findings seem to suggest an urgent need to conduct a research project on a much larger scale with a much larger sample in many different Computer Science programmes in order to identify the real communication needs of the Computer Science students during their internship. It is hoped that with the help of the empirical findings, resources will be more cost-effectively used when a preparatory course for the students’ internship is to be designed and the students will benefit more when they attend such a course.

Abstract:

This research will focus on implementing Functional Behavior Assessment as a part of Positive Behavior Support program in the home setting to identify the effect of the PBS plan on decreasing problem behaviors for 41 months old Korean-American girl. The intervention includes a variety of strategies to reinforce positive behaviors to improve her social skills.
Many Pieces of the Puzzle: A Collaborative Process of Becoming a Teacher

This paper is on an innovative model of student teaching in elementary education that emphasizes collaboration among different members of the field-based component in teacher preparation programs—student teachers, mentor teachers, administrators and university faculty. This program was purposefully entitled the CORE (Collaborations for Renewal of Education) model of student teaching.

The collaboration in the CORE program is among part-time student teachers, full-time student teachers, mentor teachers, principals and university supervisors. Student teachers work in collaborative pairs in the classroom, and the program focuses on the simultaneous renewal (Goodlad, 1990) of all members of the collaborative. The roots of the program can be traced back to the essential ideas found in peer coaching and peer observation (Joyce and Showers, 1980), the ideas spawned from the 1990’s call for school reform (Darling-Hammond, 1989; Goodlad, 1990; Holmes, 1990; Kennedy, 1990; Zimpher, 1990) and the persistent appeal for improved and more effective teacher preparation. The model has grown and developed over nine years of largely successful implementation to include lesson study and response to intervention of RTI (Howard 2009).

How CORE Works

Student teachers are placed in collaborative pairs in classrooms. Prior to the beginning of the semester, the university Supervisor negotiates a mutually agreed upon day of the week to be on site. The Supervisor is available on that particular day each week of the semester to observe students teaching, meet with the Mentor teachers, and hold on-site small group seminars. Student teachers observe peers and Mentor teachers. Students stay at the school site for one year, moving to a new classroom at semester break. Schools are asked to agree to a one-year commitment in this model, however a two-year commitment is preferable.

Meetings are held weekly among student teachers, mentor teachers, and university supervisors to discuss, debrief, reflect and plan, with a focus on what worked. The rationale for an emphasis on the elements of success is logical. Teachers often spend a great deal of time anguishing over what did not work. But close study of what was not successful is less likely to yield future success than a careful examination of what elements contributed to the greatest effectiveness of the learning episode under consideration. However, eventually all aspects of the lesson are discussed in the lesson debrief including
the challenges, concerns, the match between goals and outcomes, and the possible next steps. Insights of student teachers, mentors, principal and supervisor are shared. Interaction among the observers during lesson debriefs enabled participants to share teaching experiences and strategies, ask questions, discuss issues and concerns, obtain resources and materials, and to generally support each other.

These debriefing sessions, held after each student teaching session, were a key part the professional development of all participants. In the debriefing session, the student teachers who had finished a student teaching session were given the first opportunity to discuss their reflections on what went well followed by contributions from peer observers. After the successes were discussed and recorded a similar process was used to discuss challenges and possible next steps. The mentor teacher and faculty supervisor were the last to discuss their observations. The student teachers often were comprehensive in their understanding of the many and complex elements of the lesson and student learning.

Weekly on-site seminars were also planned with specific focus on areas of concern raised in the meetings by student teachers. In terms of teaching English learners, discussions in the meetings and seminars focused on development of academic language and literacy skills, content knowledge, higher order thinking skills and strategies. Mentor teachers, Second language coordinators, and Resource teachers from the school site are invited to these inquiry-based site seminars as a rule.

**A study of the model at one partnership site**

The purpose of this evaluation was to investigate how the student teachers, mentor teachers, and faculty responded to the CORE program. Data was collected through participant observation, interviews, reflections and comments during meetings, and written reflections from participants at all levels in the program, looking at common themes from the data that were gathered throughout one complete semester.

Common themes and concerns were identified, and three dominant themes are reported here. Though there were a number of themes that arose in observation reports, student reflections, and in discussions, the three dominant themes that consistently arose were collaboration, teaching English learners, and classroom management.

**Collaboration**

In terms of collaboration, a major focus of data collection was on how part-time student teachers, full-time student teachers, and mentor teachers interacted. Despite some feeling a bit intimidated at first, the student teachers developed a personal and professional relationship with their mentor teachers. (These teachers were themselves excellent models of collaboration, as they would collaborate with other teachers at their school to do joint projects, activities, assignments, etc.). Most of the mentor teachers got the student teachers and observers involved early. When student teachers were not observing or teaching, they were often working independently or in groups with students.
Student teachers often reported on how encouraging, supportive, and motivating their mentor teachers were. They appreciated how teachers broke things down for students. Mentor teachers invited student teachers’ ideas and helped them clarify their ideas. Mentor teachers helped student teachers develop a sense of what students need, and they also gave student teachers realistic ideas of what would work with particular age groups and what would not. Student teachers reported feelings of inclusion, respect and validation. Mentor teachers not only would tell student teachers about areas of improvement and help them learn from mistakes, but would also tell student teachers that they are doing right and give them confidence.

These benefits of mentor teacher and student teacher collaboration were not one way. Mentor teachers reported a sense of their own professional renewal from working with student teachers. Some of them adopted ideas, strategies, and techniques that the student teachers introduced into the classroom.

However, a major source of learning and development were the peers of the student teachers, and this is a strength of the CORE model. Student teachers reported on the psychological and professional benefits of learning with, and gaining support from, their peers. Some student teachers reported feeling more comfortable and safe asking their peers than the mentor teachers and university faculty. Part time teachers in particular related well to their full time student teaching peers, as full time teachers had been part time teachers before and knew what their peers were going through. Different student teachers have different points of view and perspectives on what they saw, what was pertinent to them, what was more obvious, etc. They could count on peers for support, exchanging ideas, and feedback. They shared concerns and issues with each other and talked about their anxieties. They reported that they felt that they were all learning from each other.

A common comment among student teachers concerned how they worked together in the classroom as a team. Mentor teachers, full time student teachers and part time student teachers often met after class to plan future instruction and brainstorm who could do what. Having two student teachers in the classroom, along with parents and other adults, provided a lot of opportunities for student teachers to experience classrooms in which everyone collaborated to facilitate learning among a very diverse student body.

**English learners**

This particular school had a diverse student body. Over three quarters of the student body were minority students (mainly Latino), and over half of the student body were English learners (see table 1). This was an excellent environment in which student teachers could learn how to effectively educate English learners. However, abilities to assess student needs, develop lessons and materials that make content more accessible, and instructional strategies and skills to effectively teach English learners were not easily developed, and frustrations with accommodating English learners were commonly expressed.

Table 1
Student Demographics at the Student Teaching Site
At the university, student teachers learned about different stages of second language and literacy proficiency levels and general techniques on how to accommodate English learners, but in real life, teacher candidates reported that they found that it was not so straightforward. Students in their classes differed greatly in many different areas, besides second language and literacy proficiency, that affected academic performance, such as first language and literacy proficiency, family background and parents’ levels of education, prior experiences, prior education, personalities, attitudes, learning strategies and skills, prior development of content knowledge, amount of vocabulary, and more. Some of the students had high levels of basic interpersonal communication skills (BICS), which misled some student teachers into thinking that these students could handle well the lessons that the student teachers prepared and taught, but found that these students had many difficulties in comprehending the lesson and participating in group work due to their low levels of cognitive academic language proficiency (CALP). Also, some students performed well in math, but did not do well in other subject areas that were more language intensive, such as social studies and science. Some student teachers stated that the English learners in their class had a difficult time with understanding the “abstract” concepts that they were teaching in these subject areas.

Despite these frustrations and problems, student teachers gained a lot of experience in developing instruction to meet the varied needs of all the students. Though frustrated at times, the student teachers realized the need to differentiate instruction for not only language proficiency levels, but also levels of prior content knowledge, learning skills and strategies, and other ways that students varied. In the beginning of the terms, some student teachers had looked for quick and easy techniques to accommodate English learners and other students, but soon found that there were no quick and easy solutions. Mentor teachers, peers, and university faculty helped the sometimes overwhelmed student teachers further develop and practice the instructional skills and strategies needed to
accommodate the varied needs of English learners and other students, such as adapting
texts, using visuals to contextualize content, incorporating native language resources,
pairing and grouping strategies, and more. Many of the student teachers expressed the
need and desire to learn Spanish to help in their teaching and in their communications with
parents. Student teachers found that through these techniques, some English learners who
rarely participated during the lessons began to raise their hands and share their thoughts,
and that student comprehension and understanding of stories and content increased.

Throughout the term, student teachers had many opportunities to try out instructional
strategies and find out which worked and which were not so successful. For example, one
student teacher tried grouping strategies to utilize peer scaffolding and support to help
English learners, but then realized through observation that some students in some groups
would end up doing the majority of the work while others participated little in the tasks
and work. She realized that students sometimes needed specific roles or jobs that allowed
students to take advantage of their strengths to contribute to the group process and work.

In short, student teachers found that not taking needs and strengths of various students
into account while developing lessons ended up with some students getting it while others
were not engaged at all. Student teachers found that they needed to develop a repertoire of
strategies to engage all students in their lessons and activities.

Classroom management

Classroom management was also a major concern among all the student teachers. This was
one area in which student teachers felt the least prepared. Some felt that classroom
management was the hardest part of their student teaching, and that classroom management
and behavior issues were not a separate entity, but intimately connected to how effective
their lessons were and how students learned. They reported that their classrooms would
become chaotic at times. Issues that student teachers reported that they had to deal with
included organizing and pacing lessons, setting boundaries, using their voice effectively,
offering consequences and positive reinforcement opportunities, and others.

Student teachers found that classroom management was something that they had to
consistently work on and reflect upon. A lot of discussion with peers, mentor teachers, and
faculty focused on strategies and tools that they could use to more effectively manage their
classrooms and make the environment conducive to learning without the distractions and
problems that inevitably would arise. Student teachers reflected on what worked and
didn’t work, and worked to develop classroom management skills.

Throughout the term student teachers reported on not only the problems they faced, but
what they learned and their successes. Many began to feel more comfortable in setting
boundaries and other strategies, began getting more respect from students, and finding
that their classroom environments and communities became more conducive to learning.
In spite of these experiences and successes, student teachers complained that though
classroom management was really very important, hardly any courses spent sufficient time
on classroom management. Many stated that they think that more attention should be
given to classroom management in the preservice program. However, overall, they realized
that classroom management strategies and tools were not only something to be learned in their course, but also something that need to be acquired through experience in the classroom.

Caring Teachers and Character Values Instruction Make Significant Impacts on Student Achievement in Two At-Risk Inner-City Middle Schools

Submitted by:

Karen E. Washington, Houston ISD.
June M. Giddings, Houston ISD

Abstract

Many symptoms of character degeneration in our urban schools have been indicated by the high incidence of fights, bullying, suspensions, youth gangs, and generalized display of disrespect, verbal abuse, and physical assault of teachers by students. Without a school-based character-values intervention, many of today’s inner-city children may be lost to the values of the drug culture, gang culture, television shows, and movies of violence or abuse.

The Houston Partnership for Character program was a school-based character education program that sought to improve student achievement by enhancing: a) teacher levels of caring and fairness; and b) student levels of caring and honesty. Two Houston ISD middle schools, which effectively implemented the HPC model in 2006-07 and 2007-08, were selected for this assessment of program effects. Through a carefully matched-pairs method, based on socio-economic status, ethnicity, gender and baseline reading scores, two cohorts of 6th grade students from the two intervention schools and a comparable non-participating middle school were monitored over a two-year period and used in a quasi-experimental assessment of program effects.

Results of the assessments indicated that all of the two HPC schools achieved higher and statistically significant Teacher Caring levels, with effect sizes of 0.10-0.54, and Teacher Fairness levels, with effects sizes of 0.74-1.00. The HPC students also achieved statistically significant gains: i) in levels of Caring (effect sizes of 0.41-0.64), and in Honesty levels (effect sizes of 0.59-0.72); and ii) in reading and math, with effect sizes between 0.20 and 0.45, and percentile values ranging from 8 percentile units (58th in Reading) to 17 percentile units (67th in math), higher than that of the comparison group.
Introduction

As the nation’s urban middle and high schools grapple with the provision of significant learning experiences for their students, many educators seem to have overlooked the vital role a school-based character education program could play in improving not only students’ character values but, more importantly, their academic performance levels (Berkowitz, 2006; Etzioni, 2008; Hunter, 2009; Winton, 2008). The increasing numbers of absentee-parents, emotionally distant or preoccupied parents, fatherless homes, less-stable marriages, step-families, and the subsequent lack of adequate “quality” and “quantity” time between children and parents, have increasingly relegated character-values education for children from parents to the mass-media, especially television, the internet, and children’s neighborhood peers (Popenoe, 1996; Sanchez, 2004). One can envision the adverse impact on children, of television shows and movies in which disagreements, conflicts, and sour relationships are often resolved though violence, physical abuse, and verbal abuse.

Without a school-based character-values intervention, many of today’s inner-city children may be lost to the values of the drug culture, gang culture, television shows, and movies of violence or abuse. Many symptoms of character degeneration in our urban schools have been indicated by the high incidence of fights, bullying, suspensions, youth gangs, and generalized display of disrespect, verbal abuse, and physical assault of teachers by students (Sanchez, 2004; NCES, 2009). One wonders why some students feel unsafe at school, dropout of school, commit crimes and get incarcerated, or why all of the nation’s inner city K-12 institutions now have their own police departments and building-level video-surveillance systems; and, among other factors, why the overall academic performance levels in inner-city schools are lower than they are in private and parochial K-12 schools, where high student discipline is the norm.

Houston ISD’s pioneering effort in urban school reform pertaining to character education dates as far back as the early 1990s, when it initiated K-12 character-values education. However, the integration of character values into classroom instruction began with a United States Department of Education’s Partnerships in Character Education Program (PCEP) grant in 2002. The success of the initiative led to the emergence of a comprehensive model, the Houston Partnership for Character (HPC) Program, which received a second PCEP grant in 2006-07. The research objectives that guided the evaluation of the program were: i) to determine the extent to which the HPC program strategies were implemented; and ii) to assess the extent to which the HPC program increased the caring levels of participating teachers and students, as well as the honesty and academic achievement levels of participating students.

Research Procedures

Study Design and Sample

A quasi-experimental two-group pretest-posttest design was used for this assessment of program effects or effectiveness. To facilitate baseline equivalence between the program students and the experimental comparison students, two levels of baseline matching were undertaken. First, a comparison middle school, with similar institutional and community demographics and academic performance levels was selected for the two HPC middle schools (Table 1). Secondly, for each HPC student a student from the comparison school was matched on free lunch status, ethnicity, gender, and sixth grade Stanford Achievement Test reading scores. This cohort of matched pairs was followed for two years, from 6th to 7th grade (2006-2008).

As a result of a mix of sample mortality factors such as student retentions, mobility, and cohort students who did not complete the baseline survey in sixth grade or the post-survey in seventh grade, the sizes of the match-paired cohorts experienced considerable declines: HPC-MS-1, from 173 students in baseline year to 102 in 2007-08, and HPC-MS-2, from 290 students in baseline year to 108 in 2007-08. Furthermore, while some of the intervention students who completed both surveys could not be included in the matched-pairs analysis because of their lack of Stanford Achievement reading and math test scores, others could not be included because of the loss of their pair partners, unless an appropriate substitute pair could be identified from the comparison pool of students. Consequently, the numbers of HPC 6th-7th grade cohort students with both baseline and second year survey data, Stanford test scores in both reading and math, and matched-pair partners, decreased in all HPC schools.

Data Collection Instruments

Two instruments were used for collecting relevant data for the study. The Stanford Achievement Test-10th Edition, a national norm-referenced test, was used for the assessment of program effects on student performance levels in reading and math, while a 60-item HPC Summative Assessment Student Survey (SASS) instrument was used for the assessment of program effects on Students’ Caring levels and Honesty levels, Teacher Caring levels, and Teacher Fairness.
levels. Students’ sixth grade fall semester SASS data and sixth-grade Stanford NCE scores in reading and math were used as baseline data in the study. A factor analysis of baseline SASS data involving 4,000 students was used for the instrument’s reliability assessment which yielded Cronbach alphas of between 0.7413 and 0.8679 (e.g.: Student Caring, \( \alpha = 0.7514 \); Student Honesty, \( \alpha = 0.7413 \); Teacher Caring, \( \alpha = 0.8679 \); and Teacher Fairness, \( \alpha = 0.8437 \)).

Each of the factors was aggregated from multiple items from the SASS instrument. For example, the Teacher Caring factor had 10 SASS items including the following: Teachers in this school really care about me; Teachers encourage students to be friendly and kind to each other; Teachers in this school do not give up on students and do the best they can to help all students to succeed; Teachers try their best to protect and defend students who are picked on by others; Teachers do not get angry or rude when students make mistakes; Teachers listen to students’ ideas, even if they don’t agree with them; and Teachers treat parents with respect.

**Data Analyses**

If the evaluation design had used a random assignment of subjects’ framework, the high sample mortality rates among the participating schools could have undermined the integrity of the study. But with the use of a matched-pairs design, the integrity of the findings remained strong, even though the findings could not be generalized to the entire baseline population of students. The findings could be based on the students in each of the participating schools who had all the required data. And, to ensure that minor baseline differences between the matched-pairs intervention students and the comparison group students were eliminated, an Analysis of Covariance (ANCOVA) model was used, which facilitated an assessment of program effect sizes, and the subsequent conversion of effect sizes into percentile values.

**Implementation of the HPC Model**

**The HPC Program**

The Houston Partnership for Character Model was a comprehensive school-based character education program that used a collaborative framework involving school administrators, teachers, parents, and the entire “village” of leaders, higher institutions, and business organizations in the community. Major components of the model included: a 6-Step Character Infusion Process; school-wide display of character-values’ banners and other artifacts in strategic locations; Writer Trainers, who trained teachers and facilitated the full implementation of the classroom infusion process; a University Trainer, who trained pre-service teachers in participating local universities; a Parent Trainer, who trained and engaged parents; and a Character Education Coordinating Board (CECB) that oversaw, not only the needs of the program, but also the campus-based Character Education Advisory Councils in all of the participating schools.

The 6-Step Character Infusion Process involved the: 1) identification of the district mandated instructional objectives; 2) linking of the targeted objective to real world experiences of the students; 3) selection of a pertinent core/character value; 4) determination of the relevance of the selected core value to one or more of the following: business/economics, politics, society, environment, etc.; 5) selection of an instructional strategy capable of engaging the attention and participation of the students; and 6) summarization of the mandated instructional objective and assessment of the extent to which the objective was achieved. The process was not an additional curriculum but rather a practice that allowed teachers to spend some time helping students to
internalize character values as an integral part of daily instruction. The process enabled teachers to infuse character values such as: honesty, respect, caring, trust, and fairness into instructional activities. It facilitated enhanced student engagement, group discussions, role playing, problem solving, and required teachers to demonstrate these values in their dealings with students.

**HPC Implementation**

All of the teachers in each of the program schools participated in the HPC’s Character Infusion Workshops during the first year. There was also full teacher participation in follow-up refresher sessions during the second year. Post assessments of the teacher workshops showed considerably high levels of teacher knowledge about character education and the infusion process. With an overall average rating of 3.5 (on a Likert Scale of 0-4), teachers in participating schools indicated high levels of confidence in their ability to implement the program in their schools and classrooms (HPC-MS-1, 3.3; HPC-MS-2, 3.6). Ninety one percent of the teachers rated the sessions as effective, with an overall effectiveness rating of 3.63, (based on a 4-point scale), the training sessions were also perceived to be very effective.

In support of the teacher training sessions and school-based infusion efforts, the program’s Parent-Trainer also worked with parents and organized workshops to increase parental involvement and improve parental confidence and support of the program. For two years, the participating teachers integrated the 6-Step Character Infusion process into their instruction.

One of the program’s middle school math teachers described how he integrated two character values, “honesty” and “trust,” into his math class on “interest rates.” After he had discussed the technical aspects of how interest rates are calculated, he explained to his students how the rate of interest banks charge on car loans and home mortgage loans vary from one loan recipient to another. He went on to explain how the rate is based on an individual’s credit report/rating, of which people who are honest and can be trusted with honoring their promises in paying bills regularly and on time (i.e. people with good credit) receive lower interest rates, while those who do not pay their bills on time or fail to pay their bills (i.e., people with bad credit) receive higher interest rates on their loans.

The teacher then provided a scenario where two loan seekers, one with good credit, and the other with bad credit obtained home mortgage loans of the same amount but the one with good credit received a much lower interest rate than the rate received by the person with bad credit. The students were later instructed to calculate the monthly payment amounts of the two loan recipients, and were stupefied by the realization that the person with bad credit would pay over $100,000 more than the person with bad credit, by the end of the 30-year loan payment period. It then dawned on the students how being honest, trustworthy, and responsible in ones dealings with others, provide tangible rewards and benefits. The teacher went on to describe how his class was so enlivened and engaging that one student who hardly talked in class revealed to the class how he then understood why his mother had instructed him to obtain the family home phone in his name, rather than hers, because of her bad credit record.

HPC’s Writer-trainers visited the classrooms of participating teachers to observe the implementation of the HPC’s 6-Step Character Infusion Process/instructional strategies. By the end of the second year, 70% of the targeted teachers had been observed and rated on a 3-point scale (1=Poor; 2= Average; and 3=Master Teacher) to determine teachers who needed extra training support or instructional modeling. In the 1st year, the 6th grade teachers and classrooms
were targeted, while in the 2nd year the 7th grade were targeted. An end-of-year survey of the effectiveness of the follow-up support services revealed high ratings among the participating schools of between 64% and 90%. An end-of-year survey of the HPC teachers in spring 2008 further indicated a high level of integration of CE instructional strategies into daily lessons (i.e.: HPC-MS-1, 64%; HPC-MS-2, 78%). In effect, the implementation of the program was substantively effective, with the infusion of character values in daily instruction, creation of visual effects through banners and posters on classroom, gym, cafeteria, and hall-way walls.

**Findings**

**School Environmental Quality: Program Effects on Teachers**

As a school-based program that hinges on the ability and willingness of teachers to model the targeted character values and also integrate the values into classroom instruction, an assessment was made to determine the extent to which students had seen changes in their teachers’ Caring levels, and Fairness levels. As discernible from Table 2, the Caring levels of teachers in the two intervention schools were substantially higher than they were in the comparison school.

</table>

* Significant: p<0.05; ** The average post-test score of the Non-SLC group was equated to 50th percentile in order to determine the percentile position of the average score of the HPC groups.

The differences were statistically significant for the two HPC schools, and reflected effect sizes of 0.10 (HPC-MS-2) and 0.54 (HPC-MS-1) for Caring levels and 1.00 (HPC-MS-2) and 0.74 (HPC-MS-1) for Fairness (Cohen, 1988). The conversion of the effect sizes into percentile values demonstrated the magnitude of HPC impacts as indicated by HPC’s average scores of 54th (HPC-MS-2) and 71st (HPC-MS-1) percentiles for Caring and 71st (HPC-MS-1) and 84th (HPC-MS-2) percentiles for Fairness, compared to the 50th percentile for Caring and Fairness levels of teachers in the comparison school.

**Changes in Students’ Character Values**

As shown in Table 3 the HPC students gained substantially in levels of Caring and Honesty, relative to the levels that were achieved by students in the comparison school. These gains by students in the two HPC schools indicated statistically significant differences in levels of Caring
and Honesty that could be attributed to the HPC program. The impact of the program on the two character values enabled HPC-MS-1, for example, to achieve effect sizes of 0.41 in Caring levels, and 0.59 in Honesty levels, while HPC-MS-2 achieved effect sizes of 0.64 in Caring levels, and 0.72 in Honesty levels. All of the HPC schools therefore achieved higher percentile levels than their comparison school’s 50th percentile values for both Caring and Honesty.

Program Impact on Student Achievement

As evident in Table 4, all of the HPC schools outperformed their comparison peers. The performance differences were statistically significant (p<0.05), with effect sizes between 0.20 and 0.45, and percentile values ranging from 8 percentile units (HPC-MS-2, 58th in Reading) to 17 percentile units (HPC-MS-1, 67th in math), higher than that of the comparison group.

Discussion

This study has revealed the substantive effectiveness of the Houston Partnership for Character program in generating: (a) improvements in teachers’ Caring and Fairness levels; (b) improvements in students’ character values (i.e., Caring and Honesty); and (c) improvements in student achievement in reading and math. The teachers in both HPC program schools achieved significantly higher Caring and Fairness scores than their matched comparison peers. And, with such teacher improvements, it seems unsurprising that students in the HPC program schools achieved higher Caring and Honesty percentile scores than their matched comparison peers, with statistically significant score differences also in reading and math. These findings demonstrate a strong and pervasive association between character education programming and student achievement, as has been previously observed by many educators (Etzioni, 2008; Tully, 2009).

The incremental validation that the two program schools add to the demonstrated effectiveness of Houston’s character values program is substantive. In addition, the fact that these two schools achieved higher performance levels than their comparison school lends credence to the great potential that character values education has in enhancing student achievement. Educators in urban schools with significant achievement challenges may carefully consider adopting values education models such as the Houston Partnership for Character program. Even though the case for schools to assume the responsibility for infusing character values in the youth of today has been advocated by many concerned educators in recent years, the leaders of the nation’s schools have seemingly not given the issue much attention. As observed by Tony Sanchez, we “cannot expect our students to develop good character through wishful thinking or hope that someone else will do it”…. otherwise “the media will continue to step forward as the most influential institution” in the development of character values of the nation’s youth (Sanchez, 2004).
Acknowledgements

The authors are grateful to the principals of the participating schools for enabling the collection of all pertinent data for this study. The authors also thank the staff of the Houston ISD Character Education Department for their contributions to this study. Even though the generation of items and scenarios for the character values survey instruments was a collaborative effort between the researcher and the program staff, the ideas were based on ideas from books, past conference presentations, articles, and surveys on character education; and to all who were the original sources of those ideas, the authors are thankful. This evaluation was funded by the U.S. Department of Education through the Partnerships in Character Education Program (Grant Award Number: Q215S060006).

Portfolio Assessment as a Tool for Promoting Professional Development of School Principals: A South African Perspective

Raj Mestry¹ and Michèle Schmidt²

Abstract
Poor matriculation results in South African urban schools have resulted in the implementation of professional development programs for principals who wish to improve their qualifications and practice. This article studies principals’ perceptions of the efficacy of using portfolios to assess their professional growth. Using a poststructural lens to theorize portfolio use, interview data were examined to discern what themes consistently evolved when principals were engaged in self-evaluating their own professional practice through a methodological framework of portfolio development. The findings revealed insights into the efficacy of the use of professional portfolios in the professional development of principals.

Introduction

Immediately following the democratic transformation in South Africa in 1996, its education system was characterized by fragmentation, inequity in provisions, a crisis of legitimacy, and the demise in the general academic culture. These conditions, found mainly in urban school settings, were further exacerbated by teachers belonging to militant unions and consequently resisting the new government’s incipient attempts to replace the old system. This inevitably created serious managerial problems which ultimately led to the deterioration of educational standards (Gallie & Sayed, 1997).

According to Ramphele (1997), attempts by the South African government to transform the grossly inequitable and inadequate school system failed to materialize into sound practice. The South African Council of Educators’ (SACE) Chief Executive Officer, Brijraj (Naidu, 1998), stated that the factors responsible for poor matriculation included a breakdown of professionalism by principals and teachers, lack of resources at schools, and apathy toward education by students and their communities. Matseke (1998) in Top Principals Make Top Schools, focused on the crucial role of principals in the learning and teaching process to foment change in contemporary schools. Naidu (1998) reported that there is an acute situation making it necessary to train and develop the principals of urban schools. Preparing principals properly could serve to manage organizational structures and other facets of administrative development effectively to develop improvements in the quality of learning.

This article maintains that the professionalization of the principalship through the use of professional portfolios is potentially a critical ingredient in principal programs not only in South Africa’s (SA) education context but also the United States and elsewhere. Although this article draws from data gathered in SA, implications for other nations will be discussed with the intent of emphasizing the universal importance of professional portfolios in other urban contexts. With this in mind, we will explore the potentials of portfolio use in a principal preparation program as a professional training tool for principals by theorizing the professional portfolio to explore the principals’ perceptions of their use of professional portfolios. This will include research into the benefits and challenges of portfolio use for professional purposes.

The following research questions helped to frame the study: What are the principals’ perceptions of portfolios as a tool for promoting their professional development in urban South African schools? What challenges/benefits did the principals experience in their use of professional portfolios?
Context of South African Leadership

A lack of stringent criteria and the absence of a qualification for the appointment of principals resulted in many principals underperforming in their leadership and management roles (Bush, 2004). Currently in SA, there is still no standard principal preparation or certification program. Instead, each of the nine provincial departments determines its own approach and course content (mostly in-service programs) but none has a prerequisite program or licensure requirement. In addition, some provincial departments lack the capacity to implement in-service programs. To provide principals with the necessary knowledge, skills, values, and attitudes to lead urban schools effectively has become increasingly problematic in relation to the challenges faced by a dynamic and changing educational culture.

In an attempt to address these deficiencies, the National Department of Education embarked on an intensive and continuous professional development program for appointed school principals and those aspiring to become principals (Department of Education, 2006). Of particular interest to the South African Ministry of Education is the call for preparedness to face the increasingly protean nature of education. This would include the need for principals to engage in continuous professional development if they are to meet the expectations placed upon them in South African schools.

Advanced Certificate in Education

To ensure suitable candidates are appointed as principals in SA, a new entry requirement recognizes those principals who obtain the Advanced Certificate in Education (ACE)—Principalship course or an equivalent of the National Professional Qualification for Principals. Other countries are also turning to more formal Principal Certificates in a climate of reduced recruitment and retention in the principalship such as Singapore, the United Kingdom and the United States. (Quong, 2006). In the United States, for example, a teacher is eligible to apply for the principal’s post once he or she has completed the Master of Educational Administration degree (Tucker & Codding, 2002). In the United Kingdom, teachers must first become senior teachers or deputy heads and work with the principal as a member of the senior management team for a minimum of 5 years before they can apply for “headship” (or principal) posts (Weindling & Dimmock, 2006).

For the purpose of this article, the authors examine the implications of the portfolio assessment component of a principalship program in SA keeping in mind that these implications are far reaching and relevant to other urban
centers in the United States and elsewhere. In the past 4 years, the University of Johannesburg\(^1\) has piloted a 2 year part-time ACE Principalship program. This program was designed to develop an institutional ethos, promoting professional and lifelong learners, with the goal of addressing leadership and management issues prevalent in schools. During this period, the University refined the contents of learning materials, improved delivery at contact sessions and cohort meetings, and revised its assessment strategies. The cohorts identified to undergo in-service training at the University were comprised mainly of principals and deputy principals of underperforming urban schools in the Gauteng Province. The program was designed around module instruction in leadership and management, particularly from a South African perspective, and with an emphasis on pedagogy, learning, finance, human resources, educational law, and policy.

One of the goals of the ACE program was to provide prospective leaders a sound knowledge base and rigorous intellectual experience that would equip them to harness human and other resources necessary to ensure highly effective educational institutions. It would then be expected that principals would develop insight into aspects dealing with school improvement, assessing school needs, shaping the strategic direction of the school, improving quality teaching and learning, implementing legislation and policy issues related to school education, empowering staff, and actively engaging themselves in school development. Although it is beyond the scope of this article to evaluate whether these goals were achieved, our interest was limited to an examination of four principals’ perceptions of their use of portfolios to improve their practice and to determine the benefits and challenges of using portfolios.

**Professional Portfolios**

Traditionally, the most common use of professional portfolios has been in teacher education programs. Teacher portfolio use has had a relatively short history, dating back to the 1980s, as a result of work done by Shulman (1998). This assessment tool most commonly serves as a professional development opportunity to enhance teachers’ practice, for purposes of portfolio-based teacher appraisals; in teacher education programs, and for purposes of teacher professional development (Zeichner & Wray, 2001). Since the success of teacher portfolios as an assessment tool is well documented, it provides a wealth of knowledge and insight into teacher education programs as well as the diurnal teaching process. In fact, some states in the United States mandate the use of professional portfolios for teacher accreditation purposes (Zeichner & Wray, 2001).
In contrast, only recently, principal professional portfolios gained recognition as a legitimate tool for principal professional development resulting in mixed success (Marcoux, Brown, Irby, & Lara-Alecio, 2003). Nevertheless, there exists a growing number of principal preparation programs affiliated with universities or school districts in the United States, as well as internationally such as Australia and SA, some of which employ professional portfolios. Not surprising, the literature on professional portfolios for principals remains limited, under theorized, emerging primarily from the United States. In light of these limitations, scholars (e.g., Johnston & Thomas, 2005), suggest that more research is needed to highlight what may be described as a paradigm shift in the preparation of principals entering the 21st-century. This shift is characterized by current perspectives on the assessment of learning in higher education that focuses on assessment that is significantly different from traditional practices. Furthermore, this change is based on, among other things, an understanding of how principals learn; how individual differences in learning can be accommodated; how to provide meaningful feedback of principals’ learning as well as opportunities to reflect upon their learning and practice; and how to develop outcome-based learning facilitation, curriculum, and module design (Johnston & Thomas, 2005).

Specific to this article, when taking the South African situational and historical context into consideration, the authors have shown great interest in such alternative assessment strategies for the purposes of providing training for principals in SA. The lead author, as the assessment coordinator of the Department of Education Management at the University of Johannesburg in SA, had the opportunity to initiate an in-depth study of professional portfolio assessment that could be applied to practicing principals and deputy principals in the ACE program. This study served as the impetus for this article.

As researchers, we realize that there is enormous pressure to have systems of assessment that are reliable, efficient, and cost-effective. At the same time, we are cognizant of the potentially conflicting needs to develop assessment systems aligned with current thinking on learning theories and the close relationship between types of assessment and the nature of learning (Johnston, 2004). The pitfalls of subjecting principals to traditional methods of assessment such as examinations in professional programs may result in high drop-out and failure rates, apathy in learning, limited curriculum coverage, and undue stress among principals and faculty members (Hyde-Clarke, 2005).

The rationale, then, and some of the positive outcomes for using professional portfolios include the fact that they encourage principals to think more deeply about their leadership and management practice, raise awareness of principals to be conscious of the theories and assumptions that guide their
practice, and stimulate principals to develop a greater desire to engage in collaborative dialogues about their practice (Zeichner & Wray, 2001). These outcomes are particularly desirable because the process of developing portfolios requires active and self-directed learning and reflection, all of which occur when principals invest physical and mental energy when undertaking activities that are intended to make learning meaningful (Du Plessis & Koen, 2005).

**Professional Portfolios as a Theoretical Tool**

To this point, we have done little in the way of examining professional portfolios within a theoretical context, which inevitably impacts their practical implications. Uses of portfolios are widespread and most prevalent in the United States in areas of higher education such as medical education (Challis, 1999), school and university teacher training (Baume & Yorke, 2002), writing (Broad, 2000), engineering (Payne, Bramhill, Lawson, Robinson, & Short, 1993), architecture, and art and design (Johnston, 2004). Portfolios take many forms (a report on a major project, a collection of different pieces of work) and have different purposes (to showcase performance, track developmental growth); provide records of goals, growth, achievement, and professional attributes developed over time in professional practice and in collaboration with others; and serve as an assessment strategy to ascertain knowledge, understanding, and skills (Challis, 1999). Not only are portfolios an effective way of determining the progress of principals or teachers, they are also useful for instructors of programs to evaluate teaching strategies and curriculum. Given the widespread, growing and varied use of portfolios in higher education, it is important that research findings are examined and critiqued more than they have been traditionally (Johnston, 2004).

**Portfolios as Technology**

While limited writings have attempted to theorize portfolios (e.g., Johnston, 2004), assessment in general, and portfolios specifically, are viewed as a technical activity, lacking “theoretical and philosophical contextualization” (Delandshere, 2001, p. 114). In a climate of neo-liberalism, globalization, marketization, and accountability, assessment as a technology garners critical currency in our turbulent postmodern society, particularly as a means to determine social mobility (Delandshere, 2001). Yet, such a worldview has limitations. For example, in the United States, standardized, large-scale assessment has gained an unprecedented popularity since the 1970s and continues to be debated more than alternative assessments, yet alternative assessment²
strategies tend to be more meaningful—one of these strategies being the professional portfolio (Hargreaves, Earl, & Schmidt, 2002).

When theorizing alternative assessment in general, advocates (such as Black & Wiliam, 1998; Hargreaves et al., 2002), claim that while large-scale, legislated assessment often receives the greatest attention, alternative forms of assessment matter more, since they have the capacity to provide deep and meaningful learning. Yet, what is critical is that alternative assessment strategies, (for instance, portfolios), are not ends in themselves, nor should they be perceived that way, since they embody a continuous process of learning.

As we begin to theorize professional portfolio use for the purpose of analyzing our own data in this study, we begin to see some of the problematics attached to alternative assessment. For example, as mentioned above, a technological perspective of assessment typically prevails and highlights the challenges of gaining validity and reliability with any type of alternative assessment (portfolios not excluded) (Hargreaves et al., 2002). In fact, depending on the theoretical lens used to ground professional portfolio use, such a lens determines different challenges and assessment outcomes in terms of the portfolio’s trustworthiness, reliability, and usefulness. For example, when viewed from a traditional psychometric perspective, reliability, and validity issues are difficult to determine when portfolios become a platform for narrative or journal accounts based on subjective interpretation (Johnston, 2004). It is for this reason that some scholars, (such as Snadden & Thomas, 1998), suggest more open-ended approaches to assessment that do not rely solely on scientific benchmarks and criteria. Efforts such as these are often controversial, since assessment in general is typically undertheorized in this approach. Yet it is this paradigm in which we are most interested. By shifting the focus of portfolio use away from merely a technical task, scholars, and principals alike are challenged to explore more innovative ways of thinking about learning and assessment, often resulting in acceptance or resistance to its use (Engel, 1994).

Theories of Portfolios Beyond Mere Technology

When moving beyond a technical examination of portfolios, interpretive, critical, and poststructural critiques reveal that portfolio use becomes a sociopolitical practice (Johnston, 2004). This challenges the technical grand narrative and notions of power that often favor particular populations (Giroux, 1992). Through other such theoretical lenses, it is possible to focus on principals’ reflective and unique constructions as well as diverse interpretations of their experiences with an emphasis on local context. Portfolio use
becomes fair and sensitive to the differences among men and women, race, class, and age because it reflects diverse illustrations of learning and accomplishments whereas diminishing the focus on comparisons of worth among principals (Johnston, 2004). Individual portfolios become a distinct and valued artifact with the potential to capture and reflect growth and shifts in principal identity. More importantly, portfolios have the potential to reflect professional growth for principals (Hargreaves et al., 2002). In essence, portfolios value holistic, integrative interpretations; context-bound knowledge; values and judgments of both the principals and their assessors; and multiperspective, dialogic exchanges between principals and assessors (Darling, 2001).

The apparent benefits of portfolios aside, it would be folly to ignore some of the more problematic debates surrounding the use and assessment of portfolios and other alternative forms of assessment. For example, portfolios are often described as a form of authentic assessment. While authentic assessment is often viewed as a useful form of learning and assessment (Hargreaves et al., 2002), it also becomes problematic because such assessment “may be diverse, wide-ranging, negotiated, inclusive, and multi-faceted”, which is “precisely why it cannot be authentic in this very sense of the term” (p. 89). Consequently, portfolios run the risk of resulting in products that are more contrived than authentic. Principals might select only what they believe reflects their achievements but ignore any problematic areas. This could result in glossy, artistic portfolios lacking authentic substance but are spectacularly adorned, the product of personal fawning, narcissism, self-indulgence, and hypocrisy (Hargreaves et al., 2002). In other words, “portfolio assessments can simulate rather than stimulate achievement” (Hargreaves et al., p. 90).

The very nature and quality of portfolio assessments highlight the problem in the way in which professional portfolios are conceptualized and implemented, and their value as an assessment and/or professional development tool (Zeichner & Wray, 2001). Although professional portfolios may potentially be good in theory, the practical benefits can really only be established by determining the perception of those using and assessing portfolios. Herein often lies some of the controversy attached to professional portfolios from a theoretical and practical perspective (Johnston, 2004).

In attempting to reconcile the tensions between viewing portfolios as authentic and technical assessment tools, Shepard (1991) offers a useful definition that is most plausible for our purposes when dealing with issues of reliability and validity. She suggests, “the assessment tasks themselves are real instances of estimators of actual learning goals” (cited in Bateson, 1994, p. 235). Therefore, instead of relying on traditional test items to prove
competence in a specific domain of achievement, assessment tasks (e.g., portfolios), actually become the domain of achievement, thus eliminating the need for interpretation or verification of an outcome. In other words, by virtue of its existence, the portfolio and its contents, become valid and reliable. By taking this approach to portfolio use, it becomes possible to not only respect the integrity of the author but also the contents of the portfolio since portfolios can take on a variety of roles in a variety of circumstances.

At the same time, it is important to bear in mind that, while superficially, portfolios might profess equality, scholars posit that equal does not mean the same. Instead, equal means that all principals have an opportunity to become passionately involved in their work, to explore ideas in-depth, and to be evaluated according to both the product they create and the process they go through to create it (Johnston, 2004). As principals therefore, move further away from the folk knowledge of testing as being depicted as the sole source of knowledge, that is, where the language of psychometrics translates validity to mean good, what begins to be gained is the linkage between these measures and the subjects’ history. In other words, more emphasis begins to be placed on the humanistic aspect of portfolio use and the individual thoughts and learning they reflect (English, 2003). Trevisan (1991) echoes this sentiment by stating that portfolios are able to capture learning in ways that standardized tests cannot.

Despite the arguments set out above, debates continue around authentic assessment, (portfolios included), all of which is beyond the scope of this article. However, some other salient tensions surrounding portfolio use as they are critiqued include the following: their time-consuming nature in which they have been described as prisons of time (Hargreaves et al., 2002), specific skills are required for their use, and the questionability of attaining some sort of quality assurance so that they are not mere work folders/scapbooks (Hargreaves et al., 2002). Shavelson and Baxter (1992) stress that “short-circuiting th[e portfolio] process leads to ill-conceived and poorly constructed [portfolios]” (p. 23). Bateson (1994) points out that realities such as the above become challenging when there are few exemplars from which to work, particularly when these assessments (in this case, portfolios), are intended to capture the unique, diverse nature of principal learning and reflection.

**Method**

This qualitative study was designed to capture the perceptions of principals who were enrolled in the ACE program, with regard to portfolios as a tool for promoting professional development in South African urban schools and to
explore the challenges/benefits experienced by these principals in their use of professional portfolios. The study utilized in-depth individual and focus group interviews as the main data generating tools. Four principals were interviewed more than 12 weeks.

**Selection of Participants**

A purposive sample was drawn for the interview phase. Purposive sampling involved selecting principals who fit the criteria of desirable participants based on their experience or knowledge (Merriam, 1998). The total target population was 94 principals in the Gauteng Province who completed the ACE program at the University of Johannesburg. Of this total population, four principals were interviewed in this study and a total of 12 interviews were conducted.

**Participants**

The participants were comprised of 2 men and 2 women between the ages of 32 and 53; their teaching experience ranged from 12 to 20 years. Principal A, a White male was principal of an urban school comprised primarily of Black students and a few White students with special needs. Principal B, a Black female managed a combined school situated in the residential area of Soweto, which is the largest Black township in the country. Principal C, a Colored female headed an ex-Model C primary school located in an urban area west of Johannesburg and finally, principal D, a Black male was principal of an urban primary school situated in the north-west of Johannesburg.

**Data Collection**

While both individual and focus group interviews were conducted, the individual interviews comprised not only questions about portfolios, but also other questions about the ACE program in general. On the other hand, the focus group interviews were dedicated solely to the principals’ experiences with portfolios. Both interview styles were characterized by open-ended questions. The aim was to acquire an understanding of the principals’ perceptions of their experiences with portfolios (such as how portfolio assessments were conducted); and to learn about the challenges and benefits when using portfolios.

All interviews were audiotaped and transcribed to enable careful review by the researchers. To gain reliability for the study, the principals were interviewed
once every 4 weeks. Since the discursiveness of the interviewer-interviewee interaction fluctuates over time and through events, it was deemed that this form of triangulation was critical. Research methodologists emphasize this technique, especially in the absence of other data sourcing (Kvale, 2002).

Since the lead author was closely involved in the ACE program in which the principals were using portfolios, it became incumbent that the authors be cognizant of the benefits and potential bias of this individual’s involvement. We understand that the researchers and the respondents bring along “biases, predispositions, attitudes and physical characteristics” that may influence data either positively or negatively (Merriam, 1998, p. 87). In this research, the researcher’s role during the interviews was to exercise caution and not to predetermine meaning (Creswell, 1994), but rather to objectively report the respondents’ values including their biases and judgments. To accomplish this, the researchers, particularly the researcher closely involved in the program, bracketed their own knowledge of the program in order to allow spontaneous responses from the participants.

Other efforts were made to ensure reliability and validity in the study. These included conducting a pilot study beforehand with five, randomly selected principals, who had already completed the ACE program. The pilot study ensured that the method of questioning was suitable by providing the researchers an opportunity to adjust questions if necessary. They also were instructed to adopt an appropriate tone and slant of questioning when conducting the interviews (Yin, 1986).

**Data Analysis**

A constant comparative method was used for the analysis of the qualitative data collected. The researchers analyzed the data to form appropriate categories and patterns of meaning. The data were analyzed for content, broadly using a grounded theory approach (Creswell, 1994; Strauss & Corbin, 1999) of open coding, to identify themes and categories. A process of axial coding was used to abstract, cluster, code, and categorize the data. Ultimately, the collated information was presented as a series of themes. The more salient themes are discussed as they relate to the research questions.

**Findings**

It became evident that the implementation of portfolio assessment as a management tool in the urban schools under study was in its embryonic stage at the University. There were also numerous contentious issues around portfolio
use that were being grappled with by the principals. The following themes emerged from the empirical research undertaken in an attempt to respond to the research questions in this study.

**Portfolio Assessment as an Alternative to Exams**

Eliminating written exams as an assessment tool resulted in heated debate among the principals in the study. In fact, most of the respondents were of the opinion that examinations should be abolished because they place undue pressure on them. Their ACE course was practiced-based and they believed that portfolio assessments were a better alternative. Since the average age of the respondents interviewed was between 40 and 50 years of age, the principals explained that at their age they could not see themselves sitting for a formal examination. The development of a portfolio was less pressure inducing, and they liked the fact that the assessment was on a continuous basis.

Principal B asserted:

> [The] portfolio is updated throughout the year. It is hands-on and very practical and it gives a person a chance to be in constant contact with the various role-players and to see if the project is on track. We don’t have to memorise and regurgitate the information, as we would do in exams.

She further elaborated that:

> If we undertake to do the project well, then what we learn during the contact sessions and our additional reading should be applied accordingly. It is just like exams… the only difference is that we do it at our own pace with very little stress and pressure.

Still, one respondent, (Principal D), felt strongly that examinations were a much fairer and unbiased means of assessment than portfolio assessments. He asserted:

> Examinations are an essential part of any form of evaluation. I feel that the ACE (program) lacks that part only. I would recommend that examinations be instituted because they are really a better means of assessment.

It is very difficult to repudiate the opinion that examinations are a much better way of assessing the competence of the candidates. Nevertheless, research indicates that traditional testing techniques still prove to be inadequate for testing practical competencies and skills, and thus necessitates the
implementation of authentic ways of assessing of students (Friedrich-Nel, de Jager, Joubert, & Nel, 2003, p. 49). It should be noted that Principal D did not take portfolio development seriously and waited until the eve of the deadline to compile his portfolio. In this case, we believe that writing formal examinations may eliminate those students who are not prepared to work with dedication, consistently, and effectively in the ACE course. We think that consistent and dedicated students will find performance (portfolio) assessment much more beneficial because they are assessed on their application of information or skills related to real (authentic) situations. The assessment method should focus on the integration of knowledge, practical skills, and the reflection of values and this is in line with student assessment in the faculty of education.

Application of Knowledge, Skills, and Values

Three of the four principals were in favor of portfolio assessment as an assessment tool. They thought it was holistic in nature and a practiced-based method of assessment providing students with a fair, valuable, and objective assessment based on predetermined criteria established in consultation with the relevant role-players such as the students, assessors, and faculty members.

Principal A remarked:

It gives the candidate a chance to apply the knowledge acquired in the contact sessions and shows evidence of what has been done, that is claims of competence. It is the best way of assessing students and giving them a chance to prove themselves.

Another principal, (Principal C), described the challenging nature of portfolio use, which forced him to reflect on his practice:

The compilation of portfolios was very challenging to me whenever I had to provide evidence to support activities that have been completed. As a manager, my ethics, values and morality were challenged markedly because it was virtually impossible for me to provide fictitious evidence to support claims of competence.

Developing Portfolios of a Good Standard

The principals encountered a serious problem in the implementation of the project. They initially found problems in drafting the project plan and formulating a general aim and specific objectives. All four of the respondents were
of the opinion that they were not provided with sufficient training in the compilation of portfolios. This was the first time that they were subjected to compiling a portfolio and because of the limited contact time with the University faculty members this aspect of the course was seen as a shortcoming. Many chose to consult with peers and those who found it difficult to meet with peers consulted faculty members telephonically.

Principal B described the situation: “There was a bit of confusion and a lack of direction in respect of portfolios”.

Another principal, (Principal C), critically remarked:

I don’t think the lecturers were sure what they wanted from us. Towards the end of the first year we heard about portfolios. One of the lecturers was assigned to explain [it] to us. In the second year, we met specifically for portfolios in June and the due date for handing in the portfolio was in October. There was very little time and...the requirements were increased [somewhat]. It [training] was rather too short. In your first year you need to be given all the theory on portfolios and in the second year you work on your portfolio as the final product for evaluation.

**Link Between Project Plan and Portfolios of Evidence**

All four of the principals agreed that there was a strong link between the project plan and the portfolio. In fact, portfolios cannot be compiled without project plans and therefore a well conceptualized project plan will determine the success of the project undertaken. The plan dictates the principal’s course of action.

Principal A described it adequately as follows:

The project plan was the map that gave me direction. By referring to the plan, I was able to keep the project on track so that at the end there is not so much deviation of my project plan from the compilation of the portfolio.

Another principal, (Principal C), asserted that:

Whatever was indicated in the project plan, for example, due dates, key personnel involved in an activity and resources available were undertaken accordingly. Yes, from time to time we were forced to revise the plan because of unplanned demands.
It became evident that the successful compilation of portfolios was dependent upon the project plan. The project was really the map that set the direction to the appropriate course of action in completing the project.

**The Role of Site-Based Evaluators**

All the respondents agreed that site-based evaluators played an important role in assessing their competence in the project undertaken. There was a mixed reaction about the role of department officials serving as site-based evaluators. Those in favor expressed their opinions by stating that the department officials have good background knowledge of their schools and would therefore be more sympathetic in their assessments. Others were of the opinion that these officials may have been more demanding and may have seen their role as inspectors rather than as part of a support system.

Site-based evaluation was an integral component of portfolio assessment and this was confirmed by the following comment by Principal C:

I don’t have a problem with IDSOs (Institutional development systems officers) being external examiners provided that they were involved [in] and had given their full support [to the project] throughout the process. But I think I am more comfortable with field assessors (external and not associated with the department) because they are neutral people and therefore the assessment may be [more] authentic. The site-based evaluators who visited me... helped me tremendously to understand the relevance of ensuring the core actions for managing and leading people and policy are covered in the project.

It was therefore evident that site-based evaluators were an essential part of the assessment process with which all the principals concurred.

**Discussion of Findings**

The findings provide insight into the perceptions of the principals in the four urban schools about their use of portfolios in the ACE leadership preparation program by revealing some of the more salient challenges and benefits of portfolio use in such a program. Equally important, the findings reveal a kind of universality in their implications to nations beyond SA, such as the United States and elsewhere. For example, not uncommon in our study and other U.S. studies was principal resistance to self-guided learning as long-held beliefs
and practices were challenged, indeed for our principals, they were challenged morally in their own reflections of their learning. Portfolio advocates maintain that principal portfolios hold the promise of a more authentic form of assessment of professional performance and provide an opportunity for ongoing reflection and continuous improvement (Marcoux et al., 2003; Milstein, 1996). In this way, principals are able to submit work on a more frequent basis, and test understanding and application across the content of the entire course, which was indeed the case in our study. Principals are the major role-players and “potential beneficiaries of a good assessment strategy” (Du Plessis & Koen, 2005, p. 19).

Nevertheless, our study and others conducted in the United States reveal that abandoning the traditional paradigm and successfully adopting the principles and ideas of continuous assessment requires time, energy, effort, patience, and commitment from faculty members and students (Marcoux et al., 2003; Milstein, 1996). Finally, regardless of the challenges found in this study and corroborated in other studies, the majority of the principals designated themselves as benefiting from portfolio assessment. In fact, for a number of the principals, portfolio assessment alleviated the pressure and anxiety associated with end-of-year examinations, encouraged them to work consistently, provided them with an opportunity to reflect upon their learning, and facilitated their self-directed learning.

More specific to the study under discussion, the most prevalent disagreement among the principals revolved around the issue of assessment of portfolios and the belief that there should be “one ideal, objective assessment of a portfolio through appropriate training of assessors, construction of clear guidelines, and other such measures” (Johnston, 2004, p. 397). This positivist-oriented outlook only supports what we argued earlier, in that alternative assessment (portfolios included), can be viewed uniquely as a sociopolitical practice (Delandshere, 2001), where assessment “serves in validating and reproducing certain forms of knowledge or ideas at the expense of others (p. 115)”. The principals in this study were grappling with this very notion about what assessment tool serves as the most legitimate and objective type, that is, portfolios or exams?

Eliminating written exams as an assessment tool therefore, resulted in some disagreement among the principals in the study. Specifically, for one principal in this study, written exams were popular in higher education institutions. Nevertheless, much scholarly research points to the limitations of exams in promoting student learning (Friedrich-Nel et al., 2003). For example, Elton (in Lumina, 2005) argues that the “traditional... examination... in which students answer in two or three hours some few questions... is
worryingly unreliable.” Similarly, Cole, Ryan, and Fick (1995) assert that examinations represent a limited microscopic and incomplete view of students’ abilities. With the traditional testing techniques proving to be inadequate to test competencies and skills, [alternative] assessment has emerged in the new learning society to determine the achievements of students (Friedrich-Nel et al., 2003).

These findings reveal that the majority of principals believed that portfolios served their purposes in terms of allowing a platform for reflection and regard for unique experience. The principals liked the holistic and practiced-based nature of assessment grounded in what they perceived were fair, valuable, and objective criteria established in consultation with the relevant role-players. Even so, it should be noted that one principal believed that examinations were a much fairer and unbiased means of assessment than portfolio assessment, which is by and large often a popular perception.

In acknowledging portfolios as a valid assessment form therefore, questions of reliability and validity became a factor in this study. While a lone principal’s view is a popular one, one might ask if it leads to the most meaningful assessment. When relying solely on examinations, the granting of qualifications to principals in leadership programs based solely on summative judgments remains problematic and might tend to be rooted disproportionately in power relations. This could result in questions such as the following: “How is achievement defined? Who sets the standards and in whose interests are they set? Are such standards even possible?” (adapted from Johnston, 2004, p. 398).

On the other hand, when relying solely on an interpretive assessment model, the problem does not diminish, and in fact, intensifies by raising other equally troubling issues. For example, interpretation of narratives or journaling portfolios becomes a “mental construction or interpretation” (Johnston, 2004, p. 398), by the assessor and/or the author of the portfolio. But the problem then becomes: “How can these individual constructions be noticed and honored within a program” and “How important is it to achieve reliability/validity according to traditional means?” In other words, can such truths be more a matter of consensus among informed and sophisticated constructors, rather than being based on one perceived paradigmatic reality or alleged grade that the principals should be striving to reach?

In response, supporters of a more interpretive assessment approach (e.g., Johnston, 2004), stress that subjective interpretations of assessments do not mean that anything goes. Indeed, we see the principals in this study grappling with their own values and ethics in terms of what they believed would be valid evidence of their practice as would be revealed through their portfolios.
Such reflections on the part of the principals reveal a move toward sophisticated, intelligent, and meaningful assessment of their own practice that otherwise might not be achieved if their development were assessed using examinations.

Portfolios, then, allowed the principals to reach their own contextualized and constructed assessment of their work that also challenged them to adopt an *ethic of disciplined inquiry* (Moss, 1994), all the while encouraging them to challenge and revise initial interpretations. All of this indicates that the principals required a certain set of skills, knowledge, and values to construct their portfolios. Furthermore, the issue of ethics plays a very important function in the compilation of criteria determining what constituted evidence and what did not. In composing the commentary it was evident that the principals were required to be able to communicate, negotiate, and collaborate around certain activities effectively.

In order for portfolio assessment to be implemented successfully, it became important to provide guidelines to assist the principals in preparing for the assessment tasks. Although the criteria for assessing the project plan, portfolios of evidence and the commentary were given to principals in a timely manner, the contents of these documents were not explained gradually to the principals. This made it difficult at times for them to understand all the criteria for each aspect of their portfolios within a short period of time allotted. Indeed, when acknowledging the legitimacy of a more interpretivist approach to assessment, time, collaboration, and negotiation become important commodities for ensuring the success of the portfolio process or when the process breaks down (Johnston, 2004). This became evident when the principals in this study were not provided with sufficient training in the compilation of portfolios and had limited interactions with the University faculty members, leading to “confusion and a lack of direction in respect of portfolios.” In fact, the faculty members and external assessors identified that the principals in the project experienced logistical as well as academic problems in the compilation of their projects.

Finally, the principals’ responses regarding who should assess their portfolios provided a platform for intense discussion, from both a theoretical and practical perspective. The principals believed that the assessors needed to be vested in their work and the process but also be somewhat objective, thus they favored external assessors.

On a final note, judging the quality of portfolios remained, not only in this study, but also in the research in general, a controversial topic. Some researchers (e.g., Guba & Lincoln, 1989) suggest that emphasis be placed on *credibility* and *transferability* rather than *reliability* and *validity*, both of which offer spaces for context and the unique differences among principals. Perhaps, more
importantly, a way of ameliorating this problem is to assume that assessments should be fair and transparent, leaving room for the principals’ own perspectives and development (Moss, 1994).

**Conclusion**

Since the undertaking of this study, the National Department of Education has introduced a new policy that requires all practicing principals to possess the ACE Principalship qualification by 2011. To summarize, portfolio assessment was an ideal strategy used by this higher education institution to evaluate the professional development of principals studying the ACE course. The findings revealed a tension between alternative assessment and summative evaluations (such as exams); the difficulty and necessity of certain skills to bring forth the full potential of portfolios, which at times challenged principals’ values and ethics of what was deemed as valid evidence of practice; the ever present challenge of the time-consuming nature of portfolios and the time needed to plan the project beforehand providing a map or plan of action; and finally the question of who should serve as an appropriate assessor. These observations were important in terms of the theoretical lens we used in an attempt to move beyond portfolios as mere technology.

**Declaration of Conflicting Interests**

The authors declared that they had no conflicts of interests with respect to their authorship or the publication of this article.

**Funding**

The authors received no financial support for the research and/or authorship of this article.

**Notes**

1. Rand Afrikaans University merged with Technikon Witwatersrand and incorporated Vista University to form the University of Johannesburg. This University is located in the Gauteng Province, one of the wealthier provinces of South Africa. Since the densely populated province comprises a greater urban society, this study was therefore located within the Gauteng urban schools.

2. We use the terms *alternative* and *authentic* assessment interchangeably in the article although we are aware that conceptually they differ in many cases.

Working with Clients Across Cultures: Understanding Cultural Multiplicity and the Importance of Identity Negotiation

2. Name: Roger Frie, Ph.D. Psy.D.

3. Simon Fraser University, Faculty of Education
4. 8888 University Blvd. Burnaby, BC, Canada
5. roger.frie@sfu.ca

6. Summary of paper:

Counseling today increasingly reflects the multicultural fabric of social life. One of the central issues that counselors often confront in their work with clients is the question of cultural identity. Traditionally, identity was seen as fixed and stable, reflecting bounded notions of culture and human development. Today, however, the impact of globalization, the diffusion of cultures, and the fluidity of human experience has given way to a concept of identity as multiple and context-bound. As a result, cultural experience is seen as contested, dynamic and dialogical as persons are required to negotiate multiple, often conflicting identities. The complexity of cultural identity and the psychological process of identification cannot be underestimated. Nor can its relevance be overlooked. Indeed, recent studies suggest fully one-fifth of all children in the United States today are immigrants.

Multicultural experience and the process of acculturation is a basic characteristic of contemporary life. It is also linked to recognized psychological stressors across the life-span. Because counselors are increasingly working with clients who struggle with psychological difficulties related to cultural experience, counselling education needs to be cognizant of the psychological concepts used to capture and explain the challenges faced by individuals with multiple cultural identities.

My talk will focus on two central concepts -- multiplicity and identity negotiation -- and demonstrate their relevance to counseling work. I will suggest that identity negotiation forms an
important aspect of psychological health among bicultural persons dealing with multiple, often conflicting cultural identities. Focusing on the process of identity negotiation can also help us to understand and come to terms with the conceptual terminology of multiplicity that is often employed to explain multicultural existence. I will use a clinical case illustration from my counseling work with second-generation immigrants to demonstrate the psychological processes involved in the challenges of living across cultures and languages. I will interweave clinical case material with conceptual discussions and clarifications.

I will demonstrate how the notion of multiplicity has become a major area of interdisciplinary study. When applied to the broader framework of culture, the notion of multiplicity points to the fluid and changing nature of cultural identities, thus undermining essentialist definitions of identity as fixed and stable. Bicultural persons identify not in singular categories, but often experience a fused, or hybrid identity, which is different from any of its constituent parts. This hybridity functions to decenter traditional identity regimes and suggests that subject positions in culture are often assigned rather than freely chosen. I maintain that while such notions as multiplicity and hybridity help us to understand the ambivalent and often fragmentary nature of our cultural identities, the question of “how” we negotiate and maintain these identities requires careful exploration.

I suggest that the experience of multiplicity relies on a limited form of psychological continuity that allows for self-recognition and identity negotiation across time. Indeed, counselors have spent comparatively less time studying the role of continuity, in part because talk of continuity is frequently equated with a return to essentialism. But continuity exists within the same cultural framework that yields multiplicity. Without a sense of continuity, it would be hard to have any kind of identity at all; talk of identity negotiation would inevitably give way to identity diffusion. I maintain that persons not only experience multiple identities, they also have the capacity to
negotiate their identities over time. I will suggest our potential for reflective action is based on personal agency and a limited psychological continuity. Using the clinical case example, I examine the client’s ability to negotiate identities through her authorship of a life-narrative and suggest that her narrative experience is itself premised on an embodied self-awareness of what it is like to occupy specific cultural and social positions. This perspective on identity negotiation is itself culturally embedded and made possible through the cultural frameworks of understanding in which we participate.

Abstract

This paper is a reflection of the changing nature of education resulting from internet-related technologies using the work of Jacob Getzels and Egon Guba (1957) as one of its foundations. Getzels and Guba offered the idea that organizations and institutions are social systems comprised of various individuals who all play important roles within the organization. While technological advances allow colleges and universities to offer courses and programs online, technology appears to be moving faster than the art of teaching online, even though both are advancing at ever-increasing speeds. The argument can be made that one of the unintended consequences of these efforts is the depersonalizing of the educational process for the sake of efficiency and convenience.

As these new educational opportunities emerge, a case can be made supporting the idea that the most effective educational endeavors are still the result of people interacting within the confines of a social context. Clearly, internet-related technologies offer socialization and interactivity in online educational endeavors.

This paper discusses not only the ongoing possibilities and opportunities, but also the necessity of researching the changing nature of education brought about by internet-related technologies from the vantage point of three perspectives: student, faculty and management/administration.
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

**Introduction**

Educational efforts are often primarily built around the concept of establishing teaching methodologies rather than first considering how people learn, especially adults. These theories and methodologies often expect learners to fit into prescribed academic social contexts that are found within traditional educational settings.

This paradigm of education, where the teacher dominates the education process, was captured in the lyrics of *Closer to Fine* (1989) by Emily Saliers of the musical duo Indigo Girls. The song beautifully reflects the youthful search for knowledge and identity. In the song Saliers wrote:

> I went to see the doctor of philosophy  
> with a poster of Rasputin and a beard down to his knees.  
> He never did marry or see a B-grade movie.  
> He graded my performance, he said he could see through me.  
> I spent four years prostrate to the higher mind, got my paper and I was free.  
> (Saliers, 1989)

With the onset of internet-related technologies, perhaps it is time to honestly consider putting the learner at the center of the educational process.

Internet-related technologies have the potential to offer humankind the opportunity to reshape the way it views, uses, and incorporates formal education into its cultures. The introduction of internet-related technologies into the mainstream of any society has the ability to alter both the obvious and subtle ways in which human beings learn and how they are taught. Furthermore, they have altered educational reality at a rate that was unimaginined less than a generation ago.

Technology has altered the educational landscape in a manner that has created a divide between the teacher and learner. This unprecedented occurrence has posed questions as to the role of teacher in the teaching/learning context when using technology to teach at a distance.
Traditionally, the teacher has been seen as a sage, a keeper and dispenser of knowledge, and the student has been seen as a cup to be filled with wondrous facts and ideas held sacred by the teacher and the academy.

While instructors are busy learning new skills necessary to teach online it seems that their students, who were born into the digital age, are simply adapting and transferring already learned skills into the educational arena. These students, who are at times referred to as digital natives, have grown up immersed in digital technologies from mediums such as gaming and entertainment. As a result they have a lifelong familiarity with the basic concepts of the evolving technology that may be foreign to their teachers’ world. Yet, there seems to be little adaptation on the part of the educational infrastructure to draw from the expertise of the learners within the system. Logically, this will dissipate as the learners of today become the educators of tomorrow. However, utilizing the enormous experiential base of the learner, even if it is unorthodox in traditional terms, seems wise.

In theoretical terms, incorporating the learner directly into the educational design process in institutions of higher education seems to fit well into the theory of andragogy (Knowles, 1973) and Getzel and Guba’s (1957) work with idiographic and nomothetic dimensions in social systems.

One problem with this changing paradigm is that students may expect the same kind of interaction with their online courses as they experience in other online environments such as advanced gaming, which offer instant and continuous interaction. This is highly reminiscent of several decades ago when teachers were concerned about the influence of television on their students. In the early years of television, teachers had to deal with students who were becoming accustomed to seeing a problem originate, unfold and then be resolved in an entertaining format.
of 30 minutes or an hour. They seemed to expect the same thing at school, a clearly unrealistic expectation.

Likewise, it is possible that younger online learners may expect to be challenged and entertained at the same time in their online courses. While it may be true that learning, and nurturing the skills necessary to exist in the cyber world, is hard work, especially when attempting to staying current, it is logical to ask if the process of learning is changing. Even if the format of educational delivery is in a state of continual flux with ever faster changes it still seems that learning, by its very nature, is often difficult and tedious work.

Most research into online courses is discussed from the vantage point of the instructor. While this is important, a major premise of this paper is the idea that every aspect of the educational infrastructure would benefit from a serious consideration of the students’ perspective.

There are several paradigm shifts occurring within the educational world. For example, it can no longer be assumed that institutions of higher education are the exclusive holders of information. These changes within education may impact educational institutions much in the same way that the printing press impacted the formal church. Providing the masses with the scriptures, that had previously been the sacred privy of priests, monks and church bureaucrats changed the way in which the church and the individual interacted.

Another shift of the educational paradigm is that internet related technologies have created academic and economic competition between institutions that once enjoyed monopolies created by geographic, legal and prestige boundaries. These technologies allow greater flexibility in the way students can obtain an education, and have ushered in respectability for private and for profit schools that were once sneered at by traditional colleges and universities. It is
important to note that this shift includes universities that are actually businesses, whose goal is to turn a profit, where public institutions are still expected to altruistically impart knowledge for the betterment of humankind.

Presently this competition is even occurring among sister institutions within the same university system, such as the University of North Carolina System. At one time it would have not been possible for one of the sister institutions who fall under the umbrella of the University of North Carolina system to extend its reach into a sister institution’s service area. For example individual campuses could not offer classes in contiguous counties considered to be the domain of another campus. However, nothing prevents any campus from offering their online courses to anyone within North Carolina.

**Rationale for the research**

It is clear that online education is currently in vogue and an important tool for institutions of higher education. While the science of education seems to be often driven by fads and faddish behavior it can be argued that the onset of the technological revolution fueled by the internet is not a fad and is rather a fundamental shift in our educational paradigm. Internet related technologies have the potential to reshape the way we think about education.

Educational researchers are in a unique position to not only research and report what is currently happening, they have the opportunity to help shape this new educational paradigm. They can do this by collecting and analyzing research that focuses on the learner and thus help educators gain a better perspective as to how best to create online courses and programs for maximum effectiveness.

Many institutions of higher education are focusing larger amounts of attention on distant education, including attempting to attract online learners. This is especially true in regard to non-
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

traditional students such as older students who are returning to school while maintaining jobs and family commitments that may have prevented them from attending traditional college and university programs.

In the current economic downturn, people in the United States are losing their jobs at alarming rates and the need to return to school to prepare for new jobs is high. Colleges and universities then become competitors for these students. A premise of this paper is that institutions of higher learning that are truly student centered will gain a better reputation and attract the best and the brightest of these nontraditional students returning to school now that many of the physical and geographic barriers related to taking classes have been reduced or eliminated. Establishing the student as the center of the educational design process is akin to smaller schools’ reputations for creating classes and programs where each student remains a person and is not simply a number in an uncaring bureaucracy.

There are also extraneous factors making online courses more desirable in this economic ebb such as unstable fuel prices, vehicle wear and tear and commute time that interferes with work hours or family needs. Other factors include the fact that many of the people returning to school are single parents, and without online options they could not afford baby sitters several times a week. Students having to miss scheduled classes due to family and work matters can be problematic as well. It can also be argued that this allows more family time which could be good for the children in the home, especially in times of economic and personal stress.

As potential students begin returning to school to retool their skills and abilities for the changing world of work while at the same time trying to balance work, family and shrinking budgets, institutions of higher education should also be working to help these students address their academic needs. In this regard, appropriately using technology to design educational
experiences to help the learner acquire the needed knowledge and skills from a distance is paramount.

Many of these students may be older than traditional college freshmen yet they are young enough to have technology friendly mindsets and relevant skill sets necessary to navigate online courses. While this cannot be taken for granted or assumed to be universal, many of the students already have technological skills necessary to navigate their normal world making their adaption to education quite swift.

Institutions of higher education could benefit from a serious consideration of moving toward a greater on-line presence even if they intend to maintain exemplary face to face courses. It is also apparent that centering these efforts on the learner is an excellent starting point, or even a natural turning point if the process has begun.

This paper suggests that if we, as educators, want to be leaders in utilizing internet technology rather than reacting belatedly to a changing world, we need to consider centering our efforts on the student and the needs of their future work world rather than paying homage to tradition of expecting them to fit into ours.

**On-line Student Characteristics**

Online research has been concerned with the influence of student characteristics such as age and enrollment status, gender, ethnicity and learning style on the ability of students to adopt and learn effectively online. In a 2002 study of two class sections of CSC 114, Introduction to Programming in C++, taught at North Carolina University in the 1999 fall semester. The aim of the study was to find out how students who enrolled in the online section of the course differed from those enrolled in the traditional section. The two groups were found to be differed in several important aspects. Online students were older, less likely to be enrolled in undergraduate
closer to fine: idiographic and nomothetic dimensional considerations of online education

courses, more likely to have job and or child care responsibilities, and had more experience with computers.

While the general view in previous research such as the one described above has been that students engaged in distance education are often older and busier than the traditional student, some research findings are quite contrary. According to Clayton (2001) general, national enrollment statistics reported in The Chronicle Almanac, 2002-2002: The Nation offers extensive demographical information about students enrolled in higher education. The Chronicle Almanac reports that 62.7% of students enrolled in two and four-year U.S. institutions in fall 2000 were under the age of 25 and 37.3% over 25. An analysis of the national full-time and part-time enrollment shows 72% of all students enrolled attend school full-time while 28% attend part-time. It is interesting to compare the Chronicle’s percentages with those reported by the National Education Association in “A Survey of Traditional and Distance Learning Higher Education Members” conducted in 2000. According to the NEA report the age of students in distance learning courses varies considerably.

best practices: theoretical basis for online instructional design

Teaching strategies rather than content determine success of an online course. The learning cycle postulated by Kolb is a useful teaching tool that helps students to make connections between theoretical concepts and practical applications. The stages of the learning cycle are concrete experience in which the student deals with a new concept or situation; reflective observation where the student considers or examines the experience; abstract conceptualization which occurs as the learner seeks a pattern, builds concepts and tests theories; and active experimentation follows as actions are changed because of the insight gained from the learning process. Students learn experientially by systematically performing
learning activities at each stage in the sequence and are able to link theory to practice. (Bolan, 2003; Staley, 2000; Fulkerth & Stevenson, 1997). See figure 1 below.

![Diagram: Structural Dimensions Underlying the Process of Experiential Learning, and the Resulting Basic Knowledge Forms.]

**Figure 1: Structural Dimensions Underlying the Process of Experiential Learning, and the Resulting Basic Knowledge Forms.**

Gagne, as presented by Alley and Jansak, (2001) and Deubel (2003), proposes nine conditions for experiential learning online whereby the instructor gains students’ attention, outlines learning objectives to create student expectancy, stimulates recall of prior learning, tells or shows the students what they are to do, provides learning guidance, elicits performance, gives feedback, and assesses performance. The conditions include externally observable events of instruction associated with corresponding events that occur as the learner responds to instructional processes as described in Table 1 below.

Gagne’s (Alley and Jansak, 2001 and Deubel, 2003) conditions for experiential learning online are represented below (Al-Shalchi, 2009) (Allen, 2007; Alley, 2001; Andrus, 2008) in Table 1:
### External Events: Instructor Based

<table>
<thead>
<tr>
<th>Event Description</th>
<th>Internal Events: Student Based</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Gain attention</td>
<td>Reception</td>
</tr>
<tr>
<td>2. Tell learners the objective</td>
<td>Expectancy</td>
</tr>
<tr>
<td>3. Stimulate recall or prior learning</td>
<td>Retrieval to working memory</td>
</tr>
<tr>
<td>4. Present stimulus with distinctive features</td>
<td>Selective perception</td>
</tr>
<tr>
<td>5. Provide learning guidance</td>
<td>Semantic encoding</td>
</tr>

<tr>
<td>9. Enhance retention and transfer of learning</td>
<td>Retrieval and spaced review</td>
</tr>
</tbody>
</table>

Events one through four set the instructional stage. Event five keeps learning on track and describes acts that enhance storing and recalling through hints or organizing content. Event six through eight form a *learning cycle* that should ideally recur until an acceptable level of performance is achieved. Events eight and nine determine if learning has occurred and if that learning can be applied to unfamiliar situations (Alley and Jansak, 2001; Deubel, 2003).

**Using Technology to Organize Course Content:** Technology should be used to organize course content in a consistent manner so that students can quickly locate different reading materials, find out when to complete and turn in assignments (Thurmond et al., 2002). An analysis of how students perceived the usefulness of course materials for various language courses revealed that key factors were clearly and logically organized content, clear objectives, meaningful feedback, and easy navigation (Felix, 2001). Clear organization of
course content whereby concepts are presented in a precise manner provides a structure to the teaching component of the online learning experience. Learning plans that are explicit about instructional intent and student expectations should be used to provide a framework that guides the students through the learning process. Using learning plans, online course content can be divided into lessons that are manageable within a given time period. The structures for lessons can be outlined in the learning plan by answering critical questions for online learners regarding the importance of the material to be learned (Why is this important?) and what the student is expected to learn and apply (What will I learn to do?). The structure for learning activities can be outlined in the learning plan by answering student questions regarding the manner in which the material is to be learned (How will I learn this?), and how performance will be evaluated (How will I demonstrate that I have learned this?). Instructional material embedded in the technology of delivery may include lectures, notes, outlines or summaries of key information, text readings, study guides, and case studies, written assignments, individual projects, test modules, self-tests, and final exams (Schuster, Rodriguez, Chabot, & Arundel, 2001; Klotz & Robertson, 2002; Staley & McKenzie, 2000; Richardson, Swan, 2003).

Faculty/Instructors

Early in the history of online education many, if not most college and university professors who entered the world of teaching online did so on a voluntary basis. In this case voluntary is not to be defined in the traditional altruistic way where instructors expect little or no compensation for their work. These voluntary efforts were often encouraged by institutional use of extrinsic, external and alternative incentives such as financial reward, updated technology or the opportunity to work from home.
As the number or courses and programs offered online has increased, researchers have identified several areas where faculty need institutional support in order to be optimally successful when teaching online (Parker, 2004). Thus there is a sense of importance placed on the nomothetic function of institutions to support various idiographic needs.

For example Parker (2004) identified that faculty need technical assistance in course development and delivery as they transition from teaching in traditional face to face classroom settings to teaching online. This is especially true with faculty who are not well versed in the latest technologies designed to enhance the online educational experience. Perhaps the greatest digital divide is being played out with the graying of the baby boomer generation who are more comfortable in the traditional classroom setting as compared to their younger colleagues who have a much greater understanding of technology due to the fact it has always been a part of their lives. Parker (2004) suggested that faculty with less experience teaching with technology could benefit from peer mentoring. In a shift of the traditional paradigm, older seasoned faculty may be receiving this mentoring from younger, less overall experienced colleagues, or even their students.

Other idiographic issues concerning faculty who utilize various technologies to teach online include policies addressing faculty workload and compensation, intellectual property ownership issues, and having adequate support services during the scope and sequence of the online offerings. These support mechanisms could come in the form of initial faculty orientation and ongoing in-service training provided as needed to individuals and groups.

A potential point of conflict between the idiographic and nomothetic dimensions of online education may be illustrated by the fact that much work is required of faculty teaching online before their students log on to the class for the first time. In many cases this has been a
challenging paradigm shift for educational institutions to make. Professors are not usually compensated for work they have not done, and the traditional mindset is that planning for a course is not actually teaching the course so it is paramount to work not yet done. In the new age of courses and course materials delivered online institutions may have to reconsider this established paradigm. Thus this is one of the areas of potential organizational friction between the idiographic (individual) and the nomothetic (institution) dimensions of educational institutions moving to online teaching/learning.

To restate the organization dilemma it is universally understood that instructors need adequate time to prepare for their classes, but when does the institution recoup this time? Perhaps the solution is not found by simply considering financial compensation for a specific time frame, but rather is found in the way institutions configure the way faculty are expected to spend their time. For example there could be a shifting scale in place that could be adjusted in terms of research and writing and professional service.

Another traditional institutional nuisance that may be challenged by online teaching is the idea of office hours. Given that one of the advantages of offering online classes is that students do not have physically travel to the college and/or university to take classes it seems logical that this should be true of visiting professors and advisers as well. With the capability to teach online should come the ability to meet online for office hours, which may conflict with nomothetic institutional policies that require instructors to keep specific numbers of office hours in traditional office settings.

**An Example of Superintending the Online Process**

The Department of Leadership and Educational Studies (LES) at Appalachian State University has been using 3D virtual learning environments for graduate courses in the Instructional Technology program for a number of years. To accomplish this goal the department
purchased the necessary software and maintains its own server called the AET Zone for graduate studies. This server also offers space to Clemson University in South Carolina and the North Carolina Virtual Public Schools Program.

Originally, all work was done in Active Worlds and while Instructional Technology was the majority stake holder, the Library Science and School Administration programs were also using Active Worlds to varying extents. While students and instructors seemed to be enjoying using the interactive environment, the program had certain limitations.

For example, Active Worlds required a plug in for audio and file sharing. This plug in took students into a separate window, where they were unaware of text messages from other users and could not see the virtual environment their avatars were in. It is also a Windows only format, which forces Mac users to purchase extra software at their own expense in order to participate. Three years ago the department began working with another platform, Teleplace. The Teleplace environment has real-time audio and video built in, allowing direct collaboration on documents, and it is cross-platform compatible. Again, the department purchased the necessary software and maintains its own server for graduate students as well as the STEM/ITC project. Over the past year, the programs that have been operating in Active Worlds have been moving to Teleplace and many newly interested faculty have begun teaching online in Teleplace with no prior experience in the other 3D environment. As with any new endeavor, there have been fits and starts to the process. Identifying the limitations of the program and discovering how to take an established face-to-face class and translate it into an online equivalent is a challenge.

Generally, the online courses in the LES Department are a combination of synchronous and asynchronous activities. Students are encouraged to meet and collaborate independently of
class time, and class time is sometimes limited to one or two meetings a semester, depending on
the instructor. In many cases, the ability for everyone to be online at the same time and meet in a
virtual space has led to instructors automatically re-creating a face to face classroom situation
(i.e. students sit and listen while the instructor lectures, group discussion on cue from instructor,
etc.), which is often less than ideal. Regardless of a 3D environment, the use of avatars and real-
time communication, a lecture is ultimately a disembodied voice and students are in a position of
being unable to evaluate body language, or to know when pauses are to take questions instead of
a microphone adjustment.

In Fall Semester 2010, the Library Science department started its first entirely online
degree program. In discussing how to create a sense of community and elevate interactions with
students, they decided to attempt a virtual space where there were both common spaces
(discussion areas, work spaces, amphitheatre for lecture, faculty lounge) and course specific
areas where student could find the resources and documentation for their class. Some of the
course work was designed to create discussion groups with students from different classes, and,
most importantly, instructors were available throughout the day and evening in the virtual space
to answer questions for students and generally be available for any type of discussion. Initially, it
succeeded beyond all expectation. After a brief introduction at the beginning of the semester,
students were given free reign to come and go as their time and schedules permitted, they formed
discussion groups for various projects and the timeline for course projects was updated regularly
so that they could always find the information they needed by logging on to the virtual space.
Within three weeks, the forum was amazingly active. It was rarely empty as generally one or
more students were present throughout the day. For the instructors it was simply a matter of
logging on and having the volume up on their computer in case a student buzzed. This allowed them to be present throughout the day and still work on other projects.

Because things were going so well and everyone raved about the space and how well it worked, the technical side of dealing with this virtual environment became problematic. The space became rapidly overloaded with images, documents, videos and notes and at that point, the forum crashed. One of the hardest things about working with technology is that most people don’t know—and don’t particularly care—how it works, so long as it works. They care when it doesn’t work, but in general, trying to explain “under the hood” issues is a tough sell. Individual Teleplace forums have a memory limit, and because it works as a peer to peer program, when one person enters, the current copy of the forum is passed from that user to any new person entering, as opposed to pulling its current form from the server. Because of the memory limit, not only was it nearly impossible for a user to enter the forum, no one was capable of passing a copy to anyone else, either.

This led to the painful process of meeting with the faculty to have a discussion about what could go. As is often the case with instruction, originals are sacrosanct—even digital originals—and they should not be touched; the immediate response was that nothing could be eliminated. It was quietly hoped there was another way to fix it. Unfortunately, there was not. Raising the memory limit on the forum itself made it unstable, and in its current condition, it was unusable. So after a few minor adjustments were initiated, faculty agreed to remove some videos from early in the semester that were no longer entirely necessary. That seemed to fix the problem for about two weeks. Things were slow, but students could get in and work. Then it locked up again.
At this point, faculty members decided that the common space would not work, and started requesting separate spaces for their classroom material. Unfortunately, this breaks the students out into different areas where they are less likely to see each other and to interact. It has been observed that students are hesitant to contact each other if they are not in the same space, which cuts down on the sense of community and lowers the level of interaction that instructors and programs had hoped for. Ultimately, the solution faculty opted for re-created the same issues they were initially trying to avoid, and interactivity between students and faculty has plummeted as a result of the ‘siloing off’ of the different areas.

Currently the department is looking at how to create the “happy medium”, encouraging faculty to prune back digital resources, potentially use links to videos and documents instead, for the sake of community and interactivity.
Problems and Limitations

Colleges and universities should strongly consider the needs of the learner as they move classes and programs online. This would be clearly idiographic in nature. This shift is not a quick and easy process and there are multiple pitfalls that must be considered when moving toward an on-line presence. There are multiple variables to consider when putting courses and programs on-line. Problems associated with such a fundamental paradigm become nomothetical in nature when educational institutions must consider the needs of instructors charged with delivering the courses. While some of these needs are idiographic in nature this support becomes nomothetic when administrators charged with supporting these efforts are expected to secure the necessary resources to help create an infrastructure of institutional support necessary to accommodate this changing learning/teaching process. An organizational dilemma may also develop when weighing two critical aspects within the idiographic dimension, the learner vs. the teacher.

These considerations are multiplied when a college or university is preparing to offer an entire program, or potentially an entire degree online. The number of programs and degrees available online is increasing rapidly as colleges and universities are being forced to examine the consequences of remaining stagnant in the face of immense change that is reshaping the educational landscape.

Computers hooked into the internet are not the first technological advance to spark claims of culture or institutional destruction. Some of the technological advances that have actually changed the basic foundation of education were not specifically designed as a means to improve the way we formally educate people, but they have. Examples of these technologies include the printing press, electricity, running water and indoor plumbing, in-house food preparation, various
ways and means of communication, and large-scale transportation efforts. Their impacts on education have been immeasurable. It is inconceivable to consider operating a school without these advances yet they are now so commonplace they are taken granted. When these “technologies”, primarily nomothetic in nature, fail, we cancel class, or even close schools and school systems.

Even when compared with the aforementioned changes in our educational infrastructure the onset of internet-related technologies are changing the way we educate people in ways that public and/or state institutions have not traditionally dealt with, or even contemplated. These changes can be considered a part of the idiographic or the nomothetic dimensions.

These changes have ushered in new players onto the educational stage. The privatization of education is now available on a much wider scale to potential students who are, at times, anxious to find alternate means of obtaining an education that will help them enter a given career, obtain initial or advanced licensure, or complete a program that beforehand was unavailable to them as they attempted to balance the rigors going to school while working full time and maintaining the essential elements of caring for their families. In essence a new spirit of completion is emerging that is starting to challenge the long-standing role of higher education.

These factors would seem to warrant that institutions of higher education consider how to meet the idiographic dimensions of the students. Given that the Internet breaks down geographic barriers and gives students a wider array of choices, schools that consider the idiographic dimensions of students will fare better than those who expect the students to fit into the nomothetic dimensions of the institution.

Literature regarding research into online learning often seems to be problematic as well. It is not uncommon to find studies in the current literature that are, in some ways, flawed. Some
of the data used to draw specific conclusions seem skewed thus making their conclusions unworthy of generalization.

Examples of poor research design leading to problems with validity and reliability include researchers using small sample sizes, purposive and convenient research samples, not controlling researcher bias, and false reporting of those being researched because of the power hierarchy between professor and student with grades being a primary motivator. Perhaps these problems are to be expected due to the relative newness of the internet related technologies into the formal schooling.

The concept of academic honesty has always been a challenging and problematic aspect of schooling regardless of discipline or level. Recently it was revealed that there is a congressional investigation into cheating on exams for FBI agents. This seems significant to this paper’s topic in several ways. More information on this scandal may be found at this link: http://news.blogs.cnn.com/2010/07/28/justice-department-reviewing-reports-of-fbi-test-cheating/?iref=allsearch

One of the implications of such a scandal is to highlight the fact that it is difficult, if not impossible, to externally ensure that students never cheat. In a perfect academic world, students would be operating at the highest levels of moral reasoning and questions of cheating would be meaningless to ask. Yet if using the past is an accurate predictor of future student behavior, it is a safe assumption to make that there will be cheating in the future. It seems that as long as there is a formal system of education there will be the possibility of cheating.

Furthermore, if we accept the idea that the learner is largely responsible for the education they receive it seems fitting to suggest that they are equally responsible for their ethical behavior during the process. Kohlberg (1981) and others have researched and written on
the concept of moral reasoning and it seems appropriate to propose using the principle of moral reasoning against the backdrop of online courses and programs.

In theory this should be less of a problem for graduate classes. Then again this theory would have assumed that we could have applied the same theory to the aforementioned FBI tests. The FBI cheating scandal may also be partially a result of high stakes testing. While not defending this behavior it is nonetheless logical to assume that the more that is at stake the higher the chance of attempted cheating.

Preparing courses that try to assure honesty from the students is one of the more serious challenges facing online educators. Cheating in school is a time-honored tradition and the only one true way of preventing it entirely is to convince students not to do it. It is as simple as it is complex. Online students and instructors are in a position that is unlike any other we have experienced in the history of education. It is conceivable that technology in education will create a new learning environment where it may become necessary to reconsider the concept of academic honesty. Perhaps it is time for the academic community to reconsider the debate in regard to when research becomes plagiarism.
Conclusions/Recommendations

Clearly there is much research yet to be done in the emerging field of online instruction with internet-related technologies. This paper recommends that much of this research focus on the idiographic dimension of educational organizations, helping to insure institutions of higher education meet the needs of their students, rather than simply claiming they do.

Research into best practices online seems to have been focused on most online forms (blogs, message boards, ASULearn type sites, websites etc.). However research regarding 3D virtual classrooms is sparse at this point. As a result the authors recommend serious research effort regarding the effectiveness of 3D online offerings in regard to both the idiographic and nomothetic dimensions.

Current research suggests a considerable difference between face-to-face best practices and online best practices. This seems logical given the differences between face-to-face (dynamic and rich in immediate exchanges) and online (relatively static and delayed exchanges). However, with the introduction of the 3D classroom where students and instructors interact in real time within a virtual classroom would seem to suggest that some of the best practices in the face-to-face environment could be successfully incorporated into the virtual classroom without sacrificing online best-practices. It is logical that future research regarding 3D learning environments would need to examine this issue.

Future emphasis could also focus on the fact that online education is a breaking from established and traditional wisdom of schooling the new paradigm offers an opportunity for the learner to become an active part of the educational process. This seems especially beneficial when it is clear that students sometimes know more about the technology being used to deliver
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

the course material than does the instructor. By allowing students to be more of a part of the instructional design and delivery process, institutions of higher education and the instructors working within need to acknowledge that the role of higher education has changed dramatically.

Equally important to consider is the fact that colleges and universities are no longer the sole keepers and dispensers of knowledge. While this may be initially threatening to our educational institutions, it could be a clear opportunity for colleges and universities to become more focused on higher level thinking skills. It seems logical that efforts to research this brave new world should be undertaken. Such research would allow examination of multiple perceptions and needs of all the various stakeholders in online education. Surveys could be taken that would measure these perceptions from students, instructors and administrators standpoints. From such research the idiographic and nomothetic dimensions could be examined more carefully. Sample surveys are included in appendixes A, B and C.

Another recommendation of the paper is that a meta-analysis could be conducted of existing research/literature. Looking at data globally may give a clearer and more honest set of answers to questions regarding teaching online.

This paper also argues that institutions of higher education should rethink their means and methods of granting scholarly credit for professors creating and maintaining online courses and programs. It appears that many traditional institutions of higher education have stopped short of rewarding faculty efforts in important ways that would encourage faculty to enter into the world of online teaching. A primary example is the fact that many colleges and universities seem to have prohibited awarding faculty appropriate credit for scholarly activity as a means of the encouraging and rewarding professors for designing and delivering courses in an exclusively online or hybrid formats.
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

It is conceivable that by not allowing professors the opportunity to include the development and delivery of on-line/hybrid courses as a form of scholarship amounts to institutional short sightedness or even self-sabotage. It appears that we are entering a time in our educational history where it is crucial for institutions of higher education to obtain, and then help sustain the efforts of the best and the brightest of the profession to create and teach online courses. If professors do not see the career benefits justifying the time and effort required to design and teach online courses an unintended result may be the squelching of faculty efforts to put courses on-line.

APPENDIX A

STUDENT PERCEPTIONS OF ONLINE LEARNING

The following survey is designed to gather specific data in regard to online teaching and learning from the viewpoint of instructors and/or potential instructors. The purpose of collecting the data is to provide a baseline set of information that will help assess where faculty are and where they want to be in regard to offering coursework online. While it may be possible to use demographic data to identify individuals when collecting group data no such attempt will be made by the researchers of this project. All information provided by respondents will be held in the strictest of confidence and no attempt will be made to identify any specific respondent. All respondents are assured that their participation in this survey is voluntary and individual responses will be confidential.

Individual demographics

Gender  ____F  ____M

Age:  _____under 18  ____18-22  ____ 23-28  _____29-32  _____33-38
       ____ 39-42  ____43-48  ____49-52  _____53 and above

Undergraduate Student Academic rank:  ____Freshman  ____Sophomore
       ____Junior  _____Senior

Graduate Student Academic rank:
       _____Master’s level  _____Post Masters non-degree (licensure/certification only option)
       _____Specialist (Ed.S.)  _____Doctorate  _____Post doctorate

Are you a degree seeking student?  _____yes  _____no

Have you taught a course exclusively on-line before?  _____yes  _____no

Have you taught a hybrid course before?  _____yes  _____no

Have you taken a course exclusively online?  _____yes  _____no

Have you taken a hybrid course before?  _____yes  _____no

Total years attending Appalachian State University:  _____

Total years taking course in higher education:  _____
Please respond to these statements using the following scale:

1. Strongly Agree
2. Mostly Agree
3. Neutral
4. Mostly disagree
5. Strongly disagree
6. Does not apply to me

**Personal Motivation and Interest**

I am interested in taking courses completely on-line. 
I am interested in taking hybrid (part on-line, part face to face) courses.
I am trying to decide if taking on-line courses is right for me.
My field of study typically offers online courses
I believe I can learn any skills necessary to successfully take courses online.
I feel that I already have the necessary skills and abilities to successfully take courses
My basic personality is well suited for taking online courses.
It is possible for me to take online courses without the use of ASU labs, etc.
It is possible for me to take online courses without the use of any ASU equipment

**Discipline Specific Questions**

Social/people skills are important in my field of study.
The content area of my discipline fits easily into an online format teaching/learning.
Students in my field of study who take courses exclusively online may have a harder time than traditional students in mastering specific skills necessary for success.
On line materials have eliminated the need for textbooks in my discipline.
On line materials have reduced the need for textbooks in my discipline.
The material I am presently studying will be relevant 25 years from today.

**Pedagogy**

My learning style is best suited for classes where the course instructor gives limited instruction and I am responsible for large parts of my learning.

My learning is best suited when the course instructor gives very strict guidelines and is very specific about what I need to do as a student.

Learning online is essentially the same as learning in traditional face to face courses.

It is possible to learn any subject matter as effectively online as it is to learn it in a traditional face to face setting.

Even with courses offered completely online it is important that students and teachers meet face to face at least once per course in a traditional group session.

My learning style is largely based on the premise that teachers need to gather and present relevant information to their students and provide specific guidance to insure specific learning outcomes.

My learning style is largely based on the premise that teachers need to provide their students with directing questions that challenge the students to seek answers by finding their own sources of information.

My learning style is largely based on the premise that teachers direct students to specific topics of learning without specific direction and/or leading questions, thus encouraging students to seek and share their own conclusions about assigned topics.

It is important for students to have significant input in the direction of the courses they are taking.

It is as possible to build effective learning communities online as it is in face to face courses.

Students in online courses/programs may lose networking opportunities with other members of their field of study when compared students taking traditional face to face courses.

It is as possible to build positive teacher/student relationships online as it is in face to face courses.

The courses I have taken at Appalachian State University typically require higher level thinking skills.
The courses I have taken at Appalachian State University typically require using critical thinking skills.

**Assessment**

I feel that my instructors should use rubrics when assessing my work in their courses.

It is possible to assess critical thinking through the use of rubrics.

It is possible to determine that students are using higher level thinking skills through the use of rubrics.

Assessing student work should be primarily objective with little room for teacher opinion.

**General beliefs regarding on-line instruction**

Delivering courses and programs online is driven by the fact that this kind of course/program delivery is a better form of teaching and learning than traditional face to face settings.

Delivering courses and programs online is driven by financial concerns rather than educational best practices.

Delivering courses and programs online are primarily a new educational fad and will eventually give way to the next fad hailed as best practice.

Delivering courses and programs online is an educational revolution and will forever change how humankind educates itself.

All online materials necessary for success in online courses are available at no charge.

Most online materials necessary for success in online courses are available for no charge to my students.

The online courses I have taken, or want to take require (or will require) specific resources that are only available to students for a fee.

I am not sure what costs will be incurred by taking courses online.

Social/people skills can be effectively taught online.

I believe that the vast majority of the information found on the internet is factual.

I believe the ability to ascertain good from bad research is an essential skill for students taking courses online.
I believe that online students should have at least a fundamental understanding of basic research methods.

There is a potential danger of losing some degree of human dynamics in the teaching-learning process when delivering courses/programs exclusively on-line.

It is easier for students to be academically dishonest in online courses than in traditional face to face courses.

The role of colleges and universities are fundamentally changing as a result of technology, especially the internet.

Using Technology

The technology involved in delivering courses/programs online can become more important to the learning process than the content being delivered.

Students learning how to use and adapt to the technology necessary to take online courses can be as valuable as learning some course material.

Colleges and universities who specialize in online education, i.e., Argosy and the University of Phoenix, have a clear and distinct advantage of offering courses online when compared to colleges and universities that primarily continue to offer courses in the more traditional ways, i.e., face to face/lecture/discussion, etc.

Today’s typical university student knows more about technology than their instructors/professors.

It is difficult to stay current with technological changes due to their rapid rate of change.

It is difficult for students to obtain and maintain the tools (i.e., adequate computers, programs, connections, etc.) necessary to participate in online courses/programs.

It is difficult for students to obtain and maintain the technical skills (i.e., typing, using specific programs, researching on the internet, etc.) necessary to participate in online courses/programs.

It is difficult for instructors/professors to obtain and maintain the tools (i.e., adequate computer, programs, connections, etc.) necessary to teach in online courses/programs.

It is difficult for instructors/professors to obtain and maintain the technical skills (i.e., typing, working specific programs, researching on the internet, etc.) necessary to participate in online courses/programs.
Specific Learning Styles Methodology

Using a scale of 1 to 5, with 1 being the most effective way you learn from courses you take, and 5 being the least effective, please rate the following. Use NA for those listed methods you have never experienced.

1. Lecture
2. Class discussions
3. Specific readings assignments
4. Specific writing assignments
5. Students presenting individual reports to the class
6. Students participating in group projects.
7. Guest lecturers/presentations
8. Using the internet
9. Using video/audio presentations
10. Using case studies
11. Role play
12. Assignments that involve the use of student generated technological projects that range beyond traditional word processing, power point, etc. For example products/artifacts involving student produced audio, photography, video, etc.
13. Collaborating with students on writing articles and/or formal paper presentations.
14. Other (please specify)
Specific Forms of Assessment

Using a scale of 1 to 5, with 1 being the most effective ways you feel professors can assess (grade) your work, and 5 being the least effective, please rate the following forms of assessment. Use NA for those methods that you have not experienced.

1. Multiple choice questions
2. True/false questions
3. Unannounced quizzes
4. Fill in the blank questions specific answer questions
5. Short answer questions
6. Matching
7. Analogies
8. Essay questions
9. Formal written essays
10. Identification/definition types of questions asked with no choices provided
11. Traditional/technical/term papers.
12. Projects requiring students to conduct research (not literature reviews)
13. Rubrics
14. Other forms of assessment you utilize (please specify)

What kind of assistance do you need, or anticipate you will need to assist to best assist you in your efforts to take course online?
APPENDIX B

FACULTY PERCEPTIONS OF ONLINE LEARNING

The following survey is designed to gather specific data to support our online faculty learning community. The purpose of collecting the data is to provide a baseline set of information that will help assess where faculty are, and where they want to be in regard to offering coursework online. While it is clear that when surveying a group as small as this it may be possible to identify specific respondents via demographic information all members of the group are assured that their participation in this survey is voluntary and individual responses will be confidential.

Individual demographics

Gender  ____ F  ____ M
Age:  ____ under 25  ____ 25-29  ____ 30-34  ____ 35-39  ____ 40-44
      ____ 45-49  ____ 50-54  ____ 55-60  ____ 61 and above
Academic rank:  ____ Professor  ____ Associate Professor  ____ Assistant Professor
      ____ Instructor/lecturer  ____ Adjunct Professor (any rank)
Are you tenured?  ____ yes  ____ no
Have you taught a course exclusively on-line before?  ____ yes  ____ no
Have you taught a hybrid course before?  ____ yes  ____ no
Have you taken a course exclusively online?  ____ yes  ____ no
Have you taken a hybrid course before?  ____ yes  ____ no
Have you ever participated in a Faculty Learning Community prior to this one?  ____ yes  ____ no

Total years experience teaching in pre/primary/secondary education?  ____
Total years experience teaching in higher education:  ____
Total years experience teaching at Appalachian State University:  ____
I am willing to consider allowing my work in online teaching to be a part of ASU IRB approved research project  ____ yes  ____ no
Please respond to these statements using the following scale:

1. Strongly Agree
2. Mostly Agree
3. Neutral
4. Mostly disagree
5. Strongly disagree
6. Does not apply to me

**Personal Motivation and Interest**

I am interested in teaching courses completely on-line.  

I am interested in teaching hybrid (part on-line, part face to face) courses.  

I am trying to decide if teaching on-line is right for me.  

My department supports putting courses/materials on-line.  

My department supports the concept of putting programs on-line.  

I believe I can learn any skill necessary to successfully teach online.  

I feel that I have the necessary skills and abilities to successfully teach my subject matter online.  

My basic personality is well suited for online teaching  

It is possible for me to teach online courses without the use of ASU office space.  

It is possible for me to teach online courses without the use of any ASU equipment  

**Discipline Specific Questions**

Social/people skills are important in my discipline.  

The content area of my discipline fits easily into an online paradigm of teaching/learning.  

Students in my discipline who take courses exclusively online may have a
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

harder time than traditional students in mastering specific skills necessary for success.  
On line materials have eliminated the need for textbooks in my discipline.  
On line materials have reduced the need for textbooks in my discipline.  
The material I am presently teaching will be relevant 25 years from today.  

**Pedagogy**

My teaching style is basically learner centered.

My teaching style is basically teacher centered.

Teaching online is essentially the same as teaching traditional face to face courses.

It is possible to teach any subject matter as effectively online as it is to teach it in a traditional face to face setting.

Even with courses offered completely online it is important that students and teachers meet face to face at least once per course in a traditional group session.

My teaching style is largely based on the premise that teachers need to gather and present relevant information to their students and provide specific guidance to insure specific learning outcomes.

My teaching style is largely based on the premise that teachers need to provide their students with directing questions that challenge the students to seek answers by finding their own sources of information.

My teaching style is largely based on the premise that teachers direct students to specific topics of learning without specific direction and/or leading questions, thus encouraging students to seek and share their own conclusions about assigned topics.

It is important for students to have significant input in the direction of the courses they are taking.

It is as possible to build effective learning communities online as it is in face to face courses.

Students in online courses/programs may lose networking opportunities with other members of their discipline when compared to traditional face to face courses.

It is as possible to build positive teacher/student relationships online as it is in face to face courses.
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

My courses typically require higher level thinking skills on the part of my students. _____
My courses typically require critical thinking skills on the part of my students. _____

What kind of assistance do you need, or anticipate you will need to assist to best assist you in your efforts to teach online?
APPENDIX C

ADMINISTRATIVE PERCEPTIONS OF ONLINE LEARNING SURVEY

The following survey is designed to gather specific data to support a better understanding of various perceptions of online teaching and learning. The purpose of collecting the data is to provide a baseline set of information that will help assess where various college and university administrators are, and where they want to be in regard to offering coursework online at their institution. While it is clear that when surveying a select group as small as this it may be possible to identify specific respondents via demographic information all members of the group are assured that their participation in this survey is voluntary and individual responses will be confidential.

**Individual demographics**

Gender   ____F   ____M

Age:      _____under 25  ____25-29   ____ 30-34  _____35-39  _____ 40-44
           ____ 45-49    ____50-54   ____ 55-60  _____61 and above

Administrative rank: _____Department Level _____Dean’s level _____University Campus Level
               _____University System level

Are you tenured?          _____yes _____no

Have you taught a course exclusively on-line before?  _____yes _____no

Have you taught a hybrid course before?     _____yes _____no

Have you taken a course exclusively online?    _____yes _____no

Have you taken a hybrid course before?     _____yes _____no

Have you ever participated in a Faculty Learning Community? _____yes _____no

Total years experience working in pre/primary/secondary education?   ____

Total years experience working in higher education as a professor/instructor?   ____

Total years experience administering in higher education?   ____

Total years teaching at Appalachian State University:   ____
Total years administering at Appalachian State University: _____

Please respond to these statements using the following scale:

1. Strongly Agree
2. Mostly Agree
3. Neutral
4. Mostly disagree
5. Strongly disagree
6. Does not apply to me

**Personal Motivation and Interest**

I am interested in seeing courses taught completely on-line. _____

I am interested in having hybrid (part on-line, part face to face) courses offered. _____

I am trying to decide if teaching on-line is the best way to educate our students. _____

My institution supports putting courses/materials on-line. _____

My institution supports the concept of putting programs on-line. _____

I believe anyone learn any skill necessary to successfully teach online. _____

I feel that I have the necessary skills and abilities to successfully teach online. _____

My basic personality is well suited for online teaching _____

It is possible to teach online courses without the use of University office space. _____

It is possible to teach online courses without the use of any University equipment _____

**Discipline Specific Questions**

Social/people skills are important in my discipline. _____

The content area of my discipline fits easily into an online paradigm of teaching/learning. _____

Students in my discipline who take courses exclusively online may have a harder time than traditional students in mastering specific skills necessary for success. _____

On line materials have eliminated the need for textbooks in my discipline. _____

On line materials have reduced the need for textbooks in my discipline. _____
Most material presently taught at the college/university level will be relevant 25 years from today.

**Pedagogy**

My teaching style is basically learner centered.

My teaching style is basically teacher centered.

Teaching online is essentially the same as teaching traditional face to face courses.

It is possible to teach any subject matter as effectively online as it is to teach it in a traditional face to face setting.

Even with courses offered completely online it is important that students and teachers meet face to face at least once per course in a traditional group session.

My teaching style is largely based on the premise that teachers need to gather and present relevant information to their students and provide specific guidance to insure specific learning outcomes.

My teaching style is largely based on the premise that teachers need to provide their students with directing questions that challenge the students to seek answers by finding their own sources of information.

My teaching style is largely based on the premise that teachers direct students to specific topics of learning without specific direction and/or leading questions, thus encouraging students to seek and share their own conclusions about assigned topics.

It is important for students to have significant input in the direction of the courses they are taking.

It is as possible to build effective learning communities online as it is in face to face courses.

Students in online courses/programs may lose networking opportunities with other members of their discipline when compared to traditional face to face courses.

It is as possible to build positive teacher/student relationships online as it is in face to face courses.

My courses typically require higher level thinking skills on the part of my students.

My courses typically require critical thinking skills on the part of my students.
Assessment

Rubrics are essential when assessing student work.

It is possible to assess critical thinking through the use of rubrics.

It is possible to determine that students are using higher level thinking skills through the use of rubrics.

Assessing student work should be primarily objective with little room for teacher opinion.

General beliefs regarding on-line instruction

Delivering courses and programs online is driven by the fact that this kind of course/program delivery is a better form of teaching and learning than traditional face to face settings.

Delivering courses and programs online is driven by financial concerns rather than educational best practices.

Delivering courses and programs online are primarily a new educational fad and will eventually give way to the next fad hailed as best practice.

Delivering courses and programs online is an educational revolution and will forever change how humankind educates itself.

All online materials necessary for the success in my courses are available at no charge to most students.

Most online materials necessary for the successful delivery of my courses are available for no charge to most students.

Most online courses require (or will require) specific resources that are only available to my students for a fee.

I am not sure what costs will be incurred by students taking online courses.

Social/people skills can be effectively taught online.

I believe that the vast majority of the information found on the internet is factual.
Closer to Fine: Idiographic and Nomothetic Dimensional Considerations of Online Education

I believe the ability to ascertain good from bad research is an essential skill for students taking courses online.

I believe that online students should have at least a fundamental understanding of basic research methods.

There is a potential danger of losing some degree of human dynamics in the teaching-learning process when delivering courses/programs exclusively on-line.

It is easier for students to be academically dishonest in online courses than in traditional face to face courses.

The role of colleges and universities are fundamentally changing as a result of technology, especially the internet.

Using Technology

The technology involved in delivering courses/programs online can become more important to the learning process than the content being delivered.

Students learning how to use and adapt to the technology necessary to take online courses can be as valuable as learning some course material.

Colleges and universities who specialize in online education, i.e., Argosy and the University of Phoenix, have a clear and distinct advantage of offering courses online when compared to colleges and universities that primarily continue to offer courses in the more traditional ways, i.e., face to face/lecture/discussion, etc.

Today’s typical university student knows more about technology than their instructors/professors.

It is difficult to stay current with technological changes due to their rapid rate of change.

It is difficult for students to obtain and maintain the tools (i.e., adequate computers, programs, connections, etc.) necessary to participate in online courses/programs.

It is difficult for students to obtain and maintain the technical skills (i.e., typing, using specific programs, researching on the internet, etc.) necessary to participate in online courses/programs.

It is difficult for instructors/professors to obtain and maintain the tools (i.e., adequate computer, programs, connections, etc.) necessary to teach in online courses/programs.
It is difficult for instructors/professors to obtain and maintain the technical skills (i.e., typing, working specific programs, researching on the internet, etc.) necessary to participate in online courses/programs.

**Specific Teaching Methodology**

Please rate the following using a scale of 1 to 5, with 1 being the most effective teaching strategy that professors can use when teaching, and 5 being the least effective. Use NA for the methods listed that you believe have no benefit as a teaching tool at the college and university level.

29. Lecture
30. Class discussions
31. Specific readings assignments
32. Specific writing assignments
33. Students presenting individual reports to the class
34. Students participating in group projects.
35. Guest lecturers/presentations
36. Using the internet
37. Using video/audio presentations
38. Using case studies
39. Role play
40. Assignments that involve the use of student generated technological projects that range beyond traditional word processing, power point, etc. For example products/artifacts involving student produced audio, photography, video, etc.
41. Collaborating with students on writing articles and/or formal paper presentations.
42. Other (please specify)
Specific Forms of Assessment

Using a scale of 1 to 5, with 1 being the most effective assessment strategy used to evaluate student work, and 5 being the least effective, please rate the following forms of assessment. Use NA for those listed methods that you believe are not effective judging student’s work at the college and university levels.

7. Multiple choice questions
8. True/false questions
9. Unannounced quizzes
10. Fill in the blank questions specific answer questions
11. Short answer questions
12. Matching
13. Analogies
14. Essay questions
15. Formal written essays
16. Identification/definition types of questions asked with no choices provided
17. Traditional/technical/term papers.
18. Projects requiring students to conduct research (not literature reviews)
19. Rubrics
20. Other forms of assessment you utilize (please specify)

Open ended question:

What specific kind of assistance do you feel that professors/instructors need to be effective online teachers?
Math CAMMP: A Constructivist Summer Camp for Teachers and Students

Michael Green

Abstract: This paper describes a multi-faceted, constructivist, graduate mathematics education class with an intensive, student-centered internship. The class incorporates instructional manipulatives, technology, integrated modules, ongoing assessment, supervised internship with elementary and middle grades students, and access to a K-6 database of integrated modules developed by class participants.
Math CAMMP: A Constructivist Summer Camp for Teachers and Students

The Comprehensively Applied Manipulative Mathematics Program (CAMMP) began in 1992 as an idea for teaching elementary and intermediate teachers constructivist strategies. This summer camp approach is implemented in a graduate course that entails an exciting two-for-one enterprise. First, elementary and middle grades teachers enroll in a summer term graduate course on teaching mathematics. Second, using the strategies they have learned, teachers then implement a week-long summer math camp experience for rising first through sixth grade students who come to campus.

This two-for-one enterprise is successful year after year because teachers are looking for new strategies that employ “hands-on learning,” something CAMMP has a reputation for delivering. And the course works for nearby families who rely on CAMMP’s reputation to deliver opportunities for children to get a head start on next year’s mathematics curriculum.

MATH CAMMP – FOR THE TEACHERS

The graduate course is designed for 45 contact hours and is co-taught by the authors. Two faculty (the authors) have historically taught this course with summer funding provided by very high enrollment (averaging 43 students over the past 5 years). The first 30 hours are spent in class reconstructing K-6 mathematics concepts and procedures with teachers using a constructivist, hands-on approach. We refer to our approach as “guided constructivism” (Green, Piel, & Flowers, 2008). We believe, for example, that teachers do not need to wait for their students to “invent,” for example, the standard long division algorithm; it has already been invented and is quite efficient. Rather, we encourage teachers to incorporate a variety of strategies for solving division problems with manipulatives. These manipulative strategies allow students to develop deep conceptual understanding of how the long division algorithm works. The various strategies constitute what we refer to as the elements of CAMMP. By themselves, there is nothing new or novel in any element. But taken together, it is the package, the assembling of these elements into a model of teaching that constitutes the CAMMP approach to teaching mathematics (Piel & Green, 2010).

Elements of CAMMP

Problem Solving Modules. An essential strategy for learning (NCTM, 2000), problem solving is the primary motivation for learning mathematics, and our instruction begins with problem solving situations. Grade level teams design integrated, thematic modules of problems reflecting appropriate grade-level content, such as: insect fractions, rain forest multiplication, arctic subtraction, and space shuttle decimals.
Action Language. CAMMP teaching strategies incorporate a variety of hands-on objects. Traditional language for operations doesn’t really tell children what arrangements are being formed or even how symbols can be arranged. We use action language so our students will understand how arithmetic operations describe possible arrangements of objects (where the actions are later extended to symbols).

<table>
<thead>

<tr>
<td>Multiplication</td>
<td>Sets of</td>
<td>Times</td>
</tr>
<tr>
<td>Division</td>
<td>Grouped into</td>
<td>Divided by or “gazinta”</td>
</tr>
</tbody>
</table>

Concrete Manipulatives. When new concepts are introduced, we believe concrete manipulatives should be used, whether students are in first grade or high school. We use counters and Cuisenaire rods, because both entail one-to-one correspondence between objects and their value, and because they can be held in the hand. With these manipulatives, objects can be joined, taken away, made into sets, and grouped into – all the action language we use for arithmetic and prealgebra.

Representational Manipulatives. These are one level more abstract than concrete manipulatives and allow children to extend actions on objects to actions on representations. Representational manipulatives may be pictures, tally marks, or base 10 blocks. Manipulatives at this level reflect many-to-one values for the objects being manipulated. For example, a tally mark may count as a one, a ten, or a hundred; the same mark has multiple values depending on which column it occupies. Parents are amazed that our summer students solve multi-digit problems using these manipulatives long before they have memorized basic facts.

Technology. Teachers incorporate into their thematic modules one hour each morning of computer-based math activities. These may be undertaken on either internet sites or the college’s network-based math software.

Transition Activities. Many teachers move directly from hands-on manipulatives to symbolic activities as if this conceptual leap was somehow transparent to students. From a student’s point of view, understanding place value often gets lost in this transition, and it is very difficult to teach using a purely textbook or symbolic approach. Our transition activities are the same ones for all the operations – expanded notation and partial sums, products, and differences – so that the same strategy will be successful for students regardless of which operation they are performing. The partials are effective because they do not require regrouping during multi-digit operations.
Symbolic Algorithms. CAMMP teachers understand that symbolic algorithms should come at the end of a sequence of developmentally appropriate actions that give meaning to the arithmetic operations and that originate with actions on objects. By the time CAMMP students learn basic facts and perform standard algorithms, they have a rich history of problem solving actions upon which symbolic meanings can be constructed.

Alternative Algorithms. Some students exhibit a history of difficulty with certain algorithms. For these students, we provide alternative algorithms that are always different (typically less conceptually complex) from the standard algorithm.

Quantitative Solutions. These are the numerical “answers” to math problems and are the most familiar element of learning mathematics for our teachers. But since we always teach through problems solving, quantitative solutions are incomplete. They need to be linked back to the objects they represent.

Referential Meanings. These are the objects to which quantitative solutions refer. Whether referential meaning is trees, bicycles, glaciers, or onions, this meaning can only be obtained by referring to the objects in a problem solving situation. If the is no problem to solve, no situational context, then there is no referential meaning for a solution.

Checking Reasonableness. At the transitional and symbolic levels students should learn that a complete solution includes an assessment of its reasonableness. We teach reasonableness by using an Upper and Lower Limits strategy. For every problem, students determine the logical maximum value and the logical minimum value of the solution. If the computed solution lies between these two logical limits, it is deemed reasonable.

Checking Accuracy. Many teachers and parents object to the use of calculators for computing solutions or checking answers. We use a method of checking called Casting Out Nines. The method is efficient and fun; children often beg teachers, “Can we check our answers, PLEEEEEse?” We understand that this method is imperfect and occasionally results in errors. Yet, students and teachers like it so much that we prefer it as a CAMMP strategy.

Course Structure – Scope and Sequence

Our approach at Math CAMMP is to incorporate the elements above into how we plan for instruction. One of the best vehicles we’ve found is the Integrated, thematic module. Its content comes from science, history, economic, ecological, or other “theme,” and the theme becomes the organizing idea for generating mathematics problems. Teachers are assigned to grade-level teams design a five-day unit of learning activities using their theme.
Along with the integrated, thematic module, teachers integrate math technology through internet-based math games and networked K-6 math software (i.e., IBM’s Math Concepts and Larson’s Math). One hour per morning is spent rotating groups of students through our college computer labs. The technology component provides representational and symbolic levels of math content for the students at an individualized pace.

MATH CAMMP - FOR THE KIDS

The last fifteen contact hours of the course constitutes both the teachers’ practicum and the Math CAMMP for Kids. Parents will have registered their children online and paid a registration fee for each child ($220 in 2010, with ample scholarships for low income students). That fee is about 30 – 40 percent lower than full day camps in the surrounding area. Although math is our main purpose, children attend a full day camp all week long. Mornings are spent doing math, and afternoons are spent doing Lego™ robotics.

Each morning, Monday through Friday, students engage in 3 hours of mathematics problem solving and games in which they learn the essential concepts underlying next year’s math curriculum in the North Carolina Standard Course of Study.

The student-teacher ratio at Math CAMMP is exceptional. Based on teacher’s grade-level interest, they may have as few as two students or as many as five. In 2010 for example, we averaged 2 1/3 students for each teacher. During this week teachers receive immediate, direct feedback from the course instructors, and they compile documentation for each student that conveys to parents: (1) their teacher impact on student learning and (2) “work on” activities for the remainder of the summer.

The visibility of math camp on an otherwise child-sterile environment has helped to illustrate how the college is in the business of developing innovative and cutting edge instructional systems.

LESSONS FOR TEACHERS

Teachers who participate in Math CAMMP gain valuable skills and strategies that help them in the classroom. They learn

- How to make math fun AND educational;
- How to motivate students to achieve high goals;
- That problem solving is a highly motivating context for teaching math;
- How manipulatives speed up rather than slow down learning;
That the same manipulatives are useful across a range of content (e.g.,
Cuisenaire rods for operations on whole numbers, fractions, and decimals);
Strategies for checking answers that motivate students to check their own solutions instead of asking “Is this right?”
How to adapt instruction to students’ levels of understanding;
How manipulatives can be used to differentiate instruction;
How to develop a hierarchy of instructional techniques;
How arithmetic and algebraic operations are related as actions;
How mathematics is a tool for problem solving, not something that simply is an end in itself;
How to plan instruction that incorporates all the elements of CAMMP;
How to develop individual IEPs based on differentiated instruction;
How to incorporate continuous assessment;
How to group students for instruction;
How to appreciate math in a richer, deeper, more meaningful way.

Teachers love Math CAMMP in part because of the direct experience with students and in part because it is unlike any other graduate course they have ever taken. And the students continue to make Math CAMMP the most popular academic/enrichment camp on campus.

REFERENCES

Is there a place for emotions within leadership preparation programmes?

Michèle J. Schmidt
Simon Fraser University, Burnaby, Canada

Abstract

Purpose – This article presents the argument that leadership preparation programmes in the new millennium should be required to train our school leaders emotionally as well as cognitively. A number of scholars have stressed that leaders are increasingly working within roles that are politically sensitive, conflicted and complex, resulting in role anxiety, emotional stress and professional burnout. Principals and vice-principals are frustrated because they are being forced to manage the marketplace, curriculum change and governance factors with an increased emphasis on accountability, marketability and globalisation, often at the expense of their primary role as educators.

Design/Methodology/Approach - Such a discussion is framed within a sociological perspective of emotions and presents the importance of acknowledging the primacy of school leaders' emotions in leadership preparation programs.

Findings – Sociological aspects of emotions are examined within a context of the globalisation, marketisation, and accountability confronting Western education and their implications for extant leadership preparation programs; the latent influences of these broader issues; and, more specifically, their effect on the emotions of leaders within a context unique to Western Canada. Recommendations for what apotropaic the role of leadership preparation programmes should play in shielding leaders from being overwhelmed from within a changing educational landscape are also discussed.

Originality/Value – An examination of the emotions of school leaders and the importance of acknowledging their emotions within preparation programmes remains an understudied topic in the field of education.

Keywords: professional programs, educational administration, educational leadership, emotions

Paper Type: Conceptual Paper

This paper presents the argument that leadership preparation programs in the new millennium need to train and assist our school leaders emotionally as well as cognitively. A number of scholars have stressed that leaders are increasingly working within roles that are conflicted, complex and politically sensitive, resulting in role anxiety, emotional stress and professional burnout. Principals and vice-principals are apparently frustrated because they are being required to manage the marketplace, curriculum change and governance factors with an increased emphasis on accountability, marketisation and globalisation. These societal issues under scrutiny in this paper provide the platform for discussion of school leaders’ emotions and leadership preparation programs. In fact, these issues are ubiquitous but often conflicted, contradictory and complicated depending within which socio-economic context they are examined. It is for this reason that while this paper argues their relevance in how the current and future milieu affects educational leadership, it is beyond the scope of this paper to discuss in detail their finer nuances as they develop into significant movements within society that are also inextricably entangled

---

1 The terms administrators, leaders, principals and vice-principals are used are used interchangeably although, internationally, they may have different connotations for some readers.
within the educational policy lattice. The discussion around definitions of these trends will therefore remain brief in order to focus on their implications as they operate within a system of mutual influence in contemporary Western society, affecting not only the emotions of leaders but also leadership preparation programs.

**Globalisation, marketisation & accountability**

Canada, like many other industrialised nations, has been affected by the inexorable trend toward globalisation, marketisation, and accountability. Shifting demographics, changing economies, and technological advancements certainly offer new challenges but also great potentialities and opportunities for our society. For some, these trends offer hope of increased incomes, job opportunities, and networking abilities. To others, they offer only inequities, disenfranchised national and civic identity, and poverty, all of which threaten to marginalise and even undermine the efforts of those who are unable to compete in international markets (McQuillan and Ravanera, 2006). Burbules and Torres (2000) argue that these trends may actually be conceptualised as ideological discourses creating an urgency, real or perceived, that is driving change within society to keep up with the new world order.

When attempting to conceptualise globalization for instance, it becomes evident that there are varied definitions and dimensions. For example, Bottery (2006) offers eight areas for discussion: economic, political, demographic, cultural, technological, American, linguistic, and environmental. Critics charge that while globalisation enhances financial and social capital in developing countries, it does so under the guise of a ‘colonization’ agenda by Western corporations. And indeed, while global organisations such as UNESCO, the UN, and the OECD acknowledge the benefits of globalisation, they also recognise its inherent dangers because these benefits are not distributed equally between or even within societies. These agencies are, however, seeking the means to ensure equitable benefits across countries that would result in equal access to strategies and actions needed to mobilise financial resources in support of sustainable development and reduced poverty. Emerging educational research on this topic reveals not only the soft underbelly of globalisation but, alternatively, its inherent innovative possibilities (Castles and Davidson, 2000; Hardt and Negri, 2002). The more powerful and salient themes in this topic include: the “McDonaldisation” of education policy (Wilkinson, 2006); the shifting roles and priorities of leaders (Bottery, 2006); the growing knowledge economy (Hargreaves, 2003); and the co-modification of education through IT pedagogy, innovation, and practices (Apple, Kenway and Singh, 2005).

Further to this, an examination of marketisation suggests a number of major trends in the literature. Two of the more salient foci may be particularly relevant within a Canadian context. These both concentrate on marketisation as a discursive and structural phenomenon. They suggest that an extant market orientation includes a lexicon that increasingly refers to students as clients and learning as an outcome, while structural metaphors depict education as a marketable commodity (Bartlett, Frederick, Gulbrandsen and Murillo, 2002). Along with this is the intense injection of concepts into school cultures that create growing concerns among scholars (e.g., Bates, 1995) about the dangers of market and industrial influences overriding the traditional values endemic to education. These forces often lead to a renewed and intensified focus on economic principles in education, such as deregulation, competition and stratification (Bartlett et
al., 2002), as well as the managerial concepts such as collegial surveillance, pressures for accountability, standardized testing, and managerial leadership (Bates, 1995).

Finally, in any consideration of accountability, this phenomenon is a nearly ubiquitous issue in education, affecting almost every other topic. Not unlike the phenomena discussed above, accountability has pervaded much of the Western world. A plethora of definitions appear in the various professional literatures. However, a widely accepted definition within education, primarily in the US and increasingly in Canada, seems to remain bound-up within large-scale student assessment frameworks that focus primarily, if not uniquely, on student testing (Earl and Torrance, 2000). The most-widely known legislation in North America to date is quite possibly the US federal act entitled No Child Left Behind (NCLB), the foundation of which seems to be grounded in an accountability system constructed entirely around student-test results. That is, a system that is largely premised on evaluating educational progress defined by student success with rewards or sanctions driving those efforts (Stecher and Kirby, 2004). In Canada, while there has been a long history of teacher assessment, all provinces other than Prince Edward Island, administer some sort of large-scale student assessment, although the scope, grades tested, sample size, format, frequency, and stakes vary widely (Volante, 2007). The provinces are often ranked by the media, depicting Alberta, Quebec, and British Columbia (BC) as leading the way as a result of their assessments, with Ontario following, and the Atlantic provinces lagging behind (Stack, 2006). Raham (1998) asserts that the Canadian education culture, in general, has an inveterate distrust of large-scale achievement data, stressing that testing is incompatible with many of the aims of Canadian education. Furthermore, the data increasingly seem to reflect regional, linguistic, and socio-economic differences rather than real discrepancies in the quality of teaching (Volante, 2007). Hargreaves and Fink (2006a) present the caveat of extant evidence revealing that tests have become progressively easier, presenting the appearance of improvement where none may actually exist.

In summary, Portelli and Solomon (2001) have observed that global forces tend to drive reform movements, resulting in concerns for the potential democratic deficiency in schools as they start to become agents of neo-liberal market reforms. These movements belie a tendency in our school systems to polarise global reforms and local school cultures as virtual antipodes. Shifting demographics of students, new technological infrastructures, and the emerging knowledge society present new challenges but also new potentialities in our schools. More importantly, they impose new demands on school leaders and their emotions (Cline and Necochea, 2000). Leaders are increasingly working within roles that are conflicted, sensitive and complicated, resulting in role anxiety, emotional stress and professional burnout. Principals and vice-principals are frustrated because they are being increasingly forced to manage the marketplace, curriculum change, accountability and governance factors. As a result, Crowson describes our contemporary era as turbulent, but he is quick to indicate that while turbulence has long marked education, things have recently become “different and perhaps more cumulatively frustrating” (2003, p. 30). In essence, both society and education are changing egregiously, and rapidly, as boundary-eroding forces destabilise both the cultural and educational norms. It then becomes incumbent upon leaders to acknowledge the force of these trends and to see the implications for potentially shaping and constraining their emotions. It becomes the role of leadership programs to inject into their curriculum the importance of taking potential leaders’ emotions into account. Therefore, what becomes relevant in this article is the way these movements and their accompanying
tensions affect the work of school leaders by influencing their emotions. All of this should make it abundantly clear that there needs to be a place for the discussion of leaders’ emotions at work in leadership programs during these turbulent times.

The nature of emotions

The study of emotions in educational administration and leadership covers a range of approaches. This paper emphasises a sociological perspective that has been commonly used to view emotions as a social construct (Kemper, 1978), influenced by social interactions and context (White, 1993; Hargreaves, 1998). This perspective distinguishes emotions from being merely psychological constructs and instead considers the contingent effect of interactions with others, environment, and context (White, 1993). In summary, emotions are contextual, political, and relational phenomena as well as the isolated psychological properties of unique individuals (Hargreaves, 1998). They exist in a philosophical dialectic as inter- and intra-personal constructs (Denzin, 1984), deeply embedded in, and configured by, people’s ability to define and achieve their purposes, by their experiences of power and powerlessness, and in their relationships with others (Hargreaves, 1998; Schmidt, 2000).

The research on educational change has, in the past, rarely taken educators’ emotions into consideration (Hargreaves, 2001). In fact, Spillane et al. (2002) concur that emotion as a theoretical construct in education, is often overlooked when examining the impact of educational reform and leadership and given the least recognition of all in leadership preparation programs. In particular, what seems to be missing in the literature is an examination of how emotions influence and are influenced by the work of educators. Some scholars are engaged in researching the topic of educators’ emotional lives and the effect of high stakes accountability (Jeffrey and Woods, 1996), as well as stress-inducing reform strategies (Dinham and Scott, 1996). Other scholars, (e.g., Geijsel and Meijers, 2005) posit that a major responsibility of administrators in organisations is to nurture a culture that provides the emotional support necessary to foster creative and meaningful identity within learning communities. As educators are affected by changes such as those discussed in this article, their professional lives are typically enhanced or demoralised, that is, filled with either positive or negative emotions. When professional roles are characterised by role conflict, role ambiguity, role distance, or confused role expectations, intense and often negative emotional reactions may be the consequence, thus making the work of principals virtually impossible to perform in a fulfilling way (Schmidt, 2000). Feelings of emotional labour (Hochschild, 1979) in these contexts often influence the emotional dynamics surrounding leadership roles and the political and economic climate within which leaders must work. Such conditions may promote intense scrutiny into the routines of schools, as well as administrators’ work in ways that publicly extol or denigrate principals by the media, parents, and the community. As a result, discerning accusatory epithets either humiliate or credit them with creating “poor performing” or “high performing” schools. Such judgments increasingly reify the power of test data into a valid evaluative criterion and inevitably apply pressure for commodification of schools. Repercussions include school leaders experiencing a wide gamut of emotional vicissitudes, ranging from satisfaction, pride and exhilaration to debilitating anxiety, shame, blame, guilt or fear (Schmidt, 2008). Intense emotions such as these may also lead to feelings of decreased commitment and possible resignation. On a more positive note, studies have also shown evidence of “bounded emotionality” wherein members of an organisation...
develop feelings of community and belonging thus creating a social unit out of the school (Kidd, 2004).

**Leadership preparation programs**

A growing debate critical of the applicability of school leadership training programs has been present since the late 1980s in the United States. In fact, a seminal report entitled *Leaders For America’s Schools*, prepared by the University Council for Educational Administration (UCEA) and the National Commission on Excellence in Educational Administration, identified key problem areas in the implementation of leadership training programs. These issues included the following: the definitional ambiguity of educational leadership; an absence of collaboration between school districts and colleges and universities; the low number of minorities and females in the field; a lack of systematic professional development; the poor quality of candidates; irrelevant and outdated curricula; a lack of practical internship/mentorship experiences; the need for licensure systems that promote excellence; and an absence of a national sense of cooperation in preparing school leaders (Hale and Moorman, 2003). Yet, despite these criticisms of leadership standards, many countries are turning to more formal standards by instituting Principal Certificates to help remediate a climate of reduced recruitment and retention in the principalship. As of 2003, at least 35 states adopted standards to guide policy and practice related to principal preparation with encouragement from The Interstate School Leaders’ Licensure Consortium (ISLLC).

Advocates believe that the ISLLC standards remain an important development in the field of educational leadership with the key goal of promoting lasting improvements in school leadership development systems by identifying and adopting change processes that combine the required policy and program elements (Hale and Moorman, 2003). Other countries that have adopted some form of leadership standards and formal Principal Preparation Program or Certification include Singapore, the United Kingdom (UK), Canada and South Africa (Mestry and Schmidt, forthcoming).

Nevertheless, critics of Principal Preparation Programs continue to debate these programs as: not being grounded in rigorous research; reinforcing the status quo; and not providing specific guidance to assist school leaders with their work, which includes their emotions about work (Barnett, 2004; Hale and Moorman, 2003). In other words, preparation programs may adequately address a leader's daily activity with appropriate training and skills but does not address global issues making a systemic overhaul a necessity. In addition, critics argue that there are a lack of ties between public education and universities; little authentic and on-going school-based experiences; little emphasis on management; and too much emphasis on instructional leadership (Hale and Moorman, 2003). Perhaps the most salient criticism is that the jobs of school leaders have altered so dramatically that neither organised professional development programs nor formal university-based programs can, at present, adequately prepare our educational leaders for the 21st century. Thus our educational leaders may be left emotionally overwhelmed and technically incompetent (Hale and Moorman, 2003).
The British Columbia context

This section discusses global issues within the BC context as well as addressing the implications of the BC socio-economic milieu and their potentially transformative effect on BC leaders and leadership preparation programs. The focus of the discussion will be on how the accumulated effect has had a profound influence on the emotions of leaders in general and on educational leadership specifically. An overarching question might be asked along with a few related questions in light of the accolades and criticisms of leadership training: Is it viable, appropriate or even possible for leadership preparation programs to prepare our educational leaders for the emotional upheavals of the 21st century? While seemingly rhetorical in nature, more practical questions for the purpose of our discussion might follow: 1. Do leaders need different skills and training from preparation programs? 2. Does the leadership job description need to be changed? 3. Where do emotions fit in relation to leadership preparation programs?

Research is almost unanimous in finding that the principal’s role has typically been key to successful schools, policy implementation, learning, and achievement (Fullan, 2002). Yet the seemingly inexorable progression of global and market change and the increasing demands for accountability in the Western Canadian school systems are shifting the educational landscape, and even challenging the traditional notion of the principal’s role as the key to successful schooling. Consequently, global forces are defining, changing, and perhaps even diminishing the role of principals as prime leaders. Not surprisingly, British Columbia, like other parts of Canada, faces declining numbers of principals and vice-principals due to retirement and attrition, and difficulties with retention and succession (Cowan, 2004). Consequently, unqualified educators are being hired to fill the gap (Cowan, 2004; Wallace, 2000). The natural and often historical impetus that has seemingly motivated teachers to become principals or vice-principals and that has provided leadership for teachers, students, and schools, seems to have gone by the wayside. Restructuring efforts seem to have derailed these historical intentions as administrators are increasingly expected to manage the environments of down-sizing and amalgamation of school districts, deal with shifting funding formulae and cutbacks, emphasise a skills-oriented curriculum, and involve parents in the governance of schools (Cowan, 2004; Glasman and Couch, 2001; Wallace, 2000). As a result, aspiring leaders are increasingly unsure about whether they even want to take the leap to leadership within this turbulent context, let alone how to meet global and market demands or how to address new accountability pressures. Here we see leaders’ emotions being shaped by the context in which they are deciding to work (White, 1993).

Do leaders need different skills and training provided by preparation programs?

Currently in British Columbia there is no standard principal preparation or certification program. Instead, universities, colleges, independent programs and schools administering certificates, degrees (e.g., M.Ed, Ed.D), and in-service leadership development determine their own curriculum. This leaves the education of leadership incongruent and unstandardised within the province, with some institutions lacking the capacity to implement appropriate leadership preparation programming or in-service opportunities. Therefore, providing principals with the necessary knowledge, skills, values and attitudes, let alone the emotional support to lead schools
effectively, has become increasingly problematic in relation to the challenges faced by a dynamic and changing educational culture.

As leaders’ visions shift to suit the changing educational landscape, leadership training must also evolve. Some researchers (e.g., Bottery, 2006; Day, Harris, Hadfield, Tolley and Beresford, 2000), claim that what leaders do **not** need right now is more competency and skill-based training. Rather, they require greater emphasis in training programs on a holistic model of assisting potential, new or veteran leaders in clarifying their values, their principles and their educational philosophy, as well as providing emotional support especially designated for these chaotic times. For example, within a context of student achievement and accountability, low levels of trust among government, school boards, unions, teachers, parents and administrators pervade British Columbia, and have spiraled into problems of retention and recruitment at leadership levels. What some scholars (for example, Hargreaves, 2003; Earl, 1995) are now requesting is more emphasis on celebrating aspects of student learning not captured in external, quantitative forms of accountability. Leaders need to work towards developing reflexive forms of student assessment that involve teachers, students, and parents (Earl, 1995; Hargreaves, Earl and Schmidt, 2002). This requires leadership preparation programs that work towards transmitting an understanding of the meanings, forms, and implications of student assessment and accountability (Stiggins, 1991). Leaders must not only understand and promote sophisticated forms of accountability, but they also need to do so creatively by fostering teamwork and distributing leadership.

Bottery (2006) suggests that educational leadership preparation programs and leaders in our schools must now frame their curriculum and their work differently in order to harness prevailing negative emotions. Within this context, then, they should be given an opportunity to explore situations through experiential training (e.g., mentorships, internships) in safe environments where they can apply these values and principles. In response to the *BC Principals’ and Vice- Principals’ Needs Survey* (French, n.d.), principals and vice-principals indicated that their most important role was acting as instructional leaders, supporting and supervising effective teaching and learning practices. Other priorities included the following: nurturing and fostering communities of collaborative professional relations; creating learning communities; and communicating and consulting effectively with students, staff, parents, and the broader community. BC leaders inevitably find themselves competing with market-driven government agendas and negotiating their practices to align with special interest groups, the union, the Ministry of Education, parents, the public, and local boards of education, rather than their own vision of what is needed within their schools. In light of these challenges, BC principals and vice-principals believe that leaders, particularly new leaders, require training to develop skills related to managing competing agendas, strategies, and skills for communication with students, staff, parents and public relations, the media, and other community agencies. In addition, they need strategies for balancing their personal and professional lives, their emotions, as well as learning to manage resources and budgets, working with collective agreements, building schedules, dealing with legal issues, and progressive discipline. Apparently, it is the belief of our BC leaders that if these foundational issues are addressed, they would be better equipped not only to deal with reform challenges creatively but also able to think about these issues from critical and higher-order cognitive and emotional intelligence perspectives to help mitigate emotional imbalance. Indeed, the newly developed document, *Leadership Standards for BC*
Principals and Vice-Principals (2006), is organised around four leadership quadrants that address some of the aforementioned recommendations: moral stewardship, instructional leadership, organisational capacity, and relationships, which are intended to:

provide the kind of competencies that schools leaders require to engage staffs, students, parents and community members in education for the 21st century...[Furthermore] the concepts of core leadership practices, distributed leadership, organizational learning, emotional intelligence competencies, data informed decision making, and accountability are reflected in the leadership standards (p. 7).

When asked how best to learn the aforementioned skills, BC principals and vice-principals requested collaborative models of learning in cohorts so that real-life dilemmas could be discussed with respected colleagues and trained facilitators. This could enable them to participate in the various mentorship programs, internships, or coaching programs. In fact, these respondents urged that new leaders have a mentor relationship with more experienced principals or vice-principals in the early stages of their careers.

In addition to these recommendations, an understanding of fundamental global, market, and accountability issues is required to fully comprehend their impact on policy issues, educational issues, and the ways in which they begin to reconceptualise the roles and responsibilities of leaders and the effect on their emotions (Bottery, 2006). In doing so, a full appreciation of local culture and conditions within the larger global context is paramount. Globalisation, as a concept, for instance, is reflective of processes that serve as markers for our place and meaning within the larger society (Bottery, 2006). Fullan (2004) states that leaders must be aware of issues not only within their own locale but also how they relate globally. This he terms “ecological leadership”. The moral imperative, therefore, becomes one of an expanding moral circle of concern whereby leaders must broaden their own ethical concerns beyond the purely local context to include a global concern for all of humanity (Fullan, 2004). Discussions that incorporate morals, values, and ethics must become an objective for, not only leadership preparation programs, but also the entire school community since they influence organisations, pedagogy, and student instruction (Bottery, 2006). Along with this is the need for leadership preparation programs and leaders within their own schools to recognise the need for research-based decision-making training. The promotion of principal and teacher action research in both preparation programs and within schools enables educators to contextualise global issues, all of which should shape professional development agendas. By building the knowledge capacity among their own ranks, leaders are enabling their organisations to critically examine and argue global agendas (Bottery, 2006). But more relevant to the topic of this article, the emotional dimension and accompanying literature on the nature of emotions would benefit leaders as they attempt to transform and build critical knowledge capacities.

Despite these seemingly insurmountable obstacles, Bottery (2006) urges leaders to become vigilant about the causes, synergies, possibilities, and dangers inherent in our global society. Ironically, Bates (1995) and Bartlett et al. (2002) predict that possible negative outcomes of globalization may provide the venue to strategically foster socially critical and democratic interests. Furthermore, in doing so, they may de-naturalise the economic discourse of schooling.
and restore alternative versions of public education. Then they would not simply be relinquishing old definitions of practice and limiting educational opportunities, but exploring new opportunities—opportunities that may require courage and emotional intelligence to implement. All this occurs within a dynamic sociological context as leaders work to balance the struggle to work with, and sometimes against, opposing interest groups in their jurisdictions (e.g., parents, teachers, unions, etc.)

**Do we need to change the job description for our leaders?**

In order to accomplish the initiatives discussed above, Leithwood and Jantzi (1999) suggest that the role definition of leaders should not be so specific as to constrain them from using their own principled discretion. Hargreaves and Fink (2006a) argue that leaders must focus on sustainability. Particularly in an era of “quick fixes” what is needed most are long-term solutions based on reliable structures and values. Indeed, the *Leadership Standards for BC Principals and Vice-Principals* (2006) may very well help our BC leaders embark on some of the aforementioned recommendations by providing guidance, yet leaving enough latitude for leaders to inculcate their own personal stamp on the work they do in schools. Some challenges remain endemic to the BC context, such as lack of job security and increasing vulnerability in leaders’ roles and the emotional effects that come with them. What seems most troubling to principals in British Columbia is the tenuous relationship between the Teachers’ Federation and the Principals’ Association. Therein, principals are typically viewed as the outsider curtailing collaborative improvement in schools (Wallace, 2000). Conditions such as these leave relations between administrators and teachers strained. Studies of effective leadership in the early 1980s (e.g., Blumberg and Greenfield, 1980) indicated that the quality of a principal’s leadership was dependent upon the amount of responsibility, authority and constraints to authority. Furthermore, high quality leadership seemed shaped by the factors that created the constraints and boundaries of that role. Indeed, it seems that public-sector groups and teacher unions have influenced educational governance. This, in turn, has affected the degree of flexibility a principal may exercise in making decisions, which directly or indirectly affect the quality of education and the emotions of leaders asked to provide such quality education (Ueda, 1985).

**Where Do Emotions Fit?**

According to some critics, neo-liberal agendas have resulted in administrators becoming deskilled and driven by accountability, surveillance, and measures of performance leading to a counterculture of fear and lower levels of trust in the educational system (Giroux, 2000). When leadership is characterised by conflict, change, and ambiguity, intense emotional reactions often result (Schmidt, 2000). In BC, what is important to note, is that while teachers have a nexus of support due to a strong activist union, administrators on the other hand, are increasingly vulnerable to governmental, ministerial, and board mandates. Some educators claim that the fallout of this decision has perpetuated an “us versus them” paradigm among teachers and principals (Van Bergeyk, 2005). These challenges come after decisions were made to implement or increase school closures, teacher appraisal processes, and the influence of trustees, which resulted in increased labour unrest. Of course, all of these factors continue to challenge the

---

2 The government of BC passed Bill’s 19 and 20 in 1987, which resulted in the exclusion of principals and vice-principals from the teacher federation (MacGinn, 1987).
principals’ role, their assigned level of responsibility, and their inherent authority (Van Bergeyk, 2005). As a result, opposing views concerning many policy and ideological issues exist in BC among the business sector, think tanks such as the Fraser Institute, the BC Teachers’ Federation, teachers themselves, principal associations, school boards, government bodies, and parents. Conflicting ideologies make the administrator’s role much more emotionally precarious as well as intellectually abstruse and challenging to his/her ability to prioritise responsibilities.

If we dig deeper into the currency of authority, the situation may appear rather bleak for BC leaders. In fact, the situation seems to mirror contexts outside the province, such as in the USA. There, although teachers are equipped with the academic credentials and leadership qualities, only a small percentage of teachers apply for leadership positions (Cowan, 2004). Blackman and Fenwick (2000) report that it is not education entirely that becomes a limiting factor in the principal shortage, but also emotional factors. While this paper is not specifically about the shortage of leaders in British Columbia per se, this is a critical factor, along with succession issues, when considering how best to confront the new order challenges facing today’s leaders along with the programmatic leadership preparations that are needed (Hargreaves and Fink, 2006b).

More specifically, scholars (e.g., Gronn, 2003; Fineman, 1993; Hargreaves, 2003), note that leaders are working within a role that is becoming increasingly conflicted and complex, resulting in role anxiety, emotional stress, and professional burnout. For example, principals and vice-principals are frustrated because they are being forced to manage the marketplace, curriculum change, and governance factors as a result of an increased emphasis on accountability; leaders are carrying the burden of emotional labour in greedy organisations that demand excessive physical and emotional work and commitment in order to reduce the costs of production (Fineman, 1993). These conditions typically lead to burnout and early retirement (Gronn, 2003; Hargreaves, 2003). Bates (1995) highlights the structural, relational, resource-based tensions faced by leaders that are a direct result of what he calls “fast capitalism” being mediated into schools. He also takes note of the undemocratic, anti-social, and inequitable means by which traditional schooling is being subverted, particularly with reference to cultural, social, civic, and aesthetic practices. Grace (1995) stresses that schools are increasingly being mired in contradictory possibilities that instill both confidence and doubt in school leaders.

While leaders’ varying responses to reform policies in general are due to the usual subjective nuances of human interpretation, other more specific social, economic and political factors of instability are surfacing. This seems due to an increasingly pervasive culture of fear and punishment leading to potential obstructions to the work ethic of education leaders if not addressed by pre-emptive leadership preparation programs. (Schmidt, 2009). As stated earlier, erratic, volatile or neurotic emotions are often the result of purposes that cannot be achieved (because they are unrealistic, unclear, mutually exclusive, or are constructed around purposes that belong to someone else’s agenda); feelings of power or powerlessness; and relationships that lack trust, all of which may result in anxiety, guilt, frustration or fear (Oatley and Jenkins, 1996). Haviland and Kahlbaugh (1993) note that “people . . . experience frustration, anger and despair as a result of their failure to achieve their goals which are unrealistic” (p. 315). James (1990) states that changes in self-esteem are determined not by accomplishment, but rather by the discrepancy between accomplishment and aspiration leading to anxiety and frustration. These
problems, when applied to leaders, become especially visible and compounded as they are faced with increasingly politicised roles. Leaders, then, may experience negative emotions due to their experiences with power and politics inside and outside the schoolhouse. Finally, leaders often experience negative emotions and concomitant feelings of isolation when there is an absence of emotional, or even empathic, understanding (Denzin, 1984). Woods (1983) suggests that often “the only relief for some . . . [i]s to aim for a measure of role distance, where the individual denies not the role but the virtual self that is implied in the role for all accepting performers” (p. 110). Like Goffman’s (1959) notion of managing a role, leaders may simply distance themselves from their faculty and merely go through the motions out of necessity rather than as something they enjoy doing. Worse, when leaders feel that they either lack skill or competence they might dismiss any possibility of supporting, guiding or reinforcing others out of the fear that comes with uncertainty (Schmidt 2000). Furthermore, “when conflict cannot be resolved . . . individuals will . . . abandon both goals and means and withdraw from the situation” (Calvert, 1975, p. 122). While conflict need not always be stressful (it may even be stimulating), more often it becomes an emotional burden. Hargreaves and Fullan (1996) maintain that “leading is a lonely profession” (p. 5) particularly when a leader’s decisions are constantly under scrutiny; in these situations, interactions between teachers and leaders become strained. As a result, trust and respect for leaders become diminished resulting in increased stress (Schmidt, 2000).

Indeed, stress on the job ranks as one of the primary inhibitors for educators seeking or maintaining school administrator positions (Cushing et al., 2003). Stress comes from many arenas including public criticism, high accountability demands, and high levels of responsibility while authority and flexibility are simultaneously reduced via union contracts and fiscal and legal requirements. Not to be ignored, job stress manifests itself in many ways but most obviously by causing health problems such as high blood pressure and weight gain as well as psychological symptoms of depression and anxiety disorders (Cushing et al., 2003).

In fact, when examining more closely the aspects of leadership that seem to generate the most anxiety, researchers (e.g. Schmoker, 1999) are finding that data use by principals tops the list since test data provide evidence of weakness in schools and the need for change. While it is often difficult to disentangle what causes more anxiety, that is, the use of data or change, cumulatively, both results create stress for both principals and teachers since change threatens extant routines and practices, and data can result in the termination of jobs and school closures. In these situations, principals often have to placate their faculty’s anxieties and fears about the use of data despite their own anxiety over the lack of training in leadership preparation programs when faced with gathering, organising, maintaining, and understanding data. Creighton (2001) believes that educators often fear statistical analysis since they have generally not been exposed to courses in statistical methods in leadership preparation programs. Lortie (1975) concluded in his studies of teachers’ work that they lack confidence in their own ability to raise student performance and, instead, rely heavily on the pressure and support of their administrators.

**Conclusion**

By way of summary it may be said that the leadership “landscape” is changing along with the shifting expectations for the position, the movement to define new standards for candidates, the complex balance between leadership and management skills, a nationwide focus on school-wide
improvement efforts, long hours, high stress, and an imbalance between authority given and the level of accountability expected (Ferrandino and Tirozzi, 2000). These factors have contributed to emotionally-inundated educational leaders. Further, Ferrandino and Tirozzi (2000) state that, overall, principals feel anxious about not having enough time to develop high achieving schools when having to “sell their school” to the public and parents. When taken in their entirety, accountability and its resultant marketisation highlight key obstructions to the work of education leaders. Indeed, a new era of globalisation has produced anxieties and a looming crisis of motivation where “the character becomes corroded, trust is withheld, and commitment is difficult to sustain” (Sennett, 1998, p. 31). Scase (1999) predicts that employee attitudes to work will become more short-term, instrumental, and cynical. When individuals do not feel trusted or valued, insecurity results. Within the cultures of compliance that leaders and their schools seem to exist, emotions can either be “deadly” (filled with fear, anger, apathy, envy, greed) or “dynamic” (filled with obsession, passion, delight, love, desire, trust). Leadership preparation programs are, more than ever before, key factors in preparing leaders of today, not only by including discussions about the nature of emotions as researched in the literature, but also by providing safe venues in which to discuss ways to face the changing landscape in education and, in particular, by preparing administrators to manage a complex role that has the potential of being both emotionally exhilarating or dangerously emotionally debilitating.

Principles of Andragogy in Practice:
Graduate Students’ Reflections on Learning Experiences

The paper presentation at 9th Annual Hawaii International Conference on Education, January 4-7,
2011, Honolulu, Hawaii, USA
Purpose

The purpose of this study was to explore how the learning process for adult graduate students could be facilitated according to best practice principles of andragogy. We address the question: What kind of expectations do students have regarding a research methods course (EDPS 509) focused on introductory qualitative and quantitative data analysis methods for achieving new skills essential for novice researchers?

Through the use of specific principles of andragogy, this paper will explore and summarize the graduate students’ learning experiences as they designed and implemented practical individual pilot study projects while enrolled in the EDPS 509 course. This study explores the graduate students’ personal experiences and reflections by documenting their insights on such topics as: (a) how they contributed to and supported their peers’ learning process, (b) how their peers and instructors contributed to and supported their own individual learning, and (c) how the learning environment impacted the process of learning.

Background and Context

The Department of Educational Policy Studies at the University of Alberta, offered a graduate course focused on enabling graduate students to (a) survey and practice different methods for data collection and data analysis and reduction and (b) determine best methods of data collection and analysis for their pilot studies. Students gained a better understanding in these areas, and were thus, able to further their own research projects. Establishing a safe and caring environment was a crucial factor for the students’ success. A safe and caring environment allowed the students’ to feel comfortable in their classroom environment and receptive to support from their instructors and classmates. This was achieved through written and oral feedback (from
the instructors and the students themselves) which helped the students’ to develop and refine their research projects.

The primary aim of the EDPS 509 course was to introduce students to the concepts and methods of data analysis that are appropriate for the study of educational research problems and issues. The purpose of the course was not to provide a total operational competence in any one method of data analysis, but rather, to provide an understanding of the nature of the various approaches that may be taken to reduce research data. There were three objectives for this course, namely to: (a) familiarize students with basic methods of data reduction frequently employed in qualitative studies and (b) in quantitative studies, and (c) further develop and refine data collection, analysis, and synthesis techniques appropriate for students’ research interests.

The pedagogical principles underpinning the conceptualization and implementation of the course are based in a commitment that all participants, students and faculty, bring and share different but equally critical pieces of knowledge and together to co-create a respectful and trusting educational environment where learning through practice was the norm. A fundamental premise established and reinforced in the learning environment centred on risk-taking and sharing. Through small group (groups of three or four) and whole group discussions students learned from each others’ successes and failures as they made sense of and applied theoretical research methods concepts, gleaned from readings and discussed in class, in their individual field-based research pilot studies. Such an environment maintained equality, respect, and dignity for all participants in the teaching and learning context where risk-taking was encouraged and identity explorations were safe. Creating and maintaining such an environment required establishing and maintaining the following norms: (a) people are of prime importance, and as such, bureaucratic needs must occasionally be set aside to first address students’ personal needs; (b) all students can
be successful, often accomplished by relating new concepts to students’ previous experiences and knowledge (i.e., Vygotsky’s notion of scaffolding); (c) the relationships between theory and practice are explored and made explicit through co-construction of understandings (i.e., developing and supporting others to develop analytic and synthetic abilities); (d) excellence is expected by everyone of themselves and their colleagues (i.e., constructive feedback related to conceptualizing and implementation of individual pilot study projects comes from both class peers and faculty); and (e) the collective expertise of the group far exceeds that held by any individual, including the instructors.

In addition to the face-to-face environment created which included the weekly class-time together as well as informal meetings among students and the instructors, a virtual online learning environment (Blackboard Vista/WebCT) was also created to serve as an asynchronous meeting space and a repository of class-materials (e.g., supplemental PowerPoint summaries of class discussions), supplemental readings, and additional enrichment resources such as video materials. These resources were identified and shared by students as well as generated from the course (e.g., segments of classes were video-taped and made available to students through video-casting).

**Theoretical Framework**

The theoretical basis for the analysis of graduate students’ experiences during their learning process draws on: (a) the concept of andragogy (Knowles, 1970, 1975, 1980, 1984; Marshak, 1983) and (b) reciprocal learning (Allen, 2003; Lambert, 1998, 2003).

The term *andragogy* became popular due to Malcolm Knowles’ work, which contended that a successful learning plan for adults should be based on a different set of assumptions than those of the traditional (pedagogical) learning model. In particular, his concept of adult learning
is based on the five main postulations; these are: (a) self-concept - a person moves from being dependent towards being a self-directed, (b) experience - a person accumulates a growing reservoir of experiences that becomes an increasing resource for learning, (c) readiness to learn - learning becomes increasingly oriented to the developmental tasks of person’s social roles, (d) orientation to learning - learning shifts from being subject-centred to being problem centred, and (e) motivation to learn - as people mature the motivation to learn becomes intrinsic (Knowles, 1984). Merriam and Caffarella (1991, p. 249) pointed out that Knowles’ concept of andragogy is an attempt to build a comprehensive theory or model of adult learning that is anchored in the characteristics of adult students. Marshak (1983) stated that andragogy is described by a problem project orientation; the use of experienced-based techniques; the facilitation of self-motivation to support learning; and, in general, the crucial role of the learner in acquiring new knowledge or skills. Andragogy means that instruction for adults needs to focus on the process and less on the content being taught (Tough, 1981). Instructors should adopt roles of facilitators or sources rather than lectures or graders. Mezirow (1990, p. 360) portrayed this specific type of educator as an “empathetic provocateur” where the instructor is both a committed co-learner and a caring guide while stimulating and motivating students to deeper learning and critical reflection. MacKeracher (1996) recommended establishing learner networks through small group and peer teaching techniques that lead to the formation of peer relationships and potential study partnerships and alliances. Such collaborative learning is foundational to adult education practice, where communicative interactions and an exchange of knowledge among peers and instructors is shared; thus students are able to renegotiate existing meanings, co-construct new meanings, and let go of unviable meanings (MacKeracher, 1996). Participatory and active learning teaching enables students to discuss, practice, and apply their learning individually and
collaboratively, rather then learning in a passive context that promotes information-giving teachings (Silberman, 1996). This model of involvement highlights a learner-centered approach which focuses on: the autonomy of the student, in terms of choice within the learning situation: responsiveness to the students’ desires and learning methods; full commitment to the act of learning; learning as a process and not as a possession (Thomas, 1991); developing a sense of competency; and organizing their meaning-making processes (Perry, 1970).

Many decades ago, Kurt Lewin (1948) advocated that learning environments should provide a sense of belonging, security, and freedom to make such choices. Therefore, this learning environment could reduce levels of distress and fear by building mutual trust, respect, safety (Knowles, 1975), and enhance self-esteem (Brundage, & MacKeracher, 1980). It is important to note the holistic learning approach, which means that the learning process concentrates on the emotional, relational, physical, metaphoric or intuitive, and spiritual abilities combined together with the cognitive, and intellectual elements (Griffen, 1988; MacKeracher, 1996).

On the other hand, this learning process might be viewed as complicated and painful, as it might create an emotional upheaval for the students, impacting their family and work commitments (Cranton, 1994). Researchers have expressed that “[l]earning through higher education is not just a mental journey; it also is a very treacherous journey engaging the heart and identity of the adult” (Kasworm, Sandmann, & Sissell, 2000, p. 458). Kasworm et al. (2000) stressed that postsecondary educational institutions, such as universities, should provide support that works with, instead of in opposition to, the adult life-world. Lave and Wenger (1991) declared that this deeper learning is best done in the learning communities where the being of the student is not denied but is a part of a situated and collaborative compromise.
One of the approaches which helps to create this favourable learning environment is reciprocal teaching. It is a cooperative learning instructional method, in which natural dialogue models are used to reveal the learners' thinking processes about a shared learning experience. Instructors foster reciprocal teaching through their belief that collaborative construction of meaning between themselves and their students will lead to a higher quality of learning (Allen, 2003). Students take ownership of their own roles in reciprocal teaching when they feel comfortable expressing their ideas and opinions in an open dialogue. The learning community is able to reinforce understanding of concepts, as well as to see, hear, and correct misconceptions that otherwise might not have been apparent to fellow community members. All members of the community have a shared responsibility for leading and taking part in the dialogue during the learning experiences (Hashey & Connors, 2003). Lambert’s (1998, 2003) work redefined leadership as constructivist learning which entails actively creating knowledge (Le Francois, 2000). Specifically, social constructivism emphasizes that learning occurs when people interact with one another in order to construct knowledge, which happens within collaborative learning environments (Barker, 2001). When defining leadership as constructivist learning, Lambert remarked that:

The key notion in this definition is that leadership is about learning together, and constructing meaning and knowledge collectively and collaboratively. It involves opportunities to surface and mediate perceptions, values, beliefs, information, and assumptions through continuing conversations; to inquire about and generate ideas together; to seek to reflect upon and make sense of work in the light of shared beliefs and new information; and to create actions that grow out of these new understandings. Such is the core of leadership. (pp. 5-6)

**Method and Data Source**

To investigate the facilitation of an adult learning environment described by trust, respect and risk-taking, we examined our individual practices as graduate students (3 master students at
different stages of their degree programs, of the total of 12 enrolled in the course). Reciprocal learning conceptualized by Lambert (1998) has been used to conceptualize this study. A constructivist pedagogy was used which respects multiple realities and allows one to “create mutual trust, hear each other, pose questions and look for answers together, and make sense of our common work” (Lambert, 1998, p. 18).

The main research approach used was autoethnography (Patton, 2002; Thomas, 1993). This was used to uncover and co-construct deeper understanding of how the adult learning environments facilitate reciprocal learning and teaching relationships. As expressed by Bullough and Pinnegar (2001), we were drawn to autoethnography as a form of self-study to “provoke, challenge, and illuminate rather than confirm or settle” (p.20). We examined our experiences and reflections around the establishment and maintenance of norms supporting individual and collective learning. This inquiry began in January 2010 and data collection and analysis were completed by August 2010. Data were created and collected through a series of open-ended format questions that students (co-authors of this paper) responded to. During the thematic analysis, we read and compared the data to categorize themes related to the purpose of the study (Berg, 2004; Merriam, 1998; Patton, 2002). Students’ verbatim quotes have been used to capture the significance of shared and diverse experiences and to support the conclusions.

Trustworthiness of the collected data and the following analysis was obtained through member checking of the thematic interpretations (Bogdan & Biklen, 2007). Each student verified, corrected, and elaborated upon the emerging themes and supporting quotes.
Students’ Expressions

This portion of the paper describes the students’ “wish list” for learning, it also examines whether the instructional approaches as implemented and content of the course fulfilled their needs and expectations. We also discovered the students’ points of view for specific learning experience and environment, including (a) how students’ contributed to their peers’ learning, (b) how peers/instructors contributed to students’ own individual learning, and (c) how the learning environment impacted the process. Finally, we also examine how well this course fulfilled students’ expectations regarding the learning of new research skills essential for novice researchers.

Expectations versus Reality: Students’ Words on the Learning Process

Students are well equipped to critique the value of their learning experiences in higher education and we should trust their insights and intuitions on these matters. In general, students are in a reasonable position to critique the more tangible, short-term components of their experience and more general aspects of the process of higher education. Students can be realistic arbiters on the degree of impact from the following: technology integration, the quality of teaching spaces – real and virtual, and the teaching facilitation skills of academic staff. Students’ posses a fairly straightforward vision for teaching styles they prefer. The fundamentals of effective teaching, clear goals, feedback on progress, transparent assessment requirements, and grading practices are keystones to their expectations. They also welcome personal interaction with instructors and being treated as individuals by instructors who show concern for their progress. These expectations thoroughly correspond with what the literature articulates as generating an effective higher education environment (e.g., James, 2002; Ramsden, 1992).
Students were asked what kind of expectations they had regarding the EDPS 509 course and for achieving new skills that are essential for novice researchers, and whether or not this course fulfilled them. If the students’ responded yes, we wanted to determine what exactly it was that helped them to choose their own approach for their individual research projects. The students’ expectations and reflections after having finished the course are described below:

Prior to participating in EDPS 509, I had minimal background knowledge surrounding both qualitative and quantitative research methods. I held high expectations of this course. I wanted to gain new skills essential for future research projects. I wanted to learn more about the effectiveness of using both quantitative and qualitative research methods together for research projects.

I wanted to gain more insight surrounding research interview processes. Prior to this course, I had minimal experience interviewing people for research purposes. I wanted to learn more about the different types of questions available [...] when forming an interview schedule. I wanted to heighten my questioning skills in order to keep interviews on topic while retrieving insightful information.

I wanted to heighten my skills required to observe an environment more thoroughly. I wanted to gain more knowledge as to what is worth writing down and what is not when observing an environment. I wanted to learn some effective note-taking techniques (such as how to keep from looking up and down all the time with the possibility of missing some important occurrences).

I wanted to learn more about statistics, populations, standard deviation, normal distribution, kurtosis, calculating the median, mode, and mean, analyzing residuals, regression lines, plotting data, and Z-scores. I wanted to gain greater skills working with numbers. I wanted to be able to understand what the numbers refer to when described in scholarly papers.

I especially enjoyed the courses assignments. I felt that each assignment built upon the previous assignment, and they were very practical assignments. Each assignment helped prepare me to write my pilot study, and my pilot study has helped me to write my Thesis. I also liked the order of the assignments. The semester started off by first engaging in qualitative research. [...] These were very practical assignments and very beneficial for me. [...] I had to learn to do interviews through experience and practice; it is not something that cannot be learned vicariously. [...] I also really appreciated the feedback I got on my assignments, because they were very applicable to my final assignment which was my pilot study. I was able to use the feedback to self correct myself for when I worked on my pilot study. I learned it was a lot harder to observe someone in a setting, and how to make good observation notes. It was very interesting to learn how to observe, and it led to even more questions that I would not have though of if I hadn’t taken to the time to sit and observe the situation. I am appreciative that these assignments came first before the quantitative portion of the course. Having the interview and observation assignments come first, helped me to learn how to conduct my data collection for my pilot
study. I was then able to work on my data collection and data analysis during the rest of the semester. The course then started quantitative research, and I liked that assignment built upon what we had learned that week. And that each statistical assignment built upon the previous assignment, reinforcing the concepts that we had learned. And lastly, I am thankful for the feedback I received on my pilot study. My pilot study has helped me decide how to proceed with my Thesis research and has been completely beneficial for me.

EDPS 509 exceeded my expectations! I gained a tremendous amount of new knowledge surrounding the major elements required in qualitative and quantitative studies. The subjects taught that helped me choose the mixed methods approach for my future research project were: understanding the importance behind standard deviation, normal distribution, regression lines etc... I also found comfort in observing environments of interest due to the class assignment and lectures. My interviewing skills are still improving however I know they are much more effective than they were prior to this course.

I expected to learn how to plan and execute a small scale study related to my thesis research. The course definitely helped me to do this.

I feel that I benefited greatly from taking the EDPS 509 course; without this course, I do not think I would feel as prepared as I do to write and finish my Thesis and I am very grateful for this. I am grateful because the knowledge I have gained from my EDPS 509 has been tremendously useful and advantageous to me.

Students also shared their preferences regarding how the course materials (e.g., textbooks, PowerPoint files, video files, etc.) and course activities (class time, use of Blackboard Vista/WebCT, etc.) were helpful in enhancing their learning in this course. In their words:

All the course materials and activities were helpful in my learning. The textbook provided me with the opportunity to learn in more detail interview and observation processes. Following class lectures, I went back to re-read the assigned chapters and was able to gain a deeper understanding of the material. When completing the first two assignments, the textbook was very useful. I was able to go back and ensure that I understood the types of questions used in interviews, learn more about sampling strategies. [...]

The PowerPoint files allowed me to go back and review the material learned during class time. The PowerPoint files were especially helpful with assignments B1 and B2 [introductory statistics] as they clearly identified the elements required when making the necessary calculations (e.g., standard deviation). [...]

The video files were extraordinary! I viewed the video files over five times each as I completed my assignments. In fact, the video files helped me find mistakes in my work prior to handing in my assignments. If I was not able to view the video files in slow-motion, as I did, I would not have recognized some areas where I made simple errors. I would have handed my work in with those mistakes still on the paper. This is the first
class I ever experienced video files. They proved to assist me in receiving 15/15 and 15/15 on two major class assignments. I want to make it known that I did pay attention in all my classes, but these video files allowed me to break the lectures down and hone in on areas that I may have misinterpreted.

The class time was well used. The instructors were fully prepared for each class. The class lectures lined up perfectly with the assigned readings and assignments. I believe the instructors provided us with ample time to ask questions whilst providing us with the perfect amount of information required to successfully complete the assignments.

WebCT provided me with the opportunity to view how my assignment marks related the class marks. WebCT also informed me when the video files were available and how to download powerpoint files. I used WebCT on a regular basis throughout the course. The course materials and activities helped to enhance my learning by providing me with many tools to be able to review the material after it was taught. Not all students learn the same way. I, obviously, learn by having the opportunity to review, review, and review even more the material being taught. Without the variety of class materials and activities provided by the EDPS 509 instructors, I would not have been able to learn as much as I did in this course.

I wish that each class had been video recorded, because I do not want to forget anything that I learned! I feel that everything I learned was important, and would like to one day be able to use all of the knowledge I’ve gained to write research documents. I thought the textbook for the qualitative portion was well written, and I still refer to it now. I enjoyed that all the documents used during the course were available to the students after the class. I have saved them, and I plan on referring to them whenever I need them. I did feel that the quantitative textbook was slightly confusing, but that could be my own lack of abilities for statistics. It was also very nice that my professors answered the weekly chapter questions, because I had a hard time answering all of those questions. I think the instructors did a good job of maximizing the use of WebCT.

The activity and class discussion was very advantageous to my learning on this topic. The textbook itself wasn’t overly helpful. But I did find that the chapters for the quantitative sections of our course that were on WebCT to be very helpful. I found I learned the most from talking to my two professors one on one, and from the powerpoint presentations that were given in class. WebCT was helpful, but mainly for accessing course readings and materials.

Finally, students were asked how - in their opinion - this course and/or content might be improved. What students would like to change or improve in this course is described below:

[...]I believe the intensity of this course prepared me for what is required in order to succeed in a PhD Program. I think the assignments were well prepared with ample time to complete them all. The course readings were sufficient. They challenged me to keep up with my work and to pay close attention to the “big ideas” in the literature.
I personally could have done with more feedback, but I am someone that is really interested in learning what my professors thought. I view my professors as experts, whereas, I am only a student and I am here to learn from them. So I very much value my professor’s opinions. But I’m very fanatical about feedback. I like that professors tell you what they liked or what they didn’t like. But I am someone that would like great detail in my feedback.

One thing that puzzled me on the first assignment (Interview) my instructors wanted to give us our assignment back before we handed in our second assignment (observation) because they wanted the feedback to help us write our second assignment. I found that my feedback for my interview did not in any way help me write my observation assignment. I think everything was so very well done! And there was so much that was covered in a short amount of time. Maybe it should be a 2 semester course. [...] I really enjoyed the qualitative research portion and the activities and group work. I do have one suggestion for the quantitative research portion. It would have been beneficial for me after every statistical assignment to go over a journal article that used that specific statistical analysis. I think this would have solidified how that specific statistical analysis is used and how to make sense of the data; or a supplementary activity that you can read or do on WebCT on your own time, or a supplementary class with an activity like that. I would have gone.

It probably would have been hard to generate our own data as a class to analyze, but that could have been fun and more meaningful because the students would be personally involved. But I understand that there are time constraints.

Maybe for the qualitative section, they could look at other qualitative data collection techniques? The interview was helpful, but maybe instead of the observation, they could do a focus group?

For instructors it was very important to know whether students would recommend EDPS 509 to other graduate students and “why?” The students’ voices are described below:

This is a great course to help you focus your research area and give you a concrete way to practice your research.

I would definitely recommend it and I have been. I talk about it to other students, and they were sad that they missed out on the opportunity of taking this class. At the end of the semester I presented my pilot study at research day, and a lot of the students were asking when I had time to do this during my course work and I explained it was part of my course work. I wish there were more classes like this! I’m thinking of doing my PhD studies, and I’m hoping that the department has something good like this on their course list. I tried to get into some similar classes outside of the department, but couldn’t get in because the other departments had to let their own students in first and there wasn’t any room for me. I think this class was really beneficial, and very memorable to me. Everything I learned was very applicable to my own study, and had prepared me for areas of interests I have and would like to explore in the future. I think this has been my favourite class. After having “graduated” from the class, I feel very prepared and ready
to engage in research and begin and finish my Thesis. It’s a wonderful feeling, and I think everyone could benefit from this class if they are writing a Thesis.

I would highly recommend EDPS 509 to other graduate students. In fact, I have already spoken highly of the two instructors and the course to a peer who begins his PhD Program in Fall 2010. I believe any graduate student who enrolls in EDPS 509 and is fortunate enough to have the two instructors I had will benefit from the phenomenal learning environment. EDPS 509 has provided me with the tools “to be dangerous” as I continue my journey toward becoming an educational researcher. I can now make sense of the numbers in scholarly papers. As well, I can justify the positive implications a qualitative study can generate.

Students who took EDPS 509 course wanted to gain new skills essential for their future research projects. They expected to gain new knowledge surrounding the major elements required in qualitative and quantitative studies and mostly they benefited from taking this course. Students perceived all the course materials and activities very helpful in their learning process. Mainly, the participants’ highlighted: (a) the video files, (b) the PowerPoint files, (c) Blackboard Vista/WebCT virtual learning environment, (d) class time use, and (e) the text book, as the most helpful course materials. Regarding changes which could improve this course, students suggested to: (a) give them more feedback, (b) work on some statistics contained in the articles, (c) generate “class” or “students” data and analyze it together, and (d) introduce other qualitative data collection, as well.

**How students contributed to their peers’ learning**

It is essential to the adult education practice and this graduate course, that each student will have the opportunity to engage in collaborative learning, to negotiate existing meanings, to co-construct new meanings, and to let go of unviable meanings (MacKeracher, 1996).

Throughout this course, the graduate students engaged in ongoing meaning making through collaborative dialogue, planning and writing with their peers. How and to what extent students contributed to their peers' learning is described below:
I provided engaged, constructive feedback throughout the course. In particular, a classmate and I helped each other edit our final projects, in order to enhance our own learning by learning from each other.

I consistently collaborated with my peers during EDPS 509. I ensured that my peers were able to collaborate during and after class time (e.g., I personally drove to some of my peers’ houses to pick them up so we could work collaboratively on assignments). Throughout the course, I asked and responded to questions appropriately during whole-class discussions. I do not believe I interrupted the flow of the class due to a question. I never talked to others while the instructors were teaching. I consistently gave my full attention and respect to the instructors when they were teaching. I believe I offered caring feedback to group members during small group discussions. When I noted that a group member made a mistake on an assignment question, I quickly pointed it out. As I reviewed the video files, I noticed there were some areas that my group members did not understand, so I contacted them to make sure they had an opportunity to learn from their incorrect responses prior to handing in their work. I never gave them the answers. I tried to teach them that what they had put down as an answer was not correct and strived to get them to understand why.

I was able to explain some things in greater detail that they didn’t understand during group work. I think possibly I was able to contribute to my peers’ learning during the times we were given class discussion times; I was able to give peer feedback during this time.

Students contributed to their peers’ learning process in a variety of ways, including: (a) contributing in class discussions; (b) helping each other to edit their final projects; (c) asking and responding to questions during the whole-class discussions; (d) collaboration with peers during and after class time; (e) providing constructive, engaged, and positive feedback; and (f) provoking reflective thinking. Meaning making and learning were improved within this collaborative learning community (Lave & Wenger, 1991).

**How peers and instructors contributed to students’ own individual learning**

The design of this graduate course reflects Lambert’s (1998) conceptualization of reciprocal learning (i.e., reflection, inquiry, dialogue and action) and Griffen (1988) and MacKeracher’s (1996) notions of holistic learning (i.e., the learning process addresses emotional, relational, physical, metaphoric or intuitive, and spiritual capacities in addition to cognitive and
intellectual capacities). Students described how their peers and instructors contributed to their holistic and individualized learning. Drawing on the students’ voices, the nature of reciprocal and holistic learning within this learning environment is described below:

I enjoyed the group work we did in EDPS 509, it was very beneficial. I found that peer debriefing helped me to see other perspectives and ways of looking at my own data. It was nice to hear what my peers had to say, we are in similar situations and can learn from each other. I liked that our instructors gave us an opportunity during class time to talk about our assignments and what questions we have or problems we had run into. It was very practical because if you found yourself in a similar situation, you would know how to handle it. I really liked that we were able to have different groups during the semester instead of the same ones all the time.

My peers contributed to my learning by (1) responding to instructor questions during whole-class discussions, (2) collaborating willingly in small group discussions, (3) providing constructive feedback on assignments, and (4) sharing their knowledge outside of class time on assigned topics.

The instructors were always good at pausing and asking if there were any questions. Also, if I had any questions not answered in class I was able to email either instructor and ask for help, and I would receive a prompt reply with an answer or an invite to talk about the question in person. For the quantitative assignments, the instructors held extra support classes to help any student with their assignment. Also, each instructor provided two sets of feedback on each assignment. This was beneficial to receive two different perspectives on each of the assignments.

At the beginning of the semester, the instructors had the class fill out a pilot study proposal form which was a rough outline of what your pilot study would entail. I really appreciated that we had an opportunity to fill out this sheet during the first week of class. I already had a good idea of what my pilot study was going to be about, so I think it was easier for me to fill out compared to some of my classmates who had not thought about what they wanted to do yet. Having already an idea of what I wanted my pilot study to be on before coming to class allowed me to benefit from the feedback on my proposal sheet. I knew what areas I had a good understanding of, and the areas that I would need to work harder on that semester. For instance, I had already written an introduction, literature review, and methodology section in a previous class, I knew that I would have to pay closer attention to the data analysis section because I lacked in that area.

The instructors provided support and feedback in so many ways. First of all, they both were positively responsive to students’ questions during class time. They never seemed to showcase a negative attitude toward any question aimed toward the topics being covered. They stopped the lectures when they thought the material was getting intense to ensure we understood the material. Secondly, after class the instructors did not run out of the
classroom with their books. They did not avoid any students who had questions after class.

Finally, both instructors made themselves available to meet with students outside of class time. As I stated above, their approachability was exceedingly high! Both instructors were very accessible when I had specific questions regarding the assignments. I met with one instructor on the weekend and the other during weekday office hours. Both instructors were willing to help out in any way they could. Their willingness to meet outside of class time definitely provided me with the opportunity to reach a higher level of learning in this course.

The feedback that the instructors provided was effective. Both instructors had individual ways of strategically assessing my work whilst providing constructive feedback. Although I did well in the course, I still had many questions surrounding my work because I wanted to learn from my areas of weakness. Both instructors communicated my areas of weakness in a positive manner (e.g., pointing out that my writing could have been stronger in my pilot study).

The instructors provided much support and feedback throughout the course, in person, via email, and in writing. It was so wonderful having 2 professors and receiving 2 sets of feedback! Whenever I had a question, I always felt like I could ask either professor, and I did, and I was always pleased with the help I received.

Students described many ways that peers and instructors contributed to their own individual learning, including: (a) illuminating and supporting students with their research topics; (b) sharing knowledge, expertise, and resources; (c) asking questions and providing feedback to clarify context used within the pilot study; (d) creating valuable networking opportunities; and (e) being courteous, and empathetic. In general, students felt that their learning was enhanced by individual and collective feedback and reflection.

How the learning environment impacted the process

From the beginning of the course, the students and instructors discussed and planned the creation and maintenance of a respectful learning environment. Adult learners should have learning conditions which enables self-directed learning available to them. The course instructors recognized this and sought to provide ongoing opportunities for the graduate students to
diagnose their needs, set personalized learning goals, design and implement learning, and reflect
on and evaluate their own learning (Knowles, 1984; Tough, 1981). Below are the students’
voices which illustrate how and to what extent this environment impacted adult learning:

The instructors created and maintained a climate of mutual respect by allowing us to share our feelings toward the topics being taught. When I had difficulty grasping certain concepts, the instructors were empathetic toward my level of understanding. They never let me believe I was out of place. They walked around when we were in small groups and assisted in any way they could as we were discussing the assigned topics. The instructors made me believe they were “partners in my education”. They held positive views of all the topics being covered while sharing their personal thoughts surrounding specific areas they personally believed were most effective (e.g., qualitative vs. quantitative research methods).

The instructors showed me a great deal of respect when I missed one class. The reason I missed that class was to present a research poster at a conference in Indianapolis. The instructors were happy for me when I told them of this opportunity!

There was always an open and relaxed feeling in the class. From the very beginning, both instructors were warm and kind, yet had high expectations for us. It was wonderful, because it made you want to work harder for them! We had many collaborative activities, and when we worked in small groups with other classmates, the activities were very student-directed. I felt like they were letting us take ownership over our own learning, and that was great.

I believe that both instructors endeavored to create and maintain a climate of mutual respect. I think it’s harder to learn in a poor environment, or to feel comfortable in coming to class or listening to an instructor that you do not respect. During the middle of the semester, the instructors had the students fill out a feedback sheet so that they were able to adjust their lessons to meet our needs and our desires. That was nice because it showed that they cared, and wanted the classes to be productive and meaningful for everyone. The instructors always asked if we had any questions during the lecture. Also, the instructors sent out an email after every course to review what we had done, and what we would be doing next class, and what we needed to do before next class. The professors also sat in on small group discussion to hear our thoughts, and answer any questions and were more accessible then large group discussions.

My peers created and maintained a climate of mutual respect by taking time to discuss topics outside of class time. My small group was very helpful as I gained many new insights from our discussions. I never believed I was asking a “bad” question during class. My peers would support me by agreeing that they shared the same difficulty as I did. This in itself helped create a trusting environment. I have taken some courses where I have asked questions that seemed to be “bad” questions as others would answer them
without giving the instructor time to listen to the full question. This type of scenario can force a student to never ask questions.

The students in this course were highly respectful to one another at all times during and after class time.

*My peers were very involved in the small group activities, and [...] we all gained a lot from them.*

*I felt that my peers endeavoured to create and maintain a climate of mutual respect. It was nice to have group activities where I got to interact with new people I didn’t know and learn more about them and their research interests. I felt very comfortable in the classroom, and enjoyed being there and working in groups.*

Together, the students and instructors endeavoured to create a learning environment that supported each student’s individual development. This learning environment was characterized as safe and respectful due to the: (a) establishment of trust, (b) recognition of both students’ and instructors’ expertise, feelings, and experiences, (c) accessibility of instructors and peers through face-to-face interactions and on-line or e-mail correspondence, and (d) opportunities for risk-taking, asking questions, and learning from successes and mistakes. Students discovered a sense of belonging and security (Lewin, 1948). Additionally, within a collaborative learning environment characterized by trust, respect and safety, students’ fear, frustrations and distress about the research processes were diminished (Brundage & MacKeracher, 1980). Trust was an integral factor which allowed students to feel comfortable collaborating and reflecting together. Once trusting relationships were established, the students were more open to feedback from their peers and instructors. When students had the physical and metaphorical space to dialogue, question, and evaluate their work in progress, learning became a dialectical process of consideration and reflection on alternative points of view and multiple theoretical perspectives that eventually led to more integrated understanding (Grundy, 1990).
In general, the results we have received in this study are very similar to the results obtained by PhD students in 2008 (Wright et al., 2009). It appears that the instructors who participated in this study were aware of how important it is to create such a student-centred, safe, supportive learning environment: a learning community was fostered by the participants based on the principles of adult learning in practice.

**Conclusions**

This paper summarized an empirical study of a higher education andragogical process that facilitated the development of basic research skills and understandings in participant graduate students. This was facilitated through preparation their pilot studies and familiarizing students with the basics of data analysis through the use of specific adult learning principles. Overall, the students’ experiences and perceptions of this learning environment were very positive. They would recommend this course to their peers within department or faculty. Furthermore, constructive feedback from students identified additional useful learning supports which will need to be incorporated into future course offerings.

Our findings describe how the learning environment impacted the process of learning and enabled reciprocal relationships. As well as, the students contributed to their peers’ learning and benefited from their peers’ and instructors’ contributions to their own individual learning.

While this course was viewed primarily as a positive learning experience, students’ voices illuminated how learning process could be intensified. Based on the findings and conclusions of this study, we offer the following suggestions for practice:

1. Recognize and respect the expertise and desire mature students bring to the learning environment by creating real and virtual spaces that are safe and respectful.
2. Face-to-face interactions, when possible, should be used to establish trusting relationships among students and instructors.

3. Active learning should be promoted through inquiry, collaboration and reflection.

4. Graduate students’ needs should be recognized and addressed through “just-in-time” learning to help them in their learning process – this can be facilitated through purposefully designed assignments that enable students to successively build knowledge, skills, and understandings they perceive as relevant and important for their educational and career aspirations.

5. Class groupings should be done with flexibility giving students a balance between choosing who they will interact with and rotate through groups to maximize exposure to diversity of perspectives.

6. Students should have access to a variety of different research perspectives and understand how each tool is best suited to address different types of research questions.

7. Instructors should assist students with making connections between theory and practice, novices are not able to make these connections easily and need, at least initially, the guidance that can be provided by more experienced instructors.

8. Students should be provided with formative as well as summative feedback on assignments – assignments should build on previous knowledge, either already possessed by the learners or acquired through class experiences/assignments designed to scaffold subsequent learning.

THE GOOD BEHAVIOR GAME AS A MEANS TO TEACH APPROPRIATE SOCIAL SKILLS IN A CLASSROOM SETTING

Carol Bradley, MA, RD, LD
Stephen F. Austin State University

Mary Olle, MS
Stephen F. Austin State University
Social skills refer to learned behaviors that enable a person to interact with others in ways that evoke positive responses and decrease the likelihood of negative responses. However, not all children develop the same degrees of socially acceptable behavior and so may experience negative relationships with those they come in contact with in the school setting. (Elliott, Roach, & Beddow, 2008). As a result, distracting or disruptive behaviors have become the primary reason for referrals for disciplinary problems in the school setting (Wright-Gallo, Higbee, Reagon, & Davey, 2006).

Two basic distinctions of behavior in a classroom are appropriate or desired behavior versus a target or problem behavior. “A problem can be defined as the difference between what is expected and what actually occurs” (Upah, 2008). Appropriate classroom behavior is demonstrated by following adult instructions, being on task, and appropriately engaged in the assignment. Problem behaviors vary and include inappropriate verbal behavior, refusal to comply with task instructions, leaving seat, wandering from designated work area, and sitting and staring. Factors that affect and maintain problem behavior include antecedents such as task difficulty, contextual factors, or arrangement of the classroom, and contingencies such as attention (Boyajian, DuPaul, Handler, Eckert, & McGoey, 2001, Thompson, & Iwata, 2007, Piazza, Bowman, Construcci, Delia, Adelinis, & Goh, 1999, and O’Reilly, Edrisinha, Sigafoos, Lancioni, Machalicek, & Antonucci, 2007).

Once the antecedents and contingencies maintaining the problem behavior have been successfully identified, an effective intervention can be prescribed for the individual (Boyajian, et al, 2001). For example, if attention is a contingency, the intervention should include use of the most reinforcing form of attention for the individual, contingent on appropriate behavior (Kodak,
Northrup, & Kelley, 2007). In addition to external management contingencies, individuals can even be taught to self-regulate the problem behavior once instruction on accurate identification of appropriate or desirable behaviors has been given (Bolstad, & Johnson, 1972 and Ninness, Fuerst, Rutherford, & Glenn, 1991).

Relevant information on a target behavior(s) can be gathered through direct observation using a variety of assessment instruments (Hintze, Volpe, & Shapiro, 2008). It is imperative that the observations are conducted using standardized procedures with high interrater reliability and are objective in nature. Often, these procedures can be used to observe multiple behaviors concurrently (Hintze et al, 2008).

Several decades of research on functional behavioral assessments (FBA) have demonstrated FBA to be an effective procedure for identifying contingencies that maintain disruptive behaviors in a classroom setting (Wright-Gallo, et al, 2006, Mueller, Sterling -Turner, & Moore, 2005, and Reid, & Nelson, 2002). “FBA can be defined as a set of procedures that allows for the identification of relationships between the unique characteristics of the individual and the contextual variables that trigger (antecedents) and reinforce (consequences) behavior “ (Steege & Watson, 2008).

As previously mentioned, referrals for inappropriate behavior are common in schools. School psychologists associated with preschools and primary schools (K-2nd grade) have many referrals for children who need to learn social skills as they adjust to the school environment. When confronted with the observations by appropriate school personnel that a child needs help managing behavior at school, some parents are reluctant to proceed any further. However, many
parents recognize that their child needs additional help and willingly sign forms for the child to be observed and to begin an intervention.

One such child in a public primary school was observed and parents requested intervention because the child also demonstrated inappropriate behavior in the home. This child also demonstrated problems the previous year in kindergarten, including tantruming. His peers referred to him as “the bad kid” and many avoided interaction with him when possible. Observation procedures and an intervention plan were put into place following an individualized education program (IEP) meeting which included the parents.

The student was referred for assessment and treatment based on the following criteria: 1) a wide range of behavior problems according to teacher and classroom observations by various district personnel, 2) teachers were willing to participate and implement interventions, and 3) the parent or guardian provided written informed consent and permission for the student to participate. The school psychology candidate obtained permission from the parents and IEP team to employ additional behavior intervention plans (BIPs) that had not been attempted previously.

The student, identified here as Brent (fictitious name), presented as a 6-year-old male exhibiting various problem behaviors in the classroom. He was enrolled in the PACE (gifted and talented) program in the district. He was not under the care of a physician nor diagnosed with any medical or psychological disorder at the time of referral for prevention assessment or treatment.
Accessed by the IEP Team.

1. **Focal Point** is a software package designed to provide tools for conducting FBA procedures using notebook computers (Ninness et al., 2000).

2. The **Automatic graphing** (Alessi & Kaye, 1983) is a procedure that enables an observer to record ongoing behavior while simultaneously creating a graph representing the distribution of problem behaviors in the classroom setting.

3. **Informal interviews** were conducted with Brent’s parents and members of the IEP team to address Brent’s social needs.

4. A review of records included all of the discipline reports, achievement testing, and academic assessments that were compiled on Brent during his school history.

**General Procedures for the Development and Testing of FBA Hypotheses**

IEP team members included the following: principal, school psychologist, regular education teacher, instruction specialist, school counselor, school psychology candidate, and supervising school psychologist. The team reviewed the following assessment data (described above) in order to develop hypotheses regarding variables that might be interacting with Brent’s problem behaviors.

**Automatic Graphing Outcomes.** The *automatic graphing* procedure created by Alessi (Alessi & Kaye, 1983) and automated by Ninness (Ninness, et al 2000) enables the observer to record ongoing behavior while simultaneously creating a graphing presentation of what occurs throughout a session, across multiple sessions, or days of observations. The rotation scan is used when the comparison group and identified student are seated in close proximity to each
other. In this procedure, the observer attends to only one of the comparison students in addition to the identified student during each observation interval. During each interval, the observer rotates to the next comparison student but maintains concurrent observation of the target student. Following the observation, the graph can be drawn by hand or on a computer spreadsheet. Graphed outcomes from Brent’s automatic graphing/rotation scan procedure are illustrated below.

Disruptive behaviors included talking-out or making inappropriate sounds without the permission of the teacher, hitting or physically annoying classmates, leaving desk to do unassigned or inappropriate activities and tantruming. Figures 1-3 demonstrate rotation scan comparison of identified student with 3 separate sets of other students in the same classroom. Intervals were set at 10 seconds. Groups were changed every 30 minutes as part of normal classroom routine. Figure 4 shows combined rotation scans. The identified student exhibited the following behaviors during the observations: talking out while teacher was talking; poking a container of school supplies in front of him; taking a paper clip and putting it in his mouth, then bending it; turning to child seated next to him; poking neighbor with eraser end of pencil; wiggling pencil back and forth; and making distracting sounds with his mouth. He was also observed calling out his teacher’s name, tilting his chair, and pulling on student teacher and hugging and kissing her. The identified student was reported to tantrum at times when redirected, but this was not observed by the school psychology candidate.
The Good Behavior 7

Figure 1 Seated on floor in a group with teacher talking to entire class.

Figure 2 Seated at desk completing individual assignment

Figure 3 Seated on floor in small groups
Brent’s level of inappropriate and off-task behavior was clearly in excess of the comparison students throughout these 20-minute observations. These initial observations suggested that peers in Brent’s immediate proximity (comparison students) were not exhibiting off-task or socially inappropriate behaviors. This supported the teacher’s assertion that the other students in her classroom were in compliance with her general classroom management procedures.

Although the automatic graphing procedure provided only an overview of the identified student’s level of exhibiting problem behaviors relative to other students who are in close proximity, it did allow the observer an opportunity to take preliminary note of the conditions that might be associated with a student’s problem behaviors. During this time, the observer noted that Brent occasionally seemed to be responding inappropriately to gain peer attention as well as negative attention from his teacher.
Outcomes from Interviews During an interview with Brent’s parents, it was noted that Brent had a history of behavior problems and they seemed to have little control of him in the home. Brent’s parents participated in the IEP meeting and were fully in favor of developing a treatment package that included social skills training. Moreover, his step dad indicated that they might be interested in learning how to adapt these strategies to the home environment.

Review of Records Brent’s most recent assessments were reviewed by the school psychology candidate and her field-based supervisor. In general, these records indicated Brent is very capable academically, however, sometimes Brent is unwilling to initiate and sustain some academic tasks such as writing sentences. Brent is ranked as the number 2 student academically out of 17 total students. His developmental reading assessment score (DRA) score of 28 indicates he is reading at the second grade level.

FBA Outcomes and Data-Based Decision-Making Steps The FBA included a series of individualized steps that allowed data-based decisions with the objective of helping Brent to realize his academic and social potential. This process included the following: 1) general assessment of the student’s behavior, 2) development of hypotheses, 3) direct observation of the student’s behavior, 4) implementation of treatment, and 5) development of a maintenance program.

Step 1. General Assessment of the Student’s Behavior: Prior to conducting a functional assessment and baseline observation, an automatic graphing/rotation scan procedure (Alessi & Kaye, 1983) was conducted. This observation system allowed the observer to monitor and record
behavior of the student while using a comparison recording of all other students sequentially. This preliminary observation system allowed the observer to compare Brent’s behavior with others in the classroom and to establish a “local norm of behaviors” in that setting. As previously mentioned, Brent’s level of inappropriate and off-task behavior was clearly in excess of the comparison students throughout the 20-min. observations. Outcomes from this preliminary observation suggested that peers in Brent’s immediate proximity were not “continually” contributing to his target behaviors. However, the observer noted a few occasions in which this might have been a variable. Generally, this observation system supported the teacher’s opinion that other students in her classroom were in compliance with her classroom management plan, although there were occasions during which Brent appeared to be responsive to negative attention.

Step 2. Operational Definitions and Development of Hypotheses: The compilation of all assessments and preliminary observations suggested that Brent was most likely to demonstrate inappropriate and off-task behavior that fell under the general heading of disruptive, non-compliance with adults, and general “fidgeting” during class time. The operational definition of targeted behaviors included the following: aggravation of peers by poking or punching them, talking out without permission, throwing things, making noises with his mouth that disrupted others, calling others inappropriate names, and making inappropriate comments or writing notes that were not acceptable in school. General off-task behaviors included fidgeting or tilting his chair for longer than 5 seconds and playing with materials, out of seat, or engaging in non-academic activities (e.g. playing with school supplies or other objects in the room) for longer
than 5 seconds.

Based on a review of assessments, preliminary observations, and existing records, the school psychology candidate hypothesized that Brent’s problem behavior could be related to at least four different variables occurring in the classroom setting. These might be maintained by one of the hypothesized variables of teacher attention, peer attention, “self-initiated,” or academic escape. If the student’s behavior appeared to be related to an effort to gain the teacher’s attention inappropriately, “teacher’s attention” was to be recorded. If it appeared that off-task or disruptive behavior were being engaged in to entertain or gain the interest of peers, “peer attention” was to be recorded. If during the course of a specific academic assignment, the target behavior appeared to be an effort to avoid completion of work assigned by the teacher, the behavior was to be recorded as “academic escape.” The “self initiated” condition was to be recorded if the target behavior occurred when no other environmental variable was apparent to the observer. The operationally defined classroom circumstances, antecedents, and consequences are illustrated in Table 1.

<td>None are conspicuous to observer</td>
</tr>
<tr>
<td>“Academic Escape” Maintained by negative reinforcement</td>
<td>Teacher present; academic materials present; teacher provide instructions</td>
<td>Teacher redirects Brent</td>
</tr>
</tbody>
</table>
Step 3. Systematic Direct Observation of the Student’s Behavior: In the next step, a series of computer-facilitated direct observations were conducted in an attempt to identify the actual conditions that were most likely to be maintaining Brent’s problem behaviors. Subsequent to these direct observations, the FBA/baseline outcomes were to be graphed such that a treatment protocol could be developed by the IEP team.

Step 4. Implementation of Treatment: Treatment procedures were determined subsequent to conducting the FBA. Following a four-week period, a meeting of the team was held again to assess Brent’s progress.

Step 5. Development of a Maintenance Program: When the intervention strategies were determined to be effective, procedures were implemented for fading out much of the structure of Brent’s IEP with the target of making these skills a part of his school repertoire.

FBA and Baseline Baseline observational data were gathered in this student’s three regular education classroom settings. Data were collected by direct observations using the Focal Point software (Ninness et al, 2000) on a laptop computer. During 15 minute sessions, 10 second partial interval observations were conducted and any feature of the target behavior that occurred during a 10 s interval was recorded as an occurrence. The graphed outcomes from the FBA demonstrated that in most of the episodes in which Brent exhibited problem behaviors, the observer was unable to isolate and record particular antecedent or consequent events in the classroom setting. See figure 5. Although he demonstrated a high level of problem behaviors (approximately 65% of the total observed intervals), the teacher attention condition was recorded during 30 - 35% of all intervals.
The following graphs (Figures 6 and 7) show Brent’s heightened activity on the day his stepfather was to address his class. Brent was frequently out of his seat, going to the door to see if his father had arrived. Condition 5 is attention of stepfather while speaking to class. Teacher attention decreased during this session.
Figures 8-10 demonstrate Brent’s activity level during various activity levels after intervention was begun. The total off-task behaviors decreased from 65% to about 32.5 % during one session. Another day, during a math activity his total off-task behavior was 28% and during writing sentences, it was 59%.

![Graph showing activity levels](image)

**Fig. 8.** 30-second intervals during a 15-min period with teacher standing in front of classroom.

![Graph showing activity levels](image)

**Figure 9** 30-sec intervals during a writing activity  **Figure 10** 30-sec intervals during a math activity

On one occasion, two classes were combined to watch a Thanksgiving movie that lasted 40 minutes. With the exception of one female child in Brent’s regular class who is normally very quiet and compliant, Brent was the only child who was completely engaged in the film. With the
exception of adjusting his position after about 30 minutes, he was the most attentive and well-behaved child in the room. His total off-task behavior was only 1% of all intervals recorded.

![Figure 10. 30 s intervals during a 40-min Thanksgiving movie](image)

**Treatment by Teaching Self-Control Strategies.** The social skills training procedures were conducted by the school counselor in a small group setting during one session per week. The school and behavioral psychology candidate reviewed the intended social skills training, self-control, and classroom management strategies with the IEP team, and upon request of the team, the protocol was initiated. Social skills such as accepting redirection and accepting criticism, as well as not hitting fellow classmates were addressed by the school counselor. The school psychology candidate addressed raising your hand before speaking, asking for materials from fellow classmates politely, and completing tasks in the required time period. Immediately following, Brent was given instructions regarding how to correctly assess his own performance. The candidate provided feedback regarding the accuracy of these descriptions. Protocols were based on the good behavior game (Ninness, et al, 2000). The school psychology candidate gave instruction, modeled the desired behavior, and then role-played it for Brent. Brent then
practiced each behavior during three 15-min. sessions/week. During one session when a classmate wanted to accompany Brent to the practice session in another room set up for videotaping, he was able to remember to raise his hand every time a question was asked of them. However, in the second session by himself, he was only able to remember to raise his hand about 50% of the time.

These social skills and self-control procedures were instructed, modeled, rehearsed and role-played for approximately 15 minutes each school day. Contingent upon improving rehearsal and accurate descriptions of his own behavior, reinforcers such as high fives and allowing him to shoot a basket made from a paper wad were given for each correctly performed activity. Brent was asked to attempt to continue practicing his newly learned concurrent treatment of classroom management strategies.

![Treatment](image1.png)

![Baseline + Treatment](image2.png)

Fig 11 Combined sessions during first week of social skills training (week 2)

The school psychology candidate worked with the classroom teacher to employ a classroom management system to supplement the social skills and self-control training sessions in his regular classroom setting. The program was designed to generate more opportunities for Brent to
engage in appropriate interactions with his peers and allow him to have more opportunities to practice the skills he was acquiring during social skills and self-control sessions. It was decided to implement a dependent group-oriented (collaborative) contingency (Slavin, 2006). All members of the class were required to meet a particular behavior standard. For example, designated teams could share a variety of rewards if they exhibited the following types of behaviors: 1) worked quietly at their requested assignment; 2) raised their hands to answer the teacher’s questions; 3) raised their hands to request help; or 4) completed their assignments in the designated time period. Captains were chosen and the game was begun with small, tangible rewards for all members of the winning team. After two days, classmates voted on choices on a spinner to randomize rewards. Among the eight choices were singing songs, lunch with the principal, extra recess, and five extra minutes on math buckets. See figures 12 and 13.

Fig. 12 Week 3 Good Behavior Game
The Good Behavior

Overall, both social skills training and the Good Behavior Game demonstrated that Brent could learn and use more appropriate social skills than when first observed. The Good Behavior Game showed the greatest improvements while it was played. However, a short holiday break in the school schedule created a reversal. On the first day back, Brent’s off-task activity level had increased to 64% as depicted in figure 14. He appeared to enjoy attention from both teacher and peers. The school psychology candidate was able to pull Brent out and practice modeling and rehearsing social skills with another intern present to reinforce what had previously been learned.
Two days later, after Brent’s class had a new substitute teacher for the second day in a row, more data was recorded. This substitute had made an effort to give positive attention to Brent early as he had had a tantrum when she subbed earlier in the semester. His off-task behavior was measured at about 29% after she moved on to help other students. He also began pouting. The Good Behavior Game was reinstituted with Brent as one of the captains. After two unsuccessful attempts as captain, a third attempt proved to be successful as off task behavior was reduced to less than 10%. See figures 13-16.

The school psychology candidate participated in a meeting with the IEP team and Brent’s parents after four weeks of intervention. All parties reported an obvious improvement in Brent’s behavior. He no longer broke down in a tantrum when his behavior needed redirection. On one occasion, when his classroom teacher thought he was the victim of an incident, he openly admitted to the principal his part in the skirmish. In addition, when the Good Behavior Game is begun, instead of sitting under the table, he participates no matter whom the captain is in order to be eligible for a reward.
Conclusion

Research in applied behavior analysis has demonstrated that several methods of effective behavior change have been used based on identified antecedents and consequences in schools (Bear, 2008). This includes development of self-control by learning to choose appropriate behaviors over socially unacceptable one as well as the use of appropriate reinforcers. This study demonstrates that social skills and self-management skills can be learned once the target behavior(s) have been identified and an appropriate intervention plan is set up. The current study identified attention as a contingency and the student was trained to practice behaviors that resulted in positive attention in the classroom setting.

Abstract

This paper exams Alvin Toffler’s 1970 book, *Future Shock*, from the vantage point of forty years in the book’s future. While emphasis of this paper will focus on Toffler’s work in regard to educational profession, it would be hard to make such an examination without referencing some of Toffler’s general ideas. Toffler’s work seems to have as much, if not more meaning today than it did in 1970 due to the fact that the rate and degree of technological change is exponentially greater now than it was then. Just like Toffler predicted.

It is not the purpose of this paper to offer a line by line analytic fact check of Toffler’s predictions in *Future Shock*. Rather this paper will consider specific statements made and ideas expressed by Toffler and let the reader determine the longitudinal merit of his work.
Back to the Future Shock: A nostalgic look at Alvin Toffler’s 1970 vision of
the future.

Introduction

The object of this paper is to examine the relevance of Alvin Toffler’s
1970’s best selling work, Future Shock in the world forty years into its future.
Specifically the major objective of the paper will be concentrated on what, if any,
implications Toffler’s work has for educators today. This may be especially
relevant as we are moving further and faster into using technology as a driving
force in educating people.

The reader is urged to reflect upon their own vision of how we as educators
should teach our student as we face escalating challenges resulting from our
rapidly changing world fueled by technology. This paper will attempt to serve as a
catalyst to prompt discussions that may be as relevant today as they were to Toffler
in the 1970s. In turn it is hoped that these discussions will in some way help in the
quest to improve the way we educate people, especially in regard to the way we
use various technologies to do so.

It is abundantly clear that technological change has escalated exponentially
since 1970 and Toffler’s book, Future Shock, was published. In retrospect this
work seems to be uncannily accurate. A criticism of Future Shock may be that it
was overly dramatic, but this does not diminish the fact that the work accurately
predicted our Internet related world in the years prior to microprocessors, the common use of computers and the Internet itself. These things were science fiction material at the time Toffler wrote Future Shock.

Toffler clearly did not offer a positive critique of the way American schools were educating children in the 1960s and 70s. Neither did he seem to offer any great hope for them in the future he painted in *Future Shock*. While remaining cognizant that this paper is written from the vantage point of forty years into Toffler’s future particular emphasis will be given to his view of education.

This paper aspires to offer the reader an opportunity to reflect upon the near science fiction changes technology has had on education since 1970. This may serve to inspire others to look into the future just as Alvin Toffler did. This seems especially appropriate in the field of educational leadership where there is such high value placed on the need for educational leaders to have vision. After another reading of *Future Shock* it was clear to the author of this paper that educators in 1970 would have had as a hard time envisioning what education would look like in 2010. It is very likely that this will be true of educators today trying to envision what education will look like in 2050.

A secondary benefit of this work may be to introduce people to Toffler’s body of work who were still “in the future” when *Future Shock* was first published.
His ideas seem to stand up to the test of time. At least for now they do, but who knows in 2050?

And now, back to the Future Shock

The Amazing Criswell opens the Edward D. Wood, Jr. film, *Plan 9 From Outer Space*, with the following monologue: “We are all interested in the future for that is where you and I are going to spend the rest of our lives. And remember, my friends, future events such the mysterious, the unexplainable, that is why you are here” (*Wood*, 1959). While the academic wisdom of quoting Edward D. Wood, Jr. from a film that is described by many as the worst motion picture ever made could be debated, the fact remains that Woods’ prediction delivered by Criswell is nonetheless true, albeit simplistically true.

Eleven years after the premier of *Plan 9 From Outer Space* Toffler offered another view of the future. In 1970 Toffler’s *Future Shock* was published and Toffler and his ideas became a slice of pop culture that was seemingly worthy of serious intellectual consideration. Perhaps it would be more accurate to portray Toffler’s work as a scholarly work that captured the public’s imagination and thus became a part of the early 1970’s pop culture.

*Future Shock*, the book, became such a national phenomena that cultural icon Orson Wells stared in and narrated the Alex Grassholf film adaptation of Toffler’s *Future Shock*. The film of the same name was released in 1972. This
movie was written by Toffler and Ken Rosen but seemingly did not catch the public’s fascination in the same way *Citizen Kane (1941)*, or for that matter *Plan 9 From Outer Space (1959)*. Unlike *Citizen Kane* the movie *Future Shock* has not stood the test of time and it appears as an odd comic parody of itself.

*Future Shock* (the movie) is readily available for anyone wishing to see it via a technology that was not even dreamed of when the movie was made. Anyone interested can find the film available free of charge on You Tube. At the time of this writing the You Tube link to the film was:

http://www.youtube.com/watch?v=6Ghzomm15yE. Copies of the book can be economically obtained in many used bookstores as well as online.

While Toffler addressed many aspects of the future this work will primarily concentrate on his ideas on the subject of education. However, reference to other aspects of Toffler’s work be considered.

Clearly Toffler was not the first to predict potentially dire consequences lurking in the quantum shadows cast by the future of human existence. However his work drew mass attention to the topic of the impending challenges for human kind. Similarly he was certainly not the first to warn us that our efforts to educate the masses were alarmingly antiquated and becoming more so at noticeably escalating rate.
For example, in 1966 John Goodlad seemingly anticipated the information explosion and suggested that the focus of public education would need to change. He expressed the view that the purpose of public education will increasingly be “to teach young people to learn….But then, everyone -- children and parents alike -- will have the identical problem keeping reasonably up to date in a world of exploding knowledge.” (p 245). Toffler agrees with Goodland’s concept and offers the idea that the entire construct of data explosion is even more complicated and what is relevant in the present may quickly become irrelevant. Toffler wrote

“Given further acceleration, we can conclude that knowledge will grow increasingly perishable. Today’s ‘fact’ becomes tomorrow’s ‘misinformation’. This is not an argument against learning facts or data-far from it. But a society in which the individual constantly changes his job, his place of residence, his social ties and so forth, places an enormous premium on learning efficiently. Tomorrow’s schools must therefore teach not merely data, but ways to manipulate it. Students must learn how to discard old ideas, how and when to replace them. They must, in short, learn how to learn.” (Toffler, 1970, p. 414)

One year prior to Toffler’s Future Shock Postman and Weingartner (1969) suggested that our structure of formal education lags behind the advances of society, and therefore is often reactive, rather than proactive. Writing in their then controversial book, Teaching as a Subversive Activity (1969) they summarized the American educational system in this way:

One way of representing the present condition in our educational system is as follows: is it as we were driving a multimillion dollar sports car, screaming, ‘Faster! Faster!’ while peering fixedly into the rearview mirror.
It is an awkward way to try and tell where we are, much less where we're going, and has been sheer dumb luck that we have not smashed ourselves to bits -- so far. We have paid almost exclusive attention to the car, equipping it with all sorts of fantastic gadgets and an engine that will propel it at an ever increasing speed, but we seem to have forgotten where we wanted to go in it. Obviously, we are in for a helluva a jolt. The question is not whether, but when. (p. xiii)

Toffler echoed this point in *Future Shock*. He wrote “yet for all this rhetoric about the future, our schools face backward toward a dying system, rather than forward to the emerging new society. Their vast energies are applied to cranking out Industrial Men-people tooled for survival in a system that will be dead before they are” (p. 399). If Toffler is correct that our educational systems are producing industrial men it may be that he is also correct in his thinking that “the present administrative structures of education, based on industrial bureaucracy, will simply not be able to cope with the complexities and rate of change inherent in the system just described” (Toffler, 1970, p. 407).

Even with his pessimistic view of the future of American education Toffler does discuss the fact that the system is changing. He notes that “it would be a mistake to assume that the present-day educational system is unchanging. On the contrary, it is undergoing rapid change. But much of this change is no more than an attempt to refine the existent machinery, making it even more efficient in pursuit of obsolete goals…..what has been lacking is a consistent direction and a logical starting point” (1970. p.405).
Perhaps change is a constant that school systems must embrace in order to meet the needs of educating the masses. Nearly thirty years later *Future Shock* Waldron, Collie & Davies (1999) offered their opinion “schools must change. They must change to keep pace with the world in which they exist. More important, they must adapt to help young people better understand themselves and their world, a world that is becoming more complex by the day. If we truly care we will…." (p. 144).

Fitting well into the Tofflerian model we can point to the fact that not only is their world more complex everyday it is continually happening at a faster rate of speed. Feather (2000) reported that “the Internet is spreading across society and into our lives faster than any previous medium. To reach 50 million North America uses, radio took 38 years and television took 13 years. The Internet reaches 50 million people in only 5 years. Moreover, Internet use is growing five times faster than television and ten times faster than radio.” (p. 37).

Toffler’s ideas from *Future Shock* continue to be in vogue with many leading educational minds. For example, thirty-six years after the publication of *Future Shock* renowned British educator Sir Ken Robinson, speaking at the TED conference in Monterey, CA in February 2006, remarked that educational institutions are still wrestling with a future that is as impossible to fully anticipate as it will be for people to adjust to. During his presentation Sir Robinson states
that “it’s education that’s meant to take us into this future that we can’t grasp. If you think of it, children starting school this year will be retiring in 2065. Nobody has a clue, despite all the expertise that’s been on parade for the past four days, what the world will look like in five years time and yet we are meant to be educating for it. So, the unpredictability, I think, is extraordinary.” These words could have been spoken by Toffler in 1970.

Like so many other major thinkers on modern education Robinson’s words are congruent with Toffler’s work in *Future Shock*. Toffler wrote that “tomorrow’s individuals will have to cope with even more hectic change than we do today. For education the lesson is clear: its prime objective must be to increase the individual’s ‘cope-ability’-the speed and economy which he can adapt to continual change” (p. 403).

More specifically addressing the needed changes in our educational thinking Toffler quotes Psychologist Herbert Gerjuoy of the Human Resource Research Organization who said “The new education must teach the individual how to classify and reclassify information, how to evaluate its veracity, how to change categories when necessary, how to go from the concrete to the abstract and back, how to look at problems from a new direction-how to teach himself. Tomorrow’s illiterate will not be the man who can’t read; he will be the man who has not learned how to learn.” (Gerjuoy quoted in Toffler, 1970, p. 414).
Even with all the learning that has to take place with regard to changing technologies there are still qualities that Marsh (2007) hopes is not lost in the transition to the new ways of learning within our formal institutions of education. March wrote that “educators have a responsibility to develop such strategies if we want to provide their students with meaningful education in the age of whatever, whenever, wherever. Self-awareness and the construction of a meaningful life are just good ideas. In a culture permeated by the new www these traits will be essential to counterbalance the lure of self-absorption that leads to despair” (p. 216).

Among the various criticisms of the American educational system Toffler’s writing indicates that he was not impressed by the curriculum of American schools. Even though he acknowledged that the American school system was changing. He suggested that among the changes the system was holding onto concepts that are questionable. He wrote “Anyone who thinks the present curriculum makes sense is invited to explain to an intelligent fourteen-year-old why algebra or French or any other subject is essential for him. Adult answers are almost always evasive. The reason is simple, the present curriculum is a mindless holdover from the past.” (P. 410). It can be argued that in some ways it still is.
In 1970 Toffler expresses the view that in the future, which is now the present, students should be more involved in the leadership dimension of the educational process. He stated that “students must be involved from the very start-and not merely as co-opted rubber stamps for adult notions. Young people must help lead, if not, in fact, initiate, these councils so that ‘assumed futures’ can be formulate and debated by those who will presumably invent and inhabit the future” P. 404. Thirty-seven years on Prensky (2007) agrees with Toffler. Prensky wrote "as educators, we must take our cues from our students, 21st-century innovations and behaviors, abandoning, in many cases, our own pre-digital instincts and comfort zones." (p. 217). This may be somewhat problematic. Nelson, Palonsky, & McCarthy, 2004 argued that while our educational opportunites are changing daily due to technology, but that our educators’ mindsets are not changing as fast.

Prensky (2007) also addresses the idea that our educational institutions are not keeping pace with the changes to education via opportunities provided by emerging technologies. Prensky stated:

Pragmatically, our 21st-century kid’s education is quite bifurcating. The formal half, ‘school,’ is becoming an increasingly moribund and an irrelevant institution. Its only function for many students is to provide them with a credential that their parents say they need. The informal, exciting half of kid’s education occurs ‘afterschool.’ This is a place where 21st century students learn about their world and prepare themselves for the 21st-century lives. It is revealing that one of the most prevalent student demands regarding technology is to keep their schools computer labs open until midnight and for us to stay out of their way while they are there. (pp. 219 to 220).
McCain and Jukes (2001) also argued that that education has not kept up with the transformations in our world and is now in the mode of trying to catch up in order to keep from becoming irrelevant. Specifically, McCain and Jukes wrote that “educators today are victims of their established mindsets. This is certainly not to say that they are not intelligent, but rather it is to say that they work in a system increasingly disconnected from the rest of the world. Worse, there is little if any pressure to connect, let alone keep up, with the rest of the world” (McCain and Jukes, 2001, p. 72).

Keeping with the Toffler-like theme Prensky (2007) wrote that "educators have slid into the 21st century -- and into the digital age -- still doing a great many things the old way. It's time for education leaders to raise their heads above the daily grind and observe the new landscape that's emerging" (Prensky, 2007, p. 217). This may be true, but Carr-Chellman and Carr-Chellman (2007) argues that it is not easy to keep up with the changes that educators face. They wrote it is now cliché that at this increase of access “has changed the way we live our lives, but there are some important truths behind the cliché, especially as educators are pressured to adopt new and emerging technologies as a panacea to systemic challenges" (p. 23). Furthermore they assert that "our current cultural scene is a picture of access to put Prometheus to shame, and the burden on educators to shape the use of these accessible resources is tremendous" (p. 35).
The thoughts of the prior references indicate that it is widely assumed that the formal institution of education, and the educators that work within, are not keeping up with the unparallel rate and volume of change that technology is ushering in. However, this does not seem to be the case with our children, they are believed to be keeping up with the changing technologies very well (Tapscott, 1998). Feather (2000) breaks it down this way: “...peek into any teenager’s room and you’ll glimpse the paradigms of the future” (p. 25).

This is especially important because Tapscott wrote that some children are technologically savvy enough to find ways to bypass school and home security features (1998). As an example Tapscott used the results of a survey that was conducted on Freezone and quotes a 10-year old female as saying "My mom doesn't let me e-mail, so I am busy contemplating a scheme" (p. 37). She is probably correct in that she will devise a scheme to get around the wishes of her mother, and she is not alone. Two-thirds of the kids in this survey reported that they were more proficient at the computer than their parents (Tapscott, 1998).

Henry Kelly, president of the Federation of American Scientists, put this disconnect between formal institutions of education and their students into a sobering reality when he stated that ‘the cookies on my daughter's computer know more about her interest than her teachers do’” (March, 2007, p. 220). March agrees with Kelly and wrote that “it helps even less that a great deal of our teachers
and administrators have no idea what a cookie or blog or wiki even is” (2007, p. 220). March also believes that schools of the 21st century desperately need to find ways to integrate the technology rich after-school lives of our children live into the curriculum (2007). If this idea of fully integrating the new technologies into our schools is to be realized in a way that maximizes its promised potential, while at the same time keeping children safe, it must include high levels of trust, communication, patience, and large amounts of money yearly.

Just like Toffler did thirty-one years before Bolman and Deal (2001) warned that humankind needs to be aware of the changes that are largely due to technological advances. Being a bit more specific as to how this may impact people they argue that these changes may impact our spirituality. In their unique book, *Leading With Soul* (2001), they wrote that “today’s stressful and turbulent world compounds the risk of stunted souls and spiritual malaise” (p. 38). Toffler seeming anticipated this was well and in Future Shock he wrote “to create an environment in which change enlivens and enriches the individual, but does not overwhelm him, we must employ not merely personal tactics but social strategies” (p. 383).

Regarding diversity in a school’s curriculum Toffler warned that extreme to either standardization or diversity may not be the best choice for schools. He wrote “A fight must also be waged to alter the balance between standardization and
variety in the curriculum. Diversity carried to its extreme could produce a non-society in which the lack of common frames of reference would make communication between people even more difficult than it is today” (p. 411).

Sir Ken Robinson speaking at the 2010 TED conference also addressed the idea of standardization, and was as critical as Toffler. He says that we have built modern education on linearity and conformity. In his speech he said “we have built our educational systems on the model of fast foods.....where everything is standardized....and we have sold ourselves into a fast foods model of education. And it’s impoverishing our spirit and our energies as much as fast foods are depleting our physical bodies.”

Toffler defines more narrowly his view on what a curriculum that is making an effort to prepare students for the future. In such curriculums Toffler wrote that the “range of subject matter should be broad enough so that apart from dealing with the ‘know’ (i.e., highly probable) elements of the super-industrial future some provision would be marked for dealing with the unknown, the unexpected, the possible. We might do this by designing ‘contingency curricula’-educational programs aimed at training people to handle problems that not only do not exist now, but which may, in fact, never materialize.” (p. 412)

He also suggested that the curriculum should maintain a common core of curricular items to be mastered by all students. “While all students should not
study the same course, imbibe the same facts, or store the same sets of data, all students should be grounded in certain common skills needed for human communications and social integration.” (p.413)

So, did Toffler see hope for humankind in the future? Yes, but clearly in his thinking some would cope better than others. “The people among us who keep up with change, who manage to adapt well, seem to have a richer, better developed sense of what lies ahead than those who cope poorly. Anticipating the future has become a habit with them.” (Toffler, 1970, p. 419). Furthermore, he wrote that “the problem is not, therefore, to suppress change, which cannot be done, but to manage it. If we opt for rapid change in certain sectors of life, we can consciously attempt to build stability zones elsewhere” (p. 379).

Yet Toffler’s view of survival of the future fittest may not be as clear as it appears. He put it this way:

In the light of theory of the adaptive range, it becomes clear that an insistence on continuity in our experience is not necessarily ‘reactionary,’ just as the demand for abrupt or discontinuous change is not necessarily ‘progressive’. In stagnant societies, there is a deep psychological need for novelty and stimulation. In an accelerative society, the need may well be for the preservation of certain continuities.” P. 393.

How does one close such a debate as to the future. Well, one that begins with quoting from an Ed Wood, Jr. flim has only one place to go to get the definitive wrap up quote, and that is naturally from country music. Specifically Brad Paisley’s song *Welcome to the Future*. Where he laments that he wishes his
grandparenets “could see this now, caused the world they saved has changed.” He also puts it this way:

    Hey, everyday is a revolution.
    Welcome to the future.
    Hey, look around it's all so clear.
    Hey, wherever we would go, well we’re here
    Hey, so many things I never thought I'd see happening right in front of me.

And for me? Maybe I don’t want to give up just yet. Maybe I need to push back to the future and start seeing all those things that I thought I’d never see, because Paisley is right, it’s happening right in front of me. And to bring full closure to it let me restate that Ed Wood Jr. was right, this future right in front of me is where I will spend the rest of my life. Hey, I guess Brad is right too. We’re here.

Welcome to the future.

**Conclusion**

In 2010 we have the advantage of reading Toffler’s work and doing an instantaneous fact check. Toffler was primarily writing about how societal changes due to an accelerated rate of technology would create situations that are difficult for people to adjust to. The result would be to create a dissonance unlike any humankind has experienced.

Clearly much of his work regarding technological changes have seeming been prophetically accurate. His work regarding change is also quite accurate. Without the benefit of completing a total fact check it would appear that overall
Toffler should get a lot of credit for his insight and vision. Whereas the movie may have been overly dramatic, the book is founded the work of many people who Toffler awards proper credit. The work is basically a scholarly work with perhaps a hint of bias. Yet, the bias of 1970 seems to have translated into ideas that are primarily correct in 2010. Even Nostradamus would be impressed.

**Editorial Opinion**

My first opinion is that I have a lot of nerve offering an editorial opinion on the 1970 work by Alvin Toffler, *Future Shock*. I have long admired this work and have recommended it to most graduate classes of educational leadership I have taught. While he would never recall it I met Mr. Toffler after a speaking engagement at Marshall University in Huntington West Virginia as he toured to support the release of *Future Shock* during the 1970-71 academic year. OK, I shook his hand and we spoke, but he did two things I recall. He looked into my eyes, and he actually spoke to me. This may sound odd, but to me it represented two important things he did not want humanity to lose. If that is not true, I don’t want to know.

My second opinion is that in regard to my thinking Toffler was, and still is right on the money. I have been a nomad and have averaged moving about every other year. The fact that I have been a Superintendent of Schools in two states help explain that. I have zig-zagged back and forth between public education and
higher education and as a result have had many jobs over the course of my career.

Early in my career I was a technology initiator. I was eager at every turn to grab all the technology I could find whether it be dish television, a computer, the Internet, games, etc. Yet, even with my best efforts technology passed me by and I realized that it was pulling away from me at an ever increasing speed. Finally I gave up the chase and found myself just wanting the world to stay as it was. I had all that I needed, and none of it needed to change.

Yet, as we all know, it kept expanding, increasing in scope and speed, and was always changing. The only thing that remained constant was the change. My personal and professional world was always expecting me to retool and relearn.

Over the years my students became wired to the Internet during my lectures and have data bases available that far exceeded what I could bring forward from the inner recesses of my mind. Every word I say is subject to instant fact check. Oddly enough my reasoning is that this is good and should help me to be a better teacher.

Then one night it hit me, after talking about it all these years I was a victim of future shock. I reached a point where I did not want to talk to automated answering systems, I was not wanting to try and process the multiple news sources that were present on the screen when I watched the news or a sporting event on television, there are devices in my car that can talk to me and I just want them to be
silent. Furthermore my phone takes pictures, shows movies and can beat me at chess. The list goes on and on.

Here is my point. To me Toffler was, as the kids say, spot on. However these same kids do not seem to be showing signs of being future shocked. They text. They network socially online. They don’t have to use a map because they have devises that can direct them to most any place on Earth. This list goes on and on as well.

So, maybe Future Shock is like other generational changes. My parents did not understand my love of 60s rock music. I am sure they never resolved the idea that John Lennon was the Walrus and Frank Zappa warned us that brown shoes don’t make it.

Still, it could be that humankind has simple begin to evolve faster spurred on by technological changes that Flash Gordon would have trouble keeping up with. Or it could be that the newer generations have simply learned to use skills as infants that I am trying to master in my 50s. But, never mind, I have learned how to find Brad Paisley’s videos on YouTube and I think I will watch Welcome to the Future again, and if I have time maybe even see if I can find Orson Wells and the movie Future Shock.

Perhaps John Nesbitt was right in his 1984 best seller Megatrends. He wrote that “when high tech and high touch are out of balance, an annoying dissonance
results” and “high-tech dissonance infuriates people. It’s even worse when you again use the technology of the telephone to call a warm friend and instead get more technology” (p 41). What you may get is Future Shocked.

Citizen Kane (1941). RKO Pictures.

Comprehensive training is an essential element of successful tutoring, especially for the non-professional peer tutors. There is mounting evidence of the positive impact tutor training has on overall quality and effectiveness of academic support programs. As Boylan (2004, p. 49) states: "Regardless of what sort of tutoring is being provided or where it is housed, the most important aspect of successful tutoring is tutor training." At the same time, academic literature points to an overall unevenness in the quality of training programs in post-secondary settings.

The author developed a model for delivering a research-based, cross-disciplinary training program for peer tutors working in a large, 4-year public university in western Pennsylvania. All tutors are undergraduate students who will be helping their peers with course work in a variety of disciplines—biology, chemistry, mathematics, nursing, physics, Spanish, as well as social sciences. Training occurs via a formal 1-credit course, which all prospective tutors must successfully complete before the start of their paid positions. However, this model can be replicated through a series of non-credit workshops or seminars, and within a range of formats (face-to-face, self-paced, or online). In this model, training focuses on how tutors convey subject-related information as they guide students toward success with course work. Prospective tutors rehearse and evaluate peer-helping techniques, the same techniques that they will apply in their jobs.

**Training Features**

**Theoretical Frameworks.** Content is based on theoretical models of learning and includes pedagogy vs. andragogy (Knowles, 1980); psychosocial development (Chickering, 1993); information processing (Dembo, 1998); social constructivism (Vygostsky, 1978); collaborative learning (Casazza, 1998); cognitive domains (Bloom, 1956); cognitive process instruction (Lochhead & Clements, 1979); assessment techniques (Cross & Angelo, 1988); and Jung’s
personality types and learning preferences (Lawrence, 1993). When prospective tutors learn why particular peer-helping practices are recommended, they are more likely to follow-through with implementing these practices in their work with students.

**Organization.** Each training session mirrors appropriate methods for presenting material in a peer-led tutorial session and includes:

- *Opening activities* to introduce content and focus participants’ attention.
- *Activities within sessions* to assess participants’ understanding of sub-topics.
- *Closing activities* to sum up content and check for understanding and learning.

Importantly, during training the supervisor models the same practices that tutors should implement in their sessions. Thus, participants experience the organization and sample the procedures that are associated with effective peer-led tutorial sessions.

**Application.** Using personal experiences and examples, content is related to real situations. Participants try out a range of activities, including problem-solving scenarios, case studies, role-playing and structured observations of experienced tutors’ sessions. As a culminating activity, participants lead their own tutorial session.

**Learning Strategies.** A range of strategies that promote active learning are combined within training sessions—setting goals, managing time, taking notes, textbook reading, creating study guides, and preparing for exams. Participants analyze their own learning styles, practice learning and study strategies, and familiarize themselves with ways to introduce these strategies into tutorial sessions.

**Self-reflection and Self-monitoring.** Participants are held accountable for their development as a tutor—similar to the process of self-regulation and responsibility that they will be conveying to students. Prospective tutors receive opportunities to practice, reflect upon, and assess their performance. Furthermore, they are expected to put in time, effort, and thought during training—the same ingredients that a college student should utilize when learning new and important subject matter.

**Training Topics**

The overall theme of the training model is “key characteristics of effective tutorial sessions.” As part of this theme, the major topics are:
• **Role of a tutor.** Training sessions cover material and techniques related to tutors’ roles as facilitators of learning. Participants read about, observe, and practice guiding students away from dependency and toward becoming independent, self-regulating learners.

• **Active learning.** Included are the importance of proactive learning and the transfer of crucial learning skills. The emphasis is on integrating strategies for *how to learn* difficult subject matter within tutorial sessions.

• **Critical thinking and questioning skills.** Prospective tutors work on incorporating advanced thinking (i.e. analysis, evaluation, and application) and higher-level questioning into tutorial sessions.

• **Assessing learning.** How do tutors know if a student truly understands information? As part of the training, participants work on incorporating ongoing and informal assessment of learning, that is, evidence that students understand and remember key content.

• **Collaborative learning and group work.** Included is the value of shared experiences and shared contributions in the learning process and ways to create cooperative learning situations and collaborative learning activities.

• **Tutoring as a proactive process.** Prospective tutors work on maximizing student learning in one-on-one tutoring sessions through assessing student’s needs; recommending, demonstrating, and applying strategies; breaking down content and evaluating learning; and developing a plan for application.

• **Diversity among students.** An emphasis is placed on recognizing and valuing the diverse student population present in higher education today. Through role-play and case studies, participants practice how to welcome and lead students with differing cultures, religions, sexual orientations, learning disabilities, physical limitations, and so on, with the goal of creating a comfortable and productive learning setting.

• **Working online.** Included are recommended adjustments in preparation, communication, and learning strategies and assessment for participants who will be working in online tutorial settings.

In conclusion, via this model, participants gain valuable knowledge and practice for their upcoming roles as peer tutors. Well-trained tutors approach their jobs as prepared, skillful, and confident academic leaders. Ultimately, effective training of tutors strengthens the overall quality and success of an academic support program.

Abstract: Internet Addiction (IA) is both the most rapidly growing addiction and the least understood (Watson, 2005). For counselors, treatment issues surrounding the disease are also growing. At the forefront is the lack of understanding concerning treatment protocol to manage the challenging recovery and maintenance stages after the behavior of IA has been controlled. This article will discuss Viktor Frankl's Logotherapy as an effective approach to treating IA.
Title of the submission: A STUDY OF THE PARENT-TEACHER INTERACTION BETWEEN IMMIGRANT MOTHERS AND EARLY CHILDHOOD TEACHERS.

Name(s) of the author(s): Assistant Professor Dr. Yen-ju Hsiao, Ed.D; Associate Professor Dr. Ching-Hsiang, Hsiao, Ed.D

Affiliation(s) of the author(s): Chia Nan University of Pharmacy & Science, Taiwan

Address(es) of the author(s): 60, Erh-Jen RD., Sec.1, Jen-Te, Tainan, Taiwan

E-mail address(es) of the author(s): juhsiao@gmail.com ; joshsm1236@hotmail.com

Abstract

The purpose of this study will be to explore the interaction between immigrant mothers and early childhood teachers. In order to understand the process of the interaction between immigrant mothers and early childhood teachers, this study will employ qualitative research as the research method. The participant will be an early childhood teacher now and purposive sampling will be used to select six subjects from Kaohsiung city and Tainan city in the south of Taiwan. In this study, the data collected will be derived from in-depth interviews.

Based on the finding of this study, the researcher hopes to offer the advices to Taiwan’s government authorities and school authorities to assist with early childhood teachers and immigrant mothers how to communicate with each others.

Besides, in the future, it is expected that the Ministry of Education
of Taiwan may invite professional experts and scholars, early childhood teachers, and government officials to meet and discuss how to establish a multicultural education curriculum to train all early childhood teachers to be more efficient culturally responsive in teaching children of immigrant mothers and communicating with immigrant mothers. For school authorities, they should make long-term and short-term plans in sequence to promote early childhood teachers’ awareness of multicultural education. Then, early childhood teachers should be use of efficacy strategies to practice multicultural education in kindergarten and can have better interactions with those immigrant mothers.
Title of the submission: A STUDY OF PRACTICE OF MULTICULTURAL EDUCATION OF KINDERGARTEN TEACHERS.

Abstract

The purpose of this study will be to explore practice of multicultural education in kindergarten. In order to understand the process of practice of multicultural education in kindergarten, this study will employ qualitative research as the research method. The participant will be an early childhood teacher now and purposive sampling will be used to select 10 subjects from Kaohsiung city in the south of Taiwan. In this study, the data collected will be derived from in-depth interviews and field observation.

Based on the finding of this study, the researcher hopes to offer suggestions for Taiwan’s government authorities and school authorities to assist early childhood teachers promoting their percipience concerning multicultural education.

Besides, based on the finding of this study, the Ministry of Education of Taiwan should make long-term policies to assist early childhood teachers to practice multicultural education in all kindergarten. For school authorities, they
should make long-term and short-term plans in sequence to promote early childhood teachers’ awareness of multicultural education. For teachers, they should be use of efficacy strategies to practice multicultural education in kindergarten.
The Global Forum: Engaging Students and Instructors Worldwide in Addressing the Future of Humanity & the Planet

ABSTRACT

THE GLOBAL FORUM refers to a conference, symposium, seminar or meeting involving students, instructors and experts at multiple campus and off-campus locations. This innovation enables live ("real-time") dialogue across schools and universities world-wide. THE GLOBAL FORUM integrates multiple communications technologies, including video conferencing, webcasting, chat and other social networking tools. In this workshop, the results of several GLOBAL FORUM events are reviewed, including "The Global Forum on the Future of Nuclear Weapons" and "The Global Forum on The Future of Space Exploration." THE GLOBAL FORUM evolved into institution-wide events across the Webster University network of 108 campuses world-wide. Multi-national camaraderie, collegiality and solidarity resulted from the planning and implementation of THE GLOBAL FORUM. Organizers and student participants alike sensed they were involved in summit meetings which were shaping the common future of humanity. Teachers and other educators who participated in THE GLOBAL FORUM events were inspired to use THE GLOBAL FORUM methods and strategies to bring their students in touch with authentic ("real-world") issues, and become personally engaged in voice and in action. THE GLOBAL FORUM is not only a technology innovation: It is an innovation in global communication, a tool for building cross-cultural understanding. It is an innovation in teaching and learning. THE GLOBAL FORUM raises awareness and transforms consciousness at all levels: personal, family, community, national, and global.
Introduction

Webster University uses the term “THE GLOBAL FORUM” to refer to a conference, symposium, seminar or summit meeting that is webcast live (in “real-time”) and is open to public participation via chat and other social networking tools. This innovation enables live (“real-time”) dialogue across schools and universities world-wide. THE GLOBAL FORUM integrates multiple communications technologies, including video conferencing, webcasting, chat and other social networking tools.

This workshop enables participants to: (a) identify the integration of multiple communications technologies that make it possible to conduct a multi-continent conference, meeting, or seminar; (b) to review the lessons learned from several GLOBAL FORUM events, including: “The Global Forum on the Future of Nuclear Weapons,” “The Global Forum on The Future of Space Exploration,” and “The Global Forum & Student Summit Meeting on Global Citizenship.” (c) describe the actual and expected learning outcomes and impact on students who participated in THE GLOBAL FORUM, and (c) identify the strategies and methods for designing and conducting THE GLOBAL FORUM-type events on other topics.

Background

Webster University is an independent, international university with 108 domestic and international campuses. Its enrollment of 22,000 students worldwide, include 28% of students matriculating in 100% online programs. Since 2000, Webster University has offered online graduate degree programs. Online courses now give students the opportunity to complete degree and certificate programs regardless of their geographic proximity to a Webster University campus.

Since 2005, the School of Education has also offered hybrid courses which combine online learning with international travel. These courses such as “Education in China”, “Humanitarianism & Internationalism,” and “Global Issues: Japan”, involved a full-term online course, with a 5-10 day mid-term study tour to Southern China and Hong Kong, Geneva, or Japan (Tokyo, Kyoto, Hiroshima).

Multiple electronic communications technologies have been embedded in the delivery, the instructional methods, and the content of most Webster University courses, whether they are online, hybrid with international travel, or traditional in-classroom classes. But advances in interactive web and social networking technologies, such as video conferencing, webcasting, blogs, wikis, chat and discussion tools, have accelerated the inclusion, integration and embedding of technologies in the courses. The newest interactive-social web technologies enable instructors and students to magnify and amplify their learning resources and learning opportunities. These technologies, which have been integrated into THE GLOBAL FORUM, make it possible to dialogue and collaborate with a wider network of not only peers and colleagues, but also experts, leaders and policy-makers on the topics of study.
Evolution of “THE GLOBAL FORUM”

A predecessor to THE GLOBAL FORUM was a lecture by Jack Dorsey, co-founder of Twitter, presented by the School of Business and Technology and the School of Communications.  (http://www.webster.edu/jackatwebster/)  The event originated from the Webster University-St. Louis campus, with a live video webcast open to the public and an open Twitter channel for viewers online or in the auditorium. Although this event was not associated with classes, it illustrated how the integration of video webcasting and a social network technology like Twitter can have a broader reach, and enable participants (both online and in the auditorium) to comment, ask questions or otherwise be “heard” by the speaker and the audience.

The idea for THE GLOBAL FORUM: ON THE FUTURE OF NUCLEAR WEAPONS originated when the Webster University class “Global Issues: Japan” visited Hiroshima in Summer 2009. The students toured the Hiroshima Peace Memorial Park and Museum. They heard testimony from a Hiroshima A-bomb witness-survivor, and participated in a seminar led by Steven Leeper, Chairman of the Hiroshima Peace Culture Foundation. The students became concerned about Leeper’s observation that the human family will soon decide one of two courses: whether we will get rid of nuclear weapons, or to let everybody have them.

Moved by their experience in Hiroshima, the students felt compelled to share what they had learned with their Webster University student peers and classmates across North America, Europe and Asia. They suggested that Webster University conduct a globally webcast forum to raise student and citizen awareness about this issue. They reasoned that this would be a way to reach Webster University students and faculty located at the 108 campuses worldwide.

THE GLOBAL FORUM event that developed from this was titled “Mr. Truman Meets Hiroshima on The Future of Nuclear Weapons, 1945-2020.” (http://eagle.webster.edu/Mr_Truman_Meets_Hiroshima) The two-hour program involved a videoconference meeting between The Harry S. Truman Library & Museum (Independence, Missouri) and The Hiroshima Peace Memorial Museum (Japan). The meeting was streamed live to the global audience with a video webcast and open Livestream Chat, Facebook and Twitter channels. The program on the video webcast included:

- “The Future of Nuclear Weapons: Voices & Images.” This video was a student team project in an undergraduate video editing and production class.
- Introduction and welcome remarks by: Dr. Elizabeth (Beth) J. Stroble (President, Webster University), Dr. Michael Devine (Director, Harry S. Truman Library & Museum), and Gov. Bob Holden (Former Governor of Missouri and Director of the Holden Public Policy Forum).
“The Historical Context: Truman, Hiroshima & Nuclear Weapons,” Dr. John D. Chappell (Associate Professor of History, and author of *Before the Bomb: How America Approached the End of the Pacific War* (1997)).

“Hiroshima’s Take on the Future of Nuclear Weapons” included a statement from Dr. Tadatoshi Akiba (Mayor of Hiroshima); recollections by Mr. Kenji Kitagawa (survivor/witness to 1945 Hiroshima A-bomb); and commentary by Steven Leeper (Chairman, Hiroshima Peace Culture Foundation)

Dr. Chappell and Satoko Norimatsu (Director, Peace Philosophy Centre, Vancouver, B.C.) monitored the online comments and moderated the questions and discussion period.

“Reflections, Synthesis and Action Steps” by Dr. Roy Tamashiro (Professor of Education), and Gov. Holden.

THE GLOBAL FORUM evolved into an institution-wide event on other topics. Its aims were:

1. To raise awareness about a predefined global issue among students at Webster University, other schools and universities, and the world-wide citizen public.
2. To engage experts and policy makers in the meeting to describe the controversial dimensions of the global issue, and
3. To enable students and citizen public participants to dialogue with each other and the guest lecturers to share reflections, and collaborate on conclusions and action steps to address the selected global issues.

THE GLOBAL FORUM directly involved graduate and undergraduate Education courses, but also courses on nursing, history, international studies, international business, international relations, human rights, and political science.

Other GLOBAL FORUM events ([http://webster.edu/theglobalforum/](http://webster.edu/theglobalforum/)), completed and upcoming, include:

• Open seminar and discussion originating from Webster University-Space Coast Campus on November 1, 2010 (Coordinated with the Launch of NASA Space Shuttle STS-133 Mission): THE GLOBAL FORUM ON THE FUTURE OF SPACE EXPLOARTION. Live global webcast with open UStream Chat channel.

• Multiple International Studies and Education classes at Webster University and citizen public in North America, Europe & Asia. February 8, 2011 THE GLOBAL FORUM AND STUDENT SYMPOSIUM ON THE MEANING OF GLOBAL CITIZENSHIP AT WEBSTER UNIVERSITY. Live global webcast with open UStream Chat channel.

• Multiple classes in School of Education, College of Arts & Sciences, School of Business & Technology, School of Communications and global citizen public: March 31, 2011 Women’s Rights as Human Rights: Education—Security—Economics, Webster University’s Spring Human Rights Conference. Live global webcast with open Chat/Facebook/Twitter channels.

Methods and Strategies for Conducting THE GLOBAL FORUM Events

It is possible to conduct THE GLOBAL FORUM events with easily accessible, low-cost web-based tools. Webcasting tools such as Ustream (www.ustream.tv) and Livestream (www.livestream.com) include the software to produce and transmit live video and audio, recorded video, screen images containing text, graphics, photos and other images. They include live chat and interface with other social networking tools (Twitter, Facebook, etc.), so any webcast viewer can also contribute comments and questions. The webcast is accessible on any desktop, laptop or tablet computer connected to the internet. It is also accessible on handheld devices (e.g. iPods) and smart phones.

Whether they took part in-person or online in THE GLOBAL FORUM, the teachers and other educators had intimate experience of a global issue in “real life.” The dramatic testimony of the Hiroshima A-bomb survivor-witness, as well as the openness of the Harry S. Truman Library & Museum to embrace these accounts as part of its documentation and archiving mission inspired teachers to, in turn, use THE GLOBAL FORUM methods to bring their students in touch with authentic (“real-world”) issues, and feel personally engaged in voice and in action toward seeking solutions. The video conferencing, webcasting and social networking tools are accessible and affordable for any teacher to assemble and conduct GLOBAL FORUM format events with their students.
Significance and Impact of “THE GLOBAL FORUM”

THE GLOBAL FORUM combines several electronic communication technologies to enable students in classes held at multiple Webster University campuses to dialogue and collaborate with experts and policy makers on significant global issues. The open Chat/Facebook/Twitter channels give students at any campus or off-campus locations the same opportunity to participate in the dialogue as the students in the classroom or auditorium where THE GLOBAL FORUM is originating.

THE GLOBAL FORUM application goes beyond infusion of the technologies into the instructional method and content of the “Global Awareness Education” course. The technologies are *integrated and embedded* into the instructional design and content of numerous courses in education and other disciplines, held at multiple Webster University campuses. THE GLOBAL FORUM effectively organizes the multiple electronic communication technologies and distance learning tools for application in any course environment: the traditional face-to-face classroom, online classes or hybrid (online plus international travel) classes.

The implementation of THE GLOBAL FORUM: ON THE FUTURE OF NUCLEAR WEAPONS was accomplished through the networking, collaboration, and cooperation of universities, museums, government offices, organizations, and individuals across the USA, Canada and Japan. The multi-national camaraderie, collegiality and solidarity that developed out of this collaboration have priceless value in advancing cross-cultural understanding. The leaders and organizers of the event and student participants alike sensed they were involved in a summit meeting that was shaping the common future of humanity. For many, THE GLOBAL FORUM will be an unforgettable experience.

THE GLOBAL FORUM is not only an innovation in technology. It is an innovation in global communication, a tool for building cross-cultural, human understanding and empathy, a tool for raising awareness about the interconnectedness and interdependence of human and planetary systems. THE GLOBAL FORUM is an innovation in teaching and learning. It is a tool that evolved from the creative energy of faculty and students in the School of Education. But its impact and value transcend teacher education: THE GLOBAL FORUM is a tool that has potential to raise awareness and transform consciousness at all levels: personal, family, community, national, and global.
Expanding Student Vision: A Project in Community Activism

pharrisd@sfasu.edu

Abstract
Interior design students will generate a community action plan that creates design solutions for impoverished community residents. The project objective will focus on establishing dialogue among local officials, professionals, business-owners, residents, and students to enhance community efforts in raising living standards for the impoverished. The design will be used as a tool to provide innovative solutions to home, neighborhood, or community problems.

Project methodology will include three stages. First, students will investigative the community and locate areas where living standards are poor. Secondly, students will identify key individuals and groups who might impact the solution. Thirdly, students will orchestrate dialogue among key players; therefore, students must create an open and non-threatening atmosphere conducive to idea exchange. Students’ participation in meetings will provide opportunities to interact with the community, share research findings, and offer problem-solving strategies.

The project outcome could have a national impact, serving as a model for educators when responding to students’ desire for activism. It should foster a healthy relationship among pre-professionals, community leaders, and the underserved community while addressing priority areas of research, well-being, safety, and best practices for social justice. By thus infusing design education with service learning, students will attain heightened insight into interior design’s potential for good at all levels of society; education and humanitarianism will intermingle. Finally, data collected during the project may inform future community actions and provide further discourse among educators about community service projects and post-secondary curriculum.
Math Snacks: Using innovative media to address conceptual gaps in mathematics understanding

Milos Savic, New Mexico State University
Karin Wiburg, New Mexico State University
Ted Stanford, New Mexico State University
Karen Trujillo, Alma d’ Arte Charter High School and New Mexico State University

“Math Snacks” are clever, engaging and focused technology-based resources designed to help learners access in a unique way the concepts behind frequently misunderstood mathematics skills and knowledge. Based on research and thorough assessment of existing gaps in knowledge, the final tools are developed by math educators and mathematicians partnering with game developers and animators. Users of “Math Snacks” integrate technology (web, animation, video, iPhone and iPod) into their math curriculum by using developed tools as pre- and post- class activities, as part of a lecture and as resources for out-of-school learning. All completed materials are available for free at http://www.mathsnacks.org. Further support for students include supplemental materials and Web 2.0 portals (Facebook, Twitter, Blog).

The Math Snacks project addresses the problems middle grades students have learning mathematics by focusing on basic conceptual understandings of mathematics that are a foundation for further advanced learning. The concepts to be developed into innovative media are selected for two reasons: because the concept to be learned is a key to mathematical intellectual development and because it is also a concept that has been missed across a large number of students based on test and observational data. It is also likely to be a concept that the teacher finds difficult to teach. The following article suggests the need to refocus mathematics on core concepts, and to address first those concepts that are the most difficult for most students.

Research supports students learning core fundamental understandings of mathematics, a critical content area which students need to master in order to take advanced courses in the STEM field and eventually become knowledgeable citizens and workers in the 21st century. One of the reasons mid-school students lack a conceptual understanding of mathematics may be the relatively undefined and unstructured U.S. curriculum, poor assessments, and the low level of mathematics knowledge required for teachers. As Ginsburg, Leinwand, Anstrom, and Pollock, (2005) suggest in a book comparing the Singapore and U.S. curricula, the U.S. lacks a centrally identified core of mathematical content which could help focus the country’s various curricula and teaching systems. National assessments are not utilized as formative assessments for teaching. These authors state that the U.S. “textbooks emphasize definitions and formulas, not mathematical understanding” (p. ix). The same authors continue, “The Singapore texts are rich with problem-based development in contrast to traditional U.S. texts that rarely get much beyond exposing students to the mechanics of mathematics… the Singapore
illustrations also feature a concrete to pictorial to abstract approach: “Many students who have difficulty grasping abstract mathematical concepts would benefit from visual representations of mathematical ideas” (p. xii).

Mathematical content is stored in the mind as a concept image (Tall & Vinner, 1981) A concept image is defined as “the total cognitive structure that is associated with the concept, which includes all the mental pictures and associated properties and processes”, while the concept definition is defined as “form of words used to specify that concept.” For example, the formal definition of a fraction is “any number that can be put into the form \( \frac{a}{b} \) (also sometimes written \( \frac{\ell}{\omega} \), where \( a \) and \( b \) are numbers and \( b \) is not 0” (McKeague, 2008). A possible concept image of this definition would be the usual pie cut into four pieces. When you ask students to tell you a fraction they will think of certain numbers such as \( \frac{1}{2} \) or \( \frac{1}{3} \). The Math Snacks products, by using technology, can tap into multiple representations of a concept and provide another concept image to the student in order to deepen conceptual understanding. As Moreno & Mayer (2007) suggested, “Multimedia supports learning by providing additional graphical illustrations.”

If U.S. students are to be more successful in life, they must begin with a strong foundation in core mathematics concepts and skills, which, by international standards they presently lack. Singapore, whose students ranked first in the international comparison of student mathematics performance at the 8th grade (TIMMS, 2008), provides such a foundation to students. Other high-scoring countries, such as Japan, also have clear national systems that define what topics are to be covered and then cover them in depth at each grade level (Takahashi, Watanabe, & Yoshida, 2004). In the U.S. there are current efforts to develop a focus on core understandings at specific grade levels. Examples include the Focal Points proposed by the National Council for Teachers of Mathematics and the new National Common Core Standards. The Math Snacks project provides a key set of topics to be explored and understood within a developmental framework of conceptual understanding that moves from the 6th- 8th grade levels.

**Initial Analysis of Gaps**

An analysis of over 24,000 student scores in 3rd - 8th grade in high-need NM districts showed consistent areas of weakness. In addition to receiving lower scores with the open-ended questions, students had trouble with multiple-choice questions demonstrating understanding (as opposed to just choosing a numerical answer) (Korn & Wiburg, 2008). For example, while students can measure, they don't score well in a section of the New Mexico Standards Based Assessment that requires explanation their understanding of a concept like measurement. Overall, student scores were weak in demonstrating conceptual understanding in topics that include: number systems and operations, fractions and decimals; and moving between numerical, tabular, and graphical data describing linear relationships. The Math Snacks are being developed to address these topics along with the concept of variables.

New Mexico’s Standards-Based Assessment (NMSBA) has been shown to correlate well with the NAEP national assessment (Aligning mathematics assessment standards, 2008).
The test is given yearly to all students in grades 3 through 8, and again in 11th grade. Fifty percent of the points on this test are reserved for short-answer or open-ended questions. In other words, students must write about their understanding of the mathematics they are doing, draw or interpret tables or graphs, or explain their thinking in answering a problem. In every district in the state, students score lower on the half of the test that includes open-ended items than they do on the multiple-choice section of the test. While students can generally use procedures correctly, they don’t demonstrate an understanding of the reasons for doing them. (I would move this paragraph to explain validity of test to before the other paragraph in this section to show the test is valid)

The Potential of Media

As Gee argues, games and newer electronic learning environments provide opportunities that both engage students and require a demanding kind of “reading and writing” that builds literacy and thinking skills (2004). A recent synthesis of research (Heid and Blume, 2008) describes how technology can be used for the teaching and learning of mathematics. Within this research series, Olive and Lobato (2008) describe how the use of technology aides students in understanding rational number concepts. They present six research studies in which students gained understanding of rational numbers through the use of technologies from virtual manipulatives to videos to game environments. Students were able to understand the concepts of equal parts to whole, and the use of multiplicative reasoning, when using computer-based environments that allowed them to take apart and rebuild representational pieces of objects.

Clements, who has done extensive work with young children and computers, suggests that for children, representational objects on a computer are seen as a manipulatives. They find such representational objects as easy to use at an early age as blocks and chips. He and colleagues (Clements, Sarama, Yeilland, & Glass, 2008) describe the use of a modified LOGO environment to help students learn geometry. Interactions with media around mathematical topics have the potential to help students fill their conceptual gaps in understanding. As Atkinson (2005) states, “Creating multimedia presentations that encourage learners to build coherent mental representations enhances learning.” (p. 404) These mental representations are exactly the concept images. Some concept images must be dynamic and interactive in order to fully understand the capabilities of concepts. For example, when talking about a number line, to have students actually go on a computer and zoom in and out of a number line would greatly enhance the concept image of infinite numbers between two chosen numbers and the strength of the tool that is a number line. Notice that in a classroom, a teacher without access to a computer projection image would have to draw numerous number lines to display the same message which would be time consuming and also would not support free exploration with a number line as an object. This scenario in the classroom is typical of a static concept image. Pilone & Pilone (2009) suggest “You can change the scale on your number line without affecting the values on that number line.” Assisting middle school students with more concept images, like an expandable and contracting number line, will help students to be better prepared for algebra and move from number lines to a coordinate plane.

The Math Snacks grant researches and evaluates the potential of short animations and
games in helping learners understand concepts before or after engaging in more formal classroom learning. The products are also meant to be used anywhere and at any time after school, at home or on the school bus. According to the cognitive theory of multimedia learning (CTML), combining spoken text with dynamic graphics should promote learning with understanding (Atkinson, 2005). In a preliminary study carried out by the NMSU Learning Games Lab, 20 mid-school youth were loaned iPods with only educational content on them — they were not allowed to put their own music or games on them. Content included educational videos, such as documentaries, and age-appropriate animations. Researchers found that youth spent approximately 10 minutes a day with the material in the first week. When they found an animation or video they especially enjoyed, they shared it with their peers, and often with their parents as well. According to Robert Rubenstein (1994), students fourteen years of age or younger have a working memory with an attention span of 5-10 minutes, which correlates with the length of the time involved with watching or playing a Math Snack. The six resulting pilot animations are popular with students and teachers.

From Gaps to Goals to Math Snacks

Combining our knowledge of the gaps introduced above, along with an understanding of the potential of media in classrooms, the development team then created mathematical goals and objectives to guide the multimedia development of products for the first two years. These goals are influenced not only by the gaps analyzed, but from qualitative interviews with students and teachers, and from the extensive experience of educators on staff in teaching mathematics in schools. The first year goals concentrated on number sense, with multiple representations of numbers, the use of the number line as a tool, and solving situated problems using operations. The goals for next year are still being refined but include variables with an emphasis on why they are important and powerful in mathematics.

The development team also gives plenty of thought to the pedagogical usefulness of the product along with the mathematics involved. For example, learner and teacher guides are included with every Math Snack, and the development group decided that a two page guide would suffice since the guide’s include inquiry questions and based more on conceptual learning than traditional math practice. The guides do provide application of the concepts as well as conceptual questioning; aiming at personalization such as “Can you give me an example of how this Math Snack applies to your life?” The guides also provide stimuli for further student exploration. One Math Snack, the Bad Date shows three scenarios- one in which the male talked almost all the time; one in which the female dominated the conversation and one in which their conversations can be coded as a desirable one-to-one ratio. At the end of the animation, the number of words spoken by the female and the male on the date was 57:56, until the male said “Bread!” A conceptual question that arose was “What if the male did not say ‘Bread’? This asks students to examine when approximation and accuracy are important for using mathematics in everyday life.

Once the goals are settled on, the development team brainstorm products that would address some of the goals. In the brainstorming meeting, every product that is introduced
for possible development must correspond to the agreed goals, which also reflect extensive research on the mathematics learning gaps. For example, one of our products in development is an interactive number line so that students can realize the potential of a number line and the expansiveness of real numbers. This product is linked to the goal of number sense and in particular the number line as a scalable tool. The use of technology makes possible exciting interaction with a movable number line. It is important because it brings to life the number line, which has been shown in textbooks or provided in lectures only as a stagnant image. A teacher in a classroom cannot draw on the board a dynamic magnification or expansion of a number line.

Each product is tested by the Learning Games Lab on campus, where students from local schools are invited to play or watch the product. A video closet is provided so students can walk into the closet at any time and report to a video camera what they did and did not enjoy. They are also asked to make suggestions for improving the games or animations. Then the products are used in pilot classrooms where project staff works with volunteer teachers to test the Math Snack in a classroom where more feedback is gathered. All products are tested multiple times through successive revisions and teachers are invited to suggest how the Math Snack can help them to teach concepts. Finally, a quality assurance group headed by external advisors met with the development team twice a year to give a more formal critique of the appropriateness and usefulness of the product prior to production.

**Incorporating the Math Snacks with Teachers**

Researchers (Hill, Rowan, & Ball, 2005) have found that teacher mathematics knowledge is positively related to student achievement. Many middle school teachers have had very little opportunity to learn deep mathematics in their teacher education programs in the U.S. Unlike teachers in other countries, they have not been required to pass high levels of mathematics as part of teacher preparation, nor do they receive continued professional development in learning mathematics for teaching (Ginsberg, *et. al*, 2008). Math Snacks modules allow best practices of a guest expert to virtually come into the classroom in order to share mathematics with the teachers and students via media.

In the summer of 2010, the math specialists working in the Math Snacks group were invited by the principal of Sunrise Elementary School to run a Math Snacks camp in their school. This principal then corresponded with the principal of Mesa Middle School to hand pick 8 teachers for the camp, and in turn each teacher picked 4 or 5 students from the school representing different demographics. The camp ran for 5 days, with two teachers taking 8 students and one math snack product as an area of focus from mathematics. The focus areas included: ratios, measurement, number line and scale factors. The model of the Math Snacks professional development was very innovative and had proven successful in previous grants with teachers. The teachers would spend time working with students to develop their ability to use technology to teach mathematics in the morning and then would use the afternoons to critique and modify what had happened with the students. A final project was done by the groups focused on the mathematics topic of the selected Math Snacks. For example, one group chose the snack “Number Rights”, an animation centered around people carrying number placards.
on a number line. The purpose was to help students recognize that numbers like -3.4 or ½ have actual places on the number lines. The students in the group chose a number on the number line, and built a house on their number. Each family member living in their house was a different numerical representation of their number. For example, if their number was 3 \( \frac{2}{3} \), their mother was 3. \( \overline{6} \), while their father was \( \frac{8}{3} \). Students also made up neighbors, or numbers that were living “close” to them. The group incorporated technology by setting up a website with separate pages for each student and their numerical family, and presented the website to their real family at the end of the camp. Many of these students presented their number family in both English and Spanish.

The students learned math by using the technology, however, it was the teachers who really learned the most mathematics. Prior to the summer academy they were not aware of many of their own misconceptions about math concepts. One example involved a teacher learning the difference between a ratio and a fraction. The students asked if a ratio could be written in the same way as a fraction. A ratio is defined as the comparison between two quantities. So if you compare 2 boys to 3 girls or 3 girls to 2 boys, the ratio is 2:3 or 3:2. But it depends on how you label the ratio. Similar exploratory questions were prevalent in the lesson plans of teachers for each of the mathematics topics.

The teachers loved the fact that they had ample time to cover one topic area of mathematics, and absolutely enjoyed the incorporation of technology, in particular, the *Math Snacks*. As the teachers debriefed their morning lessons with students they continued to learn and to suggest new ideas they wanted to add to their lessons. Two teachers emphasizing scale factor, wanted to add the fact of scaling down by 5 to scaling up by 1/5. These experiences enhanced the concept images of the teachers, which in turn will hopefully be passed on to the students they teach. Concept images are the key mathematical ideas that are easily retrievable in a student’s mind, and we must strive to introduce as many as we can. Math Snacks aims towards that goal.

**Conclusion**

The Math Snacks project uses the results from the NMSBA which is aligned with the TIMMS international study to identify educational gaps in mathematics. These gaps assist the development team to create goals, which guide them to produce Math Snacks. Highly engaging, these snacks tap into the potential of multimedia learning. One by-product of this engagement would be that teachers understand the importance of a student’s concept image. Hopefully Math Snacks will be able to provide students with another concept image that accurately portrays the important math concepts students need to be successful.

Title (#1223): American Foster Youth & School Dropout Rates

Author: Melissa Porter Masoner
University of Kansas Doctoral Student
Education Leadership and Policy Studies

Address: 950 SW Docking Rd; Topeka, Kansas 66615;  mpm3792@ku.edu

Abstract: This paper and power point presentation show the challenges to academic success of foster care youth in one typical Midwestern American city while pointing to some promising national education practices. The overall school dropout rate in American public schools is of great concern today, yet the over 50% dropout rate for youth in foster care is far worse and receives relatively little attention.

Although safety is the short-term priority for an abused or neglected child, an education is the best long-term solution to this costly individual and societal problem. Education enables an abused child to gain the skills and ability to pursue happiness as society has promised. Educators, child advocates, families, and students themselves must look deeper into the causes and implement solutions to the foster care education crisis.
Title: Toward Better Collaboration in the Education of Students with Fetal Alcohol Spectrum Disorder (FASD): Perspectives of Teachers, Administrators, Caregivers, and Allied Professionals

Presenters: Jenelle Job, MEd, Educational Psychology, University of Alberta
Belina Pasula, MEd, Edmonton Regional Educational Consulting Services
Deborah Brandell, MEd, Special Education, Edmonton Public School Board

Abstract: The present study addresses the call for increasing the voice of teachers, administrators, caregivers, and allied professionals in research. In particular, our findings report on the strengths and challenges in the working relationships among key stakeholders involved in the education of students with Fetal Alcohol Spectrum Disorder (FASD).

The current study employed a qualitative research approach to allow for depth and rich understanding of the experiences of individuals supporting students with FASD with respect to learning and assessment. Eleven focus groups and three interviews were held (total $n = 61$) between April 2009 and May 2010. The focus group protocol included questions about the experiences specific to each role and successful strategies for effective communication. The audio recordings were then transcribed verbatim, and a preliminary analysis generated summary reports that were provided to interviewees for member checking.

Thematic analysis yielded four major themes: relationships (i.e., enhancing the communication and collaboration between school personnel and families), strategies (i.e., classroom strategies and curriculum adaptations designed to provide students the specialized programming they need to be successful), supports (i.e., supporting children and their families through school personnel involvement in student programming and provision of academic and community resources to aid in healthy child development), and professional identity (i.e., how school personnel understand their roles in the education of students with FASD and the importance of professional development, identity, and knowledge of FAS for effective teaching).

This project is an important step towards increasing links between research and practice in the education of students with FASD. Engaging stakeholders in this type of research not only allows for the generation of evidence-based practice but also encourages opportunities for learning on the part of our research participants. The resulting optimization of educational and assessment practices helps to inform theory and equip teachers, administrators, caregivers, and allied professionals to better meet the needs of students with FASD and their classmates within the school environment.
Elementary Pre-service Teachers’ Perceptions of the Use of Problem-solving Skills in Mathematics and Art

“A rose by any other name would smell as sweet…”

William Shakespeare

Introduction

With apologies to William Shakespeare, “a problem by any other name still enhances critical thinking.” Problem-centered learning, whether in art or in mathematics, provides students rich experiences that transfer to situations beyond the classroom. Preparing students for success in the ever-changing, fast-paced world requires attention to developing effective skills in problem solving and critical thinking. When young artists decide on an appropriate media for depicting their emotional response to a situation or a particular form and structure for a sculpture, they are enmeshed in solving problems, using reasoning skills, making and testing conjectures, and finally coming to terms with the inconsistencies around them to create a unified whole. Mathematics students also wrestle with content and concepts as they work to solve problems to derive a way to find the product of two two-digit numbers in their heads or develop a process for locating a water delivery-system equidistant from the four communities it is intended to serve.

Eisner (2002) defines problem in art as “a situation in which students’ existing conceptual and technical repertoires are inadequate for coping with what they confront, and as a result they are challenged to think in new ways about how to grapple with the problem” (p.96). As students attempt to solve the problem, they experiment with ideas analyzing the results. They hold fast to the methods that lead to success and continue to make modifications to the ones that miss the mark. A problem in mathematics is defined in similar terms. Van de Walle (2010) defines a problem as a task that is not readily solvable, has no prescribed method for solving, and does not reflect a specific “correct” solution method. He states that “a problem for learning mathematics has three features: 1) It must begin where the students are, 2) The problematic or engaging aspect of the problem must be due to the mathematics that the students are to learn, and 3) It must require justifications and explanations for answers and solution methods” (p.33). For the purposes of this study, a problem will be defined as an open-ended task that requires deliberation,
may be solved using multiple strategies, a variety of approaches, and may have multiple solutions.

Based on observations of experts, there are ways to determine whether a teacher focuses the learning in her classroom on a problem-centered approach or on one more traditional approach. One of the determinants points to creating a balance between problem solving as the center of learning and the experiences developed for the students which allows them to struggle with challenging problems, examine and create better solution strategies and providing them the appropriate information at critical times to enhance student achievement (Hiebert & Wearne, 2003). Art experiences provide opportunities for problem solving and decision-making that enhance skills of communication and creative thinking. Students must make enumerable decisions as they arrange, design, paint, or draw deciding on subject matter, materials, color, shape, value, texture in an attempt to express their ideas. There is a constant ebb and flow of evaluation and reorganization as a piece evolves (Jenkins, 1980). Most of the problems encountered and solved through a students’ production of artwork parallels their experiences in life. By facing and solving problems and then implementing the solutions in their artwork, students grow as human beings and in their ability to handle situations they will face in the future (Cane, 1951). The effective teaching of both mathematics and art lies in the teacher’s ability to create a problem-centered environment in which students experience learning through a hands-on, inquiry-based approach.

If a problem-centered approach is the most beneficial for student learning, then it is imperative that pre-service elementary teachers learn through a similar experiential, problem-centered, inquiry-based approach. Current research indicates that student achievement is significantly impacted by teachers’ content knowledge and their attitudes toward the content they teach (Schunk, 1995; Clarke, 1985). Metzler and Woessmann (2010) found that teachers’ expertise in subject matter content exerts a significant impact on student achievement that can be measured statistically and quantitatively. When teachers lack strong content knowledge, they are hesitant to incorporate problem-solving, inquiry-based lessons into instruction because the solutions their students develop may not follow the same conventions the teachers learned. When teachers do not emit a positive attitude toward a content area or teach with enthusiasm, the students’ reflect the
same lack of interest and exhibit lower achievement levels in those content areas. Although most elementary teacher preparation programs include strict guidelines for content mastery, these programs fail to provide opportunities for the pre-service teachers to use that information in problem-centered situations in ways reflective of the techniques they should incorporate in their own future classroom settings.

In comparisons with students from across the globe, the United States’ scores fall well below those of countries in which content mastery and the fine arts are an integral component of the educational system. To prepare elementary pre-service teachers for the classroom, many pre-service programs require classes in the fine arts and physical education. Requiring courses in art production and courses on integration of the fine arts and physical movement into the elementary curriculum, provide these elementary pre-service teachers with the knowledge they can utilize to enrich the elementary curriculum and, thus, enhance student learning.

When elementary pre-service teachers learn content and pedagogy though a problem-centered, inquiry-based approach, they are more likely to use those same approaches in their own classrooms. The more opportunities they have to create their own knowledge base, the better prepared they will be to create learning environments in which students can, in turn, create their own knowledge. Art lessons, when incorporated into the elementary curriculum, provide students with an outlet for creative discovery, emotional release, critical thinking, and problem solving. When teachers review students’ artwork, they often can see characteristics of emerging intellectual acuity, particularly in the areas of mathematics and social maturity. Teachers need to be acutely aware of the critical thinking and problem-solving skills that evolve as students complete art projects. These are the same skills that are important components of a strong, problem-centered approach to learning mathematics. When students incorporate critical thinking and problem-solving skills throughout the curriculum, their learning is enhanced, their abilities to represent ideas in multiple ways are increased, their communication skills are refined, their sense of reasoning is improved, and they begin to make connections between what they learn in the classroom and what they will experience in the world outside the classroom.

The purpose of this study was to explore elementary education pre-service teachers’ perceptions of their use of problem-solving skills in both art and in mathematics. The
question guiding this research was: Do elementary pre-service teachers’ use the same approach to solving problems in art as they do in solving problems in mathematics? This is a descriptive study representative of survey research in which subjects responded to items focusing on statements regarding approaches to solving problems in mathematics and art production. The responses on the 4-point, Likkert-type scale were analyzed for trends in responses as they relate to the research question. Demographic data was collected and is presented as well. The subjects were drawn from a sample of convenience of the pre-service elementary teachers enrolled in a required course, Introduction to the Visual Arts in the Curriculum.

Methods

There were 44 subjects who participated in the project and responded to the twenty-seven statements on the survey. Two of the subjects (4.5%) were also concurrently enrolled in a mathematics content course, Geometric Structures, and the first mathematics method course, Teaching Mathematics at the Primary Level. Fifteen of the subjects (34%) were enrolled in the Visual Arts in the Curriculum course and another of the required mathematics content course, Mathematical Structures. Eleven (25%) of the subjects were enrolled in the Visual Arts in the Curriculum course and Geometric Structures. Three of the subjects (6.8%) were enrolled in the Visual Arts in the Curriculum course and the Primary Level Mathematics Methods course, but not a mathematics course. Almost sixty percent (59%) of the subjects had taken one or both of the two required mathematics content courses in previous semesters.

Of the previously mentioned courses, three are taught through a problem-centered approach. The Visual Arts in the Curriculum course has a lecture component and an art production lab in which the elementary pre-service teachers complete a variety of projects. The art production lab is problem-centered and the elementary pre-service teachers are presented a task to complete. They are free to decide what approach they will take and how they will complete the task. The Teaching Primary Level Mathematics methods course reinforces teaching mathematics through a developmentally appropriate, hands-on, problem-centered, inquiry-based, experiential approach. The Geometric Structures mathematics course is founded on an inquiry-based approach in which elementary pre-
service teachers are presented problems to solve and must make and test their own conjectures to derive a variety of geometric concepts and principles.

Results

Descriptive statistics were calculated for each of the twenty-seven statements. After reading each statement, each respondent could select from four levels of agree: 1 – Strongly Disagree, 2 – Disagree, 3 – Agree, and 4 – Strongly Agree. The following tables report the number of responses for each level, the mean, and the standard deviation. The statements have been grouped by similarity: mathematics-related statements, art-related statements, and creativity-related statements. Following each table, a brief discussion of the data is presented.

</tbody>
</table>
Most (84%) of the respondents are aware of their thinking as they solve problems in mathematics although they (75%) seem to follow the same steps each time. There seems to be some agreement that respondents do not actually plan the steps they will follow to solve a problem, nor are they aware of the strategies they use when solving their problems. They do try to keep track of their progress and check their work as they move from step-to-step to complete their work. Almost 90% of the respondents believe that problem-solving skills can successfully be taught and that it might be helpful to have a plan before you begin your work.

</tbody>
</table>

The data presented in Table 4 represents the grouping of like statements. Similar statements reflect similar views. For instance, respondents agree that they are aware of their thinking whether they are solving mathematics problems or art problems. They check their progress as they work through problems in both areas and they believe that even though some people might be born with a "math mind," they can be taught to successfully solve math problems. Statements where this is a difference between the responses, include following the same steps to solve problems. Thirty-three (75%) of the respondents always follow the same steps when working math problems, but only 7 (15.9%) follow the same steps in solving problems in art. Responses were almost equally split between disagree (54.5%) and agree (45.4%) on planning the steps they would follow to solve math problems, but thirty-three (75%) always plan steps to solve an art problem. They also seem to be more aware of the strategies they use in art then they do when solving math
problems. The responses were consistent for statements suggesting that they way they solve problems in art is very different from the ways they solve problems in mathematics and that errors are easier to correct in art than in mathematics. This group of subjects seem to be very visual in their learning style, are better at solving problems in art than in mathematics, and would rather teach art than mathematics. Further statistical analyses might provide additional insights into the data and reflect correlations that might exist between statements.

Implications

The results indicate that the elementary pre-service teachers do seem to use the same approach to solving problems in art as they do in solving problems in mathematics. The results indicate that they are becoming aware that the problem solving skills they are learning in the visual arts course and in the mathematics courses are very useful in solving problems. One implication for future work is to assist elementary pre-service teachers in seeing that problem-solving skills are comparable experiences in not only art and mathematics, but in other subject areas as well. If they become excited about the process of solving problems, learn strategies that are helpful in solving problems, and learn to determine effective ways to evaluate not only the process, but also the solution, they are more likely to develop a learning environment in their own classrooms that reinforce the ideas of problem solving and critical thinking. Although these elementary pre-service teachers do not recognize problem-solving strategies as common structures in both art and mathematics, they do believe the process solving problems is important. Future studies will focus on helping elementary pre-service candidates identify problem solving and critical thinking skills within the elementary curriculum, learn to employ those strategies themselves to solve problems, and to learn how to develop meaning activities that integrate these processes throughout the instructional environment.

Abstract

This paper focuses on the professional development of formal science educators through extraordinary experiences that occur within the realm of informal science learning. For many years the University of Colorado Denver (UCD) has offered programs that take teachers on “science learning journeys” to Africa, South America, through the Pacific, and many U.S. destinations through its Experiential Science Education Research Collaborative (XSci). On these adventures, teachers gain direct, first person experiences of unique and often challenging environments and multidisciplinary science within those settings. Such professional development opportunities for teachers are widespread as summer programs through a variety of informal science learning organizations nationwide. However, there is currently a lack of in-depth qualitative research investigating the actual benefits and interpretive nature of such programs as personal and professional “extraordinary” science learning experiences for the individuals who participate in them. The research agenda for the XSci Collaborative examines the experiences of educators engaged in informal extraordinary professional development experiences in order to understand the personal processes that make them extraordinary and valuable. Specifically, the primary research approach is to examine the interpretation of these experiences by teachers as case studies under the conceptual framework of a phenomenology. This approach utilizes several data sources, including teacher-created digital stories and video documentaries as personal narratives of their extraordinary experience; journals completed throughout the experiences, post experience interviews, classroom observations and student interviews.

Introduction

Although many formal and informal institutions offer experiential learning opportunities there is little in the literature about the value of informal science professional development approaches as lived experiences, how they are interpreted by educators, how meaning is made and communicated, and how such experiences are integrated into the identities and practice of those who choose to participate in them. Knowing this information informs designers of informal and experientially based science teacher professional development programs, the field of education researchers, and educators themselves about the nature and reflective processes involved. These outcomes promote better construction of such experiences in the future and contribute to the research base of these programs.
Background and Rationale

An emerging trend in science educator professional development is experiential learning through what can best be described as immersive and extraordinary informal experiences. Examples include fieldwork with scientists, experience in research labs, and STEM-oriented exploration, travel, and adventure. Experientially based learning strategies in general have a long history rooted in the early work of John Dewey (1938), and later evolved in work by Piaget (1950), Kurt Hahn (1957), Paulo Freire (1970), Vygotsky (1978), Kolb (1984), Jarvis (1987), and many others. Experiential education is best understood as a philosophy of education, in contrast to learning methodologies such as didactic or rote learning that are mostly concerned with knowledge delivery. In contrast, experiential education is concerned with learning from direct first-person experience and a holistic perspective that goes beyond content to include the construction of knowledge, attitudes, beliefs, and transfer of learning. Itin describes experiential education as a process where “Learners are engaged intellectually, emotionally, socially, politically, spiritually, and physically in an uncertain environment where the learner may experience success, failure, adventure, and risk taking” (1997). Quay asserts that learning through experience occurs at the level of the individual (constructivism), the small group (social constructionism), and culture (cultural discourses) (2003).

Although experiential learning outcomes have been receiving increased attention in the last decade (Baldwin, Persing, & Magnuson, 2004; Ewert & Sibthorp, 2009; Keys & Bryan, 2001), little research has been done to identify specific personal gains conferred by such extraordinary informal science learning experiences to educators. Instead, the majority of research into experiential learning specifically for teachers has focused on using hands-on, inquiry-based learning approaches with pre-service teachers within the context of formal teacher education programs (Gilmer, Hahn, & Spaid, 2002; Windschitl, et al, 2003). The research that does exist for informal and immersive experiential programs is often in the form of program-specific evaluations. These efforts have come part of the way in defining the benefits of such experiences, yet they have typically lacked a strong research-oriented theoretical underpinning as well as innovative research approaches for a broad-spectrum analysis of personal benefits from such experiences.

Important questions remain for the field regarding the benefits of extraordinary informal and experientially based education programs for teachers. Does it impact their practice or sense of personal and/or professional identity in meaningful ways? If so, how is that meaning made? What is the essence of these experiences that makes them extraordinary? And ultimately, if the meaning of such experiences is created through individual reflection and interpretation, what is the process of constructing an extraordinary learning experience for oneself and others? We generally address these questions through a case study research approach under the broader umbrella of a phenomenology study. Our goal is to focus on the lived experiences and individual meanings constructed by participants engaged in extraordinary professional development experiences from their respective points of view in the form of narratives, while also considering what the experiences may have in common as phenomena unto themselves (i.e. the essence of the experience for all involved), if such commonalities can be found.

Case study research, as discussed by Creswell (2007) examines an issue or event (in this study, an experiential learning opportunity), “through one or more cases within a
bounded system” (p. 73), and implies a methodology as well as describes the research products. The bounded system here is defined from when the teachers sign up for the professional development experience to several months (or even years) after the completion of their personal narratives communicating their experiences. In these studies, each teacher’s professional development experience are treated as a separate case in order to maintain his or her individual story and point of view.

The approach is informed by identity theory and what Psychologist Dan McAdams has referred to as “the narrative study of lives” in his book *The Redemptive Self* (2006). This approach considers the internalized life stories people create to make sense of their lives as “narrative identities” and the notion that such narratives determine what we do and how we make sense of what we do. In the parlance of identity theory, this can be tied to the concept of identity construction, agency, and the resultant social behavior.

Additionally, an overarching phenomenological structure forms the research context for the case studies, and is intended to consider the question of what the different teacher experiences might have in common that makes them “extraordinary,” if anything. To answer this question, we seek to describe the essence of the extraordinary experience through the elements that transcend the individual cases and apply to the experiences commonly or as shared elements emerging from the individual case studies (Creswell, 2007). We use van Manen’s hermeneutic phenomenology approach (1990), which considers the interpretation of lived experience through various “texts,” (which can include multiple data sources) and seeks essential themes to describe and represent the nature of a given experience in broad and specific terms.

Importantly, this technique goes beyond mere description to also integrate the interpretation and interpretive processes of the researcher regarding the meaning of the lived experiences, rather than attempting to *epoche*, or bracket out, the researcher’s point of view (van Manen, 1990; Husserl, 1931). The theoretical basis in conducting this research is rooted in constructivism as described by Piaget (1950), Bruner (1961), Vygotsky (1978), Bransford, Brown, & Cocking (2000), Kim (2005), and others. This stance is reflected in the operational definition of “experiential education” as a starting point for considering the extraordinary learning experiences in this program:

A transactional learning strategy in which educators and learners co-engage in direct experience and focused reflection, in concert with private personal interpretative processes on the part of the learner, to construct knowledge, develop skills, and contextualize the meaning of the experience.

In a teacher experiential learning scenario then, the professional development trainers or designers are defined as the “educators” and the teachers being professionally developed are defined as the “learners.” Given this stance, we actively look for events, instances, and reflections in which the process of knowledge construction and meaning making is taking place. This may include evidence of, or references to: collaborative learning and deep personal introspection (Brooks & Brooks, 1993, 1996); the existence and evolution of mental frameworks, structures, or schemas (Zemelman, Daniels & Hyde, 1993); and narrative accounts of development of or changes in identity (Henke, Chen, & Geis, 2000).
For this last component, identity, we apply tenets of identity theory. Identity theory is built upon the notion that society is organized and has patterns. The self emerges within the context of this organization through what Stryker dubbed “structural symbolic interaction” (1980) through the use of language and symbols based on shared meanings within a society or culture. William James (1890) posited that there are as many selves as there are positions that one might hold in society and as there are groups who respond to and interact with the self. We each have multiple identities, each one an agent capable of choice, action, and role taking (e.g. parent, friend, teacher). Therefore the notion of identity is somewhat distinct from the person owning them, but describes avenues for behavior and transactions within society based on shared meanings within particular cultural structures. In this capacity, “professional identity” – an educator for instance – is a role-based designation and is endowed with all the accoutrements, expectations, and responsibilities one understands it to mean.

But identity is also a theoretical construct existing in the mind of the individual and gives rise to the sense of self. Self is a person’s consciousness of his or her own being (Burke 2009). It allows each of us to reflect on and evaluate ourselves as both subject and object, planning and modifying on this construct to bring about desired future states. This is personal growth. Further, the self is born out of social interaction and experiences within the environment and most notably the complex structure of society and culture (Mead 1934). Because we can each assume different positions within society, the self reflects these by way of multiple identities. Therefore, the self can assume agency through identities, and is in part comprised of the sum total of those identities – which are fluid throughout our lives.

Viewing constructivism through the lens of identity theory, we take the position that the learning of new things can go beyond incorporation into an internal framework for understanding to actually inform, modify, and become integrated into a person’s identity. In short, the construction of new knowledge is, in fact, identity construction. While constructivism stresses the building of understanding through an ongoing process of linking new ideas and information within internal constructs or schemas based on previous learning, identity theory goes one step further to then also incorporate the self into the equation in the form of the relationship of the knower and the known as an essential element to learning, meaning making, and personal growth. Viewing professional development as a form of identity construction is important because it changes the notion of teacher training from one of content or methodology training to consider the larger relationship of the educator to new knowledge and its integration into his or her self perceptions.

**XSci Application**

In setting up experiential activities certain organizational considerations and areas of outcomes are investigated in the research.
**XSci Experiential Learning Definitions**

**Defined Experiences**

Clearly science interest, skills, and knowledge are developed in many places, at many times, and through many mechanisms. The driving questions commonly determining selection of experiential learning sites are: what things are to be learned and experienced and how these experiences will be supported, amplified, or expanded at different times and in different environments? So in our approach we determine what is the role of the experience, both as an entity in itself and as an addition to other formal educational experiences. There is a need for knowledge, derived from both practice and research, about how these different settings work together. To meet these objectives our partnerships includes a range of experiential opportunities extending from internships with the museum and national park system, research with NASA, NFS and others, and extraordinary field experiences to expand content understandings and challenge participant.
Experiential Learning Characteristics

XSci experiential learning is a process through which a learner constructs knowledge, skill, and value directly from an experience within the environment. In many respects it is not unlike situated learning or place based learning. Content learning within these environments occurs when carefully chosen experiences are supported by reflection, critical analysis, and synthesis. Experiences are structured to require the learner to take initiative, make decisions, and to be accountable for the results. The results of the learning are personal and self constructed preparing for and leading to future experiences and learning. Understandings are developed and deepened. Shared experiences within a group or cohort influence this learning. Lave and Wenger (1991) suggest that individuals learn as they participate by interacting with a community, its history, assumptions and cultural values, rules, and patterns of relationship; the tools at hand, including objects, technology, language and images; the moment’s activity, its purposes, norms, the practical challenges. Shared knowledge emerges from the interaction of these elements. Activities that involve professionals in open and dynamic discussion, mutual problem solving and/or collaborative learning draw the participants into a community of learners or professional cohort and contribute to a deeper understanding of the science concepts and content expressed during the experience. The increased content understanding enhances the professional efficacy of the participant resulting in more confident practice.

The use of a field site considers this theoretical base in planning meaningful activities. The field experience is designed to meet all of following program objectives.

A) Increased understanding of science content and concepts through first-person experience
B) Extraordinary experience as determined by participant as extraordinary
C) Learning personal and self constructed
D) Challenging, high stakes with possibility of failure
E) Participation within a cohort as part of a community of learners

Participant Impacts

Narrative Identity

We explain experiences to ourselves in the form of narrative. Narratives form our identities. The relationship between narrative and identity is an internal transaction. Narrative provides input to identity as the form and method of identity construction. In turn, our sense of identity thus formed contributes back to our evolving narrative through the output of meaning or how we make sense of our relationship to the experience and potentially to other experiences. The best teachers have the best stories, giving them the opportunity to form incredible stories and thus incredible identities. It’s not what they tell students but how they view the related content they teach students and model the understanding.
Content Understanding

The complexity of content and its relationships are best understood through direct experience with that content. Situating the learning in extraordinary experiences create deeper understanding of content vs. memorized content routinely accomplished through textbook use. Although students are not participating in the experience, their teachers have and in the process better understand the content they teach. In addition the descriptions of the content delivered through first person narration may better inspire the students and model for them an exciting and positive way of relating to science.

Professional Self

The quality of a teacher resides in their experiences. These expertises are developed through a combination of their formal and informal experiences. Formal and informal experiences contribute to content depth and profundity, content application understandings, pedagogical knowledge and use, and professional interactions all resulting in a strong teacher sense of professional self. Identity is revealed in the form of a sense of agency, which in turn results in social behaviors- what they actually do as educators and how they do it.

Content Communication

The transfer of content understanding to students is impacted by the depth of teacher understanding of that content. The more experience the teacher has relating to the content the better they are in relating it to a range of students. In addition the ability to engage student through first-person stories about the content enhances their understanding and interest in understanding the content. Modeling the way the teacher thinks about and understands the content helps students understand this content and gives them examples for approaching future content.

Personal Relevance

Self is people’s consciousness of their own being. Each reflects on the desired future state. This is personal growth. It allows each to evaluate themselves as subject and object, planning and modifying on this construct to bring about desired future states. Continued monitoring of participants following an extraordinary experience to determine if they seek out other experience and continue growth.

Student/Colleague Outcomes

Inspiring through Stories

The most influential classroom teachers are those who can effectively take their students on extraordinary journeys of discovery, whether of the mind, spirit, or body. Teachers themselves derive inspiration from their own extraordinary life experiences and
endeavor to bring them into the classroom in ways that engage students in the process of inquiry through a variety of creative methods and tools.

Inquiry Process Understanding

Many teachers only experience with inquiry stems from coursework labs following detailed directions with predetermined results and when presenting inquiries in their classrooms follow this model. Learning how to do and thus lead inquiries they must experience true inquiry (research). Inquiry by its nature contains a certain amount of dissidence, many times demonstrating out as frustration by students. A teacher’s recognition of this and not allowing the feeling to end the experience is important. Guiding the students to work through the experience utilizing proper scientific approaches to come to correct understanding.

Modeling Involvement

An important part of teaching is when a teacher models how to deal with content and make sense of phenomena. An expectation that all students bring a problem-solving schema to content is false. We would expect that eventually students develop these skills but many need this modeling before that happens. Another aspect of modeling is a teacher’s love of science and curiosity to learn more. This can be contagious and lead to a co-creation of a science identity.

Co-creating Science Identity

Science identity construction, like any form of identity construction is based on experience, agency and role taking. An area of research interest relating to the teacher’s professional (science) self is whether enhancement of self may result in co-creation of science identity with their students. Generating excitement, modeling science inquiry, retelling personal experience, all may contribute to a classroom community that values science and create student science identities that encourage their interest and future involvement in science learning.

Content Engagement

The more tools a teacher has to deliver and understand content the more likely they will engage students. The more experiences the teacher has with the content the better they understand it and the more likely they will expand the ways they are able to express understanding. Teacher stories enrich the content delivery. Relying entirely on textbooks and worksheets to interest and engage students is usually unsuccessful.

Attitude for Sustained Learning

Generally participants in ongoing experiences already have a positive attitude toward sustained learning. Whether those that participate in the first experiential activity continue to seek out additional experiences is part of our research agenda. For those that
Methodology Explanation

Regarding the case study and phenomenological aspects of this research, we follow a general model for data collection common to qualitative research, as identified by Madison (2005), Huberman and Miles (1994), and Wolcott (1994). This includes a phase of collecting and organizing the data for analysis, a phase of applying a coding and condensing process to reduce the data into themes and categories, and a phase of representing the data as findings using a variety of tools (narratives, discussions, figures, etc.). Typically, these phases form a data analysis spiral and occur in an interrelated and iterative fashion, rather than a linear one (Creswell, 2007).

Data collection occurs before, during and following the extraordinary experiences. We use purposeful sampling in selecting participants for the research from these trips who are willing to take part in the study, including some who create video documentaries or digital stories of their experiences.

For the purposes of this research, given its emphasis on narrative interpretation, it is not necessary to control for the variety of experiences teachers might have. After all, even on the same trip, teachers will invariably have very different experiences. What is important for the study is that participants have what they would call an “extraordinary experience.” Then the research questions regarding the nature of the experience and their interpretation of it can flow. Also, since the study will focus on extraordinary professional development experiences related to science, it is critical that all experiences studied include science learning in some way (although not all educators included have to be science educators).

Examples of such experiences include teachers travelling to Peru and Easter Island where they journey through the Andes mountains, visit the ancient city of Machu Picchu, hike part of the Inca trail, and explore the remnants of a society that depleted their natural resources ages ago, leaving only majestic stone statues on Easter Island as evidence of their existence. Another example is teachers travelling to Africa to climb the largest free-standing volcano in the world – Kilimanjaro, travel through the Serengeti – one of the last great wilds on the planet – and visit AIDS orphanages and villages beset with social, economic, and health challenges.

For some, these experiences represent first time encounters with foreign travel, different cultures, even the ocean, or represent a personal challenge. In any case, such experiences are potentially transformative experiences and provide numerous opportunities to touch teachers in unique and highly personal ways, and this is the criterion important to the research.

The role in the research is to conduct the data collection and analysis through interviews, reviews of narrative journals, review of online group sharing via Facebook, and the review and deconstruction of teacher-created video documentaries or digital stories.

We recognize that the participating teachers are not seasoned film/digital story makers and will be learning the editing software and post-production process to some extent while they develop their documentaries. Therefore we assist them in technical
ways as they complete their films. We are careful to give general guidance and options in such cases, rather than specific interpretive input.

Alternatively, our experience as designers of similar professional development experiences greatly informs the research approach and questions identified, providing potentially important insights. The identification and inclusion of our own interpretation of the data and the stories presented by the teachers is part of the reason we use a hermeneutic phenomenology structure. To facilitate this we keep a reflexive journal throughout the research process and incorporate it into the final report.

We gather a wide range of data in this research approach to allow for comparison and triangulation across the different experiences and to examine congruency among the different forms of data for validation. Data sources include: 1) iterative and recorded participant interviews and observations (immediately post-experience, during and after the video editing process, and several months post-experience); 2) participant travel journals as written narrative forms; 3) teacher-created video documentaries as multi-dimensional narrative forms, and; 4) shared narrative threads (including comments, stories, photos, and videos) typically posted among groups on Facebook.

The interviews are individual, semi-structured, guided interviews focused on open-ended questions to allow for the emergence of themes and identification of themes. Each are video recorded for later transcription and open-coding analysis, and I we take observational notes during the interview process.

The review of the participant travel journals involve treatment of them as narratives using narrative analysis and an open-coding approach to identify emergent themes and categories, and to include significant quotations and comments that represent them. We impose a narrative structure *a priori* for teachers to use when writing their journals in order to facilitate narrative form. During this process we rely heavily on the reflexive research journal to compose reactions to and interpretations of the narratives, make metaphors, and attempt to relate emerging themes to the theoretical base of constructivism and theoretical framework (Wolcott, 1994).

Regarding the analysis of the video documentaries as data sources, we use a narrative analysis approach that considers each film as a holistic story as well as a deconstruction of its elements in order to better elucidate the multi-dimensional meaning of the films. This approach in informed by two previous approaches. The first was described by Yussen and Ozcan (1997) and examines five elements of plot structure: characters, setting, problem, actions, and resolution. The second was described by Clandinin and Connelly, (2000) and examines three dimensions: interaction (personal and social), continuity (past, present, and future), and situation (physical places or circumstances). Under this framework, we apply a visual coding strategy to examine the imagery chosen by the video creators to identify visual themes and categories, a verbal-linguistic coding of dialogue and/or narration based on a textual transcription of each film to identify text-based themes and categories, a scene-by-scene plot mapping approach to create a conceptual map of each film to examine the sequential order of “scenes” chosen or developed by the video creators, and finally a running narrative commentary in which video creators comment in real-time about their choices and what they were “going for” in their documentaries. This is modeled on the “director’s commentary” option common on DVD movies as part of the special features menu and is recorded for video playback with commentary.
Finally, the shared narrative threads on Facebook involves a review of the postings by group members from each extraordinary experience as different threads. For example, a given posting of a comment, story, photo, or video typically initiates a thread in the form of responses and additional postings. These threads can be identified, mapped, and coded and then compared for emergent themes and agreement or disagreement among responders. Additionally, the impact of this form of sharing and response generation can be included in the guided interviews to examine their impact on the post-trip framing of the experience. This approach represents a new area of data collection.

Once the initial data collection is completed, we embark on an iterative interpretation process, which will include each participant and apply both the case study design and the phenomenological framework. For the case study approach, we apply the design described by Stake (1995), treating each individual participant’s experience as a separate case and using the multiple data sources discussed above to formulate a detailed description of each case. This description includes each case history, chronology, day-by-day activities, significant events, interpretations, and will synthesize the themes initially identified from the various data sources into comprehensive emergent themes. The result is a within-case analysis of each case (Creswell, 2007).

Following this step is a cross-case analysis to examine the emergent statements and themes across all the cases and consider the different extraordinary experiences as shared experiences, or phenomena. The overriding issue addressed by this phenomenology approach is what it means to have an extraordinary professional development experience. We use van Manen’s hermeneutic phenomenology approach (1990), which considers the interpretation of lived experience through various “texts” and seeks essential themes to describe and ultimately understand the common experiences of the participants. For this research, the “text” for analysis includes all of the data sources described above. From these sources, significant statements revealing how the teachers experienced the phenomena of the extraordinary experiences will be identified across the cases. From this analysis, we identify the themes and meanings which seem to be shared among all participants and yield an understanding of what each experience was like, what made it extraordinary, and how meaning was made and identity constructed by participants in their interpretation of their experiences. The result are detailed written descriptions of what they experienced (textural description) and the context (internal or external) that influenced how the extraordinary experiences (structural description). These descriptions will be compiled into a composite description that represents the “essence” of the experience shared among all the participants. This hermeneutic approach integrates the interpretation and interpretive processes of the researcher regarding the meaning of the lived experiences, rather than attempting to bracket out, the researcher’s point of view.

During this process we share the initial findings with participants as a starting place for the co-construction of the final interpretation of the data until it accurately represents the personal experience for each participant to their satisfaction. This includes member checking in the form of additional interviews and collaborative data review sessions, culminating in the final deliverables describing their experiences as represented in the different data sources. Further, we actively seek to identify discrepant information and explore its meaning within the context of the study in collaboration with participants.
as a form of negative case analysis.

Summary

The intent of XSci is to elucidate the meaning of and processes for constructing extraordinary learning experiences for oneself and others. We focus on extraordinary professional development experiences for educators, with the point of view that teachers are uniquely attentive to learning processes and are well equipped to help us, as the researchers, articulate their constructions of identity and meaning and significance regarding these experiences. However, there is currently a lack of in-depth qualitative research investigating the actual benefits and interpretive nature of such programs as personal and professional extraordinary experiences for the individuals who participate in them. If a teacher goes to Africa and climbs Mount Kilimanjaro, how does it matter to them as professional educators? Does it impact their practice or sense of personal and/or professional identity in meaningful ways? If so, how is that meaning made? What is the essence of these experiences that makes them extraordinary? And ultimately, if the meaning of such experiences is created through individual reflection and interpretation, what is the process of constructing an extraordinary learning experience for oneself and others?

TITLE
“Strategies to Decrease Burnout in Physical Educators with Coaching Responsibilities”

ABSTRACT
One of the most prevalent concerns educators face is the threat of burnout. This chronic condition occurs when demands exceed an individual’s ability to cope, instilling a sense of being overwhelmed, which can produce either a psychological, emotional, or physical withdrawal from a stressor (Smith, 1986). Unable to cope, burnout is likely to occur.

The physical education profession has been shown to experience less burnout than other professions, but is not immune to burnout. When physical educators take on other responsibilities, which is often the case, the dual role of teacher-coaches has been found to have many incompatible characteristics (Kosa, 1990).

The dual roles of physical educator/coaches create unique challenges for the individual. It is important to create awareness of these issues in order to better treat and prevent burnout. If left untreated burnout can lead to leaving the profession, becoming distant in the profession, or not giving the necessary effort to complete the tasks it takes to be a physical educator (Drake & Hebert 2002; Wuest & Bucher, 1999). While burnout affects the teacher, the effects of burnout can cause the learning environment to suffer which ultimately affects the students.

The goal of this presentation is to create a greater awareness so that physical education professionals and others can; 1) identify potential causes of burnout in physical educator/coaches, 2) identify potential symptoms of burnout, 3) identify
potential coping mechanisms for burnout, 4) present strategies to prevent and deal with current burnout.

Abstract
This study explored relationships among Self-regulation, Peer Competence, Play and Leadership of preschool children. Instruments were the Korea-preschool Leadership Scale (Lee & Choe, 2008), Korea-Self regulation Scale (Lee, 2003), Korea-preschool Peer Competence Scale (Pak & Lee, 2001), Korea-preschool Play Scale (Chi, 2007) constructed by the researcher. Participants were 214 mothers of preschool children (M=75 month) and 10 preschool teachers in Seoul. They responded to questionnaires; data were analyzed by correlation and multiple-regression.

Major results showed there were First; positive correlations among Leadership of children's and Self-regulation (r=.15, p<.05), Peer Competence(r=.61, p<.01) and Play(r=.51, p<.01), also positive correlations between Peer Competence and Play(r=.77, p<.01).

Second; (1) Leadership was predicted by sociability of Peer Competence, (2) Leadership was predicted by leadership of Peer Competence, (3) Leadership was predicted by self-control of Self-regulation.

Submission title: ‘I’ll find you on Facebook’
Adapting methodology frameworks to investigate the level of social and pedagogical inclusion of student with Social, Emotional and Behavioural Difficulties.

Format: Paper presentation

Abstract
Formal methods of interview and data collection can be of limited usefulness when it comes to investigating the lives and school experiences of students with Social, Emotional and Behavioural Difficulties (SEBD) (Travell, 1999; Department for Education and Skill, 2005). First, the constraints of formal interviewing are in themselves off-putting, ‘boring’ ‘uncool’. There exists, secondly, amongst these teens a high degree of awareness of their psychological and pedagogical ‘label’ (Dudley-Marling, 2000). Students with SEBD are highly aware of the perception teachers have of them and remain very weary of any attempt to record, analyse or obtain data that might confirm or corroborate previously established diagnosis or disciplinary rulings. Finally, if the intention of any study is to investigate the genuine, private and subtle interactions which students with SEBD entertain with their peers, the investigative methods used by researchers must be just that: subtle. Data collection must remain non-intrusive, respectful and centered on these young people’s own notions of what was relevant and not.

This is why the idea of mirroring principles of ethno-methodology for the purposes of investigating the level of inclusion achieved by children who are ‘at risk’ is appealing. Ethno-methodology has developed in indigenous contexts where researchers have had to realise and acknowledge that traditional Western research framework, even when they are qualitative, may be ill-adapted to the idiosyncrasies of a particular sub-group or culture (Smith 1999; Wilson 2001; Fredericks 2007; Jordan, Stocek, Mark, & Matches, 2009). It manifests itself in practical terms as the desire to make the research process as respectful of cultures, languages and knowledge of the indigenous participants as possible and involves reflection on the actual parameters of mindful research in an indigenous context.
In practical terms this means that individuals collecting data from the students with SEBD must similarly be respectful of the relevance attributed by the students to the different forums they use and to the nature of various exchanges, even if these do not rank equally in their own value systems. Individuals in interactions with the students with SEBD must also try to mirror registers of language used by the students to facilitate reciprocal exchanges; they must be instructed to demonstrate interest in the various technological and communication tools frequently used and mentioned by the students. An ethno-methodological approach may also mean that the researchers collecting and recording data have to venture into new media platforms, such as online games or social networking sites, and may need to engage on these platforms. The key value becomes participation and observation rather than directive questioning. This ‘blending in’ process seems essential considering the intangible nature of the exchanges being sought out.

The paper will consider the outcome of such reworking of traditional methodological format in light of the lessons learnt from ethno-methodology – from the perspective of SEBD but also in the more general context of inclusive education, where each ‘millennium’ learner (Keefe, 2008) is increasingly becoming a hybrid learner, drawing skills and knowledge from the classroom but also from a much wider array of technological avenues.

A Cross-cultural Challenge: The Impact of Society and Culture on Plagiarism
Patricia Ann Brock, Ed.D.
School of Education-NYC, Pace University
163 William St., 11th Floor, NY, NY 10038
doc@patriciabrock.com & pbrock@pace.edu

Plagiarism has been and is a perennial academic integrity problem at all levels of education. Communication technologies and distance learning settings are two-edged swords: fortunately, through the growing global presence of telecommunication options, students and teachers have increased their educational opportunities through many asynchronously- flexible course readings, discussions and online assignments; learners and educators cross time zones and political boundaries with cyber-ease according to their personal time schedules while meeting mandated timelines. Communication technologies and distant learning settings have opened the educational door to more students who need and have access to more diverse learning options. Communication technologies and distant learning settings also have opened the door to more professors who can utilize more teaching strategies and delivery modes while providing more individualized mentoring assistance to their students.

Unfortunately, communication technologies and distant learning settings have exacerbated the problem of plagiarism by permitting more anonymity and more ethical misunderstandings, especially in cross-cultural environments. While, it would be naïve not to accept the fact that a percentage of students do intentionally plagiarize or “cheat” for a seemingly unlimited number of reasons, other students unintentionally commit academic integrity infringements. It is essential to be able to identify both types. Students who unintentionally-cheat may do so for three legitimate reasons: [1] misunderstandings due to cultural academic integrity protocol – what was acceptable study strategies in their own cultures do not necessarily match the expectations of the new cross-cultural environment; [2] misunderstandings of newly integrated special needs students, as students on the autistic spectrum, who display cognitive processing challenges such as not being able to intellectualize multiple perspectives, other than their own. In other words, they have no Theory of Mind; and [3] students who have misunderstandings of plagiarism due to a combination of both cross-cultural and cognitive processing challenges.

Traditionally too often institutions through their designated course professors focus on the delivery of the course content; however, many of today’s current online learners have differentiated learning styles as well as differentiated cultural backgrounds and differentiated former learning opportunities. Institutions and professors cannot simply assume that pedagogical cultural contexts and constructs in all cross-cultural academic settings are similar. This is not the case. Because of this misconception, students can be unjustly accused of plagiarism and other academic integrity infringements. Dire consequences can lead up to course failure, resulting in a negative impact to the student’s course transcript. Student retention rates increase.
So, what can be done to address this academic integrity cross-cultural dilemma, especially with the problem of plagiarism? First, this interactive session in a collaborative format will define, discuss and present the concept of plagiarism and its many permutations across cultures. Next, the session will address the importance of college policies regarding academic integrity and the methods in which they should be shared and explored with students. Finally, researched suggestions and a recommended survey instrument will be presented in order to provide a framework for distance education professors to meet the needs and understandings of their students on this subject. In conclusion: never assume, always assess attitudes and expectations, of both the students and the teachers. Possibly, by emphasizing, the student’s role and responsibility in self-monitoring academic integrity, plagiarism online and in traditional classroom settings, will decrease and, ideally, disappear from academia.
Examining How the Enacted and Assessed Curriculum Can Be Informed by Studies of the Textbook Curriculum Using the Articulated Learning Trajectory Construct

Travis A. Olson

*University of Nevada, Las Vegas*

**Introduction**

In this paper, theoretical and conceptual frameworks are presented that highlight the relationships among the enacted, assessed, and textbook curriculum, as well as the role of learning trajectories in explicating the connections among these curriculum. In particular, I argue that the construct of an articulated learning trajectory (ALT) developed by in a previous study (Olson, 2010) for mathematical content analyses of textbooks offers a fruitful framework through which connections can be examined among these three areas of the school curriculum. That is, in conducting a mathematical content analysis using the ALT construct, the features of the textbook curriculum (i.e., the scope and sequence of mathematical topics) are examined in-depth; the resulting data and narratives can then inform the field and researchers as to what content teachers actually enact, and what content is important to assess.

I maintain that the ALT construct provides for in-depth examinations and explication of the ways in which textbook authors present and develop mathematical content. In short, an articulated learning trajectory is defined as follows:

> The articulation of a hypothetical learning trajectory in curriculum materials, namely in textbook sequencing within a grade level and across grade levels….an ALT is a learning trajectory that goes beyond the situated predictions of student learning associated with a HLT. (Olson, 2010, p. 67).

The examination of ALTs across and within grade levels is focused on the development of a particular topic or content. For example, in a previous study (Olson, 2010) I focused my examination of ALTs within middle grades mathematics textbook series around the development of algebraic thinking constructs specifically related to authors use of patterning concepts. The following section relates specifically to the theoretical and conceptual frameworks that guide connections among the various school curricula. However, selected brief findings from this study will be explored later in this paper.

**Frameworks**

**Situating the Textbook Curriculum**

Two frameworks specifically situate the role of the textbook curriculum, through which, ALT examinations, and connections to the enacted and assessed curriculum can be better understood and developed. In particular, scholars at the Center for the Study of Mathematics Curriculum (CSMC) developed a conceptual framework (Figure 2) that identifies various aspects of the school curriculum. Within this framework, I argue that the focus of mathematical content
analyses studies should be within the realm of the textbook curriculum. By identifying the content that students have the opportunity to learn, and in what sequence it was presented, assessments can be further analyzed to determine whether or not the knowledge assessed was in fact the knowledge that was likely developed through the use of a particular textbook.

Remillard (2009) also provides a theoretical framework (Figure 1) through which one can identify interactions among aspects of teaching and learning mathematics. In particular, this framework illustrates the ways in which the textbook curriculum interacts with the practice of teaching (i.e., of enacting the textbook curriculum). Specifically, the usefulness of mathematical content analyses utilizing the ALT construct is that such efforts highlight the topics, tasks, and structure of textbooks, which in turn inform examinations of the enacted curriculum by providing a robust understanding of nature of curriculum resources. Furthermore, Remillard’s identifies the need to examine the features of the textbook curriculum as follows:

The fact remains that each curriculum program has a number of features (some of which may seem trivial to the researcher or developer) that might figure significantly in how a teacher interacts with it….we lack conceptualizations of what these features might include, which are needed before we can study how these features matter. (p. 90)
Situating Learning Trajectories and the Textbook Curriculum

In a summary report on a conference to identify avenues for future research, collaboration, and development of curriculum materials with regard to the Common Core State Standards for Mathematics (CCSS) (2010), Confrey and Krupa present a theoretical framework (Figure 3) for examining the instructional core, the center of which is focused on learning trajectories. This framework is based on current research related to explicating learning trajectories for learning mathematical content, and provides an orienting lens for my work.

In the framework presented by Confrey and Krupa, the intended curriculum and implemented curriculum are evident at one vertex of the learning trajectory triangle. However, I argue that these two parts of the school curriculum in the model in Figure 3 are directly related to...
the *textbook curriculum* and the *tasks, topics, and structure* aspects presented in Figure 1 and Figure 2, respectively. In other words, I maintain it is through the interaction of the learning trajectories presented by the authors via the *textbook curriculum* (i.e., ALTs) that differences in the tasks, topics, and structures can be identified that affect teachers implementation of a particular curriculum, as well as how accurately assessments assess the knowledge that was developed through the use of one textbook versus another.

**A Brief Examination of ALTs**

The data presented in this section are from a study of ALTs related to the development of algebraic thinking constructs through the use of patterning concepts within four middle-grades mathematics textbooks (Olson, 2010). These data are presented to provide substantive examples of the ways in which studies on the enacted and assessed curriculum can be informed by descriptions of authors use, presentation, and development of mathematical content within and across grade levels. Specifically, I present data from two textbooks: Saxon Math, Course 1 (Hake, 2007) and Math Thematics, Book 1 (Billstein & Williamson, 2008). Both of these textbooks are intended to be the Grade 6 textbooks for the middle-grades textbook series of which each are a part.

Through the examination of ALTs in this study, elaborate narratives were developed and a final summary narrative of the ALTs in each textbook trajectory was developed. The two summary narratives of Saxon, Course 1 and Math Thematics, Book 1 are particularly illuminating with respect to the potential for dramatically different opportunities to learn that are provided to students of these textbook series.

In the Grade 6 textbook of Saxon, the authors generally utilize pattern recognition and extension constructs in the first three-fourths of the textbook, and pattern generalization constructs in conjunction with variable and function concepts in the final one-fourth of the textbook (Olson, 2010). In fact, according to Olson, function concepts are *only* found in the latter one-fourth of the textbook. In other words, Olson provides the following summary narrative related to ALTs in Saxon, Course 1 related to pattern concepts and algebraic thinking constructs:

However, the data overall suggest that the authors engage students with pattern extension constructs in the majority of the material. These problems often take the form: given a pattern of numbers, describe the pattern and find the next term(s). Along with the repetitious inclusion of these instances throughout the text, the authors include groupings in the final one-fourth of the textbook that incorporate pattern generalization constructs, patterns in numeric contexts, and variable concepts in the context of function tables. (p. 155)

In contrast to the way in which the authors of Saxon, Course 1 present this mathematical content, the authors of Math Thematics, Book 1 include patterning concepts in Grade 6 as follows:

…the authors provide students with material related to determining a rule for a sequence in the first part of the textbook, which overlaps with the bulk of the material related to function concepts and pattern generalization constructs. Moreover, the authors generally incorporate variable and function concepts in
problems associated with pattern generalization constructs. (Olson, 2010, p. 212)

The authors of Math Thematics also incorporate variable and function concepts within the first one-fourth of the textbook. Furthermore, Olson identifies every instance that involves pattern generalization constructs and algebraic thinking concepts to be within the first three-fourths of the textbook, the precise opposite of where the Saxon authors position the same content.

**Discussion**

Clearly, within these two textbooks, each of which are part of middle-grades textbook series, the authors not only include content represented in different ways, but at different points in the textbook. It is my assertion that merely the different textual position of similar concepts will dramatically impact the implementation of this content. Furthermore, because of the difference in textual location of similar content, the assessment measures used to identify the knowledge acquired by students using one textbook versus another, might be very well skewed by various factors, such as, when the assessment is given (e.g., before or after the three-fourths mark of the textbook).

What is not discussed thoroughly in this paper is the fact that along with the difference in textual position, there is a dramatic difference in the nature of the instances of patterning concepts that the authors include in these textbooks. This fact is alluded to by the quote regarding the Saxon textbook, in that the general “form” for the presentation of pattern concepts is given, namely: given a pattern of numbers, describe the pattern and find the next term(s). This format for patterning concepts in Saxon, is not necessarily indicative of the format in the Math Thematics textbook. Although, some patterning instances in Math Thematics certainly embody the prevalent format of the Saxon book, the authors of Math Thematics engage students in vastly more geometric contexts for patterns. Subsequently, much of the work with patterning in Math Thematics relates to drawing connections between the numeric context of a pattern and the associated geometric context of the same pattern.

Clearly then, this fundamental difference in the presentation of pattern concepts between Saxon and Math Thematics, combined with the difference in textual location for key instances of patterning, lead one to question the struggles that a teach might have moving from one curriculum one year (say Saxon in 2010) to another curriculum in the following year (say Math Thematics in 2011). One likely would expect the teacher to supplement the Math Thematics curriculum with an abundance of patterning problems that are similar in format to the Saxon problems, but which they likely perceive as being largely absent in the Math Thematics textbook. Conversely, if a teacher went from Math Thematics to using Saxon, she or he might very well feel compelled to heavily supplement patterning concepts related to variables and functions early in the year, perhaps due to a lack of understanding that the Saxon textbook will cover such concepts, but not until first three-fourths of the textbook has been covered (assuming a teacher progresses linearly through the textbook; an assumption I believe to be valid).

Given the differences in the textbook curriculum identified by in my study (Olson, 2010), I argue that it is crucial to continue to utilize and refine my framework for mathematical content analyses using the ALT construct. Such studies are critical to understanding the nature of teacher supplementation of the textbook curriculum, as well as informing the overall picture of the nature of the content and sequence of the enacted curriculum and assessed curriculum.

Using the Language Arts to Teach Cultural Humility to the Youngest of Our Learners

Dr. Leslie Ann Prosak-Beres, Director
Graduate Literacy Programs
Xavier University
3800 Victory Parkway, Cincinnati, Ohio

Ms. Sarah Weiss, Executive Director
The Center for Holocaust and Humanity Education
8401 Montgomery Road, Cincinnati, Ohio 45236

Background
The concept of “cultural humility” suggests that we engage in an ongoing process of self-awareness and self-reflection to recognize, understand, and respect different beliefs, values, and practices. It suggests being open and flexible to accept the cultural differences, to learn from others about their cultures, and to build relationships on similarities. The increasingly diverse population of the United States requires a
more inclusive approach to teaching our young children that not only commits to the understanding of cultural history, background and experiences of both our teachers and students, but can also be tailored to the individual’s cultural framework.

The concept of cultural humility has been an effective one in the medical field, yet in education our terms of “tolerance,” “acceptance,” “diversity” and “multicultural education” are the basis for cross curricular development of what is taught to our children, yet they do not truly convey what our children need. It is believed that the introduction of the term “cultural humility” is a better descriptor of the kind of curricular engagement we want to use with our youngest learners. Moreover, extending the concept of cultural humility to our youngest students suggest the development of lifelong, reflective learners by effectively weaving an attitude about cultural differences into every teacher-student encounter.

A common approach to diversity education focuses on learning about specific ethnic and racial differences. While there may be patterns of beliefs and common experiences within racial and ethnic groups, there are many layers that make each individual unique. The humbleness it engenders enhances student/parent/teacher understanding of unintentional and intentional bias while broadening the acceptance of “other” through valuing input from this learning community interaction.

According to Hall (1976), the most important part of culture...is that which is hidden and internal but which governs the behavior encounter.” This quote speaks to the unseen yet powerful nature of culture. It is hidden and internal, yet is what helps shape our behaviors and interactions with others. Mis-understandings, false assumptions, lack of communication and understandings can arise more easily when people are operating from differing core beliefs. As Linda Hunt, Professor of Anthropologicia at Michigan State University has stated:

“Culture does not determine behavior, but rather affords group members a repertoire of ideas and possible actions, providing the framework through which they understand themselves, their environment and their experiences...Culture is every changing and always being revised within the dynamic context of its enactment.

“Additionally...individuals choose between various cultural options and in our multicultural society many times choose widely between the options offered by a variety of cultural traditions. It is not possible to predict the beliefs and behaviors of individuals based on their race, ethnicity, or national origin.”

Projected Research

In conjunction with The Center for Holocaust and Humanity Education of Cincinnati and its Executive Director, Sarah Weiss, this project of studying Cultural Humility and its implication for teaching the youngest learners (ages 5-8) was initiated in late spring of 2010. The focus and desire of the projected research was to develop meaningful opportunities for teacher mentors and the children they influence, a repertoire of ideas and possible actions that learners can choose from to form their own understanding of themselves and their world.

As we move through the day, our own lives reflect the cultural maze we encounter without even thinking about it. Our personal culture is shaped by our ethnicity and skin color, but also by our class,
age, experiences, physical abilities, gender, languages(s), religion, politics, education, sexual orientation, socio-economic status, and residential status. Cultural humility is developed in our young children in much the same way. This study is reflective of the needs of parents, educators and society as we impact the lives of the young (ages 5-8) who believe in us and we in turn in them as our future culture of world citizens.

Over the past five months we have been collecting information from a specifically focused data base of teacher/educators in both public and private schools from the tri-state areas of Ohio, Kentucky and Indiana. The school districts included, urban, suburban and rural communities. The response data to date is about 25% of the 800+ surveys sent. A second wave of requested information has been sent and the return date is scheduled for the end of October 2010.

The following 14 questions were determined important for the beginning of this research and were sent as a survey to determine the needs and desires of teacher/educators to effectively present material related to cultural humility both in and out of their classrooms. As part of this research, a similar survey is planned for parent/guardians of the same population.

**Teaching Tolerance Survey**

Please respond to the following survey questions regarding tolerance and inclusion as you experience it in the schools. Thank you in advance for your time and effort to complete this document.

**Demographic Information:** Please respond to each item as accurately as possible. Mark one response for each question unless otherwise noted.

1. **Gender:**
   - female
   - male

2. **Age:**
   - 20-25
   - 26-30
   - 31-35
   - 36-40
   - 41-45
   - 46-50
   - 51-55
   - 56-60
   - 61-65
   - 65 +
3. **Race:**
   - Black or African American
   - American Indian or Alaskan Native
   - Hispanic or Latino American
   - Asian American
   - Caucasian or White
   - Middle Eastern
   - Racially Mixed
   - Other _______________________________

4. **Religious affiliation (optional)**
   _____________________________________________

5. **I teach in a:**
   - Public School
   - Private School
   - Private Religious School
   - Charter/Community school

6. **I have been a teacher for:**
   - 0-5 years
   - 6-10 years
   - 11-15 years
   - 16-20 years
   - 21-25 years
   - 26-30 years
   - 30 + years

7. **My primary content area is:** (mark all that apply)
   - Language Arts and Reading
   - Social Studies
   - Math
   - Science
   - Early Childhood Generalist (I teach across the curriculum)

8. **In what way do you currently incorporate lessons on citizenship rights and responsibilities into your curriculum to help your students learn tolerance, inclusion, and acceptance of diversity? This includes, among other things, devoting classroom time to providing opportunities for students to demonstrate the ability to make choices and take responsibility for personal actions, and discussing qualities of good citizenship such as trust, respect, honesty, fairness, and compassion? (Please mark the response that best applies to you.)**

   **A. Use Extensively.** My school district provides a model curriculum and resources on tolerance, inclusion, and acceptance of diversity for me to use. (If so, please identify
the products and publishers:

_______________________________________________________________________________________
_______________________________________________________________________________________
_______________________________________________________________________________________

B. **Use Somewhat.** I use commercially produced educational products that my colleagues and I have identified for use within our classrooms. Those items include resources from organizations like, **Character Counts, The Character Council of Greater Cincinnati and Northern Kentucky, and/or Just the Way You Are.** (List the organizations and/or programs from which you use resources, including those listed above.)

_______________________________________________________________________________________
_______________________________________________________________________________________
_______________________________________________________________________________________

C. **Limited Use.** I have created some of my own resources that I find most effective. (Please describe below.)

_______________________________________________________________________________________
_______________________________________________________________________________________
_______________________________________________________________________________________

D. **Not at all.** (Please explain below.)

_______________________________________________________________________________________
_______________________________________________________________________________________
_______________________________________________________________________________________

9. **What qualities make a resource effective for promoting tolerance, inclusion and acceptance of diversity among students in Grades K-3?** (Please mark one response.)

   a. Books with actual photographs
   
   b. Books with illustrations
   
   c. Video with real footage
   
   d. Video with animation or other simulation
   
   e. Other: __________________________________________

10. **What do you see as the biggest challenge to promoting tolerance, inclusion and acceptance of diversity among students in Grades K-3?** (Please mark all responses that apply.)

    a. Students are too young to understand
    
    b. Keeping students engaged
    
    c. Students are already predisposed to intolerance
    
    d. Although much material is readily available, the items fail to be relevant and meaningful for children in first and second grade.
e. The materials currently available on tolerance, inclusion and acceptance of diversity are not rigorous enough.

f. There is not enough time reserved during the daily schedule because the focus is on teaching mathematics, reading, and writing.

g. Other: _____________________________________________________________

11. Among your students, which of the following characteristics, if any, appear to be a common basis for intolerance? (Please mark all responses that apply.)

a. Racial bias
b. Ethnic bias
c. Gender bias
d. Religious bias
e. Intellectual bias (disability)
f. Intellectual bias (giftedness)
g. Physical Appearance (related to racial/ethnic bias)
h. Physical Appearance (related to cleanliness)

12. Please describe any acts of intolerance you have witnessed in your school, your classroom or in school related activities, which seem to be of particular note.

13. If effective and interesting resources for teaching tolerance were more readily available, would you incorporate them into your curriculum?

a. Yes, whether or not it was mandated by my school
b. Yes, but only if these resources also taught other skills currently mandated by my school.
c. Probably not, but this would depend on the particular resources in question.
d. No. I am satisfied with the resources already available to me.
e. Other: ______________________________________________________________

14. Do you have any suggestions or thoughts as we conduct our research? We welcome any insight related to Grades K-3, Tolerance Education. (Please list your ideas below.)

**Paper Presentation Focus**

Note: This presentation is one of ongoing research in the field of teaching Cultural Humility to our youngest learners through the Language Arts, Literacy and Literature for children. A more conclusive summary of findings will be available for the international conference, as well as sample curriculum materials.

The focus of the presentation will include the following: (1) the results of the survey and the implications for curriculum materials in support of cultural humility; (2) the relationship of said materials to the language arts curriculum (focused on reading, writing, speaking and listening); (3) the sharing of the materials that promote cultural humility and cultural competence; and, (4) the projected future research across the curriculum.

The areas of language arts, literature, literacy and reading were selected because of the process of learning to read and its reflective nature towards the learning cycle. Its focus on the “coming to know” process from four perspectives, reading, writing, speaking and listening makes it an important avenue for young children to have the opportunity to effectively honor their own beliefs as they relate to their family beliefs, the beliefs of their teachers and beliefs of their friends in daily life.

The process of understanding cultural humility is recognizing that ‘cultural difference’ refers to a relationship between two perspectives. It involves self-awareness and an acceptance of the other person and any differences in the contrasting cultures represented. Teaching the concept to those learners who are most impressionable, will lead to an ongoing development of cultural knowledge, skills in understanding cross-cultural interactions, and an awareness and acceptance of the dynamic variety of people and populations. Using the power of the word in literature, using oral, written and visual representations, will allow an active engagement in a lifelong process of cultural humility.
Teaching teacher immediacy: How drama techniques can benefit future teachers

Mariane Gazaille

Département des langues modernes et traduction
Université du Québec à Trois-Rivières, Canada
mariane.gazaille@uqtr.ca

Abstract. Teaching is a complex and interactive profession which hinges on communication. Efficacy of teaching depends not only on content knowledge, but also on how well teachers communicate and exploit themselves in the classroom. The purpose of this study is to document the concept of teacher immediacy through the study of the effects of non-verbal communication (NVC) workshops on student teachers’ non-verbal (NV) language and self-confidence. Results will be discussed in terms of teacher training.

Teachers play a decisive role in shaping the process of education and schooling. In line with this perspective, the quality of teacher education is an important issue in that it aims at training competent and knowledgeable teachers. Yet, as Hurt, Scott and McCroskey (1978) put it, “[there is] a difference between knowing and teaching, and that difference is communication in the classroom” (p. 3). Communication would be the contextual element that influences student learning the most (Cooper and Simons, 2007; Tremblay, 2003). Efficient, communication facilitates classroom exchanges; inefficient, it may render learning difficult or even hinder it (Anderson, 2004). There is clearly a relation between the way teachers communicate and how efficient they are in their classroom (Cooper and Simonds, 2007; Rubin et Feezel, 1986). Indeed, “[w]hat teachers do and
say can have powerful and pervasive effects on students’ intentions for learning, subsequent learning behaviors, and academic engagement” (Stefanou, Perencevich, DiCintio, and Turner, 2004, p. 97).

Teaching rapidly appears to be one of the most demanding professions in terms of ability to communicate (Tremblay, 2003). In order to facilitate their students’ learning, teachers must build and deliver clear and accessible messages. Yet, communicating implies not only words, but also gestures, posture, eye contact, facial expression, etc. In other words, to communicate means to express one’s self both verbally and non-verbally. Discrepency between the verbal (V) and non-verbal (NV) components of a message will create confusion and misunderstanding on the part of the listener (Tremblay, 2003). For effective communication to take place, teachers not only need to possess theoretical and practical knowledge, they also need to know how to exploit themselves (Anderson, 2004). Thus, effective communication resides, beyond discourse quality, in one’s capacity to exploit their personality and their body (Quentin, 2004).

**NV communication in the classroom**

Teacher efficiency is related to both clarity of the message (Tremblay, 2003) and communication skills (Rubin et Feezel, 1986). Garmston (1995) emphasizes the importance of NV communication in pedagogy, adding that a great part of classroom messages come from NV communication. Indeed, subtle aspects of communication such as glancing, nodding, half smiling, etc. may have the potential to send either motivating or amotivating messages to students. Moreover, teachers have to make sure that the NV features of their messages are in accordance with their oral counterparts because, when the NV contradicts the V content, it is the NV message that is retained as the “true” message by their audience (Quentin, 2004).
NV communication seems to be a very important, not to say crucial, element in the classroom. Indeed, the greatest discourse or demonstration of knowledge will not succeed in maintaining students’ interest and attention if one lacks enthusiasm, avoids eye contact, or adopts a lazy body posture. Likewise, unrestrained gestures, invasive tics and twitches will act as deviating attractors, decreasing or even taking one’s audience’s attention away. NV communication therefore reveals itself as an important tool to help create and maintain efficient classroom communication, which will allow to teach content more effectively (Garmston, 1995).

**Specific context**

Effectively communicating in the classroom can clearly turn out to be a strenuous and confidence-mining task for student-teachers (STs) who are not used to being exposed – not to say overexposed – to an audience basically 5 hours a day, 5 days a week. Indeed, for many people, standing in front of a group means stress, anxiety, stage fright or increased timidity. These states of mind can be explained by fears people may be experiencing while talking in front of a group: fear of judgement, of not being understood or appreciated, of making mistakes, of being or looking stupid, … (Tremblay, 2003). All emotions, fears, or states of mind that a ST can experience induce physiological repercussions that are physically visible (voice tremolo, perspiration, becoming red, …). These body messages and NV signals act as cues students use to interpret and judge STs’ competency and self-confidence. Under these circumstances, and as ready and willing as they can be to teach, it is not surprising that some STs may be experiencing genuine difficulties to communicate in the classroom (ibid., 2007).
On the one hand, and contrary to the ability to vocalize, the ability to communicate knowledge effectively and appropriately is not innate: it is learned and can be taught. On the other hand, self-confidence is an essential factor for good and effective classroom communication, and every positive experience that may “nourrish” it will improve the quality of the teacher’s presence (Tremblay, 2003). Yet, working on personality is perceived as a rather unchangeable concept and, consequently, a concept more difficult, not to say impossible, to teach or unteach. Studies on effective teacher communication have also been conducted in light of the concept of teacher immediacy. Appearing more malleable, the construct of teacher immediacy becomes more appealing in the context of teacher training.

**Framework: Teacher immediacy and NV communication**

Immediacy was first conceptualized by Mehrabian (1967) as those NV behaviors that reduce physical and/or psychological distance in interpersonal communication. Similarly, Thweatt and McCroskey (1996) defined immediacy as communicative behaviors that reduce perceived distance by individuals. In this context, teacher immediacy behaviors express the V and NV communication behaviors which reduce both physiological and psychological distance between the teacher and the learners.

NV behaviors such as turning towards a person, sitting close to someone, using facial expressions are examples of the many NV behaviors that can create immediacy between individuals. Likewise, nodding in a positive manner, smiling and using postures and intonation in a meaningful way are viewed as NV immediacy behaviors. Surveying the literature on the topic, Briñol and Petty (*in-press*) report that arm movements (flexion versus extension of upper arm muscles), nodding (up and down or side to side), facial expression (smiling, expression of disgust), and body posture can all affect
attitudes, motivation, ability to think, and direction of thinking. These authors (ibid.) also report that research has shown that judgments of power are influenced by the vertical position, leading to say that body posture may predispose people to feel confident or not.

That posture may influence STs’ sense of power becomes an interesting hypothesis to examine for teacher training. However, because immediacy is theoretically encoded and decoded as a “gestalt,” meaning that perceptions arise from an overall impression of the degree of immediacy behaviors rather than from single cues, it may also be important to address more than one NV feature if the objective is to build ST self-confidence as well as develop one’s communication skills. How can teacher training programs help STs develop their NV communication skills and, at the same time, help them build their self-confidence before they go on practica or start teaching?

**Drama techniques and the teaching of teacher immediacy**

Drama techniques offer many possibilities for the development of NVC. There would be a good number of positive impacts of drama techniques on one’s behaviors: body posture and presence, attention and concentration, physique and mental relaxedness or comfort, voice, self-confidence, etc. (Quentin, 2004). Drama techniques also facilitate the development of specific personal abilities such as presence, awareness of self and one’s body in space. After training in drama, people are different, with better placed voices, awareness of movement and, most importantly, real confidence in themselves as teachers (ibid., 1984). Following NV communication workshops, future English-as-a-second-language (ESL) teachers also reported perceptions of increased ability to communicate, dynamism and self-confidence, elements of learning that were, for some of the participants, maintained and/or transferred in the medium-term (Gazaille, Plouffe, Gauthier, Gagnon, and McClintock, 2009).
Learning to improvise would also benefit STs with regard to their ability to listen to others and to create, their perception of themselves as teachers, their confidence in their abilities, their management of classroom behaviors and tasks, and their capacity to adapt to students’ comments and reactions [see Lobman (2005), Pelletier and Jutras (2008) and Sawyer (2004)]. Being inexperienced and over-exposed, we truly believe that STs would benefit from NVC training in order to be and feel better prepared to “hit the stage”.

Drama techniques providing tools to improve teacher immediacy, self-confidence and communication efficacy in the classroom, we sought to explore the value of teaching teacher immediacy to STs. Stated from the participants’ viewpoint, our specific objectives became: 1) to identify which NV component(s) the workshops had the most influence on, 2) to report perception of self-confidence, and 3) to explore the relation between posture and perception of self-confidence.

Methodology

Empirical and exploratory, the methodology follows a pre-test/post-test device. Participants were administered a 4-point Likert scale questionnaire. The questionnaires allowed to measure participants’ satisfaction and perceptions of the workshops’ effects on their NV behaviors. Two filmed tasks, respectively done at the beginning and at the end of the workshops, worked as bases for the self-evaluation tasks and the semi-structured interviews.

Participants. A total of 33 STs (7 males, 26 females) participated to the workshops (N_{F2008} = 8, N_{F2009} = 7 and N_{w2010} = 18), 22 of which (6 males, 16 females) participated in the study (n_{F2008} = 8, n_{F2009} = 7 and n_{w2010} = 7). They were registered in the mathematics (1), arts and drama (2), preschool and
elementary (3), physical education (4), and ESL (12) teaching degrees. Three ESL STs were personally invited to the workshops and participated on a voluntary basis while 2 physical education STs were instructed to do so by their program.

_Treatment._ Drawing on research in communication and drama techniques, we built and offered NVC workshops to future teachers. The workshops were 2 hours long and were given once a week for a total of 5 workshops in the fall 2008 semester, 7 in the fall 2009 semester, and 7 in the winter 2010 semester. In order to develop communication skills and confidence, each workshop comprised a practice of one or more NV behavior (facial expression, voice, movement and gesture, posture, eye contact, etc.) as well as communication exercises inspired from the classroom reality. Each workshop resorted to varied drama techniques and classroom reality examples to stimulate the development of participants’ communication skills. The number of participants per group was kept to a maximum of 12, as suggested by Quentin (2004). We opted for a playful approach, with no or just a very few theoretical explanations because STs were following the workshops on top of their official curriculum. However, reflexive analysis question and exchange periods were systematically integrated to all workshops in order to raise participants’ consciousness and to promote reinvestment of the learning done.

**Results**

Participants’ evaluation of the effects of the workshops on the NV components studied as well as on their perception of self-confidence will be presented. Preliminary results reveal that “confidence” was the most frequently used word to describe the impacts of the NVC workshops. Results will be discussed in terms of teacher training.

Distance tutoring as a means to foster the development of student teachers’ professional competencies

Mariane Gazaille
CRIE, CRIFPE, ACLA
Département des langues modernes et traduction
Université du Québec à Trois-Rivières, Canada
mariane.gazaille@uqtr.ca

Abstract. Moulding the process of education, teachers play a pivotal role in any education system. In this perspective, the quality of teacher education is an issue of high importance in that it aims at training professional, competent, motivated and motivating teachers. Hence, teacher training must not only be thought in terms of knowledge but rather in terms of integration of knowledge and professional skills and competencies. The current study aimed at documenting the question drawing on ST reported learning within the context of a cross-level distance tutoring project that took place in Trois-Rivières, Québec, Canada. STs were asked to discuss about areas of perceived difficulty and learning from the tutoring experience. The themes that arose from the focus groups and open-ended questionnaires are summarised and contrasted with the Référentiel des compétences professionnelles (MEQ, 2001). Preliminary results show that distance tutoring allows for the integrated development of a number of features from different professional competencies.

Moulding the process of education, teachers play a pivotal role in any education system. In this perspective, the quality of teacher education is an issue of high importance in that it aims at training professional, competent, motivated and motivating teachers, a daunting task in itself considering the complexity and uncertainty of the classroom reality. With the intended goal of improving the quality of education and, consequently, increasing the success rate in the Québec education system, the ministère de l'Éducation du Québec
(ministry of Education of Québec, MEQ) published, in 2001, a reference framework composed of 12 core competencies for teaching staff. Since then, universities that offer teacher training programs (TTP) have been training student teachers (ST) not only in terms of content knowledge and teaching skills but also in terms of professional competencies. The Référentiel des compétences professionnelles (MEQ, 2001) is informed by constructivism, which emphasises construction of knowledge, and the competency-based approach (CBA), which calls for an intertwined focus on “interaction and meaning” or “reflexion and action” to teach STs. Selected as the central element of teacher training, competencies can be very briefly defined here as “a complex knowledge-to-act”. For the ministry of Education, a competency is “always a competency for action” (MEQ, 2001, p.48). “Teaching to teach” therefore implies not only teaching STs to become reflective practitioners in the sense of Schön (1983), but also opting for the development of useful, practical knowledge to foster the development of the 12 competencies herein identified.

In order to prepare them for their career, TTPs supply prospective teachers with a significant academic background in pedagogy, didactics, methodology, subject content, and technology for the lived experience of classroom teaching. Yet, and even after the addition of many hours of practica to TTPs, we can still hear comments such as “courses being too theory-oriented” or “not being concrete enough (not to say useless) for the reality out there.” In fact, many STs find it hard, not to say impossible, to apply the knowledge learned at university while having to deal with classroom management and the many impromptus of the everyday class. Surveying approximately 80 STs, Ure and Lysk (2008) remarked that their STs “did not feel prepared for the type of experiences they were exposed to and expected to master” (p. 5) and that, in the opinion of their participants, “more could have been done to prepare them” (p. 5). All of this suggests that more opportunities need to be created to enable
STs to develop professional knowledge and practice professional skills before being required to teach a class.

**Specific context**

Knowing that the language taught in the communicative second language (L2) classroom is also the language used to communicate, learning to communicate efficiently, to give clear, understandable instructions and explanations and even to create a positive learning environment can become difficult, not to say strenuous, tasks for L2 teachers. Addressing students who can barely understand the language of instruction, L2 teachers have to resort to a variety of pedagogical strategies to create a climate facilitative of learning and to meet their students’ needs and learning styles. At the same time, they must try to integrate information and communication technologies (ICT) in their teaching, nowadays a “must” for the teaching and learning of L2 (Sotillo, 2000). If we add the reality of classroom management to the picture, we clearly see why inexperienced STs can rapidly become overwhelmed when having to “deal with everyone and everything at once”. Teaching professional competencies in an integrated fashion appears to be a crucial question that TTPs should be ready to address.

On the one hand, research tends to support that it is the experimenting of new ways of teaching or carrying out of tasks that brings teachers to change their practice (Garet, Porter, Desimone, Birman, and Yoon, 2001). On the other hand, cognitive load theory (CLT) tells us that a change in performance can occur when one becomes increasingly more familiar with a given task or situation. At the same time, CLT reminds us “that our working memory is limited with respect to the amount of information it can hold, and the number of operations it can perform on that information” (Van Gerven, Paas, Van Merriënboer, Hendriks, & Schmidt, 2003). Schemas, as a sophisticated structures or combination of elements of information, permit individuals to
handle multiple elements as a single unit, allowing one’s working memory to process information more efficiently (Sweller, 1988). Knowing that experienced teachers have better developed knowledge structures of “schemata” for classroom teaching than do novice teachers (Peterson and Comeaux, 1987), how can TTPs help pre-service teachers develop these more complex schemas they would need to interpret more rapidly and cope more efficiently with the reality of the classroom?

**Cross-institutional distance tutoring and ST development**

In compliance with CLT and CBA, it can be argued that discipline-focused, one-on-one distance tutoring can reproduce the reality of the classroom at a smaller scale level. Cross-institutional distance peer tutoring is a form of individualized help offered by a peer of a more advanced level and from a different establishment. It has been observed that, in the context of L2 teaching, distance peer tutoring has had positive impacts on both tutors’ and tutees’ learning (Gazaille, 2010; Gelabert, Gisbert, Thurston, & Topping, 2008). Examining transcripts from a semester-long asynchronous discussion between foreign language methodology classes at two different universities, Arnold and Ducate (2006) found that students not only progressed in their cognitive understanding of the pedagogical topics, but also developed social presence. That is, even without the visual cues that accompany face-to-face communication, social presence can be established in online learning communities (Swan, Garrison, & Richardson, 2009).

Thus, reproducing some sort of classroom microcosm, cross-institutional distance peer tutoring could help STs better read and address more efficiently “what is going on” in the teaching-learning situation. This will become especially true if STs are provided with technical support and guidelines for the tutoring session. Diminishing the quantity of input of information, we
advance that distance tutoring would familiarize pre-service teachers with some aspects of the teaching situation, helping them build and develop more complex schemas about some aspects of the teaching-learning situation and, in the end, feel better prepared to, once again, “cope with the reality of the classroom”.

**Context of study**

The reality of the ESL classroom puts extra demands on specific professional competencies. First, the language of instruction being the language of communication, the ESL teacher’s reality calls for a maximum of clarity in communication abilities (explanation and instruction) as well as on the ability to adjust one’s L2 level to that of the learner – something many STs have forgotten when they start teaching because of the level of L2 they have come to master. Moreover, current approaches to teaching modern languages are communicative in essence i.e. ESL teachers also need to develop strategies for “provoking, maintaining and expanding” interaction on the part of learners who, often times, have to struggle with limited knowledge of and skills in the target language.

The context of this study is a teacher training program for a bachelor’s degree in teaching ESL. An experimental tutoring project provides STs from UQTR, a Canadian university in Québec, with the opportunity of teaching online to beginner and intermediate-level cégep1 ESL learners by means of a desktop videoconferencing platform (VIA). On the one hand, this tutoring experiment endeavoured to help cégep ESL language learners from a unilingual region to improve their oral skills in the L2. On the other hand, it aimed at confronting future ESL teachers with the specific challenges of teaching a L2.

---

1 In Québec, general and vocational colleges (CEGEPs) offer two-year pre-university and three-year technical programs. College teaching normally follows the fifth year of the secondary cycle. The designation CEGEP is reserved for public institutions; private college is not a CEGEP. The name “college network,” of necessity, includes both types of institutions.
objective of this paper is to investigate the effects of distance tutoring on the development of ESL STs’ professional knowledge and competencies.

**Framework : Référentiel de compétences professionnelles de la profession enseignante**

In the province of Québec, Canada, the official document for teacher training is called the *Référentiel de compétences professionnelles de la profession enseignante* (MEQ, 2001). The official reference framework defines the teaching profession by means of 12 professional competencies (see table no. 1)
### Foundations

1. To act as a professional inheritor, critic and interpreter of knowledge or culture when teaching students.
2. To communicate clearly in the language of instruction, both orally and in writing, using correct grammar, in various contexts related to teaching.

### Teaching act

3. To develop teaching/learning situations that are appropriate to the students concerned and the subject content with a view to developing the competencies targeted in the programs of study.
4. To pilot teaching/learning situations that are appropriate to the students concerned and to the subject content with a view to developing the competencies targeted in the programs of study.
5. To evaluate student progress in learning the subject content and mastering the related competencies.
6. To plan, organize and supervise a class in such a way as to promote students' learning and social development.

### Social and educational context

7. To adapt his or her teaching to the needs and characteristics of students with learning disabilities, social maladjustments or handicaps.
8. To integrate information and communications technologies (ICT) in the preparation and delivery of teaching/learning activities and for instructional management and professional development purposes.
9. To cooperate with school staff, parents, partners in the community and students in pursuing the educational objectives of the school.
10. To cooperate with members of the teaching team in carrying out tasks involving the development and evaluation of the competencies targeted in the programs of study, taking into account the students concerned.

### Professional identity

11. To engage in professional development individually and with others.
12. To demonstrate ethical and responsible professional behaviour in the performance of his or her duties.

---

**Table 1: The 12 core professional competencies (MEQ, 2001, p. 55)**

grouped in 4 domains: 1) foundations, 2) teaching act, 3) social and educational context, and 4) professional identity. The *Référentiel* introduces each of the 12 core competencies with a general description and the identification of its features and levels of mastery. These elements are used as standards to specify the learning outcomes of pre-service training courses.
This paper sets out to verify if cross-level distance tutoring contributes to an integrated development of teacher professional competencies. Our specific objectives hence become: 1) to identify and to analyse, in light of the *Référentiel des compétences professionnelles*, participants’ reported learning.

**Methodology**

The cross-institutional distance tutoring project was implanted in two cégep-level establishments in the fall semester of 2009 and the winter semester of 2010. A total of 25 future ESL teachers were hired to work as ESL tutors ($N_{F2009} = 10$ and $N_{F2010} = 15$). After the tutoring, participants were invited to participate to the study; a total of 15 tutors attended the focus group ($n_{F2009} = 8$ and $n_{F2010} = 7$). In the W2010 session, 10 participants also accepted to answer an open-ended questionnaire: group A filled the questionnaire before and completed it after the focus group (W10 gr. A, $n = 7$) while group B answered the questionnaire online (W10 gr. B, $n = 3$) but did not participate in the focus group (see table 2).

**Table 2: Participants and tools**

The cross-institutional distance tutoring is offered synchronously by way of the VIA platform. Tutor-tutee exchanges are based on audio and text support; the webcam is not used. All exchanges are done in the L2, in this case, English. Tutors and tutees meet 30 minutes, once a week, for 10 weeks. Each tutoring session is composed of two distinct tasks: a 15-minute bloc is
dedicated to guided oral communication while the second 15-minute bloc is
dedicated to the correction of a text submitted by the tutored student. Tutors
were instructed to correct both written and oral English, the former more
thoroughly and the latter less, in order not to interrupt conversational flow and
demotivate the learner’s attempts with the L2.

Results and Discussion

Results will be presented and analysed in light of the Référentiel des
compétences professionnelles (MEQ, 2001). Themes arising from the analysis
of the focus groups and open-ended questionnaires will be summarised and
contrasted with the Référentiel des compétences professionnelles (MEQ,
2001). Our preliminary results reveal gains in sensitivity, quality of
explanations, adjustment of one’s L2 level to that of the learner, ability to bind
with the learner, and L2 knowledge. The first steps of the analysis tend to
show that distance tutoring can allow for the integration of a number of
competency features from different professional competencies. Results will be
discussed in terms of what they may mean for TTPs.

Competencies for professional teachers

Research objectives

In their profession teachers have to deal with ambivalent and contradictory situations. On the one hand they have to meet high expectations and on the other hand they are exposed to lacking social acknowledgment, hierarchical subordination and substantial stress factors. Professionalism therefore means to develop realistic perspectives for a competent course of action and to establish an expertise in various fields.

The Austrian school system – An overview

To get a better understanding of the professional situation of teachers some information on the general education system of this country is essential. This offers an insight into peculiar structures that to some extent were already overcome in many other countries years ago.

A large percentage of children but not all go to kindergarten at the ages three to five. From age six to ten they attend primary school, from ten to 14 lower secondary school, and from 14 to 18/19 they go to upper secondary school. Another option is to leave school altogether at 15 after one more year of pre-vocational training. In this case they have to undergo three more years of part-time training in vocational schools combined with a vocational training (apprenticeship) at a company (dual system).

At the age of ten, children in Austria are separated to either continue their education in the Hauptschule, a comprehensive variant of lower secondary school/middle school, or in the
Gymnasium (grammar school), a more academic and achievement-oriented form. After Hauptschule there is still the chance to go to an upper vocational school for five more years and after completion get A-levels/high-school diplomas. It is an open secret that Hauptschulen in rural areas have a very high standard and are comparable to a Gymnasium, but in city centers have terrible reputations. This is due to the fact that in the cities they are mainly attended by children of migrant families and others from the lowest socio-economic backgrounds.

Pupils at Gymnasium can continue their education in the same school for eight years (lower and upper secondary level) and finish it with rather difficult and competitive high school diplomas/A-levels. Nowadays, around 38 % of all Austrian have a high-school diploma (Austria Statistik 2010). This diploma offer them access to university study programs in this country, even though many popular disciplines like medical or business studies also require an entrance examination.

School is compulsory for nine years (nine grades) beginning at the age of six, with an additional three years of part-time schooling when doing an apprenticeship.

The Ministry of Education and Cultural Affairs possesses far-reaching authority and independence with regard to syllabi, textbooks as well as the structure and organization of teacher education in almost all aspects like duration of programs, structure of courses, certificates and exam regulations (Buchberger & Seel, 1999). Another important feature of the Austrian school system is its highly bureaucratic basis. Schools as institutions are subject to state administration with a clearly defined hierarchy and a high level of regulatory activity.

Teacher education takes place at two different places. Teachers who want to work at upper secondary levels and/or at the lower level of a Gymnasium have to undertake their studies at a university. They have to choose two subjects they would like to teach in the future and get a teaching certificate. Teacher education studies are difficult and there is a high drop-out rate.

Teachers for elementary and Hauptschulen are educated at Pädagogische Hochschulen. These institutions also are part of the tertiary system, but their reputation is not the same as the one of a university. Pädagogische Hochschulen are also responsible for in-service trainings of all teachers, regardless of their original form of education.
Teachers in Austria are paid according to their form of education and their duration of service. Those who work at a Gymnasium earn more money than the others. It is not possible to change from one school type to the other. The system does not allow any vertical job mobility. This generates a two-class-system of teachers.

Methodology

A qualitative study based on the concept of the Grounded Theory (Glaser & Strauss, 1996) was undertaken. 20 Austrian teachers were interviewed on their perspectives on different competencies essential for the teaching profession.

Grounded Theory is a qualitative research methodology in the social sciences. Its aim is to generate a theory from data during the research process (Martin & Turner, 1986). So to a certain extent this method works in a reverse way when compared to traditional research methods (Boehm, 2007).

The generating and verifying of theories are a simultaneous process with Grounded Theory. For this purpose qualitative and quantitative data and methods are applied (Glaser & Strauss, 2008). Grounded Theory starts out with data collection. The crucial points are marked with codes. These are grouped into similar concepts from where categories are formed. Then they are taken as a basis on which a theory or hypothesis is developed. This means that the theoretical framework is created at the end of the process – in a totally reverse manner compared to traditional scientific research.

Simultaneously to an analysis of scientific literature on the topic (Glaser & Strauss, 1998) qualitative interviews were undertaken with 20 teachers. A research diary was conducted on the different steps of the research process, as well (Anastasiadis & Bachmann, 2005).

In addition to the method of Grounded Theory field research was undertaken implementing participant observation. Teachers were visited during their lessons which facilitated a direct participation in social situations by the observer (Mayring, 2002). The method of observation enabled an insight into a social setting which can hardly be evaluated from outside. It supported the explorative approach of the survey.

The observations followed a predetermined outline and were documented with notes and protocols. Afterwards, they were systematized. The triangulation of methods guaranteed a
complex collection of data, improved insight, and the development of new perspectives and different facets (Flick, 2000)

The selection of the interview partners took place according to the specifications of theoretical sampling in order to support data collection (Glaser & Strauss 2008). Teachers in two Austrian high-schools, two middle-schools and two elementary schools were interviewed. In all three cases one school was located in a city (Vienna and Graz) and the other in a rural area to get some geographical balance. Inner-city school teachers had to deal with a lot of immigrant student and their specific problems. School-size was between 100 students in rural elementary schools and almost 2000 in one inner-city school.

The age range of the teachers was 22 to 55, ten teachers were female, ten male. Their length of service in schools was between one and 33 years. All interviewees were certified.

All teachers were interviewed five times during December 2009 and May 2010. The interviews were recorded, transcribed, and analyzed. The interviews were partly standardized which left space for getting for more detailed information and changing the sequence of questions if needed (Hopf, 2008). All interviewed teachers were requested to disclose their subjective perspectives and interpretations (Mayring 2002).

**Outcomes**

The results prove that there are certain competencies that can be defined which are regarded as essential for a successful professional performance as a teacher (Thonhauser, 1995). Men and women did not significantly differ in their opinion.

The following categorized competencies, which include cognitive, affective and practical dimensions, could be identified as the most important ones for a successful teaching career.

1. **Personal competence**

   Personal competence was regarded as the key competence by all teachers. This competence comprises the consciousness of a teacher with regard to his own biographic data. This includes reflections on his/her background as well as on prejudice towards certain groups of students originating from past experiences. In the opinion of the interviewed teachers, decisions that were influential for becoming a teacher have to be questioned and personal strength and weaknesses detected.
2. Social competence
Social situations have to be coped with in an adequate manner. Sensitivity, efficiency, discretion and dedication were the qualities indicated most frequently that were expected from a competent teacher. Ten teachers also mentioned communication competence and the ability and willingness to successfully work in teams (Klippert, 2004). Especially teacher in elementary and Hauptschulen saw this is as a very important competence. Teachers in Gymnasium and upper vocational school usually have a more academic understanding of their profession. Being trained at universities they often copy the style of teaching they get to know during their education. As in-service training hardly concentrates on teaching methodology either, these teachers often show a lack of adequate competence. On the other hand, their colleagues at elementary and Hauptschule level enjoy a very good methodological and didactical training and are therefore much better prepared for their jobs in this respect (Buchberger, 1993).

3. Historical competence
Substantiated knowledge of historic-societal conditions is regarded as essential as well. Especially the Austrian historic past requires a very subtle and thorough historic approach. All teachers were convinced that one must never forget the crimes committed during the Second World War in this part of the world. According to the interviewed persons, teachers are responsible to guarantee the information of the next generations about the atrocities. For the two elementary teachers historical competence did not seem to have same importance as for their interviewed colleagues. They explained this fact with the young age of their students.

4. Value competence
This competence comprises the knowledge of societal and personal values (Oser, Zutavern & Patry, 1990). Students have to be aware that we live in a democratic, constitutional state. A society shares certain norms and values and students have to get acquainted with them. So teachers also have to make sure that they are aware of their own “value system”, especially in times of increasing nationalism and extreme right-wing populism. Especially teachers in inner city schools regarded value competence as very important. Due to their frequent contact with immigrant children they always have to emphasize the values of the Austrian society.
5. Methodological and didactical competence
Competent teachers need a huge repertoire of methodological skills. They have to be experts on learning strategies and be able to adapt their teaching to the different learning styles of their students (Meyer, 2004). All teachers felt rather competent, even though close observation detected a lot of deficits.

6. Theoretical and meta-theoretical competence
Teachers have to be well informed about current research results in their disciplines. More than two third of the teachers admitted deficits in their theoretical competence. They explained it with a lack of time that prevented them from concentrating more on such issues. Most of the teachers in Gymnasium felt more theoretically competent in this respect than their colleagues. Due to the very academically oriented education of this group of teachers, these findings are not really surprising (Oser 2001).

7. Reflective and discursive competence
All but two very young female teachers agreed upon undergoing continuing reflective processes. 50 % of the teachers also entered into regular professional discourses with colleagues and subordinates like principals and – although with negative connotations – school administration staff (Klippert 2004). In general, most of them felt supported by colleagues, one third complained about problems with their principals and only two of the teachers reported about constructive professional conversations with school administration. Obviously, school administration is not regarded as a supportive institution yet but still seen as a controlling authority – despite large campaigns for an image transformation (Friehs 2004).

8. Multi-cultural competence
Since the early 90’s of the past century Austria has experienced huge immigration waves that have never occurred before. As a consequence of the Balkan crisis and the conflicts in the Middle East, the Caucasus region and African countries, Austria has accepted more immigrants than any other European Union member state. This made the population rise from seven to eight million people in less than a decade (Austria Statistik 2010). Immigrant students gather in inner-city Hauptschulen and teachers are confronted with enormous problems. Many students do not speak any German, most
of them are muslims (in a predominantly Roman-Catholic country) and depend on social welfare payments. All teachers in inner-city Hauptschulen indicated that even if they had intercultural competence, this was not enough to cope with the many problems of a typical school day. They felt left alone by the school authorities and talked about the impossibility of teaching “29 kids with 18 different native languages” in one classroom. Nevertheless, all teachers who worked in inner-city schools regarded multicultural competence as one of the central competencies for a successful job performance (Keuffer & Oelker, 2001).

Teachers in rural areas are not as concerned with multi-cultural competence as their colleagues in the cities. Only one high-school teacher from the country-side indicated its relative importance for his job. Immigrants do not settle down in the countryside that often. Therefore the integration of a few kids per class with a migrant background does not seem to be too difficult compared to the overfilled classes in the cities.

9. Organizational competence
Teachers are required to create a safe learning environment. As in Austrian school counselors and psychologists are totally overworked and never available when needed, teachers very often have to assume their tasks – without any special training. This requires a lot of positive energy. All interviewed teacher complained about this additional work-load but none could think of a solution for this problem except for hiring more professional staff (Kiper & Mischke 2008). They also mentioned problems with classroom-management as more and more children do not get any proper education at home any longer. They held societal developments, like increased divorce rates, single mothers and absent fathers, economic problems and of course immigration responsible for this situation.

10. Educational, consulting and leadership competence
When being entrusted other people’s children teachers need a lot of organizational competence. In Austria teachers do not act in loco parentis (Friehs, 2004), but nevertheless they are required to educate and teach children., even if the final responsibility stays with the parents. Only one of the teachers felt sufficient competence to accept consulting tasks at an advanced level. 13 teachers indicated that their leadership competence was very strong. Especially younger teachers reported a lack of leadership qualities, however, hoped to be able to
Almost all wanted more in-service training courses on leadership competence.

Implications for Teacher Education

Efficiency and effectiveness of the in-service training institutes were criticized especially by teachers at upper secondary level. The offers of the institutions often do not meet the needs of the teachers. Also the quality of the seminars sometimes leaves a lot to be desired, especially when it comes to the developing and strengthening of competencies. In the opinion of these teachers, also teacher training did not emphasize a lot of competencies later needed on the job. The reason for this may be found in the fact that there is a strong emphasis on the subject disciplines, whereas pedagogy and psychology are part of the curricula that are not taken too seriously. As a consequence, teachers at the Gymnasium enjoy a very challenging education in all subject disciplines at universities, but do not get to know a lot about actual teaching and methodology.

On the other hand, teachers at elementary and Hauptschule level seemed to be quite satisfied with their pre-service training. This is also true for the in-service training, as all of the teachers of these school types participated on a regular basis (Buchberger, 1994). They also felt that teacher training as well as in-service programs did a lot to support the development of competencies.

It would be desirable to cooperate more in teacher education and in-service training in Austria. Reforms are planned to implement comprehensive schools for all children age 6 to 14 and abolish the differentiation at middle school level between Hauptschule and Gymnasium. Society has not supported such reform plans so far but a change in attitude is to be expected in the near future. A comprehensive school for the majority of students will also have a positive impact on teacher competence. It will lead to more cooperation and exchange of ideas also as respects teacher competencies.
References

Abstract and/or full paper: According to UNESCO (2006), nonformal education (NFE) may very likely be a “critical supplement for students enrolled in formal schools.” While NFE is commonly associated with education outside of or beyond the formal educational context, this study aims to identify the social impact of NFE at the grassroots level—not only through the analysis of its structural and environmental characteristics—but also through study of its pedagogy, content and/or subject material, and its overall objectives. Through the comparative analysis of secondary statistical data, document review, and interviews with students and facilitators of NFE, case studies from Africa, Asia, Latin America, Oceania, and North America will be reviewed. This proposed inquiry argues that there is an urgent need for NFE in order to promote and maintain goals that are most often lacking within formal educational settings—social welfare, empowerment, human security, economic development, and human rights. Due to its more learner-centered nature and grassroots approach, the importance in understanding how students and educators interact with each other and within the community is also vital to realizing the advantages of nonformal education in promoting the betterment of humankind. The study will conclude with a discussion on how nonformal and formal education compare in achieving global development and upholding human rights.
Comparison of Online and Face-to-Face Peer Review of Writing

University of Canterbury, Christchurch, New Zealand
donna.morrow@canterbury.ac.nz

Abstract
Peer response has been shown to be an effective strategy for improving writing. The social nature of collaboration as peers give and receive feedback can broaden perspectives about what good writing is and help motivate students to revise their work. Traditionally, writing groups conduct peer response in a face-to-face, synchronous environment, but questions about the feasibility of using an online environment as another space where peer response and review could take place are central to this research study and acted as both catalyst and structure for the inquiry. We examined the attitudes and experiences of adult students, who are K-12 teachers across disciplines, using both a face-to-face environment and an online environment, as well as their experiences in being peer reviewers of the writing of others in these two contexts. Preliminary results show that the power of using different environments for peer review exists not in duplicating and imitating traditional methods, but in recognizing and understanding that face-to-face and online environments function in different ways to support peer review of writing.

Introduction
The purpose of this study is to examine the attitudes and experiences of adult students, who are K-12 classroom teachers across disciplines, using both an online environment and a face-to-face environment for peer review of their writing as well as their experiences in being peer reviewers of the writing of others in these two contexts. At the time of this publication of conference proceedings, the researchers have received IRB approval and informed consent and gathered the data. Data analysis has begun, but is not complete. Therefore, this will be a preliminary report. If readers would like more information, please email the authors.

Theoretical Background
Gert Rijlaarsdam and colleagues (2008) summarize the use of peer learning as the paradigm of language instruction, especially writing instruction, with roots in the 1960’s in the theories of James Moffett, Peter Elbow, and Kenneth Bruffee who each expanded on the ideas of John Dewey. Moffett proposed writing tasks be sequenced from self as reader to larger, real audiences, which in the classroom meant peers as readers, not teachers as graders. The authors quote Moffett’s landmark book Teaching the universe of discourse (1968): “Learning to use language, then, requires the particular feedback of human response, because it is to other people that we direct speech” (p. 191).

Peter Elbow, best known for Writing without teachers (1974), advocated that a “good text” is one that speaks to the reader, not one that contains all the elements of an abstract list of features. Rijlaarsdam and colleagues explain that, according to Elbow,

[The] Success of a text depends on the subjective reader. Therefore, writers should have the opportunity to listen to readers. He [Elbow] used the word “listening” on purpose here. Writers must be able to hear what the text “sounds” like, to hear their reader’s voice and to hear whether the writer’s voice was recognized by the reader. Listening to how various readers read the text – aloud – would provide enough feedback in itself. From this listening experience, the writer could
decide whether he was clear enough to be understood, and whether what was understood was also what the writer had intended. Readers’ feedback must stimulate further thinking about what was presented in the text. As a consequence, readers became more necessary than teachers in writing education; since there was no objective theory about what a good text entailed, there was no need to transmit this knowledge… (p.55)

Finally, the authors credit Bruffee’s epistemology that all knowledge is subjective as foundational to having peers work together in the classroom and respond to each other in order to gain broader perspectives. There is no one way to know, and according to Bruffee’s rhetorical theory, no one way to write. Like Elbow, Bruffee advocated for peer groups and peer tutors in his book *A short course in writing*. *Practical rhetoric for composition courses, writing workshops, and tutor training programs* (1980).

These seminal theories starting in the 1960’s were introduced at a time when teachers were the primary readers of student writing and teachers provided the feedback. The theorists assumed that the community of writers were sharing face-to-face at the same time, and if they were not physically in the same space, they were reading documents on paper. These pace setters were challenging the dominance of teacher-directed learning in our schools, but were not investigating who learns most—the person giving or receiving responses. Nor were they anticipating the realities of the new millennium where readers and writers co-create the meaning of text using Web 2.0 tools, and may do so in a digital, non-synchronous environment. Most of the emerging studies of virtual peer groups are concerned with writing for L2 (second language) students and college-level students (Liu & Sadler, 2003). And many developing writers who are facile with e-communication see no connection to the digital writing they conduct out of school and the writing they are required to do in school. A 2008 report (Lenhart, et. al.) by the Pew Internet & American Life Project, the College Board, and the National Commission on Writing provides these statistics:

- *85% of teens ages 12-17 engage at least occasionally in some form of electronic personal communication, which includes text messaging, sending email or instant messages, or posting comments on social networking sites.*
- *60% of teens do not think of these electronic texts as “writing.” Teens generally do not believe that technology negatively influences the quality of their writing, but they do acknowledge that the informal styles of writing that mark the use of these text-based technologies for many teens do occasionally filter into their school work. Overall, nearly two-thirds of teens (64%) say they incorporate some informal styles from their text-based communications into their writing at school.*
- *50% of teens say they sometimes use informal writing styles instead of proper capitalization and punctuation in their school assignments,*
- *38% say they have used text shortcuts in school work such as “LOL” (e.g. “laugh out loud”);*  
- *25% have used emoticons (symbols like smiley faces 😊) in school work.* (p. ii)

At the center of the current study are questions that can only be raised in the advent of theories of social constructivism, digital communication, and New Literacy. In the 21st century, the answers to questions such as What is good writing? Who owns the text? and What is the role of the teacher? are shifting rapidly.

**Research on Peer Writing Groups**

Researchers have examined the connection between the writing process and the social contexts within which writing occurs (DiPardo & Freedman, 1987; Gere, 1989; Jenson, 2002; Willinsky, 1986). They attribute the effectiveness of the writing process to one essential practice – the interaction of writers with
teachers and peers during conferences and small group work. In a recent meta-analysis of 123 studies of effective writing instruction (Graham & Perin, 2007), collaborative writing, which included peer response, was found to produce a considerable effect size (ES = .75), and was thus deemed an effective strategy for teaching writing. Teachers have implemented peer groups in settings across the K-16 curriculum as a way to encourage students to write and revise. Most researchers agree that using peer groups supports the process approach by providing social benefits. These include a non-threatening audience, immediate feedback, experience of a wide-range of writing abilities, reduced writing apprehension, fostering of positive attitudes about writing, increased motivation to revise, increased quantity of writing, more teacher time for individual attention, and development of cooperation and interpersonal skills.

The effects of peer conferencing on the quality of writing has also been studied. For example, one early study on the effects of peer feedback was a dissertation by Benson (1979). Her experimental study with 288 junior high students during a ten-week period examined the effects of peer feedback on writing performance, revision, and attitudes. The experimental group was trained in providing feedback using five basic aspects of writing; the control group received only teacher-directed revision activities. All students were required to revise each of the five assigned papers at least twice. Benson found that the writing of students who participated in peer conferencing received scores that were significantly higher than those in the control group.

Peer response of writing might also help students develop ownership and responsibility for their writing (Haaga, 1993) as well as help them understand the evaluation criteria for what constitutes a good piece of writing (Rushton, Ramsey, & Rada, 1993.) A study focusing on validity and reliability of student evaluation of their peers’ writing in comparison to teacher evaluation found that “…the aggregate ratings of at least four peers on a piece of writing are both highly reliable and as valid as instructor ratings.” (Cho, Schuun, & Wilson, 2006, p.891.) Another study (Cho, Schuun, Charney, 2006) comparing content experts’ comments and students’ comments on papers found that students produced shorter comments that were a mixture of praise and “directives,” and were rarely summative. In contrast, the instructors’ comments were longer, predominantly directive and rarely summative. Students considered the mixed types of responses that their peers offered as the most helpful. A third study along the same line (Patchan, Charney, & Schuun (2009) looked closely at the quality of comments offered by peers and by instructors. The conclusion was that “Overall, students’ comments seem to be fairly similar to instructors’ comments.” (p.124).

Although our study investigates peer response, and not peer evaluation, these three studies did involve students reading the work of their peers and providing feedback. A benefit of exposure to the writing of peers might be that it helps developing writers internalize the features of good writing in terms of its effects on an audience of age-mates, not just in the published literary works they read for class, so that they believe that producing effective writing is within their reach.

Research evidence on the impact of peer groups on writing quality is mixed. Some studies indicate significant improvement in the writing of K-12 students as a result of peer response (Colling, 2002; Farrell, 1977; Lagana, 1972; Simmons, 2003). On the other hand, Wolters and Lamberg (1976) examined several studies indicating both significant improvement and no gains in student writing as a result of peer groups. In her review of the research up to 1989, Herrmann (1989) noted that “not all the studies of peer reaction show unqualified positive effects on revision.” In summarizing the spectrum of research findings on peer response up to 1976, Wolters and Lamberg stated that peer response in general has mixed effects unless it is “task-related feedback, controlled by measurement instruments, and provided by students to themselves and their peers.” (1976, p. 2).

Research on Virtual Peer Group Interaction

Because the online peer review in this study took place in a discussion forum, we have drawn on the research surrounding the nature of the interaction in online discussions. Advantages of the collaborative
and co-constructive nature of online discussion forums have been found to accrue to both individuals and groups. Hawkes (2001) lists the time and place independence of the medium, the capacity for multiple conversations and the archiving of content and messages as supports for engaging in online discourse in order to construct and refine ideas. Other positive outcomes for using online environments include the development of self-direction and independence (Lee & Gibson, 2003; Marra, 2004); a stronger sense of community (Beeghly, 2005; Lee & Gibson, 2003; Poole, 2000); the ability of students to read and respond in their own time (Beeghly, 2005); and an increase in incidences of reflection (Hawkes, 2006).

Drawbacks to participation in the online environment include lack of immediacy and spontaneity that are found in face-to-face conversations (Beeghly, 2005; Hawkes, 2006) and increase in complexity brought on by the technical aspects of the medium (Liu & Sadler, 2003). Communicating in the text-based environment of online courses can also be a barrier for students who have reservations about their writing skills or their ability to effectively communicate solely online (Stephens & Hartmann, 2004). Wu and Hiltz (2004) found that online discussions improve students’ perception of learning but caution that the instructor is responsible for promoting students’ motivation. Similarly, Pawan, Paulus, Yalcin and Chang (2003) recommend that to be effective, online discussions must be clearly structured. Angeli, Valanides and Bonk (2003) suggest that the instructor must situate online sharing within the larger structure of the class in order for students to perceive the importance of participating in the discussions.

Literature focused specifically on the use of online peer review and improvement of writing, while not comprehensive, does highlight some important issues for consideration. Evidence supports using online annotations for error correction as effective for revision (Liu & Sadler, 2003; Yeh & Lo, 2009), having an online record to monitor and mentor improvement in writing as a positive outcome (DiGiovanni & Nagaswami, 2003; Yang, 2010), and providing time in asynchronous environment as an impetus for students to form more critical and thoughtful revisions (Black, 2005).

Hawkes (2006) suggests that while online and face-to-face interaction might serve different purposes, similar discourse strategies appear in both, suggesting a reliable basis for comparing and examining the effectiveness of the two contexts. In a comparison of oral and computer-mediated peer group revision, Hewitt (2000) found that the two media created different types of talk about writing and prompted different types of changes in the writing. While the online environment focused more on concrete writing tasks and direct use of peers’ ideas, the oral environment centered on abstract, global idea development and self-generated ideas for revision. Liu and Sadler (2003) compared asynchronous and synchronous feedback in both online and face-to-face environments. They found that students using the online environment worked more effectively to review peers’ writing asynchronously than they did in synchronous chat rooms. Further, they determined that synchronous, face-to-face environments were more effective than asynchronous environments where feedback was written on a paper copy and returned to the writer. Another major finding of this study revealed that while the online group made a larger number of comments and revisions overall, the face-to-face group made a higher number of revisions based on respondents’ comments. This led researchers to suggest that a blended approach of online and traditional environments should be considered in writing instruction and investigated by researchers.

Research Questions

The guiding research questions for this study are: Do the benefits of using peer writing groups, as identified in the research literature, also accrue in online peer response groups? What are the particular strengths and limitations of each context of response, face-to-face and online?

The second tier of questions comprises the following:

1. Are the rules for face-to-face peer groups equally applicable to online groups?
2. Is one environment (f2f or online) more supportive of specific aspects or kinds of feedback? (e.g., Do respondents in one environment offer more reflective responses than in the other?)
3. What aspects of peer group functioning are applicable to both environments? What aspects apply to only one environment or the other?
4. Which environment for giving and receiving do students prefer?

A third tier of questions will arise as we do the qualitative and quantitative analyses of the data. Preliminary review of the data indicates that these questions will involve the nature/types of the responses—such as comments about surface level features, deep structure/semantics, and personal connections; use of humor; voice or stance of the persons giving response; issues of trust and risk-taking; respondents following and/or breaking the standard rules for giving and receiving response; sequence of responses—such as threaded responses, responses that piggyback on another’s comments, responses that are generic or that offer details and examples, off-topic responses, etc.; tactfulness of respondents; and recursiveness of the responses—do members develop a history and make references to earlier papers, class lessons, etc.? Quantitative data will include time-on-task in each environment.

Methods
This is a phenomenological study which does not include any intervention apart from the syllabus requirement in the course for participants to share one writing in an online environment and one writing in a face-to-face environment, with the same four-member peer groups. Except for a determination of time spent in online groups and face-to-face groups, which will be analyzed using statistics, the research methods are qualitative in nature, involving email interviews, survey of technology competence, transcriptions of digital recordings, archived online postings, participant evaluations, and pre- and post-tests of confidence in integrating technology and writing, and post-course survey of experiences in face-to-face and online groups.

Participants & setting
The participants in this research were 16 classroom teachers across grade levels and content areas who were engaged in a month-long, all-day summer course in the teaching of writing in a university setting. As one of the course requirements, the teachers met in peer response groups in both face-to-face and online environments. They were randomly assigned to four-member writing groups and remained with the same groups throughout the course.

Writing tasks
Two writing tasks were assigned in the same mode: personal expressive writing. One was a writing autobiography and the other was a childhood memory. This was done in order not to have intrusion of content knowledge by respondents (e.g., noting that the facts are wrong) on the sharing. If each writer were the expert on his or her personal writing, it was assumed that the readers/respondents would not be influenced by shared prior knowledge which could prompt them to read-between-the-lines or fill in gaps, for example. Although much other writing was accomplished in the course, only these two formal assignments were part of the study.

Instruments
The following research tools were utilized in this study:

Email Survey of Technology Background: Prior to their attending the first day of class, all participants received an email with instructions to explain their facility and comfort with computers and online environments.

Demographic information collected on each participant

Transcribed digital recordings of face-to-face meetings of peer response groups
Descriptive statistics of time in face-to-face and online meetings for each group

Archive online peer-responses

Pre- and Post-tests (on a 5-point scale) collected on the confidence of the participants to incorporate technology into their teaching of writing

A 9-question post-course survey asking participants to rate various aspects of the peer response experience (online and face-to-face)

A course evaluation

**Procedures**
Participants were provided an overview of the research study and an Informed Consent agreement. Participation in the study was not a course requirement or part of the grade. All agreed to participate in the study.

The participants learned the rules for peer response (Elbow, 1974) in a skit and follow-up discussion prior to meeting in peer groups. Peer editing and peer response were distinguished, although both are part of the peer group experience. Participants practiced giving responses according to the rules (protocol) using a paper provided by the instructor in a face-to-face environment. They were also given guidelines for making responses online, including reminders about online etiquette, readable font size, etc. Additionally, they were provided practice with the technology website and how to upload their papers and share their responses in postings. This was done to assure that lack of facility with technology did not intrude on the online responses.

After meeting their peer group members in person, participants were instructed to take part in an online peer group where they provided asynchronous responses to the Writing Autobiographies, abiding by the protocol. For example, they rotated from person to person, rather than responding randomly in a synchronous chat room -- the same rotation that they had practiced in class face-to-face. Deadlines were set for each group member to post his/her Writing Autobiography, so that papers were not shared at the same time. Multiple drafts were encouraged to be submitted for response, but at least one draft was required.

For the second assignment, participants shared their Childhood Memory drafts face-to-face and the sessions were digitally recorded. A research assistant sat outside the group and took notes as well. The due date was the same for all groups, and the length of time for meeting was sufficient—at least 20 minutes for each reader.

**Analysis**
The two researchers, working independently, are reading the transcriptions of the face-to-face peer group meetings and the archived online records. We have, so far, determined the following categories in studying the response group interactions:

I. Writer’s response to peer’s comment
II. Respondent shares personal experience relevant to writing
III. Respondent shares personal experiences NOT relevant to the writing
IV. Respondent piggy-backs on the comments of peers
V. Respondent comments on the quality of the writing
VI. Respondent offers revision ideas
VII. Communication Loops
VIII. Group members take on roles: In writing group, who is most dominant? Who is least responsive? Who is the praiser, the grammarian, the time keeper, etc? Is this the same online as face-to-face?

IX. Anything unusual that pops up, such as how groups negotiate the HOW and WHAT of providing responses

However, we are still reading, and these coding categories could change.

Results
We do not yet have comprehensive results. When we do, we will organize our discussion according to the four research questions we posed for this study.

Submission Title: ESL and Mexican American Students: Learning in a Climate of Politics, Standards, Immigration Reform, and Fear

According to the PEW Hispanic Center (2008), Hispanics children accounted for over 60% of the school enrollment growth in the United States from 1990 to 2006. The U.S. Census Bureau (2008) also estimates that by 2050, the Hispanic school-age population will increase by 166% (to 28 million from 11 million in 2006). The Hispanic school-age population will be larger than the non-Hispanic white school-age population (U.S. Census Bureau, 2008). These numbers have helped to increase Americans’ concerns about immigration, education, the economy, and public policy. It has touched off a wave of xenophobic behavior among U.S. citizens, which has affected American education in ways that should concern educators across the country.

For example, several states have enacted English-only laws that restrict how students can be educated. California (1998), Arizona (2000), and Massachusetts (2002), passed laws that have prohibited the use of a child’s native language during instruction. This has spurred a wave of similar legislation or considerations in states across the country. Arizona Governor Jan Brewer signed the nation’s toughest bill on illegal immigration aimed specifically at identifying, prosecuting, and deporting Mexican illegal immigrants. This law allows for law enforcement agents to demand identification from anyone they suspect of being illegal. How do these law enforcement agents differentiate between people of Mexican descent who are citizens and those who may not be?

The Arizona legislature has also gone so far as to pass a bill restricting the teaching of ethnic studies in school districts as well as considering the firing of teachers.
with foreign accents. Other states and some political candidates have even expressed desires to change the 14th amendment to the U.S. Constitution in order to deny children citizenship if they were born in the United States to parents that are here as undocumented workers. In states such as Texas, the State Board of Education has passed new social studies standards that are extremely conservative and passed only along official political party lines. These new standards do not reflect the history of Mexican Americans prior to 1836 and fail to include accurate historical data and appropriate role models for Mexican American students. This makes validating the history, language and culture, and contributions of Mexican Americans very difficult (Midobuche 1999; Benavides & Midobuche 2003).

Because Mexican Americans comprise approximately two-thirds of all U.S. Hispanics (Fry 2008), and many are identified as English learners, it is important that educators understand the particular educational issues involved in educating this group of students. What happens to the learning process in this type of environment? Do schools or teachers understand Mexican American children and their parents and home life experiences? What makes these students different? For Mexican American students one can add language proficiency in both the heritage and target languages, retaining heritage culture and issues of acculturation, immigration, legal status, migration, hours of employment, generation stage, teacher dispositions and preparation, teacher shortage, etc. These issues are paramount in the Mexican American community. Also, Perez, Espinoza, Ramos, Coronado, Cortes, (2009) reported that migration is one of the most radical transitions and life changes an individual or a family can endure. For immigrant children this is a dramatic experience that reshapes their lives.
Acculturation stressors among Mexican Americans include leaving relatives and friends behind when moving; feeling pressured to speak only Spanish at home; living at home with many people; feeling that other kids make fun of the way they speak English (Perez, Espinoza, Ramos, et al, 2009; Cervantes & Castro, 1985; Padilla, 1986; Padilla, Cervantes, Maldonado, & Garcia, 1988). Stress may also be created in selecting which set of cultural norms and expectations to follow. Mexican American children and their families have to select expectations from their culture of origin or that of the mainstream culture. The differences in the value of each may create additional pressures (Kurtines & Miranda, 1980; Perez, Espinosa, Ramos et al, 2009).

Perez, Espinoza, Ramos, et. al. (2009), report that there are only a handful of studies on undocumented college students. De Leon (2005), in one of these few studies on undocumented college students, reported that these students remember isolation, fear, and those teachers who treated them negatively. Dozier (1993) found three central emotional concerns for undocumented college students. These were fear of deportation, loneliness, and depression. Fear of deportation is very central to undocumented students. It influences every aspect of their lives. They are afraid to go to hospitals and it makes it impossible to obtain work authorization and therefore they are often forced to stay in bad work conditions. They are also reluctant to develop close emotional relationships with others (Dozier, 1993). All the respondents in the study by Buriel, Perez, DeMent, Chavez, & Moran in 1998, reported frustration, helplessness, shame, and fear due to their undocumented status.

Migrant children present another pressing problem in American education. Reyes, Garza, & Trueba, (2004) stated that for migrant children the image that has been
constructed is one of a perpetuating cycle of failure. Many educators have been convinced erroneously that the children of farm workers will never be able to perform at high and sustained levels in their educational programs. According to Reyes, Garza, & Trueba (2004), many of these students are led to believe that they are intrinsically inferior or that their fate is to follow the path of hopelessness that has been imposed on them for generations.

Olivarez (2006) reported that families seemed to support students’ aspirations to attend college but the home environments were not always conducive to college preparation. Students had to care for younger siblings and often did their homework away from home because it was crowded in the family’s small rented apartment or they secluded themselves in a corner or waited until everyone was asleep to get their work done. None of the students had a separate room in their homes where they could find a quiet space to study. Sixty percent of these students lived in crowded homes with 6 or more people and 90% lived in single studio apartments where everyone slept in the same room (Olivarez, 2006).

To compound the problems among Mexican American English language learners (ELLs), there exists a great shortage of bilingual and ESL educators. This shortage has remained critical since the early 1980’s. Boe (1990) noted that no national database of bilingual education teachers was available to support refined supply and demand research in this area. Gold (1992), referred to this shortage as “the single greatest barrier to the improvement of instructional programs for limited English proficient (LEP) students” (p. 223). Furthermore, research supports the lack of bilingual teachers in studies by Gándara
(1986); Macias (1989); Quezada (1991); Torres-Guzman and Goodwin (1995); Crawford (1997); Menken and Holmes (2000); and Menken and Antunez (2001).

The National Clearinghouse for English Language Acquisition (NCELA 2004) pointed out the difficulty in finding and attracting teachers for bilingual classrooms. This report emphasized that schools would need to hire as many as two million new teachers (all fields) in the coming decade. The Clearinghouse noted that bilingual and ESL education would be particularly crucial in this great teacher shortage. Moss and Puma (1995), stated that the inadequate supply of bilingual teachers had forced many districts to hire uncertified aides whose only qualification in many cases was the ability to speak another language.

Some school districts in Texas made trips to Mexico to recruit Mexican teachers (Barbe 2006). Dallas Independent School District officials wanted to work with other urban school systems to initiate changes in current immigration laws in order to permit them to hire college-educated illegal immigrants to address the growing shortage of bilingual teachers in their districts (Hobbs 2006). It is apparent to many educators that this shortage is very real.

The great shortage of teachers for ELLs in the U.S. is only magnified by the lack of preparation teachers receive for working with English language learners. Teachers and school environments are extremely important in creating and fostering resiliency in students. Of particular emphasis in addressing and fostering educational resiliency among Mexican American students is the issue of teacher preparation with an emphasis in identifying, creating, and developing positive dispositions and attitudes among teachers of Mexican American English language learners, including validation of the students’
linguistic and cultural diversity. This critical area cannot be glossed over. It is important that children receive support for who they are and the value that they represent to our society. What do teachers need to possess in order to succeed with Mexican American English language learners? Further, what responsibility does a state have to educate all of its children—legal or otherwise? Finally, what are the effects on children’s self-esteem when they feel that they are afraid and feel not only expendable, but also unwanted and unworthy of being educated? It is difficult for these children to learn in this political climate of conservative standards that do not acknowledge their contributions, and immigration reforms that cause them to be fearful, isolated, and lonely.

Mexican American children have existed in the southwestern United States for generations. And, many of these children and their parents have gradually left the southwest and taken up residence in all fifty states and all areas of the country. What responsibility does a state have to educate and prepare all of its citizens? In Arizona with Senate Bill 1070 and its assault on undocumented workers, and ethnic studies being denied in the classroom, what responsibility does the state have to ensure that minority children have an opportunity to know and understand themselves? How do citizens of a state fight back against a system determined to do harm to them or get rid of them altogether? In the end, what effects will these policies have on children’s self-esteem when no mention is ever made of their culture’s contributions to the success of the society in general?

The fear that has been created in the Mexican American community by state sanctions aimed directly at them is beginning to take a toll on this population. Bilingual programs have been cut back or in many instances eliminated altogether. Ethnic studies
courses are being removed from the curriculum and English-only and anti-immigrant laws have been passed in many parts of the country, directly aimed at negatively affecting the education, self-esteem, and future of these students.

The growing role of Massive Multiplayer Online Role Playing Games (MMOs or MMORPGs) as tools of social inclusion for 'at risk' high school students.

Abstract

There is a growing body of literature focusing on the relationship between the social and emotional wellbeing of teenagers and their use of online networking tools (Cummings, Lee & Kraut, 2006; Haase & Wellman, 2004). Some studies have looked more specifically at self-representation within social networking sites. There seems to be evidence to support the idea that the personality created online on these platforms differs from their social image in the daily context (Acquisti & Gross, 2006; Stutzman, 2006). Research also seems to imply that the availability of this different platform for self-representation may be therapeutic for some (Ellison, Steinfield & Lampe, 2007; Boyd, 2008). Mazer, Murphy and Simonds (2007) have explored further the potential benefits for at-risk students and studied the impact of teacher self-disclosure on Facebook on student motivation, learning, and classroom climate.

Apart from social networking sites used specifically for communication which have already been scrutinized by literature, SEBD students are also seen to be taking part in collaborative online videogames called "massive multiplayer online games" (MMOs) (Steinkuehler & Williams, 2006). World of Warcraft in particular seems a very popular MMO according to the findings of the study; it is remarkable not just because it is used for the purpose of playing but because of its chat capacity and the dialogues it engenders. MMOs are graphical two-dimensional (2-D) or three-dimensional (3-D) videogames played online, which allow individuals, through self-created digital characters or "avatars," to interact in the game and with each other. Aesthetically, they are part of the long history of alternative worlds found in science fiction and fantasy literature. Participation in such virtual "third places" appears particularly well suited to the
formation of bridging social capital (Putnam, 2000) and SEBD students appear to use these functionalities for the purpose of social inclusion. Call of Duty has also been found to be an important and popular MMO for students with SEBD (Greene & Bavelier, 2003). The anonymity of both online games appears to provide a safe haven beyond the reach of school and home that allows individuals to engage with others socially without entangling obligations and repercussions; it is the so-called "magic circle" of the game (Huizinga, 1949, as cited by as cited by Steinkuehler & Williams, 2006).

The paper will address the impact of its findings on the inclusion of ‘at risk’ high students, both in term of pedagogical development and social inclusion. The paper will also consider the wider impact of the paper on students generally, within inclusive education, where each ‘millennium’ learner (Keefe, 2008) is increasingly becoming a hybrid learner, drawing skills and knowledge from the classroom but also from a much wider array of technological avenues. The paper will suggest that the notion of ‘school community’ needs to be revisited and redefined and with it the notion of effective functional inclusion.

Abstract

Background and Objectives

This paper proposal is based on a recently completed book chapter that considers leadership standards at the district and school levels in relationship to advantageous systemic data analytic structures and processes facilitated by a provincial Department of Education. Evidence-informed decision making is explicated within a multifaceted, adaptive leadership framework that is evolving in the province of Alberta, Canada.

Improving learning for all K-12 students in the public education system and preparing them for the 21st century world of work and/or post-secondary studies undoubtedly epitomize one of the most comprehensive “adaptive problems” that do not entail clear-cut solutions and the answers that are known in advance (Heifetz, Kania & Kramer, 2004). These types of problems cannot be resolved by merely throwing money at them or by externally imposed changes by a single authority. Contemporary educational issues are very dynamic both time-wise and context-wise. One example of complexity is the rapidly evolving diversity of student populations and consequential comprehensive educational environments. The latter could encompass English as a second language (ESL) learners from a variety of cultural backgrounds and grade levels, low socio-economic status (SES) students in city core schools or indigenous and other minority students in both urban and rural schools.

Consequently, successful programming for students’ success and school improvement needs to be grounded in solid, comprehensive data reflecting complex education environments, including building versatile assessment systems capable of addressing various monitoring and diagnostic needs by tracking individual students’ progress. President Obama has accentuated the need for better (higher) standards and assessments to improve student achievement (U.S. Department of Education, 2009), as well as for state data systems that follow students’ education paths and track how much progress they are making and where they are struggling (see also National Center for Education Statistics, 2009).

Furthermore, balancing contradictions, prioritizing and directing joint efforts at identifying issues and meeting common goals would not be possible without development of a flexible, responsive, adaptive and systemic education leadership frameworks. Such leadership frameworks need to be “nested” whereby school districts’ major educational goals are intrinsically aligned with general provincial or state educational initiatives and priorities, but at the same time account for the specifics and unique needs arising from the local contexts. Grassroots school leadership systems should similarly be nested and organically integrated in the districts’ leadership frameworks by keeping an eye on general goals while initiating school level solutions. School results are then considered in relationship to district and provincial/state comparators as one means to judge the degrees of success being achieved. Adaptive leadership frameworks or systems presume flexibility, transparency and openness to all educational stakeholders and the public, whereby the
public and stakeholder opinions on educational priorities, goals and solutions are heard and accountability processes are in place to inform the progress achieved.

The objectives of this paper are to:

- Highlight the particulars of the province-wide (Alberta, Canada) multi-faceted student data collection system implemented in school districts and directed at: (1) attaining a comprehensive approach to student assessment; (2) monitoring and understanding students’ progress controlling for various educational, cultural and social settings and conditions; (3) supporting diagnostics of at-risk students; and (4) encouraging evidence-informed leadership, programming and decision-making at school, district and province/state levels.

- Outline the aspects and potential benefits of building system-wide and local leadership structures grounded in holistic and systematically collected empirical, data-based evidence.

**Evidence and Methodology**

This paper involves a theoretical discussion representing provincial and school district central office perspectives on an integrated leadership model that is evolving under the direction of the Ministry of Education and the College of Alberta School Superintendents, as well as a case study illustrating application of the integrated data models to inform the leadership structures. The analyzed data highlight chartering comprehensive district profiles based on the outcomes of standardized external achievement tests, classroom-based assessments, high school completion and dynamics in high school courses intake in conjunction with the attendant variables such as socio-economic backgrounds of student populations, student mobility and special needs codes (e.g., ESL and special needs).

**Theoretical Insights and Expected Research and Practical Outcomes**

The concept of “nested” or system-wide aligned leadership explored in the proposed paper is related to Fullan’s notion of “permeable connectivity” presuming a delicate balance between Departments of Education and field-based staff in ways that capitalize on each sector’s comparative advantages. As observed by Fullan (2006: 95-96),

> Centralized high stakes accountability schemes have failed to produce ownership, as has decentralized site-based management. The solution, in my view, is to develop strategies that integrate top-down and bottom-up forces in an ongoing, dynamic manner, achieving what I call ‘permeable connectivity’… [that] requires a sophisticated and delicate balance, because to work it requires all three levels – school, community and district, and state – to interact regularly across and within levels.

In addition, *Intelligent leadership: Constructs for thinking education leaders* (Burger, Webber, & Klinck, 2007) presents the view that effective educational leadership is premised on a
complex, multi-faceted and inter-related set of skills and knowledge. Effective educational leadership is becoming a clearer and better understood enterprise. Necessary conditions include:

- Inter-connected and holistic policy frameworks across system boundaries to support education leaders
- A commitment to change and change processes recognizing that status-quo leadership will not move an organization to excellence
- On-going reflective thinking about how effective current leadership strategies are for achieving success for all students in a school or jurisdiction
- A keen understanding of pedagogy and learning theories applied to curricular outcomes
- Transparent and open education systems that use data and evidence to build partnerships with students, parents and communities in moving schools to higher performance
- Balanced approaches to student assessment that give weight to formative assessment strategies linked to effective teaching methods and use summative assessment to gauge progress and provide feedback to students, teachers and parents
- A willingness to re-assign existing resources to new uses that promise more effective outputs and outcomes for students, and
- Life-long, interactive and articulated leadership training models that help to shift the accountability foci from a blame and shame process to a capacity building, networked enterprise.

At the same time, the Wallace Foundation’s (2006:8) report observes that,

> It is important to emphasize that this vision of a more comprehensive approach to leadership improvement is in an early and highly formative stage. Indeed, it is largely hypothetical, existing only in fragments in a few states and districts that have made early attempts to make the critical policy connections.

One of the challenges of building school and district leadership capacity is the different degree of “readiness” and preparedness of various education stakeholders (including schools) to actively lead locally, while connecting with the broader leadership framework.

For example, school leaders’ workloads have become increasingly complex and potentially onerous with more sophisticated administrative and managerial responsibilities and greater accountability for results. There are some notable differences between the knowledge, skills and attributes required of school leaders a generation ago and those required now. Given the increasingly complex work context, the school leader’s role today may be beyond what most practitioners can fulfill successfully.

New models of school leadership practice and related preparation and professional development opportunities need to be developed to ensure that school leaders can effectively respond to
current and future educational demands. Educational researchers and policymakers are calling for a new vision and model of distributed school leadership (Spillane & Diamond, 2007; Leithwood, 2009), concluding that traditional approaches to school leaders’ preparation, professional development and practice are antiquated. Education stakeholders in Alberta recognize the need to develop strategies to accelerate the acquisition and refinement of required competencies by new school leaders.

Another major issue is grounding contemporary leadership frameworks in firm empirical evidence, so that on-going learning about the current and emerging student needs and possible solutions, goal setting, strategies and decisions are rooted in accurate and timely data. Successful and effective leadership frameworks should be supported by comprehensive and relevant system-wide data systems.

Stakeholders are becoming increasingly aware that a solid, common (provincial or state) empirical data base would add objectivity to the discussions, information exchanges and decision-making underlying increasingly complex education challenges. Already collected data (e.g., external classroom assessments or surveys) can be combined with other data sources (e.g. external assessments and census data) and used as a base for initiating comprehensive system-wide databases. These databases can be further developed and refined to provide information foundations for a broad variety of initiatives, including enhanced program evaluations, school improvement, education policies and leadership decisions. The province or state needs to assume an instrumental role in ensuring quality student data collection (including registration, course participation, achievement and demographics). The school-generated accountability data should be enriched by additional data collections and returned back for districts’ and schools’ use or in the form of analytical reports as “value-added” feedback. It is important to emphasize that functional information flows between various elements and levels of the education system and building data-centric province or state-wide improvement systems (Kline, 2009) presume not only quality data collections and maintenance, but understanding and active usage of data at all system levels.

The proposed paper provides insights into how leadership standards can be reified in relationship to building supportive networks as well as meaningful and useful data to support evidence-based decision-making by education leaders. The paper highlights the experience of one school district in building an evidence-based leadership framework using systemically gathered data, which makes it possible to consider district results in relationship to provincial parameters.

The district first built and strengthened a culture of trust, collaboration, support and transparency throughout all levels of the organization. The degree to which any change is successful and/or sustainable is entirely dependent upon the relationships and degree of trust between all levels of the enterprise. Second, an emphasis has been put on alignment and integration of evidence and data for analysis, planning and decision-making. As the district began to engage the teachers, school administrators and central office to establish a framework for analysis, planning and decision-making, the following fundamental questions needed to be addressed:
What evidence and sources of data would best inform discussions?

What confidence did we have that the information was valid, reliable and a strong indicator of improved student achievement and engagement?

What was the proper balance of qualitative and quantitative information?

One of the important utilities of comprehensive data systems is the opportunity to provide an integrated picture of a district’s student population and associated environment. The paper illustrates how charting a comprehensive district profile using solid evidence is essential for better understanding of local contexts where students and educators interact. For example, research literature consistently points to a link between socio-economic status (SES) and student academic outcomes (e.g., Adams & Ryan, 2000; Dahl & Lochner, 2005; Magnuson, 2003; Morris, Duncan, & Rodrigues, 2006; van Zanten, 2005). Therefore it is imperative for the district’s educational leaders to be fully aware of the local SES milieus and also position themselves relative to the state/province and/or other school districts’ outcomes. Rather than using local SES-related issues to rationalize low student outcomes, it is important to account for them in designing custom interventions to counteract the potential negative effects of low SES factors.

Student mobility data (changed school registrations) linked to academic outcomes resultant from standardized tests and classroom-based assessments may provide a powerful demonstration to teachers and parents of how harmful the effects of student mobility might be for their success at school. Analyzing this relationship on a regular and more disaggregated (classroom) basis may provide indication of the effectiveness of programs designed to help highly mobile students academically and to assist families in counteracting the negative effects of student mobility.

Charting the distribution of students with ESL and special needs codes by grade groupings helps to identify programming and staffing priorities for the district as well as identify its position relatively to the province or state-wide results in general.

In order to better understand and effectively address student achievement and high school completion issues, it is important for educators to be aware of the dynamics in student high course participation (e.g., tendency to take advanced or general stream courses or switching between these categories) and associated precursors and outcomes.

Lastly, the opportunity for juxtaposing the outcomes of standardized and classroom-based student assessment models is useful for ensuring that students are well served by both sources of measurement and balanced approaches to student assessment is attained.

In summary, value-added data analysis by school and district leaders supported by emerging leadership standards is in the early stages of development. These efforts, however, promise a future where leadership behaviors are better understood through the enhanced inter-connectivity of leaders’ critical reflection focused on success for all students. The proposed paper illustrates how educational leadership is being enhanced in Alberta by linking it to comprehensive, current, accessible and balanced data supported by a data warehouse maintained by the Department of Education with practical applications at the school and district levels.

Leadership Styles of Educational Non-Profit Institutions

By: David Greenfield*, Damon Blue, and Todd C. Shoepe

Pepperdine University

August, 2010
Abstract

This paper explores the nature of leadership in interinstituational, non-profit collaborations. Interviews were conducted with 6 persons holding positions of leadership in 6 differing institutions with 4 institutions of higher education and 2 museums included in the analysis. All interviews were transcribed and occurrences were counted across 8 different areas of leadership theory as well as the number of references to collaboration in the workplace. Qualitative analysis then was performed to isolate quotes from the interviews. The findings suggest that the most common category of reference was indeed collaborative involvement and membership or the reference to being a member of a team. The next 3 categories of importance were transformational, trait, and skills theories of leadership respectively. We conclude that leaders of interinstituational nonprofit institutions perceive collaboration as a primary area of importance and associate their leadership philosophies with transformational, trait, skills, and styles theories.

Introduction

From the beginning of time, humans have engaged in social activities such that out of necessity, some individuals became leaders and some take on a more follower role. While some theorists suggest that every individual is a leader at some point, we speak typically of the leader as someone existing on top of an organizational pyramid as a result of promotion, appointment, attrition or the like. However, in recent times, due to the vastly expanding population and interdependence of collaboration in all areas of human existence from food production, religion, defense, political structure, to professional adventures, we have become increasingly interested in explicating the leadership process in hopes of producing more meaningful and productive teams. Northouse, 2007 in his expansive book *Leadership: Theory and practice* suggests that of utmost importance is operatively defining the term leadership before entering into any further discussion. Offering the notion which was adapted from Stogdill (1974), Northouse, 2007 mentions that there are a vast number definitions of leadership pervasive today in print. However, he settled on the following definition of leadership which we will adopt for this manuscript as well: “Leadership is a process whereby an individual influences a group of individuals to achieve a common goal” (p. 3).

The world is getting smaller. Obviously, not in the sense that the physical dimensions of the world are decreasing, but due to the exponentially increasing population growth of the last century coupled with technological boom of Web 2.0 and 3.0 the ability to contact, exchange knowledge, and communicate occur with an ease the likes humankind has never experienced. This convenience of contact allows the cultural dissemination and sharing of knowledge to occur at a rate that is unprecedented and with a convenience that is unparalleled. Because the world is becoming more and more intertwined, institutions are unlikely to persist on their islands for much longer into the future suggesting that collaboration is thus the way of the future.
One situation where the collaborative potential is obvious and historically relevant is the interplay between higher education, museums and even libraries. Higher education, with the basic historical charge of fostering learning requires the vast resources found in the traditional role of libraries as a storehouse of information. Museums possess vast collections of artifacts and intellectual property either in both the physical and virtual worlds. All three are engaged in certain ways in the original research missions indicating their own respective fields of discipline. We feel that these three areas lend themselves very well to the description of collaboration at present and to the future potential of these relationships.

**Purpose**

We therefore set out to investigate the process of leadership by identifying individuals of accepted societal positions of leadership. Specifically, our research purposes are as follows:

1. Are the leadership characteristics of leaders in the field of interinstitutional collaborative situations inherent in museums, higher education, and libraries?
2. What are the assumptions of these leaders with regard to their followers?
3. How do these leaders view the role of women in leadership?
Procedures

Participants

The participants (n=6) for the study were selected through personal contacts and past affiliations with the authors. Two were presently working in administrative appointments at southern California museums, and four were serving in administrative appointments in higher education at four year undergraduate universities and graduate schools along the Pacific Coast. Our sample included three males and three females.

Protection of Human Subjects

Prior to pursuing any aspect of this study, the project was approved by the Institutional Review Board for the Protection of Human Subjects in accordance with the guidelines of Pepperdine University (see appendices A and B). The nature of the approval is one of an indefinite end point subject to resubmission each year as directed by Dr. Madjidi (see appendices A and B).

Data Collection

Research participants were identified and contacted via email or phone call where the recruitment followed a script identical to the one provided via email. A copy of the recruitment form is presented in Appendix D. Upon acceptance and agreement to participate in the study, all participants were provided with a list of interview questions prior to the interview. For a list of questions used in this study, see Appendix F. The interviews were scheduled on a case-by case basis where agreements were made as to the location and time. On the day of the interview, participants were then asked to read and sign an informed consent document like the one provided in Appendix E. All aspects of the identification of participants have been obscured and respected in this manuscript unless express, signed permission was granted on the informed
consent form. The interviews lasted approximately one hour each during which time, each of the sessions were recorded. Each question from the pre-determined list (Appendix F) was elaborated on and relevant follow-up questions were posed for the purpose of clarification or further depth.

**Instrument**

A copy of the interview questions has been included in Appendix C. Each item was included as part of a larger group project fulfilling the requirements of doctoral work within the Graduate School of Education and Psychology at Pepperdine University in Malibu, California. The purpose of this research was to identify: a) what the leadership characteristics of leaders in are the field of interinstitutional collaborative situations inherent in museums, higher education, and libraries, b) what the assumptions of these leaders are with regard to their followers, and c) how these leaders view the role of women in leadership.

Our interview (Appendix F) was a seven question process with additional follow-ups as needed pending the responses of the individual interviewee. The first two items (1. Tell me a little about your career. 2. What were some of the obstacles you have faced in your career?) were useful in identifying historical events that shaped each of the participants’ leadership attributes and beliefs. The creation of a timeline identifies factors that can be identified in similarity or difference between the participants. The next item (How would you describe your leadership style?) was useful in determining the perception of the leader’s style (purpose #1) and insight into a general leadership philosophy. Later analysis can result in identifying areas of agreement and contrast between the spoken evidence of behavior and the perceived philosophy. Our next question (What leadership characteristics do you value in your employees?) addresses specific research purpose #2 where we are interested in characterizing the relationship interaction between the leader and the follower. It furthermore promotes what skills and traits in their
chosen employees leaders find vital. This provides for insight into whether they select employees in their own image or seek out those based on a contingency theory in order to match the correct person for the desired environment. The fifth item (What challenges do you face in your day-to-day dealings with your employees?) addresses specific research purpose #2 where we are interested in characterizing the relationship interaction between the leader and the follower. The sixth item (Describe to us your decision-making process) gains information on how the leader interacts with employees and hardships or barriers. Specific purpose #1 and #2 are targeted here by isolating traits of agreement, collegiality, isolation, autocracy, etc. Our last item (What role do you see women playing in leadership and what advantage or disadvantages do women face in leadership positions?) and related follow-up questions are directed at research purpose #3.

**Data Analysis**

Each interview was recorded and later transcribed by the respective interviewer into text over a period of a couple of weeks following the interviews. Then, each transcription was surveyed for the frequency of references to thoughts that were in line with the major research theories of the past and present. These coded areas were as follows: transformational, trait, skills, styles, contingency, situational, and transactional. Because a critical piece of our research question was to identify factors and theory affiliation of persons working in positions of assigned leadership of collaborative non-profit institutions, we further coded a category associated with collaboration. The interviewees then reviewed each transcript for direct references to items and terms as well as inferred content. A frequency count was accumulated for each of these categories as well as quotations specific to the topic for later discussion.
Literature Review

History

The academic interest and documentation of leadership largely began in the middle of the 20th century where seminal works focused on the notion that successful leaders were those who were in possession of certain physical and intellectual attributes that inclined them towards success in leading others. The “trait theory” as sprung forth, was possibly a product of the leadership positions historically bestowed by a higher power through birthright and thus produced the belief that leaders were born not made (Stogdill & Shartle, 1948). Among the first to publish work in this field was Stogdill (1948) who approached this work with the intention of identifying the major traits that were perceived to be the common attribute threads of all successful leaders. Since that time, there have been a number of additional studies producing a progressively longer litany of leadership traits (Kirkpatrick & Locke, 1991; Lord, de Vader, & Alliger, 1986; Mann, 1959) where commonalities and differences of the identified traits continue to be prevalent amongst the varied academics involved in this theory.

Since that early work, additional efforts have been made by others that continued to focus on the things that make up a good leader. The “skills approach” is one where the belief centers on the disagreement with the previous trait approach in one major way (Katz, 1955; Mumford, Zaccaro, Harding, Jacobs, & Fleishman, 2000). Where both the trait and skills approach identified features of leaders, the trait approach believed in the uncontrollable factors associated with birth and genetics in the creation of a great leader, whereas the skills approach centrally believed it was possible to obtain and develop certain traits through training and life experiences (Katz, 1955; Mumford, Zaccaro, Harding, Jacobs, & Fleishman, 2000).
These first two widespread and researched theories prioritized the leader and paid little attention to the role of the process, the followers, or the interactions of all parties. Because we have adopted the Northouse, 2007 definition of leadership wherein “Leadership is a process whereby an individual influences a group of individuals to achieve a common goal” (p.3) it then becomes necessary to progress the discussion to more recent and all-encompassing contemporary theories. One of these is an alternative theory of leadership stemming from a similar time which was then moved to the premise that behavior factor that must be elucidated in the identification and development of leaders. The early work performed by Blake et al. (1964) from the University of Michigan produced a summary grid identifying the interplay of concern for relationships and the concern for outcomes as being the two major factors of this new “style theory.” This basic premise of bifactor interactions of the leader and the led will resurface time and again through more modern explanations albeit in forms using differing language.

Two theories emphasizing the environment and the leader are the “contingency” (Fiedler, 1971) and “situational” (Hersey & Blanchard, 1969) approaches. In short, the situational approach supports the idea that a leader should adopt a particular style in order to best cater to and match the needs of the given situation. Therein, it is possible for widespread success of a particular leader in differing arenas if adaptation and care to choose an appropriate method is exercised. In a similar vein, the contingency theory takes the approach not from the leader matching their approach to the situation, but rather the situation choosing the appropriate leader. In this theory, the best results would occur when the ideal leader is chosen for the given situation.

In more recent times, and of growing acceptance, is the idea that previous theories, while valuable, are too simplistic in terms of the addressing the individual (trait, skills, and style
theories) or the environment (situational and contingency theories). Modern approaches have begun to classify leadership as a delicate balance of interactions between the leader and the followers such that each in turn predicates the responses and actions of the other. Theories here include the “path-goal theory,” (House, 1996) “leader-member exchange” (Graen & Uhl-Bien, 1995) and “transformational leadership” (Burns, 1978; Dowton, 1973). As stated by Wolverton, Gmelch, Montez, & Nies, 2001, “Over the past 20 years, two paradigms have dominated scholarly work on leadership-transactional and transformational” (p. 41) we will focus our attentions henceforth on these two contemporary theories.

Leader-member exchange (LMX) theory “works in two ways: It describes leadership, and it prescribes leadership” (Northouse, 2007, p. 157). The major component is the two-factor relationship between the leader and subordinates that is further classified by entities called “in-groups” (IG) and “out-groups” (OG). Also referred to as a transactional theory, relationships are theorized to begin in the OG where interactions are scripted, predictable, and fall within a restricted zone of operations. Over time, the members of the OG move towards the IG through transactions involving taking on additional responsibilities, performing above expectations, and simply gaining trust of the leader. As this unfolds, there is equal reciprocity where the leader increases the gray area of the relationship and not only allows but encourages individuality of operation. The prescription component of the model suggests that leaders should strive to move all subordinates towards the IGs in time and thereby promoting movement towards higher and more meaningful output (Graen & Uhl-Bien, 1995; Liden, Wayne, & Stilwell, 1993).

Transformational leadership is likely to be the most investigated and strived for model of leadership in operation today (Wolverton et al., 2001). Intrinsic to this theory is the identification of two related principles known as transactional and transformational leadership
with the latter argued to be the more desired form. In negotiating stimulus-response style outcomes of interactions between leader and subordinate, a transaction of effort and reward occurs. Thereby, the subordinate is motivated and performs only with the notion that they will in turn receive some assumed reward for each and every one of the accumulative efforts. Therefore, actions that result in group or team benefit with little individual reward occurring behind closed doors or beyond the watchful eye of the leader will be minimal because the subordinate perceives little derived individual satisfaction. However, transformation is best described as creating the inspiration in both the leader and follower in a positively arranged feedback system that “raises the level of motivation and morality in both the leader and the follower” (Northouse, 2007, p. 176). As a result, direct supervision becomes less intensive (and less necessary); thus stimulating personal work habits and output enhancements that would otherwise occur due to a “what’s in it for me?” attitude. The members of the cycle (leader and followers) therefore persist to engage in efforts for the greater good which in return provide deep satisfaction from a magnified, accomplished success of a nature which is often intangible.

Higher Education

State of theory.

Universities are rife with organizational complexity and multiplicity of leadership roles. Administrators in academics, student affairs, as well as scholarly roles must demonstrate leadership in a variety of different ways. As we move to investigate the current application of theory to educational pursuits, Wolverton et al.(2001) provided a relevant review of leadership from the perspective of a Dean. In this work they referred frequently to the previous works of (as cited in Wolverton et al., 2001) who is given credit for first addressing the concepts of transaction vs. transformational leadership (as cited in Wolverton et al., 2001). Wolverton et al.
offered that the original belief of Burns’ work was one where the difference was viewed as “a trading of benefits between leaders and followers and transforming leadership as mobilizing others to act in a manner that is morally superior to what might otherwise might be the case” (Wolverton et al., 2001, p. 42). Wolverton et al. argue that subsequent evolution of the theory by others has removed the statement of morality with concluding support for substantive change (Wolverton et al., 2001). The Wolverton group continued by saying that deans will be more successful who display higher levels of emotional intelligence (Goleman, 1995) where they will be able to “understand themselves, and their emotions, moods, and desires” (Wolverton et al., 2001, p. 43) and thereby provide for more relation building and shared governance than those that are transactional (Wolverton et al., 2001). Furthermore, the authors speculated that the future of deanships in American universities is one where transactional and transformational elements will not only be necessary, but lead to the greatest levels of success by attending to both day-to-day actions while not sacrificing elements of forward thinking and vision (Wolverton et al., 2001, p. 43). Current research seems to agree to some level that transformational and transactional discussions of leadership are powerful theories of description and prescription in educational settings. However, the following is a short list of other areas of investigation in line with transactional and transformational components.

**Leadership categories.**

In a separate article using a top-down approach for generalizing the technique in play throughout the university environment, Neumann & Bensimon (1990) used university presidents as a view into the methods of leadership pervading the university setting. As part of the Institutional Leadership Project of the National Center for Postsecondary Governance and Finance, the authors interviewed 32 active university presidents representing a broad spectrum of
institutions across higher education. The sample as selected specifically strove to include these institutions for greater generalizability such that universities “further stratified by control (public/private) and Carnegie category (research/doctoral granting), eight state colleges and eight community colleges differing in superstructure (system/non-system) and governance (bargaining/non-bargaining), and eight independent colleges further divided by program (liberal arts/comprehensive) and sponsorship (religious, non-religious)” (Neumann & Bensimon, 1990, p. 680) would be represented across a broad geographic area and community setting.

The study was produced in a cross-sectional format whereby transcribed interviews were reviewed for similarities and differences in three major ways: strategy, cognitive frames, and schools or leadership theory. Using this framework, the interviews were used to create four emergent clusters suggestive of presidential profiles (A-D). The profiles were then summarily presented with respect to target of attention, mode of action, relatedness to institution, and overall orientation in order to delineate broad categorical difference between the leadership perceptions of each type of president. The following is a brief summary of each presidential type.

Presidential type A leaders are those that oversee relatively stable institutions that despite some financial difficulties perceive that their documented or chosen strategies will be effective preventative measures to collapse. Neumann (1990) suggested that these types support faculty in a way where there are few problems with morale. Type As are directed externally in that they view the university as a piece of a larger community and are responsible for the contributing to the purpose. They further see themselves as initiators more so than reactors however, they maintain a tight level of connectedness with their respective institutions through generation and maintenance of structure.
The type B presidential category also usually oversee “stable institutions” and are highly regarded by their faculties. They furthermore see themselves as largely internally oriented such that they focus more on the affiliates both student and employee as being the primary directive. These individuals will work as “facilitators” more so than an “initiator” and in doing so prioritize relationships of people and personnel within the institution. Like the type A, B presidents are initiators although their direction of effort differs “(externally for A and internally for B)” (Neumann & Bensimon, 1990, p.688). Lastly, the type B also exemplifies connectivity with the institution; it is through a more interpersonal method rather than through structure and mechanism. Neumann offered that the type B “president makes persistent efforts to remain in touch with and active in the college’s internal life” (Neumann & Bensimon, 1990, p. 689).

Financially strapped, troubled, or universities in dynamic state of change typically exhibit presidents from category C. These individuals believe that systematic large changes are need to improve the state of the university and differences in the ages of C types offer that older C types “work with distressed faculty” while younger C types “work with faculty who are more hopeful” (Neumann & Bensimon, 1990, p.689). Type Cs direct their attentions externally and are motivated by establishing short-term payoffs and goals. Type C are usefully for fund raising and overcoming systemic issues in a reactionary manner.

The final category, D, are those that “have passed through financial crisis, and the fear of a possible recurrence hangs in the air” (Neumann & Bensimon, 1990, p. 691). The subordinates of these presidents register the lowest on morale. These presidents seem to feel that they are the final decision maker in all of the universities questions while they “paint bleak pictures of the college’s condition before they arrived” (Neumann & Bensimon, 1990, p.691). Type Ds advocate the idea of cutting programs perceived to be problematic or not sufficiently pulling
their weight thus directing the focus internally. They react to problems, conflict, and the environment instead of provide vision and initiative for the future. Type Ds are extremely strong in adherence to structural proceedings and bureaucracy as a way to control and maintain policy.

The authors conclude by offering that their work “represents a tool for analyzing presidential thinking at a given moment in time” (Blake et al., 1964, p. 698) while providing a baseline for establishing change in style over time. In total, this article appears to be a derivative of style theories of leadership originally proposed by Blake et al. (1964) with the exception that this study focused on the style as presented by the cognitive domain perception of the president instead of that of the followers or the more qualitative objective measures of leadership.

**Grassroots (bottom-up) approaches.**

According to Kezar & Lester, (2009) grassroots leadership is “the level at which faculty are working” (p. 717) and spring forth from the bottom up rather than from traditional top-down styles of leadership. This emergent style of leadership calls upon referent and expert sources of power rather than legitimate sources seen in the traditional top-down approach. Their work came about due to what they interpreted as a decline in the environmental conditions at American universities where faculty are bearing a smaller contribution of shared leadership throughout campuses. Kezar, (2009) as cited from Schuster Finkelstein, (2006) attributed this decline to:

- rise in part-time and non-tenure track faculty, increasing pressure to publish and teach more courses and adopt new technologies and pedagogies, increasing standards for tenure and promotion, ascension of academic capitalism, and heavy service roles for women and people of color. (Kezar, 2009, p. 716)

Using a case-study design format, they interviewed 81 faculty members from five selected institutions or higher learning representing a varied directive of purpose and sources of funding. All participants were selected due to their current participation in what was deemed to
be grassroots campaigns of change throughout the university structure. Their findings suggest that for institutions to promote grassroots leadership they should utilize a two-level approach encompassing a total of seven areas. This approach is outlined below.

1. Departmental or school wide approaches that would include a) supportive individuals who remove obstacles, b) providing autonomy and flexibility for faculty workload and role, and finally c) sending faculty to off campus conferences and professional development.

2. Campuswide approaches that would include a) collegiality of campus networks, b) developing policies for including the nontenure track faculty in governance and leadership, c) addressing the lack of community and dysfunctional departments, and d) campuses that see questioning as healthy: not threatening. (Kezar, 2009, p. 716).

The authors concluded that by addressing each of these areas in turn, leadership can emerge from faculty self-selecting the most important issues to their own personal agendas, and therefore serve as a “great source of innovation, creating high-quality teaching, experimental curriculum, cutting edge research, intellectual enrichment, student engagement, improved student outcomes, a more responsive campus to community needs, among other things” (Kezar, 2009, p. 736).

In another grassroots investigation, Thomas & Willcoxson (1998) presented an application of Schein’s (1985) four-step model in the process of grassroots leadership that occurred in a case-study of emergent curricular and culture change that occurred at a Veterinary University located in Australia. These researchers confirmed that bottom-up leadership is evident in the desires of junior faculty that bind together in a common cause of adapting curriculum and instructional practices by attending to the following four steps: a) developing a supportive “critical mass” b) relating change aims to university objectives c) “enlistment of
potential antagonists” and d) creating support and rewards for successful change (Thomas & Willcoxon, 1998).

**Museums**

The current state of leadership in museums seems to focus on the philosophies in conjunction with state of traditional leadership research theory. Literature is replete with discussion of emotional intelligence, authenticity, and transforming discussions. Griffin & Abraham (2000) undertook an expansive investigation into the items associated with successful museums in terms of leadership, public programming, and influence on the discipline. This analysis included 241 individual assessments or 66 experts, addressing 33 worldwide museums. The findings support the notion that leadership is a vital factor and more specifically, forward thinking, vision, and modeling of proper behavior scored very high. The ideals espoused by George persist through the discussion especially with reference to the five steps in demonstrating authenticity (George, 2004). The results from the interviews of Griffin & Abraham (2000) suggest that a clear understanding of purpose as seen through vision of the present and the future are keys as well as building strong relationship while serving as a well-disciplined model for followers will lead to successful curatorship of museums. Writings by Suchy (1999) further support the need for leaders in museums to exhibit emotional intelligences (Goleman, 1995) while also calling upon “flow theories” as guidelines for the leadership roles of museums. In brief, Suchy (1999) suggests that by adhering to clear goals, support, discretionary decision-making, and a sense of trust which allows total involvement in the task one can exist in a state of flow more consistently, thus promoting authenticity and serving as a powerful leader in the goal of transformation.

**Libraries**
The card-catalog and dusty basements might be permanent casualties of the digital age but, the library is far from gone. However, it is safe to say that while the library mission is not changing, the way in which it pursues and provides others with the substance to their respective missions is undergoing massive change. Change in the form of transformation is more appropriately occurring as a result of “a competitive environment, constrained resources, re-engineering and outsourcing, change management, culture of assessment” and the “extraordinary pace at which information and knowledge is being digitized” (Hernon & Schwartz, 2008, p. 243).

As presented by Hernon & Schwartz, (2008) the libraries of today and tomorrow are undergoing vast redesigns to match the evolving world of information storage and dissemination. It is now considered mainstream for libraries to:

- collaborate with other units on campus in creating new services, ones representing partnerships with centers for teaching excellence, tutorial and writing centers, information arcades, facilities for multi-media production and delivery, information and learning commons, cafes, centers for distance education, publishing facilities (e.g., university presses and digital collections), counseling and career centers, and so forth. (Hernon & Schwartz, 2008, p. 243)

Hernon and Schwartz (2008) therefore set out to outline the current states of research on change management, leadership, and managerial leadership, what the authors consider to be the most important issues facing libraries into the immediate future. They, (the authors) wrote that for libraries to be successful under the auspices of such significant challenges, leadership would be necessary for the “influencing others to attain group, organizational, and societal goals” (p. 244) in line with the necessity of re-focusing of library designs and purpose in the future. One of the major suggestions of Hernon & Schwartz (2008) was that where leadership and management circles overlap, there would exist managerial leadership. They tendered a research agenda itemizing transformation, accomplishments, and people in developing a broader base of
literature on library leadership that would provide Library Information Services with “an increased focus on managerial leadership and how it functions in practice” (Hernon & Schwartz, 2008, p. 248).

Riggs (2001) addressed what he viewed as a growing schism between the library of tomorrow and the leadership discussion of today. Citing the Bennis (1997) definition of leadership, he argues that literature for library functioning is daringly narrow and devoid of leadership instruction, philosophy, and research. Some work has been completed to relax this since the original publication date, as the work of Hernon and Schwartz (2008) would suggest. Nonetheless, Riggs then clarified a number of what he perceived as myths in the minds of library affiliates. These include the concepts that all individuals of a team are indeed leaders in one way or another, leaders (authentic we suppose) can be trusted, librarianship is not interchangeable between similar institutions, and that the trait theory is outdated and has been dismissed (Riggs, 2001). He then concludes by offering a very transformational view of leadership that he felt should be adopted wholeheartedly through visionary thinking.

In a 2004 article, Mason & Wetherbee (2004) composed a systematic review of the state of library leadership programs. They believed first, that the genetically inclined trait theory is in fact obsolete and that whether or not leadership training “long a fiercely debated topic, it is now accepted as true” (Mason & Wetherbee, 2004, p. 188). Their review of leadership training program effectiveness revealed that almost all of the data collected in the field is that of a subjective questionnaire addressing the participants’ perception of effectiveness and satisfaction in the short term. While the results of training programs appear to garner unanimous approvals with huge rates of satisfaction (as high as 94%), there is a paucity of data of any objective measure from follow ups in a prospective long-term nature. The authors commented that:
The review of leadership and leadership development training makes it clear that, although many training programs have been developed and conducted successfully, the evaluation methods used to date to assess the success of these programs have, in most cases, not yielded definitive results about the success or failure of programs to achieve their stated objectives, such as individual personal development, career mobility, workplace improvement, and so forth. Most evaluation methods employed to date have measured short-term goals, including participants’ self-assessments of whether the training met expectations and the extent of their personal satisfaction with the training. For the future, if the designers of leadership training hope to claim that such programs improve productivity and achieve an economic payoff for libraries, better evaluation methods must be developed and used in a systematic way. (Mason & Wetherbee, 2004, p. 214)

Therefore, the authors suggested improvements in the way in which trainee groups are assigned to more carefully counteract confounders and elicit more concise, agreed-upon experimental variables. They secondarily offered that longitudinal measures based on objective outcomes would give greater insight to the actual and not perceived effectiveness of these training programs and finally, that more consensus could be made as to what constitutes library leadership. The respective traits and skill sets suggestive of successful library leaders could then be greatly refined and therefore better strategized for and targeted with innovative or evolving training programs (Mason & Wetherbee, 2004).

**Women and Leadership**

Historically, women have been the subject of much undue and unjust discrimination. Professionally speaking, this was demonstrated through unfair hiring practices, inequality of pay, promotion methods, and sexual harassment in the work place. While these issues are unfortunately unlikely to disappear completely, significant progress has been shown (Deyrup, 2004). For example, statistics from the Association of Research Library, that female librarians “constitute 57% of all college and university library directors” (p. 242) and that “perhaps more significant, women essentially have achieved the same wage parity with their male counterparts”
(Deyrup, 2004, p. 242). The actual reported number of salaries that are 92% of their male counterparts while close to equitable, are diminished in importance when compared to female librarians at public libraries. However, in the context of academic librarians, the jobs are more common in women, they earn similar wages, and in fact, “at the top-tier research institutions, women directors, on average, actually earn slightly more than men” (Deyrup, 2004, p. 243). In furthering the gender equity discussion for libraries, the authors then posited four questions: 1) how do librarians compare to corporate America? 2) what led to equity approximation at academic institutions, 3) is this in response to a “women-centered” agenda, and 4) should the improvements in libraries be sued elsewhere as a model? (Deyrup, 2004).

To the first point, the authors cited data highlighting great disparity in frequency and pay scales for women in leadership positions in the big business. It was further noted that progress in this area while disparate is also very slow in change with only a shift from 11.9 to 12.5% of leadership officer positions in Fortune 500 companies held by women from 1999 to 2000 (Deyrup, 2004). The prevalence numbers improve slightly in all academic fields including approximate numbers in teaching, and librarianship. However, university presidents hovered around 19% as of data in 2000 (Deyrup, 2004) and these were more likely to be small, liberal arts focused colleges or universities in small communities.

In addressing the second point Deyrup (2004) cites “affirmative action, advancement through a process of mentoring and professional affiliation, and the recognition by women administrators that they have different leadership styles than men and can use this understanding to their advantage” (p. 246). This last notion, maintains adherence to both the authenticity approaches of George (2004) and the StrengthsFinder approaches to leadership and personal success ascribed to Buckingham (2001).
Point three is addressed by examining the online postings, resumes, and mission statements of female contributors, the authors seemed inconclusive offering both evidence supporting the idea that females promote a feminist agenda and additional research in contradiction (Deyrup, 2004). However, they did conclude the section by saying that “the overall impressions of library administrators is of conservatism, in terms of both a managerial culture and leadership values” (Deyrup, 2004, p. 248).

The last question posed by Deyrup was answered as a definitive yes in favor of distributing this model to other avenues in a way to promote equality across other fields. The authors conclude by saying:

The women are just now making the transition from being heads of liberal arts colleges and the traditionally female-dominated schools of nursing and education to becoming heads of other academic schools and colleges. It might prove useful for this generation of academic administrators to take a look at what their colleagues within the library profession already have achieved. (Deyrup, 2004, p. 249)

Collaboration

The final step we take towards understanding the leadership process of interinstitutional collaboration is to examine how all of this fits together. Because of the novel integration of the three entities which we have chosen to investigate previous work in this field is scarce beckoning the need for investigations like this one. However, seeking out appropriate sources that have previously addressed one of a combination of factors similar to ours is a relevant approach that can be built upon.

One of these studies comes from an article in the Journal of Library Management where the librarians from three different Canadian Universities presented a summary manuscript addressing the principles of successful interinstitutional collaboration (Shepherd, Gillham, & Ridley, 1999). Each of these three individuals was involved as a leader of their respective
institutions during a merger of resources in order to create a “seamlessly integrated program of library collections and services” (Shepherd, Gillham, & Ridley, 1999, p. 332) resulting in the sharing of library resources and collections, joint storage facilities, and integration of library systems. This case study focused on the presentation of four critical areas of collaboration: a) building relationships, b) learning, c) leadership, and d) community building. In addressing the concepts of leadership, the authors were careful to differentiate between management and leadership where the terms “set”, “delegate,” “control,” and “establish” were used in four areas of proposed managerial importance. Conversely, the terms “share,” “model,” and “openly” permeated the points of concentration for leaders (Shepherd et al., 1999). Clearly these authors, while not specifically identifying so, share the concept of collaborative library leadership as being predicated on vision and relationship elements of contemporary leadership theory.

Another study of collaborative interest sought to present recommendations in a case-study format resulting from a collaborative endeavor between two universities located in Scotland (Shaw & Holmes, 2005). These two universities, both residing in Glasgow, formed the opinion that a litany of benefits could be had in expanding research initiatives and funding awards by expanding the scope of team to elicit greater faculty experience and thus support efficacy of research success. While the two universities differed greatly in principal mission, they felt that the common benefits could far outweigh the initial costs of set-up and transformation that would eventually provide growth to each institution to an extent greater than they would have independently achieved. The authors suggested that collaboration “is seen as a continuum ranging from loose voluntary co-operation to collaboration so close that it leads to its own demise through merger and the creation of a single organizational form” (Shaw & Holmes, 2005, p. 481). They then put forth three focused areas of leadership they felt were critical to
successful collaborative change tasks: a) defining purpose and establishing success criteria, b) establishing governance systems and c) nurturing the development of activity. These three criteria call heavily upon some language that is offered elsewhere dealing with leadership vision (Blanchard & Stoner, 2004) and relationship building of transformational leadership approaches requiring “individualized consideration, intellectual stimulation, idealized influence (charisma), and inspirational motivation” (Yukl, 1999, p. 36). In summary, the authors concluded in support of what they considered a successful inter-institutional collaboration and offered the following:

The culture of two universities and their attitudes towards each other can be changed by top-down communication of a timely idea and through voluntary cooperation. While setup costs are high, new inter-organisational structures are workable. Finally, despite the complexities, the looser form which an alliance offers can provide significant benefits. (Shaw & Holmes, 2005, p. 487)

A progressive study put forth by Vangen and Huxham (2003) strove to add to the theory and practice of collaboration by examining and categorizing the leadership “activities undertaken by participants in collaborations” (Vangen & Huxham, 2003, p. S62). One of their major premises from previous work was that in true situations of collaboration, there is a void of traditional hierarchical forms of top-down leadership. Leaders still exist, but do not often carry legitimate power across boundaries into the team of collaborators so that Vangen and Huxham (2003) postulated that their collaborative theory “conceptualizes leadership as the mechanisms that make things happen in a collaboration” (p. S62). Working with data from 13 diverse examples of collaborative institutions, their work centered on the premise that three areas of “leadership media” (structures, processes, and participants) be addressed in order to fully describe the leadership process. They offered two descriptive processes that were eventually posed in a frame of “ideology and pragmatism” where the former would involve embracing, empowering, involving, and mobilizing the followers in each case towards the common goal
along this stepwise progression. The opposing viewpoint sees the focus of collaborative leadership as requiring one to manipulate the collaborative agenda while playing politics. Presented first as two differing perspectives, the authors tie these two together in intertwined system of what is strived for and what will actually occur. In essence they propose a middle ground of pragmatism that falls in between the polar theories “democratic versus autocratic, participative versus directive, relationship oriented versus task oriented and consideration versus initiating structure offered by Stogdill (Bass, 1981), or to the transactional versus transformational leadership dichotomy raised by Burns (1978)” (Vangen & Huxham, 2003, p. S73). Their conclusion is that an effective or rather the most effective leaders in collaborative settings will be those that are adept at negotiating both sides of the spectrum. This is not seen as someone that rides the middle ground in all cases, rather that they can drift between opposite ends of the spectrum as required by the situation. Vangen & Huxham (2003) further clarify that their conception of leadership is in contrast to both the contingency and style approaches by demanding that both are “operating together at the same time” ( p. S73).
Data Analysis and Findings

In total across these six interviews, there were 68 confirmed references affiliated with the chosen eight categories. The combined frequencies and cumulative percentages of all categories are displayed in figure 1. Surprisingly, the most frequently addressed category was collaboration with transformational, trait, and skills representing similar frequencies at the next highest cluster of items.

Figure 1- Pareto Chart of Quantitative Categorical Analysis of Interviews. The dependant variable on the left is the frequency of occurrence that each of the categories (x-axis) was addressed either directly by the interviewee or via inference of the research team.

Collaboration

It was common for the participants to mention working collaboratively in teams and focusing on the relative contributions of each member. Referring to the collective democratic ways of collaboration one of the participants spoke of the following: "I do not follow the 'my
way or the highway' method of management, but much more inclusive—trying to figure out what everybody thinks is the right idea or the wrong idea or the path to pursue". While another offered:

I think in terms of the style, I like to seek consensus, I like to bring people into the process of being informed. I don’t like to be just top-down. I like to think of working with my colleagues as more collaborative, even if they are people who are reporting to me, I still like to make them feel that they are part of the process and not just receiving orders.

These collectively gave insight that in general, these leaders see themselves as member of a large collaborative team where members were prioritized and encouraged to provide emphasis along the lines of the own perceptions of strength and passion.

One of the interviews revealed that they believed “women to be more collaborative. Grew up in household with four women. No doubt there are still perceptions in the work place.” The previous statement was offered by a male whereas one of the females said “I think we can bring a lot to the leadership table because they’re seen as being more empathetic than men…..I think that they [women] are team builders more than men are.” These statements of gender differences in collaboration were interesting, albeit infrequent statements in this category.

**Transformational.**

As part of transformational theory, a supposition exists that in this dualistic process, inspiration is seen throughout and morality is increased in both the leaders and the followers. We saw evidence of both of these where one said “Uh, I really enjoy my job. I absolutely love it. And I try to get people to enjoy their jobs equally is one of my biggest challenges.” Another quote was identified which revealed “so whatever challenges there were I remedied within a
week which was to get everybody to just relax and enjoy doing their jobs.” These both speak to inspiration and elevating the general atmosphere surrounding the workplace.

Other evidence pointed to the elevation of morality in the team. As suggested by one, “You know there are lots of reasons why people aren’t honest about things, and I can understand them, but I think you need to be fair, you need to be tolerant.” A second statement to this effect endorsed the priority of loyalty: “I like loyalty, but let me explain what that means….it means I feel that I need to be loyal to my people that I serve first, before I expect them to do anything for me.” While this suggests trait theory in the identification of a positive quality along with LMX theory due the exchange of honesty between leader and follower, it also demonstrates the concept of increasing the idealized notion of loyalty throughout the organization.

Trait.

From the straightforward “I think that people are born with certain leadership styles” to the not so the contrast of positive traits, but also the negatives associated with obstruction or poor leadership performance also appeared:

Myself. My obstacles are mainly the kinds of things….baggage, personal baggage. I don’t feel, I never felt that I’ve been held down, but what I do feel is that some of my own beliefs in my own limitations, whether they are real or not, get in my way.

One of the interviewees provided the following powerful insight:

Are leaders born? I think that to a certain extent they are but I think that the characteristics that you are born with are going to determine what kind of leader you are. I think that you put anybody in the right position and they can lead- it depends on how effective they are.

Interestingly, the belief that humor was an important trait of effective leaders appeared in three of the interviews. In addition to humorous approaches and having a sense of humor, one of these same participants also said that joviality was very important in their trait based belief system. Subjectively this could also speak to one of the limitations of the study in that the
participants were selected through previous affiliation and a selection bias could have been seen here as well as throughout the data collection.

**Skills.**

Leadership being nothing more than possessing a desired set of skills which can be crafted and obtained throughout one’s life definitely resonated with our sample. While one simply said “craft can be taught” others offered multiple instances suggestive of the ability to learn skills was at play in effective leadership. One interviewee combined elements of skills, traits and authenticity all into one by offering:

> I think that you can train people for that kind of run-of-the-mill [word drowned by traffic noise] is how you do strategic planning is how you is how you [word drowned by traffic noise]. But when it comes down to, ah, when the pressure is on, I think, you know, all that stuff gets thrown out the window, you revert to what kind of person you are.

Here they spoke of the ability to train and thus adapt in alliance with skills theory while at the same time hinting that genetic traits still dominate the depths of the authentic person.

**Style.**

With a declining set of examples or occurrences, the quality and robustness of samples declines, but we were able to garner evidence that style of the leader is evident in the following citation: “I would have had to discover them and that would have taken a level of trust that would have taken some time to get to because people are naturally protective of themselves.” Furthermore, the behaviors of the leader demonstrated in this interplay of confidence and openness in the relationship that has been developed over time with the supervisor.

> You do have to be a kind of a special person, to be able to tell your boss 'What are you thinking…that’s really not the way to deal with this,' and to have...a disagreement and still maintain a professional relationship, and so I think I do that personally and I really value it in my employees when they do it.

**Contingency.**
We did observe a single point of reference to contingency theory whereby the leader or individual is selected for the proper position or environment with this offering “To me it’s all about getting the right people under you, so hiring is hugely important.”

**Situational.**

We clearly saw an instance of situational or the ability of the leader to modify their respective approach to the given situation in a model of flexibility. In the following excerpt, we see that this leader has a preference for viewing the supervisor-subordinate relationship, but is able to modify his preferred approach to meet the perceived needs of the follower.

At a certain point I instituted a regular, weekly meeting, a staff meeting even though I do not have a staff other than one. But we meet at a regular, designated time every week and that is sacrosanct and by doing that I was really able to close the door and open up more lines of communication, so that has helped. I work with an employee who is very, she is a very private person, she holds her private life close to her, it’s not something to share. I am much more willing to share my outside life. And I learned through this process learning about different styles that the way to give her direction the best way is to do it in writing. She responds best by receiving it in an email, rather than, even though our offices are nearby, rather than my going to tell her to do something.

**Transactional.**

We identified a more pronounced transactional situation where our leaders mentioned more of the removal of negatives or punishments away from the environment instead of discussing the common approach of rewarding or giving of positives in order to encourage or promote given behavioral recurrences. In this form of stimulus- response system we heard evidence of such as “you enable people” and “yeah, I guess you enable people by letting them know it’s okay to fail.” Here we have removed the negative stigma of failure giving the followers greater stimulus to try new things and in doing so create greater results. We also heard:

if you want creativity and you want hard work, you have to let people know that there is not a consequence for screwing something up. So I rarely reprimand, you know if
somebody does something wrong I rarely say “you screwed up”, you’re a bad person kind of thing, it’s more “what do you learn from that?
Conclusions and Implications

In an ever expanding world of people and information, there is no question that social means of collaboration will be taking on a greater and more mandatory role for professionals (Shirky, 2008; Tapscott & Williams, 2006). Because leadership is viewed as a process of interaction between individuals where one exercises influences others towards a common goal, it is imperative that we participate in identifying the mechanism of leadership in order to prescribe methods of improving these relationships in the vision of cooperation and efficiency.

It is clear that the field of leadership theory has moved from an egocentric perspective to one that is based in a process of social interactions between people. To date, the field is dominated by transformational leadership investigations that are undergoing constant modification and application to other fields. Collaborative efforts (that are the way of the future), such as exist across institutions of higher learning, libraries, and museums are no exception. Currently researchers in each of these areas are working to expand the current sets of generalizability for future applications.

Transformational leadership, in its current conception, concerns leaders who inspire their followers to greater outcomes and rewards than would have been possible alone. In doing so they literally transform or change the followed, the environment, and the working culture in a substantive way for indefinite time into the future. We believe this to be the central premise of interinstitutional collaboration and argue that further investigations into the traits, perceptions, and behaviors of successful leaders involved with these processes be examined. This will give a foothold into greater expansion of that which is desirable in a leader for the purpose of selection, training, and retention of the members of each collaborative network. With the largest identified categories in this analysis being collaboration and a second greatest in transformational, we are
in line with the current leanings of leadership theory that suggest that this is the most researched theory at present (Wolverton et al., 2001).

As mentioned previously one of the major limitations of this study is the selection process of these participants, and the relatively small sample size which reflects a smaller investigative power. However, in this sample of leaders representing entities of nonprofit collaborative institutions, we found a large occurrence of belief in collaborative communication and contributions from team members. A second major finding was that we sampled relatively similar instances of transformational, trait, and skills. This is not surprising and does not necessarily contradict the support for either theory. These theories, through time, can be seen as building upon the previous where in order to elicit true inspiration as suggestive of transformational leadership, the leader might possess and believe that certain traits helped in accomplishing that task, while also prioritizing behaviors that will be adjusted to suit varied situations. This can be further produced by instilling a reward system for excellence and reducing punishments and systems of coercion in line with transactional styles all while participating in workshops and training groups to encourage the awareness and adaption of additional techniques to the leadership repertoire. Perhaps this integration of approaches and philosophies is the best approach and the most taken by leaders in the collaborative next generation.

January 4, 2006

Laura Hyatt, Ed.D., Chair
Graduate and Professional School Institutional Review Board (GPS IRB)
Graduate School of Education & Psychology
6100 Center Drive
Los Angeles, CA 90045
Dear Dr. Hyatt:

I am hereby requesting my proposed study titled “Leadership Characteristics Influential Leaders” is reviewed for a claim of exemption. This is study aligned with my research interest in the area of Leadership and will be a part of my scholarly work in the next three academic years.

To facilitate the submission and review of my IRB application, the Pepperdine GPS IRB Initial IRB Checklist is followed. Enclosed, please find:

- Two (2) copies of completed IRB application for a Claim of Exemption including copies of Modified Informed Consent Form and Interview Protocol designed for the study.
- Two (2) Copies of completed Pepperdine IRB Application for Waiver or Alteration of Informed Consent Procedures.
- One (1) Electronic copy of the complete IRB package on a CD-ROM

Please also be advised that I have:

- read and will act in accordance with the ethical principles for human research protections
- not violated any copyright laws in the use of the instruments for the proposed study

No additional departmental requirements exist, as this research as I will be conducting this research as a faculty member of GSEP. As such, the “Faculty Supervisor Review” form is not applicable. Evidence of completion of human subjects training is already on file with your office. HIPAA education is not required for this study.

If I can be of any assistance, please feel free to contact me.

Sincerely,

Margaret J. Webber, Dean, GSEP
Farzin Madjidi, Professor of Leadership, GSEP

Is the Faculty Supervisor Review Form attached? Yes   No   N/A

Has the investigator(s) completed education on research with human subjects? Yes No
Please attach certification form(s) to this application.

**Investigators are reminded that Exemptions will NOT be granted for research involving prisoners, fetuses, pregnant women, or human in vitro fertilization. Also, the exemption at 45 CFR 46.101(b)(2), for research involving survey or interview procedures or observations of public behavior, does not apply to research with children (Subpart D), except for research involving observations of public behavior when the investigator(s) do not participate in the activities being observed.**

Title of Project: _Leadership Characteristics of Influential Leaders _________

1. Briefly summarize your proposed research project, and describe your research goals/objectives.

   **Leadership has been receiving more attention in the literature than most other contemporary business topics. A simple search for the word “leadership” on the two most popular online book stores, BanrsandNoble.com and Amazon.com revealed 142,200 and 178,520 leadership books available for sale, respectively. Yet the topic seems to attract more attention and absence leadership in organizations remains conspicuous.**
There are a great number of views on and definitions for leadership. Gardner and Schermerhorn (2004) describe their model, authentic leadership, as “a process that draws from both positive psychological capabilities and a highly developed organizational context which results in both greater self-awareness and self-regulated positive behaviors on the part of both leader and associates, fostering positive self-development. Hogg (2004) emphasizes the effect of social identity on leadership by stating that where group membership is situationally salient, people self-categorize into in-groups and conform to the in-group prototypes and exhibit normative behaviors. Others such as Hall (2004) emphasize self-awareness and adaptability as meta-competencies for leadership.

While these and other authors have contributed a great deal to our general understanding of this developing field, there are still a great deal of ambiguity about leadership and leaders of various fields. In particular, our existing knowledge and understanding of leadership can be improved by learning about leadership styles, assumptions and approaches in fields such as education, healthcare, non-profit and religious organizations, to name a few.

To complete the requirements for their Leadership Theory and Practice course, students in the Organizational Leadership doctoral program (OL) are required to interview influential leaders in their fields of interest. The objective of the assignment is to interact with leaders in healthcare, industry, government and education to examine their leadership styles and beliefs about leadership and developing leaders in their organizations.

As such, their assignment aims to answer the following research questions:

a. What are the common approaches and styles to leadership among leaders in various fields?

b. What are the fundamental assumptions of leaders with respect to the leadership abilities of their employees?

c. How do International leaders make decisions in their organizations?

d. What are the views of leaders with respect to women in leadership?

2. Using the categories found in Appendix B of the Investigator Manual, list the category of research activity that you believe applies to your proposed study.

This study meets the requirements for exemption under the federal regulations (45 CFR 46 - http://www.nihtraining.com/ohrsite/guidelines/45cfr46.html) that govern the protections of human subjects. Specifically, section 45 CFR 46.101(b)(2) states: (b) Unless otherwise required by Department or Agency heads, research activities in which the only involvement of human subjects will be in one or more of the following categories are exempt from this policy:
Category (2) of 45 CFR 46.101. Research involving the use of educational tests (cognitive, diagnostic, aptitude, achievement), survey procedures, interview procedures or observation of public behavior, unless: (i) information obtained is recorded in such a manner that human subjects can be identified, directly or through identifiers linked to the subjects; and (ii) any disclosure of the human subjects' responses outside the research could reasonably place the subjects at risk of criminal or civil liability or be damaging to the subjects' financial standing, employability, or reputation.

3. Briefly describe the nature of the involvement of the human subjects (observation of student behavior in the classroom, personal interview, mailed questionnaire, telephone questionnaire, observation, chart review, etc):

Leaders who agree to participate in an interview and discussion with OL students as part of their Theory and Practice of Leadership will be given a modified informed consent and will be asked if the interview might be recorded and the content may be used for this research. Participants will also be asked if they consent to their identities and the names of their organizations to be revealed in the study. An interview protocol consisting of 6 open-ended questions will be used and is attached.

4. Explain why you think this protocol should be considered exempt. Be sure to address all known or potential risks to subjects/participants.

Risk to participants in the study is minimized in the following manner:
a. Should the participants not consent to their identities and names of their organizations being used, their names and the name of their organizations will be replaced with a generic title. No other specific identifying information will be used or reported in any part of the study
b. Should the participants not consent to their identities and names of their organizations being used, the identity of participants will only be known to the researcher and this information will be destroyed at the completion of the study.
c. A modified informed consent will be sought that ensures that participation is voluntary, the participant has the right to withdraw at any part of the interview, that there are no known risks to the participant and confidentiality will be maintained, and the results of the study are available for the participant’s review at the completion of the study.

5. Explain how records will be kept.

Interviews will be taped and later converted to MP3 files and saved on Compact Disks (CDs). Content of the interviews will be transcribed. Transcriptions, coding sheets and CDs will be kept in a locked cabinet at the researcher’s residence for five years. All other records will be destroyed.

6. Yes Are the data recorded in such a manner that subjects can be identified by a name or code? If yes:

Who has access to this data and how is it being stored?
The Informed Consent form gives participants the option of allowing their identities to be used in the study. If they do not choose this option, their names will be replaced by a generic title and reference to their organization. For example, John Doe, a Chief Medical Officer at a for-profit hospital, will be referred to as a high ranking leader at a for-profit hospital. The only reference to the actual names of these participants will be on a coding sheet that will be only available to the researcher.

A “sanitized” final transcript of the interviews will be generated which will have disguised the identities of those who did not consent to have their identities revealed. This transcript will be maintained in a locked filing cabinet in the researcher’s office.

If you are using a health or mental health assessment tool or procedure, what is your procedure for referring the participant for follow-up if his/her scores or results should significant illness or risk? Please describe

Will the list of names and codes be destroyed at the end of the study? Explain your procedures.

The coding sheet containing the lists of names of participants will be destroyed at the completion of the research.

7. Attach a copy of all data collection tools (e.g., questionnaires, interview questions or scripts, data collection sheets, database formats) to this form. Be sure to include in such forms/scripts the following information:

- a statement that the project is research being conducted in partial fulfillment of the requirements for a course, master’s thesis, dissertation, etc. (if applicable)
- purpose of study
- a statement that subjects’ responses will be kept anonymous or confidential (explain extent of confidentiality if subjects’ names are requested)
- if audiotaping or videotaping, a statement that subject is being taped (explain how tapes will be stored or disposed of during and after the study)
- All recordings of the discussion will be converted to CD or DVDs and will be stored in a locked cabinet at the researcher’s home for a period of 5 years.
- a statement that subjects do not have to answer every question
- a statement that subject’s class standing, grades, or job status (or status on an athletic team, if applicable) will not be affected by refusal to participate or by withdrawal from the study (if applicable)
- a statement that participation is voluntary
Please note that your IRB may also require you to submit a consent form or an Application for Waiver or Alteration of Informed Consent Procedures form. Please contact your IRB Chairperson and/or see the IRB website for more information.

8. Attach a copy of permission forms from individuals and/or organizations that have granted you access to the subjects.

**Permission for interviews is granted directly by the participants. No other approvals/permissions from individuals or organizational are needed.**

9. **Yes** **No** Does your study fall under HIPAA? Explain below

9.1 If HIPAA applies to your study, attach a copy of the certification that the investigator(s) has completed the HIPAA educational component. Describe your procedures for obtaining Authorization from participants. Attach a copy of the Covered Entity’s HIPAA Authorization and Revocation of Authorization forms to be used in your study (see Section XI. of the Investigator Manual for forms to use if the CE does not provide such forms). If you are seeking to use or disclose PHI without Authorization, please attach the **Application for Use or Disclosure of PHI Without Authorization** form (see Section XI). Review the HIPAA procedures in Section X. of the Investigator Manual.

I hereby certify that I am familiar with federal and professional standards for conducting research with human subjects and that I will comply with these standards. The above information is correct to the best of my knowledge, and I shall adhere to the procedure as described. If a change in procedures becomes necessary I shall submit an amended application to the IRB and await approval prior to implementing any new procedures. If any problems involving human subjects occur, I shall immediately notify the IRB Chairperson.

Faculty Supervisor (if applicable):

Title of Project: _____ Leadership Characteristics of Influential Leaders

1. Please explain the purpose for the request for waiver of informed consent, or alteration of informed consent process (e.g., no written consent obtained; written consent obtained but not discussed with subjects).

   **The purpose of requesting an alteration to informed consent is to allow interview participant to send a copy of the Informed Consent form to the participants in advance of the interview date. The researcher believes this step allows participants ample time to read the form carefully in advance of the interview, thus providing an additional safeguard for them.**

2. Is the research or demonstration project to be conducted by, or subject to the approval of, state or local government officials, and designed to study, evaluate, or otherwise examine: (i) public benefit or service programs; (ii) procedures for obtaining benefits or services under those programs; (iii) possible changes in or alternatives to those programs or procedures; or (iv) possible changes in methods or levels of payment for benefits or services under those programs? Yes **No**. If yes, please explain.

3. Does the study involve procedures for which written consent is normally required outside of the research context? Please explain.

   **No.**

4. Explain why the research as proposed involves no more than minimal risk to the subjects.

   **Risk to participants in the study is minimized in the following manner:**
a. Should the participants not consent to their identities and names of their organizations being used, their names and the name of their organizations will be replaced with a generic title. No other specific identifying information will be used or reported in any part of the study.

b. Should the participants not consent to their identities and names of their organizations being used, the identity of participants will only be known to the researcher and this information will be destroyed at the completion of the study.

c. A modified informed consent will be sought that ensures that participation is voluntary, the participant has the right to withdraw at any part of the interview, that there are no known risks to the participant and confidentiality will be maintained, and the results of the study are available for the participant’s review at the completion of the study.

5. Explain why the waiver or alteration will not adversely affect the rights and welfare of the subjects.

Participants will be given full informed consent, except that the form will be sent to them in advance of the interview taking place. This step will not in any way affect the rights and welfare of subjects.

6. Explain why it is not practicable to conduct this research without a waiver or alteration of informed consent procedures:

If seeking waiver of the written documentation requirement, explain why it is not practical to get participants’ written informed consent.

7. If seeking waiver of the written documentation requirement, will the investigator provide subjects with a written statement regarding the research? Explain.

This application does not seek waiver of the written documentation.

8. If seeking waiver of the written documentation requirement, will the only record linking the subject and the research be the consent document and the principal risk would be potential harm resulting from a breach of confidentiality? Please explain.

9. If so, will each subject be asked whether the subject wants documentation linking the subject with the research, and the subject's wishes will govern? Explain.

This application does not seek waiver of the written documentation.
10. Will the subjects be provided with additional pertinent information after participation? Explain.

Should the results of the study be accepted for public dissemination, a copy of the study will be provided to the participant, upon their request.

11. Have all personnel who will participate in the activity/project been trained in all required policies and procedures relating to research protections for human subjects/participants? Please explain.

The interview questions will be asked only by Pepperdine University students and faculty who have completed IRB training.

In signing this form, the investigator warrants that s/he will protect the information accessed as described, cannot practicably conduct the research without a waiver (or alteration to standard practices) of informed consent, and cannot practicably conduct the research without a waiver.

Appendix D - Interview Request (Participant Recruitment Form)

Hello. My name is Professor Todd C. Shoepe of Loyola Marymount University. I am also a doctoral student in Educational Technology at Pepperdine University’s Graduate School of Education and Psychology. I am conducting a study on leadership of inter-institutional collaborations.

You have been carefully selected to participate in the study. Participation in the study is voluntary and confidentiality and anonymity are maintained to your satisfaction. Participation entails an approximately 45-60 minute interview. Questions asked in the interview and an informed consent form will be sent to you in advance of the interview. Your participation in this study will be extremely valuable to new and aspiring executives in institutional collaboration as well as other scholars and practitioners in the field.

I would like to ask if you would be willing to be interviewed as part of this study.

Myself and my colleagues greatly appreciate your time and consideration of this matter in light your extremely busy schedule.

Sincerely,

Todd C. Shoepe MS, CSCS, ACSM-HFS
Clinical Professor
Department of Natural Science
Loyola Marymount University

Office: North Hall 201 Mailing Address: 1 LMU Drive, MS 8160 Los Angeles, CA 90045-2659 Phone: 310-338-7825 Fax: 310-338-7882
Appendix E - Informed Consent

The following information is provided to help you decide whether you wish to allow us to use the information we gain in our conversation with you today in our research and scholarly work at Pepperdine University.

The purpose of our conversation today is to learn about your leadership characteristics, style and decision making. This study will allow us, and those who read our research, to gain a better understanding of leadership styles and approaches of leaders. In order for me/us to use what we learn from you today in our research and publications, our University requires that I/we read to you the following statement and ask for your permission. I would like to ask you if you would agree with one of the following to arrangements:

___________ I agree to permit the researcher to use my name, (please initial) professional affiliation and the name of my organization.

I understand that prior to submission of this research for publication; I will receive a copy of the manuscript and review it for two weeks. I may then request revisions to any quotes/information directly attributed to me. If the researcher cannot accommodate my request, the researcher will then delete my name, professional affiliation, name of my organization, and any other pertinent identifying information related to me and simply refer to me by a pseudonym and my organization as a “generic organization”, e.g., Dr. Jones, President of medium size community college.

OR

___________ I agree to permit the researchers to refer to me (please initial) only by a pseudonym from a “generic organization.” I understand my identity and the name of my organization will be kept confidential at all times and in all circumstances any research based on this interview is presented.

In either case, you should be aware that your participation in this study is voluntary. You are free to decide not to participate or to withdraw at any time without affecting your relationship with me/this group or Pepperdine University or ______________. Upon your request, I will provide a copy of any published papers, dissertations or professional presentations that take place as a result of this interview.
Appendix E - Informed Consent

With your permission, I will be recording this interview. Please feel free to ask us to stop or resume taping this discussion at any point in our conversation. Your name, your position and the name of your organization will be kept confidential at all times and in all of our research. May I record this interview?

Please feel free to ask any questions about this study before we begin or during our conversation. If you have any additional questions, please feel free to contact Dr. Farzin Madjidi, Principal Investigators at 310-568-5726 or (fmadjidi@pepperdine.edu), or Dr. Doug Leigh, Chairperson, GPS Institutional Review Board at 310-568-5600 or Dleigh@pepperdine.edu

At this point, I am required to ask you if you fully understood my statements and if so, to initial next to the category that applies to you and sign this form.

______________________________    ________________
Researcher’s Signature      Date

______________________________    ________________
Investigator’s Signature      Date
Appendix F - Interview Protocol

1. Tell me a little about your career
2. What were some of the obstacles you have faced in your career?
3. How would you describe your leadership style?
4. What leadership characteristics do you value in your employees?
5. What challenges do you face in your day-to-day dealings with your employees?
6. Describe to us your decision-making process. For example, when your staff brings to your attention a problem, how do you go about selecting a solution?
7. What role do you see women playing in leadership and what advantage or disadvantages do women face in leadership positions?
The benefits of peer review have been well documented in both first language (L1) and second language (L2) writing literature, but concerns have been frequently raised about the effectiveness of peer review in the context of L2 writing, particularly in English as a foreign language (EFL) due to a variety of reasons such as cultural differences, students’ limited language proficiency, their lack of knowledge of the English rhetorical conventions, and their unfamiliarity with peer review activities. In response to these concerns, this study examines the applicability of peer review in the context of an EFL Academic writing course where peer review is an emerging but not well-established practice. Using a qualitative case study approach, this study explores the researcher-teacher’s three–semester experiences while implementing peer review in an Academic writing course at a Korean university. Data include the teacher’s reflective journals, and students’ journals, feedback, drafts and revisions. By analyzing these multiple data sources, this study presents an in-depth description of the challenges the teacher encountered, the solutions he came up with, and the perceptual changes of peer review he went through. Based on the findings, this paper discusses pedagogical implications of using peer review and suggests the ways to improve using peer review in an EFL context, Korea.
A Needs Analysis: Differing Perspectives.

Brian Shoen
Lecturer
Kanda University of International Studies, Japan
M.A. in Second Language Studies
Department of Second Language Studies
University of Hawai’i at Manoa

This presentation will discuss the findings of a broad-scale needs analysis, conducted at a Japanese university, which incorporated the perspectives of four diverse stakeholder groups. The study participants included Japanese university administrative staff and faculty, native English-speaking instructors, senior-level Japanese university students, and recruiters from domestic companies looking to employ graduates with foreign language skills. The project was undertaken to evaluate the suitability of the current English-language curriculum and inform the future direction of the program. It focused upon the extent to which our current curriculum was preparing students for entry into the job market.

The study was motivated by the following research questions:

- What English language-related knowledge and skills are beneficial for Japanese university students entering the job market?
- What non-language-related knowledge and skills are beneficial for Japanese students entering the job market?

The project employed a mixed-method approach (i.e. structured and semi-structured qualitative interviews, computer- and paper-based questionnaires) that allowed for the collection of a broad range of data. This was deemed necessary given the diversity of the stakeholders participating and the difficulties associated with accessing members of each group. Results will be presented from each group independently to be followed by a cross-group comparison focusing on significant areas of overlap and divergence. Finally, implications and directions for potential further research will be discussed.
TITLE: Attachment trauma and loss: An examination of university students’ responses to stress and coping

Arwen Franquez, M.A.    Stephen W. Kane, Ph.D.
University of Guam    M.A. in Counseling Program, University of Guam
P.O. Box 505    UOG Station
Hagatna, GU 96932    Mangilao, GU 96923
poetacaecus@yahoo.com    stoppinger@hotmail.com

One hundred eighty five freshmen at the University of Guam participated in this study to examine the prevalence of loss they had experienced in the previous year, the level of stress related to the loss, and specific coping strategies they used to manage the loss.

While the intent of this study was to replicate Rheingold’s (2004) establishment of baseline frequencies of loss experienced by adolescents on the mainland United States, this study focused only on young adults within the age range of 18 to 22 in this region of the world. This study likewise broadened Rheingold’s examination of loss to include the elaboration of various categories of family loss which are defined in this study as attachment traumas (Kane, 2005).

The prevalence of loss was examined with the use of the Life’s Challenges Questionnaire (Franquez & Kane, 2009) which is a modified version of the Family Crisis Scale (Kane, 2005). The Questionnaire elicits responses to the experience of loss within the perspective of the family, or attachment traumas, which include: the family moves, someone in the family experiences a developmental conflict, a family member loses financial security, a threatening illness, threats of separation, a divorce or abandonment, terminal illness and loss of the family member. The Questionnaire also added two other variables, death of a friend and breakup of a significant relationship.

The rank order of loss for this sample included: 1) break up a relationship, 2) developmental distress of a family member, and 3) loss of financial security. And while results indicated that females reported higher responses to stress than males, the stress levels of attachment traumas for this sample of young adults in their first or second year of university ranked “threatening illness” and “terminal illness” as more serious than the western mainland rank order of “threats of dissolution of the family” and “dissolution of the family”.

Finally, coping strategies for dealing with stress revealed that this sample of young adults preferred alternating patterns of “being alone” or “being with friends” regarding their experiences of loss vis a vis break up a relationship, death of a friend and family attachment traumas. An understanding of these results are discussed from an ethno-specific perspective and a case is made for appreciating these young adult university students as an understudied population of grievers in this region of the world. Recommendations are suggested for supplemental student affairs programming to raise entering student’s awareness of these complicating adjustment factors and for providing supportive counseling services.
9th Annual Hawaii International Conference on Education
January 4-7, 2011
Honolulu Hawaii, USA

TITLE: “The Path to Cultural Competence for Pre-service Teacher Candidates, focus on Islam.”

TOPIC AREA: Teacher Education, Social Studies Education

PRESENTATION FORMAT: This will be a presentation of a Power Point and Paper Session of research about attainment of cultural competence, knowledge about, skills to teach, and dispositions about Islam.

NAME OF THE AUTHOR: Leah G. Stambler, Ph.D.

DEPARTMENT & AFFILIATION: Education and Educational Psychology Department, Western Connecticut State University [WCSU]

MAILING ADDRESS: 1785 Litchfield Turnpike
Woodbridge, CT 06525, USA

E-MAIL: stamblerl@wcsu.edu, leahgreenbean@aol.com

PHONE NUMBER: 203-389-4323

FAX NUMBER: 203-837-8413

CORRESPONDING AUTHOR: Same as lead author listed above
Abstract:

Teacher Educators have the responsibility to lead their pre-service teacher candidates to prepare themselves to be culturally competent in the K-12 classrooms. There are an ever increasing number of people in the American population who are of the Muslim faith, and whose children attend public schools, charter schools, and/or are home schooled. Appropriate educational grounding for teachers is critical in the American multiethnic society. It is important for pre-service teacher candidates to address multicultural situations and look at their K-12 students with a variety of perspectives that allow the teachers to apply their knowledge, skills, and dispositions to teach their courses in an even handed manner. The pre-service teacher candidates need to develop culturally competent and responsive attitudes and techniques to teach an increasing diverse student population that includes Muslim K-12 students.

Section One Introduction

RATIONALE FOR CHOOSING THE TOPIC

The author is responsible for infusing diversity issues and curriculum content about multicultural, global, and comparative education into the courses that she teaches at Western Connecticut State University, in Danbury, Connecticut. The pre-service teaching candidates will be teaching History, Geography, Social Studies, Language Arts, Mathematics, Biology, and Cultural issues in their own classrooms after graduation from college/university.

It is important for the pre-service teacher candidates to address multicultural situations and look at their K-12 students with a variety of perspectives that provide them with the knowledge, skills, and dispositions to teach their courses in an even handed manner. Also, the pre-service teacher candidates need to develop culturally responsive attitudes and techniques to teach an increasing diverse student population that includes Muslim K-12 students.

Pre-service teacher candidates need to see themselves as American citizens with global understandings about various societies. Given the contemporary concerns about homeland security since September 11, 2001, and American involvement in Afghanistan, Iraq, and other Middle Eastern states with predominantly Muslim populations, it is vital that pre-service teacher candidates have the opportunity to become culturally competent about the knowledge, skills, and dispositions related to Islam the religion, Muslim society, and Islamic culture.

The author has a major responsibility to her students to lace her courses with the knowledge, skills, and dispositions about Islam that will assist her students with achieving the objective of cultural competence about Islam. The course description and students' learning requirement in one of the professional semester courses taken by Secondary Education students exemplifies this principle.
ED 440 Integrating Language: A literature based approach to the teaching of language arts across the K-12 curriculum, including an understanding of literary values, elements, and genres. Classics and content area texts will be used to enhance listening, writing, spelling, drama, and debate. The study of linguistic variations will provide methods for meeting the needs of special as well as culturally diverse students. The K-12 curriculum requires quality literature to transmit the values of society to the future citizenry. A language arts program allows teachers to go beyond speaking, writing, and reading to integrating language, literature, and composition. A required literature based language arts course for certification is necessary to promote reading throughout the content areas in K-12 curriculum.

STUDENTS‘ REQUIREMENT: Creation of a curriculum module that must include: cultural diversity perspectives [global, multicultural]; character and civic education perspectives, presence of the integrated language approach; activities representative of lower and higher order thinking skills; examples of how to read/write/study techniques; assessment techniques using rubrics/portfolios; and, techniques for teaching students with limited English skills/ELLs. Problem based learning should be included in the lessons. The use of technology in teaching the module and in students' activities should be present. Include the print out of a power point presentation. The module must adhere to discipline specific aspects of the CSDE Curriculum Frameworks and to the CSDE Common Core of Learning

THE PROBLEM STATEMENT

There are an ever increasing number of people in the American population who are of the Muslim faith, and whose children attend public schools, charter schools, and/or are home schooled. These children are part of the future adult citizenry of the United States. All American students need to be well versed in what it means to live in, be loyal to, and protect the American representative pluralistic democracy. In addition, acceptance of various creeds and respectful interaction among America’s various populations are important to the continuous operation of the Constitutional principles upon which this nation was founded and has expanded.

Appropriate preparation for the instructors of K-12 and university students is critical in the American multiethnic society. It is necessary for the author, a Teacher Educator, to have cutting edge information to infuse in her courses in order to maintain a high level of preparation for her students as they move into the teaching profession. It is the author’s responsibility to equip her students to teach all students of multiple ethnic and religious backgrounds and prepare pre-service teacher candidates to be culturally competent or –Culturally Skilled Educators.―

Each of the courses that the author teaches requires the students to write a position statement about how they intend to become –Culturally Skilled Educators.― This requirement is due after the author instructs her students about the pluralistic nature of American society and its impact on the nation’s system of schooling. The author includes in her instruction a variety of resource materials, opportunities for discourse, and interactive lessons about the history of immigration, historic –victimized” ethnic and religious groups, and the Constitutional push for equal access to education in the
United States. It is the author’s intent to prepare and apprise her students that it is their responsibility to include Moslem students and Islam in their position statements about becoming culturally competent. This position statement only represents one of the many ways that pre-service teaching candidates may bolster their cultural competence about Islam and Muslims.

Many research questions may be posited about cultural competence for educators. These questions will follow and will form the data portion of this paper, with the “Work in Progress” collection of readings and activities based on those readings. All questions will converge toward the topic of “What is the path to cultural competence for pre-service teacher candidates, with a focus on Islam?”

**Section Two [Selected] Review of Literature:**
[to be added with the next iteration of this piece]

**PRELIMINARY RESEARCH QUESTIONS:**

1. What is culture?
2. What is cultural proficiency?
3. What is cultural competence?
4. How does the review of literature about cultural competence inform Teacher Educators?
5. Why is cultural competence important for teachers?
6. Issues related to teaching cultural competence in higher education
7. How do we teach for cultural competence and which “tools” may be used to teach cultural competence in higher education?
8. What are some of the issues faced by Muslim students in a non-Muslim nation?
9. How can a teacher understand his/her own sensitivity and level of cultural competence?
10. What does a teacher have to do to be culturally competent and responsive?
11. What is a culturally competent K-12 curriculum?
12. How is cultural competence integrated into Education?
13. What are some examples of knowledge about Islam, skills of teaching about Islam, and dispositions about Islam that are necessary to incorporate in pre-service teacher candidate courses?

**Section Three Analysis of Data and Findings**
[Responses to the Preliminary Research Questions will be answered in this section for the actual 9th HICE 2011 presentation]

[Sample readings about cultural competence and Islam, with corresponding directions for pre-service teacher candidates’ activities, are included in this “Work in Progress” section for the 9th HICE Conference presentation, and inclusion in the 9th HICE Proceedings.]

See the Table of Contents, readings, and activities to be included in the manual.

**NOTE:** THIS FIRST COLLECTION OF READINGS AND ACTIVITIES DESIGNED TO ASSIST STUDENTS WITH THEIR PATH TO CULTURAL COMPETENCE IS A WORK IN PROGRESS THAT WAS

Section Four Summary

Brief Reiteration of Research Questions [to be added with the next iteration of this piece]

Concise Description of Findings and Limitations [to be added with the next iteration]

Teaching and Cultural Competence

By Gloria Ladson-Billings

THE TEACHER SHORTAGE

One of the current concerns plaguing the nation's schools is how to find teachers who are capable of teaching successfully in diverse classrooms. Although teacher education programs throughout the nation purport to offer preparation for meeting the needs of racially, ethnically, culturally, and linguistically diverse students, scholars have documented the fact that these efforts are uneven and unproved.

Several factors interfere with the ability of teacher education programs to prepare teachers for diverse classroom settings. One factor that is rarely discussed in the literature is that most of the teacher education faculty are white. As I said earlier, there are approximately 35,000 faculty in the United States; 88 percent of the full-time education faculty are white; 81 percent are between the ages of 45 and 60 (or older). These numbers alone do not prove anything about the ability of the teacher education faculty. However, they may cause us to wonder about the incentive of teacher education programs to ensure that all of its graduates are prepared to teach all students.

WHAT DIVERSITY MEANS TODAY

The diversity that today's new teachers face is qualitatively different from what I faced as a new teacher in the late 1960s. My students were clearly differentiated by their ethnic, cultural, religious, and racial differences during a time when such differences seemed more consequential; today, notions of diversity are broader and more complex. Not only are students likely to be multiracial or multiethnic, but they are also likely to be diverse along linguistic, religious, ability, and economic lines that matter in today's schools.

The "success" of the 1960s Civil Rights Movement helped to create an African-American middle class with experiences and backgrounds different from their brothers and sisters who remained in the old neighborhoods. Indeed, changes in the economy and political climate created an African-American underclass that is less trusting of schools and education. Urban centers began to serve growing numbers of immigrant students from Mexico, Central America, and Southeast Asia. The working-class, ethnic neighborhoods of the 1960s knew nothing of the scourge of drugs like crack cocaine or diseases like AIDS. The industrial economy of the 1960s meant that there was plenty of work for people with high school diplomas and even less education. Homelessness was a condition left to indigent men who
struggled with drugs and alcohol, not to families with school children. In addition to the problems the students experience in their personal lives away from school, the schools create a whole new set of problems for children they deem different. As schools become more wedded to psychological models, students are recruited into new categories of pathology. Students who do not conform to particular behavioral expectations may be labeled "disabled" in some way, that is, suffering from attention deficit disorder, emotional disability, or cognitive disabilities. Students do in fact confront real mental and emotional problems, but we need to consider the way students' racial, ethnic, cultural, linguistic, and socioeconomic characteristics are deployed to make their assignments to these disability categories more likely.

WHAT TEACHING WELL MEANS TODAY
Who are the teachers capable of transcending the labels and categories to support excellence among all students? Martin Haberman calls them star teachers; I call them dreamkeepers. But in both my work and that of Haberman, we have identified experienced teachers who knew how to teach well in challenging circumstances. Teaching well, in this instance, means making sure that students achieve, develop a positive sense of themselves, and develop a commitment to larger social and community concerns.

Such teachers are inspiring and admirable, but their ranks are decreasing with each passing school year. The question facing most urban school districts is how to ensure a faculty of effective teachers when there is high teacher turnover and relative inexperience.

One issue is that new teachers are the more vulnerable professionals in schools; they need to be nurtured and supported in the profession. They expect — and should receive — well-planned and implemented professional development that helps them learn about their work as they make those first, tentative steps in the profession. Knowing that new teachers need support and providing such support are two very different things. In an attempt to make a more seamless transition between preservice and inservice, my colleagues and I developed a program for college graduates who have expressed a desire to teach school in communities serving diverse racial, ethnic, and socioeconomic populations. We called the program Teach for Diversity or TFD.

THE IMPORTANCE OF CULTURE
The average white teacher has no idea what it feels like to be a numerical or political minority in the classroom. The persuasiveness of whiteness makes the experience of most teachers the accepted norm. White teachers don't understand what it is to "be ashy" or to be willing to fail a physical education class because of what swimming will do to your hair. Most white teachers have never heard of the "Black National Anthem," let alone know the words to the song. Most have never tasted sweet potato pie or watched
the intricate process of hair braiding that many African-American girls (and increasingly boys) go through. And although African-American youth culture has become increasingly popular, and everyone can be heard saying, "You go, girl!" and belies she has the right to sing the blues, the amount of genuine contact these people have with African Americans and their culture is limited.

Similarly, the growing Latino population has forced a change in popular culture. Ricky Martin, Christina Aguilera, and Enrique Iglesias are enjoying huge popular success. But most white teachers cannot speak even rudimentary Spanish — enough even to signal an emergency or satisfy a basic need. More disturbing is the way Latinos are racialized into a unitary category. Few teachers (and prospective teachers) know the distinctive histories of Mexican Americans, Puerto Ricans, Cuban Americans, Salvadorans, Guatemalans, Peruvians or the countless groups who originate in the Spanish-speaking Americas.

The indictment is not against the teachers. It is against the kind of education they receive. The prospective teachers with whom I have worked generally express a sincere desire to work with "all kinds of kids." They tell me that they want to make sure that the white children they teach learn to be fair and to get along with people different from themselves. But where is the evidence that the prospective teachers can get along with people different from themselves? When asked, most of my students admit that they have never gone to a movie or shared a meal or visited the home of a peer who is racially or culturally different. Some, because of program requirements or their own faith commitments, have worked in a soup kitchen or shelter or in other "helping" roles with people different from themselves. But these brief forays into the lives of "others" often serve to cement the impression that others are always needy and disadvantaged. "Helping the less fortunate" can become a lens through which teachers see their role. Gone is the need to really help students become educated enough to develop intellectual, political, cultural, and economic independence. Such an approach to teaching diverse groups of students renders their culture irrelevant. There is nothing there to be learned, let alone built upon and developed. Certainly, every group has some "worthies" like Martin Luther King, Jr. or César Chávez, but even these cultural heroes have become sanitized to meet normative standards. Students are encouraged to be like (Martin Luther King, Jr., César Chávez, Sojourner Truth, Dolores Huerta, and so on) because they were "good Americans."

Rarely are students invited to learn about the way such people stood up to America (not just to a "few bad people") and demanded that the country live up to its own democratic rhetoric.

Culture is a complex concept, and few teachers have an opportunity to learn about it. Most teacher education programs are founded on the social science discipline of psychology (and some sociology). Rarely do prospective teachers examine education through the discipline of anthropology. And although it is important for teachers to understand their
students' culture, the real benefit in understanding culture is to understand its impact on our own lives. Thus, the TFD program was interested in helping prospective teachers look at the way their cultural background influences and shapes the way they understand and act in the world.

**NOTIONS OF WHITENESS**

Helping students become culturally competent is not an easy task. First, it requires that teachers themselves be aware of their own culture and its role in their lives. Typically, white middle-class prospective teachers have little or no understanding of their own culture. Notions of whiteness are taken for granted. They rarely are interrogated. But being white is not merely about biology. It is about choosing a system of privilege and power. The white ethnic students in my first teaching job called themselves Italian or Irish or Polish. Their working-class backgrounds made it difficult, if not impossible, for them to identify with whiteness. In our current society, people with ethnic and cultural identities often find themselves choosing whiteness over those identities. Such a choice comes at a cost.

I gave a lecture at a local community college when a young man approached me at the end of the question-and-answer period and said, "You said a lot about Native American history and African-American history and Asian-American history, but what about white history—what about my history?"

I followed up with a question that seemed to startle the young man "Are you white?" I asked. "Or do you have an ethnic or cultural heritage other than white?" He responded by saying, "I'm Irish." I then began to tell him about some of the aspects of Irish history—how the Irish were the first group the British exploited for slave labor in the Americas. I told him about the intricate clan structure the Irish had developed that allowed them to hold land in common and prevent exploitation. The young man knew nothing of this. I was not surprised. I suggested that he did not know his history because, somewhere along the line, his family may have chosen whiteness over all else. And when one chooses whiteness as a primary identity, one's ethnic and cultural history disappears. All he has left to signal his existence is something about a potato famine and St. Patrick's Day.

It would be simplistic and wrong to suggest that cultural and ethnic identities are fixed and discrete. Few Americans have a pure heritage or identity. But the customs and traditions we observe, the people with whom we associate, and the ideas we cultivate all shape our identities; in a society that places such priority on racial identity, we are naive if we attempt to ignore race. Indeed, ignoring race may prove to be a dangerous decision for some.

Teachers who are prepared to help students become culturally competent are themselves culturally competent. They do not spend their time trying to be hip and cool and "down" with their students. They know enough about students' cultural and individual life circumstances to be able to communicate well with them. They understand the need to study the
students because they believe there is something there worth learning. They know that students who have the academic and cultural wherewithal to succeed in school without losing their identities are better prepared to be of service to others; in a democracy, this commitment to the public good is paramount.

EXCERPTS FROM
CULTURAL COMPETENCY:
WHAT IT IS AND WHY IT MATTERS

This brief, prepared by California Tomorrow, was part of a convening of grantees that the Lucile Packard Foundation for Children's Health held on Thursday, Dec. 7, 2006.

By Laurie Olsen, Jhumpa Bhattacharya and Amy Scharf

What is Cultural Competency? P.3
Cultural competency is the ability to work effectively across cultures. For individuals, it is an approach to learning, communicating and working respectfully with people different from themselves. Culture can refer to an individual’s race, class, gender, sexual orientation, religion, immigration status and age, among other things. For organizations, cultural competency means creating the practices and policies that will make services more accessible to diverse populations, and that provide for appropriate and effective services in cross-cultural situations.

What is Culture? PP.4-5
Cultural competency begins with understanding “culture.” Culture encompasses all the learned beliefs, traditions, language, values, customs, rituals, manners of interacting, forms of communication, expectations for behaviors, roles and relationships commonly shared among members of a particular group, and often transmitted from generation to generation. It shapes experiences, large and small – the ways parents discipline their children, the structure of family relationships, expectations of what it means to be a boy or a girl, values about health and approaches to healing, body language, what types of things get said and what types go unspoken. All of these define how things are supposed to be for the members of a given culture. They become, for that group, the “norm,” and feel so natural that they often become unconscious and invisible to people within that culture.

- Everyone has a culture. It is core to their identity, behavior and perspectives on the way the world works and should be. In fact, everyone lives as part of multiple cultural spheres: ethnic, religious, class, gender, race, language, and others. Culture is not just the group a person is born into. It is possible to acquire a new culture by moving to a new country or region, for example, or by a change in economic status, or by becoming disabled. (University of Kansas’ Community Tool Box, http://ctb.ku.edu.)
There is diversity within cultures. While two people may both be Latinos with parents from Mexico, for instance, a religious Catholic daughter of professionals who lived in Mexico City will have very different cultural norms and perspectives from the son of an indigenous farmer who spent early years in a very poor rural area.

Cultures are not static. They grow and evolve in response to new circumstances, challenges and opportunities. The ways of being female learned by young girls in South Asian culture, for example, have changed from one generation to another, and as people have moved from place to place.

Culture is not determinative. Different people take on and respond to the same cultural expectations in different ways. Assumptions therefore cannot be made about individuals based on a specific aspect of their cultural experience and identity.

Cultural “differences” are complicated by differences in status and power between cultures. When one cultural group has more power and status, the norms of that culture permeate the institutions of society as the “right” way. Cultures of less status and power become seen as “other,” or even deviant and deficient. In addition to understanding cultural norms and experiences, service providers and professionals in agencies that work with diverse populations need to be aware of these kinds of cultural biases, both as they play out in the lives of communities, and as they affect the practices and policies of organizations.

“Everyone has a culture, and it is core to their identity, behavior, and perspectives on the way the world works and should be.”

this involves ongoing learning – about one’s own responses and about the cultures of others – and then changing responses to situations based on that learning. Central to this is becoming aware of one’s own culture, position in society, and assumptions. This may be through learning family history, reading about the history of one’s heritage, and observing carefully what kinds of things seem natural and what seems “different” or “uncomfortable.” Often, it is the moments when a person is tempted to judge negatively the behaviors of people who are different from them that provide clues to their own cultural assumptions or biases. In addition to learning about one’s own culture, it also is important to learn about the history of different cultural groups in the communities served – where they came from, when they came, and why they came – by asking people, by reading, by seeking out community events. And it is important to learn about the history and dynamics of power that have shaped and continue to affect the relationships between cultural groups – both within organizations and in the broader society. Key to all this is developing the skills of listening carefully, observing without judgment, and recognizing that one person’s way of doing things is not the only way – or the best way – it can be done. Attitudes that contribute toward cultural competency also include empathy, comfort with differences, self awareness and reflectiveness, flexibility, and an appreciation of multiple perspectives.

Resources on Cultural Competency

Working Definition of Cultural Competency

Cultural competence is based on a commitment to social justice and equity.

Culture refers to integrated patterns of human behavior that include the language, thoughts, communication, actions, customs, beliefs, values, and norms of racial, ethnic, religious, or social groups.

Cultural competence is a developmental process occurring at individual and system levels that evolves and is sustained over time. Recognizing that individuals begin with specific lived experiences and biases, and that working to accept multiple world views is a difficult choice and task, cultural competence requires that individuals and organizations:

a. Have a defined set of values and principles, demonstrated behaviors, attitudes, policies and structures that enable them to work effectively in a cross-cultural manner.

b. Demonstrate the capacity to 1) value diversity, 2) engage in self-reflection, 3) facilitate effectively (manage) the dynamics of difference, 4) acquire and institutionalize cultural knowledge, and 5) adapt to the diversity and the cultural contexts of the students, families, and communities they serve, 6) support actions which foster equity of opportunity and services.

c. Institutionalize, incorporate, evaluate, and advocate the above in all aspects of leadership, policy-making, administration, practice, and service delivery while systematically involving staff, students, families, key stakeholders, and communities.

The Oregon Department of Education's working definition of cultural competency was created at the May 2004 Summit by a diverse group of education stakeholders throughout the state. We welcome any feedback on this definition. Please send comments to Cultural.competency@ode.state.or.us.

PP. 47-50 APPENDIX B Intercultural Sensitivity Scale Teacher Survey

Part A: Instructor Information

In what department do you teach? __________________________

What level do you teach? Graduate_____ Undergraduate____

Are you an ESL instructor? Yes____ No____

Approximately how many students do you teach each semester? ______________

Were you born in the United States? Yes____ No____ If no, where were you born? ______________

My Gender: Male_____ Female_____

Part B: Use the following key to circle the appropriate letters.

SA: If you strongly agree with the statement.

A: If you agree.

U: If you are uncertain.

D: If you disagree.

SD: If you strongly disagree.

1. I enjoy interacting with people from different cultures. SA A U D SD

2. I think people from other cultures are narrow-minded. SA A U D SD

3. I am pretty sure of myself in interacting with people from different cultures. SA A U D SD

4. I find it very hard to talk in front of people from different cultures. SA A U D SD

5. I always know what to say when interacting with people from different cultures.

   SA A U D SD

6. I can be as sociable as I want to be when interacting with people from different
cultures.

7. I don't like to be with people from different cultures. SA A U D SD

8. I respect the values of people from different cultures. SA A U D SD

9. I get upset easily when interacting with people from different cultures. SA A U D SD

10. I feel confident when interacting with people from different cultures. SA A U D SD

11. I tend to wait before forming an impression of culturally-distinct counterparts. SA A U D SD

12. I often get discouraged when I am with people from different cultures. SA A U D SD

13. I am open-minded to people from different cultures. SA A U D SD

14. I am very observant when interacting with people from different cultures. SA A U D SD

15. I often feel useless when interacting with people from different cultures. SA A U D SD

16. I respect the way people from different cultures behave. SA A U D SD

17. I try to obtain as much information as I can when interacting with people from different cultures.

SA A U D SD

18. I would not accept the opinions of people from different cultures. SA A U D SD

19. I am sensitive to my culturally-distinct counterpart's subtle meanings during our interaction.

SA A U D SD

20. I think my culture is better than other cultures. SA A U D SD

21. I often give positive responses to my culturally different counterpart during our interaction.

SA A U D SD

22. I avoid those situations where I will have to deal with culturally-distinct persons.
SA A U D SD

23. I often show my culturally-distinct counterpart my understanding through verbal or nonverbal cues.

SA A U D SD

24. I have a feeling of enjoyment towards differences between my culturally distinct Counterpart and me.

SA A U D SD

Skilled Dialogue

Strategies for Responding to Cultural Diversity in Early Childhood

By Isaura Barrera, Ph.D., with Robert M. Corso, Ph.D., and Dianne Macpherson, MSW, CISW

Learn the essentials of Skilled Dialogue,

including suspending judgment;

appreciating other beliefs and value systems;

tuning in to each family’s hopes, dreams, and definitions of “success”; and

reframing differences between practitioners and families as complementary rather than contradictory.

What Three Qualities Characterize Skilled Dialogue?

Excerpted from Chapter 4 of Skilled Dialogue: Strategies for Responding to Cultural Diversity in Early Childhood, by Isaura Barrera, Ph.D., with Robert M. Corso, Ph.D., and Dianne Macpherson, MSW, CISW

“In interactions across diverse cultural parameters, three qualities are key to determining whether interactions can be described as skilled or unskilled: respect, reciprocity, and responsiveness.”

USE THIS FRAMEWORK WHEN THINKING ABOUT AND WRITING HOW YOU PLAN TO
BECOME A CULTURALLY COMPETENT/SKILLED EDUCATOR
APPLY YOUR POSITION STATEMENT TO WORKING WITH STUDENTS WHO ARE
MUSLIMS

I. What goals do you have for teaching culturally diverse populations? Why? How will you
achieve those goals?

II. What awareness do you need to have about your own assumptions, values,
and biases? Why? What do you need to do to be
* aware of your own cultural heritage & valuing/respecting differences
* aware of your own values and biases and how they may affect your culturally diverse students
* comfortable with differences that exist between yourself and your students [in terms of
  ethnicity and beliefs]
* sensitive to circumstances that may dictate referral of the culturally diverse student to a
  member of his/her own culture or to another educator
* aware of and acknowledge your own racist attitudes, beliefs, and feelings

III. What understanding of your culturally different students' world view do you need to have?
Why? What do you need to do to
* possess specific knowledge and information about the particular group with which you are working
* have a good understanding of the sociopolitical system's operation in the
  United States with respect to its treatment of culturally diverse populations
* be aware of institutional barriers that prevent culturally diverse populations from
  accessing and using educational services

IV. What appropriate intervention strategies and techniques do you need to develop to have an
approach that is truly nondiscriminatory? Why? What do you need to do to
* generate a wide variety of verbal and nonverbal responses
* send and receive both verbal and nonverbal messages accurately and appropriately
* exercise institutional intervention skills on behalf of your culturally diverse student when
  appropriate
* be aware of your teaching style, recognize your limitations, and anticipate the impact
  upon your culturally diverse client

HISTORICAL CONTEXT OF ISLAM AS A RELIGION and POLITICAL POWER

MODIFIED TIMELINE OF ISLAM

From Teachers’ Guide for Frontline video – Muslims”

The start of Islam is marked in the year 610, following the first revelation to the prophet Muhammad at the age of 40. Muhammad and his followers spread the teachings of Islam throughout the Arabian peninsula. Soon after the death of the prophet Muhammad, there were military expeditions, called "futuhat," or literally "openings," into what is now Egypt and other parts of North Africa. In other parts of the world, Islam spread through trade and commerce. The following is a brief timeline that highlights some of the major occurrences in Islam's development, as well as the geographical spread of Islam to some of the countries featured in the film.

570 C.E. Muhammad is born in Mecca. He comes from a noble family and is well-known for his honesty and upright character.

Late 600s Ruling classes in East and West Africa convert to Islam.

610 C.E. According to Muslim belief, at the age of 40, Muhammad is visited by the angel Gabriel while on retreat in a cave near Mecca. The angel recites to him the first revelations of the Quran and informs him that he is God's prophet. Later, Muhammad is told to call his people to the worship of the one God, but they react with hostility and begin to persecute him and his followers.

622 C.E. After enduring persecution in Mecca, Muhammad and his followers migrate to the nearby town of Yathrib (later to be known as Medina), where the people there accepted Islam. This marks the "hijrah" or "emigration," and the beginning of the Islamic calendar. In Medina, Muhammad establishes an Islamic state based on the laws revealed in the Quran and the inspired guidance coming to him from God. Eventually he begins to invite other tribes and nations to Islam.

630 C.E. Muhammad returns to Mecca with a large number of his followers. He enters the city peacefully, and eventually all its citizens accept Islam. The prophet clears the idols and images out of the Kaaba and rededicates it to the worship of God alone.

633 C.E. Muhammad dies after a prolonged illness. The Muslim community elects his father-in-law and close associate, Abu Bakr, as caliph, or successor.

638 C.E. Muslims enter the area north of Arabia, known as "Sham," including Syria,
Palestine, Lebanon and Iraq.

**641 C.E.** Muslims enter Egypt and rout the Byzantine army. Muslims consider their conquest as the liberation of subjugated people, since in most instances they were under oppressive rule.

**655 C.E.** Islam begins to spread throughout North Africa.

**661 C.E.** Imam Ali is killed, bringing to an end the rule of the four "righteous caliphs": Abu Bakr, Umar, Uthman, and Ali. This also marks the beginning of the Umayyad rule.

680 Death of Husayn marks beginning of the Shi'at Ali ("party of Ali") or Shi'a sect.

**711 C.E.** Muslims enter Spain in the west and India in the east. Eventually almost the entire Iberian Peninsula is under Islamic control.

**732 C.E.** Muslims are defeated at Potiers in France by Charles Martel. Muslim empire reaches its furthest extent. Battle of Tours prevents further advance northwards.

**750 C.E.** The Abbasids take over rule from the Umayyads, shifting the seat of power to Baghdad.

**786-809** Reign of Harun ar-Rashid, best known through the stories of *The Thousand and One Nights*.

800s Written collections of Hadith (sayings of the Prophet) are compiled. Sicily comes under Muslim rule.

813-33 Reign of Ma'mun. Theological controversy over whether the Qur'an is created or uncreated and eternal. Center for translation of texts from Greek to Arabic founded in Baghdad.

869-883 Uprisings of black slaves (Zanj) are eventually defeated.

**908** First Fatimid caliph in Tunisia. 928 Umayyad Abd ar-Rahman III declares himself caliph in Cordoba.

**940** Muhammad al-Mahdi, the twelfth imam, disappears. Twelvers still await the future return of the "Hidden Imam."

**945** The Buyids (Persian) invade Baghdad and take power from caliph.

**969** Fatimids gain power in Egypt and attack Palestine, Syria, and Arabia. Cairo (Al-Qahira, "the victorious city") is founded.

late 900s West Africa begins to convert to Islam

**1000 C.E.** Islam continues to spread through the continent of Africa, including Nigeria,
which served as a trading liaison between the northern and central regions of Africa.

**1099 C.E.** European Crusaders take Jerusalem from the Muslims. Eventually Muslims defeat the Crusaders and regain control of the holy land.

**1120 C.E.** Islam continues to spread throughout Asia. Malaysian traders interact with Muslims who teach them about Islam.

**1299 C.E.** The earliest Ottoman state is formed in Anatolia, Turkey.

**1453 C.E.** Ottomans conquer the Byzantine seat of Constantinople and change its name to Istanbul.

Circa **1800 C.E.** Approximately 30 percent of Africans forced into slavery in the United States are Muslim.

**1870-1924 C.E.** Muslim immigrants from the Arab world voluntarily come to the United States until the Asian Exclusion Act is passed in 1924.

World War I ends with the defeat and dissolution of the Ottoman Empire, which was the last of the Islamic empires. Many regions populated by Muslims in Africa and Asia are colonized by Europeans. Traditional religious ways of life are threatened and, in some cases, destroyed.

**1930 C.E.** The Nation of Islam is created in the U.S. by W. D. Fard. It is based on some Islamic ideas, but contains innovations, such as the appointment or declaration of Elijah Muhammad as a prophet.

**1948 C.E.** The state of Israel is created. Some Palestinian and Lebanese refugees flee to the United States, among them, Muslims and Christians.

**1952 C.E.** The McCarren-Walter Act relaxes the U.S. ban on Asian immigration. Muslim students come to the U.S. from many nations.

**1965 C.E.** Revisions of immigration law further open the doors for Muslim immigration.

**1975 C.E.** Wallace D. Muhammad, the son of Elijah Muhammad, takes over leadership of the Nation of Islam after his father's death and brings most of his followers into mainstream Islam. He later creates the Muslim American Society, which attracts many members, most of whom are African-American.

**1979 C.E.** The Iranian Revolution results in the establishment of the Islamic Republic of Iran, the first attempt at an Islamic state in the modern era.

GLOSSARY FROM TEACHERS’ GUIDE WITH FRONTLINE VIDEO —MUSLIMS”

TO DO: CREATE ADDITIONAL PAGES TO THIS GLOSSARY OF ARABIC WORDS SIGNIFICANT FOR THE CONTEXTUAL STUDY OF ISLAM

Allah (A- lah'): Arabic word for God, the same God worshipped by Christians and Jews.

Arab: A person whose ethnic or national background is from an Arab country. Approximately 15 percent of Muslims in the world are Arabs.

Arab countries: Those countries whose primary language is Arabic. There are 22 Arab nations: Algeria, Bahrain, the Comoros Islands, Djibouti, Egypt, Iraq, Jordan, Kuwait, Lebanon, Libya, Morocco, Mauritania, Oman, Palestine, Qatar, Saudi Arabia, Somalia, Sudan, Syria, Tunisia, the United Arab Emirates, and Yemen.

Fatwa (Fa'-twa): A non-binding opinion or ruling based on religious knowledge made by an Islamic scholar, mostly on matters of day-to-day life.

Hadith (Ha-deeth'): The reported sayings and actions of the prophet Muhammad which serve as a model of behavior for Muslims.

Hijab (Hee-jab'): Literally, the word translates as "curtain" or "veil." It refers to the headscarf and non-revealing clothing worn by many Muslim women to maintain modesty. The style of headscarf and dress varies from country to country. Modest behavior is mandated for both women and men.

Imam(s): Leaders of prayer in a mosque. In Shia Islam, the descendents of the prophet Muhammad whom he chose to lead the community following his death.

Islam (Is-lam'): Literal translation is "submission to the will of God." It originates from the Arabic word, "salaam," which means peace.

Jihad (Jee-had'): Arabic word meaning "striving in the way of God." This striving can take a number of forms, the most common of which is the daily inner struggle to be a better person. Armed jihad is permitted in defense of Islam.

Lunar Calendar: A calendar that is based on the moon rather than the sun, so that each month begins with the sighting of the new moon. Muslims follow a lunar calendar. This means that each Muslim month begins 11 days earlier than the year before.

Mosque: Place of worship for Muslims. Many mosques are recognized by their tall minarets or towers; however, minarets are not a physical requirement of mosques.
Typically, mosques have a prayer hall covered with carpets, and people take their shoes off at the door to maintain the cleanliness of the prayer area. In the U.S., mosques usually have additional areas including classrooms, a lecture hall, dining room and kitchen.

**Muhammad**: Muslims believe Muhammad was the last in the chain of divinely appointed prophets through whom God sent his message to humankind. Muhammad was born in the year 570 C.E., in the town of Mecca on the Arabian peninsula. Muslims believe that he was the recipient of God's last divine revelation, the Quran.

**Muslim (Mus'lim -- the "u" in Muslim is like the "u" in "put")**: One who follows the religion of Islam; literally, one who "submits to the will of God."

**Quran (Kur-ään')**: The holy scripture of Islam, believed to have been revealed to the prophet Muhammad through the angel Gabriel over a period of 23 years. It contains many of the same teachings, admonitions, and stories of earlier prophets found in Jewish and Christian scriptures.

**Shahada (Sha-ha'-da)**: The declaration of faith in Islam that "There is no deity except God and Muhammad is the messenger of God." Anyone who believes and declares this is considered a Muslim.

**Sharia (Sha-ree'-a)**: Islamic law, based on the Quran and the sayings and actions of the prophet Muhammad (hadith).

**Shiite/Shia**: One of the two major groups in Islam, comprising approximately 20 percent of Muslims worldwide. Shiites believe that Ali, the cousin and son-in-law of the prophet Muhammad, was designated as Muhammad's successor.

**Sufism**: The inner, spiritual dimension of Islam that relates to purification of the heart and involves devotional practices to bring one closer to God.

**Sunni**: The majority group of Islam, comprising about 80 percent of Muslims worldwide. Sunnis believe that the prophet's best friend, Abu Bakr, was selected by consensus of the majority to succeed him.

Teachers and Teaching Islam and Muslims in Pluralistic Societies: Claims, Misunderstandings, and Responses

Sarfaroz Niyozov
Published online: 22 January 2010 # Springer Science+Business Media B.V. 2010

Introduction: Data Sources, Argument, and the Structure  P. 24
This paper argues for critically engaging teachers' voices and practices in the education of Muslim minority students. Its data sources include a targeted literature review about teachers' work with Muslim students (Niyozov and Pluim 2009), activities of the OISE-based Muslim Education Project (e.g., Niyozov and Memon 2006; Niyozov 2007), my ongoing Social Science and Humanities Research Council (SSHRC) project on teachers' perspectives on the education of Muslim students in Toronto's schools, and my earlier research on pedagogy in developing Muslim societies (Niyozov 2001). From the above-mentioned SSHRC project, I have used preliminary data from interviews of six public high school teachers of English, History/Civics, and Science in schools with a significant Muslim student population.

Muslim Presence in North America  P. 24
Within the last 25 years, Muslims have become the principal non-Christian religious group in Canada and the USA, due to immigration, higher birth rates, and conversion. American Muslim population grew by 108% between 1991 and 2001, numbering 2.5 million (unofficially 7 million; Seljuk and Fine 2008, p. 39); and Canadian Muslims by 128%, increasing from 253,000 in 1991 to 842,200 in 2007 (Adams 2007, p.108). North American Muslims are relatively young (50% of Canadian Muslims age between 15–44; and 40% of American Muslims between 18–39); are well educated, i.e., above 34% of Canadian Muslims have undergraduate or graduate degrees (Moghissi et al. 2009, p. 27); two thirds of American Muslims have at least a college degree, compared with the US average 28% (Seljuk and Fine 2008, p.41). Muslims are relatively well to do (i.e., according to the Zogby survey 2004), a third of the US, Muslims' median income was $44,389 compared to the US average of $ 42,158 (Seljuk and Fine 2008, p. 41); Muslim median income in Canada in 2008 was $37,000 (Moghissi et al. 2009, p. 37). Approximately 90% of US and 95% of Canadian Muslims are legal residents (Adams 2007; Moghissi et al. 2009, pp.26–44; Seljuk and Fine 2008; Zogby 2004).

Muslim Education in Canada: A Challenge to Educational Multiculturalism  P. 25
Muslims' educational responses and strategies in the West have similarly changed with time and context, and their understanding is helpful in sensitively and effectively engaging Muslim students, parents, and communities (Daun and Walford 2004). Around 80–90% of Muslims in North America attend public and private secular schools. Several studies show that the majority of Muslim students in
the US and Canadian schools have positive attitudes towards public schools and institutions (Cristillo 2008, p. 9; see also CBC News 2007; Pew Research Center 2007).

At the same time, the number of private Islamic schools, now around 400 Islamic schools in the United States and 50 in Canada has mushroomed (Memon 2009; Zine 2008) highlighting Muslim dissatisfaction with public schools. In Ontario alone, there are 36 Islamic schools of which 35 adhere to various Sunni orientations and one to the Twelver Shi’a Muslim orientation. Formal Islamic schools are only one of many forms of Islamic education (Douglass and Shaikh 2004). While most Muslim students gain some information about Islam and Muslim societies in public schools, they receive alternative Islamic education through mosque, evening, weekend and summer schools, homeschooling, as well as through community practices, the media, internet, and transnational networking. Our students, technologically savvy, ambitious, and aware of multiple perspectives, are increasingly critical of the authorities and politicians and able to resist peer and family pressures.

A multiplicity of students' color, linguistic, ethnic, religious, and socio-economic backgrounds is encountered by a still predominantly Anglo-Saxon, Judeo-Christian, feminine teaching population. Subject curricula and policy documents speak about inclusion of non-white cultural and historical perspectives (TDSB 2000), yet changes have been cosmetic, superficial, and sporadic (Azmi 2001). There are signs of increasing alienation, anti-Westernism, religious, and nationalist radicalization among these youth, disappointing the host societies' expectations that the second generation would be more integrated and assimilated into Canadian society (Zine ambitious, and aware of multiple perspectives, are increasingly critical of the authorities and politicians and able to resist peer and family pressures. 2008). Schools and teachers are simultaneously grappling with the emergence of multiple religious interpretations in the public arena, competing visions on schools and the purpose of education; how to celebrate religious discourses while promoting students' critical thinking, and autonomy; how to reconcile constructivist views of knowledge and social reality with divinely ordained immutable texts, authorities, and laws (Merry 2005). How can schools be expected to celebrate diverse cultures when these cultures may possess problematic elements such as racism, sexism, and social inequalities? Is the role of schools to affirm and reflect society and its cultures as they exist, or to transform these into better, pluralistic, and just ones?

The Role of Teachers in Educating Muslim Students: Claims, Misunderstandings, and Responses’ P. 28

The teachers’ voices corroborate instances of teacher racism (Alladin 1996; Zine 2001). They also say that while teachers are becoming increasingly aware of their and the school’s racism and phobias (not just toward Muslims), and while these teachers also fight against racism where possible, there is a need for deeper and wider digging into forms of personal, structural, and cultural racisms. Not just teachers and the Western society, but their students, and their students’ communities also have racist elements. In the context of pluralist education, it is important that the racism of minority as well as of majority groups is addressed fair-mindedly. Otherwise, the fight against racism may only reproduce and perpetuate new forms of racism. Teachers who are largely ethno- and Euro-centric and with Judeo-Christian background, ignore or denigrate the historic and contemporary contributions of Muslims to science, architecture, culture, geography, navigation, literature, and history.

Within the scholarship community, there is a debate regarding curriculum representation of Muslim history, culture, religion, and contributions (Abu El-Hajj 2006; Abukhattala 2004; Azmi 2001; CIE 1995; Moore 2006; Panjwani 2005; Sewal 2003; Zine 2001). Muslim leaders of various inclinations have also
emphasized this: radical and anti-western Islamists employ this charge to urge Muslims to boycott secular society and leave public schools in favor of Islamic schooling. Moderates, negotiators, and multiculturalists see this as a matter of ignorance and suggest the enrichment and pluralization of the public school curricula as the solution.

**Non-Muslim Teachers are Not Fit to Teach Muslim Students P. 31**

This is a conservative Islamist perspective that is based on the assumption that Muslims should avoid or reduce their relations with non-Muslims to a minimum. This position selectively uses anti-racist and anti-colonial critics, colonial history of Christian missionary activity and cultural anthropologists‘ assertions that outsiders are not emotionally, socially, academically, and even psychologically qualified to talk to those whom they study or educate, and that insiders care about and fight for their own better (Henry 1996). It is a suspicion based on history, mistrust, and political agenda. Accusations may be made that non-Muslim or ‘not-proper Muslim’ teachers were secularizing and corrupting, or converting Muslim children, if they expressed alternative Islamic or non-Islamic perspectives (for critique Milligan 2005, pp.161–163; for examples, Niyozov1995).

[P. 32] Earlier Ghuman (1994) and Sarroub (2005) have illustrated that there are Muslim students who do not want to have ethnic minority teachers because their coreligionist teachers over-discipline them, misinform their parents on their behavior, or control them in the name of culture and religion. Like the majority of their classmates most Muslim students do not isolate themselves; they confer and confess their personal concerns to their non-Muslim teachers and peers.

[P. 33] The assumption that Muslim teachers are in a better position to teach Muslim students, their history, and culture appears unfounded. The right question may be less about who teaches whom, but more how does one teach, to what end, with what ethics and interest? The above examples show that teaching is more than an authoritarian

[P. 34] There are many Muslim teachers in the public school system. These teachers serve as bridges between cultures, helping their colleagues understand the nuances of the students‘ backgrounds, their deeper needs, and allay parents‘ misconceptions about public schools and western societies (Collet 2007; Kassam2007). Further, by virtue of living in an increasingly pluralistic society, public school board policies have become more responsive to the practices of Islam.

**Discussion of Findings: Implications for Research, Policy and Practice of Education and Pluralism**

[P. 35] According to Wheeler (2003) and Panjwani (2005), the recent shifts in discussions of religion and education such as uncritical celebration of differences, and political correctness, often blur the more serious discussions on the actual aims of education and do not help students to develop analytical skills and engage in open-minded discussion, do not expose students to more than one view, do not address critical intra-communal issues of education access and quality, gender and social discrimination, and do not enable students to reflect upon the existential and social questions of the day. Despite all the critique, today more than ever before, Western teachers, educators, and the general population are aware not only of Islam and its major tenets, but also of its internal diversity, complexities, and of Muslims‘ relations with non-Muslims globally.
As educators, we also need to know that debates around Muslim education are connected not only to concerns for justice, opportunity, and recognition, but also to conflicting worldviews and power relations. Our experiences of Muslim education suggest that the voices of teachers, researchers, religious clerics, and organized groups must be equally and thoroughly engaged with in terms of their origin, purpose, and implications for particular Muslim students, Muslim communities, and global humanity; that schools are places where all students freely engage in critical analysis of self and society, historically and today. Fundamental education questions need to be asked such as, what is the purpose of education, what is the role of the teacher, how can we prepare our students for the twenty-first century, where identities are no longer fixed, but evolving, multiple, and hybridized (Kassam 2003; Wheeler 2003).

The disregard for and distrust of teachers (especially in public schools) and the ignoring of their perspectives, leads to misunderstanding of the complexity of their work and working conditions, and the de-professionalization of the teacher’s image in society. Teachers think and work through a broader pragmatic perspective than any particular parent, and religious/cultural/social group (Hargreaves 2003). They work to support the needs and hopes of all students as their human rights (Parker-Jenkins et al. 2005). Any community’s demands on teachers require an acknowledgement of the impact on them of the emotional, intellectual, political, and physical intensification of their work.

Commendably, no teacher in our study rejected the idea of including Muslims’ cultures and histories in the curriculum; none ignored racism, Islamophobia, cultural insensitivity, and ignorance. They went further, acknowledging that these are not confined to Muslim students only (Amin et al. 2006; McLaughlin et al. 2005). All teachers questioned what information would be appropriate, accurate, and common to all Muslims. In some cases, they simply needed help finding the right resources and strategies. Others saw deeper issues beyond the politics of recognition, culture, identity, and representation: what is Islamic about the values in question? Whose power and benefits do these critical voices serve? Is it education’s role to confirm the students within their heritage, culture, and religion as fixed entities? Whose Islam and which Muslim are we talking about in our debate about Muslim education? Is there anything distinctive about Muslims that makes their needs different from their non-Muslim peers? Is there a danger of singling out Muslims and making them look strange and peculiar? Are the differences so deep that we are doomed not to communicate properly? Why can’t we talk about issues of discrimination and injustice in Muslims’ history and society?

Teacher preparation in a time of multiple perspectives, knowledge explosion, and increasing uncertainty, requires teachers to learn more than to teach, requires them to pose difficult questions for everyone rather than play it safe, to examine critically their own beliefs and practices before enabling their students to do so. Without the developments of such understandings of their professional role and identity teachers will not relinquish their position in the classroom as source of authoritative knowledge.

Teacher education in pluralist societies requires cultures, religions, and histories to be included as starting points, as materials for scrutiny and analysis not as sacred and untouchable entities (Kassam 2007). Pluralism is a creative construction of the new, not a mechanical collection of differences as exotic materials. Pluralism starts by acknowledging complexity and imperfection within oneself; by being open to other perspectives with humility, rather than by claiming religious, moral, or civilizational superiority. The provision of curricula and textbook materials on religions should not provide idealized and perfect realities and images; or avoid religious community’s social and historical
problems (Banks 2006; Kassam 2003). Within this context Muslim education (whether in public or Islamic schools) as a concept needs to be engaged with seriously, openly, and fairly, using global and comparative frameworks (Case 1999). Comparative and global perspectives should be brought in so as to reveal the particular commonalities between Muslims and non-Muslims and redraw the line of allegiance from religious and parochial to fundamental global issues such as social injustice, ecology, and peace (Abou El Fadl 2005; Banks 2006; Jackson 2002; Wheeler 2003).

He offers courses in "Issues in International, Global Education", "Introduction to Comparative, International and Development Education", "Teacher
The Purpose of an Islamic School
and the Role of an Islamic School Teacher
Fawzia Gilani-Williams

In order to come to some agreement regarding the purpose of an Islamic school, it may be beneficial to firstly elicit a definition of Islamic education. Educators generally maintain:

The purpose of Islamic education is not to cram the pupil's head with facts but to prepare them for a life of purity and sincerity. This total commitment to character-building based on the ideals of Islamic ethics is the highest goal of Islamic education. (Al-Attas, 1979, p. 104)

The emphasis can then be said to be on a value system. What is important is that the Muslim child be exposed to an education that predominantly teaches values such as obedience, care, forgiveness, respect and truthfulness etc. According to Sharif, Islamic education is "the device for helping an individual to full stature", (1976, p. 45). This, he elaborates involves "the assimilation of Divine attributes" leading to a life of "unity, power, freedom, truth, beauty, goodness, love, and justice" (ibid). A more comprehensive definition of Islamic education was composed at the First World Conference on Muslim Education where participants were of the following view:

Education should aim at the balanced growth of the total personality of man through the training of man’s spirit, intellect, his rational self, feelings and bodily senses. Education should cater therefore for the growth of man in all its aspects: spiritual, intellectual, imaginative, physical, scientific, linguistic, both individually and collectively and motivate all aspects towards goodness and the attainment of perfection. The ultimate aim of Muslim education lies in the realization of complete submission to Allah on the level of the individual, the community and humanity at large. (Ashraf, 1985, p. 4)

It would follow then that the aim of an Islamic school is to provide an environment which allows the student to realize these ideals and gain an education that enhances his spiritual, intellectual, imaginative, physical, scientific and linguistic growth. Using the above definition as an informative guide, one would expect an Islamic school then, to have facilities and a programme of learning that allows a pupil to develop his/her sense of spirituality and build a positive relationship with God which becomes manifest in doing righteous deeds.

According to Ismail (Ismail, 1997, p. 36) there are "four basic patterns of knowledge. Although they are not inclusive, they are the most important patterns needed for producing
effective, creative and successful teachers:
   a. Causal Knowledge
   b. Normative Knowledge
   c. Experiential Knowledge
   d. General Knowledge

In addition to this, Ismail also gives four skill components, each of these having four sub-components (Ibid, pp. 36-7). These are said to represent the very basic talents, qualifications and characteristics needed to develop a successful and effective teacher. They are:
   a. Knowledge of the subject matter
   b. Wealth in internalized values and beliefs
   c. Ability of transferring knowledge
   d. Generating student’s cooperation and confidence

Essentially, the call is for a Muslim teacher to have moral values and professional knowledge and to be able to actualize these in daily life routines. They must be honest and sincere, and cultivate faith in absolute values such as justice, mercy, truth, charity, love and righteousness, all of which are enshrined in the names of God, (Ismail, 1997, p. 45). They must be familiar with classroom management, curriculum management, records management, to use a variety of teaching strategies and an understanding of learning modes. They must have an awareness of each pupil’s background and motivate students raising their self-esteem. They are also effective in home-school liaison and have a reciprocal relationship with the administrative body.

In order to attain this in the Muslim student, the teacher is charged with competency. This essentially requires the teacher employed, to be proficient, effective and skilled in primarily the teaching of values and secondly in the specific field that he is being asked to teach. Teachers must have sufficient experience and training in the subject and be aware of development in that field. Along with this they must also be able to deliver the subject taking into account the different ability groups in the class and understanding the varied strategies of delivering the material. An understanding of a pupil’s learning style is also essential. A pupil must be given an environment that is positive for his or her personal development. By creating an atmosphere of approval the teacher sets the scene for success.

Other aspects of an Islamic school education include the provision of opportunities in physical education, languages, science, creativity and reasoning. However, all of these are delivered in such a way that there is no dichotomy between religion and so called secular knowledge:

An essential prerequisite is that religious and secular subjects should be made an indivisible whole. The compartmentalization of religious and secular education, based on a factitious division of life into spiritual and temporal, is not sanctioned by Islam. (Rauf, 1988, p. 63)

A Muslim teacher must therefore be one who follows this philosophy and tries to correlate
the Islamic perspective with academic subjects that they teach.

The role of an Islamic school teacher can be best understood by firstly considering what the essential constituents of a competent Muslim teacher are. The Islamic Society of North America delivered a workshop on the qualities of an effective Muslim teacher. One of the accompanying handouts was entitled: ‘What a good Muslim teacher is all about’. The personal characteristics of a ‘good Muslim teacher’ as described in the ISNA handout were:

Love for children; love for the profession of education; humility without weakness; health and vitality of the body; psychological health and emotional balance; neatness, cleanliness and good appearance; eloquence and good pronunciation; intelligence and deep understanding; understanding students and their needs; strong command of the subject; broad and deep reading and knowledge; punctuality and respect for time; co-operation with the school system and policies; being courteous with students and fellow teachers; socialization with people and no isolation; knowledge and practice of Islam; to stay away from questionable sayings or deeds, even if it is lawful to do so; and sincerity. (ISNA handout, 1994)

This description is one that ISNA has proposed as its criteria for the hiring of Muslim teachers. The description calls for an adult who possesses an affinity for children. One who enjoys the rigors and challenges of teaching. Appearance, mannerisms and intellect are factors that are seen to contribute to what a ‘good Muslim teacher‘ is. In addition to this, a teacher is asked to have the following ‘professional characteristics’:

Class control; respect for the student‘s personality; involving the student in discussions and corrections; involving students in school activities; recognizing and dealing with individual differences; gradual reforming of student‘s behavior depending on the situation; linking the lesson to lively practical applications; using fun and appropriate laughter; using the lecture style appropriately with the following considerations... using questions with the considerations to the following...(ISNA handout, 1994)

Baloch describes an Islamic teacher as one who educates a child ‘according to his level of maturity’. Such a teacher nurtures the child to have ‘faith in the One’ God, leading to the development of ‘a spirit of inquiry‘ in order to procure an understanding of the universe and its operations. The pupil is then to ‘use his knowledge, skills, and understanding to improve himself and the society’, (Al-Afendi&Baloch, 1980, p. 165).

The purpose of an Islamic school and the role of an Islamic school teacher can also be presented by drawing on the early models of Islamic education and the teachers who were called upon to dispense knowledge to students:

...because of the inseparable bond between ‘Islam‘ and ‘education‘, the teacher in a Muslim
society has to be a ‘committed’ teacher, and consequently ‘accountable’ to the society... a teacher's harsh treatment of a child was quick to attract attention and the great educators like Ghazzali ... and IbnMiskwayh...advocated the use of rewards, recognition, and recreation (play) by the teacher to motivate learning, rather than any form of punishment. IbnKhaladun explained how physical punishment was psychologically harmful and distorted the normal growth and development of the child. (Al-Afendi&Baloch, 1980, p. 169)

A number of points are raised in this extract. Firstly, a teacher in a Muslim society is answerable to the people. His or her actions and words are the target of scrutiny. Moreover, he or she must be a dependable and responsible person whose role does not end with the bell but continues even after school, implying that a teacher's professional duty is one that extends to society. He or she must not be seen to engage in any questionable activities.

There is also a point made that a teacher should not be severe and resort to punishing the child but use strategies involving positive reinforcement and also appreciate the value of play as a means of learning and providing the student with a motivating learning environment.

Shami raises the point that Muslim teachers who are trained in colleges and other professional institutions based on models from the West are not equipped to deal effectively with delivering an Islamic education to a Muslim child. This, he says is because such an institution does not cater for the spiritual development of the child. He calls for a teacher who is ‘responsible for the development of the soul ... the mind and body’, (Baloch&Afendi, 1980, p. 155). The implication may then be that teachers who are trained at the latter institutions should be given opportunities for Islamic development that will allow them to cater for the ‘mind and body‘ of the student.

In one of his addresses on the topic of a new education system, Mawdudione said:

If you teach history, geography, physics, chemistry, biology, zoology, astronomy, economics, political science and other social sciences without any reference to Allah ... a student will be unable to synthesize the conflicting ideologies into a unifying whole. Because of this intellectual polarization, his religious faith gradually weakens. Under the circumstances, he cannot remain totally committed to religion, however strong his faith may be. (Rauf, 1988, p. 64)

This can be used to further highlight the necessity for a Muslim teacher to put subjects in the context of Islam. If subjects are not Islamized, the indication is that the resulting pupil, through not viewing God to be the author and controller, assigns the latter to something other than God. He will therefore suffer a weakness in faith. Mawdudi also believes that students should consolidate their knowledge in Qur’anic Studies and thereafter ‘be offered a course in comparative religion so that they can assess for themselves how mankind went astray‘.
(Rauf, 1988, p. 67)

There is also the point that ‘the most important quality of a Muslim teacher is not what he knows but what he is’, (Baloch & Affendi, 1980, p. 157). The emphasis is placed on the character of the teacher. The teachers must be exposed to exemplary behaviour on which to fashion themselves. Presumably this would come from the teacher training institutions in the first instance and then the leadership body within a school.

It is also important for an Islamic school, especially those that exist in non-Muslim countries to provide students with an understanding of their role and obligations not only to the Muslims who reside around them but also towards the non-Muslims. It is important that Islamic schools exude through their students the same neighbourliness towards the non-Muslim that Muhammad (sws) practiced and taught.

Hashim also agrees that the Muslim teacher is not just a professional worker but is also a mu’addib who concerns himself with instilling adab, (manners) in their students:

A teacher in the Islamic tradition is also a guide to leading pupils to the righteous path. Consequently, the excellence of a teacher in Islam is not only measured by his or her faith, beliefs, character and conducts. This notion of a teacher in Islam is a very important consideration in the preparation of teachers for an Islamic school system. (Hashim, 1997, p. 58)

The purpose of an Islamic school is essentially to create an environment that reflects an Islamic ideology. It is warm, embracing, encouraging and its decor redirects its inhabitants towards God remembrance and good actions. The role of an Islamic school teacher is to then produce a wholesome child who carries out his obligations as set out by the precepts of Islam. The teacher’s directive is to educate a child by giving him or her the mannerisms and the etiquette that will serve the child and the community: To ultimately make the child understand the purpose of his life and to provide that child with knowledge that will equip him/her to pursue both worldly gains and most importantly after-life gains. Such a child does not feel coerced, stifled or imprisoned but feels motivated, free and eager.

Guide for Non-Muslims Working in Islamic Schools

There are several cultural issues that a non-Muslim entering an Islamic school environment may encounter. The purpose of this guide is to educate non-Muslims about such things in order to set "guests" in the Muslim school at ease. Some of these issues may stem from religious beliefs, while others may be purely cultural.

1. **Multiculturalism** – Americans are used to the terms “diversity” and “multiculturalism” but they may not be completely prepared for the variety of ethnic backgrounds and nationalities in attendance at Muslim schools. Students in Muslim schools may come from the Middle East, North Africa, South Asia, Southeast Asia, and other places. Their families speak a variety of languages and dialects. Ties with their home countries are usually still intact and families feel quite strong about the importance of keeping the heritage and culture alive in their children. Of course, there are American Muslim families as well, and many households may even be multicultural.

2. **Religious observations** – Islam is considered by Muslims to be more than just a religion, but rather, a way of life. In fact, teaching this way of life to Muslim youth is one of the purposes of establishing Islamic schools. At least one, if not two of the 5 daily prayers are scheduled into the school day. During the month of fasting known as Ramadan, the school schedule may be altered to accommodate the increased religious observances made during that month. Religious classes are usually taken by all students throughout the year. Arabic is usually taken as a second language since Muslims believe that God’s word has been recorded for humanity in Arabic in a book called the Qur'an. Students usually strive to memorize this book, and the book itself is treated carefully with the utmost respect.

3. **Religious terms & phrases** – Muslims often employ religious terminology into their speech as well. For example:
   - **Greeting**: Muslims may greet one another with “AsalaamuAlaikum ” and “Walaikum Salaam” which mean “May the peace of Islam be upon you”. This greeting is usually not extended to non-Muslims, due to the religious implications of the meaning. Instead, casual American greetings would be used.
-*Exclamation:* “Subhan Allah” meaning “Glory to God” or “Allahu Akbar” meaning “God is Great” 
-*Praise:* “Alhamdulillah” meaning “Praise to God” 
-*And another common phrase:* “Insha’Allah” meaning “if God wills” which is usually said anytime something is planned for the future. 

4. Islam in the curriculum – While the subjects non-Muslims may be hired to teach are so-called “secular” subjects, the belief that Islam is a way of life means that religion permeates even the secular subject matter. For this reason a Muslim teacher would try to integrate an Islamic approach into each course. For non-Muslim teachers, a Muslim teacher’s assistant may be provided to bring this perspective to the class and to help make the non-Muslim teacher aware of areas where the subject may become controversial or inappropriate in an Islamic school. For example, while the concept of evolution may be included in the curriculum, an approach that accommodates the Muslim belief in God as The Creator must be incorporated. 

5. Gender Relations – Muslims hold conservative views regarding relations between the sexes. The reason for this is to safeguard the family and to build respect for people based on their personal qualities rather than physical attraction. In general, casual mixing between unrelated males and females is forbidden in Islam. However, interactions that take place for a particular reason (such as professional meetings or parent conferences) are allowed with certain safeguards in place:

- No physical contact should be made, including handshaking or other casual touching. 
- Eye contact may be sporadic. This should not be taken as a sign of shiftiness. Rather, both Muslim males and females have been commanded to lower their gaze in the presence of non-relatives of the opposite gender out of respect for one another. 
- Meetings should not be completely private. A meeting could be held with a third party present or the door could be kept open. 

Other ramifications of gender relations in Islam may also extend to the classroom. For example, dating and boy/girl relationships are not allowed between the students. Students may be seated separately according to gender, and in some case separate classes may even be established. Non-Muslim teachers involved in personal non-marital relationships should not discuss them with students, nor should the possibility of exploring such relationships be posed to students. If a Muslim student asks questions of such nature, they should be referred to their Islamic studies teacher for an appropriate answer. 

6. Physical appearance and Attire – In light of the previous point about gender relations, Islam requires that modest dress be employed in the presence of non-relatives of the opposite sex. Some aspects of this modesty are specified for each gender. Both genders must wear non-revealing clothing that is loose, non-formfitting, and not see-through. For the woman, such clothing should cover all of her person except her face and hands. Some Muslim women opt to include their face and hands as well. Perfume, make-up, jewelry, and
other means of external beautification are reserved for the privacy of the home and are not appropriate in public places such as the school. Muslim men often grow beards to imitate the Prophets. Since the teacher in the Muslim school is expected to set an example for students, most schools require their staff to abide by these standards while on the job, regardless of their personal habits outside of the school. This usually applies not only to non-Muslims, but to Muslims who may not personally observe these conditions, though policies may vary from school to school.

7. **Dietary considerations** – Muslims do not eat pork or pork-based products. Such meat is considered to be an impurity and unfit for consumption. Some Muslim families also may not eat other meat that has not been slaughtered in a “halaal” manner.

8. **Holidays and celebrations** – Muslims only celebrate the holidays specified in Islam which are called “Eid”. The first of these is the Eid of breaking the fast which is celebrated when Ramadan ends. The second is celebrated during the season of the “hajj” or Muslim pilgrimage. It is a commemoration of when Prophet Abraham was commanded to slaughter his son Ishmael and the ram was miraculously put in his place. These holidays should be scheduled on the school calendar. Other non-Islamic holidays such as Halloween, Thanksgiving, Christmas, Valentines, Easter, and Birthdays are not to be celebrated in the school. Classroom parties that have nothing to do with any holidays may be held in accordance with school policies.

9. **Islamic Art** – Muslims have been forbidden from sculpting or drawing animals and people or displaying such imagery. Some may even object to having their picture taken for this reason. However, for specific needs, such as identification or education, such images may be used in the school. Musical instruments are also not generally an approved form of art in an Islamic school.

**Conclusion**: It is hoped that this list could serve as a useful introduction to common scenarios one may encounter in an Islamic school. This list is not comprehensive, and must be accompanied in the school by a Muslim assistant or mentor who can help the non-Muslim make the cultural adjustments needed to function effectively in such an environment. It is also recommended that one may learn more about the basic beliefs and practices of Muslims by looking into classes or programs available at the school or Islamic center which may be available for the non-Muslim pu

A Sample Letter: To your child's Non-Muslim teacher

The following is a sample letter that can be written to your Child's Non-Muslim TEACHER OR PRINCIPAL to create an awareness of Ramadhaan at the school level. This gives Muslims the opportunity to educate Non-Muslims on Fasting, Ramadhaan etc. This is a very useful avenue for Dawah and education. The contents can be edited to suit different situations and needs.

SAMPLE LETTER TO TEACHER
Monday October 22, 2002
Dear Mr. Staten:
Greetings of Peace. We are the parents of Ameen Thawban, who is a grade five student in your class. We would like to bring to your attention the upcoming Islamic month of Ramadan, its implications for Ameen and what you can do as his homeroom teacher.

Given the current climate of fear, grief and intolerance in the wake of the events of September 11, 2001, we hope that you will seriously consider our request not just for the sake of Ameen, but also that of the other children in the class who are probably still confused about various elements of this tragedy.

Ramadan is the ninth month of the lunar Islamic calendar. This year, it is expected to begin on November 6, depending on when the new moon, which indicates the beginning of a new lunar month, is sighted.

Muslims who have reached puberty, are required to fast during this month. The fasting entails abstaining from food, drink and sex between dawn and sunset each day during the month of Ramadan, which lasts 29 or 30 days.

Although Ameen is not yet at an age where he is required to fast, he looks forward to Ramadan every year. Last year he fasted the entire month of Ramadan without it negatively affecting his health or his marks! We would like to encourage Ameen’s participation in Ramadan again this year to cultivate his spiritual growth as a Muslim. We hope that you will support us in this
decision, in the interests of Ameen, other Muslim children like him in your class, as well as
tolerance and openness to diversity as part of the children’s learning experience.

We have enclosed a sheet from the Council on Islamic Education (see enclosed sheet
called Ramadaan explained) which can give you more information. This sheet also provides
some excellent ideas of activities teachers can use in class to increase awareness and
understanding of Ramadan. We would also encourage having Ameen and other Muslim
students do presentations explaining Ramadan for the benefit of the class.

We would like to meet with you to discuss and seek your advice on further issues surrounding
religious celebrations and holidays, so that students of other religious backgrounds can not
only grow academically in your class but spiritually as well.

If you can kindly contact us so that we may set up a meeting this week or next week, it would
be greatly appreciated. You may call us at home at (123) 555-0000 in the evenings or Mr.
Thawban’s office during the day at (123) 444-0000.

We look forward to hearing from you. Thank you for your time and attention.
Sincerely,
Mr and Mrs. AffanThawaban.

ACTIVITY NUMBER 5 [based on reading numbers 5-10 and 13-14]

©July 2010 L.G. Stambler

1. Read this sample letter that you might receive from the parents of one of your
   Muslim students.
2. List all of the information that you think that you will have to know in order
to respond to your student’s parents.
3. Research the information that you need to know.
4. Organize, compose, and write a plan for how you would answer your
   student’s parents in writing.
5. Write an outline of talking points for a face to face meeting with your
   students’ parents using the 3Rs of Skilled Dialogue. See glossary of terms.
6. SEE POWER POINT COMPILLED BY L.G.STAMBLER, Ph.D. ENTITLED “Islam” in this collection
   of readings and activities to assist you with finding information and additional
   resources.

A Muslim is a follower of the religion of Islam. There are over 1.4 billion Muslims worldwide, divided among three major groups: Sunni, Shīʿī and Khariji. The word Muslim means one who submits and implies complete submission to the will of God (Allah). Adherent of the religion founded by Prophet Mohammed in the year 610.

- Muslim New Year
- Ramadan
- Day of Ashura
- Laylat al-Qadr
- Isra and Mi'raj
- Mid-Sha'ban

Muslim New Year

The Muslim New Year occurs on Muharram, the first day of the first month. This day is remembered as the day of Muhammad. Shi’a and Sunni Muslims do not celebrate the New Year. On this day many people give and receive gifts. The date of Muharram varies because the solar calendar is 11 to 12 days longer than the Islamic lunar calendar.

Ramadan

Ramadan is the ninth month for the calendar of Islam. The main part of Ramadan involves fasting during the day. During the day, eating, drinking and having sex is prohibited. Fasting is supposed to bring you closer towards God and away from worldly things.

There are many exceptions for people who do not have to fast during Ramadan, including children who have not gone through puberty, pregnant or menstruating women, the elderly, diabetics or other people for whom it would be dangerous if they fasted. If the person’s illness is not for a prolonged period of time, they have to make up the days of fasting on Ramadan they missed before the next one. If the person’s illness is long-term or permanent, they should give food to a poor person for every day they miss. If a person has sex between sunrise and sunset during Ramadan, they have to fast for 60 more days.

The final Friday during Ramadan is called Jumu‘ah-tul-Wida.

Day of Ashura

Ashura is in the month Muharram on the tenth day. It represents the Remembrance of Muharram. Muslim’s recognize Ashura as when Noah’s ark came to rest after the great flood.
Some Shi’a Muslims go to Karbala in Iraq to what is called Mashhad al-Husayn. They go there on Ashura to visit the tomb of Husayn to mourn his death.

In the tradition of Sunni, Muhammad fasted during Ashura in Mecca. When Muhammad observed the Jewish people fasting during Yom Kippur, he then made it mandatory for all Muslims to fast.

Since the Sunni and Shi’a schism, there has been much violence between these two groups during the holiday. For example in 2004, the pilgrimage to Karbala made by the Shi’a was bombed, and people were killed and injured.

**Laylat al-Qadr**

Laylat al-Qadr celebrates the time when Muhammad first saw the whole Qur’an. Since the true date is very unclear, it is recommended to celebrate all the possible nights of the holiday. Because of this night’s importance, Muslims try harder to do good deeds and give more worship to God.

For those who can, they spend the final 10 days of Ramadan in a mosque. They pray, read and recite the Qur’an, and remember God.

**Isra and Mi’raj**

This holiday is about the journeys of Muhammad. Isra is what Muslims refer to as the night Muhammad came to Jerusalem from Mecca.

This event was followed by Mi’raj, when Muhammad went into heaven. This is described as when Gabriel gave him Buraq, a horse with wings. Muhammad then led some prophets into prayer and then flew off to heaven. When Muhammad went to heaven, he met God, or Allah. Here, Allah told him to pray 50 times a day with all Muslims. Moses convinced Muhammad to tell Allah to make the number smaller, because they would never be able to pray 50 times a day. Allah agreed for them to pray five times every day.

**Mid-Sha’ban**

In the month of Sha’ban on the 15th day, Sha’ban is celebrated. The Shi’a recognize this day as Muhammad al-Mahdi’s birthday.

Sunnis worship this day as the time when Allah assigns specific destinies that will come to all people within the year. The significance of this event is to remember what Muhammad did in Mid-Sha’ban: He prayed for those who passed away at night. Today, Muslims honor Muhammad by praying at night and fasting in the day. The sacred text of Muslims, called the Qur’an, is recited. People feed the needy or pray for them in order to gain the acceptance and gratitude of those who have passed away. To celebrate, Muslims set off fireworks, cook and eat sweets.
Goat and Lamb Holidays

Dr. & Mrs. Robert D. Herr
Nix Besser Farm

In the coming months, goat and lamb will be featured on the holiday menus for many people. It is important to keep track of these holidays so goat and lamb producers can take advantage of these special markets.

In addition to the usual celebrations for Christians centering around the Christmas and Easter holidays, there is a significant Muslim population now in the U.S., estimated at more than 14 million currently, and these celebrate some other less familiar holidays.

During the holy month of Ramadan, Muslims do not eat or drink from sunrise to sunset for approximately 29 days. This holiday is in celebration of Mohammed receiving the first of the Koran’s revelations from Allah and occurs when the “White Thread Becomes Distinct From the Black Thread,” a poetic description of the coming of a new moon. Based on the lunar calendar, this holiday moves backwards 11 or 12 days each Julian calendar year.

During this period of abstinence, after fasting from dawn to dusk, the fast is broken with a drink of water and three dates followed by a light meal. After 29 days, the fast is broken with the first sighting of the next new moon. And this is the id al Fir or the Festival of the Breaking of the Fast. During the period there are three joyous days of celebration when Muslims will enjoy an abundance of the most festive foods including lambs and goats.

In reviewing your culling program, older goats and sheep often command exceptionally high prices during this period and it is certainly the time to clean out your older thinner animals.

Most desired lambs are between 60 and 80 pounds live weight. The most desired goat is usually a young animal weighing between 50 and 70 pounds. Either animal is usually acceptable and male animals are
preferred. It is also important that the animals be “without blemish.”

A second significant Muslim holiday is Id al Adha or the Festival of the Sacrifice. This is a celebration marking the end of the “Hajj” or the annual pilgrimage to the Holy City of Mecca which all Muslims are expected to make at least once in their lifetime. After public prayers, a sheep or goat is sacrificed to signify the Prophet Abraham’s obedience to God as evidenced by his readiness to sacrifice his son. The sacrificed meat is to be shared with relatives or given to the poor. Again, a male animal without blemish is required.

It is not possible, however, to just check your calendar and see when these holidays occur. The Muslim calendar is lunar and based on the sightings of the new moon. It contains 354 days, approximately 11.25 days short of the solar year. Ramadan occurs during the ninth month of each Islamic year. These holidays move completely around the western or Julian calendar, which most westerners observe. This moves each holiday about 11 or 12 days each year. In addition, there is always much controversy each year as to who the most reliable witnesses are when reporting a new moon.

Thus, there is always some confusion as to exactly when the holidays will absolutely occur. Sometimes the sightings are as much as two days off and occasionally Muslims have had to return to fasting for a day or two after they thought Ramadan was over.

Animals for use during these holidays are generally purchased and shipped about 7 to 10 days prior to the holiday. Considering that there are more than 14 million Muslims residing in the U.S. who observe these holy days, there is a significant marketing opportunity for lambs and goats, not only during these special days, but throughout the whole year.

Two other days of importance in the Islamic calendar are Nawlid, celebrated in honor of Mohammed’s birthday, and Ashore, a remembrance of the Martyrdom of Mohammed’s grandsons. For additional or future dates, producers may contact Dar’adh-Dhikr Mosque, 4312 Rosedale Avenue, Bethesda, MD 20814.

The term “Halal” is the religious term used to describe food that is “lawful to eat” according to the laws of Islam. Halal slaughter is very similar to kosher (Jewish) slaughter. By USDA standards both are considered religious or ritual slaughter and are exempt from USDA’s humane slaughter laws. This is not because they are inhumane since Halal slaughter requires that an animal be humanely treated on the way to slaughter. During the killing process, the animal’s head is turned toward Mecca and a prayer is spoken. A very sharp knife is used and the carcass is completely bled out. In addition, there must be no
contact with any pork. In Halal slaughterhouses, pork is never killed with the same instrument or in the same areas as lamb, goat or beef. In fact, a truly Halal slaughter house never kills any pork at all.

The Muslim population consumes approximately 75% of the goat meat consumed in the U.S., so an astute producer will try to learn a little more about it to meet its demands and needs. Other significant holiday periods include the Eastern Orthodox or Greek Easter, which follows the Western Easter, usually by a week. But, in some years they can be separated by almost one month. Certain Hispanic groups have significant celebrations early in January and many ethnic groups celebrate many of the same holidays that are on the official U.S. calendars... Memorial Day, Labor Day, Mother’s Day, Father’s Day, etc.

If there are groups of other ethnics in your marketing areas, knowing their special days and rituals can help you meet their needs as well as your own to market your animals in a most profitable way. It is important to note, however, that most of these markets are quite price conscious and will go to a lesser priced species of animal of good quality rather than pay for an over priced lamb or goat. On the other hand, given the choice, most can easily select the best lambs or goats for their needs quickly and most definitely choose the top quality animals on foot.

[The per capita consumption of sheep meat (lamb and mutton) in the United States is less than one pound per person. Americans (or immigrants) of Northern European descent traditionally do not consume much lamb; however, lamb holds a significant meaning in the observances of many religions and is a dietary staple in many countries. In the U.S., the largest consumers of lamb are Middle Easterners, Greeks, and Hispanics. Population demographics and immigration patterns favor an increase in demand for lamb and goat.

Most lamb is consumed on the East and West Coasts and in major metropolitan areas; however, ethnic markets can be developed anywhere where ethnic populations exist (e.g. college towns, rural areas where foreign labor is utilized). The demand for sheep and lambs increases prior to various religious observances. The type of lamb (age, weight, sex, condition, etc.) and manner in which it is to be slaughtered (Halal, Kosher) depends upon the ethnic/religious group and the holiday.]

sschoen@umd.edu
http://www.sheepandgoat.com

There are many sources for accurate holiday dates, usually a religious bookstore has several sources available. In addition, there are probably many internet sources though I do not have web sites available. This can help you in planning for your future marketing programs as well as your breeding or feeding
programs in the production of sheep and goats.

SCHOOL APPROACHES: DESIGNING A CURRICULUM FOR MUSLIM STUDENTS

August 16, 2008, 12:23 am
Filed under: August Volume 1 - 2008, Education, Magazine/ Culture | Tags: Islamic curriculum, Islamic school, Muslim homeschool, Muslim teacher

Tips for New Educators:
Preparing a Standard School Curriculum

- Research and plan properly.

By ZahidahFaruq, Islamic Post Staff Writer

“Seek knowledge from the cradle to the grave.” This maxim is a tradition of the Holy Last Messenger Muhammad, may the peace and blessings of Allah be upon him and his family. It applies to men and women, boys and girls. “If the actions of a teacher are contrary to what he preaches, it does not help toward guidance, but it is like poison. A teacher is like a stamp to clay and a student is the clay. If the stamp has no character, there is no impression on the clay,” wrote Hazrat Imam Ghazzali, may Allah have mercy upon him, said in his famous book IyhaUlumiddin under the section on knowledge.

What is curriculum development? The term curriculum is used in different ways by parents, the education community and the business world. A standard definition of curriculum is defined as what is taught, its scope, and sequence. Instruction covers how, where and by whom the curriculum is taught. Education philosophies, attitudes, values and appreciations may be informal or hidden aspects of a curriculum. Most curricula are sequential, meaning they build on the previous lessons and subjects. The development of a standard curriculum is a lengthy task normally done by an entire curriculum team.

Simplified version.
A home school curriculum can be simplified, however. The key to every curriculum is for the educator to know what the student is expected to know—
what the student should be able to do— at each grade level and in each subject. The simplest way is to break down reliable textbooks into unit studies, and form the broken down form into a curriculum. (Continues below…)

A seasoned educator may omit textbooks entirely, or use them only as resource books, adding a variety of sources such as the internet, libraries, museums, and field trips to places like farms, zoos and observatories, to develop their curriculum.

Islamic Cultural View
For Islamic schools, or home schools, an Islamic view is the best to establish. This curriculum; and uses Islamic cultural resources, books, and videos, as the backbone to all lessons, in all content areas. This is similar to the approach in parochial schools, and gives a firm grounding in understanding of Islamic heritage.

Standard K-12 curriculums are broken into various categories such as primary, elementary, intermediate, and high school. Each category is broken into content areas; these are detailed below.

Standard Primary Level
The standard primary level curriculum concentrates on language development, phonics, sight words, phonemic awareness, spelling rules, reading fluency and comprehension; beginning mathematics, introduction to science and social studies; introduction to the Arabic language, teaching the stories from Holy
Qur'an, stories about the life of the Holy Last Messenger, Muhammad, peace be upon him, known as seerah, and stories of other Holy Messengers (Joseph, Noah, Moses and Jesus, among others, peace be upon them all) and Islamic etiquette, among other things.

Standard Elementary Level
The standard elementary school curriculum concentrates on subjects such as: Quranic studies, memorization or hifz; the Islamic belief system, termed aqidah; the life story of the Holy Last Messenger, peace be upon him, which is known as seerah; Islamic history and law; calligraphy, Arabic reading and writing; mathematics, science, social studies, and English language arts with emphasis on writing development.

Intermediary Level
The Intermediate level continues to concentrate on the same subjects, but at a more technical level: Quranic studies and commentary, hifz of longer ahaadith, which are the traditions of the Holy Last Messenger Muhammad (peace be upon him) as well as Holy Qur’an; more detailed classes in aqidah, seerah, Islamic law and history; calligraphy, and Arabic reading and writing. Then there is pre-algebra and algebra, literature analysis, life science, physical and earth science; history (global and American), and English language arts with an emphasis on writing skills.

At this level students begin to choose electives.

High School Level
At the High school level, all of the core subjects are still taught. However the curriculum becomes specialized and technical. Advanced science, math and English are taught for a year at a time. Islamic law, science of ahaadith, in depth study of Holy Quranic commentary and commentary of ahaadith are introduced. Electives are now a part of high school credit-earning. Advanced courses prepare the student for entrance into college, trade school or employment.

Possible Resources
The sources given below are just a sampling of some of the options available for curriculum development or enhancement.
School District Curriculums
Curriculums developed by local school districts are aligned with the state’s educational standards and tied to federal education mandates and high stakes testing. Student competence is tested at various grade levels. If you are a parent or community member, you are able to access these curriculums or curriculum maps from your local school district free of charge.

Online Virtual Schools
Virtual schools refer to online schools that offer student services and courses that are conducted through Internet technology. Some virtual schools offer a full K-12 curriculum. The virtual school may use different types of media in the implementation of the curriculum. DVD’s, video segments, animation and graphics are usually infused throughout the lessons. A teacher or tutor may be assigned to monitor the student’s progress, intervening when he, or she, needs help understanding a lesson.

Correspondence Curriculums.
Many correspondence curriculums span the grades K-12, and cover the core curriculum areas and/or electives in the higher grades. Textbooks, workbooks and other teaching aids are included with some of the more expensive systems. These curriculums normally have the lessons scripted out, month by month, for the entire year. The process is simple; the educator reads the material, and follows the script. Student progress is tracked by way of tests and quizzes.

A Final Word.
Remember, you do not have to reinvent the wheel. The internet, the library, and your local community all offer a wide array of materials and resources for educators, home school parents and students. Take the time to do the research and properly plan. Your curriculum, and the result it produces, will be enhanced tenfold.
ACTIVITY NUMBER 6

COMPARE THE CURRICULUM FRAMEWORKS OR THE COMMON CORE OF LEARNING OF THE CONNECTICUT STATE DEPARTMENT OF EDUCATION

and

THE CONTENT OF THE READING ON DESIGNING A CURRICULUM FOR MUSLIM STUDENTS

SIMILARITIES BETWEEN THE TWO MODELS
ALTER THE CONTENTS OF THIS TEACHER MANUAL INTO A WCSU FORMATTED LESSON PLAN FOR A MIDDLE SCHOOL OR A SENIOR HIGH SCHOOL CLASS SESSION. SEE ATTACHED LESSON PLAN FORM.

http://www.pbs.org/wgbh/pages/frontline/teach/muslims/activities.html

Before watching the film, help students think about what they may already know, as well as questions they may have about Islam or Muslims.

You may want to hand out the glossary to students and review the terms "Muslim," "Arab," and "Islam" with them prior to watching the film.

Explain to students that the film shows Muslims in six countries -- Egypt, Iran, Malaysia, Nigeria, Turkey, and the United States -- and that you will be asking them to think about some specific issues while viewing. Put the following questions on the board and ask students to think about these issues as they watch the film.

1. What Muslim beliefs and practices do you observe in the film?

2. What roles do you see women playing in the film?

3. What are the connections between the legal system and Islam in each of the
countries? What are the differences?

4. Are there conflicts you observe in the film between globalization and the Muslim cultures you see portrayed?

5. In the section on Muslims in the United States, how do the people portrayed in the film view their roles as Muslims within a non-Muslim country?

After viewing, discuss students' responses to the questions.

Pre-Viewing Activity: Stereotypes and Myths about Islam

Description

Prior to viewing, students will write down what they know about Muslims and/or Islam. While viewing, they will look for information that confirms or contradicts what they know. After viewing, students will discuss their findings.

Instructions

Ask students to make three columns on a sheet of paper. The first column is for "Beliefs about Muslims prior to viewing." The second column is for "Contradictions or confirmations." The third column is a place for comments or questions to bring up for discussion after viewing the film.

1. Ask students to list what they know about Islam or Muslims in the first column on their sheet of paper. Typically, students will list a mixture of stereotypes and facts, so it will be important for teachers to be able to differentiate between the two. If students are quiet or in younger grades, teachers can prompt them by asking them if they know any famous Muslims. Often students will suggest people like Malcolm X or Muhammad Ali. Ask students how they know that those people are Muslim. This often gets them talking about stereotypes that they were aware of, but were not identifying as Muslim stereotypes. You can also stimulate discussion by asking students if they know what the major religions of the world are and what some of the differences are between them? This question will likely get students talking about Muslim women covering themselves, or Islam and violence.

2. Tell students that as they view the film, they should notice and write down in the second column whether any of the information they have written down in their first column is confirmed or contradicted. Tell them to be as specific as possible. For example, students typically list something about women not having rights. In the film, there are several examples of women working outside of the home.

3. Tell students that while viewing the film, they should write down in the third
column any unfamiliar vocabulary, issues or questions that come up for them. You could also hand out the glossary ahead of time to help them identify or circle words they do not know.

4. After viewing, stimulate a discussion by asking students to share what they learned, what comments and questions they have, and what stereotypes were confirmed or contradicted. Discuss with students where some of their stereotypes might originate. For example, how have they seen Muslims portrayed on television, movies, commercials, magazines, and newspapers?

Internet Resources

The following Internet sites provide easily accessible information about Islam. You can also give students the following Web site addresses to use in doing a research activity to follow up their viewing and discussion of the film.

- Islamic Information Center, www.Islaminfo.com
- Islamic Institute, www.islamicinstitute.org
- University of California Muslim Student Association, www.USC.edu/dept/MSA
- Islam Online, www.islamonline.net (explicitly by Sunni Muslims)
- Muslim Journal, www.muslimjournal.com

Teachers who would like to invite religious leaders or scholars into the classroom can also find contact information on the above-mentioned sites, as well the following Web site: http://www.ing.org/about_us.htm

Islamic Networks Group (ING) is a nonprofit, educational organization based in San Francisco that delivers presentations relating to Islam and the Muslim world with the goal of eliminating stereotyping through education.

For a list of countries with significant Muslim populations, visit the Web site of the Organization of the Islamic Conference to the United Nations: http://www.oic-un.org/about/members.htm

News and Politics

The following Web sites are good resources for news and information about the politics of American Muslims. These are also good sources for better understanding the global politics involving Muslims and Muslim countries.
• American Muslim Council (AMC), www.amconline.org
• Council on American Islamic Relations (CAIR), www.cair-net.org
• American Muslims for Global Peace and Justice, www.globalpeaceandjustice.org

Pre- or Post-Viewing Activity: Media Analysis

Description

Students will compare coverage of Islam or Muslim related news stories, such as Ramadan, in a U.S. and Islamic newspaper.

Instructions

1. Have students locate a news story from an Islamic news source, centered on Islam and/or Muslims in another country. Coverage of Ramadan is a good topic to focus on for this exercise. Students can find their news story online or bring a newspaper or magazine to class. See the listing below of sample newspaper Web sites.

2. Have students locate coverage of the same news story in a major United States newspaper such as The New York Times.

3. What do students notice about the way in which the event or story is told? What is the same? What is different? What is included and excluded?

4. Discuss the following questions: Do you see bias in each of the news stories? Are events covered in non-U.S. newspapers that are also covered in U.S. papers?

Examples of Online newspapers (in English)

• Arabia.com, www.Arabia.com (Arab News)
• Tehran Times, www.Tehrantimes.com (Iran)
• El Ahram, www.ahram.org.eg/weekly (Egypt)
• Chicago Tribune, www.chicagotribune.com

Alternative

Assign students to analyze their social studies or history textbooks looking for the
following: What does your book say about Islam? Does your textbook include contributions from Muslim-dominant countries as a part of world history? Is Islam mentioned in countries other than the Middle East, including the United States? How would you characterize the information your textbook tells you about Islam? (Note: This alternative is particularly useful for schools that do not have Internet access and/or access to international newspapers)

**Post-Viewing Discussion Questions**

Here are some questions designed to get students talking after the film:

- What did you notice about the relationship between Islam and the law in the different countries in the film?
- What are three things you learned about Islam from the film?
- What did you learn about the influence of globalization on Muslims who do not live in the United States?
- Name some of the tensions the film identifies between "the West" and Muslims

**Post-Viewing Activity: Gender Issues in Islam**

Students will be asked to compare and contrast the roles of men and women with regard to various topics in the six countries featured in the film.

1. Divide students into five topic groups: Paid labor, family, education, marriage, and activism. Alternatively, there can be six groups, one group for each country, and they can compare the roles for each of these categories.

2. Each group should discuss what they saw in the film about each topic or country, and prepare a brief oral report to present to the class. For each of the countries featured in the film (Egypt, Iran, Malaysia, Nigeria, Turkey, United States) they should review the roles that Muslim men and women play with regard to each of these topics.

3. After each group has presented their report to the large group, discuss the similarities and differences across countries, the differences and similarities between men and women, and how these roles differ from other religions they may know about. You can also discuss any conflicts they see between the culture of the country and Muslim practices they observed in the film.

Note: The film does not cover all of these areas for each country. You can assign students to research the 'blank spaces' for this exercise.
ACTIVITY NUMBER 7 [LESSON PLAN BASED ON PBS TEACHER’S MANUAL]

Student Teacher ________________________ Grade Level ______ Date of lesson _____________
Institution _____________________________ Length of lesson ______________

Content Standards: Identify one or two primary local, state or national curricular standards this lesson is designed to help students attain. How will the learning tasks lead students to attain the identified standards?

Learner Background: Describe the students’ prior knowledge or skill related to the learning objective(s) and the content of this lesson, using data from pre-assessment as appropriate. How did the students’ previous performance in this content area or skill impact your planning for this lesson?

Student Learning Objective(s): Identify specific and measurable learning objectives for this lesson. COGNITIVE, AFFECTIVE, SKILL DOMAINS; CONDITION OF LEARNING, OBSERVABLE BEHAVIORS, MEASURABLE PROFICIENCY

Assessment: How will you ask students to demonstrate mastery of the student learning objective(s)? Attach a copy of any assessment materials you will use, along with assessment criteria. PRE AND POST ASSESSMENTS

Materials/Resources: List the materials you will use in each learning activity including any technological resources.

Learning Activities:
Identify the instructional grouping (whole class, small groups, pairs, individuals) you will use in each lesson segment and approximate time frames for each.

Initiation: Briefly describe how you will initiate the lesson. (Set expectations for learning; articulate to learners what they will be doing and learning in this lesson, how they will demonstrate learning, and why this is important)

Lesson Development: Describe how you will develop the lesson, what you will do to model or guide practice, and the learning activities students will be engaged in order to gain the key knowledge and skills identified in the student learning objective(s). INCLUDE ELEMENTS WITH CONCEPT STATEMENTS; WHAT THE TEACHER IS DOING; WHAT THE STUDENTS ARE DOING; DISCIPLINE CONTENT
**Closure:** Briefly describe how you will close the lesson and help students understand the purpose of the lesson. (Interact with learners to elicit evidence of student understanding of purpose(s) for learning and mastery of objectives)

**Individuals Needing Differentiated Instruction:** Describe 1 to 3 students with learning differences. These students may be special or general education students and need not be the same students for each lesson. Students may represent a range of ability and/or achievement levels, including students with IEPs, gifted and talented students, struggling learners, and English language learners.

*Note: Differentiated instruction may not be necessary in every lesson. However, over the course of the student teaching placement, it is expected that each student teacher will demonstrate the ability to differentiate instruction in order to meet the needs of students with learning differences.*

<table>
<thead>
<tr>
<th>Which students do you anticipate may struggle with the content/learning objectives of this lesson?</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

**Notes from the pre-conference with your supervisor and/or cooperating teacher**

1. How will you know if your teaching objectives have been met?

2. What concepts or essential questions do you want your students to be able to answer during the lesson?

3. How do your materials/resources align with your teaching objectives?

4. How do your assessments align with your objective?

How History Shaped Literature and How Literature Changed History: Serbs and the Battle of Kosovo

Introduction | Task | Process | Evaluation | Conclusion | Teacher's Section | PDF

This 2-period lesson (with homework) explores the way in which history can inspire literature and literature can change the course of history.

Author: Lisa Adeli, Ph.D.
Introduction

Did you know that literature based on a medieval battle could help start a world war on June 28, 1914? could shape a dramatic break in diplomatic relations on June 28, 1948? could inspire events in June 28, 1989 that led 10 years later to genocide and the US/NATO bombing of a country? Well, according to the Serbs, that's exactly what happened - and why June 28 is a portentous date in their history!

So what's up with this date, and why is it so important in the history of the Yugoslav area? And what does poetry have to do with history and history have to do with poetry? Answering these questions is more than just an intellectual exercise for you; it may make or break your career.

You work for an intelligence agency that advises your country's leaders about important social/political ideas and trends in southeastern Europe. (You will find out later in what country and what year you are working.) June 28 is fast approaching, and you must report to your superiors about what is happening in the Balkans and what problems could arise on that day. Remember that not only your job, but your country's well-being AND the lives of millions of people hang in the balance.

Task

Day 1:

As a class, you will read and discuss a few of the legends of Kosovo. You will learn about what the stories mean to Serbian history and how they shaped the course of that history.

Day 2:

You and a partner will research a topic in Serbian history that is related to June 28. You will write a one-page report on the day's possible significance using the template that you are given. According to your teacher's instructions, you will either print out 3 copies of your paper (one for the teacher to grade; two for the class file to be shared with your classmates), OR if your teacher has created a blog, you will post it there.

Homework:

You must read at least one other student's work (either on the blog or by taking a copy of a paper from the file) and write a thoughtful response to it.
Process

Day 1:

Three Kosovo poems are provided for you in Document 1. It is a very readable translation not only from Serbian into English but from poetry into prose. As a class, read aloud and discuss the first poem ("The Fall of Serbia") and one or both of the following poems. Questions for discussion and answers to those questions (including more information that the teacher can share with students) are provided in Document 2.

**Homework:** Students should work in groups of two. (Whether students choose their partner or are assigned one is up to the teacher.) Half of the groups in each class should be assigned to read the background reading on the Sarajevo assassination of 1914; the other half should read the background reading on the 1999 Kosovo crisis. The background readings are also found in Attachment 2. (Note: Both members of a pair should read the same background reading.)

Day 2:

- Students should work with their partners, preferably with access to a library and a computer lab.
- Each pair chooses a scenario from the list. (Only one pair per class should sign up for any one scenario.)
- Each pair is given a task sheet. The list of scenarios, suggestions of websites, and task sheets are all in Document 3.
- The pair then researches the topic. They should divide up the work so that the group as a whole consults at least 3 different sources. (They may decide, for example, that both of them read a general overview and then each consult a different specific source.)
- Together, the pair does the writing assignment on the task sheet according to instructions.
- They then either post it onto the class blog OR make 3 copies to hand in (one copy for the teacher to grade, the other two to go into a file for their classmates to read.

**Homework (a few days later):**

- Each student individually reads a report by one of his/her classmates. Note: The student should choose a report that is a different scenario but from the same background reading that he/she read.)
- Each student then crafts a thoughtful, one-paragraph response, either posting it to the blog or handing it in according to the teacher's instructions.
### Relevant Documents:
- **Document 1:** Heroes of Serbia
- **Document 2:** Discussion Questions
- **Document 3:** Possible Scenarios

### Evaluation

<table>
<thead>
<tr>
<th>Category &amp; Score</th>
<th>Quality of research about the historical event - Part 1 of the guide sheet.</th>
<th>Analysis of the event and its potential impact on a particular country - Part II of the guide sheet.</th>
<th>Clarity of writing demonstrated in the report.</th>
<th>Written response to someone else's report.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beginning 1</td>
<td>One or two sentences in length. Demonstrates little understanding of the topic. Lacking in substance (generalities without specific information).</td>
<td>One or two sentences in length. Demonstrates little analysis of the topic. Lacking in substance (generalities without specific information). Little or no sense of audience (according to the students' scenario/role).</td>
<td>Writing is very difficult to understand. Use of simple sentences or confused style. Use of inappropriate vocabulary. Containing frequent grammatical or spelling errors.</td>
<td>One or two sentences in length. Demonstrates little understanding of the report. Comments lack in substance or reference to the specific topic.</td>
</tr>
<tr>
<td>Developing 2</td>
<td>One or two sentences of substantive comments OR a full paragraph of generalities. Some confusion about the topic.</td>
<td>One or two sentences of substantive comments OR a full paragraph of generalities. Some confusion about the topic or errors in information. Some problem writing to the scenario/role.</td>
<td>Writing is a bit awkward because of errors in sentence structure and vocabulary. Some grammatical and spelling errors.</td>
<td>One or two sentences of substantive comments OR full paragraph of generalities. Comments have some substance but not much.</td>
</tr>
<tr>
<td>Very Good 3</td>
<td>A full paragraph. Generally reflects knowledge of the topic but with a significant error or lacking specific references.</td>
<td>A full paragraph. Generally reflects knowledge of the topic but with a significant error or lacking specific references.</td>
<td>Writing is generally clear but containing a few errors in grammar, structure, or vocabulary.</td>
<td>A full paragraph. Generally reflects knowledge of the topic but with a significant error or lacking specific references.</td>
</tr>
<tr>
<td>Exemplary 4</td>
<td>A full paragraph or more. Excellent knowledge of the topic with specific examples to support the main assertions. Analytical.</td>
<td>A full paragraph or more. Excellent knowledge of the topic with specific examples to support the main assertions. Analytical. Convincing writing in accordance with the role they are playing.</td>
<td>Writing style that is fluid and easy to follow. Varied, complex sentence structure. Appropriate vocabulary. No major grammatical or spelling errors.</td>
<td>A full paragraph or more. Excellent knowledge of the topic with specific examples to support the main assertions. Analytical.</td>
</tr>
<tr>
<td>Score</td>

</tbody>
</table>

**Total Score:** %100
Conclusion

This lesson has shown how history influenced Serbian literature and how that literature, in turn, changed the course of history. But does this extreme example have any relevance to us?

Yes, it does. Even though the Serbian case is unusually vivid, it illustrates an important part of human culture. The fact is that even here, even now, our stories (oral, written, film) draw from our sense of history to shape who we are and what we believe about ourselves and about the rest of the world.

Teacher's Section

Focus:

This webquest was designed for high school World History, English, or Social Studies/English block classes. The lesson requires 2 days of in-class work and 1-2 evenings of homework.

Required Preparation:

It is best if students have some knowledge of the geography of southeastern Europe and the history of the Ottoman Empire. However, you can easily teach the lesson without the students having much prior information.

Targeted Skills - Based on Arizona State Standards:

Grade 10 Reading:

- Concept 2: Historical and Cultural Aspects of Literature. PO 1: Describe the historical and cultural aspects found in cross-cultural works of literature.

Grade 10 Writing:

- most concepts for persuasive writing

High School Social Studies: World History Strand:

- Concept 1: Research Skills for History. PO 5 - Evaluate primary and secondary sources. PO 7 - Compare present events with past events.
Concept 3: The World in Transition. PO 3 - Compare the development of empires. (The Ottoman Empire is specifically cited.) PO 4 - Describe the interaction of European and Asian civilizations from the 12th to the 16th centuries.

Concept 8: World At War. PO 1 - Examine the causes of World War I. (Subsequent points include specific references to Balkan nationalism.)

High School Social Studies: Geography Strand:

- Concept 2: Places and Regions. PO 4 - Analyze the differing political, religious, economic, demographic, and historical ways of viewing places and regions.

Student Requirements during the Project:

- access to a computer

Teacher Requirements during the Project:

- a handout for every student of "the Fall of Serbia" and EITHER "The Death of the Yugovichi's Mother" OR "The Maiden of Kossovo"
- an overhead projector OR computer with power point and projector OR a large map of showing the medieval Balkan states just before the Ottoman invasion

A Cultural Inquiry into the Education of Muslim Students in America

SomayyahNahidian

Copyright 2001 by SomayyahNahidian
Included here with permission of the author

It all started when I was a child — a Muslim child growing up in the middle to high-class suburb of McLean, Virginia. I slowly began noticing that I was different from everyone else and what went on in my house was very different from what went on in my neighbor’s house. Religion has always been an important part of my family’s life. In fact, it was in the fourth grade where I had to decide just how much it would be a part of mine. According to Islam, girls from the age of nine should begin covering their hair from men, other than relatives. I remember telling my closest friends a few weeks before my ninth birthday that I would begin wearing a scarf to school. I guess I was trying to prepare them and I needed to know that I would still be accepted by them. Of course, being the good friends that they were, they saw no big deal in it. But I was always concerned about the rest of the school and the reactions of the other kids. At that time, in the ’70’s, there weren’t a whole lot of Muslims in the area and I certainly didn’t know anyone my age, even in our small community, who would have been going through what I was. Now it is very common to see Muslim children in public schools and girls wearing scarves or other types of hair coverings. Nonetheless, I was faced with a tough decision. My parents never forced anything on me. My father taught me about Islam and told me why we do certain things, but always said the decision was mine. I knew my parents would love and support me whatever I decided to do, but I also knew that my father would be so proud of me if I decided to follow the way of Islam, especially in a society that often ridiculed it. At that time, pleasing my father and making him proud was all I knew. I do remember asking my mom the day before my ninth birthday if I could wear a wig instead of a scarf! I actually already knew the answer and when she
laughed and said, "The purpose of covering your hair is to keep your beauty for only certain men to see," I felt empowered by the fact that I would have something special about me that not everyone could see. She compared me to a gift that you wrap neatly to give to a friend and surprise her. She said I was so special that I needed to be covered from the eyes of men and kept safe for only the man I marry and those in my family.

My decision was made! I would do my best to please my parents (and God) because it made sense to me. I went to school from November 1st, 1977 on, covering my hair. I was asked a lot of questions, some friendly, some not. I was laughed at, stared at, and the topic of many whispering conversations as I walked through the school hallways and cafeteria. But my confidence was never shaken and I never regretted my decision.

I went to Iran for my seventh grade school year and came back to the U.S. the next year to attend a newly established Muslim school in Washington, DC. Of course, I had no problem "fitting-in" in Iran and now for the first time in the U.S., I was among other girls my age who were also Muslim!! I graduated from that Muslim school and went on to the University of Maryland to receive a Bachelor of Science degree in elementary education and have returned to that same school to teach. I have been teaching there for ten years. My students find it interesting that some of their teachers were once my teachers and are now my colleagues.

I feel as though we have all been put on this earth for a purpose. We all have interests and talents in different areas and I have always asked myself what can I do for the Muslim community I am a part of. I enjoy teaching and hope to instill a sense of confidence in my students that it is okay to be Muslim in a society that has a severe misunderstanding of what Islam and Muslims are. Hence, my puzzlement.

Puzzlement

The puzzlement I have as a teacher in a private, Muslim school is how can we ensure pride in our students' identity as Muslims growing up in a non-Muslim society? We have seen that simply attending a Muslim school is not enough. As much as we try to shelter our students from the un-Islamic aspects of the society we live in, we still find it creeping in via some students. Do the parents know that their children may be watching certain television shows or reading certain books or magazines that could do more harm to a Muslim child's mind than good? Is there more we, the teachers, should be doing? This has been a question I have had for a while now as I notice that
it is getting harder and harder to teach academics mixed in with Islam to students who seem to be uninterested.

Known Information

The school is located in the Washington, DC, metropolitan area and consists of both elementary and secondary grades. The first floor is where the school offices, lunchroom, kitchen, auditorium and prayer room are located. The second floor houses the pre-K through sixth grades and the third floor is where the seventh through eleventh grades are.

The school is accredited by the state. Teachers and other staff are all Muslim and they follow the county's curriculum. In addition to the core subjects of Math, Science, Social Studies and English, students are also required to take Arabic, Islamic Studies and attend the weekly Friday Congregational Prayer (only students in the fifth grade and higher attend the Friday Prayer which consists of a sermon followed by prayer). All students attend the daily prayer time from 1:40 to 2:10 pm.

To help enforce the Islamic dress code, students are required to wear uniforms. The boys‘ uniform is a dark blue shirt worn over black pants and the girls‘ uniform is a loose fitting, greenish-blue top that comes just above the knees and is also worn with black pants. The girls must wear either white or black scarves.

The school does not have an elaborate transportation system. About ninety percent of the families commute back and forth to the school to drop off and pick up their children from all over Maryland, Virginia and DC. Some parents carpool and there is one van that picks up children. So some students must get up very early to get to school on time for the 8:00 am opening.

The school has a very limited budget, running strictly on tuition payments and donations. Teachers‘ salaries are less than half what they could receive in public schools. But the strong sense of dedication and responsibility among the staff makes up for whatever monetary incentives the school lacks. Teachers think of their jobs as an investment in the "hereafter" and as a form of charity, which is highly regarded in the religion.

Monthly staff meetings are held with the entire staff and biweekly "team meetings" are held on each floor (i.e. there’s an elementary team and a junior and high school team). Minutes of these meetings are provided to all staff members so each team is familiar with what the other team discusses. Common concerns have included the
following observations made by teachers on both teams, but especially the junior and high school team:

There are some students in the school who mention wishing they could go to regular public schools. They say they don’t understand why their parents insist that they attend a Muslim school. When the entire school reports to the prayer room for the daily prayer there are always a few who try to get out of the prayer, often coming late or asking to go to the bathroom once they get there and not showing up till the prayer is over. Some students will try their hardest to get out of wearing the uniform. They claim it's lost or needs mending, etc. Students do not show much enthusiasm in their classes, including Islamic Studies and Arabic. They don’t understand the need for such classes and will do the bare minimum to get by. When parents are spoken to, some offer their support and will intervene. But there are some parents who feel that since their kids are attending a Muslim school and they are paying tuition, the school is responsible for teaching their children everything about the religion. These parents are often working long hours and do not spend a whole lot of time with their children.

On the other hand (and this is something I find interesting) whenever there is a political event, such as rallies for innocent Muslims put in jail based on "secret evidence" or demonstrations against the Israeli killings of Palestinians, the students are ready to go and show their support. They don’t question participating in those types of things and will, in fact, be very vocal about their opinions.

Cultural Questions

Using the Cultural Inquiry Process (CIP), I am wondering if there are mismatches between what is emphasized at home and what is emphasized at school (CIP Step 3.3). Are there outside influences on the students that are contributing to my puzzlement (CIP Step 3.4)? Do the students watch a lot of television? Many, actually most of the ideas and topics shown on the popular television shows, are directly opposite those emphasized in Islam. Specifically, dating, sex outside of marriage, and disrespect/sarcasm towards one’s elders, parents or others, are all very common themes in such television shows and all of them are to be avoided in Islam.

I feel many of the answers to my puzzlement lie in the fact that our students have to do something their parents never did: grow up Muslim in a non-Muslim society, and
with pride. As I look at the students, I see that either their parents migrated to the United States after growing up and getting married in their own culture (be it Pakistani, Arab, Afghan, Iranian, etc.), or if the parents are American born and raised, they converted to Islam later in life. This is true for every one of my own nine students and all of the upper level students. This is important for me to consider because it means that the parents don’t know what their children are facing and if they know, they might not know how to deal with the situation since they never had to defend their religion as children.

Therefore, I will be focusing on a couple of cultural questions from the CIP. Mainly, how might influences on students from outside school be contributing to my puzzlement (CIP Step 3.4) as well as how might individual students’ negotiations of home, peer, and school cultures be contributing to my puzzlement (CIP Step 3.5)?

Gathering Information

To begin gathering information I realized that I needed to hear from the students themselves. The questions I wanted to ask required very honest and frank responses. I didn’t want the students to feel as though they had to watch what they say. To help ensure honesty in their responses, I prepared a written questionnaire (see Appendix). I didn’t ask for any names on the questionnaires, just grade levels. I wanted to know the grade levels because I think there’s a big difference in the elementary level’s overall attitude and that of the upper level. Perhaps my concern is better explained by Hillary Clinton in her book, It Takes A Village, "However we go about it, we must recognize that the years of adolescence have traditionally been the times of greatest opportunity and greatest danger.” (Clinton, 1996) So, one day after the daily prayer, I asked the fifth graders and up to remain for a moment. Once everyone else was dismissed I presented my questionnaire to the students telling them that I needed their help for a paper I was writing. Luckily, I have a pretty good relationship with the students, even the upper level kids were once my students and they will stop by every once in a while to say hello. So almost every single student in the prayer room that day agreed to fill out my questionnaire. I even had to run to the office to make more copies. I began receiving completed questionnaires that afternoon and for the next few days.

I received fifty completed questionnaires from the 80 students in grades 5 through 11. I separated the questionnaires by grade level and began going over their responses. When asked whether they felt that being Muslim was difficult, almost half said "yes" and half said "no." Some of the responses from those who said "yes"
included: "Because we get a lot of temptations from the society" and "Because there are many rules and laws. It’s very hard for kids today". A few who said no added that you should just be yourself and not worry about pleasing others and it won't be difficult. One student wrote: "If you know that your pleasing God and your taking a step in the future that will be good and if you do it for the love of God it is easy."

More female students commented that it is difficult because of the head covering and modest clothing that they have to wear. They wrote that it makes them stick out in the society and people stare. Even some of the boys confirmed that fact by saying that it’s easier for them to be Muslim because they blend in with everyone else.

I was surprised with the responses I got when asked about television watching. Only five students said they didn’t watch television. The rest mentioned shows like: Simpsons, Gary and Mike, Recess, Moesha, MAD TV, Friends, music videos, cartoons and MTV. I believe these TV shows are examples of outside influences and often the worst type. As reported by Mark Crispin Miller, the author of Boxed In: The Culture of TV, "If you watch Saturday morning kids‘ TV, you can see it in programming that is unrelievedly frantic, hyped up, hysterical, in its own way quite violent and pervasively commercial. It’s all about selling, and this, I think, is the primary reason why there is something of a cultural crisis involving children" (Miller, 2001). Shows intended for teenagers often lack parents and other adults or has adults that don’t matter. The kids in many of the shows mentioned have "adultified kids". Perhaps it is a reflection of today’s society where in many households both parents are working and children are left on their own for huge amounts of times. Muslim families are no exception. Yet in Islam, respect for parents and elders in general is very important. Our parents are our guiding lights through life and should be treated in respectful manners at all times. The children in our school don’t spend a lot of time with their parents. Responses on the questionnaire ranged from five minutes to four hours, with an average of one hour being the actual amount of time spent with parents each night — not on the computer or in another room, but actually with their parents. Considering how much reassurance and guidance Muslim children need in this society to maintain their beliefs, I feel this is not enough time. As Lang (1997) has said:

In an environment where their religion is greatly feared, where of all of the great world religions theirs is the most despised, where its rituals and practices are the most demanding, where its constraints seem to go against the larger society’s trends and lifestyles — in such an environment, we should not at all be surprised if a significant fraction of children born to Muslim parents leave aside the faith they inherited. (p.5)
Most of the students responded that they learn more about their religion at school in Islamic Studies classes but agree that such learning should come from a combination of both the school and home. Some said that they learn the basics at school but see it put into action and practice at home. One of the keys to raising Muslim children in this society is exposure and lots of it. Not just at school, but in the home and by participating in and visiting local mosques. "Churches, synagogues, mosques, and other religious institutions not only give children a grounding in spiritual matters but offer them experience in leadership and service roles where they can learn valuable social skills" (Clinton, 1996, p.173).

As I hypothesized earlier, all but two of the questionnaires came back stating that either both parents of the student grew up in another country, or both grew up in America but not as Muslims or one parent grew up in another country as Muslim while the other is an American convert to Islam. This, I believe, is where the problem lies and where any interventions should begin.

Children who come from religious Muslim families are caught between very different worlds: that of their home and that of the larger society. They may be Muslims, but their experience is very different from their parents. Unlike their mothers and fathers, they are not immigrants, converts, or children of the Civil Rights struggle. Their situation is much more ambiguous. Their causes, goals, and identities are not defined so clearly. Unlike immigrants, America is the only culture they really know. Unlike converts, Islam was chosen for them as a religion. They may face discrimination and prejudice, but it is very different from what African-Americans faced in the past. The way they think about, discuss, and explore issues is identifiably American. Their religion does influence their morals and ethics, but these are also influenced by the mores of American society. (Lang, 1997, p.222)

And to make matters worse, the parents are not aware of these differences; or if they are aware, they don’t know how to handle the situation. Muslim parents can help their children discover what the message of Islam is and help them compare its values to that of the society and decide for themselves which is the better way of life. But it will take patience and courage because that discovery might not be a smooth and steady climb.

In the words of the students themselves: "I have it much harder than my parents because they were non-Muslim back in the day"; "If you like go to the mall you see
people wearing shorts. My parents were not Muslim they don't know how hard it is; "I have it harder because the U.S. shows a lot of bad things on TV than when my parents were children"; "Actually my parents do understand what I am faced with. They try to make life easier for me by bringing me to a Muslim school so other kids won't make fun of me"; and "My mother who converted understands but my father who is Pakistani has the idea that everything that happens has to happen like it does in Pakistan and has no idea what I'm going through." There were also a few who commented that their parents are understanding.

I am reminded of Phelan, Davidson and Yu's *Students' Multiple Worlds* model that identifies six descriptions of students' worlds and their perceptions of borders (Jacob, 1999). When asked to choose which description best describes them (see question 17 in Appendix), the majority of students chose the "different worlds/border crossings managed" pattern, with about the same number of students choosing the "congruent worlds/smooth transitions" pattern. My interpretation of these data is that it seems that our students are aware that there's a difference between their worlds and that of the rest of society, yet they are able to manage living in both. This is promising. We want the students to be aware of "what's out there" because it can't be avoided in totality. We do want our students to feel normal and natural in their own society, which includes continuing to practice their Islamic beliefs.

**Interventions**

The focus of my interventions needs to be three-fold. First, I need to change my own beliefs and perceptions of our students. I never expected to get such a response from the students in the first place. Like I said, I had to get additional copies of the questionnaire because I didn't think the students cared enough to respond. I was also very impressed with the answers they gave to my questions. A lot of them were well thought out and students were often running out of space to write. This is a message I need to send to my colleagues, as well: don't underestimate these students! If asked in the right manner, they will respond quite eloquently. We should treat them as the young adults they are and maybe even stop worrying so much. As long as the students have a strong foundation in understanding their religion, they will most likely do fine. We need to listen to them and give them time to express their thoughts and concerns in the classrooms, assuring them that they are safe in doing so. We need for them to feel comfortable questioning the rules and guidelines of Islam and how they relate to their lives. We should be ready to catch our students being good as often as we are catching them doing wrong. Letting a student know how much we
liked what they did right is a better motivator than getting after them for what they did wrong.

Second, we must come up with a counter attack for the outside influences to which our children are exposed. This is one area that teachers cannot tackle alone. My belief is the biggest outside influence is television. With the parents help, we need to come up with an alternative pastime or at least keep it under a minimum and well supervised. Students need to learn to be their own policemen and monitor their own behaviors. If they must absolutely watch television, then they should understand that they cannot expose others to anything inappropriate. This goes back to strengthening their foundation. Enjoining the good and forbidding the evil is a pillar in Islam that our students need to practice.

Finally, we need to help our students view the borders they may encounter as learning experiences rather than as obstacles in their lives. Again, parental involvement will be needed to help reduce the borders our students face. "Children who truly grasp that they have a choice are more likely to make a responsible one. Most influential of all is the optimism and awareness that comes from knowing their parents are interested in and involved in their lives" (Clinton, 1996, p. 166).

When I was reading over the completed questionnaires, I kept thinking how some parents and teachers would love to read what I was reading. When students feel unthreatened to speak their minds, a whole lot can be accomplished. My interventions center around one goal: communication. Parents need to be informed of their children's feelings. Teachers need to be informed of their students' feelings. I presented my findings to one of my colleagues and she agreed that I should share the information I have gathered to the teachers and parents. I asked for a few moments to speak during the next staff meeting and during the next parent/teacher meeting, which are held on a monthly basis. I feel more "at home" speaking among my colleagues, so I chose to do that first, as a practice run for facing the parents.

My colleagues were very impressed with the information I shared with them and we decided to allow more time for our students to simply share what's on their minds before the beginning of each class. It is important that we are mindful of the different personalities among our students and how some will find it easy to be Muslim in America while others have a more difficult time with it. I mentioned our Barnga activity and how some of us were more adamant about our points of view while others gave up and went with the flow.
We also agreed that all teachers, not just Arabic and Islamic Studies teachers, should include Islam in their lessons more often. If students can see how Islam is part of all aspects of their lives then hopefully they will feel more of a connection to it. We designated a shelf in the teachers’ lounge for books that we may each have in our possessions that will help us achieve that goal. Most of these are books that include stories of the prophets’ lives and the contributions to science, math and literature made by Muslims throughout history - things that our students will not find in their textbooks, but would make them proud of their ancestors and heritage.

Next came what I thought would be the toughest group to reach — the parents. Monthly parent/teacher meetings are held on the third Sunday of each month. I was given 15 minutes to present my findings. After doing so I suggested that parents be mindful of what their children watch on television. I went on giving them a feel for what their children might be experiencing growing up in America as young, very impressionable Muslims. Some of the experiences I shared were personal ones I remembered from my childhood, while others I read word for word from the questionnaires I was given. The room was very silent while I spoke to the approximately thirty parents who were present. At the end of the meeting, I was approached by several parents who thanked me for my presentation. They expressed their concern for the children as well, and said we need such reminders from time to time.

Monitoring the Interventions

My only strategy for monitoring the success or failure of the above mentioned interventions was to check on occasion with my colleagues to see if they noticed any changes in students’ attitudes. I waited until the next staff meeting and raised that question. While progress seemed slow, I was happy that there was some progress. We all agreed that emphasis should be placed on the younger students — our elementary students. Preparing a strong foundation seems to be the best insurance we have in guaranteeing proud young Muslim adults. It is at that age that children still find it important to please their parents and teachers. Trying to fit in is not an issue. They were the ones who gave all positive answers on my questionnaire saying they don’t want to attend public schools, they enjoy their Arabic and Islamic Studies classes and they do not find being Muslim a difficult task. We need to strengthen that confidence to help buffer what these same kids will face in a few years as young adults. Our collection of books in the teachers’ lounge to help each other integrate Islam into our lessons is growing. I expected some difficulty for teachers to change their teaching strategies in such a short time. Most agree that next year would be a
good time to make more substantial changes in the way things are done for the benefit of our students.

I was also unable to monitor how the parents are doing with their children. My goal was to inform, it is out of my league to enforce anything. But knowing the dedicated and concerned colleagues of mine, I don't doubt that they will continue to do their best to instill pride in our students. Whether or not my interventions are successful will be seen over the next several years.

Conclusion

Even though my focus has been on what we, Muslims are doing wrong or what we can do better for our children/students, what really needs to happen is the current public perception of Islam as a religion alien to America needs to change in order for our children to grow up with less difficulty. If and when Islam becomes an acknowledged and contributing part of American culture, some Muslim children will no longer feel the need to distance themselves from Islam or downplay its impact on their lives. Some borders will disappear and the difficulties our students face will begin to fade. I guess I am really speaking to the western media that has tarnished Islam’s image in the eyes of the public.

In the meantime, and in case such changes never come about, we are forced to accept the fact that this generation of Muslims in America are faced with a difficult task. They must seek to harmonize their Americanness and their religion, striving to be good Muslims while being good citizens as well. Some may see that as impossible. I see it as a challenge.

ACTIVITY NUMBER 9 [see previous reading as a model]

Cultural Inquiry Process Steps: Overview

http://classweb.gmu.edu/cip/g/gs/gs-top.htm

This page introduces you to the Cultural Inquiry Process (CIP). The page titled, "Cultural Inquiry Process Steps: Conducting Your Own CIP Study," helps you understand how to use the Guidebook section of this Web site to support conducting your own CIP study.

As you read these pages, you may want to use the links provided to read the items they describe. If you do follow a link, please remember to return to these introductory pages and finish reading both of them before starting your own CIP study.

Cultural Inquiry Process (CIP) steps

The Cultural Inquiry Process (CIP) has seven basic steps:

1. Select as your focus one or more students and identify your puzzlement(s) about the student(s).

In this step you consider possible foci for your study and select one as the focus of your CIP study. (See the following note for a discussion of using the CIP with puzzlements not related to students.)

2. Summarize what is already known about the focus individual(s) and the context.

In this step you collect and summarize easily available information about your focus student(s) as a first step in increasing your understanding about your puzzlement.

3. Consider alternative cultural influences and select one or more of them to explore.

In this step you carefully consider possible cultural influences on your puzzlement by reading all the CIP pages under Step 3 with your puzzlement in mind. After considering the various cultural influences presented in Step 3, you decide on one or
more cultural influences to examine in your study. The influence(s) you select become the basis for your research question(s).

4. Gather and analyze relevant information as needed.

In this step you collect and analyze information to examine whether and how the cultural influence(s) you selected in Step 3 are related to your puzzlement. After analyzing the information you collected, you decide what cultural influences seem to be relevant to understanding your puzzlement. These influences provide the basis for your work in Step 5.

5. Develop and implement intervention(s) as needed.

In this step you design and implement intervention(s) based on the information you collected and analyzed in Step 4 and the decision you made about cultural influences.

6. Monitor the process and results of intervention(s).

In this step you again collect and analyze information. This time the focus is on monitoring the process and results of your intervention(s) to see what effects your intervention(s) are having in relation to your puzzlement.

7. Write a report of your CIP study.

In this step you write your report of your CIP study, describing what you did, what you found, your reflections on what you found, and what you think are the implications of your study for educational practice and future research.

As the summary of Step 7 and the CIP logo suggest, the end of the CIP takes you back to the beginning, with new understandings, but possibly also with new puzzlements. Thus, the CIP can provide the structure for an ongoing process of inquiry focused on improving your teaching (or other educational) practice.

Moving through the CIP steps

In general, you will proceed through the CIP steps one step at a time. However, you may find that you need to cycle back through one or more steps as you conduct your study, creating more of a "spiral" process. For example, if at the end of Step 4 you
decide (on the basis of the information that you have collected and analyzed) that the cultural influence(s) you selected in Step 3 are not appropriate, you might reread the pages of Step 3 in light of your data to identify a more appropriate cultural influence. A visual diagram of the CIP presents an overview of the process of moving through the seven CIP steps. (The diagram is in PDF format and will open in a new window.)

With this basic overview in mind, you may find it helpful to read some CIP studies that other educators have conducted. These provide a wide range of examples showing how educators have used the CIP to improve the educational experiences of students. If you decide to read some CIP studies at this point, return here afterward to finish this page.

Complete your introduction to the Cultural Inquiry Process by reading "Cultural Inquiry Process Steps: Conducting Your Own CIP Study."

**How to Cite the CIP Web Site**

To cite a page from the CIP Web site, identify the URL of the page itself (not the frameset). Because the site uses frames, the URL displayed in your browser will be the URL of the frameset, not the pages displayed. To identify the URL for the specific page, open the frame in a new window (typically, right click on the desired frame and select "Open Frame in New Window").

We recommend the following generic citation format:

Author/editor. (Year). Title (edition), [Type of medium]. Producer (optional). Available Protocol (if applicable): Site/Path/File [Access date].

Pre-Test Your Knowledge of Islam

- What are the pillars of Islam? What does the word "Islam" mean? Who are the prophets and the angels? Take this quiz and see how much you know about the religion of the world's 1.3 billion Muslims.
- Click on the above link in this slide.
- Please answer all questions before moving forward to the end of the quiz.
- Save your score.
Islam

Arabic: al-islām
"the submission to God" is a monotheistic faith, one of the Abrahamic religions, and the world's second-largest religion.

Islamic Symbols

“The star and crescent is the best-known symbol used to represent Islam. It features prominently on the flags of many countries in the Islamic world, notably Turkey and Pakistan. Surprisingly, the symbol is not Muslim in origin. Rather, it was a polytheistic icon adopted during the spread of Islam, and its use today is sometimes controversial in the Muslim world.”

“It is important to keep in mind that Islam has few traditional symbols, and the crescent moon and star are not ones that are recognized as traditional symbols by Muslims. The symbol is due to cultural diffusion and the spread of Islam to the Ottoman Turks who ruled a large area and also put the crescent moon and star symbol on their flag. It has since become associated with Islam”.

http://www.religionfacts.com/islam/symbols.htm
The crescent and star are said to be Islamic symbols, but flag historians’ citations state that they were the insignia of the Ottoman empire, not of Islam as a whole.

HOW DOES GLOBAL RELIGIOUS ADHERENCE COMPARE, 2007-2009?

Ethnicity of Muslims

- African-American: 30%
- Arab: 25%
- South-Central Asian: 33%
- Southeast Asian: 2%
- European: 2%
- Other: 5%
- African: 3%

Ethnicity of Muslims in America:

http://www.nvcc.edu/home/lshulman/Religions/Islam/index.html

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy

The Qur’an, the Sunnah and the Hadith

http://islamislife.org

• The Qur’an and the Sunnah hold a pivotal place as the source of understanding of religion.
  – They do not abrogate each other.
  – They cannot be overruled by Hadith.
  – They contain the entire religion.

• Hadith can
  – explain these sources or
  – provide the best example set by the Holy Prophet (pbuh)
  – not abrogate or contradict the basic body of religion
  – not add to the content of religion
  – explain the Holy Qur’an and the Sunnah, and
  – dictate sense and reason.

The Islamic Worldview

To Al-Faruqi and Al-Faruqi (1986), “The Islamic worldview is based mainly on Tawhid (the Unity of God) as a general view of reality, of truth, of the world, of space and time, of human history” (p. 74). Rashid (1990) suggests that the Islamic worldview consists of “(a) Inmate goodness of human beings, (b) Moral absolutism, (c) Unitary concept of Creator, (d) Brotherhood based on faith, (e) Women as mothers of civilization, (f) Domination of the earth is for Allah (God), and (g) Unity of knowledge” (p. 19).
“The Qur’an is the basis of all Islamic understanding”

http://www.islamislife.org

CONCEPTS FROM THE QUR’AN

http://islamislife.org

• Purpose of Religion
  – “The purpose of our lives is to please God; which leads us to Paradise”
  – “Successful is he who has cleansed himself.” (87:14).

• The Concept of Guidance
  – “Human beings have not been created blind and ignorant”
  – “Have we not shown him the two ways [that he could understand the good and the evil]? (90:10).

• Source of Religion
  – “The Prophet or messenger of God is the solitary source of the religion”

• Authority of the Qur’an
  – “The Qur’an is the fountainhead of religious authority.”
  – “And to you (O Prophet pbuh), we have revealed a Book with the truth confirming what the previous scriptures (say about it) and it stands as Guardian over them……… (5:48)
THE SUNNA AND ISLAMIC LAW

“The Quran also tells us to obey the Prophet Muhammad (Surah an-Nisa verse 59), to take what he allows and refrain from what he prohibits (Surah al-Hashr verse 7), to follow his judgments (Surah an-Nisa verse 65), and to abide by his decisions (Surah al-Ahzab verse 36).”

“It also tells us that some of its verses are ambiguous in meaning (Surah Ali Imran verse 7), and that the Prophet Muhammad will explain the meaning of the revelation (Surah an-Nahl verse 44). All of this is the domain of the Sunna.”

“The Sunna records what the Prophet Muhammad said, did, and silently allowed. It shows us how he put the Quran into action. It tells us what he commanded, allowed, prohibited, judged, and decided. And it informs us how he explained the Quran.”

“The Sunna is an important and necessary source of Islamic law.”

Six Basic Beliefs Shared By All Muslims:

“Belief in God, the one and only one worthy of all worship. God is described in Sura al-Ikhlas, (chapter 112)

Belief in all the Prophets and Messengers (sent by God).

Belief in the Books sent by God.

Belief in the Angels.

Belief in the Day of Judgment (Qiyamah) and in the Resurrection.

Belief in Destiny (Fate) (Qadaa and Qadar in Arabic). (Note that this does not mean one is predetermined to act or live a certain life. God has given the free will to do and make decisions.)

www.baydenocuu.org/Islam.htm
In some verses of the Quran, God almighty swears by the Quran itself:

**Chapter 36, Verses 2-4:**
I swear by the Quran full of wisdom, most surely you are one of the messengers, on a right way.

**Chapter 38, Verses 1-2:**
I swear by the Quran, full of admonition, nay! those who disbelieve are in self-exaltation and opposition.

**Quran, Chapter 43, Verses 2-3:**
I swear by the book that makes things clear, surely we have made it an arabic quran that you may understand.

**Quran, Chapter 44, Verses 2-3:**
I swear by the book that makes manifest (the truth), surely we revealed it on a blessed night surely we are ever warning.

---

**Quranic Verses about Hijab**

"O you Children of Adam! We have bestowed on you raiment to cover your shame as well as to be an adornment to you. But the raiment of righteousness, that is the best. Such are among the Signs of Allah, that they may receive admonition." (Quran 7:26)
Quranic Verses about Hijab continued

"And say to the believing women that they should lower their gaze and guard their modesty; that they should not display their beauty and ornaments except what must ordinarily appear thereof; that they should draw their veils over their bosoms and not display their beauty except to their husbands, their fathers, their husbands’ fathers, their sons, their husbands’ sons, their brothers, or their brothers’ sons or their sisters’ sons, or their women or the servants whom their right hands possess, or male servants free of physical needs, or small children who have no sense of the shame of sex, and that they should not strike their feet in order to draw attention to their hidden ornaments. And O you Believers, turn you all together towards Allah, that you may attain Bliss." (Quran 24:31).

"A Muslim woman wears hijab for the simple reason that God has commanded it in the Quran and Sunna."

"O Prophet, tell your wives and your daughters and the women of the believers to draw their cloaks close round them (when they go abroad). That will be better, so that they may be recognised and not annoyed. Allah is ever Forgiving, Merciful." (Quran 33:59)

We.Love.Hijab

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy
THERE ARE 5 BASIC TENETS OF ISLAM

www.baydenocuu.org/Islam.htm

"Shahadah": The Testimony that there is none worthy of worship except God and that Muhammad is his messenger.

"Salah": Establishing of the five daily Prayers (salah).

"Zakat": The Giving of Zakaah (charity), which is one fortieth (2.5%) of the net worth of savings kept for more than a year, with few exemptions, for every Muslim whose wealth exceeds the nisab, and 10% or 20% of the produce from agriculture. This money or produce is distributed among the Muslim poor.

"Ramadhan": Fasting from dawn to dusk in the month of Ramadan (sawm).

"Hajj": The Pilgrimage (Hajj) to Mecca during the month of Dhul Hijjah, which is compulsory once in a lifetime for one who has the ability to do it.

Tenets of Islam

While faith in God, the Qur’an, and the Prophet Muhammad unite Muslims in their common belief, the five pillars of Islam provide a unity of practice in the midst of rich diversity. The five pillars are the common denominator, the five essential obligatory practices that all Muslims must follow (Esposito, 1995). They are (a) shahadah (the profession of faith), (b) salat (prayer), (c) zakat (almsgiving), (d) sawm (fasting), and (e) hajj (pilgrimage). To understand the significance as well as the influence of each of these tenets on the lives of Muslims, I provide the following more detailed information.

QUOTE FROM AHMED NIZAR KOBEISY’S TEXT

Kobeisy p. 22

http://www.euro-islam.info/country-profiles/united-states/
QUOTE FROM AHMED NIZAR KOBEISY’S TEXT

Shahadah (Profession of Faith)

For Muslims, a declaration of faith identifies the belief that there is no god but God and that Muhammad is the last Messenger (Al-Faruqi, 1994). By uttering this declaration, one becomes a follower of Islam (Farah, 1994). It also makes Muslims aware that only God has supreme power and that it is their duty to emulate the exemplary life of the Prophet Muhammad (Al-Faruqi, 1986; Alatech, 1996; Farah, 1994). Shahadah is the first few spoken words a newborn baby hears and the last a dying person would speak (Farah, 1994). It, therefore, acts as a source of identity. It also helps bind Muslims in the community of faith (survival) and at the same time helps overcome barriers of race, ethnicity, national origin, language, or culture (Ahtareb, 1996; Haddad & Lummiss, 1987).

Kobeisy p. 22

“Whoever works righteousness, whether male or female, while he (or she) is a true believer, verily to him we will give a good life, and we shall pay them certainly a reward in proportion to the best of what they used to do.”

Quran 16:97

Shahadah

QUOTE FROM AHMED NIZAR KOBEISY’S TEXT
Kobeisy p. 22-3

Salat (Prayer)

Salat is the second pillar of Islam and the supreme act of worship in Islam (Al-Faruqi, 1984). Many Muslims disagree with the translation of the Salat into prayer. Al-Faruqi (1984) states, “It is mistakenly referred to as "prayer." The latter is an act of adoration or worship possible in any shape, form, language or condition... Per contra, Salat may be performed only at certain times, in a prescribed way, under certain conditions” (p. 142).

Salat in the Arabic language means “connection.” The sole purpose of salat in Islam is to connect Muslim worshipers with their Lord. There are five daily prescribed prayers: at dawn, at midday, in the afternoon, after sunset, and at night. These prayers are short and require bowing and prostration. It is common to see devout Muslims praying additional voluntary prayers. Muslims may pray anywhere provided that the place is clean and that there are no distractions, preferably in congregation, facing Mecca. They are required to worship as a community on Fridays at midday and on two major holidays. The Qur’an describes the benefit of prayer as “restraints from shameful and evil deeds” (Qur’an 29:45, trans. Ali, p. 1164). Altareb (1996) states, “If Muslims dutifully practice Salat, then they can not stray too far off God’s path, for they will have to face God during dawn, midday, afternoon, after sunset, and night” (p. 32).

The performance of salat, therefore, allows Muslims to be mindful of the right behavior in the midst of worldly activities. It also provides the strength and support to individuals that help them deal with difficult situations and challenges of life.
The Right Way To Pray

• 1-Intention
• 2- Takbeer
• 3- Opening Supplications
• 4- Recitation of Suratul Fatiha
• 5-Recitation after Suratul Fatiha
• 6- Bowing (Rukoo’)
• 7- Straightening up from Rukoo’:

• 8- Prostration (The sujud)
• 9- Rising from Sajdah
• 10- The second Sajdah
• 11- The Second Rak'a
• 12- The First Tashahud
• 13- The Second Tashahud
• 14- The Salution (Tasleem)
Leah G. Stambler, Ph.D.

based on Counseling American Muslims by Ahmed Nizar Kobeisy

www.mirror.co.uk/.../
QUOTE FROM AHMED NIZAR KOBEISY’S TEXT

Kobeisy p. 23

Zakat (Charity)

The third pillar of Islam is also referred to as “almagiving,” “poor tax,” or “poor-tax” and literally means the purification of one’s own self from greed and miserliness while purifying one’s own wealth through giving to the poor. It also serves as an “expiration” or “purification” of what the Muslim retains of material possessions (Ghazal, 1994). By giving to the poor of one’s own honest earnings, seeking no return or reciprocity, the Muslim is doing both an act of worship and an act of community. This pillar helps the rich show their compassion and, at the same time, rid the poor of ill feelings against those who are well off. According to Sachedina (1997), “In a number of poor Muslim countries this beneficence provided by wealthy individuals has underwritten badly needed social services for those who can not afford them” (p. 33).

The institution of niqah gives the person, giving or receiving, a sense of worth and value, thus connecting with and belonging to the community.

Zakat: A Symbol of Islamic Social Justice

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy
ZAKAT continued

• “Zakat is the 3rd pillar of Islam and is the determined share of wealth prescribed by Allah S.W.T. to be distributed to the 8 categories entitled to receive it. Zakat as translated from Arabic means growth, multiplicity, fertility, cleansing, full of baraqah. It is an ibadah in terms of wealth. A symbol of Islamic social justice, Zakat cleanses your soul, purifies and grows your wealth while eradicating poverty.”

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy

QUOTE FROM AHMED NIZAR KOBEISY’S TEXT

Fasting means abstinence from food, drinks, and sensual pleasures, particularly sexual intercourse, from dawn until sunset during the month of Ramadan, which is the ninth month of the Islamic lunar calendar. In the month of Ramadan, the Prophet Muhammad received his first revelation of the Qur’an. Since the lunar calendar is some ten days shorter than the solar year, the fasting and all Muslim festivals occur in different seasons. Fasting is prescribed only for every healthy, adult Muslim. Exempted from fasting are children, the sick, and those for whom fasting may constitute physical or mental harm, such as travelers as well as hard laborers. Esposito (1995) writes, “The primary emphasis is not so much on self mor-

Kobeisy p. 23

Muslims are also encouraged to be more charitable during Ramadan, a practice that brings an influx of beggars to Jakarta at this time of year.

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy

QUOTE FROM AHMED NIZAR KOBEISY’S TEXT  continued

tification as such but rather on spiritual self-discipline, reflection, and the performance of good works” (p. 246). The end of Ramadan is marked by a great festival, Eid Ul-Fitr, after which life returns to normal. Eid Ul-Fitr is one of the two greatest religious holidays in Islam. Family members, relatives, and friends join to feast and exchange gifts in a celebration that lasts in many cultures for three days (Esposito, 1995).

In addition to strengthening one’s relationship with God, disciplining one’s soul, and preparing the person for possible future hardships, fasting also makes the rich empathize with those who are less fortunate and feel for a month what they always go through. Fasting in community and celebrating the end of fast also in community along with all Muslims of the world help bring Muslims into a unity both religiously and socially.

Fasting makes people aware of their abilities and discipline, thus giving them a sense of confidence to make other changes in life as they become necessary.  
   Kobeisy p. 22

Muslims in Indonesia performing the extra prayers held every night during Ramadan.

www.athreedayjourney.com/.../ramadan/
Those who are sick, elderly, traveling, or women who are pregnant or nursing are permitted to break their fast and make up the missed days at a later time. If they are unable to do this, they must feed a needy person for every day missed. Children are required to begin fasting from the age of puberty.

A child prepares food for the breaking of the fast in Pakistan.

A RAMADAN POEM
THE HOLY MONTH OF RAMADAN
FOR THE MUSLIMS (SUBMITTERS) HAS BEGUN
PRAISING GOD THROUGH THE DAY,
FROM DAWN TO DUSK WE FAST AND PRAY.
WE PAY ZAKAT (CHARITY) FOR THOSE IN NEED,
TRYING OUR BEST TO DO GOOD DEEDS.
WHEN THE SUN HAS SET, AND DAY IS DONE-
I'LL BREAK THIS CHAIN, BUT ONLY ONE.
BY THE END OF RAMADAN, THIS WHOLE CHAIN WILL
BE ALL GONE!
IT'S TIME TO CELEBRATE AND SHARE IN THE FUN!!!

www.submission.org/YES/child2.htm
http://www.nancymusic.com/Ramadan.htm
“Historically, Saudi Arabia has occupied a special place in the Islamic world, for it is towards Makkah and Islam's most sacred shrine, the Ka'abah, located in the Holy Mosque there, that Muslims throughout the world turn devoutly in prayer five times a day.”

www.saudiembassy.net/.../Islam
WHAT IS THE CONTEMPORARY HAJJ?

www.usnews.com/.../photos

• Hajj rituals re-enact the stories of Ishmael, Hagar, and Abraham, as well as visits to sites central to Muhammad’s life.

• Pilgrims’ activities include
  – Circumambulating the Kaaba,
  – Walking between two nearby hills to commemorate Ishmael and Hagar’s wandering, and
  – Dipping their shawls, future burial shrouds, in the Well of Zamzam, which channels water from Mecca’s holy spring.

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy

WHAT IS THE ROUTE OF THE HAJJ?

SEE EXPLANATIONS THAT FOLLOW THIS SLIDE

Leah G. Stambler, Ph.D. based on Counseling American Muslims by Ahmed Nizar Kobeisy
EXPLANATION OF THE ROUTE TAKEN BY PILGRIMS

• “1. Pilgrims perform cleansing rituals at designated stations outside Mecca. Men and women exchange their street clothes for hajj garments - stripping themselves of social distinctions and embracing their dedication to God.”

• “2. Among other rites, pilgrims circle the Kaaba, a shrine at the center of the Grand Mosque - built by Abraham and his son - seven times counterclockwise in a procession called the Tawaf. It symbolizes placing God's House at the center of their lives.”

• “3. On the first official day of the hajj, pilgrims take a three-mile journey into Mina, where they spend the night in a massive tent city.”

• “4. In the morning, pilgrims continue east to the Plain of Arafat, where Muslims believe Adam and Eve were reunited after leaving Eden. A daylong group vigil, in which pilgrims stand in the presence of God, marks the zenith of the hajj.”

• “5. At sundown, the hajj loops back toward Mecca, halting at a patch of hills called the Muzdalifah, where pilgrims stop for the night, participate in a nightlong vigil, and collect stones for the next day.”

• “6. At dawn, pilgrims cast pebbles at the Jamraat, three stone pillars that symbolize temptation - places where Satan tried to tempt Abraham from the path of God. They first throw seven stones at the largest pillar, and then stone the other two over the course of two or three days.”

• “7. Back in Mecca, pilgrims can perform the seven turns around the Kaaba one last time before heading home. The end of the hajj is celebrated with a three-day feast.”
"Muslim pilgrims have a meal in the plain of Arafat outside Mecca, Saudi Arabia on December 6, 2008. More than two million Muslims head to the holy city of Mecca, Saudi Arabia, to make the annual Hajj pilgrimage. All fit and financially able Muslims are expected to perform the Hajj at least once in their life. “(UPI Photo/Mohammad Kheirkhah).

"New safety measures were added to the Hajj, aimed at preventing stampedes that have killed hundreds in previous years."

"The pilgrims are marking the re-enactment of the trials of Abraham."

The Enduring Call of Islam’s Holiest City
Mecca, Saudi Arabia
By Sara Dabney Tisdale
Posted November 16, 2007

www.usnews.com/.../photos/

Muslims circle the Kaaba during the hajj pilgrimage.
(Kazuyoshi Nomachi/Corbis)

MALCOLM X AT THE KA’ABA
http://roiword.wordpress.com/2008/12/06/malcolm-x-and-the-power-of-the-hajj

“Carrying my sandals, I followed the Mutawad.
Then I saw The Ka’ba, a huge black stone house in the middle of the Great Mosque. It was being circumambulated by thousands upon thousands of praying pilgrims, both sexes, and every size, shape, color, and race in the world. I knew the prayer to be uttered when the pilgrim’s eyes first perceive the Ka’ba. Translated, it is “O God, You are peace, and peace derives from You. So greet us, O Lord, with peace.” Upon entering the Mosque, the pilgrim should try to kiss the Ka’ba is possible, but if the crowds prevent him getting that close, he touches it, and if the crowds prevent that, he raises his hands and cries out “Takbir!” (“God is Great”) I could not get within yards. “Takbir!”.
HISTORICAL CONTEXT OF THE HAJJ

www.usnews.com/.../photos/

• “The birthplace of the prophet Muhammad, Mecca is the destination for some 3 million Muslims who each year undertake the pilgrimage known as the hajj. Beyond Mecca’s iconic imagery—tens of thousands of white-robed pilgrims swirling around the sacred Kaaba, a cubical shrine covered in thick black silk hand-embroidered with Koranic verses in golden thread—lies a spiritual power deeply rooted in the city’s history.”

• “While Mecca today is the holiest city to Muslims, it was an oasis town and major crossroads on Arab trade routes long before Muhammad’s birth in the year 570. Governed by merchants, it witnessed constant blood feuding among nomadic, kinship-based tribes that roamed the surrounding desert. Yet Mecca was also a thriving religious center full of shrines, says F. E. Peters, author of The Hajj: The Muslim Pilgrimage to Mecca and the Holy Places. ‘How far back it goes, we don’t know.’ ”

HISTORICAL CONTEXT OF THE HAJJ continued

www.usnews.com/.../photos/

• “But for a month every year, desert clans declared a moratorium on fighting and embarked on a pilgrimage, descending on Mecca to trade and worship at the shrines of 360 polytheistic idols. The city’s religious focal point was a hollow stone temple, the Kaaba, surrounded by effigies but devoted to the powerful pre-Islamic god Allah (which in Arabic means ‘the god’).”

• “After Muhammad rose to power, he swept the idols from around the Kaaba and dedicated its space, and the hajj, to Allah, now God, the only recognized deity for Islam’s monotheistic believers. The hajj is the once-in-a-lifetime obligation of all Muslims. The journey serves to remind them of their mortality, to foster spiritual unity, and to commemorate Islam’s beginnings.”
HISTORICAL CONTEXT OF THE HAJJ continued

• “Those beginnings lie in the ancient story of Abraham and his first son, Ishmael. … and his mother, Hagar, [who] wandered the desert in exile, searching for water.”

• “Eventually, God commanded a spring to appear, saving the two from death. According to Islamic tradition, Abraham later visited the spot and erected a temple to serve as God’s house on Earth: the Kaaba. Today, the Kaaba stands empty, save for lamps to illuminate its interior.”

• ***NOTE: Reportedly, Ishmael was disruptive in the camp because of his “mocking” ways.

THE GREAT MOSQUE AND KA’ABA

• “Surrounding the well and the Kaaba is the Great Mosque, now an air-conditioned supercomplex. Yet Mecca’s ancient spiritual power endures, manifest in the Kaaba—rebuilt at various points because of flooding, political strife, and the wearing of time.”

• “At one corner of the Kaaba is the revered Black Stone, said to be from God (some say it is a meteorite). Pilgrims able to get close pause to touch or kiss it. It exists in pieces, supposedly darkened by contact with millions of sinners.”

Denotes a MEOC Award Winner

Lesson Plans & Other Resources:

"Arabs in America Unit"
This Lesson plan is from “The Arab World” series. Slides, information, and suggestion for projects to help students learn more about the Arab-American community in the United States.

Archaeology: Digging Deeper to Learn About the Past
By Judith Cochran
A (published) middle school unit of study.

Country Themed Culture Kits
Each kit comes with artifacts and activities for teaching about a specific country.
Cyprus and Turkey: Conflict Resolution Curriculum
A lesson – on CD – developed by a middle school teacher on a CMES-sponsored Teach Cyprus program. Includes a simulation for students, who work to resolve some of the issues surrounding the Greek-Turkish conflict over Cyprus.

“Introduction (to the Arab World)”
This Lesson plan is from “The Arab World” series. Slides, lessons, artifacts (including headgear) to teach about the Arabs and their culture.

The Islamic Year
By Noorah Al-Gailani and Chris Smith
A book of activities, crafts, and recipes that a teacher can do with children to help them understand the meaning behind Muslim holidays and traditions.

“A Moroccan Specialty: Pigeon Pie, Camel Rides, and Mosques: A Virtual Tour of Morocco’s Landscape and Culture”
By Jeannine Kuropatkin and Cheryl Wiens.
A 2-day middle school lesson – on CD – developed by teachers after a CMES-sponsored trip to Morocco. It’s wonderfully detailed with pictures, worksheets and activities for students and detailed explanations for teachers.

“Music and Dance Unit”
This Lesson plan is from “The Arab World” series. Slides, pictures, cassette, and explanations of Arab music and instruments. The unit itself is designed for a higher level (maybe high school), but it can be easily adapted for a Middle School classroom.
North Africa: Morocco
Stencil set of Moroccan designs with a map and explanations of Moroccan culture.

Persepolis Recreated
An amazing photo/picture book and DVD set that recreates the ancient Persian city of Persepolis, one of the greatest cities of the ancient world until it was burned by Alexander the Great. It would give students a feel for the glories of an ancient civilization while countering some of the negative (and totally false) images in the movie “The 300” of the Persians as barbaric and subhuman.

Fun with Hieroglyphs
By Catharine Roehrig
Art kit put out by the Metropolitan Museum of Art. It is a set of alphabet stamps for the Egyptian hieroglyphic alphabet with a book of explanations.

Silk Road Encounters
Teachers’ guide, sourcebook, CD of lesson plans and other materials to help your students explore the Silk Road.

“Storytelling and Games Unit”
This Lesson plan is from “The Arab World” series. Slides and game cards teach about and give the rules for Arab games.
“Virtual Field Trip to Turkey”
By Kate Mahady.
A presentation (on CD) that explores Turkey. This can be used by individual students or as a presentation for the whole class (with instructions for teachers provided).

Books:

**Festivals of Egypt**
By Jailan Abbas
A description of the different holidays celebrated in Egypt.

**Suleyman and the Ottoman Empire**
By John Addison
A brief overview of the subject along with a series of short, primary source documents.

**Children of War: Voices of Iraqi Refugees**
By Deborah Ellis
This book provides an opportunity for students to read interviews with Iraqi refugee children and see how the war has affected their lives.

**Afghanistan: The Land**
By ErinnBanting
Photos and descriptions of Afghanistan.
The Illustrated Encyclopedia of Arabia
By Mary Beardwood

This detailed encyclopedia entry focuses on the geography, cultures, and, especially, the flora and fauna of the Arabian Peninsula. With many photographs, charts, maps, figures, asides, this exhaustive and beautifully illustrated text will answer every question you never knew that you had about Arabia on subjects from pearling to fossils, migratory birds to the many uses of the date palm. The sheer breadth of information will eliminate the narrow geographic and social stereotypes so many students have about the Middle East.

Lebanon A-Z: A Middle Eastern Mosaic
By Marijean Boueri, Jill Boutros, and Joanne Sayad

An introduction to Lebanon’s history and culture seen through the eyes of an eleven-year-old boy and his friends.

Egypt and the Middle East
By Daniel De Bruycker and Maximilien Dauber

Beautifully illustrated with cartoons and photographs and easy to reference (question and answer format), this book would be easy for students to use in learning about the basic history of the Middle East.

Muhammad
By Demi

A beautifully illustrated book on the beliefs of the Muslim religion for late elementary and middle school children.
Muhammad and the Arab Empire
By John Duckworth
A brief overview of the subject along with a series of short, primary source documents.

Great Muslim Philosophers and Scientists in the Middle Ages
A series of six books, each on a different medieval Muslim scholar.

Tales from Ancient Egypt
By George Hart

Celebrate Ramadan and Eid Al-Fitr with Praying Fasting, and Charity (National Geographic, “Holidays Around the World” series)
By Deborah Heiligman
Although it is at a low reading level, this book is even interesting to adults due to its great pictures and clear explanations. (It is National Geographic book, so the photography is amazing!)

Holy Cities: Jerusalem and Holy Cities: Mecca
Maps, photos, and descriptions of each of these two religious centers.
Celebrating Ramadan
By Diane Hoyt-Goldsmith
Bright color photographs help tell the story of a 4th grade Muslim boy living in New Jersey as he celebrates Ramadan.

Understanding Islam and the Muslims
By Islamic Affairs Department of the Embassy of Saudi Arabia
An introduction to Islam in a brief booklet with bright photographs.

The Iranian Revolution
By Brendan January
This book is part of the Pivotal Moments That Changed the World series, focusing on the Iranian revolution of 1979. Instead of succumbing to the "clash of civilizations" argument, it delves into the deeper causes of the Iranian revolution, and brings the story forward to describe how the forces that triggered the revolution continue to play out in the troubled relationship between the United States and Iran today. This book is a welcome entry to the corpus of research literature for younger people.

Iraq
By Dale Lightfoot

The Apprentice's Masterpiece: A Story of Medieval Spain
By Melanie Little
A young adult novel set in 14th-century Spain, tells the story of a family with a secret at a time when the Inquisition brings intolerance and torture. Written in elegant free verse this is a
dramatic story set in a troubling time.

Mosque
By David Macaulay
If you liked his books/films about the building of a medieval cathedral or fortress, you’ll like this one about the construction of a 16th century Ottoman mosque.

Inside Story: A 16th Century Mosque
By Fiona MacDonald and Mark Bergin
Detailed illustrations and clear explanations make this a terrific resource book with information about the building, religious background, and history surrounding the construction of a mosque.

Extraordinary Women from the Muslim World
By Natalie Maydell and Sep Riahi
This book introduces readers to 13 Muslim women in history who have lived extraordinary lives and influenced their communities in a positive way, often overcoming extreme hardship and inaccurate stereotypes that have been placed on the role of women in Islam. In addition to showing the impact these women have had throughout the years, Extraordinary Women from the Muslim World seeks to make a difference in the lives of Islamic women today, inspiring them to fervently pursue their goals. All proceeds from the special edition hardback series will be donated to Islamic Relief to benefit the women and children of Sudan.

The Arabs in the Golden Age
By Mokhtar Moktefi and Veronique Ageorges
Nicely illustrated, easy-to-reference account of Arab history.
Islam
By Sue Penney

From the “Introducing Religions” series, this gives an overview of the Muslim faith.

The Grand Mosque of Paris: A Story of How Muslims Rescued Jews During the Holocaust
By Karen Gray Ruelle and Deborah DurlandDeSaix

When the Nazis occupied Paris, no Jew was safe from arrest and deportation. Few Parisians were willing to risk their own lives to help. Yet during that perilous time, many Jews found refuge in an unlikely place—the sprawling complex of the Grand Mosque of Paris. Not just a place of worship but a community center, this hive of activity was an ideal temporary hiding place for escaped prisoners of war and Jews of all ages, especially children. Beautifully illustrated and thoroughly researched.

Historical Atlas of Islam
By Malise Ruthven and AzimNanji

Traveling Man: The Journey of Ibn Battuta, 1325-1354
By James Rumford

The true story of the travels of 14th century Arab explorer Ibn Battuta. Beautifully illustrated.
Foods of Iran
By Barbara Sheen
Beautiful photographs and clear prose show a lot about Iranian culture through a description of the food. There are recipes, cultural descriptions, and details about how the food is grown and sold.

The Travels of Benjamin of Tudela
By Uri Shulevits
A fictionalized account of a Spanish Jew, who explored the Middle East and North Africa in the twelfth century (a century before Marco Polo). It’s nicely illustrated and in the form of short stories, a book you could read aloud to the class.

Mesopotamia
By Jane Shuter
A beautifully illustrated, well organized short book about Mesopotamia from the “Excavating the Past” series.

Islamic Design: A Genius for Geometry
By Daud Sutton
Focusing on Islamic geometric patterns, simple and complex, man-made and in nature, this book offers unique insight into Islamic culture.

Travellers and Explorers
An illustrated book that gives an overview of notable explorers from the Middle East.
Seven Wonders of the Ancient Middle East
By Michael Woods and Mary B. Woods
A nicely illustrated book about the ancient Middle East. It provides history of the societies of the time.

The Tomb of King Tutankhamen: Unearthing Ancient Worlds
By Michael Woods and Mary B. Woods
Nicely illustrated and contains great photographs, this book gives a lot of history about King Tutankhamen as well as ancient Egypt in general.

Multimedia:

VHS format. 50 min. each - 4 videotapes.

Various Discovery Channel specials.
DVD format. 60 minutes each.

Families of Egypt
Explores the family lives of two Egyptian children.
DVD format. 30 min.
I Will Not Be Sad in This World (2001).
"Portrait of a 94-year-old Armenian woman’s life from the genocide through her childhood in a Lebanese orphanage through her life in America."
56 min. VHS and DVD formats available.

Inside Mecca
"A National Geographic special about the Muslim pilgrimage and its rituals."
60 minutes.

Islam: A Pictorial Essay in Four Parts
"Four sections include: “The Doctrine,” “The Life of the Prophet and the Faith,” “The History and Culture,” “The Arts and Sciences.”"
VHS format. 90 min.

Secrets of Lost Empires: Pyramid (2007)
"Nova special"
VHS format. 60 min.

A Team for Peace
"About a group of preadolescent soccer players, half of them Palestinian, half of them Israeli, who are put together to play on an all-star team to compete in an international youth soccer tournament."
DVD format. 45 min.
Young Voices from the Arab World: The Lives and Times of Five Teenagers (1998)

About everyday life in Arab society told through the eyes of five young people from Jordan, Lebanon, Egypt, Kuwait, and Morocco. (Note: A teachers’guide/resource book comes with it.)

VHS format. 30 minutes.

Author(s): Lisa Adeli
Grades: 3 (can be adapted for other grades)
Students will learn about children’s lives in Vanadzor, Armenia, and will compare/contrast life in Armenia with life in the U.S. Students will conclude by writing a friendly letter to a child in Armenia.
Overview

Armenia Presentation

Presentation Notes

Day in the Life of an Iranian Child
Author(s): Shauna Little
Grades: 1-3
A lesson plan featuring a children’s story (illustrated by powerpoint pictures) and a series of learning centers with follow-up activities.

- Class Powerpoint Presentation
- Teacher Instructions
- Powerpoint Script
- Learning Center 1: Middle East Outline Map
- Learning Center 1: Student Instructions
- Learning Center 2: Student Instructions
- Learning Center 4: Persian Writing

Iranian New Year
Author(s): Lisa Adeli
Grades: K-5
A lesson on Iran’s biggest holiday (No Ruz), a holiday that lasts for weeks but centers around New Year’s Day, the first day of spring (Mar. 21).

- Class Powerpoint Presentation
- Teacher Instructions and Notes

The Librarian of Basra
Author(s): Shari Lossou-Lossavi
Grade: 4 (The lesson is written for fourth grade, but could definitely be modified/changed for the upper grade levels.)
A Reading Lesson that integrates Social Studies and Character Education. This lesson also has Geography, Writing, Science, and Math extension activities.

- [Lesson Plan](#)

Nasreddin Hodja: Turkish and Middle Eastern Folklore Philosopher

Author(s): Joyce Daigle

Grades: 3

This lesson introduces Nasreddin Hodja, the Turkish and Middle Eastern Folk Philosopher. It can be used in conjunction with other folk stories from around the world. Students already should have a working knowledge of folk tales, fables, as well as tall tales. Many stories can and should be shared with students about Hodja. Two of the Hodja tales have in turn been written into a reader’s theater script to help students work on their fluency.

- [Powerpoint](#)
- [Speech Script](#)
- [Hodja Borrows a Pot](#)

Night of the Moon

Author(s): Laura Provencher

Grades: K-5

This is a multi-disciplinary lesson based on the book “Night of the Moon,” which involves reading, social studies (learning about the Muslim celebration of Ramadan), science (phases of the moon), and Language Arts (homophones, homonyms).

- [Lesson](#)
- [Read-A-Loud](#)
- [Exploring Phases of the Moon](#)
- [Homophones & Homonyms](#)
Ramadan
Author(s): Lisa Adeli
Grades: 1-5
A lesson about the religion of Islam and the best-known Muslim holiday.

- Class Powerpoint Presentation
- Overview for Teachers
- Notes on Pictures
- Fact Sheet: Ramadan
- Supplementary Activities

Read Aloud Literature
Author(s): Vicki Waxman
Grades: K-5
A series of lesson plans designed to introduce primary school children to the history and culture of the Middle East.

- Lesson Plans for Various Grades

The Blind Man and The Elephant
Author(s): Laura Provencher
Grades: K-2
This lesson encourages students to see “the rest of the picture” in a situation. In making the situations relevant to K-2 (actually, all) students it creates a foundation serving as a launching pad for students to explore multiculturalism within a community, whether that be in a school, neighborhood, town, or national or global setting (particularly for older students). It serves as a basis for following lessons examining particular cultures and is intended to assist students in seeking other perspectives in assessing situations. Ultimately this provides a tool for avoiding conflict stemming from misunderstanding and even misinterpreting events.

- Lesson
Tiles For The Sultan
Author(s): Gili Sherman
Grades: 4-5
Students will learn about the history of Iznik tile for Turkey and make their own Iznik style pottery.

- Lesson

Secondary Level

A - F | Return to the top

Agriculture and Food of Cyprus
Author(s): Denise Reilly
Grades: High School
High school students will learn about the crop and livestock production of Cyprus and the effects of agriculture on the lives of the people in Cyprus in writing with 85% accuracy. This lesson will teach students how agriculture affects what people eat, and the students will try new and unique foods central to the culture of the Cypriots.

- Lesson Plan

All About CyprusPowerpoint Presentation
Author(s): Lori Hare
Grades: Middle School
A comprehensive Powerpoint presentation all about Cyprus. It goes into multiple aspects of Cypriot society with photos from Cyprus.

- All About CyprusPowerpoint

American Government Problem Based Learning: Create a Government for Iraq
Author(s): David Rubin
Grades: High School

This lesson plan focuses on the complicated government structure of post-war Iraq. Students get the chance to create a government for the country and must consider multiple religious and cultural factors while doing so.

- Lesson Plan

A Moroccan Specialty: Pigeon Pie, Camel Rides, and Mosques – A Virtual Tour of Morocco’s Landscape and Culture
Author(s): Jeannine Kuropatkin and Cheryl Wiens
Grades: Middle School

A lesson plan on Moroccan geography and culture with all kinds of materials: from PowerPoint photos and slides to worksheets and evaluations.

- Class PowerPoint Presentation
- Audio Files: Call to Prayer, Djemaa, Marhabat, Danse Atlas, Aid Zitoun
- Teacher: Map Answer Key
- Teacher: Slide Show Notes Key - p1, p2, p3, and p4
- Teacher: Regions Handout Key
- Teacher: Postcard 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15
- Student: Middle East Map
- Student: Slide Show Notes - p1, p2, p3, and p4
- Student: Writing Assignment
- Student: Regions Handout

Armenia in A Time of Change
Author(s): Lisa Adeli
Grades: High School

The purpose of this lesson is to help students examine the development of a small country in a time of transition, in this case the breakup of the Soviet Union, which coincided with a national disaster and a war.

- Overview and Directions
- Fact Sheet 1
Compare and Contrast the Empires
Author(s): Brian Croone
Grades: High School
Students will compare and contrast the great empires of The Ottoman Empire, Rome, and China learning similarities and differences between the empires.

- Lesson Plan

Conflict Resolution
Author(s): Callie Ward
Grades: Middle School
Students will learn about conflict resolution by examining the conflict over the island of Cyprus.

- Lesson Plan

Conflict Resolution Mini Unit
Author(s): Jennifer Turner
Grades: High School
Students will learn about conflict resolution by examining the conflict over the island of Cyprus.

- Lesson Plan
Cultural Diffusion: The Impact of the Middle East on the Balkans
Author(s): Lisa Adeli
Grades: High School
A lesson with PowerPoint pictures and maps about Middle Eastern cultural, religious, and linguistic influences in southeastern Europe.

- Class Powerpoint Presentation
- Teacher Instructions and Script
- Bibliography

Florentine and Ottoman Women of the 14th – 16th Centuries: A Comparative Curriculum Unit
Author(s): Louise Forsyth
Grades: Middle School
This lesson uses short primary documents to challenge students’ assumptions about the status of women in the Ottoman Empire and Renaissance Florence.

- Lesson

Footprints Across Cyprus: A Virtual Fieldtrip of Cyprus' Landscape and Culture
Author: Diane Godfrey
Grades: Middle School
Students will gain an understanding of the regions of Cyprus, as well as the human and physical characteristics of Cyprus through an interactive PowerPoint slide show. Students will become familiar with the historical event referred to as the Grand Tours which helped influence western interest in the Mediterranean region, including Cyprus. Students will create a series of six postcards describing the physical and cultural aspects of Cyprus. The postcards will be used for a “postcard book” project.

- Rubric

Ratios and Proportions in Turkey
Author(s): Martha Mallinger-Rubin
Grades: 9
Students will learn about Turkey while utilizing mathematic skills.
Reality Check: You Won't See These Muslims on T.v.
Author(s): Benjamin Breault
Grades: Middle/High School
A very informative lesson which helps students identify their own biases regarding Islam and learn facts about the faith.

Teach Ottoman Empire
Author(s): Abbey McNair
Grades: High School
An extended, comprehensive lesson on the Ottoman Empire, this includes several powerpoint photo presentations, a “coffee house” lesson where students play the role of different Ottoman officials meeting to discuss how to “save” the empire, and lots more.

The Importance of Cyprus During the Crusades
Author(s): Jeremy Church
Grades: High School
High school students will apply several reading, writing and history standards to the
study of Cyprus’ role during the Crusades. Students will study the geography of the Mediterranean region with an emphasis on Cyprus and its location, usage, and importance in the age of the Crusades. Students will also gain an understanding of this conflict in the Middle East with regard to religion. Resources for these lesson plans include maps, selected readings, and educational videos.

- Lesson Plan

The Ottoman Empire
Author(s): Lisa Adeli
Grades: High School
An overview of the Ottoman Empire and its unique institutions. Includes a PowerPoint presentation and a script for teachers.

- Lesson Overview and Instructions
- Class Powerpoint Presentation
- Powerpoint Script

**Turkey: Bridge Between East and West**
Author(s): Carol Barnes and Barbara Martin  
Grades: Middle School  
*Students learn about the geography and cultural aspects of Turkey.*

- **Lesson Plan**

**Turkey Joining the European Union**
Author(s): Sigma Colon  
Grades: High School
Students learn about the complex relations between Turkey and the European Union. This lesson allows students to analyze the many perspectives on the issue and decide what is best for Turkey and the EU.

- **Lesson Plan and Graphic Organizers**

**Turkey Trip**
Author(s): Chris Walden-Jones
Grades: High School, adaptable for Middle School
Students will learn various computer programs while planning a mock trip to Turkey. This will allow them to combine the knowledge of culture and world history with practical computer skills. Students will also use math skills to create a budget for the trip.

- **Turkey Trip**

**United We Stand…Case Study: Cyprus**
Author(s): Lori Hare
Grades: Middle/High School
A lesson (with PowerPoint pictures and maps) about conflict resolution, using the case study of the Greek-Turkish conflict in Cyprus.

- **Class Powerpoint Presentation**
- **Lesson: Part 1**
- **Lesson: Part 2**

**Water in the Desert**
Author(s): Jennifer Jenkin
Grades: Middle School/High School
In this lesson, students will work with a variety of instructional tools to create a comparison between the flooding of Rainbow Bridge, and the refilling of the Dead
Sea. This comparison will involve humanitarian, governmental, cultural, religious, and environmental aspects. The student will apply all these considerations in order to pose a solution to a multi-dimensional, international problem.

- Lesson Plan
- Powerpoint
- Bubble Map
- Dead Sea Webquest
- Double Bubble Map
- RAFT Writing Assignment

Virtual Field Trip to Turkey
Author(s): Kate Mahady
Grades: Middle School/High School
A PowerPoint presentation which takes young people on a trip through Turkish history, culture, and art.

stamblerl@wcsu.edu
Title:  Response to Intervention and Empowering Every Student to Succeed.

Abstract: The purpose of this workshop is to help educators empower students, who are struggling to succeed in traditional educational programs, to reach their full academic and creative potential. Participants will learn specific strategies to enhance their current curriculums via Response to Intervention (RTI). Participants will learn the differences between Skill, Fluency, Generalization, and Motivation Deficits as well as Escape or Avoidance techniques. They will identify the RTI “Pyramid of Interventions”. Participants will also learn how to Define Problem Behaviors in Five Quick Steps. Additionally, participants will learn how to assess and monitor progress of the interventions they utilize with students.

Response to Intervention integrates assessment and intervention within a multi-level prevention system to maximize student achievement and to reduce behavior problems. With RTI, educators can identify students at risk for poor learning outcomes, monitor student progress, provide evidence-based interventions and adjust the intensity and nature of those interventions depending on a student’s responsiveness, and identify students with learning disabilities or other disabilities. (Batsche, Castillo, Dixon, & Forde, 2008).

Many students who struggle with academic deficits do not do so in isolation. Their difficulties are revealed and discovered in the larger context of the school environment and curriculum and represent a difference between the characteristics of the student and the instructional demands of the classroom. (Foorman & Torgensen, 2001).

Educators need to learn that the problem-identification step is the most critical for matching the student to an effective intervention (Bergan, 1995). Problem identification statements need to be defined in clear and specific terms sufficient for a stranger to understand. (Howell, Hosp & Kurns, 2008).

The following recommendations are for increasing educators’ capacity to frame student skills in relation to curriculum requirements:

- Be knowledgeable of school curriculum and key student academic skills
Describe the academic problem in specific, skill-based terms

Develop a fuller description of the academic problem and provide a meaningful instructional context

Develop a hypothesis statement to explain the academic skill or performance problem

Many students are identified as at-risk with social/emotional, behavioral and learning issues who are struggling with success. Several of these students are being recommended to special education, but are falling short of eligibility requirements, thus lacking the support they need to succeed. “With appropriate early services, referral to special education may be prevented for children showing early indicators of behavioral maladjustment”. (Baker, J.A., Kamphaus, R.W., Horne, A.M., & Winsor, A.P., 2006).

A. Title
MacIntyre’s Narratives: an Alternative Approach to Narrative Inquiry

B. Author
Yun Wen (Winni) Chan
Graduate Institute of Curriculum Studies, National Chung Cheng University, Taiwan
Phone: 886-928920685
Email: november22.tw@gmail.com

C. Abstract
The purpose of this study is to construct a narrative approach based on A, MacIntyre’s narrative notions that emphasizes on investigating the corresponding virtues of social roles in a certain era, a narrative approach that enables researchers or educators to inquire virtues of specific social roles in a certain era and how the virtues are “practiced” by the social roles. Three salient features of MacIntyre’s narrative notions are expounded: narrative as unity, narrative as history and narrative as the quest for intelligibility. These concepts are extended into three important features of structural analysis: genre of social role, big events in a certain era, and intelligible sequence. These concepts help teachers to clarify virtues qualified for their students based on their traditions.

Title of the Submission: College students’ lecture note-taking and academic performance

Topic Area of the Submission: Educational Psychology

Name of the Author: Pin-Hwa Chen

Affiliation of the author: National Pingtung University of Education, Taiwan

Address of the author: No.4-18, Minsheng Rd., Pingtung City, Pingtung County 90003, Taiwan (R.O.C.)

Email Address of the author: phchen@mail.npue.edu.tw
College students’ lecture note-taking and academic performance

Pin-Hwa Chen
Department of Educational Psychology and Counseling
National Pingtung University of Education, Taiwan

Abstract

Lecture note-taking is a popular learning strategy among college students. It not only takes place during class but also after class. During class, students listen to what the lecturer says and they write down notes on what they consider to be relevant information. After class, they may correct, refine and even rewrite the notes. This study aims to create predictive models of lecture note-taking during and after the class. Thirty-eight undergraduate students enrolled in a General Psychology class at a university in southern Taiwan were recruited as participants. Targeting the unit of “Memory”, participants’ notes taken during the class were collected after each lecture on this unit. After all the lectures on this unit had been completed, participants received the unit test and completed a questionnaire on how they had taken notes after the class. Meanwhile, their unit notes (the notes taken during class and revised after class) were collected. Results indicated that the predictive model of note-taking during the class could explain the variances of academic performance. “Quality of notes during the class” could predict academic performance positively. Moreover, the predictive model of note-taking after the class could explain the variances of academic performance. Both “Quality of unit notes” and “Revision of notes before next lecture” could predict academic performance positively.

Edmund Hillary School
P.O. Box 272 1515
Papakura
New Zealand

Telephone:64  09 2989132
Abstract

There is no single solution to transforming a small school in a low socioeconomic community with a twenty year history of poor performance. It requires more than simply applying normal solutions to an abnormal situation. This paper explores some of the multifaceted approaches used to improve the quality of teaching and learning and to reinvigorate a school and community that has suffered from long term poverty.

Background

Edmund Hillary is a Decile 1 full primary school in Papakura, South Auckland, New Zealand with a current roll of 160 students. The combined Maori and Pasifika student population represents 97% of the student body. The history of poor performance of the school is well known to the Ministry of Education and the Education Review Office the government department responsible for reporting publicly on the quality of education in all New Zealand schools. At a local level the public perception of the school in 2006 was such that if parents could afford a car they would opt to drive their children to any number of 'better' schools down the road. For those who couldn't afford to do this there was little option but to send their children to Edmund Hillary School. Their greatest fears were for the safety of their children rather than concerns about poor quality education. Families recount stories of children running home to alert them to fights in the school playground and in turn running to school to sort them out because school staff either couldn't or wouldn't. A Supplementary Review of the school by the Education Review Office (ERO) in 2006 identified significant shortcomings which had gone unchecked for years.

Most teachers were performing at an unacceptably low level. Many children were bored or frustrated because the work set for them was not appropriately matched to their learning needs. Because effective quality assurance measures were lacking, there was very little accountability evident in the planning, delivery and evaluation of the curriculum and in the assessment of children’s progress and achievement. (2007, p.4)

The report also noted that the board had a limited understanding of its governance role. By the end of 2006 the principal resigned and a new principal was appointed for a fixed term at the beginning of 2007. In the 2008 ERO Report it was noted that;

The present principal, staff and board of trustees had to deal with a long period of poor performance at Edmund Hillary School. The school had eighteen principals in twenty-five years and ten ERO reviews in the past
sixteen years. It had been run-down, lacked adequate teaching and learning resources and faced some major staff performance issues. Weak child management practices led to poor student behaviour that threatened the board's provision of a safe learning environment for students. (p.3)

ERO also referred to the high level commitment demonstrated by the new leadership to "reinvigorating a school that had become stalled in its development... which was part of the overall change management necessary to move the school forward after a sustained period of dysfunction." (p.4)

The solutions to addressing the dysfunction have required innovation, hard work and concerted school and community efforts. Innovation requires more than applying normal strategies to abnormal circumstances which are unlikely to be effective in the short or long term. Barth (1990: p164), suggests "that if we want to improve schools, we must risk doing things differently next September than we did them last September". The need not only to rebuild the foundations to ensure stability and sustainability but to also forge ahead with “outside the square” solutions is urgent. The task of breaking down the barriers resulting in gross educational negligence has propelled everyone, involved in the school, on an arduous yet incredible journey. It is by no means a journey for the faint hearted.

For those new into the school in 2007 the scene could be likened to being in the middle of the Pacific Ocean in a leaky waka (canoe) with one gaping hole in the centre and several smaller ones which combined were of the same magnitude. The solutions lay in exploring and defining many pathways to success as a means of motivating everyone to do their share and keep the waka afloat. Pathways that would promote;

- working together
- sharing and caring
- looking after self and each other
- mental, physical and spiritual nourishment
- a sense of achievement and satisfaction
- a positive way forward

And something that would signal not only to those in the school but also the community that the holes in the waka were being repaired and it was no longer in danger of heading to the bottom of the ocean.
Mahinga Kai Gardening

“Mahinga Kai” was the first big 'Something.' It is not rocket science but simply about providing space for people to give and receive care, love, help, support manaaki, aroha, awhina, tautoko to nourish the mind, body and spirit, the hinengaro, tinana, wairua of the individual and subsequently the family, whanau, the community hapu and therefore all people, nga iwi katoa. As well known New Zealand author and organic gardener Kay Baxter states, "gardening is the ethic which puts care of the people and care of the earth above all else." (2008,p.4)

Mahinga Kai gardening model promotes:

- A new, applied approach to capacity-building in the local community through the sharing of skills, knowledge and resources and transitioning Edmund Hillary's current participation in the “Fruit in Schools” initiative into a longer-term self-sustaining model. It fosters a community where working together to achieve a common aim is valued and nurtured based on Kaupapa Maori and incorporating the principles of partnership, participation and protection embedded in the nation's Treaty of Waitangi.
- Increased Civic Engagement through planting, harvesting and maintenance days and where members of the community are welcome to drop in for produce.
- Community Building and stronger school-community-home partnerships through whanau participation in Mahinga Kai and the various threads combining; Mahinga Kai i te Kainga (gardens in homes), are all woven together to make up the kete basket of Hauora mo ake tonu atu (everlasting health).
- Positively promotes whanau (family) health and well being and adds value to the school's current initiatives which include “Breakfast Club”, “Healthy Lunch Programme,” and the nationwide "Fruit in Schools" programme for low decile schools.
- Puts into practice the underlying concepts, strands and key competencies of the New Zealand school curriculum.
- Opportunities for the evolvement of further initiatives.

The initiative began in 2007 with digging up the school grounds for gardens and inviting students, families and community members to a Community Arbor Day planting of heritage fruit trees. From there students and staff planted massive crops of vegetables interspersed with companion planting and participated in composting, worm farming and general garden maintenance. Many varieties of vegetables were harvested throughout the season for
students to take home to share with whanau. Students and their families also participated in special whanau days to plant the subtropical garden with bananas pawpaw, passion fruit, watermelons and many other varieties of fruit. Students and teachers worked together on the project coordinated by Mariu Wetere, a staff member with special expertise and interest in driving the project.

In 2008 Mahinga Kai was then extended to include backyard gardens. Selection of families was mainly determined by students who had developed a love of gardening at school and wanted their whanau to reap the benefits of having their own gardens at home. Many students were keen to demonstrate their newly acquired skills and knowledge to their families aware that gardening had not previously been an option for them. The necessary tools and compost were provided by the school and funded through successful applications to the Manukau District Health Board under the "Let's Beat Diabetes" Programme. A total of 16 gardens were started. Now families in their second year of gardening continue to be enthusiastic and tend their own gardens with minimal or no school support.

Val Matahaere was one of the first parents to put her hand up for help in setting up a vegetable garden at home. Val was interviewed for an article published in the Listener a national magazine. She had this to say about her garden;

> It's saved me heaps of money and I don't buy veggies at the supermarket any more........... We're eating more healthy food now and not just eating and getting junk food. I go over and help at the school garden and I soak up whatever the garden lady (Mariu Wetere) does. I see what's working well at the school and my other neighbours and I try to bring it home here in my own garden. I enjoy it because it's nice and peaceful and healing and my backyard is my bit of heaven on earth. Barry (2009, p.35)

In 2009 an additional 25 backyard gardens were established bringing the total number of backyard gardeners in the local community to 45. Naomi Lees Backyard Garden Coordinator and part time teacher for students with English as a Second Language at the school worked closely with families to achieve the expected outcome of extending the number of veggie gardens in the community. The leaky swimming pool which was too costly to repair was turned into a garden nursery and became the source of plants, seedlings fertiliser and expert advice from the 'garden lady.' In 2010 the “Mahinga Kai” model was extended and replicated in three other local schools by key community partners Papakura Marae and the local Whaitiaki group who secured more funding from Manukau District Health Board through the Maori Obesity Initiative. Mahinga Kai has brought national acclaim to the school through feature articles for national publication and from television programmes developed for
national viewing. The community is at last proud to be attracting positive attention and recognition as a result of the gardening project rather than for past notoriety.

Further Pathways to Success

Transition Programme for "High Needs" Students

An evaluation report by the Education Review Office June 2010, "Including Students with High Needs" recognised that "significant proportions of schools had some or few inclusive practices" (p.32) for students with "high needs." In 2010, the number of students identified with “High Needs” enrolling at Edmund Hillary School had reached critical levels. High needs classification means students have;

- extreme learning needs and/or
- extreme behavioural needs and/or
- family circumstances demonstrate a high level of need.

The current numbers of “High Needs” students already in the school, combined with new “High Needs” students enrolling, were propelling the school towards a precarious tipping point. Therefore a much greater level of planned support was required. It was critical that we find another pathway to enable the school to adhere to the shared vision of the New Zealand Curriculum, “to foster lifelong learners who are confident and creative, connected, and actively involved.” (2007,p.8) Part of the solution would likely come from a shared commitment to a transition plan to enable new students to be integrated into school with additional support and therefore provide them with every opportunity to be successful participants in their own learning. Other considerations included provision for existing "High Needs" students in the school and working in partnership with families. The cost of not getting it right was becoming too great for the individual, for the school and ultimately for society.

Background to Transition Programme and identification of High Needs in the School

Concern over the increasing numbers of “High Needs” children at Edmund Hillary School was addressed at a staff meeting. Discussion arose on the nature of the “High Needs” prevalent amongst students and the following three categories were defined based on teachers' knowledge and experience gained through working in the school.

1. Students with High Learning Needs;
2. Students with High Behaviour Needs;

Teachers then identified criteria for each category again based on their knowledge and experience gained through working with students in the school.
Criteria for High Needs Classification

1. Students with High Learning Needs
Criteria:
For students in Years 1-2 evidence of delayed learning e.g. low alphabet knowledge; emergent/early reading strategies underdeveloped; limited experiences and delayed oral language as well as other pertinent aspects linked to poor retention; poor self management; poor concentration. Year 3 students and above were identified with high learning needs if achieving 2 years below chronological age in literacy learning.

2. Students with High Behaviour Needs
Criteria
Students who were consistently unable to maintain positive peer and teacher relationships; had poor self esteem, were verbally and physically abusive; frequently angry, uncooperative and regularly demonstrating high level stress.

3. Students with High Family Needs
Criteria
Students showing signs of neglect, had health/sight/hearing issues, were consistently without lunch and hungry, showed signs of abuse, poor hygiene, clothes unwashed for long periods, body odour, truancy and absenteeism, long term neglect and high level stress.

Identification of “High Needs” Students
Students who met the criteria as defined by teachers were identified and results for each class were shared and discussed. Moderation occurred where some teachers were challenged to include children whom they had not identified because other teachers felt they warranted inclusion based on the criteria. In all cases the classroom teacher agreed. Subsequently the data was collated and analysed.

Results
The following tables include whole school results. The entire school roll comprises; 28 Year 1 students, 17 Year 2 students, 17 Year 3 students, 27 Year 4 students, 22 Year 5 students, 27 Year 6 students, 10 Year 7 students and 7 Year 8 i.e. a total student roll of 155 at Edmund Hillary School 31 May 2010. A significant finding is that 65% of students across the school have some identified level of high need.
Figure 1 shows students with "High Learning Needs." Overall across the school there are 76 students i.e. 49% with "High Learning Needs."

Figure 2 shows students with "High Behavioural Needs." Overall across the school there are 46 students i.e. 30% with "High Behavioural Needs."
Figure 3 shows students with "High Family Needs." Overall across the school there are 61 students i.e. 40% with "High Family Needs."

NB Of these "At Risk" students 42% are from 12 families. 35% of this group are Maori and 7% are Pasifika.
Figure 4 shows students with "High Overall Needs" at Edmund Hillary School are as follows; 49% of students are identified as having "High Learning Needs," 28% of students are identified as having "High Behavioural Needs" and 39% of students are identified as having "High Family Needs".

NB Students with High Needs in all 3 Categories at Edmund Hillary School are as follows; for Year 2 students; 6% (1 student) has high needs in all three categories, for Year 3 students; 18% (3 students) have high needs in all three categories, for Year 4 students 26% (7 students) have high needs in all three categories, for Year 5 students 19% (4 students) have high needs in all three categories. For year 6 students, 11% (3 students) have high needs in all 3 categories, Year 8 43% (3 students), have high needs in all three categories.

Formulating the plan for “High Needs” Students

We have a sincere commitment to providing the best possible education for all students, hence the need to explore other ways of catering for those with “High Needs.” The number of current “High Needs” students already enrolled in the school is excessive and adding more students without a robust plan of support is not conducive to either teacher or student welfare nor quality teaching and learning programmes.

Staffing

Long term staffing issues and budgetary constraints have also had a significant impact. Last year in 2009 there was a 23% teacher retention rate. This year with current staff, six of seven classroom teachers have an average of 3 years teaching experience. Two teachers are in their first year of teaching in a New Zealand School, another two are provisionally registered teachers. Subsequently teaching staff require support too.

Currently some “High Needs” students are entering school with funding for teacher aide support. Firstly it is difficult to attract suitable teacher aides because of the limited hours of employment and the short term nature of positions offered. Secondly to expect teacher aides to fill specialist roles is unrealistic given that they are not trained teachers. Thirdly “High Needs” students cannot engage successfully for a whole day in a classroom even with teacher aide support. This approach sets them up for certain failure as we have already found.

Consequently the issue of formulating a plan required consideration of some broad objectives to ensure full and successful integration of “High Needs” students into school. The objectives were to;
- Provide specialist teaching tailored to students' learning and behaviour needs in a safe and stimulating environment
- Manage the integration process as a shared commitment between home, school and other support agencies

The plan is, in part, based on an existing strategy of working in partnership between home and school with current “High Needs” students. Three students who were close to being excluded from the school because of their extreme behaviour are now in a transitioning process. All families have supported the plans which have been tailored to suit their own child. One student after 5 weeks will be transitioned back into school full time. Another student who was returning home during interval and lunchtime is now only having part of the lunch hour at home. This group learning component with a specialist teacher has been included and is based on the success gained through another existing school programme. The high level engagement and progress of students is transforming not only their learning but not surprisingly their behaviour too.

**Transition Programme**

Prior to starting the transition programme family and student meet with the principal specialist teacher and other key staff to share information and discuss programme. Student then attends school at 8:45 for Quiet Time Meditation Training with Meditation Teacher. An assessment of learning for literacy with specialist teacher is carried out. Then following a programme of induction into the school the student is supported through the following stages of transition. The length of time taken to transition through the stages depends on the student's ability over time to integrate successfully. A time frame therefore cannot be pre-determined.

**Stage 1**
- Student attends school 8:45 for meditation training.
- 9-11; for 2 hour literacy learning with specialist and teacher aide.
- Returns home 11am

**Stage 2**
- Student attends school 8:45 for meditation training;
- 9-11; for 2 hour literacy learning with specialist and teacher aide.
- Integrated into playground with support from 11 am to 11:20 am.
- Returns home 11:20

**Stage 3**
- Student attends school 8:45 for meditation training; 9-11 for 2 hour literacy learning with specialist.
- Integrated into playground with support from 11 am to 11:20 am.
- Transitions into classroom with support for 1 hour mathematics period 11:20 to 12:30
- Returns home 12:30
Stage 4
- Student attends school 8:45 for meditation practice;
- 9-11; for 2 hour literacy learning with specialist and teacher aide.
- Integrated into playground from 11 am to 11:20 am.
- Transitions into classroom with support for 1 hour mathematics period 11:20 to 12:30
- Integrated into playground with support for half of lunch hour until 1 pm.
- Returns home 1:pm

Stage 5
- Student attends school 8:45 for meditation practice;
- 9-11; for 2 hour literacy learning with specialist.
- Integrated into playground from 11 am to 11:20 am.
- Transitions into classroom with support for 1 hour mathematics period 11:20 to 12:30
- Integrated into playground with support for full lunch hour until 1:30 pm.
- Returns home 1:30

Stages 6-8 continues with half hour additions of time until by Stage 8 the student is fully integrated into school for the entire day. Literacy support continues until the student reaches a level that will ensure continued independent success in the classroom setting.

Support for Whanau

It is one thing to address the learning and behaviour needs of students, which is the school's core business, but these efforts are in vain if we fail to ignore and absolve responsibility for addressing and supporting the needs of students' families. One successful strategy to support and engage families in student learning is the opportunity for formal discussions where parent/student and teacher together have a minimum of half an hour to discuss achievement. In the four years these discussions have been held there has been 80-90% family attendance. This demonstrates high level family and school commitment. In some instances where there are as many as five children attending school from one family this means at least two and a half hours of discussion which means the family is very well informed about how their children are achieving and how they can help them. Absolum: (2006) suggests that; "the majority of parents care about their children's education, want to support them and are prepared to work in partnership with others to do so." (p.203) This notion is well supported by the high number of families who attend the school's learning discussions.

While the value of such engagement cannot be disputed such partnerships however require knowledge and understanding and clarity around issues which are often extremely complex. For example in the Executive Summary Ministry of Education Best Evidence Syntheses by Biddulph et.al (2003) they maintain that;

Ethnicity and culture are linked to children's achievement. Overall, Pakeha and Asian children have consistently higher achievement than Māori and Pasifika children. However, this finding is confounded by socioeconomic
status (SES); the families of most Māori and Pasifika children occupy the lower levels of the SES scale (including the poverty level) and these children also make up a disproportionate number of those in low-decile schools.

This is most definitely the case at Edmund Hillary School with a decile 1 rating which is at the lowest level of the SES scale. The Ministry of Education explains decile ratings in the following way; "A school's decile indicates the extent to which it draws its students from low socioeconomic communities. Decile 1 schools are the 10% of schools with the highest proportion of students from low socio-economic communities. Decile 10 schools are the 10% of schools with the lowest proportion of these students."

In addition to the school's decile rating there are other factors which compound the low socio economic status. The local community population is younger and there are more families. 26.5 percent of people aged 15 years and over in Papakura East have a post-school qualification, compared with 42.5 percent of people throughout the greater Auckland Region. In Papakura East, 42.3 percent of people aged 15 years and over have no formal qualifications, compared with 20.3 percent for the Auckland Region as a whole. (Statistics New Zealand (www.statistics.co.nz). Furthermore over 95% of families are in either state or private rental accommodation. Single parent families are also a significant feature as too are the numbers who rely on state benefits for financial support. As Biddulph (et.al.2003, p.34) state; "It is the quality of family ties and resources available to children and parents that are critical." In recognising this fact, the school has taken steps to improve the quality of family ties and resources through researching a range of services and giving due consideration to what may likely work.

Child Youth and Family is a service line of the Ministry of Social Development which delivers front-line social work. On an average day the department;

- receives 230 notifications of child abuse or neglect
- meets more than 100 families to talk about their situations and children's safety
- facilitates around 20 care and protection and 40 youth justice family group conferences
- houses just over 100 young people in our youth justice residences
- supports the more than 5,000 children living with caregivers or extended whānau.

Refer Child Youth and Family website www.cyf.govt.nz

It is undeniable that high level crisis intervention by the Department has an important place, however the school is attempting to reduce the number of families requiring high
crisis intervention by exploring the range of support that can be provided to families through a range of early intervention strategies.

**Strengthening Families Programme**

The school has in 2010 implemented the "Strengthening Families" model of working with families with a view to better addressing families’ needs and in the long term those of families from other schools in the local area. A staff member attended a 3 day training workshop designed to: increase participants knowledge of the Strengthening Families process; improve understanding of the roles/responsibilities of those involved in the collaborative process and enhance confidence in effectively coordinating and facilitating meetings. Effective communication and negotiation skills to positively influence others to work together in the best interests of families were other key components of the training. The knowledge gained through the training was brought back to share with school personnel.

Strengthening families is a local community based initiative using a coordinated approach to support families to access a range of services. Last year, over 1,500 families with social service providers participated in Strengthening Families. This whole-of-government service spearheaded by the Ministry of Social Development (MSD) provides early intervention to families to prevent difficult situations escalating to crisis intervention levels when circumstances are then likely to be more difficult and therefore more complex. Family and agencies work closely together in a supportive and effective way to develop an action plan based on the needs identified by the family. A specially trained and skilled Strengthening Families Coordinator liaises with the required agencies who attend the meetings alongside other support people. This practice is recommended by the Whanau Ora Taskforce convened to report and make recommendations on ways to strengthen Maori Health and Well being and to explore and make recommendations on a more coordinated and effective interagency level of support. The task force recommends some aspects of delivery will go a long way to improving service such as, "contracting practices that minimise fragmentation, target positive whanau development, encourage provider collaboration, utilise integrated data and communication systems and enable whanau needs to be addressed in a coherent and integrated manner" (2009,p.59)

The school is now capitalising on the proven local service of the Strengthening Families model in preference to coordinating the services themselves. The advantages of the Strengthening Families model for the school include;
• immediate access to a skilled facilitator and the support networks and range of services already developed by the facilitator;
• the voluntary rather than legislative aspect of participation by families;
• the school has the opportunity to participate but does not have sole responsibility for overseeing the plan of action;
• the school's confidence in knowing families are in safe hands which often has not been the case in working with many of the external agencies;
• the school and family are able to access early intervention rather than crisis intervention and have confidence that help will be forthcoming;
• family health and well being are priority;
• a culturally friendly environment is nurtured.

In addition the Strengthening Family model fits with Bowen's notion that; "communities with strong networks and high levels of trust between citizens, and between our diverse groups of citizens, tend to be safer, richer and healthier" (2009, p.11) In addition the Government's new "Whanau Ora" Initiative for Maori has direct alignment with the Strengthening Families model. There is cohesion across government agencies and improved opportunities for a sustainable whānau-wide approach to resolving issues. Families are actively involved in planning interventions and therefore are presented with choices about the types of services most suited to support them. The Whanau Ora Taskforce (2009) maintain that services to date have been;

Compromised by lack of economies of scale, fragmented sectoral approaches and an alignment with funder expectations rather than actual whanau needs. Moreover, the focus has largely been on crisis management, support and care, with relatively less emphasis on positive development and the enhancement of whanau capabilities. (p.20)

As with the Strengthening Family model, the health and well being of whanau is pivotal as it is not possible to focus solely on one family member without considering and working to support all members of the whanau.

Quick60 Literacy Programme

The school's governing board also funds two literacy specialist teachers, one for 4 days a week and one for five mornings a week to support small groups of students identified as “At Risk” in learning and behaviour. Literacy specialist Carol Goldsmith worked with
programme developer Sandra Iversen to implement the Quick60 Literacy Programme. The subsequent improved achievement and behaviour of students has had far reaching effects and produced some outstanding results. Quick60 is a small-group literacy prevention/intervention programme based on the research of Iversen and Tunmer (1993) and Iversen, Tunmer, and Chapman (2005).

   The programme design incorporates the essential learning into the books and provides comprehensive and detailed lesson plans that enable the programme to be delivered by a trained teacher or a teacher aide without further training. The non-fiction texts enable older students with limited literacy knowledge to use the books without feeling patronized.

Methodology

15 at-risk students from Years 2 – 5 were tested at the end of Term 1 2010. The tests included alphabet letter and sound knowledge, high frequency word knowledge, spelling ability, and the ability to decode pseudo words. The spelling and pseudo words test have two scoring systems. One gives the total correct. A point score is also available to show teachers how well their students are progressing towards complete accuracy. A record of oral reading was also administered to each student to determine an instructional reading level. The students were then divided into four groups and began their programmes with the specialist literacy teacher at the beginning of Term 2. At the end of Term 2, the students were again tested with the same battery of tests. They were also asked to read an unseen text from either the Ready to Read Series or the PM Series to determine their instructional reading level. Initial test scores and test scores at the end of Term 2 were collated. The number of lessons and the actual hours of instruction are also included.

Results

   The results show that with as little as 12 hours of quality instruction using appropriate materials, at-risk students can increase their literacy knowledge and use this to read increasingly more complex text. (See Appendix 1 for results)

Classroom Support Intervention

   There is an over representation of "High Needs" students at Years 4&5. These year groups who are currently in two classrooms have the highest percentages of students with "High Needs" in all three categories i.e. in learning, behaviour and family circumstances. Without some form of additional intervention the concern is that by the end of the year achievement for some of these students may not change at all. An even worse case
scenario is they may regress from the achievement levels of the previous year. Therefore as a possible solution the following intervention is now being trialled to support teachers and students in both classrooms.

The principal who is also a literacy specialist is now leading the reading programme in one of the Year 4/5 classes along with the classroom teacher and a teacher aide. The class of 24 is divided into three broad achievement groups. The lowest achievers are at three different reading levels but with the specialist teaching, these students can be expertly taught as one group. Ordinarily the teacher would be expected to manage two instructional groups a day which means students usually have instructional reading on average two or three times a week. With the current intervention every reading group now has instructional reading for an hour a day. The weekly reading planning is managed in conjunction with the classroom teacher and all three teaching personnel are assigned a reading group. The programme is structured and begins with the lead teacher discussing the learning intention for the lesson and the success criteria with the whole class as follows;

**Learning Intention:**
- To read and understand what we are reading.

**Success criteria:**
- We will be able to answer questions accurately (orally and in writing.)
- We will be able to complete cloze exercises about the story

Students then move to their reading groups to participate in planned instructional reading and related oral and written follow up exercises linked to the instructional text. Students are provided with support tailored to their needs and receive immediate oral and written feedback. The class comes back together at the end of the hour to discuss progress in relation to the success criteria and teachers provide feedback to their group.

During the first day of instruction the children were engaged, motivated and on task. The students reputed to be behaviour problems appeared to be the most engaged, most likely because they were receiving positive feedback for engagement in learning rather than the usual feedback for inappropriate behaviour. Another outcome early in the intervention is that the positive behaviour of the identified "High Needs" students has continued to be sustained outside of the reading programme. Most of all though, students are switched on to reading and writing and excited about their success and personal achievements. The overwhelming success of the intervention had such success that it was soon replicated in the other Year 4/5 class and lead by the Literacy Specialist Carol Goldsmith and ESOL teacher Naomi Lees working alongside the classroom teacher. Regular review meetings were held to discuss organisation and to share teacher made resources and activities.
Students were tested after 7 full weeks of classroom implementation. All showed gains in achievement with some showing increased gains in reading age of up to 6 months.

Reading Teacher Support

Three retired teachers Judith, June and Chris are in the second year of working voluntarily in the school. Two work one on one or with small groups of “At Risk” older students i.e. students in Years 4-8 and one works with Year 1&2 students who require additional early literacy support. They work 2 hours a day twice a week and recently have begun extension work with gifted and talented students. Again the rates of progress and therefore the achievement results for these children are outstanding with some moving up a year in reading age as detailed below in Figure 5.

Friends of the School

The interconnections between and across people provide some of the most powerful contexts for fostering and promoting teaching and learning. In the case of Edmund Hillary School the benefits of these connections known as “Friends of the School,” have provided a network of like minded people willing to put their hands up to help teachers, children and families. They see the level of under privilege and the vision of transformation and want to
contribute. The interactions between students and the many 'friends' of the school provide a rich social world for children to make sense of and provide valuable opportunities for learning through shared and often new experiences which occur out-of-school. As Alton Lee explains;

Carefully designed out-of-school learning opportunities can also be used to bring funds of family and community knowledge into the classroom. Such opportunities can have significant and sustained impacts on student knowledge, attitudes, self-esteem, independence, and confidence. (2003:p.61)

Many special people have come through the gate with their hands up to help. Only some are detailed in the following section as the list is infinite.

The Three J's

Special people known as the Three J's, Dr Jude, Jo and Jilly come weekly to take selected students on special excursions in their own time and at their own expense. They came into the school last year as a result of a professional connection between a teacher at the school and one of the group. Many children were treated to a variety of special excursions such as visits to the zoo, a trip to Snow Planet New Zealand's first and only all-year indoor snow resort which is a journey of some 50 minutes from the school. This year they have enrolled 8 senior students in the "First Tee" programme and consistently transported them across town to participate every week despite their own busy schedules. The mission statement of the programme is; "To impact the lives of young people by providing learning facilities and education programs that promote character development and life-enhancing values through the game of golf." (www.thefirstteenz.org). Nine core values of respect, sportsmanship, judgement, honesty, perseverance, courtesy, confidence, integrity and responsibility are integral to the programme. Students and the Three J's have developed deep bonds which are likely to remain forever. The love, respect and delight is there for everyone to see when the waiting students spot the Three J's cars appearing through the gate.

Breakfast Club

Angels Light Breakfast Club which is part of Papakura Christian Services Trust was initiated by local resident Bronco Fox in 2001. The service embraces four needy schools in Papakura one of which is Edmund Hillary School. Bronco began with no money or volunteers and now provides breakfast to over one thousand children across the four schools with the support of many local volunteers. The service at Edmund Hillary School started out for 3 mornings a week and was extended to 5 mornings a week when volunteers
from the local Papakura East Presbyterian Church offered to provide support for the other 2
days. So now with both organisations working together, students every school morning are
provided with a substantial breakfast of weetbix and milk, toast and milo.

The benefits from school feedback are as follows;

1. Improved behaviour in class with better concentration which in turn benefits other pupils.
2. The social benefits of sitting around a table with other children and the interaction with adult volunteers.
3. The table etiquette which is expected of the children and the requirement to take their dishes to the kitchen when finished may be the only such training some of these children may receive.

The Gate

The Gate is a vibrant multicultural church in the local area. Members of the church led by Tania and Paul Kauri and their family organise and lead a range of “After School” activities for students, provide them with a healthy afternoon tea and provide a range of resources which children would not otherwise have access to. Mentorship and support with lunchtime activities were also provided and for a term a select group of students participated in the ‘Seasons for Growth’ programme which is based on the belief that change, loss and grief are normal and valuable parts of life. It aims to produce a sense of resilience, personal growth and acceptance of change in people’s lives.

The high level commitment both in terms of personnel and resources is voluntary and from the heart. The list of support also includes donations of money to help with special projects in the school, providing resources for school celebrations, providing tuition for students to participate in performing arts and treating staff to dinner to acknowledge their hard work and commitment to the school and community.

Private Schools

Edmund Hillary School has gained much from the special relationships forged with three private schools in the wider Auckland area; namely Kings School; King’s College and St Kentigerns School. King’s College students organised after school activities twice a week for children and travelled for over an hour a day to do this. Again special bonds were formed between the Year 12&13 students from Kings and our Year 1 to Year 8 students. Recently the school formed a partnership with St Kentigerns another private school in Auckland. This began when another person came through the Edmund Hillary School gate who had links with St Kentigerns School and recognised the value to both schools of a partnership based on giving and caring for one another.
Aonui Programme

In 2008 the school was included in a Community Initiative which involved piloting a Community Constable Programme. Constable Tony Tumai, a local police officer, was appointed to work fulltime with the school and community. The initiative had a significant impact with the police, members of the community and the school working positively together to build stronger relationships.

The many projects either initiated, ongoing or in some cases completed have signalled progressive change especially in bringing home/school and police partnerships closer together and in building another level of confidence and respect between the school and community.

The Aonui programme is an extension of this initial work. Constable Tony Tumai's partner Donna is employed as a teacher aide to work with two of the "high needs" students who are being transitioned into the school. In discussions with Tony they concluded that both students and another who had severe learning difficulties would benefit from experiencing a range of learning activities outside of school. Essentially they decided that the students would benefit from trips out into the "big wide world" hence the name Aonui and the title of the programme. Tony allocates one morning a week during one of his days off work to accompany Donna and the boys on trips. They have visited many local places of interest and met many people of interest. The boys look forward to their weekly adventures with Tony and Donna and the range of activities and places they get to see outside of school.

Papakura East Presbyterian Church

In addition to supporting the school with Breakfast Club, the Presbyterian Church provides the school with significant funding towards school and community initiatives. The support has enabled the school, the church and the community to celebrate 'International Children's Day' together. This event is now looked upon as the highlight of the year for children, families and community. Support from the church has also extended to organising and funding a positive parenting night and supporting end of year functions leading up to Christmas. In 2008 some twenty needy families in the community were identified and provided with Christmas hampers. The hampers were specially made up with every family member in mind.

The three Reading Teachers who help to raise literacy achievement with 'at risk' students also belong to the Presbyterian Church congregation.
Papakura Council

The school has invaluable links with Mayor John Robertson and Deputy Mayor Peter Goldsmith. It so happened that the Mayor and the Principal, who was new to the school and to the area in 2007, reconnected after some 40 years of attending a little country school together. The principal attended a meeting in the council chambers early in 2007 and gave an account of the 'poor state of the school.' Now both the Former Mayor and Former Deputy Mayor have continued to maintain a strong interest in the development of the school and to continue to call on their networks to support as well as provide mentorship and friendship to the principal over dinner.

Not all "Friends of the School" are listed here as there are so many who have contributed and continue to contribute. Other names include Troy Heslop who has stocked the school nursery with donated veggie plants since the beginning of the gardening project, Maggie Cameron who voluntarily contributed many hours and resources to initiate and drive the 'Healthy Lunches' scheme our Business Partners KPMG who have provided financial advice to the school for over three years and donated much needed computers for every classroom.

The varied and rich contexts provided by the many 'Friends of the School' foster an environment in which cooperation, aspirations, ventures and achievements are well appreciated and highly valued by all.

Meditation

Another initiative started in 2009 has been the whole school implementation of the "Transcendental Meditation Quiet Time" programme. All teachers and support staff have the opportunity to train and practise the Transcendental Meditation technique. In addition all students practice the technique twice each day at school. Year 1 – 5 students walk either inside or outside their classroom for 5 minutes with their eyes open and meditate while students from Year 6 to Year 8 sit at their desks in the classroom close their eyes and meditate for 12 minutes. Teachers report that students are more settled in class, have increased concentration and are doing their work better. They also report that the line of children waiting outside the principal's office has significantly reduced. The children themselves say they find it easier to study and they feel calmer, happier and less pressured.

Staff refer to higher energy levels and generally improved health and well being since learning Transcendental Meditation. Everyone is offered the opportunity to train and all teaching staff have taken up the offer including new staff into the school. Up to now this programme has been funded by private donations. The Board are now seeking long term
sustainable funding to maintain Transcendental Meditation in the school and to extend the programme into the community.

Ministry of Education Support

Currently some of the students identified as “High Needs” who are enrolling in the school have some funding support from the Ministry of Education. This enables the school to employ a teacher aide to work alongside students providing some assistance with learning and behaviour in the classroom and playground.

Schooling Improvement: Papakura Achievement Initiative.

The school is part of the Ministry of Education school support initiative which aims to raise student achievement in literacy learning across 22 schools in the Papakura area. Poor student achievement in the school has been a longstanding issue. As Timperley explains, "Where achievement problems are entrenched, possibilities for improved outcomes may become apparent only over time, as teachers see evidence that students can acquire new knowledge and skills when taught differently." (2008, p.8)

Teacher professional development through the initiative is in the form of regular workshops and in class support for teachers from a literacy facilitator who observes teacher practice, provides feedback on practice and models teaching strategies tailored to the needs of students in classrooms. Achievement data is collated regularly and analysed for shifts in student achievement.

To date the shifts in achievement have been minimal with the majority of students remaining well below expectation as demonstrated in the accompanying results for the Year 4 Supplementary Test of Achievement in Reading. The results reported for this year group are similar to those for all year levels in the school. Exceptionally high teacher turnover has been a feature of the school for many years and has a significant impact on student achievement. Since the schooling improvement initiative began in 2008, there is only one teacher out of seven who has been teaching in the school for the duration. Currently the majority of teachers are in the early years of their teaching profession and most have not yet completed one year of teaching in this school. It is going to take some time to get traction and for them to reach the required level of expertise. The issue then will be ensuring a school environment in which they will want to remain. This is not easy when most other schools with higher student numbers generally enjoy a better level of resourcing.
Figure 6

Supplementary Test of Achievement in Reading (STAR) Test 1 Year 4 Students

Results
- The distribution of Year 4 students at stanines 1 & 2 (65%) is significantly higher than the normal distribution of 11%.
- 92% of boys are below average
- 80% of girls are below average
- 88% of Māori students are below average
- 87% of Pasifika students are below average
- There are no students at stanines 7, 8 & 9 i.e. above average or high

Despite the quality professional development the greatest impediment to raising student achievement in the school is recruitment and retention of quality teachers.

Social Worker in Schools and Resource Teacher Learning and Behaviour

There is also a Social Worker in Schools (SWISS) funded by the Department of Child Youth and Family and a Resource Teacher Learning and Behaviour (RTLBD) funded by the Ministry of Education. Both are attached to the school however the time constraints; (SWISS 2 days per week and RTLBD 4 hours per week) and level of high need in the school means that, despite best efforts, the work undertaken by both personnel is barely touching the surface.
Conclusion

The title of this paper "Transforming a Decile 1 School and Community in South Auckland New Zealand" is in the present tense and as such signals that the work of transformation is by no means over and in fact has some way to go before we can be assured students are receiving high quality teaching and learning. It is an indictment on the system that such levels of disadvantage in a school should be allowed to go unchecked for so long and then for Government departments such as the Ministry of Education and the Education Review Office to have the expectation that the disadvantage can be fixed by simply applying normal approaches to fixing complex issues. It takes time to transform a failing school and a community in poverty but the big issue is that there is no time. Every day it takes to move forward to normal is another day where students' rights to the best possible education are compromised.

Some of the 'pathways to success' continue to have a very positive effect in the school and in the community such as the "Mahinga Kāi" project and the student learning interventions implemented by the school. Other factors including the practice of Transcendental meditation by students and staff has had a 'calming' influence on student behaviour which previously was a major issue. The greatest benefits however come from the many 'Friends of the School,' who enter the school gate and see what we are doing and choose to participate in the process of transformation. The open door policy at Edmund Hillary School has served us well over the last four years and will continue to do so as we engage in problem solving discussions with like minded committed people and push the boundaries in the process of transforming a school well known for failure.

No one likes to be associated with failure. No one consciously chooses to fail. When we see evidence of it, those of us who are privileged, have an obligation to commit to a stance of zero tolerance otherwise we fail also. This requires knowledge, commitment and endurance but above all passion. We have a vested interest because what children do in life, how they think and how they behave will determine not only their future but ours too. The key is not just for educators but for everyone to care enough to make some kind of contribution towards improving the wellbeing of others less fortunate. The rewards as many of us have found are limitless.

Therefore as we endeavour to shift the school forward to 'normal' and then on to 'exceptional' we remember the determination and courage demonstrated by Sir Edmund Hillary when he conquered Everest in 1953 and recall a favourite quote of his; "It is not the mountain we conquer, but ourselves". Finally the motto he bestowed on the school in 1963 presents a formidable challenge to us all;

"Be Determined, Aim High."

Kia kaha Kia Rangatira

C. Abstract
As the population of elder increases, the government and private institutions have responded to the elder's needs to hold many learning activities accordingly. However, this causes the phenomenon of repeating to use and waste community resource. The aim of this article is to reexamine the community resource with resource integration. First, describe the status quo of Taiwan community elder education. Second, the researcher briefly explores the origin and context of resource integration. Third, using an integration view to discover and analyze the community resources with six categories: human, material, financial, organizational, cultural, and natural sources. To conclude, strategies for establishing community learning network for senior citizens are presented.

This paper was presented at the Hawaii International Conference on Education January 4-7, 2011.
Abstract

The purpose of this study was to identify persistence factors that influenced African American doctoral students’ completion at selected historically Black colleges and universities (HBCUs) in the Southern region of the United States. The conceptual framework for this study includes an integration of theoretical constructs from four widely utilized and tested theories of undergraduate student persistence guided by the theoretical framework of student motivation, student choice, and student persistence. Data were collected utilizing a Likert scale survey, the Doctoral Student Persistence Survey which assessed the perceptions of doctoral students as to factors which promote persistence and those perceived barriers for student success.

Key Words: retention, attrition, graduate, historically Black college and university
An Analysis of Graduate Student Retention and Attrition Efforts at Selected Historically Black Colleges and Universities in the Southern Region of the United States

Introduction

Research universities in the United States are internationally known as the foremost institutions in graduate education. With this reputation, research institutions have recruited students of all nationalities, ethnic groups, and religions for their student population. However, in the United States, graduate schools have been less successful in recruiting the minority population which includes: Hispanics, African Americans, Asians, and Native Americans. In fact, the proportion of minority students in higher education declines as one moves from baccalaureate to master’s to doctoral degree programs, and at each level the percentage is well below the percentage of these individuals in the U.S. population (American Council on Education, 2003). Simultaneously, the nation's minority population is steadily rising and now makes up 35 percent of the United States, illustrating a trend that could make minorities the new American majority by 2050.

New Census Bureau data estimates that minorities added more than 2 percent in 2009 increasing to 107.2 million people, due to Hispanic births and more Americans describing themselves as multiracial. During this time, the White population remained flat, making up roughly 199.9 million, or 65 percent, of the country. Just ten years ago, Whites comprised 69 percent of the total population and minorities 31 percent. Currently four states – Hawaii, New Mexico, California and Texas – as well as the District of Columbia have minority populations that exceed 50 percent (Census Bureau, 2010). Such demographic changes in the nation will be reflected in the graduate student population.
In the last decade, African Americans have made advances in doctoral degrees (National Science Foundation [NSF], 2007). From 1996 to 2006, the number of African American doctoral recipients increased 27%. In that same period, the total number of Ph.D.s conferred by all United States universities increased by 8%. In the last twenty years, the number of African Americans who received doctorates in science and engineering has more than doubled (National Science Board, 2008). While graduate schools have made great efforts to increase graduate enrollment and degree success for African American students, HBCUs have led the increase in the number of African American doctoral degree holders.

Another factor fueling this increase was affirmative action programs created by colleges and universities during the late 1960s and 1970s, largely to comply with Title VI of the Civil Rights Act of 1964, which prohibits several types of discrimination in student recruitment, admissions, and financial aid (Ervin & Davenport, 2007). This growth was aided by the Supreme Court’s decision in Regents of the University of California v. Bakke (438 U.S. 265, 1978), which allowed race to be a determinant in the admission to graduate schools. Preferential race-based programs were developed partly in response to the demands to improve the graduation rates of minority students at Traditionally White Institutions (TWIs).

The perceptions of barriers and strategies for the recruitment and retention of diverse graduate student population of college and university administrators and others who are responsible for recruitment and retention of the graduate student population are critical players for creating changes in higher education during the 21st century. Therefore, the purpose of this study was to identify persistence factors that influenced African American doctoral students’ completion at selected historically Black colleges and universities (HBCUs) in the Southern region of the United States. The conceptual framework for this study includes an integration of
theoretical constructs from four widely utilized and tested theories of undergraduate student persistence guided by the theoretical framework of student motivation, student choice, and student persistence.

Background

The *Higher Education Act of 1965* defined an HBCU as any historically Black college or university, established prior to 1964, whose principal mission was, and is, the education of African Americans. These educational institutions are accredited by a nationally recognized accrediting agency or association, as determined by the United States’ Secretary of Education to be a reliable authority as to the quality of training offered or is, according to such an agency or association, making reasonable progress toward accreditation. HBCUs were founded during an era when African American students were barred from attending traditionally white, postsecondary institutions. The Civil Rights Movement opened the doors of traditionally White colleges and universities to minority students, some policymakers have challenged the relevance of HBCUs, arguing that they serve no purpose in an integrated system of higher education. Of the 105 HBCU institutions in America today, 27 offer doctoral programs and 52 provide graduate degree programs at the Master's level.

However, HBCU graduate programs continue to help promote campus diversity nationally as a result of assaults to affirmative action. In 1996, California voters passed Proposition 209. The initiative prohibits discrimination against or preferential treatment for any individual or group in public employment, education, or contracting on the basis of race, sex, color, ethnicity, or national origin (Ervin & Davenport, 2007). Voters in Washington State followed suit in 1998, and voters in Texas accepted similar initiatives as well (Chang, Witt, Jones, & Hakuta, 2000). Meanwhile, *Grutter v. Bollinger* (539 U.S. 306 (2003), a case in which
the United States Supreme Court upheld the affirmative action admissions policy of the University of Michigan Law School, 5-4 decision, was overturned by a referendum of Michigan voters.

Therefore, today although HBCUs represent only 4% of all colleges and universities in the U.S., they account for nearly one-quarter of the African American bachelor’s degree recipients (Redd, 2000). HBCUs have been increasing their involvement in graduate education and since 1996 more HBCUs have begun to offer doctoral programs. Prior to 1996, less than one-quarter of the 87 four-year public and private HBCUs awarded doctorates. By 2006, the percentage of HBCUs with doctoral programs grew to 32%, with just under fifty percent of the four-year public historically Black institutions offering such programs. The increase in HBCUs offering doctorates and the number of graduate students attending these programs has led to a rapid growth in the number of African Americans receiving Ph.D.s and other doctoral degrees in the past five years. In fact, the percentage increases in African American doctorates from HBCUs appears to have accelerated, while the number of these awards overall has slowed.

The enrollment of African Americans and students of color in graduate programs is one of many problems facing this country. A lack of minority graduate students in the educational pipeline means a lack of minorities in higher education and despite minimal gains recruiting, retaining, and graduating minority students in graduate programs, a problem still exists in the graduation of doctoral students, and many universities are searching for innovative strategies to increase retention and graduation of African American students. As the overall color scheme of the Flagship and Research I institutions across the nation has become more Asian and White, African American graduates and people of color are being displaced (Hale, 2006). Therefore, this further highlights the importance of additional examination of issues related to retention and
graduation rates of African Americans at HBCUs. Because of this growing trend, HBCUs have become a refuge of last resort for graduate exploration of many African Americans and people of color (Garibaldi, 1984).

Hale (2006), stated: “Black institutions of higher education have assumed the burden of responsibility for those students who have hungered for knowledge and the opportunity to gain it” (p. xvii). Therefore, the question this society must ask itself is, if HBCUs do not “do it right,” that is retain, adequately prepare and graduate minority students, who will do it? (Hale, 2006). HBCUs now more than ever have an even more important role in society through the education of African American graduates prepared and ready to compete in the global market.

Retention and Attrition Theoretical Models

Retention in post-secondary education is described as activities or programs which reduces student dropout rates and enhance the institution’s overall graduation rates (Pascarella & Terenzini, 1991). However, there exists a vast array of literature on student retention and attrition in general; over the past half century. According to Pascarella and Terenzini (1991), numerous studies such as Bean and Metzner's (1985) Nontraditional Student Attrition Environmental, where they discovered environmental factors have a greater impact on departure decisions of adult students than academic variables. Kamens (1971, 1974), used multi-
institutional data to demonstrate how colleges of greater size and complexity had lower attrition rates. McNeely (1973) "College Student Mortality", examined many factors in college student retention including time to degree, when attrition was most prevalent in a student's education, and impact of college size Spady Model (1971) studied the interaction between student characteristics and campus environment; all conducted to relate the affects of colleges themselves on the retention, attrition and graduation of students. Among them the most noted have been Tinto’s Student Integration Model (SIM, 1975, and 1997); Astin’s Student Involvement Theory (SIT, 1984); Bean’s Student Attrition Model (SAM, 1982, 1983, 1985, and 1990); and, Padilla’s Expertise Model of Successful Students (EMSS, 1991, and 1994).

Tinto’s Student Integration Model

Tinto (1975) developed the Student Integration Model (SIM) of attrition (see Figure 1). This model was to offer an explanation of the aspects and procedures that influenced an individual’s decision to leave an institution, and how these processes interact to ultimately produce institutional attrition. Tinto’s SIM model was based solely on Durkheim’s (1897) theory of suicide (McCubbin, 2003). According to McCubbin (2003), Durkheim’s theory was founded in the likelihood of someone committing suicide being predicated on the level of their integration into society as a whole.

Durkheim (1897) argued that if an individual has an adequate support network and sufficient moral integration that the likelihood of them committing suicide is reduced tremendously. To this assertion, Tinto (1975) interjected that the act of committing suicide was basically the willful withdrawal from existence by individuals, and, therefore, was equivalent to dropping out of higher education, which was the willful withdrawal by an individual from one aspect of society. Durkheim concluded that the reason an individual commits suicide is because
he or she are not sufficiently integrated into society. Conversely, Tinto (1975) asserted the reason for dropping out is a result of the individual’s insufficient integration into the different aspects of college or university life (Tinto, 1975).

Figure 1: Tinto’s Student Integration Model (1975).

According to Tinto (1975), the two most important means of student integration in a college or university are the institution’s academic and the social systems. Tinto asserted that a student’s reasoning for dropping out occurs through the lack of or extreme integration into either or both systems. Tinto asserted that if a student expends a great amount of time studying that his or her social skills suffer and vice versa. He further indicated that if a student spends a large amount of time on social activities and not enough time dedicated to studying or academics, then his or her grades reflect it. Unlike Durkheim’s (1897) model, Tinto’s (1975) model, according to
McCubbin (2003), failed to take into account the individual’s psychological predisposition in the decision to withdraw.

Key features of Tinto’s SIM model included the degree of integration in the institution’s academic and social systems, and the student’s commitment to the institution itself and his or her individual goals (the enrollment commitment). Tinto (1975) pointed out a number of characteristics which affect the student’s pre-enrollment commitment. These include individual attributes which include race, sex and academic ability. Pre-college experiences include a student’s grade point average, academic and social recognitions, and family background, (i.e., socioeconomic status, family values, climates and cultural backgrounds (Tinto, 1975).

Included also in this model are an individual’s educational expectations, which drive the student’s selection of educational institutions. This researcher stated that because each student views selection of an educational institution as pivotal to future success, commitment to that institution persistence is greatly enhanced. A student’s assessment of their post secondary experience comes in the form of cost benefits analysis. According to Tinto (1975), if the student determines that the cost benefit is high, the likelihood is that the individual will persist, and on the other hand, if he or she concludes that the cost benefit analysis is low, then it is more likely to cause dropout or withdrawal.

Tinto asserted that persisters and non-persisters view educational processes differently. Non-persisters see education as a vocational process and persisters view it as an intellectual gain. He makes a direct link of attrition to social integration, stating that it likely leads to voluntary withdrawal rather than academic dismissal. Social integration within the faculty is one of its most important aspects. According to Tinto, interaction with faculty not only increases the
student’s level of social integration, but it also leads to increased academic integration which translates to increased academic performance by the student.

Tinto’s (1975) student integration model illustrates his premise that academic and social integration, individual goal and institutional commitment are intertwined in a student’s decision to persist. He asserted that academic integration has a direct impact on a student’s individual goal commitment and commitment to his or her chosen institution is directly affected by his or her ability to socially integrate.

While Tinto’s SIM (1975) has been widely accepted for more than twenty years, according to McCubbin (2003), several criticisms exist. McCubbin stated that the criticisms revolve around Tinto’s SIM are “(a) inadequate in modeling student attrition; (b) only applicable to ‘traditional students’; and, (c) academic integration is not an important predictor of student attrition in traditional student populations.”

The criticism that SIM is inadequate in modeling student attrition stems from research conducted by Brunsden, Davies, Shevlin and Bracken in 2000. In their study, Brunsden et al. (2000) administered a questionnaire to first year students to assess the validity of Tinto’s model. They found that global application of the model proved impossible to assess its individual components. However, Brunsden et al. (2000), in their assessment and criticism, did indicate possible shortcomings of their own study, since they did not actually assess social or academic integration, only the potential of these characteristics (Brunsden et al., 2000). They also openly criticized Tinto’s reliance on Durkheim’s model of suicide, arguing that serious doubts arise when linking the relationship of suicide and student dropout.

In an effort to address the levied criticisms of Tinto’s SIM model, he made updates to take into account the importance of the classroom in the educational environment and attrition
process (Tinto, 1997). Tinto affirmed the importance of classroom-faculty interaction on the processes of academic and social integration. It is through this process that institutions realize significance in attrition rates reduction (Tinto, 1997).

In the SIM model revisions, Tinto (1997) asserted previous inadequacies in his original model as seen in Figure 2. These inadequacies occur in his modeling of the relationships between learning persistence, involvement, and quality of effort (McCubbin, 2003). He asserted the inadequacies in how SIM previously assessed the relationship between social and academic interaction as separate and discrete. He subsequently concluded that they

are factors of the larger process and do not warrant individual consideration.
Astin’s Student Involvement Theory

Astin’s (1984) Student Involvement Theory posited that a student’s participation in an institution’s academic as well as social environments encourages enhanced learning and thus equates to retention of students and their successful graduation. Astin (1984) stated that students who are involved devote considerable energy to academics, spend time on campus, participate actively in student organizations and activities, and network often with faculty. On the other hand, he asserted that uninvolved students neglect their studies, spend little time on campus, abstain from extracurricular activities, and rarely initiate contact with faculty or other students (Astin, 1984). The most persuasive types of involvement are “academic involvement, involvement with faculty, and involvement with student peer groups” (Astin, 1996, p. 126). This theory is consistent with student-centered teaching approaches, in that the student has an integral role in determining her or his own degree of involvement in various educational activities.

According to Astin (1984), the quantity and quality of a student’s involvement influences educational value added attributes such as cognitive learning, overall satisfaction with the college experience, and increased student retention rates, which translates to increased graduation rates (Astin, 1984, 1996). For a student to be totally involved in the learning process, he or she must invest genuine energy in the academic relationships and activities of the institution. The amount of energy a student invests in these types of activities will vary based upon the student’s interest, goals, and other commitments.

Astin (1984) argued that instructors should use the involvement theory to maximize student learning. To accomplish that goal, instructors must be aware of how motivated students are and how much time and energy they are devoting to the learning process. Studies conducted by Pascarella and Terenzini (1991) and Tinto (1993) have investigated the effectiveness of
Astin’s (1984) Student Involvement Theory and offer support of his assertion that positive levels of involvement positively influences student’s academic experiences (Ford-Edwards, 2002).

Bean’s Student Attrition Theory

Bean’s (1980, 1982, 1983, and 1990) Student Attrition Model of persistence expanded the previous work of Tinto and Astin by integrating academic variables (i.e., student intent, goals, expectations, and external and internal environmental factors). In addition, Bean’s attrition model includes another set of five facets: (a) Routinization—the idea that student life becomes routine; (b) instrumental communication—how well an institution distributes information about student life; (c) participation in classroom decisions; (d) integration; and, (e) distributive justice—whether rewards are consistent with effort expended.

According to Felder-Thompson (2005), Bean’s model demonstrates how a student’s attitude and behavior correlates with institutional determinants to produce a level of satisfaction which encourages institutional commitment. Felder-Thompson cited Bean’s statement that a student’s environmental factor shapes his or her attitudes and invariably influence behavior. Students should feel a “sense of belonging” or “fitting in” within an academic environment in order to develop institutional commitment (Bean, 1990).

Bean’s Student Attrition Theory’s validity has been well-documented through his many persistence studies (Bean, 1982, 1983, 1985, and 1990). However, the predictive power of the influence of a student’s commitment was not supportive (Cabrera, Castaneda, Nora, & Hengster, 1992). Based on his research, Bean (1985) also developed a Conceptual Drop-Out Syndrome Model. This model focuses on a student’s socialization and how it impacts his or her academic, personal and social outcomes (Felder-Thompson, 2005). The Drop-Out Syndrome is
characterized by a student’s intent to leave, discussions about leaving and the action of leaving, Bean explains and highlights the domains of his Student Attrition Theory (See Table 2).

Bean’s (1980, 1982, 1983, and 1985) model bears many similarities to Tinto’s (1975) model in all areas except the effects of external factors on students’ persistence. He proposes that the role that external factors have on a student’s decision to stay or leave is much more intricate than that indicated by Tinto.

Padilla’s Expertise Model of Successful College Students

Padilla (1991, 1994) developed a local expertise model of successful ethnic minority students at a large research university in the Southwest. Padilla sought to identify the campus specific heuristic knowledge and actions that successful minority students employ to overcome
Padilla’s expertise model is based on the results of qualitative research and on expert systems theory (Harmon & King, 1985), which suggested that the characteristics of successful college students are those in effect which make the students “experts” at being successful students. Consistent with Harmon and King’s (1985) theory, expertise is viewed as compiled knowledge, which comprises two key components: theoretical and heuristic knowledge. Theoretical knowledge is knowledge acquired through a student’s academic pursuit and heuristic knowledge is that which is acquired in everyday activities. He supports his theory that knowledge is based on acquired facts:

…the knowledge of an expert system consists of facts and heuristics. The ‘facts’ constitute a body of information that is widely shared publicly available, and generally agreed upon by experts in a field. The ‘heuristics’ are mostly private, little discussed rules of good judgment (rules of plausible reasoning, rules of good guessing) that characterize expert level decision making in the field. The performance level of an expert system is primarily a function of the size and the quality of a knowledge base it possesses. (Padilla, p. 187)

Theoretical knowledge is largely, book knowledge that is learned on campus through coursework and formal study, whereas heuristic knowledge is locally defined and is acquired experientially. Padilla et al. (1997) surmised that all students arrive on campus with an already acquired intensity of theoretical and heuristic knowledge. Upon their arrival on campus and subsequent indoctrination as a full-fledged student, they are challenged by the institution to
demonstrate increasing levels of theoretical knowledge before they can be awarded a degree. Such knowledge is typically acquired through courses and demonstrated through performance on tests, examinations, research papers, or other formal assessment procedures.

This aspect of the college experience is well understood conventionally. However, the expertise model also suggests that students must acquire a certain amount of heuristic, or practical, knowledge that is necessary to function competently, as, knowing when to drop a course, rather than failing the course and acquiring skills when to change a major can make the difference between earning a degree or not obtaining one. In the case of financial aid, students must know the importance of funding to their persistence, and must monitor key deadlines to ensure that funds are available to continue in college.

Padilla (1991, 1994) pointed out that heuristic knowledge is not usually formally taught to students nor is it significantly generalizable from one institution to another. Heuristic knowledge is passed along informally from experienced students to new students on a one-to-one basis or by student organizations to groups of new students. Overall, heuristic knowledge is not acquired systematically, thus such knowledge may not reach all students. Yet, students are required to amass a substantial body of heuristic knowledge early in their college careers and to expand this knowledge throughout their college years. Those who fail to do so are not likely to complete their degrees since heuristic knowledge is critical for success.

The importance of using Padilla’s Expertise Model of Successful College Students has been extensively examined by Trevino and Rendon (1991, 1994). This model utilizes students’ perspectives in addressing campus-specific issues (Hernandez, 2000; Padilla et al., 1997). Researchers drew on Padilla’s view that successful students’ persistence is based on the knowledge of the student rather than identifying what students do wrong (Hurtado & Garcia,
The following figure compares Bean’s, Tintos, Astin’s and Padilla's theories.

![Figure 3: A comparison of the elements in the Tinto, Astin, Bean, and Padilla Models](image)

Therefore, the researches utilized procedures that incorporates conceptual models of student persistence of Tinto (1975, 1987, 1993), Astin (1984/1985), Bean (1990, 1982, 1985), and
Padilla (1991, 1997) to examine factors that promote persistence for African American doctoral students at HBCUs in the Southern region of the United States as seen in Figure 3.

Methodology

Data were collected utilizing Likert scale surveys from two institutional groups by means of the *Doctoral Student Persistence Survey* for doctoral students to assess factors which promote persistence and those perceived barriers to student success. A convenience sample completed surveys through SurveyMonkey.com. The resulting ordinal data, for purposes of analysis was not summed but, rather analyzed on a case by case basis using Spearman Rho Coefficient to determine the relationships between factors that measure students’ perception of persistence toward degree completion (n=86 students). The population was all African American students in doctoral degree programs and institutional administrators at selected HBCUs in the Southern region of the United States. The focal institutions were: Alabama State University, Fayetteville State University, Florida A & M University, Grambling State University, Howard University and Jackson State University, and Morgan State University.

Based on the statement of the problem, the purpose of the study, and the conceptual framework, the following research questions and hypothesis were addressed:

Research Question 1: What are the motivating factors that influence African American graduate students at the respective HBCUs (Alabama State University, Fayetteville State University, Florida A&M University, Grambling State University, Howard University, Jackson State University, and Morgan State University) to persist toward completion of graduate programs?

Research Question 2: What are the factors that influence academic success for African American graduate students at the respective HBCUs (Alabama State University, Fayetteville State
University, Florida A&M University, Grambling State University, Howard University, Jackson State University, and Morgan State University)?

Research Question 3: What are the barriers that impede progress for African American graduate students at the respective HBCUs (Alabama State University, Fayetteville State University, Florida A&M University, Grambling State University, Howard University, Jackson State University, and Morgan State University)?

Research Question 4: What are the intervention efforts utilized at the respective HBCUs (Alabama State University, Fayetteville State University, Florida A&M University, Grambling State University, Howard University, Jackson State University, and Morgan State University)?

It was hypothesized that:

\( H_01: \) There is no significant difference in the success rate of African American doctoral students and relationships development with faculty within their doctoral programs.

\( H_02: \) There is no significant difference in the success rate of African American doctoral students and a supportive faculty which has a strong impact of the student’s intellectual development.

\( H_03: \) There is no significant difference in the success rate of African American doctoral students and adequate financial support and institutional commitment to the student.

\( H_04: \) There is no significant difference in the success rate of African American doctoral students and their personal commitment to the degree, family support, and practice of chosen religious belief.
H_0_5: There is no significant difference in the success rate of the African American doctoral student and feedback and grading of scholarly projects.

H_0_6: There is no significant difference in the success rate of African American doctoral students and faculty interest research and the ability to present research at professional conferences.

H_0_7: Institutional commitment, retention programs or policies, comprehensive orientations, and quality academic advisement have no significant impact on the success rate of African American doctoral students.

H_0_8: Professional development seminars or workshops and collaborative research projects have no significant impact on the success rate of African American doctoral students.

Findings

*What are the motivating factors that caused African American graduate students at the respective HBCUs to persist toward completion of graduate program*

The hypotheses answered with these statements are:

1. H_0_1: There is no significant relationship between the success rate of African American doctoral students and relationship development with faculty within their doctoral programs.

2. H_0_2: There is no significant relationship in the success rate of African American doctoral students as it relates to a supportive faculty and a strong impact of the student’s intellectual development.
3. Ho3: There is no significant relationship between the success rate of African American doctoral students and adequate financial support and institutional commitment to the student.

The data collected indicated that the motivating factors that cause African American graduate students to persist toward degree completion were the areas which centered most on their relationships with faculty within their departments. They indicated that the strong impact of at least one faculty member in their program on their intellectual development and the ease at which faculty-student relationships are developed and maintained during the student degree pursuit assisted in their persistence. Both institutional administrators and the students themselves indicated adequate financial support as a motivating factor to persistence. However, the area that seemed to appear throughout the study for students is their relationships with faculty, whether that be through fair grading policies or collaborative research opportunities.

Research Question 2

What are the factors that influence academic success for African American graduate students at the respective HBCUs?

The hypotheses answered with these questions are:

1. Ho4: There is no significant relationship in the success rate of African American doctoral students and their personal commitment to the degree, family support, and practice of chosen religious belief.

2. Ho5: There is no significant relationship between the success rate of the African American doctoral students and the feedback and grading of scholarly projects.

The data collected indicated that the factors which most influenced academic success for African American graduate students as it relates to their respective HBCUs were institutional
support and commitment, faculty support and interest in their research, professional
development, and adequate financial assistance. There were also three identified factors which
had to do with persistence from the student viewpoint. They were family support and
encouragement during the stresses of the doctoral process, their personal commitment to their
goal of degree attainment, and their belief in and practice of their chosen religious faiths.

**Research Question 3**

_What are the barriers that impede progress for African American graduate students at the respective HBCUs?_

The hypotheses answered with these questions are:

1. \( H_o6: \) There is no significant relationship between the success rate of African American
doctoral students and faculty that demonstrate an interest in their research and their
ability to present that research at professional conferences.

2. \( H_o7: \) Institutional commitment, e.g., retention programs or policies, comprehensive
orientations, and quality academic advisement have no significance on the success rate
of African American doctoral students.

3. \( H_o8: \) Professional development seminars or workshops and collaborative research
projects have no significance impact on the success rate of African American doctoral
students.

The data collected indicated that the barriers that impede progress for African American
graduate students at their respective HBCUs overwhelmingly were institutional support and
commitment, faculty support and interest in their research, professional development, and
adequate financial assistance. Though these are seen as success factors, they were also identified
as potential barriers to degree persistence. Both student participants and institutional
administrators pointed out that financial packages which included research, travel, and conference grants as well as tuition stipends were most desirable, yet the most difficult to receive.

Research Question 4

What are the intervention efforts utilized at the respective HBCUs? Recruiting and retaining minority students are growing concerns for leaders of colleges and universities across the United States. Presidents of universities and deans of colleges have depicted minority recruitment and retention as vital issues for higher education. African American students completing their undergraduate education at HBCUs are more likely than those from other schools to attend graduate school and to complete doctoral degrees. HBCUs also account for 17 percent of African American graduate students in science and engineering fields (NSF, 2000b, p. 30). Therefore, often issues of recruitment and retention are not considered important at their graduate institutions. Further, the financial assistance, often available at TWIs, is not available at most HBCUs, except for specialty areas such as the science, engineering or public health areas.

The researchers examined University websites and recruitment, admission, and retention documents of the focal institutions in order to answer this research question. One researcher serve as the director of the Graduate Feeder Scholars Program (GFSP) in the School of Graduate Studies and Research GFSP, an official partnership agreement arranged by FAMU with more than 40 participating universities located throughout the United States. FAMU acts as the hub of the consortium with a committed role of providing a pool of qualified African American students motivated to pursue the Master’s or Ph.D. degree. This individual’s role is to be knowledgeable about graduate programs, including, but not limited to a university’s recruitment, retention, and attrition statistics.
In fact, an examination of the websites and admission, recruitment, retention literature indicates that although each of the institutions under consideration had a retention and attrition policy statement, as well as a graduate school and/or graduate support program, Howard University had the only established program, the Retention, Mentoring, and Support Program. The goals of the Retention, Mentoring, and Support Program at Howard University are to:

1. provide the structure for an organized, well-designed program of mentoring and retention that will improve the quality of life for students in the Graduate School at Howard University

2. reduce attrition;

3. reduce time to degree;

4. provide opportunities for fellowships and internships; and

5. enhance career and professional development.

To achieve its goals, the Howard University Retention Mentoring Program works directly with peer mentors, graduate faculty, and graduate program directors to provide information, mentoring, recognition, role models, funding and other resources necessary to ensure the success of its graduate students. The Office of Retention and Mentoring works closely with academic departments to identify and secure funding for graduate students. Students compete for several prestigious fellowships annually both university based and nationally (See http://www.gs.howard.edu/omrs/default.htm).

Table 3 provides an Exploratory Factor Analysis of Student Persistence. The Doctoral Student Persistence Survey asked students to rate their satisfaction with factors that determine their ultimate persistence to degree completion. These factors included the student’s commitment to their goal of degree completion; how they felt that their institutions demonstrated
commitment to their degree completion through adequate financial support; their feelings on the importance of family support during the stresses of the doctoral process; and how the practice and belief in their chosen religious faiths affected their persistence toward degree completion.

Table 3: Exploratory Factor Analysis of Student Persistence

<table>
<thead>
<tr>
<th>Persistence Factors</th>
<th>% of Variance = Statistical Dispersion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commitment to Goal</td>
<td>39.4%</td>
</tr>
<tr>
<td>Institution Financial Support</td>
<td>27.6%</td>
</tr>
<tr>
<td>Family Support</td>
<td>20.5%</td>
</tr>
<tr>
<td>Religious Belief/Faith</td>
<td>17.6%</td>
</tr>
</tbody>
</table>

The results of the Exploratory Factor Analysis indicated that the students had a 39.4 percent variance or statistical dispersion in their commitment to their goal of degree attainment. This analysis supports what researchers in other studies (Ford-Edwards, 2002 and Felder-Thompson, 2005) have concluded, which is that African American doctoral students are a strongly resilient group and persist beyond odds. The analysis also indicated that there was a 27.6 percent variance or statistical dispersion in the student’s belief that their institutions were committed to their goal of degree completion through the awarding of adequate financial support. Previous studies which looked at the importance of financial support to a student’s decision to persist or not to persist have been wide-ranging. These studies offered no clear indicators of its importance, however, suggesting that if a student failed to persist because of financial reasons, the student more often than not had issues with the institution itself (Ford-Edwards, 2002).
Family support indicated a 20.5 percent variance or statistical dispersion. This result is in line with other studies in that family support is seen by the majority of participants in the study as a major importance in their decision to persist. Doctoral programs are accompanied with a great deal of stressors, family support acts as a path to stress relief and potential crisis solving. Religious faith or practice in religious beliefs indicated a 17.6 percent variance or statistical dispersion. These results indicate that a participant’s religious faith or belief plays a significant role in their persistence; often offering a major source of motivation for a student’s ultimate academic success.

Each of these four persistence factors determines the student’s ultimate persistence to degree completion. They total 100 percent of the student’s overall satisfaction with factors that equal academic success. These results overwhelmingly support the fact that African American students in doctoral programs at selected HBCUs persist for a variation of reasons, but they do persist greatly in part to their own inner desire and commitment to their goals.

Analysis of Findings

Upon review of the statistical analysis, several themes emerged as significant in participants’ responses which indicate that (1) faculty support, (2) clear communication, (3) family support, (4) relationship building with faculty and other students within their programs, (5) institutional commitment to graduate education, (6) freedom from financial burdens, and (7) their belief in and practice of their chosen religion were significant factors in motivating African American graduate students towards academic success (we can’t use or note that several themes exists because this was a quantitative study – change themes to something else). Themes which emerged as perceived barriers by the students, as well as the administrators were (1) lack of adequate financial support, (2) institutional commitment to graduate education, (3) students
relationships with faculty, (4) clearly established retention policies and (5) and clear articulation of institution’s commitment to graduate education.

Consequently, the emerging themes of both persistence factors and perceived barriers offer a lens through which the student’s experiences in their respective graduate programs and institutions can be understood. It also allows the researcher’s the opportunity to ponder the development of a useful model for improving attrition, retention, and graduation rates at HBCUs nationally. Earlier we discussed previous models of students’ success by theorist Astin (1996), Tinto (1975), Bean (1980), and Padilla (1991). Each of them examined persistence behavior of students which lead to their ultimate success. However, the factors of persistence at HBCUs given their unique financial postures and limited resources sometimes vary immensely from those of TWIs, leaving their students with the task of mastering other avenues for persistence. While these models were very useful in recognizing behaviors which students utilize to persist in the social and academic educational environments, their measure of student success had often been limited to whether the student actually completed their intended degrees. This study examined what factors were perceived by both the administrators who managed graduate programs and the students who navigated those programs. From this examination, the researchers were able to gleam the emergence of the success strategies utilized by African American graduate students to persist toward degree completion. Thus, we consider those who have successfully navigated these processes, experts in the application of persistence.

It was concluded that institutional and faculty support, as well as adequate financial resources, was vital to these students' ultimate success. No association was found between the success of African American graduate students and their perceptions of the relationship of development with faculty; perceptions of supported faculty; financial support and institutional
commitment. Similarly, there was no association between academic success of the African American student and graduates in the study and personal commitment, family support, and chosen religious beliefs.

Recommendations for further study included developing comprehensive retention programs; conducting an in-depth analysis of attrition factors in doctoral education of African American students; and offering professional development workshops and seminars as a required components of doctoral curriculum.

Abstract
The Vanderbilt study on Performance Pay reveals merit pay does not boost student achievement. Despite evidence to the contrary, many politicians and policymakers today link school accountability and school performance. Drawing on evidence from the corporate world, they assume that strong external accountability will impel schools to improve student achievement. This paper discusses one such movement in the State of Florida.
Teacher Accountability Wars in Florida

Introduction

In August 2010, Florida was one of 10 winners in the second round of the federal Race to the Top grant competition, securing approximately $700 million to be used in part to develop merit-pay plans for teachers. State school districts that signed Florida's Race to the Top application — 65 of 67 school districts had 90 days (until November 22, 2010) to work out preliminary plans with their teacher unions. The grant mandates that school districts develop procedures that base at least half a teacher's evaluation on their students' growth on standardized tests. The current grant was Florida’s second attempt to win the coveted Race to the Top federal education grant. The second time, unlike the first, the State had the backing of most of the state's teachers unions. In the first round of the application process, Delaware and Tennessee were awarded grant money with Florida finishing fourth out of 41 states. Many believed that the lack of teacher union support clearly played a role in its previous placement. In fact, a reviewer of the initial application noted the fact that only 8 percent (of) union leaders endorsed the state's application raising a concern about barriers that needed to be addressed by the state and at the local level. The Race to the Top grant and its emphasis on teacher accountability is the last in a long line of measures created by the Florida legislature to force teacher accountability.

Education in Florida

The Florida education system consists of public and private schools in Florida, including the State University System of Florida (SUSF), the Florida College System (FCS), the Independent Colleges and Universities of Florida (ICUF) and other private institutions, and also secondary and primary schools. As mandated by the Florida Constitution, Article IX, section 4, Florida has 67 school districts, one for each county (Florida Constitution). All school districts
are separate from municipal government. School districts have the power to tax their residents under Florida state law, there was a continuous effort to improve and refine Florida’s Statewide Assessment Program (U.S. Census Bureau, 2005).

The Florida Comprehensive Assessment Test (FCAT) is part of Florida’s overall plan to increase student achievement by implementing higher standards. The FCAT, administered to students in Grades 3-11, contains two basic components: criterion-referenced tests (CRT) measuring selected benchmarks in Mathematics, Reading, Science, and Writing from the Sunshine State Standards (SSS) and norm-referenced tests (NRT) in Reading and Mathematics measuring individual student performance against national norms. Table 1 illustrates a brief outline of the origin of the student assessment and school accountability system, including the origin of the Sunshine State Standards and the development, administration, scoring, and reporting of the Florida Comprehensive Assessment Test (Assessment & Accountability Briefing Book, 2007).

Table 1: The origin of the Sunshine State Standards and the development, administration, scoring, and reporting of the FCAT

<table>
<thead>
<tr>
<th>Chronology</th>
<th>The Origin of the sunshine State Standards and the development, administration, scoring, and reporting of the FCAT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1991</td>
<td>The 1991 School Improvement and Accountability legislation, commonly referred to as Blueprint 2000, established the Florida Commission of Education Reform and Accountability and called for sweeping changes in schools. The intent of the legislation was to ensure higher levels of achievement for all students and more accountability for schools. The legislation also committed the state to</td>
</tr>
</tbody>
</table>
rewarding higher performing schools and providing assistance to unsuccessful schools. School boards were required to identify and report on the status of schools not making adequate progress. At the end of the 1991 school year, school boards reported 72 schools in 65 districts were not making adequate progress.

1992

In October, the High School Competency Test (HSCT) administration for students was changed from Grade 10 to Grade 11. Students could continue to retake the HSCT through a thirteenth year as high school students or as adults, as long as they were continuously enrolled. The Grade 10 Assessment Test (GTAT) was first administered in 1992. It was a customized, norm-referenced, multiple-choice test in reading comprehension and mathematics given in Grade 10. The Florida Writing Assessment Program (FWAP) was administered for the first time to Grade 4 students in 1992.

1993

The program was expanded to include Grade 8 students, and Grade 10.

1994

Florida participated in the NAEP Grade 4 reading assessment. The Improving America’s Schools Act of 1994 introduced design changes that expanded the data that NAEP gathered to include mathematics and reading assessments of students in Grades 4, 8, and 12. However, due to budget issues, only Grade 4 reading was funded.

1995

The Florida Commission on Education Reform and Accountability recommended procedures for assessing student learning in Florida
that would raise expectations for students and help them compete for jobs in the global marketplace. The State Board of Education adopted the recommendations, called the Florida Comprehensive Assessment Design (FCAD), in June 1995. Also, in 1995 the State Board of Education established student achievement criteria and identified critically low schools based on these criteria. The criteria included norm-referenced test (NRT) scores at Grades 4 and 8, writing scores at Grades 4, 8, and 10, and HSCT scores at Grade 11. Schools were identified as being critically low when average scores in all three subject areas were below the minimum criteria for two consecutive years. In November, there were 158 critically low performing schools (7 percent of the total number of schools reported). Identifying these schools resulted in a commitment to improving student achievement for all schools and all students.

1996 The Sunshine State Standards, Florida’s curriculum framework, were adopted by the State Board of Education for seven subject areas. New legislation (s. 229.565, F.S.) recognized the Performance Standards as the academic standards for Florida students and authorized the Florida Comprehensive Assessment Test® (FCAT). The Grade 10 Assessment Test (GTAT) was discontinued.

1997 Schools not meeting the accountability criteria were identified and reported for the third year. The number of critically low schools decreased to 30, indicating the positive impact school accountability
was having on student achievement. The Florida Legislature created, but was unable to fund, a statewide program to recognize schools with exemplary or improved performance. Revisions to s. 229.57, F.S., required criterion referenced statewide assessments in reading, writing, and mathematics for students in elementary, middle, and high school. Grade levels were not specified. The new assessments were required to include performance tasks. In February, FCAT Reading and Mathematics was field tested in Grades 4, 5, 8, and 10. Each test included items in multiple formats: multiple-choice, girded response and open-ended items (also called performance tasks).

1998 The FCAT was administered for the first time in January to students in Grade 4 (Reading), Grade 5 (Mathematics), and Grades 8 and 10 (Reading and Mathematics). Tests at these grade levels established baseline data and included performance tasks. Achievement levels 1 through 5 were set for FCAT scores. Although the FCAT results were not used for accountability purposes in 1998, school results were reported. FCAT scores from this administration could be used to exempt students from the HSCT required for graduation. Students who scored at or higher than 327 on FCAT Reading and 315 on FCAT Mathematics could take advantage of this exemption. Based on the accountability criteria, only four schools were identified as not making adequate progress in 1998, compared to 158 three years earlier. The Florida School Recognition program was funded for the
first time at $5.4 million, and 140 schools received recognition and monetary rewards. NAEP first offered accommodations to Students with Disabilities (SWD) and English-language learners (ELLs).

1999 The Florida Legislature revised several of the statutory requirements for the state assessment program and enacted bold new accountability legislation known as the A+ Plan for Education (CS/HB 751). This legislation increased standards and accountability for students, schools, and educators. The concept of annual learning gains was added to the accountability system with the addition of tests at grades 3 through 10. The revisions also included the addition of a science assessment for students in Grades 5, 8, and 10; a norm referenced test at grades 3 through 10; the use of the FCAT for graduation; and the development of a system for calculating the academic growth of each student over a year’s time. Consistent with the new legislation, the State Board of Education identified five school performance levels as letter grades, and the 1999 FCAT results were used to assign school grades. In the first year that school performance grades were issued, 78 schools were designated as “F” schools. Students in two schools that were designated critically low performing in 1998 and received “F” performance grades in 1999 were eligible for and some received opportunity scholarships. Approximately $30 million was disbursed to 319 schools for meeting the school recognition criteria.
2000 | New FCAT Reading and Mathematics tests were field tested for Grades 3, 6, 7, and 9 and for Grade 4 Mathematics and Grade 5 Reading. This was the first time all students in grades 3 through 10 were assessed. Florida did not participate in state NAEP because of the expansion of the FCAT. The Florida Writing Assessment Program (FWAP) became FCAT Writing. The first FCAT Norm-Referenced Test (NRT) for reading and mathematics was administered in grades 3 through 10. The FCAT NRT provides information to help ensure that Florida students are keeping pace with their peers nationally. Because the FCAT NRT is designed for this purpose, it is not necessarily aligned with the Sunshine State Standards. The FCAT results for Grades 4, 5, 8, and 10 were again used for assigning school grades. All 78 “F” schools from the previous year improved their rating to a grade of “D” or higher. Four schools were issued “F” performance grades for the first time in 2000. In the third year of school recognition awards, 1,015 schools received financial incentives for earning an “A” or improving at least one letter grade.

2001 | In the third year of issuing school grades, the number of “A” and “B” schools increased from 21 percent in 1999 to 41 percent in 2001. In the same time period, “D” and “F” schools decreased from 28 percent to 12 percent. There were no “repeat” or new “F” schools in 2001. In addition, 842 schools received school recognition awards for “A”
grades or for improving by at least one letter grade. In August, the State Board of Education established the FCAT passing scores that students had to earn as one of their requirements for receiving a standard high school diploma. In December, achievement level standards for reading and mathematics were also established by the State Board of Education. Five levels of achievement were identified for FCAT scores in Grades 3, 4, 5, 6, 7, and 9 to complement the achievement levels established in 1998 for Grades 4, 5, 8, and 10.

The No Child Left Behind Act of 2001 (NCLB) was passed requiring states/districts who receive Title 1 funding to participate in biennial State NAEP in reading and mathematics at Grades 4 and 8, beginning with the 2002-03 academic year.

During the 2002 special legislative session, Section1008.25(5)(b), F.S., was amended to require the retention of Grade 3 students who failed to achieve a score above Achievement Level 1 on FCAT Reading. For the first time, it was possible to report annual growth scores for FCAT Reading and Mathematics using a developmental (growth or learning gains) scale. The FCAT developmental score scale was used to report scores representing achievement across grades 3 through 10, with scores ranging from approximately 0 to 3000. The developmental scale score (DSS) and change in this score provided parents and educators with a measure of student learning gains over a year’s time.
The use of the DSS growth score was included as part of the A+ Plan school performance grading system for the first time in 2002. Using this new system, a record 1,311 schools earned school recognition awards for earning an “A” or improving a letter grade. However, 64 schools received “F” grades. FCAT Science was field tested in Grades 5, 8, and 10 in a representative sample of Florida schools in April 2002.

2003 During the 2002 special legislative session, Section1008.25(5)(b), F.S., was amended to require the retention of Grade 3 students who failed to achieve a score above Achievement Level 1 on FCAT Reading. For the first time, it was possible to report annual growth scores for FCAT Reading and Mathematics using a developmental (growth or learning gains) scale. The FCAT developmental score scale was used to report scores representing achievement across grades 3 through 10, with scores ranging from approximately 0 to 3000. The developmental scale score (DSS) and change in this score provided parents and educators with a measure of student learning gains over a year’s time.

The use of the DSS growth score was included as part of the A+ Plan school performance grading system for the first time in 2002. Using this new system, a record 1,311 schools earned school recognition awards for earning an “A” or improving a letter grade. However, 64 schools received “F” grades. FCAT Science was field tested in
Grades 5, 8, and 10 in a representative sample of Florida schools in April 2002. In a legal challenge to the law that protected the security of the state mandated assessments, a Pinellas County student who failed the FCAT, and his family, sued to see the scored booklets. Leon County Circuit Court ruled in favor of granting access to the tests; however, the District Court of Appeals overturned the lower court decision. State and National NAEP were administered in Florida in Grades 4 and 8 in reading and writing.

2004 Rule 6A-1.094222, FAC, entitled “Standards for Mid-Year Promotion of Retained Third Graders” and effective for the 2004-05 school year, was passed. A Grade 3 student retained because the student did not pass the Reading portion of the Grade 3 FCAT is eligible for mid-year promotion during the first semester of the following academic year if the student demonstrates mastery of the Grade 3 Sunshine State Standard Benchmarks of Language Arts and beginning mastery of the Benchmarks for Grade 4 (mastery should be consistent with the month of promotion to Grade 4). A student may complete a portfolio that demonstrates mastery of the appropriate Benchmarks, or a student may demonstrate proficiency by performing at an acceptable level on a locally selected standardized assessment. Rule 6A-1.09981(8) (a), FAC, raised writing proficiency to 3.5 up from 3.0 on a 0 to 6 scale for the 2004-05 and 2005-06 school years and to a 4.0 for 2006-07 and beyond (in 2006, Rule 6A-
(a) was amended to keep the proficiency level at 3.5, rather than raise it to a 4.0 in the 2006-07 school year). Sub-paragraph (8) (c) requires inclusion of FCAT Science for determining school grades for the 2006-07 school year.

2005 In response to the FCAT Science Advisory committee, Science Performance Review committee, the Florida Association of Science Supervisors, and the Florida Association of Science Teachers, FCAT Science was moved from Grade 10 to Grade 11 to allow an additional year for students to receive high school level science instruction.

2006 In February 2006, FCAT Writing became FCAT Writing+ due to the added multiple-choice component that is now operational for Grades 4, 8, and 10. For FCAT Writing+, students receive a whole-test score between 100 and 500 as well as subscore on a rubric of 0 to 6 for the essay. Students’ scores on FCAT Writing+ were reported for the first time in May 2006. Effective for the 2006-07 school year and beyond, science will be added to the school grading calculation. Section 1003.428(2)(b)2c and d, F.S., requires remediation in the subjects of reading and mathematics for high school students in grades 9 through 12 who score below a Level 3 on FCAT Reading or Mathematics the previous school year, effective in the 2006-07 school year and beyond. Section 1008.25(4) requires each student who scores below Level 3 on FCAT Reading or Mathematics to have a progress monitoring plan that assists the student or the school in meeting state
and district expectations for proficiency, effective in the 2006-07 school year and beyond.

2007 State and National NAEP were administered in Florida in Grades 4 and 8 in reading and mathematics, and Grade 8 students were assessed in writing. Florida’s Grade 12 students participated in reading and writing national assessments.

Note. From FCAT Assessment and Accountability Briefing Book (pg. 1).

Overall, the FCAT assesses how well students are learning the Sunshine State Standards, which schools are required to teach in accordance with Florida Statutes. The FCAT includes reading, mathematics, science, and writing assessments, but the test questions are placed in the context areas of social studies, science, mathematics, reading, the arts, health/physical education, and the workplace, and they employ real-life situations to check student skills in the various subject areas.

**Florida to U.S. Gaps: Elementary and Middle School Students**

Since the mid-1980s, the standards-based education reform and accountability movement has raised expectations of performance for American schools (Buttram & Waters, 1997). To face these demands, then Florida, Governor Jeb Bush instituted the *A+Plan* in 1999, a standards-based accountability system that focuses on improving the performance of all students. The *A+ Plan main premise* was that “every child can learn and no child should be left behind” (Executive Office of the Governor, n.d.). Florida H.B.7087 (2006) otherwise known as A++ legislation, was created and adopted as a means to increase the rigor and relevance of a public school education, specifically at the middle school and high school levels. The
anticipated result of the implementation of this bill was to better prepare middle school students for high school and thereby increase high school student performance and decrease the dropout rate. However, in increasing the promotion standards for middle grade students, interpretation and implementation have created additional barriers for grade level advancement and may place more students already at-risk of failure to higher retention rates.

Due to these assessment and accountability measures, for the most part, national tests such as the National Assessment of Educational Progress (NAEP) showed Florida’s public school students gaining on their national peers from 1992-2003. The exception was in 8th-grade reading. On the NAEP, Florida has shown visible success in 4th-grade reading. Historically, Florida’s deficit relative to the U.S. has been greatest in this area (-9% in 1994), but by 2003, the percent of Florida students scoring at the basic level and above exceeded the national average. Unfortunately, similar improvements have not been realized at the middle school level. Florida’s 8th graders still fare poorly in reading relative to their national peers on the NAEP. In math, gaps have closed between elementary students in Florida and the nation. In the 1992 math NAEP testing, 5% fewer 4th-grade students in Florida were scoring at the basic level and above as compared to the U.S. By 2003, there was no difference in performance in this category, i.e., the percentages were the same for Florida and the nation. In 8th grade, however, Florida students still lagged in 2003, but the gap between Florida and the U.S. was narrowing slightly (-8% in 1992 and -5% in 2003 (Chatterji, 2005). In writing, Florida’s students have fared better in comparison to students in the nation. NAEP results are available since 1998, but it should be noted that Florida’s standards-based writing assessment program was established around 1993. By 2003, Florida’s 8th graders equaled national performance percentages, while Florida’s 4th
graders slightly exceeded the percents of U.S. students at or above the Basic level (Chatterji, 2005). Table 2 illustrates these results.

From Closing Florida’s Achievement (2005)

The Florida Public Accountability System and the Florida Comprehensive Assessment Test, FCAT, have been in use since 1996. Since that time, schools have received grades, rewards and sanctions for performance, promotion requirements have changed, and the results of the FCAT are published annually for public scrutiny. With testing required in grades 3 through 11, middle schools (grades 6--8) must test all the students in their schools (Roberts, 2005). However, this system has required more accountability on the part of Florida K-12 teachers.
Teacher Accountability in Florida

According to Michael Petrelli

For going on two decades now, the twin movements to expand parental choice and foster accountability have been the major drivers of reform in the K-12 education system. And while choice and accountability can be seen as ends in themselves, for many reformers they have been primarily means: tactics for creating a high-performing education system, one that puts the needs of kids over the needs of adults. They are tonics meant to overcome the corrupting influence of complacency and protectionism within our public schools (2010)

Reformers have tried for years to draft policies that allow student-achievement data to be used to reward good teachers and identify poor ones. As early as 1997, Newmann, King, and Rigdon argued that three issues keep this theory from working in practice:

1) implementation controversies around standards, incentives, and constituencies;

2) insufficient efforts to organize the human, technical, and social resources of a school into an effective collective enterprise — what the authors term "organizational capacity"— and

3) failure to recognize the importance of internal school accountability. (p.41).

In their study of twenty-four restructuring schools, the authors found that strong accountability was rare; that organizational capacity was not related to accountability; that schools with strong external accountability tended to have low organizational
capacity; and the strong internal accountability tended to reinforce a school's organizational capacity.

Many politicians and policymakers today link school accountability and school performance. Drawing on evidence from the corporate world, they assume that strong external accountability will impel schools to improve student achievement. Therefore, linking teacher pay to student achievement has long been a goal of some educational reformers, mostly conservatives, but their ranks also include people in the Obama administration who designed Race to the Top. Those in support of accountability argue that teachers should be treated like most professionals, and be paid based on their effectiveness. This teacher accountability movement crystallized in Florida in Senate Bill 6. Senate Bill 6 (SB 6), had 38 sections that would

1) Cripple the idea of community control of public schools

2) no longer considering a teacher’s experience or advanced degrees in salaries, and

3) require even more standardized tests on our schools.

The bill threatened to push experienced teachers out of Florida’s classroom and place students in classrooms with teachers with little experience. Specifically, the bill would have:

- Decreased the ability of local school boards and school districts to make a wide array of decisions having an impact on local schools and replacing them with a one-size-fits-all approach mandated from Tallahassee.

- Required that all teachers be retained, certified and compensated based on student test scores on standardized tests -- not years of experience or degrees held.

- Penalized school districts that even consider length of service or degrees held when determining compensation or reductions in force.
Ordered that teachers be issued probationary contracts for up to five years; then an annual contract every year after that … eliminating due process.

Mandated more standardized testing for students (end of course exams for all subjects) and for teachers (additional certification requirements).

Excluded the salary schedule as a subject of collective bargaining. The state will decide what categories of differentiated pay will be provided for.

Given, the state would have been given a greater hand in appraisals, and

Abolished an effective and popular program that rewards those who become National Board Certified Teachers, a rigorous national program that awards certification after a yearlong, independent review of a teacher’s work in the classroom and knowledge of their field.

The provisions of Senate Bill 6 would have been devastating for the Colleges of Education, making advanced degrees for teachers in the State of Florida useless and virtually without value. It would have required the COEs to track all graduates and tied their jobs to past student’s performance if they were involved in the education of children, including School Counseling, Physical Education, Educational Leadership, and other programs, not just classroom teaching. In fact, COE graduate programs, not undergraduate education programs, would have taken the biggest hit from this legislation and this legislation would have eventually affected the entire university as any kind of continuing education in the arts, sciences, or social sciences for teachers or other educators would have been impacted, but the COE would have taken the hit first. Deans of the Colleges of Education around the state were “threatened” not to obstruct the bill and staff in the Department of Education were admonished to do the same. The Senate Bill 6
was on a very fast track through the Legislature and reached the Governor’s desk in record time. The bill had powerful sponsors, including former Governor Jeb Bush.

Governor Charlie Crist vetoed Senate Bill 6 on April 15, 2010. SB 6 and its companion bill in the House was defeated because people across the state—teachers, faculty, parents, grandparents, and many others wrote letters, sent e-mails and left phone messages for legislators and the Governor protesting the bill and its provisions. However, Charlie Crist’s efforts have not ended this movement.

And the beat goes on…

According to the Vanderbilt Study (NCPI, 2010), the first scientific study of performance pay ever conducted in the United States, rewarding teachers with bonus pay, in the absence of any other support programs, does not raise student test scores. The Project on Incentives in Teaching, called the POINT Experiment, took place between 2007 - 2009 school years with participation by mathematics teachers in grades 5 through 8 in Metropolitan Nashville Public Schools. Nearly 300 teachers, approximately 70 percent of all middle-school math teachers in Nashville's public schools, volunteered to participate. The complete study, including set up and analysis began in 2005 and ended in 2010. The Vanderbilt Study found that students whose teachers were offered bonuses of up to $15,000 a year for improved test scores had the same gains on standardized exams as those whose teachers were given no monetary incentives. The study tested no other types of incentives or systems of support for the teachers, such as professional development or guidance on instructional practices.

Despite this research, a bill proposing merit pay for Florida teachers will return in 2011 (Restrepo, 2010). A spokesperson for the Florida Chamber of Commerce recently stated that the Chamber expects to participate in a bill proposing merit pay for Florida teachers during the 2011
legislative session. A draft of a bill titled “Teacher Quality Legislation” is currently circulating. This bill includes changes to how and when education personnel performance would be measured in Florida. The new bill would also require the State Board of Education to establish and implement evaluation measures for teachers and administrators based on student progress in statewide assessment tests. In addition, the state board would also issue annual performance reports on graduates of state-approved teacher-preparation programs and adopt a multiyear formula to measure student gains in statewide assessment and end-of-course tests, identifying critical teacher shortage areas. Finally, school districts would be mandated to establish compensation, creating two salary schedules: one for instructional personnel who hold professional continuing contracts and another one with higher pay for instructional personnel who choose to give up professional service or continuing contracts for annual contracts, with up to 50 percent of an annual salary raise tied to a performance rating. School districts must also develop a Department of Education-approved annual appraisal system for instructional and administrative personnel based on the performance of students assigned to their classrooms or schools. The Florida Department of Education, in their approved Race to the Top grant, is instituting similar measures.

Abstract

Historically Black colleges and universities (HBCUs) are effective in graduating African American students who are poised to be competitive in the corporate, research, academic, governmental and military arenas. Specifically, over half of all African American professionals are graduates of HBCUs. Nine of the top ten colleges that graduate the most African Americans who go on to earn PhDs are from HBCUs. More than 50% of the nation’s African American public school teachers and 70% of African American dentists earned degrees at HBCUs. Finally, both Spelman and Bennett Colleges produce over half of the nation’s African American female doctorates in all science fields. This article discusses the importance of HBCUs in today’s higher education landscape.
The Role of HBCUs in Today’s Higher Education Landscape

**Introduction**

Today, this nation’s minority population is steadily rising and now makes up 35 percent of the United States (U.S.) population, illustrating a trend that could make minorities the new American majority by 2050. New Census Bureau data estimates that minorities added more than 2 percent to the U.S. population in 2009 increasing to 107.2 million people, due to Hispanic births and more Americans describing themselves as multiracial. During this period, the White population remained flat, making up roughly 199.9 million, or 65 percent, of this country’s population. Just ten years ago, Whites comprised 69 percent of the total population and minorities 31 percent. Currently four states – Hawaii, New Mexico, California and Texas – as well as the District of Columbia, have minority populations that exceed 50 percent (Census Bureau, 2010). Such demographic changes in the nation will be reflected in the higher education student population.

The minority shift is taking place at a time when American universities are failing at graduating students---any student. In fact, data recently released by the National Center for Education Statistics (NCES, 2009) show that in 2008, four-year Institutions of Higher Education (IHEs) graduated less than 60 percent of their students in six years. In fact, public colleges and universities are less effective than not-for-profit institutions, which on average do a better job (NCES, 2009).

This problem exists despite an increase in enrollment in U.S. IHEs which have increased by 14 percent between 1987 and 1997 and 26 percent between 1997 and 2007, from 14.5 million to 18.2 million. Most of this growth was in full-time student enrollment which rose to 34 percent
from 1997-2007. During this same period, the number of part-time students rose by 15 percent. In regards to gender, the number of females rose 29 percent, compared to an increase of 22 percent in the number of males during that same period. In addition, enrollment in accredited 2-year colleges, 4-year colleges, and universities also rose during this period (NCES, 2009).

Since 1984, the number of females in graduate schools has exceeded the number of males. Between 1997 and 2007, the number of male full-time graduate students increased by 32 percent, compared to a 63 percent increase for female graduate students. Among part-time graduate students, the number of males increased by 10 percent and the number of females increased by 23 percent (NCES, 2009).

The percentage of American college students who are minorities has been increasing. Over thirty years ago, 15 percent of the college population were minorities, compared with 32 percent in 2007. Much of the change between the years 1976-2007 is attributed to the rising numbers of Hispanic, Asian, and Pacific Islander students. During this same period, the percentage of Asian and Pacific Islander students rose from 2 percent to 7 percent and the Hispanic percentage rose from 4 percent to 11 percent. The percentage of African American students was 9 percent at the beginning of the time period rising to 13 percent in 2007. In the past decade, African Americans have also made advances in doctoral degrees (National Science Foundation [NSF], 2007). From 1996 to 2006, the number of African American doctoral recipients increased 27%. The aforementioned total of African American PhDs is in comparison to the PhDs conferred by all United States universities which increased by 8%. In the last twenty years, the number of African Americans who received doctorates in science and engineering have also more than doubled (Redd, 2008). As depicted in Table I:
Table 1: Total fall enrollment in degree-granting institutions, by sex of student and attendance status: Selected years, 1970 through 2007 [In thousands]

The enrollment of African Americans and students of color in graduate programs is one of many problems facing this country. A lack of minority graduate students in the educational pipeline means a lack of minorities in higher education and despite minimal gains recruiting, retaining, and graduating minority students in graduate programs, a problem still exists in the graduation of doctoral students. Many universities are searching for innovative strategies to increase retention and graduation of African American students. As the overall color scheme of the Flagship and Research I institutions across the nation has become more Asian and White, African American graduates and people of color are being displaced (Hale, 2006). Therefore, these activities further highlight the importance of additional examination of issues related to
retention and graduation rates of African Americans at HBCUs. Due to this growing trend, HBCUs have become a refuge of last resort for graduate exploration of many African Americans and people of color (Garibaldi, 1984).

**Historically Black Colleges and Universities (HBCUs)**

Historically Black colleges and universities (HBCUs) have led the increase in the number of African American doctoral degree holders. In 1965, in the Title III of the *Higher Education Act* of 1965, Congress officially defined HBCUs as an institution whose principal missions were and is the education of African Americans and were accredited and established before 1964. These educational institutions are accredited by a nationally recognized accrediting agency (these institutions are accredited by regional accrediting agencies) or association, as determined by the United States’ Secretary of Education to be a reliable authority as to the quality of training offered or is, according to such an agency or association, making reasonable progress toward accreditation HBCUs were founded during an era when African American students were barred from attending traditionally White, postsecondary institutions.

The first HBCU, Cheney University in Pennsylvania was founded in 1837. Today, there are 105 HBCUs. HBCUs graduate far more than their share of African American professionals. While the 105 HBCUs represent just 3% of the nation’s institutions of higher learning, they graduate nearly one-quarter of African Americans who earn undergraduate degrees. To state it differently, HBCUs graduate 75% more of their African American students than other schools do. Specifically,

- Over half of all African American professionals are graduates of HBCUs.
Nine of the top ten colleges that graduate the most African Americans who go on to earn PhDs are HBCUs.

More than 50% of the nation’s African American public school teachers and 70% of African American dentists earned degrees at HBCUs.

United Negro College Funds (UNCF) members Spelman College and Bennett College produce over half of the nation’s African American female doctorates in all science fields (Title III Administrators, http://www.hbcut3a.org/HBCUImportance.aspx).

Since the Civil Rights Movement opened the doors of traditionally White colleges and universities to minority students, some policymakers have challenged the relevance of HBCUs, arguing that they serve no purpose in an integrated system of higher education.

Affirmative Action and Minority Enrollment in Higher Education

One factor fueling this increase has been affirmative action programs created by colleges and universities during the late 1960s and 1970s largely to comply with Title VI of the Civil Rights Act of 1964, which prohibits several types of discrimination in student recruitment, admissions, and financial aid (Ervin & Davenport, 2008). This growth was aided by the Supreme Court’s decision in Regents of the University of California v. Bakke (438 U.S. 265, 1978), which allowed race to be a determinant in the admission to graduate schools. Preferential race-based programs were developed partly in response to the demands to improve the graduation rates of minority students at Traditionally White Institutions (TWIs).

According to Jacqueline Ford-Edwards (2002), affirmative action was designed to provide higher education admission opportunities to racial and ethnic minorities and women. This institutionalization of affirmative action served to diversify higher education and thus, the
In the book *The Unfinished Agenda of Brown v. Board of Education*, Chism (2004) asserts that the Supreme Court’s decision was the cornerstone to an ongoing African American grassroots struggle to make America live up to its creed of equality for all of its citizenry. This milestone case overturned more than half a century of legal racial segregation in America’s public schools, paving the way for the Civil Rights Movement of the 1950s and 1960s and ultimately the *Civil Rights Act of 1964*. The *Civil Rights Act of 1964* greatly impacted education in general, but more importantly America’s higher education system. Armed with the Act’s tenets, African American students that were long denied admission into TWIs now stood ready to enter their self-proclaimed hallowed halls. These were equipped with federally established policies and guidelines that were intended to eliminate discrimination based on race, sex or national origin in public institutions of higher learning, public facilities in local, state and federal governments as well as employment (*Civil Rights Act, 1964*).

According to Ford-Edwards (2002), prior to the American Civil War education in publicly ran institutions were outlawed for African Americans. After the Civil War, northern benevolent societies, freedman bureaus, and African American churches began opening colleges specifically to educate African Americans collectively known as HBCUs. It was not until the passage of the *Civil Rights Act of 1964* that more African American students began exercising their rights and enrolling in TWIs.

To eradicate the vestiges of discrimination, many states resorted to equalizing policies termed affirmative action, which provided minorities (those not self identified as White or Caucasian)
and White women certain preferences in employment and college admissions. Affirmative action policies exist in many different forms as a result of constant legal attacks by those who argue that they amounted to reverse discrimination against White males (Connor, 1985). Consequently, affirmative action in America has experienced a downward spiral. Over the last forty years a number of court cases, legislative mandates and Executive Orders have sought to overturn all vestiges of educational, economic, and pursuit of liberty gains of African Americans in the United States. Supreme Court decisions during the 1970s through the 1990s significantly diluted affirmative action programs (Milakovich & Gordon, 2001).

In 1967, in the Supreme Court Case of Bakke v. University of California (438 U.S. at 320, 1978), a White University of California at Davis medical school applicant who had been rejected for admission twice, even though he considered himself better qualified with a higher grade point average than some of the minorities who had been admitted, sued the University based on discriminatory admission policies. In this case, the Court held that “a substantial interest that legitimately may be served by a properly devised admission program involving the competitive consideration of race and ethnic origin” was permissible (In Bakke v. University of California, 438 U.S. at 320, 1978).

In writing his opinion, Justice Powell affirmed the constitutionality of affirmative action admission policies in IHE (Ervin & Davenport, 2008). He stated that such policies not only promoted critical thinking, “processes he states are essential to the quality of higher education” (In Bakke v. University of California, 438 U.S. at 312, 1978) but they enhanced and strengthened a diverse society of contributing leaders and professionals. In 1978, Bakke argued successfully that the medical school’s quota for admitting minorities amounted to reverse discrimination. The
U. S. Supreme Court then agreed and Bakke was admitted to the institution (*University of California Regents v. Bakke*, 1978).

However, in 1996, California voters passed Proposition 209. The initiative prohibited discrimination against or preferential treatment for any individual or group in public employment, education, or contracting on the basis of race, sex, color, ethnicity, or national origin (Ervin & Davenport, 2008). Voters in Washington State followed suit in 1998, and voters in Texas accepted similar initiatives as well (Chang, Jones, & Hakuta, 2000) Meanwhile *Grutter v. Bollinger* (539 U.S. 306 (2003), a case in which the United States Supreme Court upheld the affirmative action admissions policy of the University of Michigan Law School, 5-4 decision, was overturned by a referendum of Michigan voters.

Other states also began implementing these and similar measures. The State of California in 2003 denied enrollment of qualified high school seniors because of instituted enrollment caps. These and other similar actions created an even wider gap in the equality in admission of minority students and the racial/ethnic make-up and complexion of this country IHE in traditionally White institutions.

The State of Texas in 2005 through Senate Bill 254 instituted caps on the number of entering freshmen, the total enrollment of freshmen and sophomore students, with a portion of the cap conditionally set aside for the enrollment of minority students. These actions forced minority students and other non-minority students to seek out second and third tier institutions and HBCUs to obtain their educational goals.

Affirmative action allows all citizens, independent of race, ethnicity, gender or socioeconomic status, to become full participants in our society. Affirmative action initiatives in the last few decades have been negatively impacted and thus disenfranchised those persons they were designed to help who are now left by the wayside. Ballot initiatives eliminated all
remnants of affirmative action policies in their respective systems of higher education and state governments. However, despite their best efforts they did not totally eliminate it. They still have affirmative action; they have just re-characterized the term and gave new names and meanings to it (Orfield & Miller, 1998; Klink, 2003; Rivers, 2000).

Past President George Bush (1991), described the unique mission of HBCUs. “At a time when many schools barred their doors to Black Americans, these colleges offered the best, and often the only, opportunity for a higher education” (p. 6). Past President Bush further stated that today, most of those barriers have been brought down by the law, and yet HBCUs still represent a vital component of the American higher education system. Therefore, in the year 2010, no doubt these institutions should still exist as a vital component in higher education as the role they play in eradicating the exclusion that was, and still in some instances, the modus operandi in TWIs.

**HBCUs and African American Graduation Rates**

While IHEs made great efforts to increase enrollment and degree success for African American students, today although HBCUs represent only 4% of all colleges and universities in the U.S., they account for nearly one-quarter of the African American bachelor’s degree recipients (Redd, 2000). Therefore, greater efforts to increase African American enrollment and persistence in graduate education must be a priority. HBCUs also play an important role in expanding educational opportunities for under-represented students. In fact, HBCUs have been increasing their involvement in graduate education and since 1996 more HBCUs have begun to offer doctoral programs. Prior to 1996, less than one-quarter of the 87 four-year public and private HBCUs awarded doctorates. By 2006, the percentage of HBCUs with doctoral programs grew to 32%, with just under fifty percent of the four-year public historically Black institutions offering
such programs. The increase in HBCUs offering doctorates and the number of graduate students attending these programs has led to rapid growth in the number of African Americans receiving Ph.D.s and other doctoral degrees in the past five years. In fact, the percentage increases in African American doctorates from HBCUs appears to have accelerated, while the number of these awards overall has slowed as Table 2 indicates.

HBCUs, Jobs and Diversity

According to Jennifer Millman (2007), “the U.S. workforce is rapidly transforming, thanks to changing demographics, work-force dynamics, immigration flows and globalization. At the same time, the annual labor-force growth rates will slow to nearly a standstill by the year 2025” (DiversityInc Magazine, p. 23). Labor trends show that the current work force of baby boomers is aging and by the year 2030, research indicates that there will be 35 million more jobs than people to fill them (Millman, 2007).

Diversity in the workplace has become a global concept. Employers are looking to fill positions within their organization with individuals who are prepared to deal with all aspects of our world’s global market. The Internet has changed our marketplace conceptualization, how we
Running head: THE ROLE OF HBCUS IN TODAY’S HIGHER EDUCATION

Think of our marketplaces, and the consumers of our products and services. Taking the once boundary driven world into a boundless environment. Corporations must be ready with a diverse workforce to meet these boundless global demands. HBCUs are major contributors in meeting this need.

*Figure 1. 2007 DiversityInc top 50 companies for diversity*

Diversity engenders a more creative work force, but the convergence of different attitudes, beliefs and experiences along racial/ethnic, gender, and other lines present new challenges for employers seeking to motivate their workers. According to the Bureau of Labor Statistics (2007), “the U.S. economy is expected to expand at a moderately strong pace over the coming decade, with restrained inflation, continuing strong productivity growth, and a...favorable
outlook for a wide array of job opportunities” (p. 27), but most of the jobs opening up are going to be in management and business. People of color will disproportionately be the new entrants to the workforce according to DiversityInc Top Fifty Companies for Diversity (Figure 2), thus making the contributions that HBCUs make in this effort invaluable (Bureau of Labor Statistics, 2007).

**Conclusion**

As HBCUs continue to play a vital role in today's higher education landscape, the 2008 edition of "America's Best Black Colleges" marked the first time *U.S. News & World Report* has released a stand-alone ranking of HBCUs. Despite this recognition, HBCUs have been hit particularly hard by the recession; therefore, it is an important time to analyze their role in educating the neediest students in the higher education landscape. As Mickey Burnim (president of Bowie State University of the University System of Maryland) (2008) stated, the challenge for HBCUs in the 21st century is how to remain true to their historic mission of providing access for African Americans while doing whatever is necessary to insure the long-term viability of the institution.

The need for an educated citizenry is more important now than ever before. HBCUs’ are of important in providing a diverse, educated citizenry that is seen in the following accomplishments:

1. More than 80 percent of all African Americans who received degrees in medicine and dentistry were trained at the two HBCUs of medicine and dentistry—Howard University and Meharry Medical College.
2. HBCUs have provided undergraduate training for three-fourths of all African Americans holding doctorate degrees; three-fourths of all African American officers in the armed forces; and four-fifths of all African American federal judges (National Center for Educational Statistics [NCES], 1999).

3. HBCUs, in particular, Florida A&M University, are leading institutions in awarding baccalaureate degrees to students in the life sciences, physical sciences mathematics, education, and engineering (Black Issues in Higher Education [BIHE], 2007).

4. HBCUs continue to rank high in terms of the proportion of graduates who pursue and complete graduate and professional training (Black Issues in Higher Education [BIHE], 2007).

5. Fifty percent of the African American faculty in traditionally White research universities received their bachelor’s degrees at an HBCU (Hale, 2006).

HBCUs remain instrumental in creating an industrious citizenry and will be the cornerstone to globalization of the current and future marketplace.

Teacher-directed Synchronous and Asynchronous Group Discussions about Technology in Schools

By Dr. Michelle Kowalsky, College of Education, William Paterson University
1600 Valley Road, Wayne, NJ, USA

Abstract

In two graduate courses in the College of Education, teachers were asked to discuss amongst themselves, -- without the instructor present at the time -- several issues and readings about technology in schools. The university instructor did not monitor or participate in the chats each week; instead, the chats were considered ‘homework’ assignments and used as the basis for preparation and discussion for subsequent class meetings and assignments. Revealing information about teacher perceptions, values and philosophies were obtained from these honest and detailed online discussions, and thus were able to help university instructors a) understand global and local barriers to technology from teachers’ points of view, and b) target instruction and reform efforts in meaningful ways for school leaders at the graduate level.

Overview

Teacher talk in group discussion often reveals a variety of perceptions, dispositions, and opportunities for growth which cannot be fully captured via other means. When teachers talk to each other in diverse groups, both the variety of their experiences and the commonalities of their views emerge. Teacher perceptions of technology in general and for its use in schools clearly have an impact on implementation efforts in all types of educational settings. By listening to teachers’ willing yet unfiltered conversations about technology, leaders and colleagues may be able to hear many of the perceived barriers and attitudinal tendencies which can easily be overcome with targeted education and experience.

Conceptual Framework

The study was deployed in an environment in which both instructor and graduate students were familiar with the types of operations experienced within a constructivist tradition of teaching and learning at the post-baccalaureate level. In this tradition, discourse at the university continues among students, and thus with and without the instructor, who is seen as a peer guide during conceptual struggles, neither the primary provider of understanding nor the final arbiter of controversy. In alignment with the explanations and inferences of Gordon (2009, p. 43), the content goal of these synchronous chats within the immediate course context were minimal. Instead, broader learning and thinking objectives within the discipline helped to integrate the chats with other long-term goals. Although the chats in the current study display these kinds of active constructions by teachers of their own understandings of the subject matter (Gordon, 2009, p. 47), the students-to-students interactions remained only one part of an integrated teacher-to-student, teacher-to-students and student-to-student multidirectional constructivist conversation which each lasted over a six- to eight- week period.
A number of studies informed the progression of the current work. For example, Mäkitalo, Häkkinen, Leinonen, and Järvelä (2002) explain that teachers need to strive for mutual understandings, to share assumptions, and “not only show evidence of their understandings through written feedback, but also to provide support to their peers in their replies” (p. 247). In a study of preservice teachers, the researchers aimed to explore how participants in asynchronous discussion boards about teaching gained common ground as a precursor to achieving deeper understanding and learning.

Especially with technologically-enhanced communication, the teacher candidates needed to understand one another’s perspective prior to an in-depth understanding of the content at hand. “Presenting questions also signals the willingness of participants to continue the discussion, which is essential for maintaining [that] common ground,” they note (p. 247). The current study espouses this research, the current participants display many of the same characteristics in their discussions; additionally, it determines the viability of establishing these practices with synchronous discussions among teacher learners who are already acquainted with each other from previous courses.

Lock (2006) realizes that teachers must change their existing perceptions and develop new images, both of professional development and of teaching itself. The researcher suggests that schools must “carefully and deliberately design dynamic learning environments that foster a learning culture” (p. 663), and this suggestion applies to both K-12 schools as well as schools of education. The present study, like Lock’s, aims to build on the relationships, intimacy and trust among the current teacher participants in order to begin the process of collaborative inquiry, and make it part of the teachers’ expected routines in these courses.

Much has been written about asynchronous forum posts in Blackboard™ and similar systems in the literature. However, Van Aalst (2006) argues that “a new conceptualization of online work is needed -- not primarily discussion, but a variety of activities intended to iteratively improve a community’s ideas” (p. 280). As this researcher suggests, the volume and scope of asynchronous forum posts tend to undermine the goals of the online discussion at hand (p. 279); it is posited in the current study that weekly or more frequent synchronous chats may alleviate the problem of message counts but also (along with targeted readings) help teachers to focus on specific areas to explore for a specified time. Van Aalst’s list of the many prior online collaboration problems have been experienced previously by the participants of this study as well. Renninger and Shumar (2002) agree that fostering community among teachers with similar goals or teaching assignments is a valuable pursuit despite possible technical problems.

Dillenbourg, Schneider and Synteta (2002) assert that “many Web-based courses combine distance and presence, which makes learning environments more robust,” and that this robustness is important for the multiple aims of vocational training, for university coursework, and for lifelong learning (p. 10-11). Similarly, the authors assert that any virtual learning environment “does not have intrinsic effectiveness, only affordances,” and since expectations are raised about the usefulness of a new technological tool, learning gains are often (but mistakenly) attributed to the tool rather than to the pedagogical context in which it was employed (p. 13). The present study employs Dillenbourg, Schneider and Synteta’s structuring collaboration and
regulating interactions through helping the synchronous teacher discussion groups monitor themselves for task, time and content constraints, points on which they performed admirably.

Methods

This study reports on the synchronous online work of teachers of various K-12 grades and of varying levels of teaching experience (in other words, matriculated graduate candidates, hereinafter referred to as “the teachers”). In two graduate courses taught in the College of Education, the teachers were asked to discuss various issues and readings about technology in schools. They were instructed that these group conversations were to take place amongst themselves via a synchronous online tool, and without the instructor present. Although the content of other asynchronous chats via Blackboard™ were graded as part of the course assignments, these synchronous technology chats were not similarly assessed; teachers simply got credit for their group by submitting a transcript to the instructor by the specified deadlines. However, teachers often voluntarily referenced their group chats during class meetings, other online conversations and coursework. In addition, these “homework” assignments, in which they chatted for one hour at a time with each other about that weeks’ course topic, were assigned as preparation for subsequent class activities. The course instructor counted submitted transcripts each week to insure their timely submission.

This paper is a preliminary report on the first few of a series of courses in which the teacher-directed online conversations were conducted; the class sections described are from the same course during different semesters within a three-year period. A larger study included graduate students from a variety of courses in a College of Education sequence at the university. Teacher discussion transcripts were solicited periodically as part of course schedules during calendar years 2007-2010; exact semesters and courses of collection are not indicated in order to further protect the participants’ identities. This research follows the university’s protocols and policies for consideration of human subjects who are also students, and is considered exempt by the Institutional Review Board. The content of the chats was not considered as part of the course grade or performance evaluation of any kind; teachers were able to further disguise their identity through choice of screen name and use of a non-university email for submission of the chat transcripts to the course instructor. This report has also been provided for review after most of the participants have entirely completed their graduate studies.

Teacher discussions took place via a variety of Web 2.0 tools, including Skype™, AIM®, Zoho® and others. Topics discussed included books about the technology context of society, such as *The Long Tail: Why the Future of Business is Selling Less of More* by Chris Anderson (2006, 2008), Internet phenomena such as the online viral video “The Machine is Using Us” by Michael Wesch (2007, 2008), and white papers from various organizations such as the Horizon Report (2007-2010) and studies from the Milliken Family Foundation (2005-2009).

Results

Revealing information about teacher perceptions, values and philosophies were obtained from these honest and detailed online discussions. Teachers were instructed to discuss each reading or topic in a free-form manner within a one-week period at a time of their mutual convenience, almost exclusively in the evenings or on weekends. Rich and sometimes surprisingly negative interchanges about technologies in schools ensued, uncovering
dispositional attributes, perceived barriers, and a list of emotional and technical needs which impact technology implementation of many kinds at the classroom, school, and district levels. A total of 64 group conversations from the initial two courses included a mix and re-mix of participants so that every student shared a group with every other student at least twice in the first course, and twice in the second course; neither course contained the same students in subsequent years. Samples of three group responses, and the similarities/differences among them, are provided here in vignette fashion for illustration purposes.

**Sample Group 1**

This teacher group consisted of four female graduate students ranging in age from 24 to 60, who chose to focus this particular discussion on Web 2.0 tools. They described the tools as “great websites,” thus displaying a beginning understanding of their nature as was expected, and used the term “great” a hundred times to capture how impressed they were with the variety of new tools and the features afforded by them. The group experienced minor difficulty in talking about technology between the generations, such as when the older participants didn’t recognize instant message abbreviations such as “bc” as shorthand for because by the younger participants, but otherwise the group appeared to communicate easily about the topics at hand. Periodically, differing opinions were offered contextually and intellectually, but then followed up by some kind of reflection or analysis. For example, a point about younger generations accused of always thinking technology is “great” was followed by the reflection “I can’t believe I am saying this, but I am lost without my computer.” Subsequent interactions were supported much in the same manner by younger participants’ reflections such as “I think in this day and age we are all addicted to some form of technology.”

The group brought up additional examples of technologies we rely on every day, like cell phones and debit cards, direct deposit and job-searching sites. They also offered many non-educational and non-instructional examples of the tools, as seen in use by fellow teachers, such as showing their grandchildren’s photos on Flickr™ or using Skype™ to talk to children in the military stationed abroad. Critique ensued about how some of these tech tools were created by people without college degrees, and suspicion that content we read daily may be or have been created by random “teenagers.” This interaction is surprisingly similar to some of the sequences described later in this manuscript for Group 2, in which a critique of poorer schools getting taken over by the state and thus going “high tech” is seen as an unfair advantage of the “other.” But, unlike Group 1, Group 2’s similarly comprised teacher group offered a counter example from a real city nearby, and then another counter example which supported the original critique from a participants’ own experience. Nevertheless, Group 1 continued to show alarm at the pace of technology by focusing on a quote from the reading in which “according to a 2005 study that 57% of teens who use the Internet could be considered media creators.”

The teachers’ default evaluation stance on new Web 2.0 tools, after reading about them and trying them out as part of the course is cautious to the point of inaction, similar to what schools and teachers around the country have reported. Group 1 teachers said some of the tools “could be good” or “could useful and fun” but with the caveat that they were “not for me.” Apparently, these teachers can articulate the features of a product accurately, but can’t figure out how it might be used themselves. They provided a couple of complaints about the first time they used a new tool, even those with the simplest interfaces (“confusing,” “frustrating,” “took more
than half an hour to log on,’’ “I never tried it because I heard it was difficult to use’’), which was similar to the thoughts of Group 2, but not of Group 3, as seen below.

Sample Group 2

This group of three teachers, between the ages of 24 and 59, picked out of the reading the topics of filtering, equity, and multiple literacies. The three topics were neither predetermined by the group nor were one offered by each member; as with other conversations, these topics developed organically from interaction with the text and each other. “Filters schools have on their computers can stifle the creativity and participation of those who do not have home computers,” one participant began. The counter example discussion sequence similarly ensued as in Group 1, with a participant pointing out that indeed cities like Philadelphia provide free network access at shelters and in surrounding communities, as well as to all of their residents regardless of socioeconomic status. The conversation then returned home to their own schools, where one participant reported, “I have not seen much interest in any of the higher technology. For many, there is little or no interest in academics.”

Relating to a line in the reading about equity of technology among the “haves” and the “have-not’s,” a participant offered a connection between the reading and her observation that “poor kids without technology” was similar to illegal immigrants’ rights to education, and the group participants chimed in with other examples from the news and local problems, including perceptions about “corrupt politicians spending school funds,” and many other topics. The resolution to this thread of the conversation was offered by a participant who did not initiate the conversation, but who asked the group rhetorically, “what will happen to those kids without an education?” A flurry of responses fleshed out ideas about how the typical family unit has changed, and how “well-off” kids do not know about the poor world around them. Clearly, the teachers saw these socioeconomic connections inherent in the technology discussion and were able to bring attention to the idea of “other” at which Group 1 had arrived also.

One of the readings about multiple literacies invoked a worried reaction in a participant, who said “I almost feel that this is saying children can not relate with written text, but can relate to games.” Another similarly participant offers, “I always thought playing computer games was an escape, but not an intellectual one. Does this mean reading will become passé because children feel better playing games?” All members of the group share similar views of this perceived troubling situation, offer no solutions to it, and come to a similar conclusion as Group 3 below, who complain that there “isn’t enough time” to do all that kids need to learn in relation to tech use, but who are able to articulate their role as teachers in the process.

Sample Group 3

This group consisted of four participants, 3 females and 1 male between the ages of 26 and 52. All participants immediately critiqued the results presented in one of the readings at hand, and did so immediately at the start of their chat. They explained, “I think it was an interesting study, but a little repetitive in its findings to results at least,” and “I was surprised that at the same time students were reporting that computers and tech didn't help writing that another study [mentioned by name] was calling something similar a success.” Each described how he or she was bothered by the idea that technology didn’t help, and alternately by the idea that students’ skills are not showing improvement.
The group discussed various state tests which still require handwritten long essays, and participants quoted other studies, radio programs, and other articles or organizations which discussed students’ overall decline in writing ability. “Writing isn't necessarily worse,” one participant challenges another, “maybe different. But what should I do about it in my classroom? That's the loaded question.” Participants in this group were not afraid to disagree with each other, provide outside “scholarly” examples as evidence for both sides, or to back up assertions with personal experiences from classrooms. Yet all seemed to agree that “kids are underprepared” in general for schoolwork and for life.

Texting, formal and informal writing, what is required on the job, holistic rubrics, standardized tests, grammar vs. content, “purpose and audience need to be taught; students think of audience as only the teacher,” and the effect of tech on language like abbreviations becoming common words (as also evidenced by Group 1) were aspects of the continuing discussion. Group 3 participants also discussed kids’ inappropriate screen names for communication with adults, inappropriate photos posted by them online, cyber bullying, and students’ reliance on staying up late at night to communicate with each other. All of these were perceived as interrelated problems or issues exacerbated by access to technology.

Group 3 members were also able to summarize and synthesize their own work, and meta-cognitively reflect on the purpose of the reading and/or the discussion. One participant offered, “I think between the two readings it is safe to assume that the teenagers do not view online activities and gadgets as beneficial for school, but beneficial for them -- we need to connect the two.” A flurry of shared examples of personal videos of student work and online samples of educational use were shared and viewed by group members via links, but then they again questioned the research at hand, asking about “how much kids told the surveyors what they wanted to hear.” This suspicion of students is again similar to Group 2’s view of games and Group 1’s view of Web 2.0 tools, with the conversation once again ending on a negative note.

Sample groups are provided here to help characterize the depth and content of teacher-directed talk in response to readings about technology in society and schools. Analysis of the discussion transcripts was performed using content analysis and grounded theory both by semester and across semesters (and is underway across all chats collected during the three year period of the study. As anticipated, further detail of the many themes and viewpoints which were identified and categorized must be discussed later via a future report of the study’s findings. Although over 100 chats have been analyzed to date, the most general and preliminary results have been provided in this version. Details of the exact directions given to students, the exact topics and readings assigned by semester, and an analysis of the improvement and adjustment of the project in subsequent semesters may also be reviewed for possible impact on study results.

Clearly, teacher free-form talk about technology is not as simple or short-sighted as some may think; similarly, many of their dispositions and understandings are influenced by their current teaching situations, which are not easily overcome by experience with course content or interaction with a diverse group of peers. Preliminary analysis of these results in total show that teachers’ negativity about current technology use by their own K-12 students, both at home and at school, was quite high given the known inverse correlation between perception of use and an individual’s increased personal skill level with technology (both for the teachers and their students). Conceptualization of their classmates’ viewpoints was considerably black-and-white without instructor intervention, yet based on a complex series of informational inputs and
experiences. As is perhaps their nature as teachers, the participants were quick to render a personal judgment about any offering of ideas about technology, whether negative or positive.

Discussion

The information about teacher perceptions, values and philosophies obtained from these chat segments will be able to help university instructors understand and make decisions about the teaching of K-12 teachers about technology knowledge and reform topics. Specifically, it can assist professors in a) understanding global and local barriers to technology use in schools from teachers’ points of view, especially if those teachers are deemed to be teacher-leaders by virtue of their pursuit of additional training at the masters level; and b) targeting instruction and reform efforts in meaningful ways for school teachers and leaders through graduate level curricula and course activities.

Utilizing materials from non-educational publishers, and utilizing non-teacher-centric readings for discussion appeared to help teachers broaden their context of understanding, but did not fully integrate into their world view. Perhaps a longer time period is needed for reform of “hearts and minds,” but this study provided a clear indication that the messages from the readings were heard, even if teachers have rejected them as “not useful for my particular situation” or “someone else’s problem.” Known communication habits of teachers (which may also be preferences) were clearly seen in these exchanges, and included reflection and understanding of the speaker’s message, along with a personal view offered and a perspective rendered in almost every instance. Possibly, the content of the teachers’ messages when stripped of these types of viewpoint packaging, may indeed ultimately prove to be either more positive or more neutral (indicating confusion about what to conclude about the topics at hand).

Anonymity to the professor appears to have had perhaps some effect on the honesty and detail of the postings; timely submission and obvious group dynamics (rather than one or two participants solely dominating the discussions or contributing ideas) were the only intended initial outcomes, and these were met by the participants readily and easily. Teachers were able to speak their minds freely and thus disclose many of the important perceptions they hold and share. Not all of the teachers who shared negative thoughts or observations about technology had instant agreement among others in the group; the same is true for those who shared positive thoughts or observations and received counterexamples and criticism in return. Upon initial review, both negative and positive views were shared by teachers regardless of age, level of experience in teaching, or reported comfort level with technology in general.

Chen, Chen and Tsai (2009) conducted a similar study of teachers in Taiwan. Their analysis concluded that “teachers posted more social messages in the beginning and the end of discussion, and most messages did not involve any cognitive and metacognitive skills,” with the former characteristic similar to the current participants. However, the more substantive latter characteristic indeed describes these U. S. teacher participants; teachers in the current study may have had previous experiences with the instructor, constructivist method, or peers themselves, which may have contributed to an inherent understanding among them of what type of work was expected in the chats.

University educators, school administrators and teacher leaders who use this technique with teachers for coursework, for research, or for professional development may be able to more
easily pinpoint underlying perceptual barriers, habits of thought or communication, or reflections of teacher experiences which help to construct the patterns and reactions of teachers’ responses to certain topics. The teachers in this study were not entirely against technology for themselves or their students, or even the rest of the world; already their discussions display the type of shared mutual understanding which the research suggests is a prerequisite to deeper understanding. However, it is the teachers’ internalization of their new learning, and methods that encourage personal change and institutional reform on these fronts, which must be attended to in future studies.

Theatricalizing “Death” in Buddhist Concept for the Audience’s “Awakening”

Assistant Professor Punnasak Sukee
The Department of Performing Arts
Bangkok University, Rangsit Campus
Pathumthani, THAILAND

e-mail: punnasak.s@bu.acth

ABSTRACT

This study is an experiment on using theatre as a tool to promote the Buddhist Concept of “Death”. Though death is a truth of nature as the Buddhists believe, the suffering it causes cannot be easily erased. The loss of a beloved causes incalculable grief. The purpose of this study is to create a contemporary Thai theatrical work which leads Thai audience to a spiritual awakening by realizing the impermanence of all things. Research procedure includes 3 phases

Phase 1: The study and analysis of death and dying in Buddhist tradition
This phase consists of a survey of Buddhist Scriptures (Tipataka), literatures related to death and dying. The purpose of the survey is 1. to understand the real concept of death in Buddhist Scriptures and see how the Buddhists in modern Thailand perceive it. 2. to build up theme and plot of the play script by capturing the essence of Buddhist Concept of Death. The results indicated that, in Buddhist Scriptures, the concept commonly recognized by the Buddhists are death is regarded as truth of nature, no one can escape death, death is certain, the time of death is uncertain, the only thing that can help us at the time of death is our mental/spiritual development, but what is not widely recognized and sometimes misinterpreted is we should learn about “Death before Death” or dying away from “self”. Some Buddhists, like other man in general, is still afraid of death.

The title of the play is “Dear Death” with the theme from the Buddhist Scriptures: “Sabbe dhamma nalam abhinivesaya” or “Nothing, whatsoever, should be clung to. The plot reveals the reflection of an ordinary man who is strives to reach the religious enlightenment, but great loss inevitably occurs on the pathway while he is not yet free from ‘grasping’ and ‘clinging’. His beloved grandmother is dying. He thus looks at death in other way, beautifully and magnificently, different from religion’s metaphysical concept which death is merely current of natural change, and absolutely opposite to myth and old legend which death is merciless and frightful. He imagined death as a kind-hearted god who relieved and cured those who suffered from pain and illness. The concept of Death is theatricalized by
using dance, drama, symbols and music. The visual aspect is the key element to convey the meaning. Death is personified as god who rides on heavenly exquisite chariot to take our beloved one to eternal happiness. The result is the innovative dance-music-drama that combines the classical and contemporary performing arts.

Phase 3: The performance
The performance took place in two countries; Singapore and Thailand. The interview, the questionnaire and the observation of audience’s feedback indicate that both Non –Buddhist and Buddhist audiences can follow the story which is universal, the style of presentation which consists of images and symbols, the dialogues which discuss the Buddhist philosophy’s “Death before Death” or dying from “self”. The performance can help the audience recognize how precious and how short life is and we should make it meaningful and live it fully. The performance also helps the audience understand the death process, familiarize themselves with it, remove fear and get themselves well-prepared with consciousness and intellect for the moment of great loss or death.

-----------------------

“It is usually proclaimed eloquently, but ambiguously, that birth, ageing and death are dukkha. But birth is not dukkha, aging is not dukkha, death is not dukkha where there is not attachment to “my birth”, “my ageing” and “my death”. At the moment, we are grasping at birth, ageing, pain and death as “ours”. If we don’t grasp, they are not dukkha, they are only bodily changes. The body changes thus, and we call it “birth”; the body changes thus, and we call it “ageing”; the body changes thus, and we call it “death”; but we fail to see these events just as bodily changes. We see it as actual birth, and what is more, we call it “my birth”, “my ageing” and “my death”. This is a multiple delusion because “I” is a delusion to start with; so seeing a bodily change as “my birth” or “my ageing” compounds this delusion. We fail to see these are simply bodily changes. Now just as soon as we do see these as only bodily changes, birth, ageing, and death disappear, and “I” disappear at the same time. There is no longer an “I”, and such a state is free from dukkha.”

The Truth of Nature
Buddhadasa Bhikkhu
UNESCO’s great international personality

Introduction
Theatre can be used as a tool for social development. Unfortunately, it is perceived as merely a kind of entertainment by Thai audience. Contemporary Thai Theatre has been budded for more than three decades, but it has never bloomed. There is only one big theatre company in Thailand which gains reputation and financial success, for the tactics that the company uses to draw the audience are extravaganza, big-name stars,
popular music with catchy tunes, and most of all, a guaranteed overwhelmingly emotional value, the same feeling as going to a concert of favorite stars. 

Buddhism shares the same fate. Though country censuses, statistics and quotas show that it is a nation full of devout Buddhists, Thais, especially in modern society, have not been able to embrace the concept and fundamental ethics and philosophy that Buddhism represents. People go to temple for rite and ritual, making merit and wish themselves good fortune in return. The essence of Buddhist teaching has been neglected in materialistic world. The world where money and power are most sought after.

Nowadays, when Thai has to face the crisis: coup, economic slowdown, terror in the south which seems to spread out into other part, especially in Bangkok, the capital city. The situation is worsening. People become aware that their minds need a cure. They need religion to help them through sufferings. They know that Buddhism talks about suffering, to understand the nature of suffering, and how to get out of it. It is significant that the lists of top 10 best-selling books of any major bookstores in Thailand always comprises Dhamma books on how to live happily with application of Buddhist teaching in daily life written by Buddhist monks. It shows that some group of people, especially modern Thais, are striving to find their way back to spiritually peaceful state of being. They are seeking a way to comprehend the essence of Buddhism, but not by going back to the monastery where Buddhist monk chanting incomprehensible Pali.

**Theatre of Death : Theatre of Awakening**

In Buddhist teaching, Death is a natural thing. It follows the rules of three characteristics of existence; Impermanence, Incompleteness and Non-self. What comes to be must cease to be. Birth goes side by side with death, arising with ceasing, existence with non-existence. People seem to fully aware of this law of nature, but when Death is approaching them or someone they love, it is not easy to welcome Death. Death is still a word definitively shunned by all who will try to escape it at all costs. In normal circumstances, if anyone let slip the word in social gathering, he/she cannot avoid being frowned upon by others as if he/she were speaking out of time and place. For lay people, death is considered highly sinister and should never be mentioned unless entirely unavoidable. This is how most people view death-negatively, fearfully, with hostility. (Vajiramedhi, 2005)

This study is an experiment on using theatre as a tool to promote the Buddhist Concept of “Death”. Though death is a truth of nature as the Buddhists believe, the suffering it causes cannot be easily erased. The loss of
a beloved causes incalculable grief. The purpose of this study is to create a contemporary Thai theatrical work which leads Thai audience to a spiritual awakening by realizing the impermanence of all things.

**Phase 1**

**The Study and Analysis of Death and Dying in Buddhist Tradition**

**The Three Basic Facts of Existence**

"Whether the Tathagatas (Buddhas) appear or not, O Bhikkus (monks), it remains a fact, an established principle, a natural law that all conditioned things are transient (anicca), sorrowful (dukkha) and that everything is without a self (anatta)." (Sutta Pitaka)

The Three Basic Facts of Existence are also known as the Three Characteristics, the Three Signata or the Three signs. The formula for the Three Basic Facts given in verses 277-9 of Dhammapada is:

- Sabbe sankhara anicca  all conditioned things are impermanent, transient
- Sabbe sankhara dukkha  all conditioned things are sorrowful, unsatisfactory
- Sabbe dhamma anatta  all phenomena are without ego, self, substance

Therefore, if we are clinging to something, someone, or even our “self” that will cause us suffering (Dukkha), for what we are clinging to is impermanent. It has to cease to be. “Emptiness” is what we should be aware of. Bikkhu Buddhadasa explained “emptiness” as the heart of Buddhist teaching.

The saying of the Buddha which deals with the practice in regard to emptiness is the one that is the heart of the Buddhist Teachings: 'Sabbe dhamma nalam abhinivesaya' which translates literally as 'No dhamma whatsoever should be grasped at or clung to'. If one amplifies the meaning a little it may be rendered as 'no one should grasp or cling to anything as being I or mine'. 'No one' means that there are no exceptions; 'should grasp or cling' means to give rise to ego-consciousness; 'as being I': refers to the feeling called ahamkara, the grasping at a (non-existent) soul or abiding ego-entity; 'as being mine' refers to the feeling called mamamkara, the grasping at
phenomena as being connected to ego. So don't have ahamkara or mamamkara with regard to anything at all starting from a worthless speck of dust up to valuable objects such as diamonds, sapphires, gems and the objects of sensual desire, and on to things higher than that - Dhamma, its theory, practice and attainment, the Path - Realizations, their Fruits and Nibbana. Nothing whatsoever should be grasped at or clung to as being 'I' or 'mine'. This is the heart of the Buddhist Teachings and was affirmed to be so by the Buddha himself.

D definite Death will definitely come to all of us.

E equally Death will treat us equally. We all equally die.

A afraid We are afraid of Death.

T time We never know when we will die.

H how We never know how will we die.

W. Vajiramedhi wrote in his “Looking Death in the Eye” that seeing Death is seeing through the nature of all things. Constant awareness of our mortality will make us unafraid of Death. Contemplating Death can prevent bad deeds;

We should talk about death everyday and find an occasion to remind each other frequently to beware- that today we may possibly die. Hence, whatever good remains for us to do must be done in haste. Whoever we love we should let them know of our love. If we haven’t looked after our parents we should hurry up and go back to take care of them. Talk about Death twice daily, morning and evening in the same way we honour the national flag, and we Thais will be much better off, Thailand will be cleaner, corruption will decline because when you speak about death, fear of death will make you ashamed of evil and shame in the face of evil will make you give up evil deeds, your life will instantly become virtuous.

He explained that Death, according to the analytical doctrine of the Buddhist canon which incorporates the Buddhist philosophy, happens all the time. It
arises, stays and ceases. We never know how many times in a second we arise, stay and cease. Therefore, we must see the close proximity in which we are born and die, arise and cease mentally. We arise and cease all the time. Hence, we should learn and see through the phenomenon of our inner life, so that we can see death happening all the time. Such is the nature of things.

We die mentally every moment as we do physically. Our body cells die all the time. When bathing, scurfs is dead skin that disintegrates in the form of filth. After seven years our physical body is no longer the same person we once were because all cells renew themselves totally every seven years. Scientifically speaking, we become a new person every seven year.

He also further discussed that Being dead (marana) in the Dhamma is whenever mind-spirit ceases or the last mind-spirit moves from Being to the next conceived mind-spirit, the last mind-spirit that dissolves and forms into the present one, with its life disrupted, is called disrupted santati (discontinuation of life) and that makes for death. Naturally the human mind arises and dies all the time. Each cycle of birth and death is faster than a lightning flash and continues like the flow of a river.

Rules and Regulations or the Nature of Life
The nature of things consists of five tenets, namely
1. Everyone must age in the course of time. No one can avoid ageing.
2. Everyone must suffer illness in the course of time. No one can avoid illness.
3. Everyone must die in the course of time. No one can avoid death.
4. Everyone must suffer separation from whom or what they love in the course of time. No one can avoid separation.
5. Everyone who did what they did, whatever good or bad must be the recipients of their own respective deeds.

Contemplating Death
Life is more fragile and than glass and lighter than a feather. Death is approaching us, timely or untimely, so we should treat each day like the last day of our life. Buddha remarked “Let you all contemplate death well”. Death awareness has the following benefits:
- It allows you to see through the nature of things.
- When you see through it, you can live your life heedfully.
- When you live your life heedfully, you will expedite your acts of merit.
At the time of your death, you do nothing awry nor go astray. It is the basis for higher levels of insight meditation. It guarantees your new sphere of being. People who develop their awareness of Death, even if they have not attained enlightenment (nibbana), will be born in higher sphere.

And W. Vajiramedhi thus summarises the benefits of the contemplation of Death as follows:
- You live without heedlessness
- You let go of all clinging and attachment.
- You do not long for your past life at the terminal moment.
- You shun evil and fear sin, i.e. you choose to do only good deeds.
- You do not lust after material things as you must leave them behind eventually.
- You understand the impermanence of things.
- You do not fear death.
- You die in peace when your time comes.

It is the basis of higher transcendental meditation.

In death, you will be born on higher sphere as you possess a mind without blemish just before dying.

In the Visuddhimagga written by Phra Buddhagosajarn, death awareness can be contemplated through a number of means, as follows:
- In the guise of an executioner.
- By dispossessing oneself.
- By analogy.
- By visualizing the body as the home to a plethora of worms.
- By deteriorating with age.
- By seeing Death unannounced.
- By time limitation.
- By the brevity of the lifespan.

Phase 2
The creating of Theatre of Awakening : “Dear Death”, A Contemporary Thai Theatre.
The title of the play is “Dear Death” with the theme from the Buddhist Scriptures: “Sabbe dhamma nalam abhinivesaya” or “Nothing, whatsoever, should be clung to. The plot reveals the reflection of an ordinary man who strives to reach the religious enlightenment, but great loss inevitably occurs on the pathway while he is not yet free from ‘grasping’ and ‘clinging’. His beloved grandmother is dying. He thus looks at death in other way, beautifully and magnificently, different from religion’s metaphysical concept which death is merely current of natural change, and absolutely opposite to myth and old legend which death is merciless and frightful. He imagined death as a kind-hearted god who relieved and cured those who suffered from pain and illness.  
The playscript consists of 7 scenes, with approximately run-time 90 minutes with no intermission.

**Scene I : Prologue**

Dusk, Grandson helps grandmother preparing herself for a journey. He will go to see her off at ‘The Station’, where she is supposed to wait for someone called “HE”. Grandson told his grandmother not to worry and take some rest. He promised he would be with her until “he” would come and pick her up. Grandson dreams of the royal chariot and a man with god-like grace standing on the chariot’s throne. The chariot accompanied by celestial maids is passing him by. He is frightened and looks for his grandmother.

**Scene II : A Dewdrop on the Grass**

Dawn, Grandson helps his grandmother get dressed and leave their place. Grandmother points out a dewdrop on the grass which is beautiful, crystal clear and pure, but its time is so short. Merely an instant. It will evaporate, when the sun shines through. The chorus sings the Buddhist teaching in Pali “Uppajjitaṁ nirujjhantaṁ āciṁ vupasamo sukho” – All arises and ceases, that is their nature: when arising and disappearance cease completely, that is ultimate happiness.

**Scene III : Station**

Grandson and Grandmother arrive at the station. Grandmother is homesick and worried. She wonders for how long she has to wait for “HIM” at this station. Grandson entertains her by singing Dhamma song about Samannalakkhana (The Common Characteristics) – Anicca (impermanence), Dukkhata (state of suffering or being oppressed), Anatta (soullessness or state of being not self). These abstract ideas are personified by three characters and amusing choreography. There is a group of people welcome a new born child. They walk pass Grandson and his Grandmother with merriment. Only
awhile, the fun atmosphere is interrupted by siren sound. Grandson rushes out, then comes back sadly and tells his Grandmother that the baby is dead.

**Grandmother:** Life is so short Alas! 
Like a dew on the grass 
Merely an instant, 
It will evaporate.

The group comes back, carrying the baby’s dead body. The chorus sings Buddhist teaching in Pali “Anicca vata sankhara. Uppada vaya dhammino. Uppajjitava nirujjan’ti. Tesam vapasamo sukho”- Impermanent, alas, are all conditions. Arising and passing away. Having been born they all must cease. The calming of conditions is true happiness.

**Scene IV: Aciram**
In his dream, The grandson sees the dance of the losing mother. He tries to console her with Buddhist teaching, but he eventually collapses himself, realizing he is also clinging to his loved one. The dance is accompanied by the singing of Buddhist teaching in Pali.
“Addhuvam me jivitam. Dhuvam me maranam. Avassam Maya marittapam”- My life ends in death, life is not permanent. Death is permanent.
“Aciram vata’ yam kayo. Pamhavim adhisessati. Chuddho apetavunnano niratthamva kalimgaram”- O Bhikkhu, this body of yours will soon, truly and verily, lie upon the ground when all of our consciousness is gone. It is no better than a decaying wooden piece. It is useless.

**Scene V: A Nightmare**
Still in his dream, Grandson sees his Grandmother become healthy. All her weakness and illness are gone. She dances in a Thai traditional style with other celestial maids and tell him to take care of himself. She is taking a long journey to make merit. She dances and then disappears. Grandson is frightened. He tries to look for his Grandmother. The royal chariot and “HE” approaches him once again and passes him by. He runs after the chariot to find out if his Grandmother is in there.

**Scene VI: The Encounter**
The conversation between “HE” and Grandson. Grandson is asking him for more time with his Grandmother. “HE” teaches Grandson with Buddhist teaching. The scene portrays the inability of a modern man to embrace the essence of Buddhist teaching, though he intellectually knows what is good in the teaching.
Grandson: And there… I could see him again. He still resembles someone I once familiar with, He’s as graceful as god, staying on his chariot, his apparel is exquisitely beautiful.

(to Him) Will you take my grandma away from me?

HE: I part no one from anyone.

Grandson: Please kindly give me a little more time to spend with my grandma.

HE: Dhuvam Maranam

Grandson: Death is permanent.

HE: Jivitamwya aniyatam

Grandson: Life is not permanent.

HE: Maranam me niyatam

Grandson: Death is permanent.

HE: When Death is permanent. Why not thou learnest about Death before Death?

Grandson: You mean I should die away from love and attachment?

HE: Diest away from Self.

Grandson: Die away from Self.

HE: Sabbe Dhamma nalam abhinivesaya

Grandson: Nothing, whatsoever, should be cling to.

HE: Atthi nu kho kichi lokasmin yamaham upadiyamanonavajjava assam

Grandson: Nothing, in this world, that if we cling to, will never cause us suffering.

HE: Be awakened!

Grandson: Who are you?

HE: If thou art awakened., whenever, there shalleth be no “ME”.

Grandson: I want to be awakened, please help me, help me.

HE: Dhamma willeth help thee.

Grandson: I am just an ignorant.

I am in my nightmare and just can’t wake up. I’m frail. I’m ignorant.

HE: Be awakened!

Scene VII: The Last Farewell

Grandson wakes up to find out that Grandmother cannot walk. Grandmother tells him not to cling to what is not ours. Grandmother realizes the truth of life and the law of nature which is Dhamma. She asks her grandson to make the best of their last moments together by composing a poem describing “HE” and his royal chariot. While he is composing the poem, “HE” comes and takes Grandmother with him. Grandson promises that he will make only good karma (good deeds), until his time will come and he will go with that beautiful chariot himself.
Grandson

HE and my Grandma, they are as graceful as god. The ray of merit is shining through the darkness of the night. HE turns to look at me. He looks merciful, understanding, as if HE knows that I ask him to take good care of my grandma for me. I see him smile, a little smile. Now, HE and I are acquaintances. Everytime I think of my grandma, I will also think of him. I will mindfully aware that life is so short. Like a dew on the grass. Merely an instant, it will evaporate when the sun shines through. I promised to my grandma that, in this short life, I will make only good deeds, because I am her good Karma. Until then, until the day I will see HIM again. I day I will sit beside HIM on that chariot, glowing and shining. I shall be delighted with my good Karma, and realize that my life has nothing to regret.

Voice

Sabbe dhamma nalam abinivesaya

The concept of Death is theatricalized by using dance, drama, symbols and music. The visual aspect is the key element to convey the meaning. Death is personified as god who rides on heavenly exquisite chariot to take our beloved one to eternal happiness. The result is the innovative dance-music-drama that combines the classical and contemporary performing arts.

Phase 3: The performance

The performance took place in two countries; Singapore and Thailand. The interview, the questionnaire and the observation of audience’s feedback indicate that both Non –Buddhist and Buddhist audiences can follow the story which is universal, the style of presentation which consists of images and symbols, the dialogues which discuss the Buddhist philosophy’s “Death before Death” or dying from “self”. The performance can help the audience recognize how precious and how short life is and we should make it meaningful and live it fully. The performance also helps the audience understand the death process, familiarize themselves with it, remove fear and get themselves well-prepared with consciousness and intellect for the moment of great loss or death. Some critic reviews the performance as
While Buddhist teaching emphasises death and impermanence, it's not easy to set ourselves free from multiple cravings and the pleasures of a euphoric life. Death can come at any time, even without a warning, whether our own departure from this world or the loss of our loved ones.

The kind-hearted God of Death on his golden chariot eventually picks up the grandmother to take her on a journey to eternal happiness.

As much as sunset can be a beautiful sight, death can be positively viewed as a happy ending as it comes along with the cessation of suffering. Bangkok University Theatre Company attempts to bring us closer to an enlightenment of death as a truth of life through a contemporary Thai performance, Dear Death or Yern Phra Yom (Phra Yom or Yama, the God of Death). Following last month's enthralling performances at Singapore's Esplanade Theatre Studio, the theatre company will stage a bigger production of the show at the opulent Aksra Theatre, on March 28 and 29.

Playwright and director Assistant Professor Punnasak Sukee continues to portray Buddhist philosophy in this story, after last year's Dancing to Nirvana delivered the key message of Ittappajayata, the concept of existence and uncertainty. Dear Death amplifies on this uncertainty with the theme Sabbe dhamma nalam abhinivesaya, meaning "Nothing, whatsoever, should be clung to."
Playwright and director, Punnasak Sukey is keen on creating 'food for thought' dramas.

Looking younger than a fortysomething, Punnasak shares how he faced a mid-life crisis three years ago that had him questioning about whether what he was doing really served a purpose. He found an answer in Buddhist philosophies that are reflected in his works, the most prestigious being Mahajanaka The Grand Musical, to commemorate the 60th anniversary of HM the King's accession to the throne.

"It may be because of ageing that got me deeper into dhamma. At any age, you can benefit from Buddhist teaching that gives you the 'how to' to cautiously lead your life and to find a 'way out' of suffering," he says.

"But the difficult part of it is to put it into practice. Moreover, people may think it's about going to the temple, entering monkhood, or becoming a vegetarian when actually anyone can practise dhamma on a daily basis."

Moranansati, an awareness of death, is one example of Buddhist mind-training to be mindfully conscious of its inevitability and be well prepared for it.
The performance engages contemporary dance movements.

"In reality, people may shun death, fearing it as a terrible fate and a horrible thing. Dear Death aims to turn this attitude around, to become proactive about dying. Essentially, if one can detach ourselves, it will come on easy and thus the Pali verse of Sabbe dhamma nalam abhinivesaya or 'Nothing, whatsoever, should be clung to' echoes throughout the play," says Punnasak.

Dear Death tells the story of a man and his grandmother and their encounter with the God of Death. The young man, afraid that the elder will soon die, is in suffering due to his love and attachment to his grandmother. In his dream, he meets a kind-hearted god riding on an exquisite chariot to pick up people and transport them to eternal happiness.

Prayunsak Rattanaseranee plays the young man, and Neeranuch Patamasutra, the grandmother.

He's awakened to look at death, not from its dark side, but with an enlightenment that it's merely a part of a natural change. In the end, he readily accepts the loss of his grandmother, and with the uncertainty of life, he commits himself to doing good deeds.

The thought-provoking story comes to life through an amalgam of acting, singing and contemporary dancing performed by 50 students of Bangkok University's Department of Performing Arts. Sophomore student Prayunsak Rattanaseranee takes the demanding leading role of the young man, who's virtually in every scene of the 90-minute show. Neeranuch Patamasutra, the only professional performer in the cast, plays his merry grandmother who's ready to let go and embark on her last journey.
The God of Death characterised as 'He', performed by sophomore student Preechan Maneechote, appears on a man-powered golden chariot several times throughout the show. Repetitiveness of some parts of the story may have audience asking when 'He' will eventually take the grandmother to, supposedly, heaven.

Overall, Dear Death presents contemporary Thai performing arts in a riveting way. The choreography by Parinya Tongphonthong boasts a contrast from vigorous contemporary movements in the "grasping and clinging" scene to nimble footwork of traditional Thai dancing by the God of Death and his entourage.

The spectacular production features a cast of 50 performers.

Music composers Krisada and Napisi Reyes smoothly mixes traditional Thai and Western music, pali verses, traditional Thai chanting and opera singing for a stimulating score that expresses death in a sanguine rather than a melancholic spirit.

With subtitles in English, Dear Death was immensely appreciated by a multi-national audience at Esplanade Theatre Studio in Singapore. Aksra Theatre, by far, will be a grander venue and its auditorium with carvings of humans, gods, and angels and a Six Heaven ceiling provides an ethereal ambiance for the performance. Even so, will it appeal to Thais?

Contemporary Thai performances don't normally draw a big crowd but Punnasak optimistically observes an increasing number of theatre-goers who seek 'food for thought'.

"This is a story that Thais can relate to and it offers an essence of Buddhist philosophy on embracing death besides the entertainment," he says. "In Thailand, contemporary Thai performances are like buds that are ready to bloom. Somehow they never get to bloom to the fullest because of the lack of support. Nevertheless, Bangkok University Theatre Company hopes to change that and keep this performing arts alive."

   The purpose of this interactive poster session is to define effective teacher-made podcasts for use in science secondary education classrooms. Usefulness to Practitioners

   Students with learning disabilities often need supports that their general education peers do not. Podcasts can provide advance organizers, knowledge-based information, independent reference, follow-up activities and homework assignments. Any assignment can be made into a podcast. Additionally, podcasts can be accessible to students at any time. The presenter will provide easy, step-by-step instructions for creating and using podcasts in the science classroom. Creating and using podcasts can be simple and enjoyable to teachers and students.
Abstract

Religion and the American Public School: Is There a Place for God in Public Schools?

Dr. Christopher L. Sny

We Americans are a Christian nation with a secular constitution – a paradox of a culture often at war with itself over religion that is nowhere more contentious than in our public schools. The first phrase of our First Constitutional Amendment states, “Congress shall make no law with respect to the establishment of a religion”, and then immediately follows with, “...or prohibit the free exercise thereof;” thus establishing a dynamic balance between freedom from state imposed religion while respecting and protecting individual religious practice including freedom from religion for those who choose to practice no religion at all, a daunting enforcement challenge for government in today’s multi-cultural and multi-ethnic America. The basic foundation of our American democracy with regard to freedom of religious thought and practice is the First Amendment cited above. But what is the meaning of this elegant declaration for modern American life in schools? A discussion of the often complex and sometimes conflicting views and recent case law on this core American value will be the basis for this paper. Thomas Jefferson once said that, “differences of opinion leads to inquiry, and inquiry to truth”. Jefferson, a deist in religious outlook like most of the founders, believed more in the sanctity of freedom of thought than in any prescribed method of religious expression. Thus, while we today think of ourselves including our schools, as the product of a “Christian nation” we also recognize by both aspiration and well codified law the inherent right to free exercise of religion including the right to no exercise at all, which by extension leads to the question: “Does God belong in public schools?

Religion and the American Public School: Is There a Place for God in Public Schools?

Abstract

“Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof;”

We Americans are a Christian nation with a secular constitution – a paradox of a culture often at war with itself over religion that is nowhere more contentious than in our public schools. The first phrase of our first constitutional amendment states, “Congress shall make no law with respect to the establishment of a religion”, and then immediately follows with, “…or prohibit the free exercise thereof;” thus establishing a dynamic balance between freedom from state imposed religion while respecting and protecting individual religious practice including freedom from religion for those who choose to practice no religion at all, a daunting enforcement challenge for government in today’s multi-cultural and multi-ethnic America.

The basic foundation of our American democracy with regard to freedom of religious thought and practice is the First Amendment cited above. But what is the meaning of this elegant declaration for modern American life in schools? A discussion of the often complex and sometimes conflicting views and recent case law on this core American value will be the basis for this paper.
Thomas Jefferson once said that, “differences of opinion leads to inquiry, and inquiry to truth”. Jefferson, a deist in religious outlook like most of the founders, believed more in the sanctity of freedom of thought than in any prescribed method of religious expression. Thus, while we today think of ourselves including our schools, as the product of a “Christian nation” we also recognize by both aspiration and well codified law the inherent right to free exercise of religion including the right to no exercise at all, which by extension leads to the question: “Does God belong in Public Schools?”

Introduction

From the beginning of the public school movement in America, early to mid nineteenth century, through the “Happy Days” of the mid twentieth century 50’s, the presence of God and religion in the public school was never seriously challenged in the courts and unquestioned acceptance of religion in the public school house as in American life was an understood expectation of faculty, administration and community. That was until the 1962-'63 academic year when the Engle v. Vitale decision was handed down by the U.S. Supreme Court which stopped the practice of reading a “non sectarian Regent’s prayer” in New York public schools in which Justice Hugo Black wrote:

“…the constitutional prohibition against laws respecting an establishment of religion must at least mean that in this country it is no part of the business of government to compose official prayers for any group of the American people to recite as a part of a religious program carried on by government.” (Engle v. Vitale, 1962)

This decision was followed by the ruling in the combined cases, Abington vs. Schempp and Murray vs. Curlett that ended the practice of state initiated prayer in the rest of the
country’s schools seemingly overnight. Ms. O’Hair, a virulent atheist and founder of the “American Atheists” organization instantly became, “the most hated woman in America” along with Earl Warren, the Supreme Court Chief Justice, who reappeared on bumper stickers now fading since Brown v. Board school desegregation decision a decade earlier with bright communist red lettering that read: “Impeach Earl Warren”! Writing for the majority Mr. Justice Clark delivered the opinion saying, “While the Free Exercise Clause clearly prohibits the use of state action to deny the rights of free exercise to anyone, it has never meant that a majority could use the machinery of the State to practice its beliefs.” (Brown v. Board, (1954); Abington v. Schempp, Murray v. Curlett, (1963). Thus God had summarily been dismissed from public school – only to reappear periodically in several landmark cases decided by our nation’s highest court over the next several decades up to and including today. The question, “Does God belong in our public schools?” continues to be relevant even today and of concern to Americans of all faiths and no faith and crosses all socioeconomic lines in our culture. Why should this issue continue to be at the center of American public school life? The answer, perhaps, lies in the continually contested and sometimes seemingly contradictory decisions of our nation’s highest court with regard to religion in American life that inevitably spills over into the most public of our institutions – the neighborhood school.
Religion and Construction of Our Constitutional Home

Despite the Founders deep concern for the issue, religion appears almost an afterthought in our Constitution which references religion only in the next to last, Article VI, final clause which states: “…no religious test shall ever be required as a qualification to any office or public trust under the United States”, which appears to put the issue virtually on the back porch of our American constitutional home. The reality of course was that the issue was central to American colonial life and in order to avoid irreconcilable conflict at the constitutional convention the issue was virtually avoided in the original document. Construction began on this uniquely original American constitutional home on May 25, 1787 in Philadelphia after demolition of the crumbling and dysfunctional Articles of Confederation. Initial construction was completed rather quickly for such an important structure that would eventually provide a constitutional roof over the heads of nearly 300 million inhabitants today, when in September 1787 it was signed off on by 39 of the original 42 designing architects. The actual structure wasn’t finally accepted by the new federation of states until June 21, 1788 when the New Hampshire contingent became the ninth state to ratify and accept it as originally designed. However, it was not until April 30, 1789 when George Washington was inaugurated our first President and moved into America’s virtual constitutional home that he became the first in a long line of temporary occupants. With regard to guarantees of basic civil rights, the founders knew something was missing. On June 8, 1789 the leader of the original design team, James Madison, moved to rectify the omission by proposing a Bill of Rights as a virtual protective entry way for the new constitutional home. This virtual front porch was completed on December 15, 1791 when a majority of the original
designers by majority vote had it nailed into place. During the ensuing 219 years to date since the original construction and front porch addition, the home has been altered only 17 more times, an average of only once a decade. Despite the major civil and political storms of these past two centuries our constitutional virtual home remains basically intact and seems to weather each assault on it no matter how grave the current constitutional crisis with the unfailing enlightened guidance of each temporary occupant President, Congress and Supreme Court.

**Origins of Religion in American Schools**

Of the first 108 universities in the U.S. 106 were religiously affiliated, one of which, the first, Harvard, 1636, student handbook rule number one required students seeking entrance to know Latin and Greek so they could study scripture. “Let every student be plainly instructed and earnestly pressed to consider well, the main end of his life and studies is, to know God and Jesus Christ, which is eternal life, (John 17:3); and therefore to lay Jesus Christ as the only foundation of all sound knowledge and learning”, (Merino, 2008, p.72).

In a similar vein the first publicly supported primary and secondary schools in America were also established with religious motivation resulting in a foundation for American public education established and conducted almost exclusively by churches for the purpose of advancing their exclusive religious beliefs. As an example in 1647 the Massachusetts legislature enacted the now famous “Old Deluder Satan” Act which required towns of 50 or more families to teach children to read and write so they might
“achieve salvation and delude Satan”, (Schimmel, et.al., 2008, p.93). In fact, the concept of public education, “divorced from denominational control was foreign to the colonial mind”, (Pfeffer, 1967, p.321). Indeed, this primarily Protestant conviction of faith based literacy gave a decidedly Protestant influence to our earliest public schools which in turn later caused Catholics, Jews and other religious groups to establish their own schools since the public schools were early on in our history so infused with Protestant beliefs and practices. Justice Felix Frankfurter, writing two centuries later in the 1948 McCollum case opinion said: “Traditionally, organized education in the Western world was Church education. It could hardly be otherwise when the education of children was primarily the study of the Word and the ways of God. Even in Protestant countries where there was a less close identification of Church and State, the basis of education was largely the Bible, and its chief purpose, inculcation of piety. To the extent that the State intervened, it used its authority to further the aims of the Church. The immigrants who came to these shores brought this view of education with them. Colonial schools certainly started with a religious orientation”, (McCollum v. Board of Ed., 1948). The pervasiveness of the early religious influence on public schools is also illustrated by the primer used to teach public school pupils to read in New England in the the 18th century. The book entitled, The New England Primer taught the alphabet using letters and pictures with Biblical connotations; for example, “A-in Adam’s fall we sinned all or P-Peter denies His Lord and cries”. Because of these origins of religious involvement in public education, it has been difficult to keep public schools from becoming inundated in subsequent years with religious strife and discord, (Schimmel, et.al, 2008, p. 146). As the era of the Enlightenment encompassed the later 18th century the conflict between secular rationalism and religious
teaching intensified as noted in Adam Smith’s, An Inquiry Into the Nature and Causes of the Wealth of Nations (1776) when he said: “Science is the antidote to the poison of religious enthusiasm and superstition.” To further illustrate religious turmoil in colonial America, Justice Douglas writing two centuries later in, The Bible and The School notes:

Every one of our colonies had to a degree some union between Church and State. Some were more tolerant of religious minorities than were others. The colony of Plymouth was ruled by a governor and a small and highly select theological aristocracy, a church-state with various grades of citizenship and noncitizenship. Puritan persecuted Quaker, as before him Roman Catholic has persecuted Protestant and Anglican persecuted Puritan. Maryland became the home of religious toleration under the Catholic Calvert, extending free exercise of religion to all Christian sects except the Unitarians and to all others except the Jews. ..therefore taught the new states that an accommodation of conflicting religious enterprises was essential; and that the best way to assure individual liberty and fair treatment to each sect was to separate Church and State.”, (Douglas, 1966, p.19).

James Madison, the principle designer and author of the Constitution, in response to a 1785 bill in the Virginia legislature proposing a tax for the support of teachers of the Christian religion responded by stating his belief in separation of church and state in his “Memorial and Remonstrance Against Religious Assessment” in which he stated:

The Religion then of every man must be left to the conviction and conscience of every man; and it is the right of every man to exercise it as these may dictate. This right is in its nature an unalienable right. It is unalienable; because the opinions of men, depending only on the evidence contemplated by their own minds, cannot follow the dictates of other men: It is unalienable also; because what is here a right towards men is a duty towards the Creator. It is the duty of every man to render to the Creator such homage, and such only, as he believes to be acceptable to him. This duty is precedent both in order of time and degree of obligation, to the claims of Civil Society. Before any man can be considered as a member of Civil Society, he must be considered as a subject of the Governor of the Universe: And if a member of Civil Society, who enters into any subordinate Association, must always do it with a reservation of his duty to the general authority; much more must every man who becomes a member of any particular Civil Society, do it with a saving of his allegiance to the Universal Sovereign. We maintain therefore that in matters of Religion, no man’s right is abridged by the Institution of Civil Society, and that Religion is wholly exempt from its cognizance. True it is, that no other rule exists, by which any question which may divide a Society, can be ultimately determined, but the will of the majority; but it is also true, that the majority may trespass on the rights of the minority… experience witnesseth that ecclesiastical establishments,
instead of maintaining the purity and efficacy of Religion, have had a contrary operation. During almost fifteen centuries, has the legal establishment of Christianity been on trial. What have been its fruits? More or less in all places, pride and indolence in the Clergy; ignorance and servility in the laity; in both, superstition, bigotry and persecution. (cited in Hunt, ed., 1901)

Madison’s colleague Jefferson, voiced similar views when in 1802, after one year in the White House, he wrote to the Danbury Baptist Association of Connecticut:

Believing with you that religion is a matter which lies solely between man and his God, that he owes account to none other for his faith or his worship, that the legislative powers of government reach actions only, and not opinions, I contemplate with sovereign reverence that act of the whole American people which declared that their legislature should “make no law respecting an establishment of religion, or prohibiting the free exercise thereof,” thus building a wall of separation between Church and State. (cited in Lee, 1961)

Clearly the founders understood the separation of church and state must be part of the makeup of the new nation. Despite this understanding and declarative attempt to separate the two with the adoption of the First Amendment, conflict continued over the decades between clergy and the proponents of the state sponsored public school. As an example when Horace Mann in the 1830’s provided the leadership in the establishment of the first state system of public schools in Massachusetts, his chief opposition came from clergymen who sought to prevent him from creating what they called “Godless” institutions. Mann insisted the public schools should have no sectarian religious motivations and the state should “abstain from subjugating the capacities of children to any legal standard of religious faith.” (Schimmel, et. al., 2008, p. 147).

Later, however, contrary to Mann’s belief that the public schools should be secular, religious activities were permitted in public schools in most states, including prayer, Bible reading, and other religious exercises. By the early 20th century, most states had regular morning religious services in their public schools. These religious practices
that clearly combined church and state were upheld by a majority of state courts and thought to be consistent with state constitutions. That is until the Supreme Court resolved this issue when it held that the fundamental concept of “liberty” embodied in the Fourteenth Amendment incorporates the guarantees of the First Amendment and safeguards them against state interference. (Gitlow v. New York, 1925).

Since under the Tenth Amendment to the Constitution education has been ruled by interpretation of the Supreme Court to be a state function, even though states delegate most school operations to local governing boards, controversies involving public schools are litigated primarily under the Fourteenth Amendment “equal protection” guarantees. Further most of the court rulings with regard to religion in public schools have been established since World War II with only five cases on religion reaching the nation’s highest court before 1947.

As indicated in the following case analysis this law continues to evolve as the religious clauses, establishment and free exercise, interact with the free speech guarantees of the same First Constitutional Amendment and “equal protection” clause of the Fourteenth. The majority of church-state cases in education since the second world war have involved the Establishment Clause of the First Amendment charging state imposition of religion in schools while a fewer number have had the Free Exercise Clause as the main issue charging state infringement on individual religious liberty. The sum and substance of these cases show, despite some notable decisions maintaining the proverbial “Wall of Separation” between church and state with regard to prayer in schools, that religion may be creeping back into schools as a result of an increasingly conservative makeup of the U.S. Supreme Court.
The beginning of court sanctioned sectarian trends in American schools came with the early 20th century ruling in a landmark case filed with the U.S. Supreme Court in response to The Compulsory Education Act adopted November 7, 1922 by voters of the state of Oregon. The case, Pierce v. Society of Sisters (1925), was initiated when the challenged act, effective September 1, 1926, required every parent, guardian, or other person having control or charge or custody of a child between eight and sixteen years to send him “to a public school for the period of time a public school shall be held during the current year” in the district where the child resides; and failure so to do is declared a misdemeanor, (Alexander, 2009, p.309). The mandatory attendance requirement of the Oregon law was in line with the norm of the era with legislation passed in most states requiring school attendance to thwart the abuse of child labor which was commonly exploited in the mines and factories of the industrial revolution era of the late 19th century and early 20th centuries in this country and other rapidly industrialized nations. The contested issue in this case however wasn’t the mandatory attendance requirement but that the law required every parent or guardian to send the child to a “public school”…which “without a doubt enforcement of the statute would seriously impair, perhaps destroy, the profitable features of appellees’ business and greatly diminish the value of their property.” The Court in its opinion written by Mr. Justice McReynolds went on to note, “Under the doctrine of Meyer v. Nebraska, we think it entirely plain that the Act of 1922 unreasonably interferes with the liberty of parents and guardians to direct the upbringing and education of children under their control. The fundamental theory of liberty upon which all governments in this Union repose excludes any general power of
the state to standardize its children by forcing them to accept instruction from public
teachers only.” (Pierce v. Society, 1925).

Thus by officially recognizing the validity of a private religious education to fulfill the mandatory school attendance laws sweeping the nation during this era, the Court opened the way to the development of what later became known as the “child benefit” doctrine paving the way for the subsequent undermining of the “Wall of Separation” between church and state embodied in the First Amendment establishment clause. Under this doctrine first enunciated five years later in Cochran v. Louisiana State Board of Education, (1930), the Court ruled that a state plan to provide textbooks to parochial school students does not violate the Fourteenth Amendment. Though the Court in this case was not asked to determine whether the First Amendment was violated, the decision set the stage for a subsequent decision, ten years later in Cantwell v. Connecticut, (1940), in which the Court decided that the religious liberties of the First Amendment not only provide protection against actions by the Congress, but also, when applied through the Fourteenth Amendment, protect the individual from arbitrary acts of the states as well. Thus in Cochran the Court first identified its “child benefit” doctrine reasoning that the state of Louisiana public textbook funds were expended for the benefit of the individual child and not for religious purposes and were therefore not in violation of the First Amendment establishment prohibition. Subsequent decisions in Everson v. Board of Education, (1947), determined the establishment clause does not prohibit spending tax funds to pay bus fares for parochial school students in New Jersey, (30 states currently provide such aid in a variety of ways) and in Zorach v. Clauson, (1952) the Court found constitutional the New York practice permitting release time for
public school students to attend religious classes off public school grounds. These cases are examples of the application of the “child benefit” doctrine to further break down separation and the establishment prohibition with regard to financial support of private parochial schools with public tax monies. These decisions and the times in which they were decided were a time in American school life and law when religion was a very central and important part of the lives of most Americans whether Catholic or Protestant in their beliefs with only a few relatively small other non-Christian faiths represented in the population. In today’s larger and more secular, multi-cultural population these decisions might have been different, even with a conservative majority on the court.

By contrast in another dimension of the religious debate in our public schools however, the introduction of prayer into the daily activities of the school house, the Court has consistently upheld the anti establishment prohibition of the First Amendment. Beginning with its shocking to the general public 1962 decision to banish the New York regents “neutral” prayer from schools, Engle v. Vitale (1962), immediately followed by the combined rulings in School District of Abington Township v. Schempp and Murray v. Curlett, (1963), striking down Bible passage reading in schools, an uproar in popular culture ensued resulting in the call for impeachment of then Chief Justice Earl Warren. In the decades that followed the Court in turn struck down the practice of posting the Ten Commandments in schools, Stone v. Graham (1980), moments of prayer disguised as “moments of silence” in Wallace v. Jaffree (1985), and prayer at graduation exercises in Lee v. Weisman (1992). Each of these rulings represent a Court resisting on the one hand the religious right’s wish to inject religion into the schools in the form of state sponsored prayer while at the same time on the other hand permitting public financing of various
religious initiatives up to and including those of the Bush Administration “Republican Right” favored “faith based” initiatives carried on by the current Obama Administration’s council of 25 ministers appointed to oversee the expenditure of public funds for support of presumably “Democratic Left” favored religious initiatives. While these seemingly conflicting positions taken by the court may be a reflection of increasing ambivalence toward religion in the American life generally, they certainly have created a culture of confusion with regard to the issue of free exercise of religion for individuals versus state religious establishment prohibitions in public schools.

Perhaps the most definitive ruling supporting public finance of private parochial education to date came in 2002 when in Zelman v. Simmons-Harris, the U.S. Supreme Court ruled that Ohio Pilot Scholarship Program, a voucher program, did not violate the Establishment Clause since the tuition was distributed to parents who in turn convey the funds to the school of their choice stating in the summary of their decision: “This Court’s jurisprudence makes clear that a government aid program is not readily subject to challenge under the Establishment Clause if it is neutral with respect to religion and provides assistance directly to a broad class of citizens who, in turn, direct government aid to religious schools wholly as a result of their own genuine and independent private choice…Under such a program, government aid reaches religious institutions only by way of the deliberate choices of numerous individual recipients,” (Zelman, 2002).

Since this decision in 2002 much has happened to influence religious fervor in the U.S. as in the rest of the world with the U.S. invasion of Iraq, the economic collapse of 2008 and continued struggle of American schools to reform and meet national standards. Forty-eight of fifty states have recently committed to development of such national
standards, leading to the inevitable national curriculum that may in turn result in an increasingly conservative Court’s support for the further breakdown in the Wall of Separation for religion in schools to parallel the wholesale transfer of public tax monies to private parochial education noted in the cases decided under the “child benefit doctrine” cited above. It only remains to be seen how much longer the Court can or will resist right wing political pressure to bring God back into schools in the form of Bible reading, Ten Commandment posting, prayer at graduation and other actions urged by the powerful Christian Right in American politics.

In fact what we are quietly and gradually experiencing is a paradigm shift toward redefinition of the meaning of the public/private school concept in America. Just as segregation of the races in schools during the pre Brown v. Board era perpetuated a dual system of education, economic and religious segregation through dual taxation and vouchers is currently occurring by extension of the child benefit doctrine into 21st century schools. Combination of church and state may become an evolutionary consequence of the intersection of a failed property tax support system and popular support for prayer in schools in a time of economic crisis which also may then inevitably lead to systemic restructuring of school finance with choice as the carrot to soften the stick of increased taxation to support both private sectarian, through vouchers, and public non-sectarian schools.

Also, an increasingly conservative majority, sectarian influenced Supreme Court, (6 of 9 present justices are Catholic, with Judge Sotomayor’s ‘09 confirmation) may create a new bifurcated secular/non-secular system of private/public schools, both supported by the American taxpayer. One secular, urban, poor, under resourced and
failing its urban student population and the other suburban/rural, church affiliated and supplemented by both tuition paying church members and taxpayers providing superior parochial education via these enhanced resources with no pretense of church-state separation. This “sectarian public” model currently exists wherever popular voucher programs, (Cleveland, Milwaukee, Washington D.C.) provide an escape alternative from failing urban factory model public schools. This evolutionary church/state recombination may ultimately lead us “back to the future” of educational theocracy in schools, not unlike the colonial era in America, unless the U.S. Supreme Court moves to re establish the eroding separation of church and state constitutionally designed by our nation’s founders as the cornerstone of our American form of democracy.

Just as the twin central issues in American life, race and religion, remain the elephants in the proverbial 21st century American constitutional living room, they loom equally as unresolved issues in schools. The race issue, definitively addressed in Brown v. Board, despite five decades of implementation, has resulted in de facto resegregation of schools as a result of judicial retrenchment. Religion, which has remained a powerful force in American life from colonial times to date, also may re emerge as a central force in 21st century American schools as the result of school privatization through vouchers and similar judicial retrenchment on religion in schools disguised as the child benefit doctrine. Thus confusion with regard to religion continues in schools as the wall of separation alternately rises and falls in the face of an increasingly conservative court and the redefinition of public school to conform to the prayerful will of the radical religious right faction of Americans who fervently wish to find a new accommodation between church and state in public schools.
Conclusion

Like many Americans, I attempt to live each day in humility and gratitude for the blessings God has granted me. However, while I have nothing but gratitude and reverence for these blessings God has brought to this American life the last place I want to experience God’s presence is in a state endorsed prayer in a public school. As to whether or not God belongs in the public school, I say yes, but only in individual hearts and minds left totally free of government coercion.

Of Jazz and Possibility: Student Empowerment in the Music Classroom

Erin Rivero, M.A. | erinrivero@gmail.com
Chapman University (Orange, California)

Abstract

This practitioner-based case study evolves from an educational research practice of qualitative, action research. The research question is "In a high school jazz ensemble, what are the effects of beginning to develop student ownership in learning?” The study’s theoretical foundations draw largely from Freire, Greene, Kumashiro, and Zander. Systematic cycles of data collection and analysis include the following methods: reflective journal entries, observational field notes, student assignments, student and parent surveys, frequency charts, photography, audio and video recordings, and frequent analyses of data by reviewing individual data sets as well as findings across sets. The author identifies codes, patterns, and themes, and makes use of constant comparison analysis and triangulation to identify necessary interventions and support conclusions. These interventions consist of opportunities for student-led rehearsal, student-led inquiry, and expression of student voice. The conclusions regarding the question are I) students given space to own learning may experience a healthy crisis; this crisis, given time, may lead students from a place of stalemate to a position of breakthrough and possibility; II) students given space to own learning demonstrate intellectual curiosity and critical thinking; III) students given space to own learning experience enhanced musicianship as a result of pursuing the context of their musical works; and IV) students given space to own learning experience existential freedom as a result of identifying problems and implementing change.

Abstract

The research question posed for this review is: which teaching behaviors and supports most enable students to achieve in urban schools? First, there will be a summary of the two key issues of working with students in urban school settings. Next, the authors will explore studies on the most effective teaching strategies to combat those issues and detail teacher supports that increase achievement of students in urban schools. The authors conclude with several key findings: there is an inextricable link between teachers’ instructional effectiveness and the emotional environment of the classroom; effective urban teachers displayed some common characteristics; the most effective schools implemented these common characteristics systemically; and these teaching behaviors and teaching supports must be implemented with fidelity.
The Importance of Ethics Training for Principals, Superintendents and School Boards

This is a Workshop Proposal
Topic Area: Educational Leadership
Key Words: Ethics, Board ethics training

Abstract:
The provisions of NCLB requiring that all schools meet standards for adequate yearly progress (AYP) have presented serious challenges to many schools and districts as they seek solutions to existing student performance gaps. In addition, recent instances of unethical practices and isolated cases of cheating by some educators have raised significant ethical issues for the profession. Yet recent research has shown an encouraging and significant linkage between the ethics training of principals and student performance on state assessments that support the case for intensified training in professional ethics by districts and educator preparation programs. (Hughes & Jones 2010). Additionally, districts may find that increased levels of professional ethics training for district leadership teams and board members is helpful in building organizational health and stronger levels of commitment and integrity in district practices.

Abstract

Many Taiwanese scholars and parents have concerned about whether the partial English immersion programs (EIPs) could affect the children’s Chinese and English communicative ability. This study investigates whether the partial English immersion programs could affect the children’s Chinese communicative ability and the partial English immersion programs are really helpful for children’s English communicative ability. This study uses qualitative methods which apply the participants an interview and questionnaire to explore these matters.

Key words: language immersion programs, TESOL, EFL, kindergarten, bilingual education
INTRODUCTION

Kindergarten partial English immersion programs (EIPs) have become popular for preschool children to learn English in Taiwan. Partial English immersion programs are considered good programs to learn English because of its “no Chinese-speaking” policy instead of some subjects, such as Chinese language class, art and physical education. The rationale is based on the belief that students can learn a second language by using it to communicate. Y. - L. Chen (2002) investigated that the children who study in English immersion programs could use hybrid language in their oral and written texts. Besides, I. – S. J. Chen (2006) also claimed that it is possible to carry out English literacy teaching in preschools. Although the studies showed that the children who learn two languages at same time are slower in the growth of language development than the children who just learn one language normally. Children don’t have the confusion of mixing up languages (Brown, 2000).

However, for most of preschool children, their communicative ability has not developed completely. Recently, many Taiwanese scholars and parents have concerned about whether the partial EIPs could affect the children’s mother tongue (Chinese) learning and English language learning in conversation field, such as pronunciation, vocabulary used and sentence structure (林佩蓉, 2006; Y. - L. Chen, 2002). Therefore, the purpose of the study is to investigate whether the partial English immersion programs could affect the children’s conversation in Chinese and English
Research Questions

In Taiwan, partial English immersion programs raise parents and scholars’ concerns recently. The research aims to investigate the influence of partial English immersion programs (EIPs), such as:

1. Does kindergarten partial English immersion programs (EIPs) have any effect on children’s Chinese communicative ability?

2. Does kindergarten partial English immersion programs (EIPs) really help children to learn English well?

LITERATURE REVIEW

2.1 The Theory of Bilingualism

Bilingual education originated from America, which stands for the education which teaches in two languages in general way. In order to promote amounts of immigrants who came to America to get into the society easily, bilingual education became the one of most important measures for them. In most cases, bilingual education should not only teach two languages, but also consider two languages as the appropriate medium which build the learners' whole academic knowledge, the usage of two languages and the meaning of two cultures. English immersion programs (EIPs)
can have different types, such as transitional model, maintenance model, pluralistic model and immersion model (Trueba, 1979). Besides, Brown (2000) showed that the children who learn two languages at the same time are slower than the children who just learn one language normally in the growth of language development. But they don’t have the confusion of mixing up language.

2.2 The Positive Aspects of Previous Studies

I. -S. J. Chen (2006) investigated that certain instruction strategies can help the children to extend the use of English. They can demonstrate a high level of English literacy neither in traditional literacy nor in digital literacy. To sum up, it is possible to carry out English literacy teaching in preschools. Some researchers consider that the children can learn English language well though external ways. Fassler (1998) stated that children who came from different language backgrounds can help each other to use English in informal contexts. Besides, Li (2006) stated that it has some relation between scientific concepts and English language learning for public elementary and secondary schools in Qingdao City.

2.3 The Opposite Aspects of Previous Studies

However, there are several the opposite views of the problems. First, although Y. -L. Chen (2002) investigated that the children in English immersion programs they
could use hybrid language in their oral and written texts and her study also revealed that most of children who study in EIPs don’t have negative attitudes toward language one (L1) and culture one (C1). However, some cases conducted by Chen (2002) developed negative attitudes toward either L1 and C1 or language two (L2) and culture two (C2). Secondly, Fillmore (1991) stated that L1 which children learned from their families in early age influences English language development, especially for immigrants and American Indian families. Thirdly, Hsieh (2006) claimed that learning English language in preschool age reveals some equivocal issues, such as power, system, instruction and quality in Taiwan. Finally, 林佩蓉 (2006) investigated that children can only learn English easier when they have mature development of Chinese. Besides, English programs in preschools should be orientated towards Foreign Language Exploratory Program. And she also provided several useful ways to teach English in kindergarten. In conclusion, teachers could play and study English with children in order to let them learn English in natural situation.
METHODOLOGY

3.1 Participants

The research use the cross-sectional approach which is required two groups as participants. The first group is required three 6-7 aged preschool students in kindergarten partial English immersion programs to investigate whether the programs have any effect on children’s Chinese conversation and English conversation. And the second group is required three 7-8 aged elementary students who have studied in kindergarten partial English immersion programs are also required in the research to compare with the previous group. In order to identify the participants, the research also use snowball sampling to gain the students’ further information by students’ parents and teachers.

3.2 Treatment

6-7 aged preschool students are provided for the story of English and Chinese version which called “Party Fun” by listening to the C.D. The researcher applies the story C.D of English and Chinese version which called “One Pizza, One Penny” to 7-8 aged elementary students.
3.3 Instruments/Materials

3.3.1 Individual Interview

The research design of an individual interview (Appendix 1) in both Chinese and English mixed with every student to discover something about the individual’s perceptions of the story and feelings about the story of Chinese and English version. From the individual interview, children’s communicative ability can be found more easily.

3.3.2 Questionnaire

After the students’ individual interview, the researcher apply the questionnaire (Appendix 2) to their parents and teachers, which is included several open-ended questions in Chinese to gain further information about the students’ Chinese and English conversation using. Besides, the questionnaire will be collected by the researcher within three days.

3.4 Procedure

In the beginning of the research, the researcher may use random sampling to select the groups of participants. Then, the researcher asks the students to listen to the story C.D for 10 minutes. After listening to the C.D, every student should have an
individual interview with the researcher by orally answering several questions in Chinese and English in 10 minutes.

Moreover, the students’ parents and teachers are provided for the questionnaire which is about several open-ended questions to describe their children’s English and Chinese conversation using at home or in the class.

3.5 Data Analysis

The research uses discourse analysis to gain the information from the interviewing. During the individual interview, the researcher would use the sound recorder to record the whole interviewing. After the interviewing, the researcher analyses the meaningful data from the interviewing and the questionnaires from the participants’ parents. Finally, the data from two groups of participants would be compared by the researcher.

Besides, triangulation is used to describe the ways in which the reliability of the study can be assessed. Also, after the data analysis, the researcher would show the participants and their parents the findings to see the validity of the study.

Interview Questions

*以下的問題可以使用中文或英文回答：

1. 請將剛剛的故事簡單地用自己的話再說一遍。（Tell me the story in your words again.）

2. 說說看你聽完這個故事後的想法。（What do you think about this story? Do you think it is funny or sad? Why?）

3. 你覺得用英文說話或用中文說話哪個比較難？為什麼呢？

4. Do you like English or Chinese? 在上課的時候你習慣或喜歡用中文還是用英文說話呢？為什麼？

5. Do you understand what the teacher said in class? 老師上課用英文說話比較聽得懂還是用中文說比較聽得懂？為什麼？

6. 平常的時候你習慣或喜歡用中文還是用英文說話呢？為什麼？
台 湾 六-八 歲 幼 兒 中 英 文 會 話 使用 之 問 卷 調 查

1. 您的孩子(學生)平常使用英語與他人(例如爸媽、老師、同學)溝通狀況如何?
   請詳述之並舉例。

2. 您的孩子(學生)平常使用中文與他人(例如爸媽、老師、同學)溝通狀況如何?
   請詳述之並舉例。

3. 您的孩子(學生)在溝通上是否有中英語詞彙混用的情形發生?請具體說明之。

4. 您的孩子(學生)是否曾因無法使用單一語言表達自我想法而造成溝通上的障礙?
   請簡述當時狀況(如地點、時間、對象)。

5. 請簡述您對孩子使用中英文會話溝通的想法與態度。

感謝您的配合與合作！
Within music instruction in America’s schools, assessment of students’ musical understanding, progress of skills, and development of appreciation is an ongoing process. Throughout the 20th century, music programs in American schools have demonstrated strength in the quality development of performance skills, technical proficiency, and performance experiences. Curriculum documents traditionally exhibit learning objectives focused on performance skill development, which are often assessed subjectively by the instructor. When asked for evidence of music learning, music teachers turn to the attendance record, the sound of the concert, the variety and range of music presented, or the frequency with which students perform. Although motivation that leads to attendance and technical skill development are important elements of successful performance experiences, many other assessment have been implemented in school music programs that can provide opportunities to observe students’ music learning in a broader context that can focus on higher order thinking skills, such as musical understanding, creative listening skills, and aesthetic sensitivity.

Assessments have been used in schools across America as a means to understand what and how students learn music. Self and group assessments strategies, similar to ideas promoted in Arts PROPEL (Davidson, et al., 1992), includes students critically listening to their performance,
describing aural observations and make decisions for self-improvement (Burrack, 2002). The instructor provides immediate feedback concerning the quality of the performance as it relates to each category, guiding appropriate context of the student’s comments, and offering suggestions on how to improve the students’ self-assessment abilities. Improvement goals are set by the student and enhanced by the teacher through discussion. Many schools use MSWord notebook, mp3 recorders, and similar technologies to facilitate the self-assessment process. Self-assessments are maintained by each student in individual electronic portfolios. Periodically assessments are reviewed for reflection of goals and to strive for more advanced levels of learning.

Another assessment for developing sensitivity in listening skills, awareness of musical concepts, and improvement in assessment skills is referred to as the Group Assessment. Scattered throughout rehearsals over the weeks of preparation for concerts or contests, students listen to recorded segments of rehearsals for specific elements of tone quality, intonation, rhythm, balance and blend, performance techniques, and musical interpretation. They write at least one specific observation in each category on the assessment sheet, immediately followed with discussion and rehearsal application. When the students verbally offer their suggestions for improvement and immediately apply these suggestions by performing the selection, they gain independence and self direction in the learning process and exhibit an enhanced performance quality.

Too often we teach the students to perform at the neglect of true musical understanding. Each piece in our performance classes includes unique opportunities to teach the musical elements through which understanding of the music can be nurtured. Technology is an effective tool to bring cultural and historical understanding to musical compositions and provide unique ways of teaching that make learning available that is not attainable through traditional methods. Video and .jpg images can be found on the web that allows authentic examples into the classroom. Using video projection musical elements that are inherent in the music can be reinforced and assessed. Strategies using visual projection will be shared.

American teachers use many computer-based tools to create assessments to assess cognitive knowledge of musical terminology, rhythmic understanding, historical information, and other assessable content. Sometimes assessments are presented in an enjoyable format as a crossword puzzle or word search. These are very easy to create using free internet based software.
Many American music programs use new technologies to help students learn individual performance skills outside of the rehearsal. They create an accompaniment track and overlay the part with which the students practice. These are often posted as an mp3 on websites for the students to download on their computer, flashdrive, or iPod. Examples of web-based strategies from elementary to collegiate levels will be provided.

Today’s technology makes it easy to not only capture rehearsals and concerts in audio and video. Making available portions of rehearsals with which students can rehearse, assess, and set improvement goals expands assessment possibilities. Students assess and respond to rehearsal samples via email. This is a way teachers can document musical learning and improve student performance beyond the confines of the rehearsal room. This is particularly useful for ensembles that include strong visual elements, such as swing choir or marching band.

An emerging technology only recently found as useful in American music programs is video conferencing. Schools are beginning to offer in-class mentoring for new teachers, provide students with specialized instruction on not normally available, and allow students the opportunity to learn from professional musicians from around the world without leaving their classroom. We are successfully using this technology for private music lessons with notable teachers. The studio setting may involve professional mentors in student instruction and assessment. Conductors provide ensemble clinics from distance venues using video conference. It is an effective way to share student performances and compositions between schools without the time and expense of travel, enabling critical thinking skills in music beyond what was formerly possible.

An effective learning environment can be established through assessments, offering the opportunity for students to develop an awareness of the music which was initially inaccessible. Many students are not aware of many technical and expressive aspects until they listen and evaluate specific elements. An enhanced awareness presents the students with the opportunity to construct meaning of particular occurrences and, through further rehearsal, apply the isolated observations to the musical whole. These individual constructions exist in an interactive relationship of the student, their prior knowledge, and the assessment experience. Musical concepts are developed and refined within the assessment context developing a new and broader understanding of the relationship to the musical whole.

Can parents count on providers of the Supplemental Educational Services?

Can parents count on providers of the Supplemental Educational Services?

Introduction
The No Child Left Behind of 2001 (NCLB) is marking an epoch in reforming school regardless of its accomplishment. There are varied strategies to enhance school quality, but the Supplemental Educational Services (SES) must be a challenge of narrowing the achievement gap and improving students’ performance beyond a site of school. According to NCLB, a local educational agency shall provide the opportunity of SES for students who enroll in Title I schools that failed to satisfy the Adequate Yearly Progress (AYP) for two consecutive years. Due to a relatively short history of the debate on supplemental education compared with the public school choice provisions noted in NCLB, there is little information about SES of NCLB. Furthermore, the existing studies have focused on how many students have had the benefit of SES and how much students’ achievement have been improved by SES. Yet, whether or not academic performance increases through SES depends on the quality of providers in essence. Though public money of states and districts is used in private, especially for-profit providers, most scholars have overlooked how states approve, monitor and evaluate SES providers in order to control quality of providers and provide better services for students. In this context, my research question is how states hold accountable for providers’ quality of the supplemental educational services.

Supplemental Educational Services in the United States
In the United States, supplemental education—including after-school programs, out-of-school-time tutoring programs, and summer school programs—has long been in operation (Heinrich, Meyer, & Whitten, 2009). Despite a long history of after-school programs and summer schools, these programs have put interest in intervention in children development, not in supplemental tutoring for academic achievement. Almost for the first time, Title I funds of the Elementary and Secondary Education Act of 1965, which was initiated to supplement low-income students’ educational opportunity at the federal level, have been used for improving students’ academic performance.

Leaving the government’s effort of the Title I funds focusing on low-income students who are at risk for academic failure aside, for-profit tutoring companies as one type of markets for supplemental education have emerged since in the 1980s. Yet, markets for supplemental education should be understood in a different way. Contrary to the Title I fund targeting at low-income students, the markets for supplemental education is created and operated by the class who can afford to pay additional tuition fee. Such users in markets for supplemental education have participated in supplemental education with different reasons and in different levels (Lauer et al., 2006). As McDonough (1994) described that a history of private tutoring in the US resulted from college choice industry, for-profit industries like “Kaplan Test Prep and Admission” and “The Princeton Review” have been growing with the purpose of test preparation such as SAT and ACT. Along with this, “Sylvan Learning Center” established in Oregon in 1979 and “Kumon” known as an international tutoring company in Japan are becoming one of popular supplemental tutoring services. Namely, supplemental educational services vary in duration, in target, in content and in objective.

Compared to the past that the governments’ interest and support of supplemental education had initially remained little and indirect, NCLB made it possible that the federal and state governments can be concern in the markets for supplemental education. According to NCLB, if a school entitled to Title I school fails to satisfy AYP for consecutive years, federal and state governments should provide students in the school with alternatives of either public school choice or supplemental education service. The notion that the government should be responsible for students with a poor record of academic performance and have a duty to raise test scores underlies the supplemental educational services of NCLB.

Basically, the supplemental educational services include existing after-school programs and other tutoring programs, and at the same time, focus more on academics. The difference from the public school choice programs of NCLB is in using real markets outside the US public education system. With the supplemental educational services of NCLB, parents choose one or more courses among state-approved supplemental tutoring corporations, governments pay selected corporations tuition, and tutors provide programs for students instead of teachers in failing schools. Unlike the past that the government seldom had interest in tutoring markets, they are now trying to build a cooperative relation. Of course, this governmental effort can contribute to more franchised and commercialized industry beyond growing in number (Ascher, 2006).
Previous research on SES

Despite the criticism that SES is “mini vouchers” (Hess & Finn, 2004, p. 290), disadvantaged students are likely to prefer SES to the public school choice programs of NCLB (U.S. Department of Education [USDOE], 2009). According to USDOE (2009), 17 percent of eligible students for SES actually participated in SES in the 2006-07 school year, and $ 375 million was used for SES in the 2005-06 school year. 88 percent of state-approved providers are private providers, and 76 percent of students participating in SES are served by private providers (USDOE, 2009). The more interesting fact is shown in the comparison with other private supplemental tutoring services, not with SES by federal and state governments. While 27 percent of students enrolling in eligible schools for SES paid for other private tutoring services, 67 percent of students in other public schools, not eligible for SES, used supplemental tutoring services by private corporations (Warkentien & Grady, 2009). These statistics show that despite the governments’ effort for equal and better opportunity, there must be still a gap in interest and participation rate in supplemental educational services.

Some of the recent research on SES analyzed the effectiveness of SES in terms of academic achievement. Unfortunately, the results are mixed. According to Zimmer, Christina, Hamilton and Prine (2006), rather than in reading, students signing up SES substantially outperformed in mathematics. The Chicago Public Schools found that students who participated in SES recorded small but significant gains in reading when comparing with non-participants in the same schools (Office of Research, Evaluation, and Accountability Office of Extended Learning Opportunity, 2007). This improvement was shown more remarkably in the lower grades. Similar to this, Springer, Peeper and Ghosh-Dastidar (2009) found there was a significant improvement in mathematics under SES. In contrast, the Heinrich, Meyer and Whitten study in 2009 demonstrated the different findings as a result examining the impact of attending SES on reading and math scores. They found that students in Wisconsin failed to show some significant achievement gains. In the case of Kentucky, Muñoz, Potter and Ross (2008) stated that their findings did not support the expectation of NCLB that academic tutoring services would improve student achievement. In reading and mathematics, SES participants resulted in non-significant gains. Ross and et al. (2008) also indicated that contrary to parents and teachers’ positive perception, the impacts of supplemental educational services were close to zero.

As summarizing previous studies about SES, most researchers’ interests have been limited to who participated and what students gained (USDOE, 2009; Warkentien & Grady, 2009; Zimmer, Christina, Hamilton, & Prine, 2006). Nevertheless, the impact of government-sponsored tutoring services remains as an inconclusive ending. Because SES under NCLB is a relatively new type of educational policy, it is true that in-depth studies are working (Burch, Steinberg, & Donovan, 2007). The limitation such as research subjects, controlled variables and statistical techniques makes the effectiveness of supplemental educational services hard to evaluate. Furthermore, few studies took the approach of accountability to markets for supplemental education (Association of Community Organizations for Reform Now & American Institute for Social Justice, 2004; Burch, Steinberg, & Donovan, 2007; Center on Education Policy, 2006). Due to the policy structure of SES that a parent chooses and a government pays, accountability with regard to the use of public money for private tutoring corporations matters. For governments, two rising issues are of how to find qualified providers and how to control the quality of programs.

Method and data

To investigate two aforementioned questions, I looked at administrative codes, regulations and policy guidance concerning supplemental educational service providers at the state level. According to the No Child Left Behind of 2001, because states shall approve highly qualified providers, regulation and policy at the state level can be the first indicator of examining how a state control providers’ quality before districts contract with providers. States’ regulation codes are analyzed at three stages: an approving stage, a monitoring stage, and a terminating stage. This study is focusing on the cases of three states, California (5 CCR 13075, 2010), Illinois (23 Ill. Adm. Code 675, 2010) and New York (8 NYCRR § 120.4, 2010). In view of the fact that SES utilizes the existing markets for supplemental education services, the quality of SES provided for students, to some extent, depends on how much abundant market is already established and run. The Los Angeles Unified School District in California, the Chicago Public Schools in Illinois, and New York City in New York are one of the largest urban cities in the United States. Also, since these cities have a high proportion of Title I eligible schools, more expected eligible students for SES can need supplemental education, and the state governments need to prepare for appropriate services.

Preliminary findings
Under to NCLB, the supplemental educational services are basically operated by the federal government’s guidelines (USDOE, 2009). It is difficult to find the explicit difference among states. Yet, a large part of the role and responsibility concerning policy implementation is under the state’s authority. Hence, characteristics such as demographic and political context by state can affect detailed regulatory and statutory languages to operate the supplemental educational services.

At the first stage of approval, three states are limited to eligible applicants for supplemental educational service providers in different ways. As shown in Table 1, all of states selected for this study permit a local educational agency to be an eligible applicant for the supplemental educational services. Instead, New York and California confine a local educational agency and a school to one that is not identified for improvement, corrective actions or restructuring under NCLB. Illinois restrictively allows a school district or school identified for improvement to be an eligible applicant. Contrary to California and Illinois where institutions of higher education can enter markets of supplemental educational services, New York does not include them.

Different public education systems by state determine who reviews an application and approves a proper provider of the supplemental educational services. One thing interesting is that these different approvers in three states apply the similar standard of approval to screening providers. Of standards for approving providers, the most representative criteria is to demonstrate record in order to prove the effectiveness of providers. Since the supplemental educational services of NCLB basically aim at improving students’ proficiency of English and mathematics, the first condition to be a service provider is in showing how much participants can get benefit from this service. Despite the importance of demonstrating a provider’s record, the regulatory languages are quite ambiguous. In the case of New York, it does not mention what record providers should provide with the state governments and what kind of test will be used for this. Illinois and California include test scores in record of effectiveness, but California especially considers teachers’ evaluation on student improvement through service as one critical factor. Also, Illinois noted the ratio of tutors to students and qualification of tutors in the approving stage unlike California and New York. Except these, all of three states require letters of reference for selecting appropriate providers, insurance for liability, and fiscal condition in common.

After the state’s approval, a process of monitoring selected providers plays a significantly important role in assuring the quality of the supplemental educational services. California and Illinois state the requirement of a mid-term report, whereas New York does not mention it specifically. This process is connected with the term of approval noted in Table 2. As California confines the approval period up to two years, the information of this process is close to a general regular report. However, in Illinois where there is not a mentioned term of approval, required elements of annual reporting are used for grading each provider. For this reason, rather than any other states, Illinois shows how to calculate the effect size of supplemental educational services, its regulation has evaluation rubrics and decision matrix.

Based on the monitoring process, three states selected for this study noted the rationale of terminating the approval in their regulations and administrative codes. Though the way to describe the cause of termination varies by state, the common reason for termination is to fail to contribute to test scores.

Discussion and conclusion

Basically, the initial purpose of this study is not to blame a certain type of languages presented in regulatory codes. It is obvious that the supplemental educational services are implemented at the federal government, but it is also true that the success or failure of the supplemental educational services depends on how much they are locally initiated. Because of different perspective on privatization of public education, it is impossible to determine which state is doing well. For this reason, this study is significant enough in focusing on how states put their efforts to winnow providers with high quality out of inappropriate providers.

The findings can be summarized in some major implications. First, an applicant limitation implies two conflicting possibilities. It can hinder and help the emergence of supplemental educational service providers. According to how much the potential provider pool is open to the existing markets for supplemental education, the probability that students as consumers and states as payers and approvers can be satisfied with the policy can change. Of course, the openness of market cannot guarantee the high quality of service. However, considering that NCLB has a premise emphasizing the improvement of public education through competitiveness, a range of eligible applicants play a significant role in raising test scores.

The second is the qualification for instruction and instructor. Schools are generally run by related codes and policies of how to select qualified teachers and what to be taught at the state or national level. However, the supplemental educational services do not. As noted above, three states do not mention the minimum qualification of tutor. Also, instruction in the selected states’ regulations pays attention more to outcome than to process. Because the actual policy implementation relied on the existing markets for supplemental education outside of the public school system in a large part, eligible students for the supplemental educational services should choose a service based on insufficient information. It means that parents and students can take in not-qualified or inefficient supplemental educational services for the reason of obscure regulatory languages.

If focusing more on the process of policy implementation than on the relation between the federal, state and local governments, measuring outcomes by qualitative tools, rewarding or sanctioning based on the results, and providing alternative opportunity for students assumed as consumers are grounded on privatization of the Neo-liberalism. Under NCLB, all of the US public schools are evaluated by test scores, and students attending so called failed schools can choose another school and take part in the supplemental educational services. Still, compared to the public schools applied strict standards by the governments and public, providers in the markets for supplemental education are not regarded as a subject of evaluation. Looking at the regulations of the supplemental educational services in NCLB, how to measure the effectiveness is still questionable in assuring of own outcomes of the policy. In other words, without stating providers’ quality, the policy is playing a role in heading private market toward public education. As Dannin (2006) indicated, the notion to solve the problem of
public education through market can result in publicization of market for supplemental education as well as privatization of public education. A remaining dilemma is that the state government is required to take responsibility for assuring the minimum quality of services insomuch as public money flows in market. Frankly, we are standing at the crossroads of potential and peril.

Rejection, resilience, renaissance: My 3 Rs for reviving leadership talents

"Success is the ability to go from failure to failure without losing your enthusiasm."
~ Sir Winston Churchill

“If you’re going through hell, keep going!”
~ Also Sir Winston Churchill

It has been a little more than two years since I last participated in an academic search firm’s project to hire a new Provost, and it was at a small, religious, liberal arts college in the northeast. Years prior to that experience, I had made the definitive and determined decision to enter the frenetic and grueling world of administrative searches in higher education to seek and attain a VPAA/Provost position. We have all at some point in our lives heard the phrase “everything happens for a reason.” However, I heard it far too many times throughout what eventually became a four-year journey of myriad searches, and it fully lost its ability to be consolatory in the face of rejection. Subsequently, it took many months for the deep wounds of rejection to heal. During that period of convalescence, I developed various ideas for this essay, while working diligently to revive various leadership talents I actually thought I possessed, but had seriously begun to question.

All of us, at one time or another, have experienced failure in the form of loss, futility, lack of common sense, or even naiveté. For me, one of the more difficult forms of failure to deal with comes with rejection, which is the first “R.” As a young girl...
growing up, I constantly found myself among those who were labeled the LOPs --- does anyone remember what that label meant?? It refers, of course, to being among the “last ones picked” – for kickball, softball, cheerleading, tug-of-war, spelling bee teams, whatever. The whole process of team selection was horrifying for me. Apparently, having “Markert” on your team was the kiss of death!! When you experience rejection, you might feel like:

Your ideas have not been accepted,  
You are not good enough to be on the team,  
Your opinions are not valued,  
Your proposal lacks what is required to merit funding,  
Your credentials are not well respected,  
Your affection or love is not being returned to you, or  
People simply do not like you!!

And so forth. . . .

Dealing with rejection in higher education might mean that your sabbatical proposal was denied, or your bid for promotion was not approved, or that the final chapter of your dissertation was found to be unacceptable, or your grant application was not funded, and so forth. In the face of these rejections, we might find ourselves reaching out to friends and colleagues for support, and I guarantee that one or more of them will tell you that “everything happens for a reason.” Career consulting experts who write about dealing with rejection and failure tell us to remind ourselves that “it’s a numbers game” and that we all need to encounter a certain amount of failures before reaching success in the job search. What they don’t tell us is – how many failures we should endure before ending the quest?

Here are some hugely depressing numbers that chronicle my Provost search experiences in several states across the country, and they seem to defy this sage career advice: 71 individual applications prepared and processed; 32 telephone interviews, both with search firm consultants and search committees; 23 neutral site (airport) interviews concluded; and 17 multi-day finalist interviews completed on college campuses. I received some of the 60-odd rejection notices via snail mail letters, while other curt messages arrived in my electronic mail inbox. An analysis of the content of these letters is another study unto itself, and a number of IHEs never even contacted me. On more than one occasion, a verbal pronouncement of rejection came over a cellular telephone call, received while en route to another finalist or semi-finalist interview. You can imagine the impact of that inopportune news on one’s self-esteem and confidence, especially while driving to a new campus, or running through an airport to make a quick connection.

Regardless, I remained determined to devote all efforts to being resilient despite repeated rejections. And, for each of the above applications – countless essays were written, a dozen search firm questionnaires were completed, formal PowerPoint
presentations were developed and delivered, and an endless series of demanding interview sessions were endured. Over the course of the process, I met one-on-one with at least twenty different college/university presidents, and interacted with faculty/staff union representatives, student leaders, and boards of trustees. For many of the finalist interviews, from what I have been able to discern, I finished second or third, marginally behind individuals who: were already VPAAs and thus making a lateral move; had previous experience at a similar IHE; possessed more impressive academic credentials; or were fortunate to be the institution’s internal candidate. In a few cases, the campus officers decided to suspend their search and retain the interim candidate for another year. Each time my colleagues calmly assured me that the rejection had probably happened for a very good reason.

**Resilience** or resiliency, my second “R,” generally means that one is able to bounce back, cope with disappointment, renew enthusiasm, and revitalize in the face of difficult challenges. In materials science & engineering, **resilience** refers to the property of a substance that enables it to resume its original shape or position after it has been bent, stretched or compressed – in this context, it is somewhat synonymous with elasticity. Those of us who are somehow able (perhaps magically) to be elastic, and accept a series of setbacks and adverse conditions as opportunities for growth, exemplify resilience. When it became apparent that my earnest efforts were not going to reap a vice president level administrative post, I found myself constantly questioning my own leadership abilities as dean. My resilience was jeopardized each time I failed to land the position at XYZ IHE – that place where all of the interviews had seemingly gone very well, personalities had meshed, and my capabilities seemed to align perfectly with the needs of the academic affairs division of the institution.

Closing the door on the search process was a huge positive step (albeit very demoralizing), and it forced me to stop dwelling on the rejections, and focus on resilience. Taking the necessary steps to acknowledge each and every one of my professional references, for their undying support and constant encouragement, was an intensely cathartic exercise. Following these essential correspondences, I spent the next year and a half directing energies toward creating a renaissance within a position I had held for more than a decade. Quite simply, **renaissance** as the third “R,” means a type of rebirth or revival. The term “renaissance person” generally refers to an individual who has diverse interests and expertise in a number of areas. I like to believe that as each one of us continues to grow and evolve as administrators, teachers and scholars – we are catalysts for recurring renaissance periods, both for ourselves and for those with whom we spend our time.

My decision to seek a VPAA/Provost appointment was never based on a lack of joy and satisfaction within my current decanal position – I simply felt a calling to help shape institutional direction, vision and culture at a higher administrative level in a new leadership environment. Fortunately, leadership resiliency is further enhanced when one has, like I do, an amazing group of colleagues to work with. These individuals enabled me to emerge unscathed after all of the failed searches, fully charged to act on the
courage of our convictions with optimism, to accomplish both short-term projects and long-term goals.

The most important aspect of resilience in leadership is being able to accept the “boundaries” of one’s current position and find inner resolve to expand and invigorate new initiatives within those “boundaries.” Stated differently – “If, for whatever reason, I was not meant to land an administrative appointment at the next level, let me figure out what it will take to breathe new life into my current position to move our unit forward with renewed energy, enthusiasm and conviction to remain alive and actively engaged. Both assertions spell a type of renaissance. Both also enable veteran administrators to revive their leadership talents, especially those who have spent five or more years in their appointments. They are also able to let faculty and staff members at their home institution know they are still growing, learning and improving as academic leaders, with new vitality to be an influential, contributing member of the campus community.

For all persons in leadership roles, the process of reflection is soulful and often lonely. Ultimately though, this reflection fuels the potential for renaissance which in turn kindles one’s resiliency quotient. Through much reflection and resolve during this past two years (which might represent my fourth and fifth Rs), I took on a variety of new assignments and challenges. Several specific fruits of this labor for the unit I lead at my institution include: 1. the establishment of a new revenue-generating Educational Leadership Institute, which only occurred after months of legal inquiries; 2. our acquisition of a competitive educational leadership enhancement grant funded through the Wallace Foundation, and I am one of the co-principal investigators; 3. complete restructuring and reconfiguration of the duties and responsibilities within the dean’s office; 4. this resulted in the appointment of both a new assistant dean for accreditation & assessment and a new associate dean, each of whom I am presently mentoring; and 5. creation of several new & unique collaborative partnerships with external agencies, each of which demand individual time, attention, and big picture perspectives. Many of my leadership talents were revived and revved up by virtue of these “boundary-stretching” initiatives. Concurrently, the renewal of leadership skills further enhanced this dean’s performance of all of the other day-to-day responsibilities of the job.

There is no simple recipe for being or becoming resilient, but much has been written about resilience strengths and various ways we might increase our leadership resiliency. My time spent perusing a portion of this literature essentially compelled me to write this essay. Perhaps the most salient snippet of advice I found is framed in the idea that persons who are inflexible are probably not resilient. I anticipate that readers, who may have experienced similar negative results through an arduous search process, will find new ways to revive the very leadership talents that initially motivated them to seek a higher level position. The following recipe (formula) is one I am playing around with at the moment, but ingredients will likely change as time goes on and newer flavors are introduced or discovered.

Rejection = the state of being dismissed or not considered....
Add Resilience = the ability to bounce back, cope, renew & revitalize....
Experience Renaissance = revival of intellectual or artistic talents & vigor....
Which Further Strengthens Resiliency & Ameliorates the Effects of Rejection, which =
A Cyclic and Evolving Path to Engaged & Rewarding Leadership!

Eventually, when people tell you that “you probably did not get THE XYZ
administrative position for a very good reason,” you will no longer regard the comment
as a feeble excuse for condolence. Conversely you will respond with enthusiasm – “why
of course – the entire process inspired me to revive my leadership talents and re-create
the job I am already doing quite well!” Institutions of higher education continue to
represent one of the strongest venues for optimism and hope in our contemporary world.
At all administrative levels, we need to be resilient leaders and renaissance men &
women to make sure our colleges and universities will always be places where young
adults can discover new joys about living in a global society.

ABSTRACT: Teacher Retention Through Clinical Faculty Training

Teacher attrition is a problem nationwide; it is estimated that 30-40% of teachers leave the profession within the first five years of teaching; a Tennessee study, for example, reported that of the teachers who started teaching in 1995, 42% had left the classroom five years later. Not only is this costly in terms of money, with the average replacement cost estimated at $15,000, it can be costly in terms of academic progress of children. Children do not benefit when they get many beginning teachers; schools which have a large turnover of faculty have a difficult time doing any type of long range planning.

Ingersoll, among others, believes that the teacher shortage cannot be solved simply by hiring new teachers – the revolving door must be shut. Teachers can be retained if the organizational structure of the school is changed. Merrow writes that “We’re misdiagnosing the problem as ‘recruitment’ when it’s really ‘retention’.”

Yet, there is evidence that appropriate teacher induction programs can reduce this turnover rate. Ingersoll describes a training program which had a turnover rate of 29% for first time teachers while the predicted probability of leaving was 40%.

A collaborative effort by a University and five surrounding school districts addresses this turnover rate through a Clinical Faculty Training Program. In place now for almost 6 years, well over 250 teachers have been trained and the evidence suggests that the training has a positive impact on the transition into the teaching profession. This partnership program has the potential of working with a variety of districts which can follow the basic model.
A Unique and Effective Approach to Teaching Educational Psychology with Metaphors and Artistry

A Unique and Effective Approach to Teaching Educational Psychology with Metaphors and Artistry

Deborah A. Stiles, Ph.D.

In 1980, when I began teaching graduate courses in Educational Psychology, I taught as I had been taught. I lectured, led discussions, gave exams, and had students write term papers. Topics included child growth and development, motivation, learning theory, instructional practice, intelligence, and achievement. The course was intensive and comprehensive and we covered psychology applied to education in just eight-weeks. Back then (and now) most of my students were tired, working adults who wanted to become certified teachers and were taking the Educational Psychology course as a certification requirement. Typically, only a few students had a background or interest in psychology and many of my students were career changers who were looking for more meaningful (but less lucrative) employment. Then (and now) classes were held in the evening and were four-hours long; sometimes my students fell asleep. Fortunately for my students, I have evolved over the years and so has my Educational Psychology course.

Today the course content is similar, but I now choreograph the four-hour “Ed Psych” classes. Every moment and movement in the class is designed to illustrate an important concept or skill. I teach my graduate students, as I would want them to teach their elementary and secondary students. I make an effort to know each of my students and their interests and goals and I differentiate instruction accordingly. I keep students involved and engaged through the use of personalized instruction and five metaphors:
sprinting, maple syrup, yogurt, hurdling, and choreography. This paper describes my current Educational Psychology course and the five metaphors.

Here is the Educational Psychology course description: Students explore the nature of human growth and development from the perspective of learning, examine the factors contributing to academic success, and consider how effective teaching can have a positive impact on students’ classroom behavior, motivation, and learning. Theoretical knowledge, educational research, and practical applications are stressed. This course includes a field experience in which students observe and interview educators and then write a paper describing their experience and applying their knowledge of educational psychology.

In teaching the course I choose not to provide a survey course, jam-packed with information on psychology applied to education. Instead, I take a very focused approach; we study only four topics and spend two weeks on each topic. I pose four questions and help these future teachers find their own answers. Each question was selected because of its importance to early career teachers and its relevance to the field of education psychology. Students explore the answers to these four questions:

1. How do your previous school experiences compare with those of students in 2010?

2. What is the relationship between intellectual ability and academic success?

3. What do you believe about human nature, classroom relationships, and discipline problems?

4. What can you learn from observing and interviewing educators?
I attempt to enliven my Educational Psychology course by presenting five metaphors: sprinting, maple syrup, yogurt, hurdling, and choreography.

Sprinting

I am a track and field athlete (now a Senior Olympian). I use starting blocks and I know if I want to finish strong while running 200 meters, I must start fast. The same principle applies to teaching an intensive Educational Psychology course. In the first class I begin with activities, lectures, course expectations, and an assignment that is due on week two. Students meet with their age groups (22-25, 26-29, 30-34, 35+ years) and they reminisce about their own school experiences. We share, summarize, and discuss their findings. I give a power point presentation on how to give a professional oral presentation as described in the Publication Manual of the American Psychological Association. For the following week, each student in the class does a brief oral presentation about “kids today” integrating theory, research, and a conversation with a child, adolescent, or parent. By week two of the course, I know a great deal about each of my students, including their interests and their academic skill levels.

Maple Syrup

I explain to my tired, working adult students that even though they are very busy, they need to work very hard in my Educational Psychology course. I use a metaphor; I ask them, “How many gallons of sap it takes to make one delicious gallon of maple syrup?” The answer is 30 to 33 gallons. Maple sap is a metaphor for all of the reading, thinking, researching, preparing, drafting, and rehearsing that is required for a polished oral presentation (or written paper). The students need to boil down the sap until its
delicious maple syrup. This metaphor works; students do high quality and delicious
presentations.

Yogurt

I teach “yogurt” classes. I want to provide my students with a course that is a
culture for their growth. I don’t want their exploration of Educational Psychology to end
after eight weeks, but to continue throughout their teaching careers. I present the structure
of the academic discipline of psychology so that they have the tools to continue to read
and study in the field of psychology.

I did not invent the metaphor of yogurt classes. A book by Belenky, Clinchy,
Goldberger, and Tarule (1986) describes Peter Elbow’s comments about courses that are
‘yogurt’ and provide growth opportunities in contrast to ‘movie classes’ in which
students are spectators who are entertained. In the first class and then again at the last
class I bring yogurts (or yogurt raisins or yogurt almonds) and give them to my students.
They enjoy these treats.

Hurdling

I own an adjustable hurdle that is used for teaching this track and field event to
children and I bring the hurdle to my Educational Psychology course. The hurdle is good
for explaining challenges and expectations. If the teacher places the bar too high, students
will fail (and they may injure themselves and/or give up). The hurdle should be set at a
challenging but attainable height. Believing in the capabilities of students is important
and confidence contributes to success. It is possible to keep raising the height of the
hurdle. This is good. The teacher should not stop raising the height of the hurdle when the
minimal level of competency has been achieved; the teacher should have high expectations and encourage students to do their best work.

I want my graduate students to encourage their elementary and secondary students; I want them to be supportive, to set high expectations, and to help the children and youth they teach to achieve. In the Educational Psychology course I try to do the same for my graduate students.

Choreography

Teaching (or taking) a four-hour night class after a long day’s work is exhausting; it’s brutal. It’s hard to keep students awake and moving. As a former dancer, I’ve observed that choreographers seem to know how to create rhythm, flow, movement, sequence, and art. I try to choreograph each class and include a variety of experiential learning activities, discussions, and lectures.

My students are graduate students; I take them seriously and I treat them as professionals. Students in my course hand in their final papers on the 7th week of class. For this paper students are required to select topics that are meaningful to them; they observe and interview at least three educators; and they apply educational psychology theory and research. They write up the paper in the standard order: title, abstract, introduction, method, results, discussion, conclusion, and references. Before the final class I read each of their papers three times; I write comments; and I grade the papers. I also prepare a talk on each of my student’s papers.

Using the four questions of the Educational Psychology course, the course builds to a “finale” in the eighth week. During the last class students write their answers to the four questions. Also, during the 8th class I pass out yogurt almonds and talk to my
students about continuing to grow as professional educators. In the most important part of
the 8th and final class, I assume the role of a discussant at a professional conference. I
comment on each of the papers and make connections and comparisons with their work.
Students learn from me and they learn from each other. As one student (a future
mathematics teacher) commented,

“I enjoyed this class and found the content particularly memorable. I think the
format allowed the information to become more meaningful. As for the paper
presentations, I found them beneficial. It was interesting to hear about the
different topics and draw similarities between like topics. Also, I felt that your
providing feedback as a discussant added value to the time and effort spent on
the research. It gave the paper importance beyond ‘just a grade’.” (Angela Ruble,
personal communication, October 15, 2010).

In summary, my Educational Psychology course has evolved over thirty years.
The course is intensive and requires a great deal of effort on my part. Each time I teach
the course I shake my head and doubt my sanity after I collect the big pile of papers on
the 7th week. I worry because I have promised to give a talk on each paper the following
week and these talks will take me many hours to prepare. When I read the papers, I feel
differently. The Educational Psychology papers are always really good. Almost every
student has selected a meaningful and useful topic and almost every student has produced
his or her best work.

6. Abstract:

Music education in Canada is experiencing a period of rapid change and considerable pressure due to shifting educational priorities; cultural, social, and political changes; quickly evolving technologies; and financial pressures exacerbated by globalization. Moreover, instructional methods prevalent in Canada’s secondary school music programs are deeply entrenched in outmoded paradigms, imported from and modeled on those employed in the United States and Europe. Such practices are no longer meeting the needs and interests of the vast majority of Canadian students; consequently, approximately 90% of secondary students opt out of their school music program.

In fact, Fiske predicts that instrumental programs, particularly band programs, will become increasingly jeopardized in Canada over the next decade. He bases this prediction on several factors: Music education at the secondary level has become increasingly insular and divorced from contemporary society and its musical expressions; band, in particular, is often a more social or team-competitive experience than a musical one, therefore, the focus is typically on group results rather than the individual student’s acquisition of musical understandings, appreciations, and skills; limitations imposed by typical school band repertoire; limited opportunities for continued participation after high school graduation; and expanded interest in computer-based composition and individual, rather than large group, musical activity.

Walker, Bowman, and others have criticized Canadian music educators’ reliance on American methods and materials. Walker’s criticisms focus on the domination by school bands based on an American model in Canadian music education. He contends that curriculum materials produced in the United States are in direct conflict with the basic principles of Canadian society (i.e. cultural mosaic vs. melting pot) and urges Canadian music educators to develop Canadian solutions rather than simply adopting American philosophies, instructional methods, and materials. Similarly, Bowman attacks institutionalized music education in Canada and places the blame squarely on the shoulders of post-secondary music teacher education programs. Additionally, Morton emphasizes the need to address the ethnic diversity of Canada’s population as moral imperative for educators generally and Canadian music educators in particular. She observes that, to date, Canadian music educators generally have paid little more than lip service to this federal mandate.

Clearly, there is a need for new and innovative solutions to better meet the musical needs and interests of the Canadian students of today, as well as tomorrow. This pilot study tested the efficacy of newly created web-based video resources for pre-service and in-service music
educators. Both content and modality are assessed. Specifically, it seeks answers to two questions:

1. Do these videos effectively inform Canadian music educators about innovative and alternative instructional approaches to teaching instrumental music and possible solutions to challenges they face?

2. Are web-based resources effective in disseminating new ideas about teaching and learning instrumental music?

The method was survey research. A targeted sample of 132 secondary instrumental music educators (pre-service, in-service, and post-secondary) in each of the 10 provinces and the Yukon were invited to participate, with the hope that at least 25 would respond. Participants were asked to view nine newly created videos posted on a dedicated website (motifmusiclearning.com) and assess both the content and the medium using a researcher-developed survey (MMLVRL Online Survey).

The survey was created and data were collected and collated using an online survey management service. The study is complete and but final results have yet to be tabulated and analyzed. Nevertheless, preliminary findings indicate results are very promising. Final results will be reported in this presentation. The findings will inform the creation of a robust online digital resource library for pre-service and in-service Canadian music educators demonstrating and discussing best practices and innovative methods, strategies, and materials, and solutions to uniquely Canadian challenges. In this way it will meet an urgent and important need in music education by providing new directions for current and future Canadian instrumental music educators.
Using Manipulatives to Teach Elementary Mathematics

Abstract: The purpose of this paper is to explain the importance and benefits of math manipulatives. For decades, the National Council of Teachers of Mathematics has encouraged school districts nationwide to use manipulatives in mathematical instruction. The value of manipulatives has been recognized for many years, but some teachers are reluctant to use them in their lessons. Throughout this paper, a discussion of the positive results of several research studies that strongly suggest the use of manipulatives will be mentioned. The history and advancement of manipulatives with also be discussed. Defining manipulatives and explaining the correct way to use them will be highlighted in this paper.

About Authors: Dr. Boggan is an Assistant Professor of Educational Leadership, Coordinator of Educational Leadership Programs at Meridian Campus, & PI/Project Director of Project LEAP (Learning and Educating through Alternative Programs) at Mississippi State University; Dr. Harper is the Associate Dean of Education at Mississippi State University’s Meridian Campus, Coordinator of Elementary Education Programs, and Associate Professor of Curriculum and Instruction at Mississippi State University; Dr. Triplett is an Assistant Professor of Elementary Education at Mississippi State University;
INTRODUCTION

According to the Principles and Standards for School Mathematics, “the foundation for children’s mathematical development is established in the early years” (Seefeldt & Wasik, 2006, p. 249). It is important for children to have a variety of materials to manipulate and the opportunity to sort, classify, weigh, stack and explore if they are to construct mathematical knowledge. “In order to have opportunities to learn math, children need firsthand experiences related to math, interaction with other children and adults concerning these experiences and time to reflect on the experiences” (Seefeldt & Wasik, 2006, p. 250). Educational research indicated that the most valuable learning occurs when students actively construct their own mathematical understanding, which is often accomplished through the use of manipulatives.

HISTORY OF MANIPULATIVES

Since ancient times, people of several different civilizations have used physical objects to help them solve everyday math problems. The ancient civilizations of Southwest Asia used counting boards, which were wooden or clay trays covered in a thin layer of sand. The counting board users would draw symbols in the sand to tally inventory or whatever else they may need to count. The ancient Romans created the first abacus based on counting board. The abacus was made of beans or stones which moved in grooves in sand or on tables of wood, stone, or metal. “The Chinese abacus, which came into use centuries later, may have been an adaptation of the Roman abacus” (“Research on the” n.d.). The Mayans and the Aztecs both had counting devices that were made of corn kernels strung on string or wires that were stretched across a wooden frame. The Incas also had their own counting tool, which was knotted strings called quipu (“Research on the”, n.d.).

“The late 1800s saw the invention of the first true manipulative-maneuverable objects that appeal to several different senses and are specifically designed for teaching mathematical concepts” (“Research on the” n.d.). In 1837, German educator Friedrich Froebel introduced the world’s first kindergarten. “He designed the educational play materials known as Froebel Gifts, or Frobelgaben, which included geometric building blocks and pattern activity blocks” (“Friedrich Froebel”, 2009). Then in the early 1900s, Italian educator Maria Montessori continued with the idea that manipulatives are important to education. She designed several materials to help elementary students learn the basic ideas of math. “Since the 1900s, manipulatives have come to be considered essential in teaching mathematics at the elementary school level” (“Research on the,” n.d.). In fact, the National Council of Teachers of Mathematics (NCTM) has recommended the use of manipulatives in teaching mathematical concepts at all grade levels.

MANIPULATIVES DEFINED

Manipulatives can come in a variety of forms and they are often defined as “physical objects that are used as teaching tools to engage students in the hands-on learning of mathematics” (“Using manipulatives,” 2009). Manipulatives can be purchased at a store, brought from home, or teacher and student made. The manipulatives can range from dried beans
and bottle caps to Unifix cubes and base-ten blocks. They are used to introduce, practice, or remediate a math concept. “A good manipulative bridges the gap between informal math and formal math. To accomplish this objective, the manipulative must fit the developmental level of the child” (Smith, 2009, p. 20). Kindergarten children should have individual counters, whereas older students could use colored wooden rods that represent different numbers. The manipulative must fit the mathematical ability of the child or it is useless.

WAYS TO USE MANIPULATIVES

Manipulatives can be used in teaching a wide variety of topics in mathematics, including the objectives from the five NCTM standards: problem solving, communicating, reasoning, connections, and estimation. The materials should “foster children’s concepts of numbers and operations, patterns, geometry, measurement, data analysis, problem solving, reasoning, connections, and representations” (Seefeldt & Wasik, 2006, p.93). Teachers could use counters, place-value mats, base-ten blocks, and fraction strips while teaching from the numbers and operations standard. The counters could be used to teach one-on-one correspondence, ordinal numbers, and basic addition and subtraction. The fraction strips could be used to add and subtract fractions or to show equivalent fractions. Pattern blocks, attribute blocks and scales could be used to assist students in the learning basic algebra. Student could use geoboards when trying to identify simple geometric shapes. They could also use geometric solid models when learning about spatial reasoning. Teachers could use standard and non-standard rulers and measuring cups to represent length or volume in measurement lessons. The students could also use tiles when trying to find the area or perimeter of an object. When it comes to data analysis and probability, students could use spinners to find the probability of landing on a designated area. They could also use number cases or dice to find the probability of rolling a certain number or combination of numbers (“Using manipulatives”, 2009). The numbers of ways that manipulatives can be used are limitless. In fact, some schools use math manipulatives as a way to get parents involved. Stephen Currie, math specialist for grades Kindergarten through fourth grade at Poughkeepsie Day School in New York, created ‘mathtubs’ to pique math interest for both kids and their parents. Each Friday several students are selected to receive a mathtub, which are not due back until the next Wednesday. The mathtubs are filled with “math games and puzzles, two or more different kinds of manipulatives such as number cubes or tangrams and math challenges—questions which required no materials but creative brain power” (Currie, 2005, p. 52). Feedback from the parents was both positive and helpful. “In general, the parents appreciated the activities and were please to see their child engaged in mathematical thinking” (Currie, 2005, p. 53).

USING MANIPULATIVES CORRECTLY

Manipulatives can be extremely helpful young children, but they must be used correctly. Children must understand the mathematical concept being taught rather than simply moving the manipulatives around. Smith (2009) stated that there are probably as many wrong ways to teach with manipulatives as there are to teach without them. The math manipulatives should be appropriate for the students and chosen to meet the specific goals and objectives of the mathematical program. “The complexity of the materials provided will increase as children’s
thinking and understanding of mathematical concepts increase” (Seefeldt & Wasik, 2006, p. 93). It is also important for teachers to allow their students to have free time to play with the manipulatives. After the students have explored the manipulatives, “the materials cease to be toys and assume their rightful place in the curriculum” (Smith, 2009, p. 17). Carol Seefeldt and Barbara Wasik also think that teachers should provide children with opportunities to work with materials with open-ended objectives that have no specific preset goals. These opportunities allow the children the chance to explore their own questions and generate a variety of answers. “These experiences help children think about their world in alternative ways and help them understand that there are multiple ways to solve problems. Generating multiple solutions to problems in an essential strategy in mathematics” (Seefeldt & Wasik, 2006, p. 250).

RESEARCH AND BENEFITS OF MANIPULATIVES

The use of manipulatives is recommended by the NCTM because it is supported by both learning theory and educational research in the classroom. “Manipulatives help students learn by allowing them to move from concrete experiences to abstract reasoning” (“Research on the” n.d.). When students manipulate objects, they are taking the first steps toward understanding math processes and procedures. “The effective use of manipulatives can help students connect ideas and integrate their knowledge so that they gain a deep understanding of mathematical concepts” (“Research on the, “ n.d.).

Over the past few decades, researchers have studied the use of manipulatives in several different grade levels and in several different countries. The majority of the studies indicate that mathematics achievement increases when manipulatives are put to good use. Many studies also suggest that manipulatives improve children’s long-term and short-term retention of math. Cain-Caston’s (1996) research indicates that using manipulatives helps improve the environment in math classrooms. When students work with manipulatives and then are given a chance to reflect on their experiences, not only is mathematical learning enhanced, but math anxiety is also greatly reduced. Kenneth Chang (2008) examined the work of research scientist Jennifer Kaminski and he found that children better understand math when they use concrete examples.

Puchner, Taylor, O’Donnell, and Fick (2008) conducted a case study which analyzed the use of manipulatives in math lessons developed and taught by four groups of elementary teachers. There four researchers decided to study the way teachers use the manipulatives rather than studying the outcomes of the students. “The study found that in three of four lessons studied manipulative use was turned into an end in and of itself rather than a tool, and that in the fourth lesson manipulative use hindered rather than helped the student learning” (Puchner, Taylor, O’Donnell, & Fick, 2008, n.p.). The researchers believe this occurred because of the “deeply embedded focus in U.S. mathematics teaching on the procedure and the product” (2008, n.p.). In a few of the lessons, the manipulative use became an exercise separated from the solving of the problem. In the second grade lesson, the students simply copied the teacher’s example and never attached meaning to the manipulatives. The teacher’s manipulative use and misuse provided the researchers with a focus for further study. The researchers also realized that “teachers need support making decisions regarding manipulative use, including when and how to use manipulatives to help them and their students think about mathematical ideas more closely” (Puchner, Taylor, O’Donnell, & Fick, 2008, n.p.). Catherine Kelly, a member of the Montana Council of Teachers of Mathematics, stated that “teachers need to know when, why, and how to
use manipulatives effectively in the classroom as well as opportunities to observe, first-hand, the impact of allowing learning through exploration with concrete objects” (Kelly, 2006, p.188).

Dave Munger, author of *Researching Online*, reported the results of a study designed to describe the benefits of manipulatives. The sample consisted of two third-grade classes with twenty-six students. A two-week geometry unit from the Silver Burdett textbook was administered in both classes. The experimental group teacher used mathematical manipulatives to teach the concepts presented in the unit, and the control group teacher used only drawings and diagrams to teach the concepts. “Analysis of covariance revealed that the experimental group using mathematical manipulatives scored significantly higher in mathematical achievement on the posttest scores than the control group” (Munger, 2007, n.p.).

Additional studies have shown that students who use “manipulatives in specific mathematical subjects are more likely to achieve success than students who don’t have the opportunity to work with manipulatives” (“Research on the,” n.d.). Some children need to use manipulatives to learn to count, while other students’ understanding of place value increases with the use of manipulatives. Research also indicates that using manipulatives is especially useful for teaching low-achievers, students with learning disabilities, and English language learners.

CONCLUSION

Elementary teachers who use manipulatives to help teach math can positively affect student learning. Students at all levels and of all abilities can benefit from manipulatives. Mathematician, Seymour Papert, believes manipulatives are ‘objects to think with’. “Incorporating manipulatives into mathematics lessons in meaningful ways helps students grasp concepts with greater ease, making teaching most effective” (“Research on the,” “n.d.).

Abstract: This study was designed to investigate the effects that resiliency training had upon a selected group of sixth grade students in a rural, low socioeconomic school with a student population of approximately 600 in grades K-12. Planned solution strategies included staff development training and implementing activities to establish the school climate and student readiness. The Resiliency Skills and Abilities Scale (RSAS) was used as a pretest. RSAS is a 45-item survey to determine resiliency scores, before implementing resiliency skills. Training from the Resiliency Training Program, a Trainer of Trainers by Nan Henderson, M.S.W., was used as an intervention strategy. The intervention strategies involved a section of sixth-grade students, teachers, counselors, administrators, and parents. The RSAS was administered as a posttest to students at the end of the training to measure any changes in their resiliency level. An analysis of the data and teacher perception revealed that participants’ resiliency level increased as a result of resiliency training in a rural school setting.

About Authors: Dr. Boggan is an Assistant Professor of Educational Leadership, Cohort Coordinator for Educational Leadership Programs at Mississippi State University’s Meridian Campus, PI/Project Director of Project LEAP (Learning and Educating through Alternative Programs) Transition to Teaching Grant; Dr. Sallie Harper is the Associate Dean of Education for Mississippi State University’s Meridian Campus and Associate Professor/Coordinator of Elementary Education programs; Dr. Elizabeth Bifuh-Ambe in an Assistant Professor of Elementary Education at the University of Massachusetts at Lowell.
INTRODUCTION

Can schools build resiliency, or is resiliency held individually? Research supports the concept that resiliency can positively impact school success (Henderson & Milstien, 1996; Higgins, 1994; Werner & Smith, 1992; Wolin & Wolin, 1994). Resilience, which is the ability to thrive, mature, and increase competence in the face of adverse circumstances, encompasses both individual and environmental factors (Masten, 1992). Lifton (1994) identified resilience as “the human capacity of all individuals to transform and change, no matter what their risks.”

Wang, Haertel, and Walberg (1994) define educational resilience as the heightened likelihood of success in school and in other educational accomplishments, despite risk and environmental adversities. A better understanding of the contribution of resilience in schools may contribute to the understanding of individual resiliency. Henderson and Milstien (1996) explain that it may be possible to help students develop the necessary strategies to develop factors that foster resiliency by creating an environment of caring personal relationships (Henderson & Melstein, 1996). While some students develop resiliency on their own, other students may need assistance in developing factors that foster resiliency.

Educators must look beyond the circumstances of children’s birth and foster their success. In his first radio address in January 21, 2001, President Bush stated, “Our country must offer every child, no matter his or her background or accent, a fair start in life with a quality education” (Bruni, 2001, p. A9). Noddings (1998) wrote, “Children will work harder and do things for people they love and trust. In other words, schools can and must provide the environment to make the difference in the lives of children” (p. 32).

Too few young people grow up experiencing key ingredients for their healthy development (Meier, 1995). They do not experience support from adults, build relationships across generations, or hear consistent messages about values. Most of our young people do not have much to do with positive issues or issues that are constructive. This results in our communities having an overwhelming number problems in the lives of our youth. However, young people who experience positive assets are likely to grow up caring, competent, and responsible.

School resiliency includes: (a) teacher involvement with the job; (b) peer cohesion, or how friendly and supportive teachers are to each other; and (c) supervisor support, or the extent to which the administration is supportive of teachers. Benard (1993) states that a nurturing school climate has a tremendous influence on children overcoming incredible risk factors. Benard further explains that creating this nurturing environment for students necessitates creating this environment for all school personnel. School administrators can facilitate a nurturing environment for school personnel by demonstrating positive beliefs, setting expectations and trusting teachers, and providing on-going opportunities for teachers to reflect, dialogue, and collaboratively make decisions (McLaughlin & Talbert, 1993). A common finding in resilience research is the power of teachers to facilitate the transformation of students being deemed at-risk to being deemed resilient. Bernard (1993) labels these teachers as “turnaround teachers.” The turnaround teachers provide and model the following protective factors: caring relationships, positive and high expectations, and opportunities to participate and contribute. Henderson and Milstein (1996) explain that schools, which build resiliency in students through creating an environment of caring and
personal relationships, have educators who have resiliency-building attitudes as a foundation. As an outgrowth of a strengths-based perspective, turnaround teachers let students express their opinions and imagination, make choices, problem solve, work with and help others, and give their gifts back to the community in a physically and psychologically safe and structured environment. They treat students as responsible individuals, allowing them to participate in all aspects of the school’s functioning (Kohn, 1993).

Masten (1992) explains that all students may be deemed at-risk at sometime in their lives. Pianta and Walsh (1996) explain that despite adversity some at-risk students are able to adapt and succeed. Research indicates that schools can assist in this development if they embody the environmental conditions that support resilient reactions to situations and events (Henderson & Milstein, 1996).

Due to the wide variability between and within young adolescents in their ability to think abstractly, it has become increasingly clear that schools with diverse and flexible curriculum seem to be in the best position to meet the needs of all students (Irvin, 1992). The school environment should contain important protective factors such as fostering a sense of achievement in children, enhancing personal growth, and increasing social contacts.

Resilience is an attractive concept particularly to anyone who has struggled to link the connection between stress and school failure. Educators are also familiar with the concept of success in the face of challenging circumstances. Instead of seeking and identifying success-producing factors in schools that succeed against the odds, discussions of resilience focus upon identifying individuals who succeed.

As researchers attempt to understand how various factors such as the child, contextual factors, and biological factors interact with exposure to difficult circumstances, the question why some individuals appear to succeed and some individuals do not remains vexing (Master & Coatsworth, 1995). It has been hypothesized that individuals who are in control, committed, and challenged may be influenced by a different set of coping strategies than individuals who are in less control, committed, and challenged by circumstances. Individuals who are in control, more committed, and challenged have been categorized as hardy or resilient. Resilient individuals tend to select and employ more active problem-focused coping strategies while those who are less hardy or resilient tend to use emotion-focused coping, avoidance, or denial (Williams, Weibe, & Smith, 1992). They also found that active or adaptive coping strategies mediated self-reported illness symptoms. These studies offer evidence that the resilient or hardy individual may transform stressful events into less stressful events.

ROLE OF SCHOOL

School involvement, cohort support, and supervisor support have been identified as important protective factors in resilient schools (Benard, 1991; Frieberg, 1994). The school environment is a critical component to the development of protective factors associated with individual resilience. Students in effective schools, which are powerful environments, can acquire resilience in educational environments that foster development and competence in achieving learning success (Wang, Haertel & Walberg, 1997).

Just as teachers can create a nurturing classroom climate, administrators can work to
create a school environment that supports teachers’ resilience, promotes caring relationships among colleagues, demonstrates positive beliefs, provides ongoing opportunities to reflect, and allows colleagues to become collaborative decision makers (McLaughlin & Talbert, 1993).

Expectedly, there have been numerous calls for school leaders to take the initiative in developing a school environment that is conducive to individual and collective success. Along these lines, Pazey (1995) emphasized that constructs of an ethic of caring and leadership practices are positively associated with educational reform. While the notion of reform is typically associated with changes in instructional practices, one can make a case that altering the school environment has the potential to make a much greater impact on all facets of the school related to productivity. Many researchers have outlined how school leaders can assist in the development of a more caring, and thus, more resilient environment. Kohn (1991) points out that caring dispositions will best be learned where the leader and peer interaction is intense and regular, and where learning is evident. This suggests that the leader needs to initiate interactions with others in the school on a regular basis. Furthermore, the leader should make sure that such interaction emphasizes “real” issues in the school and provides opportunities for both giving and receiving information from group members. Additionally, subsequent interactions should build on previous ones.

In a similar vein, Reihl (2000) described three distinct tasks of school leaders in responding to issues of diversity and equity. These tasks include fostering new meanings, promoting inclusive practices within schools, and building connections between schools and communities. Such activities enhance the schools “caring” environment and help both school faculty and staff and community stakeholders make sense of the issues related to the school. The ability for individuals to ascribe meaning to a setting creates a stronger, more resilient entity. Fullen (2001) described the principal’s role as follows:

“Effective leaders understand the value and role of knowledge creation, they make it a priority and set about establishing and reinforcing habits of knowledge exchange among organizational members”.

Clearly, the school leader can have a significant impact on school environment through a thorough and continual plan of communication concerning pertinent issues with both individuals within the school and those external to it. An enhanced, caring environment can assist the school in dealing with problems in a healthy manner.

Benard (1993) explained that a nurturing school climate has a tremendous influence on children overcoming incredible risk factors. Benard further suggested that it is far less acknowledged that creating this nurturing environment for students necessitates creating this environment for all school personnel. Krovetz (1999) echoed this theme by stating that resilience is about building a community that is rich in the protective factors of caring, high expectations, purposeful support, and ongoing opportunities for participation. It is becoming increasingly clear that in order for resiliency building to be accomplished, teachers must support their own resilience because they need the protective factors for success. Seligman (1996) contended that teachers who are student-centered use students’ own strengths, interests, goals, and dreams as the beginning point for learning and tap students’ intrinsic motivation for learning.
Fostering resiliency and increasing positive development assets of young people comprise the continuum of a comprehensive approach to improving the lives of all kids (Benson, 1997). Resiliency studies offer evidence of what practitioners have long suspected and hoped; more than any institution except the family, schools can provide the environment and conditions that foster resiliency in today’s youth and tomorrow’s adults (Henderson & Milstein, 1996). There is a statistically significant positive relation between individual resiliency and school resiliency. Research findings suggest that resiliency has a positive impact on the academic achievement of students.

Research indicates that it is probable that middle school educators can help students thrive during adolescence, improve their academic development, and ensure success in school if they assist them in developing resiliency (Richardson & Nixon, 1997). Since adolescents often develop the beliefs and values that may follow them into adulthood, middle schools are the most powerful force to recapture millions of youth (Manning, 1993). As we begin shifting our thoughts toward more positive ones, we anticipate creating communities where all young people are valued and valuable, problems are manageable, and an attitude or vision, hope, and celebration pervades community life. With this in mind, this study attempted to determine if a section of sixth-grade students at this rural school could achieve a higher level of resiliency with resiliency training in school than at a prior time without resiliency training.

**Study**

Dr. Cynthia Jew and Dr. Kathy E. Green’s Resiliency Skills and Abilities Scale (RSAS) a 45-item survey to determine resiliency scores, was used to collect data for comparison on the pretest and posttest.

The aim of this study was to build in factors that protect the individual and offset the impact of stressful life events. The school system for this study, a K-12 Attendance Center, was located in the central portion of a rural southern state. The county where the school system was located had approximately 9,000 residents and three school systems. Of the 82 counties in this southern state, this county ranked among the bottom five counties in the state’s unemployment rate. The focus of this study was to identify individual factors that contribute to educational resiliency, or academic success in adverse circumstances.

For the purposes of this study, some terms relevant to this study were defined as follows: At-risk students were defined as students who have certain characteristics such as: living with one parent, being a member of a minority group, having an English deficiency or performing poorly or failing in school. Harris (1991) described at-risk students as having poor reading skills, low aspirations, family problems, poor attendance, weak participation in school, or discipline problems. Resiliency referred to the process of coping with disruptive, stressful, or challenging life events in a way that provides the individual with additional protective and coping skills (Richardson & Nixon, 1997). The following definition of resiliency was used as defined by Jew (1997) in her study.

Resiliency refers to the psychological endurance skills and abilities. That is, a child who is resilient will reduce his likelihood of serious negative impacts associated with maltreatment as other children who are not resilient (Mrazek & Mrazek, 1987). Skills include precocious maturity, conviction of being loved, idealization of aggressor’s competence, cognitive restructuring, positive projective anticipation, optimism, and hope. Abilities include rapid responsibility to danger, disassociation of affect, information seeking, decisive risk taking, altruism, and formation and utilization of
relationships. The child uses the psychological endurance behaviors to better adapt to his/her environment. Furthermore, resiliency is a belief system; a set of behaviors based on one’s belief system (pp.11-12).

OVERVIEW OF RESULTS

The primary purpose of this study was designed to determine if a relationship existed between a sample of sixth-grade students with resiliency training at the K-12 Attendance Center. A second purpose was to determine whether relationships existed between the level of personal resiliency and demographic variables with at least two at-risk factors. These variables included socioeconomic status, gender, race, at-risk factors, and individual resiliency. The 45-item instrument, The Resiliency Skills and Abilities Scale (RSAS), was used.

The specific research questions addressed in this study were as follows:

1. What was the level of resiliency of selected sixth-grade students at the K-12 Attendance Center as measured by the RSAS?
2. Was there a significant difference between the level of resiliency in sixth-grade students after implementing a resiliency-training program?
3. Was there a relationship between a student’s score on the RSAS and sixth-grade students who have at least two at-risk status factors?

Methodology

To answer the questions, the RSAS pretest and Resiliency Survey were administered to WAC sixth-grade students, who agreed to participate in this study and had parental consent to do so. Sixteen out of 18 survey forms were returned in a usable format. This represented a response rate of 89%. Demographic data were collected on all participants. For nine weeks resiliency-training skills were implemented and enhanced to the sample of sixth-graders by teacher, counselor, parents, and administration. The RSAS posttest was administered to the sixth-grade participants to measure any change in resiliency.

Characteristics of Participants

Demographic data describing the research subjects involved in the study are described in Tables 1 through 6. Table 1 presents information on the gender of all participants in the study. Female participants appear to represent a higher percentage than male participants.

*Findings of Research Questions*

*Question 1.* What is the level of resiliency of selected sixth-grade students at WAC as measured by the RSAS?

Table 3 represents a summary of the Total Score and Subscale Scores of the 16 participants without resiliency training. In examining the mean Total Score of 193.13, it can be concluded that the participants in the study had above average level of resiliency. The mean responses for all 45 items were examined.

Five items ranked higher than all others. These items included the following:

- I believe someone loves me: mean = 5.63
- I can be loved by a teacher, coach, or someone else other than my family: mean = 5.5
- Someday, I will be able to use what I have learned in my life to help others: mean = 5.38
- Everybody is able to be loved: mean = 5.31
- I look forward to the future: mean = 5.19

These results revealed that participants had a strong conviction that they were loved and demonstrated optimism and hope for their future. In addition, five items ranked lower than all other items. These items included the following:

- I believe that it is best to take a risk no matter what the consequences: mean = 2.94
- Sometimes it is worth it to take risk that I shouldn’t: mean = 3.0
- The past is not as important as the future: mean = 3.0
- I can feel what other people are feeling: mean = 3.13
- Something good always comes out of something bad: mean = 3.19

These results revealed that participants did not have a strong desire to take risks. In
addition, these results could reveal that sixth-grade students have not developed strong
decision-making strategies.

**Question 2.** Is there a significant difference between the level of resiliency in sixth-
grade students after implementing a resiliency-training program?

Table 4 represents a summary of the Total Score and Subscale Scores of the 16
participants with nine weeks of resiliency training. In examining the mean Total Score of
212.19, it can be concluded that the participants in the study had a higher level of resiliency.

<table>
<thead>

</tr>
<tr>
<td>Independence &amp; Risk Taking - Highest possible = 90</td>
</tr>
</tbody>
</table>

Five items ranked higher than all other items. These items included the following:
- Someday I will be able to use what I have learned in my life to help others: mean = 5.94
- Everybody is able to be loved: mean = 5.5
- If one of my parents developed serious illness, I would learn a lot about it, so I
could help them: mean = 5.44
- I look forward to the future: mean = 5.44
- I believe in the “goodness” of others: mean = 5.44

These results revealed that participants had a stronger desire to be loved and help
others. In addition, these results could reveal that sixth-grade students have developed
stronger decision-making strategies, and look forward to the future.

In addition, four items ranked lower than all other items. These items included the
following:
- Sometimes it is worth it to take the risk that I shouldn’t: mean = 2.50
- The past is not as important as the future: mean = 3.31
- If something had happened, I would talk to my friends about it: mean = 3.44
- Some people cannot make it because of their childhood: mean = 3.56

These results revealed that participants did not have a strong conviction to take risks.

In addition, these results could reveal that sixth-grade students have optimism and hope.

T-test analyses were used to determine if there was a relationship between the
resiliency scores of sixth-grade students with resiliency training. The independent variables
are students without and students with training in a school setting. The dependent variables
included subscales Future Orientation, Independence and Risk Taking, Active Skills, and
Score. The mean responses for all 45 items were examined. Table 5 displays the results of
the Total Score and Subscores of the 16 participants.
Although students without resiliency training appeared to have lower resiliency scores than students with resiliency training, the differences are statistically significant. Thus, there appeared to be a relationship between resiliency scores without and with resiliency training.

*Question 3.* Is there a relationship between a student’s score on the RSAS and sixth-grade students who have at least two at-risk factors?

One-way ANOVAs were used to examine the relationship between at-risk status and resiliency as measured by the RSAS. The independent variables are at-risk status. The dependent variables include the subscales Future Orientation, Independence and Risk Taking, Active Skills, and Score. There was a slight increase in relationship between a score on the RSAS and at-risk status as determined by the presence of two at-risk factors. Table 6 demonstrates the results.

### TEACHER PERCEPTION

Teacher observation revealed that participants’ level of resiliency increased as a result of a resiliency-training program in a school setting. Teachers observed caring and support, high and clear expectations, opportunities for meaningful participation, and skill building. Changes in internal resiliency factors of social competence, problem-solving skills, sense of autonomy, and sense of purpose and future were observed. Teachers also noticed changes in the external protective factors of helpfulness to others, high anticipations, and the desire to participate.

In the areas of social competence teachers reported an impact on students’ ability to
develop better relationships with peer friendships, communication, and trust. In the areas of problem-solving skills, they observed students as they were building a level of confidence to deal with problems and getting help from others to solve problems at home and at school as reflected in the following responses from teachers:

“The resiliency training helped my students to feel more comfortable in talking about their problems. They became more aware that there were other people going through the same things, and that they were not the only ones with that problem.”

“Students trusted more people.”

“Students talked about what to do in different situations.”

“More students were able to solve some of their problems and get through the day almost without anger.”

“They are listening better and trying to make better decisions.”

Here are some responses from participating students in this study which supports their change in behavior.

“When I get mad at my parents, I can better control my anger.”

“It helps me express my feelings with my friends that I trust.”

“I try to think before I act. I often count to ten before reacting.”

“I am proud of myself and have gained a lot of respect for myself.”

Teachers observed that students who perceived their parents as concerned about their activities and whereabouts had more positive developmental outcome in a number of areas including academic achievement and problem behavior. Teachers noticed that those participants who felt more included and respected in the school environment were the ones less likely to engage in problem behavior. They had a better desire to do right and help others.

Another teacher observation was that resilient students were able to move beyond their mistakes socially and academically. Effort and determination served as protective factors for these students because their attempts to achieve were met with positive results. By looking for the good in others, regardless of background or appearance, the door to learning always stays opened.

The teachers and school community were contributors to positive adaptation and developmental outcomes of the participants in this study. Educational counsel and guidance were also important factors in developing resilience. Difficult children present many challenges, but out of those challenges can emerge children who become very productive resilient adults.

**Conclusion of Findings**

The findings of this study lead the researchers to make conclusions that are important to sixth-grade students in this rural community. A summary of the findings is presented below:

1. The sixth-grade students involved in this study were considered resilient individuals.
2. There was a significantly higher score in the resiliency levels of students with resiliency training.
3. There was a significant relationship between resiliency scores and at-risk status by sixth-grade students.
Teacher perception was of great importance and significance in this study as they were involved with the growth and changes of the participants.

**Discussion**

The community consisted of students with lower to middle class socioeconomic backgrounds. The sixth-grade students in this study had above average resiliency levels. There are several potential reasons for this finding.

1. These students live in an impoverished rural area in the southern United States. Perhaps in rural areas, there is less of a social stigma related to poverty than there may have been in Jew’s study.

2. The rural communities in this study might be closer and more connected than the urban communities examined by Jew. Therefore poverty might not be an important issue when dealing with defining “at-risk.”

3. In rural areas in the South, students tend to place a lot of emphasis on religion. This membership in an organization may provide the necessary bonding to foster hopefulness and optimism, factors in resiliency.

4. Family factors may have played a significant part in students having an above average level of resiliency. Forty-four per cent live in two parent households. This could account for the conviction of being loved.

5. Students in this study may have different values in relation to their future goals than those in other studies because resiliency can take on different meanings for different socioeconomic classes across rural and urban areas.

6. There may be a possibility that resiliency training in school and resiliency are not connected.

Conceivably students attending this rural K-12 Attendance Center experienced caring and support, high and clear expectations, opportunities for meaningful participation, and skill building. The school appeared to provide students with a much greater opportunity for overcoming adversity and experiencing success in school than if there were no factors present.

In this study, if students identified at least two at-risk factors, they were considered a part of the at-risk group. The presence of at least two at-risk factors did produce a statistically significant relationship to their resiliency scores. This may possibly have resulted from the school families, or communities providing these students with the tools that they needed to become resilient. In addition, when examining the single-parent family and C average or below statuses, the sample groups were of unequal values. Perhaps if three or more at-risk factors had been used or if the analyses had looked at one or more elements individually, the results might have been higher.

**Recommendations for Further Research**

Significant relationships were found between resiliency without and with resiliency training. Future studies could certainly provide greater knowledge about this issue. Some recommendations for further research are as follows: (a) Conduct a study with a larger population to include sixth-grade students from various areas; (b) Conduct a study with a population that includes a combination of both urban and rural area populations to determine if geographical location impacts resiliency levels; (c) Expand the study to determine if resiliency and academic achievement are related; (d) Conduct a study that focuses on family life and home conditions that might contribute to resiliency; (e) Conduct a study that examines other risk factors in students other than those used in this study to determine if any
relationship exists between them and student resiliency; or (f) Conduct a study to determine if resiliency continues through elementary school, middle school, and high school years.

In summary, the findings in this study suggest that there was a relationship between personal resiliencies with resiliency training in this sample. Perhaps this study has raised more questions than answers. The recommendations for further research provide possible avenues to address some of these questions.

The research aimed at developing physical and biological environment as a place for both living and learning, and developing environmental learning activities for schools. Lad Community School, Muang District, Maha Sarakham Province, was selected as a model school and 179 students from Prathomsuksa 1 to Matthayomsuksa 3 were chosen as the sample group. The research methodology used was an action research integrated with an experimental research emphasizing on the development of physical and biological environment and the development and application of learning plans to study the effects of the learning plans on students’ environmental knowledge, students’ attitude towards environment and environmental ethics. The results were revealed as follows:
1. For physical and biological environmental development, the physical and biological environment of the school was improved and the quality of the school’s environment after the evaluation was at the high level (84% of the total score). When examining the school’s environment separately in different quality standards, it was found that 12 environmental quality standards were at the highest level and 4 quality standards were at the high level.

2. In terms of learning plan preparation, the school teachers created 15 learning plans by integration from the regular curriculum for the learning activities of the students in the school and 5 projects for promoting environmental development, which included Bai Sri tray project, rice container making project, school garbage management project, biomass compost project, and organic farming project. The evaluation results of the teaching plans were at the highest level (82.13% of the total score).

3. Regarding students’ environmental knowledge, attitude, and environmental ethics, it was found that the environmental knowledge of the students in general after learning was significantly higher than before at the statistic level of .05. The students’ attitude towards environment in general and in all different grade groups after learning was significantly higher than before at the statistic level of .05. In terms of environmental ethics, only the students in Prathomsuksa 4 and 5 groups significantly had higher ethical knowledge after learning at the statistic level of .05.

Introduction

1) The Japanese pre-school system.
In Japan, most children over 3years old enter kindergarten ‘yochien’ or nursery school ‘Hoikuen’. Parents send their children to the pre-school or the bus stop of kindergarten bus. Generally speaking, most pre-school have classes which 10 to 30 children and 1 or 2 teachers belong to. Parents go to pick their children up when the pre-school is over. They usually leave education to the teachers and rarely attend the activities because they are busy in their work or housework. It is rare that the pre-school asks parents to attend the programs proactively though the situation slowly changes.

2) Solitude to take care of little children in Japan.
In Japan, the local community is weakening because of a decrease of household sizes and high population fluidity. This brings solitude to take care of children. It is difficult for parents who move to a new place to make friends.

These parents tend to have trouble with taking care of their children. If the grandparents or other family members are not living close by and there is no community which helps young parents, they neither depend on others when they are in poor health nor consult about troubles of childcare.

In addition, they only get limited information on child care. Instead of having information by people, they need to rely on the magazines or the Internet. Such information entails many difficulties to live up for beginner parents as it is not flexible enough that parents may not able to arrange it for their own child. In the worst case, these information from media unnecessarily worry parents.

In this situation, we must prepare good childcare support as soon as possible.

3) Needs to create a sustainable society
In addition to local problems, now we are facing serious international problems. For example, environmental pollution is spreading all over the world. Scrambling limited
natural resources and misunderstanding of diversity of belief end up to international conflicts. In order to solve these problems, it is necessary to understand people who are in different situations and to cooperate with each other. We must realize peaceful coexistence.

We can learn how to realize peaceful coexistence in a small community. Only the individualism doesn't realize a sustainable community. If one person makes some benefits, it may damage another. People need to sympathize with each other to maintain a good community.

4) To solve these problems

In these social backgrounds, Kids Art College (KAC) was established in 2005. KAC is a new type of pre-school in which both mother and child learn together. Mothers attend the program everyday and spend three years here.

In three years, mothers make good relationships with others and get to cooperate with them taking care of children. Mothers in KAC sometimes need to accept different opinions of others and seek the way to coexist with various people. But once it is succeeded, all mothers recognize various individualities and take care of all children as if they are their own.

This attempt was started under the educational policy of Kyoto University of Art and Design. The university aims to create a peaceful world through arts and affords a chance to study arts for people of all ages by setting the preschool and distance learning systems.

What is the KAC?

KAC is a new type of pre-school that both mother and child enter together. Most of them spend three pre-school years here. We named this pre-school “college” because mothers are also students of this institution and attend the program everyday together with their children. In Japan, it is rare that mothers come to pre-school with their children everyday. Most children, 3 years to 5 years old, enter a nursery school “hoikuen” or kindergarten “yochien”. Generally, parents don’t need to attend the program.

Everyday they spend from nine 9am to 2:30pm together at KAC. 35 mothers and 36 children are registered now. The pre-school building stands on the premises owned by Kyoto University of Art and Design. We use one floor of the building. The floor is half divided into three rooms. There are two big rooms where children can run around. The biggest room has a kitchen while the smaller has a piano. The smallest room with many
picture books is suited for reading. The building is situated on the foot of a mountain so children can go out and play on the mountain immediately.

KAC asks mothers to come everyday because it is the key of mother’s learning. It is a hard request for mothers because they are busy in housework. But most mothers who choose this alternative to a yochien have various, strong motivations. Some mothers may come here for the purpose of seeing the development of their child continuously, some making friends through childcare, and others reconsidering their way to educate children.

KAC gives opportunity to encounter friends to take care of children together. It is not only a support for young parents but also an education opportunity for all parents. Mothers who make good relationships with others weaken their anxieties and reconsider their way of instruction to child. Most of them tend to force good behavior, but they need to wait their child's development and give chance to the thought how it should behave. They get at ease in themselves. This is also good for their children.

What Do Mothers Do?

It may be difficult for you to imagine this new type of school. First of all, I introduce the activity of mothers and children from 9am to 2:30pm.

Maybe a nuance of the word “Art College” reminds you on art lessons or talent education of art. But the staff of KAC rarely teachs these kinds of technique. Instead, parents and children are able to learn many things through daily life here.

1) The time of playing and learning

Mothers and children spend “the time of playing and learning” from 9am till 10am. During this time, mothers and children engage in any activity which they are interested in. In this regard, some mothers may play piano, some knit, or others cook sweets. During these activities mothers enjoy chatting and sometimes they talk seriously about their family affair. Talking to each other makes their friendship close.

Meanwhile some children play with their friends without adults. Sometimes they invite the staff or mothers to play with them. Other children participate in activities of adults. So we can see various patterns of interaction simultaneously.

2) The time of dialogue

After “The time of playing and learning”, from 10am to 11:30am everyone participates in the same activity. We call this time “The time of dialogue”. In this time, children share their experiences. For example, one child may show a beautiful insect
that it had caught in the morning to everybody. Another child does forward upward circling on the horizontal bar in front of friends, because he has trained very hard and hoped to show it to friends. So we can see that children who show the leadership in the activity get confident. Sharing their experiences brings good effect to every child.

The staff coordinates these activities putting mother’s talents and interests to use. So for example the staff proposes to a mother who had worked as a baker that she should make bread with yeast fungus together with children. Or if some mothers are interested in growing plants, the staff will recommend to seed vegetables with children. In this regard we can see that mothers enjoy producing the program for children and get ideas to enjoy childcare by their own way. Creative ideas are often provided from mother’s interests, and the staff tries to utilize these ideas to the activities of children.

3) The time of reflection

Everyday, mothers have a meeting before going home. They share today’s experience like a worry or notice about the development of their child. They don’t only talk about their own child but also the other’s children as they spend the day with many parents and children. Some mothers may see the development of their own child differently because another mother may provide her with a new point of view. Additionally, mothers can hear various opinions and reconsider their way of child caring. So time of reflection helps mothers in many ways to feel that they are never alone with their happy and worried feelings.

What Do Mothers Learn?

Mothers learn various things. I will give some concrete examples. I use diaries of mothers as instruments of research. To write a diary is a part of the educational programs of KAC. Mothers write a short diary everyday. They should write the affairs, feelings, and notices of the day. Everyday mothers hand in the diary to the staff. The staff writes comments for mothers or development of their children. It is a tool for communication. In addition, it helps to reflect their learning when they read their own diary after a long time past.

I am a member of the staff of KAC and I have confirmed to mothers that I use their diary as instruments of papers and present on any conferences. I use codenames in the diaries.
Episode 1  Realizing a new aspect of a child by seeing her playing.

It is the first year for Mrs. Sugiyama to come to KAC. She worried that her daughter Aiko was too modest to express herself.

She wrote about when Aiko and another child scramble the swing. There are two swings in KAC. There is a sofa for adults near the swings. She might look at Aiko from the sofa.

The first worry which new comer mothers often have is a fight of children. Before entering this pre-school, mothers and children only experience family affairs. Especially children who don't have a brother or sister rarely experience troubles with friends. Once they commit to a group, mothers get to realize a new aspect of their child.

It is troublesome for mothers to watch their child scrambling for a swing and beating or being beaten by another child. At first, mothers simply stop the fight saying “Fighting is bad.” or "Be nice to each other.”.

Mrs. Sugiyama was also surprised about the fight of children. But in this diary, she finds the change of behavior of her child in the fight with friends and regards the change as a good development.

Of course, she understands that the violence is bad and wants Aiko to make peaceful relationships with her friends. But she sees a development in the expression of her insisting. Because though she had only been patient when she faced some troubles with friends, after she got close to Ryoko, she got to express her emotion. Aiko gets confident because she succeeds to make close bond with friends.

It is important for a little child to insist on itself not to suppress her emotion and avoid troubles. Especially Japanese children tend to solve the conflict by being patient in many situations. But only being patient, children cannot get the ability to solve the

July 1, 2009  From the diary of Mrs.Sugiyama, Mother of a girl Aiko

Dear  Aiko
I heard that you and your friends said loudly "change!" "no" or “change!” "OK" near a swing today. I thought you had only been hesitating or watching before.
I saw you were crying when you scrambled for a swing with Ryoko and lost by her. I thought it was rare. Usually you don’t assert yourself and only wait after you say “change”. But you insist only to Ryoko. I guess Ryoko is your closest friend.
conflict. Children must express themselves and listen to the emotion of others to understand each other. It is the first step to express their own emotion.

Mrs. Sugiyama found that the fight is an opportunity to learn how to manage stressful events and to solve the conflict for children. She tried to watch the trouble and supported her daughter’s emotional development except for the case which may injure her friends. It makes the basis of reliable relationships and a close bond with her child.

**Episode 2  Finding pleasure in the growth of another child.**

This diary was written after a year later of episode 1. Himeko, the daughter of Mrs. Nakagawa, and the other children became the second older class. It had been a year since their mothers entered here.

Mrs. Nakagawa wrote about Aiko who we just talked about in episode 1.

<table>
<thead>
<tr>
<th>May 28, 2010   From the diary of Mrs. Nakagawa, mother of girl Himeko.</th>
</tr>
</thead>
<tbody>
<tr>
<td>What I realized and thought today.</td>
</tr>
<tr>
<td>・ Aiko showed her empty lunch box in order to appeal that she ate faster than usual. I think it is a good relationship to understand her feeling immediately without speaking to her mother.</td>
</tr>
<tr>
<td>・ I feel she has developed because she tries to interact with Himeko and Takako by jumping and clowning, although she had always played with adults not with Himeko. She tries to make friendships with kids of the same age though the expression remains still immature.</td>
</tr>
<tr>
<td>・ Yesterday, Himeko suddenly began to cry in the bath and confessed that “Today, I was told that ‘You mustn’t play with us’ by Takako and Ryoko. What a pity.” I was surprised of her intricate relationship with friends even of four or five years old. I cannot imagine it from her childish character like a runabout being naked. She said that “I cannot be nice with them. It is difficult”, though I thought you got along with them. I realized you already had intricate feelings.</td>
</tr>
</tbody>
</table>

At this time Mrs. Nakagawa understood the meaning of Aiko’s action easily and she felt happy. It was not because she evaluated to eat faster but because Aiko, who couldn’t eat much, tried and succeeded to eat fast. It was sympathy rather than praise. Mrs. Nakagawa could catch the heart of the child because she participated in its daily life. Thus, the mother encouraged Aiko to develop.

Mrs. Nakagawa also realized that the relationship between Himeko and her other friends gets intricate. Some Japanese children keep their worries in mind because they think having a trouble is bad and feel ashamed. In that case, children don’t like to be
asked about their worries. Getting over this kind of trouble needs complete trust that the mother is always loving and saving me and a good balance of relationship between child and mother.

The most important thing for the mother is to understand the child's feeling and to give a support which the child needs. Maybe it is only to hear. Mrs. Nakagawa understand that Himeko developed to have intricate relationships. She may regard Himeko's friendship with Takako and Ryoko more mature than before, prepare to support and advise her when Himeko needs it.

Children greatly develop in a group. Watching the growth of child in a group is very important to understand a child's behavior and mind. As the mother participates in KAC, she can be a good supporter of her child as she knows the world of children.

**Episode 3  Mother's development through child caring.**

Mrs. Furuta is the new comer of this school. Mrs. Gamou has spent five years here.

<table>
<thead>
<tr>
<th>May 7, 2010   From the diary of Mrs. Furuta</th>
</tr>
</thead>
<tbody>
<tr>
<td>What I moved yesterday</td>
</tr>
</tbody>
</table>

Suddenly, I heard a loud voice and found that Mrs. Gamou scolded Jun. It was so serious that I couldn't stop to watch them. I heard Mrs. Gamou was saying “It's against your interests!” from a distance. I didn't know what he had done, but I was moved by her serious attitude. How wonderful she could scold another child so serious. It's impossible if she didn't love him as her own child. I am happy to enter this school. I hope to become a mother who can scold other children seriously.

As I mentioned before, all mothers take care of all children while cooperating with each other. But it is difficult for newcomer mothers to deal with other’s children as their own especially when they must scold a child, for example when a child acts dangerously for others or hurts others feelings. Newcomer mothers tend to hesitate about cautioning because they think that they should not intervene the childcare of another household.

Mrs. Furuta got to hope to become like Mrs. Gamou in the future because she found what mothers should be like in Mrs. Gamou. She thinks that it is important to accept the feelings of the child. She regards Mrs. Gamou as a good model because she can consider the feeling of all children and doesn't take a passive attitude towards social
pressure.

The merit of making good relationships is not only the support of child caring. A newcomer mother encounters various people who have various identities and ways of thinking. Sometimes she got moved by others. At other times, she must manage a conflict of opinions, reconstructing her view of life and child caring. KAC is the place to learn human relationship and to find their own way of child caring through a group life.

**Episode 4  Making reliable relationships**

The diary was written when Mrs.Nakagawa could not come to the school because of her injury. For a while, Mrs.Baba, who is the mother of Takako, took Himeko to the pre-school. Although Himeko spent discouraging days here without her mother, Mrs. Baba and other mothers helped her.

---

June 18, 2010  From the diary of Mrs. Nakagawa.

・ Since I got injured on June 6, I had been helped by mothers of second older class. I was not good at relying on others though I was always relied by others and overcame hardship by myself. But in this time, it was hard for me to take care of Himeko by myself, though Himeko also helped me. I could depend on Mrs. Baba and other mothers. Everyone helped us. The injury was unhappy, but I felt very happy to find the kindness of my friends for this week.

・ It is the best treasure to get many friends who are kind to me like a family. I am happy that I have found myself to be pleased with the development of kids, even not in the case of Himeko, and to love all kids. I am also happy that kids always trust to other mothers even if she is not his mother. I want to appreciate it.

As I mentioned in episode 2, Mrs.Nakagawa understands the character of other children well and takes care of them. She is so sensitive and honest that she always helps other mothers. Her injury ended up to be a good opportunity for Mrs.Nakagawa to learn mutual aid.

Other mothers also understand many children and support each other to take care of them. Bringing up all children by all mothers, they can make good, reliable companions.

**Conclusion**

As I mentioned before, KAC is the place where mothers help each other to take care of children. By learning various ways to care children, they develop as a mother
together with their child.

KAC offers the chance to participate in children and to make a bond between mothers. These also mean to learn from others and to consider about diversity of individualities. In order to make a good community for childcare, it is necessary for mothers to be thoughtful of all children and all mothers. The goal, creating a community in which everyone can coexist, is connected with making a peaceful world.

Children give us many chances to reconsider about our lives. Often they conflict with their friends but they surely seek to the ways to make up. They don’t fix the relationships when it is in bad condition. We can learn to coexist from children. Having the purpose to raise children connect with many people. People can make a better world if they hope for the common future.

TEACHER EDUCATION: FROM EDUCATION TO TEACHER SUBSTANCE AND PRACTICE

Abstracts

This article aims to reflect the trajectory of the teacher from the perspective of building and rebuilding the knowledge of the professional in education; it shows the teacher constituting the development of his knowledge-substance and knowledge-practice over the course of teacher performance, which makes each professional unique, though they consist of the same feelings and the same needs. These perspectives are made salient in the view of authors such as Tardif, Maués, and others. The methodological proposal used is naturalistic-constructive. This article deals with the difference between a mathematician and a Mathematics teacher, and highlights the aspects relevant to classroom practices in this discipline. The importance of practices that are reflective, critical and allied to theory is also highlighted. The characteristics pointed out in the text with respect to teacher education evidence the need for general cultural education, that is, the education of a “civilized man”. This characteristic, when constructed, enables the Mathematics teacher to relate the content of this discipline to the daily situations of the student’s life, thereby establishing the meaning of the discipline for the student.

Keywords: Teacher Education, Mathematics, Mathematics Teacher

INTRODUCTION

Every teacher, before becoming one, has been a student, and certainly innumerable experiences, as a student, have an impact on the learning process and, by extension, the teaching process, since teaching and learning are interwoven.
The teacher’s first contact with the teaching career is like an object of study for other teachers. This means to say that teachers, apart from aiming to achieve determined objectives in education, also work on an ‘object’, which is the student (Tardif, 2002). Tardif, upon identifying students as objects, sees them as human beings who, while socialized, are individualized, unique, and each one has particular characteristics, differences, a particular way of learning, comprehending and understanding, not only the content inherent to the academic context, but also to society as a whole.

This way, the academic, the future teacher, builds his conceptions with respect to teaching and learning, according to the experiences had through different pedagogical conceptions, once each teacher assumes a theory of teaching and learning.

In the perspective considered, the student, upon entering teacher education courses, comes rooted in ‘conceptions’, ‘ways’ or ‘models’ that were experienced as a student. These experiences are capable of aiding in his own education as well as complicating or inhibiting the development of proper teaching practices, since they imply the consideration of a style of ‘teaching’ related to the way in which he had learned.

One study presented by Raymond et al. (1993) points out these conceptions regarding teaching, as implicit and established as certainties, since this is how they learned and how they intend to ‘teach’.

This position appears to imply that being a teacher means taking a ready and complete pedagogical model, and simply repeat it (as if that were possible) like an unchanging technique that can be applied without adaptations or changes necessary for each context.

However, the teacher is directly connected to objects of knowledge, and they are built and rebuilt constantly. Thus, taking a teacher as a model cannot mean adopting a
way of being or doing, since we cannot, given that we are unique, but he should be
reflected in it like a stimulating model to achieve his own objectives which enable the
development of one’s own autonomy, personally as well as professionally.

This autonomy enables the teacher to not only perceive or understand the
academic and social context, but mainly, to perform in a way that improves them,
contributing towards the enhancement of one’s own knowledge as well as those
involved in such contexts.

Only by understanding the circumstances of each context and the consequences of
the processes under way can the teacher build and rebuild his autonomous performance,
that which reflects his understanding of the situation and the possibilities of defending,
improving and even changing them (Contreras, 1997). This represents a pursuit, a
learning process and the construction of a reflective and critical teacher.

Teacher education refers to a series of factors, among them practice, the aspect
which contributes to the construction of knowledge. Certainly, practice in itself is not
only about knowing, but when it provokes a critical effect in knowledge it can be
understood as a learning process, where teachers rebuild their education.

Practice allied with theoretical conceptions structures the identity and the know-
how of the teacher. Maués (2007) reinforces this idea saying that teacher education must
be based on a solid theoretical background. The teacher builds his own knowledge,
complete with sets of knowledge, those currently as well as previously acquired, which
contribute to the creation of a unique professional identity.

The identity and the know-how of the teacher are related to the way in which he
develops his classroom activities, in other words, through the different ways in which he
can contribute to the development of the teaching and learning process. But, for this he
needs to have a quality academic education. An education capable of building and
rebuilding practices and/or experiences acquired and developed by the academic over the course of his life, or, the education of a “civilized man” (Carr, 1995; Kant, 1958; Ortega and Gasset, 1999). The ideas of Carr, Kant and Ortega and Gasset on the education of a “civilized man” implies thinking about civilized not in the ornamental sense, but as a system of ideas about situations, the world and humanity in each era, and being able to reflect and conjecture about them.

The perspectives mentioned above can improve the quality of academic development, and by extension, the quality of teaching, since teaching is a cyclic process, and since working teachers at the teaching levels prior to Higher Education have, for the most part, come from these levels.

QUALITY IN TEACHER EDUCATION: mathematician or Mathematics teacher

Quality university education has lately been an object of concern and international level studies. And one of the indicators pointed out by the World Bank (1995, 2000) regarding a qualification that tends to the demands of the market is a greater adaptability of Higher Education to the demands of the job market. This demand of the academic, apart from competence in a specific area of knowledge, flexibility and awareness of knowledge that, upon graduating from a Higher Education institution, his education is not ready and complete, but demands constant renewal and improvements, in order to keep up with the scientific and technological advancements of the globalized world.

This means to say that there is a need for continuous study, which makes the professional more and more qualified in his profession, being able to contribute with greater success to his area of performance. In this context, the graduate programs, with their relevant research, respond to educational needs, improving teaching in the institution itself and by extension the educational quality of the previous levels.
A quality teacher education, whether from an undergraduate or graduate program, or a continued education course, is a relevant aspect in the teaching and learning process for all levels of education. The teacher is a fundamental part of this process.

Teacher competence is not summed up in a technique composed only of skills specific to his discipline; in other words, “the teacher is not a technician or an improviser, but a professional who can use his knowledge and his experience to develop himself in preexisting practical pedagogical contexts.” (Sacristán, 1995, p. 74).

Understanding teacher professionalism goes beyond knowledge and skills: it includes attitudes, behaviors and values that form the particularities of the teacher. Being a teacher means being capable of programming one’s own program of professional development. It means being open to learning as a whole, being an investigator in the whole of the teaching profession, to know how to adapt the content of the discipline to the needs of the job market.

The needs of the area of teaching Mathematics go far beyond knowledge of Mathematics. They mainly require knowledge of how to teach it. In this sense, teacher education in this area requires a set of strategies that contribute to better teaching, and consequently better learning. This set of strategies refers to differentiated learning activities, such as using games, mathematical modeling, expository classroom dialogues, and tutorial services, among others. This diversified set of methodological practices will be understood here as “good practices” for teaching Mathematics.

When “good practices”, mainly in Mathematics, are experienced by academics, they can be learned, and then applied to their own teaching practice. However, it is known that for a differentiated teaching practice, there are various factors that are involved, like for example, the organizational structure of the teaching institution where they will be taught. Nevertheless, the use of good practices for teaching Mathematics in
academic development enables the students to learn, to compare and contrast new information from known information. This means to say that one is collaborating towards the education of a critical and attentive teacher, in other words, enabling the construction of teacher autonomy.

This suggests, then, that the teacher who only ‘professes or teaches’ should start to rethink his role as an educator. The teacher who is aware of his teaching role needs to answer to the demands of the job market, which means to say that teaching Mathematics needs to be aimed at applicability; that is, the student needs to learn how to use and perceive where to use Mathematics from school in his daily life. Learning needs to be meaningful for the student (Ausubel, 2000). Studies in the area of Mathematics emphasize the importance of teaching aimed at meaningful learning for the student (Nuthall, 1997; Good, Grouws and Ebmeier, 1983).
