My experience has been learned. Like I noticed that one of the EA’s that I work with just did not take a lot of initiative to do anything. So I just mentioned this to the resource teacher because the school that I work at, the resource teacher is the supervisor for all the EA’S. If there are issues or difficulties, we just talk to the resource teacher, and she sort of gives us strategies, or tells us how to work with the EA. So the resource teacher just said, “You know, you are the teacher, and if something is bothering you, you need to be able to go and talk to him/her. At that time I also told the resource teacher that I struggle with confidence because the EA is a lot older that I am. The resource teacher gave me a boost of confidence to go and talk to the EA and I just approached it in such a way that it was more casual in conversation, like, “Oh, by the way, just make sure you’re always checking over the schedule I gave you. That’s one of the ways I helped the EA take more initiative, because I made a schedule for him/her on the six day cycle. When EA’s stay in my classroom, they are both specifically assigned to two students. That is their first job. They look after the two students to see if they need help with their assignments, behaviorally, or if they need any reminders. Near the beginning of the year, the one EA that I work with would check on the student he/she was assigned to, and if that student wasn’t needing any help, sometimes I would see him/her sitting down on a chair, and that’s where initiative comes in. So I said, “You know, walk around the class, see if anyone else needs help because it’s really a classroom job. I don’t view it as just a one student job. Yes, you’re in the classroom to help this one student, but if that student doesn’t need help, then take initiative and go help others, because we know that all students need help, and they’re not all assigned to EA’s. She’s better now about monitoring and going around to see if anyone else needs help.

Participant #3:

Like I said, I find it really difficult to know what’s o.k. to ask them to do and what isn’t. For example, when the class is working on an activity or a project the EA’s wander around to make sure all the kids are o.k., especially the kids that they know will have more trouble with very specific instructions. Sometimes they’ll help the kids take notes but beyond that I find it really hard to know what’s o.k to ask them to do, and I feel uncomfortable about that. I know that the ones that come in with specific students, like if they’re attached to “A” student, they’re responsibility is that student.
Participant responses indicate that classroom teachers have varied experiences directing the work of educational assistants. Directing may mean having the EA:

- Help with immediate needs, sometimes photocopying, sometimes odd jobs
- Assisting a struggling student, talking through a task
- Guiding a student through reading
- Guiding a student through writing
- Guiding a student through an assignment
- Following a classroom schedule
- Learning to take more initiative in the classroom
- Participating in student behavior coaching

Each of the respondents identified different experiences directing the work on an EA. While Respondent #1, focused on directing the EA to assist with immediate needs of students in the classroom, or the class as a whole with a focus on one on one assistance, guided reading and writing, Respondent #2, identified challenges in directing the work of an EA who lacks initiative, and developing confidence in speaking to an older adult. Respondent #3 identified struggles with knowing what is acceptable to ask of the EA in the classroom.

**University Preparedness**

When asked how their university education prepared them for directing the work of an educational assistant, the responses were:

Participant #1:

Good question. Very little. I would say very little, very little. The most experience that I got was in my practicum. In my last year of practicum in the classroom. The teacher told me, “Use your EA, she/he is there.” And I was so caught up in trying to teach, being that I was still learning, that I didn’t know how to use the EA, so it was hands on learning. Right there.”Use y our EA” that’s what I was told, so I tried.

Participant #2:

I’m trying to think back on where I heard about working with an EA, and I don’t think I did other than in the practicum, my student teaching practicum. It was only in my second year of practicum that I had an EA in the classroom. I don’t remember hearing about it in university. Although, we had a class on development – and the different exceptionalities that students could have in your classroom, like ADD, and then I think I heard that we might have an EA in the classroom, but we didn’t learn how to work with them, no.
Participant #3:

In my final year we took one course and learned a little about adaptations and modifications, but no talk about EA’s. I don’t even think it entered our minds. It was part of our professional role to be able to plan programs for students, but then to not only plan programs for students, but also plan for whoever comes with them and to know what their role is [the EA] – I don’t think any of us ever thought about that. I don’t think it was ever mentioned – I don’t have any concept of being trained or educated for this. I never even saw one [an EA] in my first year of practicum, I saw one in my second year but had very little contact with him/her. He/she was mostly dealing with the cooperating teacher, and I just never thought about what that interaction was. I guess the cooperating teacher also just never thought to highlight that information. Then in my final year, there was one that I saw but he/she was the English as an Additional Language EA, and because they ran their own program, I had very little to do with it. The experience was so little and so brief, it didn’t seem to me at the time that it would ever apply to the big picture of things. Whereas now in my job, I probably spend half of the day with an EA in some capacity in the classroom.

The common theme running through all the participant responses indicate that classroom teachers have very little, if any university training or preparation on how to direct the work of an educational assistant in the classroom. Additionally, participants indicate giving very little, if any thought to how directing the work of an educational assistant in the classroom would ever apply to them in their careers.

**Current Questions**

When asked what questions they currently have about directing the work of an educational assistant in the classroom, participants replied:

Participant #1:

Yes, now almost having done a year, I feel good about how it’s going in my class. I think it would be different if I had a funded student in my class – always having to go back and look at the programs of that funded student. And, then perhaps changing the roles of my EA as that student improved academically. Not currently having a funded student, I am privileged to have someone just be that extra hand in the classroom.

Participant #2:

Do resource teachers supervise the EA’s in all the schools? Cause that would be one thing, about directing them. Do you go to the resource teacher and ask for strategies, or do you go right to your EA?
Participant #3:

I would like to know what you can and cannot ask them [the EA]. But I also think that differs by school, and will differ by school division, and will differ by student, and will differ by EA. So it’s almost like you need some sort of workshop at the beginning of the school year as to who all the EA’s are, who they will be working with and what their schedule is – and what the needs of the students are. I would also like to know what to do when it’s a relationship that’s not working. I would like to know what my role is in that especially when they’re old enough to be my mom. How do you deal with that? I don’t know what makes that easier, but I would like to know.

The first participant avoided directly answering the question instead focusing on current accomplishments although identifying how different the situation may be if there were a funded student in the classroom. The second participant is interested in the supervision of EA’s and how the role of the resource teacher affects the EA teacher relationship. The third participant has since the onset been addressing the need to know about the roles and responsibilities of the educational assistant, speculating those roles and responsibilities may differ from school to school, between school divisions, from student to student and also by individual EA’s.

Do Schools have Handbooks Addressing the Roles & Responsibilities of Educational Assistants?

When asked whether or not their school had a handbook addressing the roles and responsibilities of educational assistants, responses were:

Participant #1: Yes, they do.

Interviewer: Have you seen the document?

Participant #1: Yes.

Participant #2: You know, I don’t know. Nothing that I have ever read or been asked to read.

Participant #3: I don’t know.

Manitoba Education & Training

When asked about knowledge of Manitoba Education and Training documents identifying the roles and responsibilities of educational assistants in Manitoba schools participants stated:

Participant #1: I’m not aware. I haven’t really looked into that.

Participant #2: I don’t know.

Participant #3:
I would say “no” because I don’t think that EAs are required to have formal training to be an EA. So, because they don’t have to have formal training, my guess is that there are no formal guidelines.

In the Fall of 2009, Manitoba Education and Training issued a document titled “Educational Assistants in Manitoba Schools”. The purpose of the document was to provide educators, school administrators, and school division administrators with a resource to support the work of educational assistants in Manitoba Schools. Educators at the university level should be the first to provide pre-service teachers with an introduction to the roles and responsibilities of educational assistants in the province. With pre-service discussion about the various disabilities teachers might encounter in the classroom, familiarization with Individual Education Plans, Behavior Intervention Plans, program adaptations and modifications, consideration about how to direct the work of an educational assistant in the classroom is pragmatic. During student teaching practicum’s, pre-service teachers should be required to demonstrate competencies in the directing the work of a paraprofessional in the classroom. Finally, school administrators have an obligation to provide first year teachers with a school and/or division document outlining the roles and responsibilities of educational assistants within the school division.

The results of this study add to our understanding of first year teacher preparedness to direct the work of another adult in the classroom, specifically, an educational assistant. It encourages university teacher training programs to incorporate both theory and hands on training for pre-service teachers on how to direct the work of an educational assistant in the classroom. It reminds school administrators to make certain that first year teachers are aware of the roles and responsibilities of educational assistants from the provincial level as well as specific school division level.

Interviewing first year teachers who direct the work of an educational assistant in the classroom gave me the opportunity to hear from teachers’ first-hand as opposed to speculating on other first year teacher’s experiences based on my own. I heard from three remarkable young women about their challenges to focus on teaching, become familiar with curriculum, manage student behavior, and figure out how best to direct the work of an educational assistant in the classroom. More substantial pre-service training and on-going in-service training on how to supervise another adult in the classroom would more effectively prepare classroom teachers for their roles.

Abstract

The presentation will introduce participants to Title V PPOHA grant, awarded to the University of St. Thomas in Houston, Texas to offer on-line Master of Education degrees for primarily Hispanic American teachers. Graduate studies will focus on Educational Leadership, Special Education, and Dual Language. A Graduate Success Center serves as a resource to support the students in technology, research and writing.

Keywords: distance education, online learning, grant, masters in education, principal, dual language, special education, Hispanic
HISPANIC AMERICAN TEACHERS AND MARGINAL SCHOOLS

Title V: Preparing Hispanic American Teachers for Marginal Schools (PPOHA)

The main goal of the title V grant at the University of St. Thomas (UST) is to implement an on-line Master of Education program designed primarily for Hispanic American teachers to assist them in providing high-quality education for their students in marginal schools. This graduate program will help to fill the critical shortages of P-12 masters-level educators in the areas of dual language, special education and educational leadership.

The greater Houston area contains one of the most diverse student populations in the entire nation. The student population in the Houston Independent School District (HISD), the seventh largest school district in the nation, is largely culturally and linguistically diverse. African American students make up close to close 28%, and Hispanic American Students make up over 61% of the total student population (HISD Facts and Figures, 2009). In 2009, 55 out of 222 schools missed making Adequate Yearly Progress (AYP). Urban students bring various complex problems to school. Challenges arising from poverty, language differences, and social needs must be addressed. A majority of HISD students have special needs that present many challenges. School leaders must be equipped to provide interdisciplinary leadership with their staff to improve outcomes for children.

The Title V Promoting Post Baccalaureate Opportunities for Hispanic Americans (PPOHA Program) was developed to initially offer a Master of Education degree with emphasis on Educational Leadership that will lead to Principalship certification. The number of master’s-trained educators in Texas is far below the national average. Nationally, 45% of P-12 teachers have a master’s degree (National Center for Educ. Statistics, 2009); in Texas the number is 21% and in the Houston school district the number is 27.4%. Master’s-level teachers assume leadership roles in the schools and are prepared to “train the trainers” in up-to-date technology-rich solutions. They provide professional development for the school and district and thus are responsible for introducing and supporting state-of-the-art research-based teaching practices. Their influence extends far beyond a single classroom.

Among special education teachers, the attrition rate has remained high, at approximately 14% (Boe, Cook & Sunderland, 2006). The primary reason for this attrition is lack of support from building-level administrators (Hansen, 2007; DeMik, 2008). In a national study, practicing special educators reported being hampered by unmanageable caseloads, ambiguous and competing responsibilities, job fragmentation, and conflict caused by ill-defined and often contradictory expectations on the part of parents and administrators (Hansen, 2007). A recent Texas study of special education personnel needs supports this concern. One in three special education teachers surveyed indicated they were planning to leave their jobs. Nearly 75% indicated they were planning to leave the field of special education entirely (Texas Education Agency, 2007). Administrators in Special Education are expected to support the induction of new teachers, and view results for students with disabilities and cultural diversity as an integral part of the school’s accountability system. These responsibilities together with demands on special educators to meet the complex needs of diverse learners increase the need for administrator who can support and reduce attrition of special education teachers (Washburn-Moses 2009).

The Need for Dual Language Instruction is critical. In the Houston Independent School District, the number of English language learners (ELLs) doubled from 29,112 in 1988 to 59,055 in 2008 (Window on State Gov’t.; 09), and by far the vast majority of ELLs are Hispanic. While the appropriate educational strategy for ELLs was at first unclear, research confirms that the best approach is unquestionably dual-language learning – an approach in which instruction proceeds in both English and the student’s native language. In several studies, ELLs were randomly assigned to groups in which students were taught either in English only or in English and Spanish. Students taught in both languages consistently outperformed students taught only in English (Goldenberg, 2008). A formidable problem remains in implementing these promising findings – a critical shortage of appropriately trained dual-language teachers. The situation is particularly bleak in Texas: “Elementary bilingual and ESL positions are the most critical teacher shortage area in Texas” (Lara-Alecio & Galloway, 2009). According to the Texas Coalition for Bilingual Education, at least one out of three new teachers hired to work in bilingual or ESL classrooms are not certified to teach in those areas; the highest incidence occurs in elementary school (2005). The Texas Education Agency reports that 2165 elementary and middle school ESL/dual language teachers are teaching without certification (2009). These “out-of-field” teachers provide an opportunity for UST to increase its graduate enrollment; UST is poised to provide master’s-level training to these dual language teachers so that they may
become certified in their field. These master’s-trained education leaders are poised to make significant improvements in P-12 special education and dual language education throughout the Houston area.

UST will improve access to the master’s in education program by developing a significant portion of the graduate programs in educational leadership, special education, dual language for online delivery. The students will have an option of registering for a fully online or a blended program. Revising graduate course content for online delivery will provide a welcome opportunity to revisit best practices and incorporate them into the curriculum as appropriate. UST will design institution-wide graduate fellowships and scholarships for low-income students to defray costs of tuition, research, and professional travel. Hispanic students who are classified as low-income and other low-income students will be offered a $5,000 annual scholarship based on their undergraduate GPA.

When one considers the total Hispanic population of the state of Texas and the United States, it is evident that this program will reach far beyond the perimeters of the city of Houston. For this reason, a fully online program is imperative. According to the 2010 Census Bureau, 36.5% of Texans and 15.5% of USA citizens are of Hispanic or Latino origin. Texas is one of 16 states that has at least one half million Hispanic residents. In fact, 97% of Starr County’s residents are Hispanic. (US Census Bureau) Where will the dual-language specialists and principals come from to fulfill the needs of that county? They need to come from within the district’s teacher population. Reaching out to other states will also prepare teachers for the growing Hispanic populations in their communities. For example, North Carolina, South Carolina, Georgia, and Tennessee’s Hispanic population has grown exponentially over the past three decades. (See figures below.) By offering a completely online program, the University of St. Thomas desires to reach out to teachers in areas such as these to prepare them to accommodate population changes in their classrooms.

UST developed an Institution-wide Graduate Student Success Center (GSSC) to improve retention and graduation of master’s students, including Hispanic students. The GSSC incorporates both face-to-face and virtual services. It includes three development activities. First, an advising/mentoring component to assist students with barriers such as acculturation to graduate school, balance of family and academic responsibilities, financial aid, career planning, and to connect students with mentors who can provide support throughout the student’s graduate career. Second, a writing support component was developed. As noted previously, the majority of graduate students are unprepared for the rigors of writing at the graduate level and struggle with writing throughout their program. Writing software, writing workshops, and writing tutors/mentors will be provided. Third, a research support component to assist in overcoming a major barrier to graduate student success is a research-oriented thesis. This component will include access to up-to-date research databases and statistical software, workshops and tutoring/mentoring services. Assistance with research methodology and human subjects’ protocols is also available.

The participants of the presentation will be introduced to the PPOHA program development at the University of St. Thomas. This program will serve time and place-bound students who need a graduate degree to further their career. It will particularly focus on educators who need a graduate degree in educational leadership, special education or dual language to improve their skills, their credentials, their school and their district. The project will serve graduate students who are faced with daunting challenges, including demographic and socioeconomic issues and almost overwhelming financial issues.

Dr. Rita Richardson has brought a wealth of experience to the University of St. Thomas from teaching special education in Louisiana to serving as a faculty member of Old Dominion University, Southeastern Louisiana University and University of Texas at Brownsville. She has authored four volumes of a social skills program, *Connecting with Others: Lessons for Teaching Social and Emotional Competence*, and a text book on behavior management. She is presently developing on-line graduate courses with Mrs. Kelly Gideon.

Kelly Gideon has worked in the field of online education for the past ten years with a variety of experience in corporate and university settings. In addition, she has taught from elementary to university students both in the United States and in Central and South America, which gives her a unique perspective as a course designer for this grant. She has an intense dedication to the success of this UST program.

ABSTRACT

Exploring University Students’ Development of Emotional Intelligence Skills for Leadership

Dr. Joseph Ramos-Villarreal
Dr. Glenda Holland

The study was conducted to add to the knowledge base and further the understanding of Emotional Intelligence and leadership theory. Leadership has been a matter of much debate, since its broad definition still leaves much to be defined about measurement and what constitutes good leadership. Numerous theories have emerged from scholarly research and observation in studying Emotional Intelligence, human behavior, characteristics, traits, roles, and social status. Leadership assessments, instruments, and tools have been used by researchers and scholars in studying good leadership and the well-being of people. Some theories that emerged from research on leadership were The Great Man Theory of Leadership, Trait Theory, Behavioral Theory, Contingency Theory, Transactional Theory, and Transformational Theory of Leadership. These theories helped to reinforce how the perception of leadership has been identified and has changed throughout the years to reflect organizational development. Studies in the area of leadership helped to identify relationships between leadership theory and other factors that promote success for understanding human behavior and achievement. Successful Intelligence, Emotional Intelligence, organizational excellence, and career field development areas are examples of Leadership relationships with other field areas.

The study added to the research knowledge base of Emotional Intelligence and leadership though the development of student profiles of both First-year freshmen and graduating senior
business students. The Personal Excellence Map (PEM) (Nelson, Low, & Hammett, 2007) was used in developing the student profiles. This study developed benchmarks of development and a rationale for initiating development of Personal Excellence skills for university students in business.
Building Relationships and Developing Excellence in the Classroom

Topic Area(s): Teacher Education and Cross-disciplinary areas of Education

Dr. Doris Sikora

Western Kentucky University
Bowling Green, Kentucky

Address: Western Kentucky University; 1 Big Red Way AC 303; Bowling Green, KY 42101
E-mail: doris.sikora@wku.edu

Abstract:
As we focus on the future of education, two major themes come to the forefront – school reform and student success. It doesn’t make a difference if we are dealing with “no child left behind” or we are “racing to the top” we must remember that our major concern must be the students in our classroom. The relationship developed between a student and the teacher is the greatest predictor of success. It is paramount that each teacher learn to build positive relationships and models excellence in their teaching. This workshop will provide teachers with a fun and interactive way to develop effective strategies and provide them with a “new bag of tricks” for building those relationships necessary for excellence in the classroom (successful students). Using “True Colors”, participants will learn about their own personality color style as well as those of their students. This workshop will demonstrate how to create lessons to increase learning by providing for every student. Participants will leave with research based strategies that will foster positive attitudes, increase communication and team building skills and improve personal relationships amongst their students.
In 2006 the State of Massachusetts issued five-year continuation grants to help local school systems adopt strategies to better serve the needs of students who had experienced trauma. Since then, 23 school systems have been funded. These schools have established committees of parents, noted trauma experts, educators, community mental health centers and advocates to address the educational and psycho-social needs of children in the regular education classroom whose behavior interferes with learning, particularly those who are suffering from the traumatic effects of exposure to violence.

The Problem

Schools are seeing more and more children in the classrooms who are trauma survivors and attempting to meet their needs. Many schools are learning to identify children who are trauma survivors and understand how their trauma experiences impact their learning and the educational community. The following statistics reveal the magnitude of the problem.

- Between 3 and 10 million children witness violence in their home every year
- 1 in 25 homes has an adopted child residing there
- One out of four children in the United States will experience a traumatic event before the age of 16
- More than 500,000 children in foster care
- More than 50,000 are adopted from foster care annually
- More than 20,000 are adopted from other countries
- More families are adopting post-institutionalized children from orphanages overseas and from foster care.

Trauma has been found to impact the child’s ability to learn and the long-term consequences of trauma are just now being recognized. Just looking at adoption status of students suggests that children who have been adopted are at higher risk for learning problems. It is estimated that 30-40% of all adopted children qualify for special education (only 9% of biological children require Sped). Adopted children are 2-5 times more likely to require psychological treatment.

This Workshop will review the literature on the effects of trauma on learning including both the effects by function (Attachment, Biology, Affect Regulation, Cognition, Behavioral Control and Self Concept) and by the child’s age. A brief description of the cycle of violence and how it impacts the students ability to learn will be presented with implications for educators. Different types of trauma will be reviewed and the implications on the child’s learning will be identified. The broader effects of a student’s trauma on the school community will be reviewed and individual case examples will be presented to illustrate the impact of that child’s trauma on the school community.
**Intervention**

The schools participating in the Massachusetts Trauma Sensitive Schools Grant Program have taken a number of steps to improve the educational environment of children who have suffered trauma. These include:

- Comprehensive professional development for teachers and other staff
- A team of school/district personnel to assess individual student cases
- Expanded counseling services
- Referrals to outside support services
- Parent and family workshops on the effects of trauma
- Conflict resolution training for both teachers and students
- Consultation with local hospitals, mental health facilities, women's shelters, and other community based organizations
- School/district administrative support for establishing a trauma sensitive environment
- Academic instruction techniques for teaching traumatized students
- Development or revision of school policies to be more trauma sensitive

These interventions will be reviewed with some guidelines offered on how a school system could implement such programs. Implications for individual classroom teachers who are not currently working in a trauma sensitive school will be presented.

**Outcomes**

Schools that have been involved with the Massachusetts Trauma Sensitive Schools Grant Program have experienced a number of positive outcomes including:

- Significant decrease in the number of school suspensions and expulsions
- Reduced incidents of students sent out of the classroom for disciplinary action
- Reduced incidents of school bullying
- Reduced incidents of student violence toward other students
- Increased classroom time spent in instructional activities and reduced time spent in student correction for behavioral problems

The Workshop will outline methods of measuring outcomes and tying these outcomes to interventions will be reviewed so that systems can measure the effectiveness of programs.

Finally, funding options will be briefly reviewed citing Federal sources for grant monies and available foundation supports.
Title: Psychosocial Predictors of Adjustment and Well-Being during the First Semester of College

Topic: Higher Education

Psychosocial Predictors of Adjustment and Well-being during the First Semester of College

Abstract

Previous research (Hardin & Witcher, 2005; 2007) examined how college adjustment and psychological and physical well-being were predicted by college choice variables such as the attitude toward college and the influence of important others (e.g., parents, high school counselors). Our previous research focused primarily on variables related to the Theory of Reasoned Action (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975), and individual differences variables such as coping styles (as described by Greenglass, Schwarzer, Jakubiec, Fiksenbaum, & Taubert, 1999). Our findings in 2005 and 2007 were fairly consistent. To determine whether these results are valid and reliable, they need to be replicated using additional samples and alternative measures of the variables. Therefore, the present research was commenced to determine the reliability and validity of previous findings and to examine any other factors from the College Choice Influences Scale (Dixon & Martin, 1991) that were previously unexamined.

Dixon and Martin (1991) identified internal and external influences on the decision of whether to attend college rather than pursuing some other goal. Their five factors include (1) the influence of important others such as high school guidance counselors and teachers; (2) a family tradition of attending college and perhaps even a specific institution; (3) the opportunity to use college as a life and career planning resource; (4) the opportunity to experience new social environments or to gain independence from home and parents; and (5) the student’s own attitude toward a particular university or college. Previous models (Hossler & Gallagher, 1987; Litten, 1982; Trusty, Robinson, Plata, & Ng, 2000) treat college choice as an outcome variable. Hardin and Witcher (2005, 2007) examined what predictive powers the college choice influences might possess.

Hardin and Witcher (2005) found that the student’s attitude toward attending college was a predictor of several adjustment and well-being variables. Positive attitudes toward college were associated with less depression and more positive well-being. Also, the attitude toward college was positively related to adjustment to college, and specifically optimism about being in college. Active coping styles were associated with positive well-being and a positive outlook toward the future. These results indicated that the factors behind the decision to attend college, rather than pursuing some other goal, and individual differences variables such as coping styles, do predict students’ adjustment and well-being during the first semester of college.
Hardin and Witcher (2007) also demonstrated that the attitude toward college was related to levels of overall psychological adjustment, including optimism, general negative affect, and homesickness. The attitude toward college also predicted well-being variables such as positivity, depression, and anxiety. The influence of others also served as a predictor of psychological adjustment. Therefore, the Theory of Reasoned Action (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975) could be applied to predict psychological well-being and adjustment after the college choice behavior had been performed.

This current research sought to replicate the previous findings and to validate them using an alternative measure for well-being. Doing so will increase the confidence in the results and provide a firm basis on which to develop interventions utilizing them in the college environment. We used college choice influences as predictor variables and examined how they were related to adjustment to college and psychological well-being. The College Choice Influences Scale (Dixon & Martin, 1991) measures five factors: Attitude, Life Planning, Others’ Influence, Independence, and Family Tradition. The College Adjustment Test (Pennebaker, Colder, & Sharp, 1990) measures the psychological adjustment to college on three subscales: optimism, homesickness, and general negative affect. These subscales can be combined into an overall adjustment score. Finally, the General Health Questionnaire (Goldberg, 1972; GHQ) measures psychological and psychosocial symptoms. This measure was chosen because it is intended for use in community samples rather than clinical samples. The GHQ has five subscales (Huppert, Walters, Day, & Elliott, 1989), utilizing 24 items of the original 30, to measure anxiety, incompetence, depression, difficulty in coping, and social dysfunction.

Method

Participants

Participants were 24 students at a women’s college and 44 students from a co-educational, private university. These participants were 18.2 years old on average, and the majority of participants were Caucasian (77%). Students enrolled in the first-year seminar class received an invitation to complete the questionnaires and participated in exchange for the chance to win a gift certificate in a lottery.

Questionnaires

College Choice Influences Scale (Dixon & Martin, 1991).

This scale assessed the influences that students considered when deciding to attend college. The questionnaire contained 26 items, and students rated their agreement using a 1 (disagree strongly) to 6 (agree strongly) Likert-type scale. The five subscales measure (1) the student’s attitudes toward the chosen college (seven items; e.g., “I came to [college/university] because it has a friendly reputation”; \( \alpha = .76 \)); (2) the degree to which the student is attending college to clarify career and academic goals (five items; e.g., “I am going to college while I figure out what I really want to do with my life.”; \( \alpha = .31 \)); (3) the degree that other individuals influenced the student’s decision to attend college (five items; e.g., “In my family, going to college is encouraged”; \( \alpha = .40 \)); (4) the student’s desire to escape parental influence and
have new social experiences (six items; e.g., “I am attending college to get away from my hometown.” \( \alpha = .61 \)); and (5) the influence of family tradition of attending the chosen institution (three items; e.g., “Other members of my immediate family attend or have attended [college/university]”; \( \alpha = .60 \)).

**College Adjustment Test (Pennebaker, Colder, & Sharp, 1990)**

This scale measured the psychological adjustment to the new college environment. This questionnaire contained 19 items that students rated on a 1 (not at all) to 7 (a great deal) Likert-type scale. Students indicated how often they had certain experiences over the past week. The three subscales measure the degree of optimism, homesickness, and general negative affect and can be combined for an overall adjustment score. Homesickness was assessed with six items (e.g., “Missed your parents and other family members”; \( \alpha = .64 \)). Optimism was assessed with six items (e.g., “Liked college in general”; \( \alpha = .69 \)). Negative affect was assessed with nine items (e.g., “Worried about how you will perform academically at college”; \( \alpha = .84 \)). A composite score of overall adjustment was created by reverse scoring homesickness and negative affect items and averaging those items with the optimism items so that higher numbers indicate better adjustment.

**General Health Questionnaire (Goldberg, 1972).**

This scale measured psychological and psychosocial symptoms that students could be experiencing over the previous few weeks. The scale contained 24 items with 4-point Likert-type responses ranging from Not at all or Much less than usual to Much more than usual or Better than usual. The five subscales (Huppert, Walters, Day, & Elliott, 1989) measured anxiety, incompetence, depression, difficulty in coping, and social dysfunction. Anxiety was assessed with eight items (e.g., “Lost much sleep over worry”; \( \alpha = .88 \)). Incompetence was assessed with three items (e.g., “Been managing to keep yourself busy and occupied”; \( \alpha = .57 \)). Depression was assessed with five items (e.g., “Felt that life is entirely hopeless”; \( \alpha = .68 \)). Difficulty in coping was assessed with five items (e.g., “Been getting scared and panicky for no good reason”; \( \alpha = .76 \)). Social dysfunction was assessed with three items (e.g., “Been finding it easy to get along with other people” \( \alpha = .49 \)).

**Results and Discussion**

Correlations were computed between the measures of the college choice influences, psychological adjustment, and well-being (see Table 1). Attitude toward college was positively correlated with overall adjustment (\( r = .32, p < .01 \)). The attitude toward college was also significantly correlated with two subscales of adjustment—optimism and general negative affect—and all five measures of well-being—anxiety, incompetence, depression, difficulty coping, and social dysfunction. Life Planning was significantly correlated with anxiety and depression. Others’ Influence was significantly correlated with difficulty in coping.

Multiple regression analyses were then performed to examine the extent to which the college choice factors were associated with adjustment and well-being.
Adjustment
When Attitude, Life Planning, Others' Influence, Independence, and Family Tradition were simultaneously regressed onto adjustment, the overall model was marginally significant ($F(5, 65) = 2.02, p = .09$). Attitude was the strongest predictor when controlling for the influence of the other four factors ($\beta = .30, p = .02$).

To examine adjustment in greater detail, the five factors were regressed onto the subscales of the College Adjustment Test (Pennebaker, Colder, & Sharp, 1990). When Attitude, Life Planning, Others' Influence, Independence, and Family Tradition were simultaneously regressed onto optimism the overall model was significant ($F(5, 65) = 4.00, p = .003$). Once again, Attitude was the strongest predictor when controlling for the influence of the other four factors ($\beta = .42, p = .001$). When the five factors were simultaneously regressed onto general negative affect the overall model was significant ($F(5, 62) = 2.77, p = .03$). Once again, Attitude was a significant predictor when controlling for the influence of the other factors ($\beta = -.26, p = .04$). In addition, Others' Influence was a significant predictor when controlling for the influence of the other factors ($\beta = -.28, p = .02$).

The findings of previous research (Hardin & Witcher, 2005; 2007) were replicated with these results. A more positive attitude toward the chosen school somewhat predicted overall adjustment, but significantly predicted the subscales of optimism and general negative affect. When the student’s attitude toward the school was more positive, they adapted to the new environment more successfully.

Well-being
Attitude, Life Planning, Others' Influence, Independence, and Family Tradition were simultaneously regressed onto the subscales of the General Health Questionnaire (Goldberg, 1972). For anxiety, the overall model was marginally significant ($F(5, 62) = 2.26, p = .06$). Attitude was the strongest predictor of anxiety when controlling for the influence of the other four college choice factors ($\beta = -.28, p = .03$). For depression, the overall model was significant ($F(5, 62) = 2.61, p = .03$). Life Planning was the strongest predictor when controlling for the influence of the other four factors ($\beta = .30, p = .02$). For difficulty in coping, the overall model was significant ($F(5, 62) = 3.94, p = .004$). Attitude and Others’ Influence were significant predictors when controlling for the influence of the other factors ($\beta = -.36, p = .003$ and $\beta = -.30, p = .021$, respectively). For social dysfunction, the overall model was significant ($F(5, 62) = 2.59, p = .03$). Attitude was the strongest predictor when controlling for the influence of the other four factors ($\beta = -.42, p = .001$).

The general findings of previous research (Hardin & Witcher, 2005; 2007) were replicated with this new measure of psychological and psychosocial well-being. As with previous research, a more positive attitude predicted better well-being. In addition, the new measure of well-being allowed for the examination of the influence of college choice factors on the ability to cope and operate socially. A more positive attitude predicted less difficulty in coping and better social functioning. Interestingly, using college to explore life and career options may be beneficial to the student when compared to not going to college, but doing so was related to increased levels of depression for this sample.
One limitation of these analyses is the low scale alphas for some of the variables. Because these variables were included in previous research (Hardin & Witcher, 2005; 2007), we believed it was important to include them here, even though the accepted standard for alpha is .70 (Nunnaly, 1978). It is possible that the influence of Attitude as a predictor is a result of its scale strength. However, it is also possible that this is not a statistical artifact, as research has demonstrated that in individualistic cultures, attitude toward the behavior is sometimes the stronger predictor of behavioral intention, more so than subjective norms (Trafimow & Finlay, 1996). It would be premature to conclude that with the weak scale strengths, some of these variables do not warrant attention in the future. For example, Life Planning was a significant predictor of a well-being variable, even with its weak alpha value. Larger, and perhaps more diverse, samples and additional refinement of the scales should be pursued.

Conclusion

This research replicates and validates previous research findings (Hardin & Witcher, 2005; 2007) regarding the importance of college choice influences as predictors of first-semester adjustment and well-being. For higher education professionals, this research provides evidence that all stakeholders need to work collectively to promote the health and success of first-year students. This research confirms the importance of academic and administrative areas working collectively to protect positive attitudes toward the college. The positive attitude may contribute to a better campus environment, but also seems to contribute to better psychological and social health of the students.

This research also demonstrated influence of college choice factors on psychological well-being. Studies demonstrate that college students have significant mental health and well-being challenges. For example, the National College Health Assessment, compiling data from more than 16,000 students throughout the United States, found that 10 percent had been diagnosed with depression and experienced mental health problems between 1 and 10 times during the previous academic year (American College Health Association, 2000 as cited by Arehart-Treichel, 2002). Additionally, other research has shown that college students are twice as likely to be clinically depressed as compared to individuals of similar ages and backgrounds who are in the workforce (Dixon & Reid, 2000). With these challenges already existing, it is especially important that attention is paid to the college choice factors and that resources are made available on campus to assist students with the well-being struggles that they encounter.

Finally, this research serves as a useful resource for admissions personnel, campus mental health professionals, parents of high school students, and others who have influence on their decisions. By considering the information provided here, perhaps those involved can assist with making the decision in such a manner to produce the healthiest outcomes for their students in the long run.

Practical experience and the research literature demonstrate that parental involvement in learning and school life has positive effects on student success. Attendance, discipline, retention, higher scores in math and science are all improved as a result of strong school-parent involvement. (Hiatt-Michael 2001). Music students also benefit from consistent and meaningful parental involvement. However, it appears that schools involve music parents by providing information about music programs and through volunteer efforts such as booster clubs. As valuable as these efforts are, the proposed workshop focuses on moving beyond public relations and booster clubs to a teaching approach that involves parents in actively learning content along with their children.

The proposed workshop presents and discusses the Connecting Parents with Learning Project (CPLP). This non-commercial project was created by the workshop presenter as part of his university research interest. As part of a graduate course taught by the presenter, CPLPs were implemented by music educators from public and private schools in Virginia, U.S. The purposes of the CPLP are to strengthen parent-student-teacher relationships while increasing parent and student content knowledge.

The CPLP involves parents in learning what their children are studying through the use of teacher prepared materials. Parents complete assignments and quizzes, and are assessed by their own children on the content. Parents reciprocate by assessing their children on similar content. Upon completion of the project, participating parents, teachers, and students complete surveys that assess the effectiveness of the project. Survey results will be discussed as part of the workshop.

The CPLP involves parents and students from elementary and secondary programs. Each CPLP is tailored by the local music educator to fit the content being studied and the grade level.

In this interactive workshop, session participants learn how to develop strategies to connect parents with learning by implementing a CPLP in their schools. Participants will receive sample CPLPs contained in a packet of information.
Samples include:

- *The Rhythm of Music: Rhythm reading and composition* (middle school beginning band)
- *Haydn’s “Hen” symphony: Composition and form* (seventh grade general music)
- *Making music together: Rhythm and the instruments* (kindergarten and sixth grade)

The session will also include how to present a CPLP program to administrators, how to prepare parent/student/teacher quizzes, and how to conduct parent, student, and teacher surveys. The workshop will provide tips on how to make the whole project positive and fun. The CPLP can be especially effective in connecting with parents of different cultures. It removes the mystery of what the students are studying by engaging parents and students in cooperative learning and by presenting content in manageable portions. The CPLP has also been effective in integrating music learning with other subjects.

6. **Abstract and/or full paper.**
   **(ABSTRACT)**
   The latest data from CDC’s National Health and Nutrition Examination Survey show that an estimated 17 percent of children and adolescents ages 2-19 years are obese. The initial results for 2007-2008 survey show obesity increased 5 percent in pre-school age children 2-5 years of age, between 1976-1980 and 2007-2008 and 13 percent among 6-11 year olds. The number of overweight teens ages 12 to 19 increased from 5 to 18 percent in the same time period.

   Obesity in childhood leaves children at risk for health problems both in childhood and throughout to adulthood.

   Therefore it is vital that children learn about and participate in lifelong physical activities that can help combat the effects of obesity. While often times the physical education course tackles this issue, both physical education and classroom core courses can team up to fight the cause. Teachers can expose students to interdisciplinary activities based on lifetime fitness reiterating some of what is learned in physical education, but can keep them active and involved well beyond the classroom.

   The goal of this program is: (1) Identify lifetime fitness activities, (2) Implement instruction of lifetime activities into the curricula, (3) Emphasize enjoyable participation in physical activity for all students across the curriculum, (4) Deemphasize sport activities and competition, (5) Help students developing the knowledge, attitudes, motor skills, behavioral skills, and confidence needed to incorporate and maintain physically active lifestyles.
The lesson assistance system aiming at the increasing motivation by the target setting and evaluation instruction.

Abstract Nakayama [1] is adding an individual correspondence function to the lesson assistance system, and it was shown clearly that the study opportunity according to an understanding of a student is sponsored, and results improve. However, it became a subject how volition is raised to the student who does not use a system positively. So, in this research, in order to raise the motivation to system use of a student, the system which paid its attention to inside or outside-motivation were developed and practiced. After performing individually a target setup of attendance of a lesson, a small test, comprehensive results, etc. in the stage before having a class, evaluation instruction was able to be individually performed for those results using the cellular phone, and the motivation which uses a system positively was able to be raised by making a target setup reconfirm according to a result. Furthermore, individual positioning in a simultaneous lesson becomes clear, competitive spirit with others, and volition also increases by the ability of rates of achievement, such as results and attendance of themselves and other students, can be compared after the lesson using a system.

Keyword: lesson assistance system, inside and outside-motivation, educational support, a target setup, evaluation instruction, a cellular phone

1. Introduction
1.1 Background
Nakayama and Matsuda [1] developed the decision support system of the teacher for a lesson and the lesson assistance system which enables effective individual correspondence by the simultaneous lesson to the student from whom an understanding differs. It was shown clearly that the student to whom an understanding is progressing is provided with the study opportunity of a development matter, and the results are raised, making all the members understand a basic matter by using the function concerned, as a result of an experiment lesson employing and estimating a system. While the degree of satisfaction to a system was as high as the student who returned the reaction to the teacher positively using the system at that time, even if it showed the student advice with a suitable system, it also became clear that the student for whom does not use a system positively low cannot fully utilize a function. Therefore, it is thought that the motivation for making it care which uses a system is required for such a student in a certain form. "Motivation" is fundamentally divided into inside-motivation and outside-motivation. It is defined as inside-motivation being the motivation which may happen from the intellectual curiosity from an inside, achievement, and a challenge, and outside-motivation being the motivation aiming at the "prize" given from outside [5]. Generally in pedagogy, it has been thought that inside-motivation is important. It is because reducing inside low motivation is reported if study by outside-motivation is continued and used. However, it is said that outside-motivation such as "praises" and "encouragement" have little influence on reducing inside-motivation [6]. That is, it is thought that outside-motivation may change to inside-motivation, and is described that it is effective to perform outside-motivation by the suitable technique for the spiritless student who will not perform the study itself positively [2]. Especially, shifting to an inside-state from an outside-state by promotion of spontaneity and target nature is also reported [6][2]. From the above thing, there are each strong point and demerit in both sides, and it is thought important to use both motivation appropriately. For example, in the stage where the lesson is attended at
first, although acted as whom, I think whether it can use well having the outside-motivation referred to as acquiring a credit. Wanting to take a credit is having applied the credit to mind. That is, it is surmised from the outside-motivation referred to as wanting to receive evaluation suitable for credit acquisition that it is possible to make it shift to inside-motivation. The evaluation method is devised, as the example of the systems development aiming at improvement in study volition, in order that Takamoto[3] might make study volition maintain, in the study support system, he made high the degree of individual adaptation of the study teaching materials spontaneously used for review of a student of after school or a home, and built the study support system which took in the self-valuation of the rate of achievement by the student. And study volition was strengthened with using a system and it is said that validity becomes high. Moreover, using the lesson assistance system of a Web base, the student has solved the problem on a system, and with the group review system, Takagi[4] urged activation and has reported the effect of the system in which competition and cooperative problem creation are possible. Consequently, the theme in question turned equally, the interaction between students improved, and by stimulating a student's sense of rivalry has described that validity becomes high. Moreover, using the lesson assistance system of a Web base, the student has solved the problem on a system, and with the group review system, Takagi[4] urged activation and has reported the effect of the system in which competition and cooperative problem creation are possible. Consequently, the theme in question turned equally, the interaction between students improved, and by stimulating a student's sense of rivalry has described that it is useful to improvement in the study volition using a system. In addition, Matsubara[10][11] and Hiraki[2] say that it is effective when performing motivation with effective adding a message generation mechanism to an intellectual educational system based on a student's study history and study condition by lesson at each time. These researches are performing motivation by message generation functions (praise, encouragement, etc.) to the contents of a lesson, and it is thought that these are effective in performing motivation. However, in the above research, it is a premise that a student uses the system and the correspondence to the student for whom participating volition is low and does not use a system positively is not taken into consideration. Moreover, the self-target to results, such as an attendance situation and a small test, is set up, and it is not investigating about the motivation at the time of comparing a target value with an achievement value. Then, it is thought that the student for whom participating volition does not use a system positively low needs to perform a certain motivation for using a system positively in the stage of the beginning of study. Taking attendance first in the stage which participated in the lesson estimates it the motivation considered concretely. Next, it is possible about evaluate how many which portions of whether he wants what kind of evaluation to obtain through the whole lesson, and the contents of a lesson to carry out a target setup clearly. These work is that it is shown from the stage of the beginning of a lesson that it is the process of an scholastic evaluation that a teacher uses a system, and let it be the causes to which outside-motivation is urged. Furthermore, it guides to inside-motivation attachment by showing a student the result to which the system totaled all students' data automatically, and making one's target value compare with other students' target value after one's target setup. Although it is thought that the target value of the student for whom participating volition does not use a system positively low is also low, education is urged by seeing other students have set up the target value highly. Moreover, the self-target and attendance situation for every contents of a lesson at each time, and the rate of achievement of a small test are shown through a system. Furthermore, an opportunity to compare a self-target with the rate of achievement for other target values and rates of achievement of a student is given. It is surmised by the above that inside-motivation attachment is urged. It carries out by instruction of the information and teacher who are shown the above work by the system.

1.2 Purpose
Then, this investigation performs evaluation instruction with a target setting through a lesson at each time from the stage of the beginning of the lesson by a relative outside-motivation and a relative inside-motivation, in order to materialize the above contents. By doing so, participating volition offers the realization and evaluation using the system of the student who does not use a system positively low of a lesson assistance system aiming at the upswing in a motivation. It is surmised that the cause involved in the lesson using a system can specifically be made from it being shown from the stage of the beginning of a lesson that it is the process of a scholastic evaluation that a teacher uses a system through a target setup. Next, it is made to educate through comparison of one's desired value, an achievement value and one's achievement value, others' achievement value, etc., and it is thought possible to make it migrate to an inside-motivation (Fig. 1). In addition, it is thought appropriate also to an ARCS model[12][13] to carry out motivation to the stage of the beginning of a lecture, to check an achievement situation by lesson at each time, and to raise motivation.
Fig. 1: The conceptual diagram involved in an inside-motivation from an outside-motivation

2 System Outline

2.1 Feature and Whole Composition of System

The stage where a student works by this system is divided roughly into use by "the time of using a system by the first lesson", and "a lesson at each time." The former takes attendance in the stage which participated in the lesson. And a comprehensive target including the merit of the percentage of attendance, the small test achievement quotient, and a final test into and is carried out through the whole lesson from the 1st time to the last round. Furthermore, a target setting is clearly carried out to evaluate how many achievement targets for every contents of study of a lesson at each time. At this time, it clarifies that it is the process of a scholastic evaluation to use a system. In order to materialize the above, the function (a target setting function is called henceforth) to perform a target setup is prepared. The latter carries out evaluation instruction and makes the rate of comprehensive achievement and the rate of achievement for every contents of a lesson including its percentage of attendance accumulated for every lesson, the rate of small test achievement, and the results of a final test and compare through the lesson which used the system at each time. Furthermore, their rate of achievement (the percentage of attendance, the rate of small test achievement, the rate of comprehensive achievement, rate of achievement for every contents of a lesson), others' rate of achievement, and a target value are made to show and compare. In order to materialize the above function (an evaluation instruction function is called henceforth) in which mark show the rate of achievement in a lesson at each time is prepared in a system. The above two functions are the features of this system.

In addition, an attendance registration function, a small test facility, and attendance registration and a smallness test check function also accompany, and this system is constituted as a whole. In addition, while, for this system, a teacher uses PC, lesson support is carried out, and a student makes it premise environment to receive a lesson, using a cellular phone.

2.2 Outline and Employment Procedure of Each Function Which Should Be Realized

Fig. 2: The outline and application procedure of a system

The outline of this system and the procedure of application are shown in Fig.2. And a serial number (from (1) to (10)) is met, and it explains. Moreover, it supplements with the operation screen of Fig. 3 to the figure 9 as explanation. A system has two, an information input function and a lesson support function, as a whole, the former is a function for a teacher to prepare before a lesson, and the latter is a function which a teacher and a student use during session.

(1) A teacher draws up a lesson plan before a lesson and prepares teaching materials.

(2) An information input required in order that a teacher may perform lesson advance using this system performs a setup of the school register number and individual password which are used as an input ID of the student who participates. Furthermore, they are three kinds of the answer the lesson password shown for every lesson at each time, and for a small test, and the password for a small test. Details of a password are given below. In addition, in the cellular phone, since there were restrictions on a display, the problem decided that a teacher shows with paintings-and-calligraphic-works equipment or printed matter.
At the time of the 1st lesson start, a teacher performs explanation and directions of the employment method of a system. If it accesses to the system which the student specified using the cellular phone, the main menu (Fig. 3) of this system will be displayed.

**Lesson proceeding assistance system**

**Main menu**

- A target-setting function
- An attendance registration function
- Small test facility
- Attendance & small test confirmation function
- Evaluation teaching function

Fig. 3: Main menu screen

A student chooses a "target setting function" (Fig. 4) from a main menu (Fig. 3), and sets up the target value of a lesson. This function mainly has the following three setup.

In addition, it is told to a student that it is one of the processes of the scholastic evaluation of this lesson to perform a target setup by this function.

- Enter the school register number and individual password for using as ID stated by (1). An individual password can be changed at this time.
- A student sets up a comprehensive target, an attendance target, and a small test target. Moreover, these three achievement targets set the whole lesson as the target which leads.
- The achievement target according to contents of study is possible (15 times is possible) in a setup the whole lesson of each time.

After setting up the above, a teacher makes it the reference for attaining a lesson plan by grasping the outline of a student's target value and grasping a student's motivation based on the total result of the target value by the system.

A student performs attendance registration in entering the "lesson password" presented by the teacher for every lesson of a school register number and each time by the "attendance registration function" (Fig. 5).

![**Target-setting function**](image)

(4) A student chooses a "target setting function" (Fig. 4) from a main menu (Fig. 3), and sets up the target value of a lesson. This function mainly has the following three setup.

(5) A teacher checks the attendance situation by the system after registration of attendance.

(6) A student carries out a small test by this function based on the shown information (Fig. 6). A small test is a selection type (4 selections), the reply made enforcement possible to 2 times, and if it is a correct answer at once, get 1 point, if it is a correct answer at the second time, get 0.75 points, and 3rd henceforth are made into zero point. The reason for having made the reply possible to 2 times was setup based on the result of having investigated the number of replies out of which a motivation comes most, by the questionnaire from a student. Moreover, by this experiment lesson, since it set up as one item of contents of a lesson by one lesson, the small test was taken as one setting a problem by one lesson.
A student transmits a result after small test implementation. Then, a school register number and an individual password are entered using "attendance and a smallness test check function" (Fig. 7), and it checks as a result of the small test currently carried out now. Simultaneously, it is possible to check the situation of attendance registration of each lesson. In addition, since middle and a final test were carried out with a paper base, after grading, it presupposed that a teacher inputs a test result into a database directly, and it was made different from grading of attendance and a smallness test.

(7)' From the total result of the small test transmitted by the system, a teacher checks a student's achievement situation and makes a judgment required for lesson advance.

(8) A teacher directs to check evaluation instruction by the "evaluation instruction function" (Fig. 8) to a student based on the total result of the small test of (7)'.

(8)' A student performs self-evaluation by the "evaluation instruction function." An evaluation instruction function is mainly divided roughly into...
two, results achievement information and the achievement information classified by contents of study. Motivation is performed by checking the following information by lesson at each time. First, a small test target, the rate of small test achievement and an attendance target, the percentage of attendance and the comprehensive target which summarized them further, and a rate of comprehensive achievement are consisted of by results achievement information. In addition, although these three target values are values set up by themselves, three rates of achievement are the values automatically calculated by computer. Moreover, there is information (a total of 12 kinds) of itself's and other students in the above six values, respectively. The rate of comprehensive achievement in this experiment lesson (R) is calculated by the sum of four values. For dignity attachment, the percentage of attendance (S) and the rate of small test achievement (T) are set up to 10\% (W1, W2), and the midterm exam (CK1) and the final exam (CK2) are set up to 40\% (W3, W4).

If expressed with a formula, it will become like this. (Show Fig.9)

\[
R(\text{Comprehensive achievement quotient} : \%) = \frac{S \times W_1 + T \times W_2 + \frac{CK_1}{2} \times W_3 + \frac{CK_2}{2} \times W_4}{\text{Total number of grades}}
\]

Moreover, in this experiment, the achievement target classified by contents of study was set up in one lesson. If expressed with a formula, it will become like this. (Show Fig.9)

\[
X(\text{the rate classified by contents of achievement} : \%) = \frac{S_{n-2} + T_{n-2} \times 50}{n}
\]

(9) A teacher performs directions required for a student, and advice presentation orally based on the information on (7)'.

(10) Simultaneously, carry out judgment required for lesson advance and carry out explanation of the contents of a lesson and a small test for the second time, if needed.

(10)' A student changes a target value through the advice from the contents and the teacher of evaluation instruction if needed.

### 3. Evaluation Experiment of System

#### 3.1 Purpose

The purpose of this experiment is evaluating whether an effect being in the improvement in motivation whose target setting function's and evaluation instruction function's use a student's system by which participating volition's does not use a system positively low. It is made to convert into the motivation of "setting up a target by oneself and attaining it" from the motivation of "wanting to acquire a unit" at first in this system. Furthermore, it has the intention of raising to the motivation of "setting up a higher target and attaining it" by comparing with others. Then, it is necessary to investigate how (1) When system is used first, (2) When its achievement situation is checked, and (3) When it compares with others, influence motivation as a viewpoint of evaluation.

Concrete evaluation criteria and a concrete procedure (Fig. 10) were carried out as follows.

(1) Verify whether a difference is looked at by

---

**Fig.9: The calculation technique of score achievement information**

Next, there is a target which met the item (this experiment has six items) for every contents of a lesson in the achievement information classified by contents of study, and each is shown its target value, the rate of achievement and others' target value, and the rate of achievement. These information are referred to by lesson at each time, is checked and judged synthetically, and self-valuation is performed. In addition, the rate classified by contents of achievement for every lesson by which calculation of the rate of achievement of the achievement information classified by contents of study is matched according to contents (X) is displayed. It set up so that the sum total as a result of the percentage of attendance (S) and the rate of small test achievement (T) might become a display 100\%.

The purpose of this experiment is evaluating whether an effect being in the improvement in motivation whose target setting function's and evaluation instruction function's use a student's system by which participating volition's does not use a system positively low. It is made to convert into the motivation of "setting up a target by oneself and attaining it" from the motivation of "wanting to acquire a unit" at first in this system. Furthermore, it has the intention of raising to the motivation of "setting up a higher target and attaining it" by comparing with others. Then, it is necessary to investigate how (1) When system is used first, (2) When its achievement situation is checked, and (3) When it compares with others, influence motivation as a viewpoint of evaluation.

Concrete evaluation criteria and a concrete procedure (Fig. 10) were carried out as follows.

(1) Verify whether a difference is looked at by

---

**Fig.9: The calculation technique of score achievement information**

Next, there is a target which met the item (this experiment has six items) for every contents of a lesson in the achievement information classified by contents of study, and each is shown its target value, the rate of achievement and others' target value, and the rate of achievement. These information are referred to by lesson at each time, is checked and judged synthetically, and self-valuation is performed. In addition, the rate classified by contents of achievement for every lesson by which calculation of the rate of achievement of the achievement information classified by contents of study is matched according to contents (X) is displayed. It set up so that the sum total as a result of the percentage of attendance (S) and the rate of small test achievement (T) might become a display 100\%. Moreover, in this experiment, the achievement target classified by contents of study was set up in one lesson. If expressed with a formula, it will become like this. (Show Fig.9)

\[
X(\text{the rate classified by contents of achievement} : \%) = \frac{S_{n-2} + T_{n-2} \times 50}{n}
\]

(9) A teacher performs directions required for a student, and advice presentation orally based on the information on (7)'.

(10) Simultaneously, carry out judgment required for lesson advance and carry out explanation of the contents of a lesson and a small test for the second time, if needed.

(10)' A student changes a target value through the advice from the contents and the teacher of evaluation instruction if needed.
motivation before and after making a target setup carry out to the stage of the beginning of a lecture. In that case, participating volition divides into the student (it is henceforth described as low rank group) who does not use a system positively low, and the student (it is henceforth described as a high rank group) who is not so, and performs comparison before and after. In addition, as a result of performing volition to low rank group using a system for the stage of the beginning of a lecture by the five-affair method (5: Very eager -1 : it is completely unwilling.), it considered as the student who estimated it as 1 or 2, and other students were taken as the high rank group.

Fig.10: A system-evaluation item and a procedure

* (1), (2), and (3) correspond with the serial number of 3.1.

(2)-A, The lesson using a system and the lesson which is not so are made to experience, and it verifies whether a difference is looked at by the motivation in low and the high rank group in the case where the results achievement information of the evaluation instruction functions (Fig. 8) is checked, and the case where that is not right.

(3)-A, It verifies whether a difference is looked at by the motivation in low and high rank group by the case where the results achievement information in an evaluation instruction function compares target value and rate of achievement of itself's and others simultaneously, and the case where that is not right.

(2)-B and (3)-B
Although an overall achievement situation does not change rapidly reflecting the result of the past lesson, if the achievement situation according to contents for every time does its best in the time, the high rate of achievement will be obtained. Then, the influence on motivation is simultaneously grasped by the case where it checks for the achievement information classified by contents of study in an evaluation instruction function, the case ((2)-A) where that is not right, the case where target value and rate of achievement of themselves and others are compared, and the case ((3)-A) where that is not right.

3.2 Experiment Method
81 students who study the subject of a "management information system theory" at the science-and-engineering system universities are divided into two classes (a following A group, B group) of 45 persons and 36 persons, and carried them out. Both sides carried out 12 lessons, and each group divides the case (6 times) where a system is utilized, and the case (6 times) where that is not right, in the second half in the first half, and experienced the experiment. However, A group utilized the system in the first half, and B group utilized the system in the second half (Fig. 10). In addition, the procedure which utilized and employed the system met the procedure of Fig. 2, and was performed.

3.3 Result and Consideration
(1) Volition before and after a target setup

** S.D.: Standard Deviation, Sig.Dif: Significant Difference

In order to evaluate the portion of (1) of 3.1, the reply was calculated by the five-affair method ("5 : It became motivation very much." ~ "1: It did not become motivation at all") from the question "Please answer about the volition using a system before and after performing a target setup." As a result (Table 1), both the groups of the direction after a target setup were intentionally high.
Moreover, in the opinion by free description of the student of low rank group, the reply "it got used to participating to a lecture by setting up a concrete target positively although target achievement was not vaguely considered before participating in a lecture" was obtained. It was suggested that motivation for which low and high rank group use a system is performed by making a concrete target setup perform before beginning a lesson.

After the lesson implementation using a system, in order to evaluate the portion of (2)-A of 3.1, the reply was calculated by the five-affair method: "It became motivation very much" ~ "it did not become motivation at all "from the question "answer about the motive to use a system before and after checking one's rate of achievement for the achievement information classified by contents of study." As a result (Table 3), the evaluation after both groups check their rate of achievement for the achievement information classified by contents of study was intentionally high. From these things, it was suggested by checking one's rate of achievement that motivation for which low and a high rank group use a system is performed.

In the lesson using a system, in order to evaluate the portion of (3)-B of 3.1, the questionnaire was carried out to four items in the question item of Table 5 as a candidate for comparison of evaluation instruction. The reply was evaluated by the five-affair method " 5: it became motivation very much " ~ " 1: it did not become motivation at all". As a result (Table 5) in the "When my target is compared with my achievement quotient" at which it is based on the achievement information classified by contents of study, both the groups of the direction after enforcement were intentionally high. Moreover, when the contents of the reply by free description of low rank group were judged synthetically, these opinions such as "the item good at them and the
poor item having become clear” and “I can study effectively about a poor item” were seen. Judging synthetically from the above result, it was suggested that motivation for which low and a high rank group use a system is performed, “When my target is compared with my achievement quotient” based on the achievement information classified by contents of study.

4. Subject of Conclusion and Future

It is that this experiment performs spontaneous motivation attachment with an inside and an outside-motive by the target setting function and the evaluation instruction function, and verified whether the improvement in motivation to system use of the student who does not use a system positively would be possible. Consequently, the following things became clear.

(1) Motivation for which low and high rank group use a system is performed by a target setup is made to carry out to the stage of the beginning of a lecture.

(2) Motivation for which low and high rank group use a system is performed by checking the rate of achievement of one's results for the results achievement information in an evaluation instruction function, and the achievement information classified by contents of study.

(3) Although the effect was in motivation on the whole about comparing an achievement situation with one's setting target, or comparing with others, it turned out that comparing according to a contents item with others the case of low rank especially is not necessarily connected with motivation.

It is thought that improvement in volition of a student whose participating volition does not use a system positively low can be performed by the above by performing spontaneous motivation attachment with suitable an outside-motive by the target setting function and the evaluation instruction function as far as this experiment lesson is concerned. As a future subject, when a lecture cannot be attended by the reason such as practice teaching, it is thought that it is necessary to perform supplementary study by remote education. It is also considered that it is necessary to inquire how it is reflected in the rate of achievement in the time, and motivation is maintained. Moreover, although this system performed target setup in a student's position, and instruction evaluation, I want to also consider relation with the teaching plan relevant to a target setup in a teacher's position, or the rate of achievement.

Mentoring Postsecondary Tenure-track Faculty: A Theory Building Case Study with Implications for Institutional Policy

Abstract

The featured research uses theory building case study to understand the experiences of junior faculty in a mentoring program. Findings suggest the importance of professional interaction on faculty members’ integration into their campus communities. An explanatory model illustrates the findings and supplements discussion of the implications for administrators in terms of retention of new faculty members in postsecondary settings.

Leading Edge Technologies in a Community College Library Setting: Identifying
Disconnects of Academic Libraries and Their Users

by

Theresa C. Stanley
August 2010
The intent of this research was to discover, what if, any disconnect exists between community college students’ library perceptions and technology use. I replicated a recent study done by Char Booth at Ohio University. Her research was presented at the 2009 Association of College and Research Libraries (ACRL) conference in March 2009. ACRL also published the entire study, *Informing Innovation: Tracking Student Interest in Emerging Library Technologies at Ohio University*, in May 2009.

The research questions represent six of the seven questions used in the original study, with changes only to reflect the community college student profile.

1. What are the technology profiles (defined as technology ownership, use, skill, and adoption status) of students at a very-large size southwestern community college?
2. What are the library profiles (defined as library use, skill, awareness, and emerging technology receptivity) of students at a mid-size southwestern community college?
3. How do the library and technology profiles of students of disparate demographic factors such as age, digital status, gender, and academic status differ?
4. How can student receptiveness to and awareness of emerging technology library services be characterized?
5. How do students of disparate library and technology profiles compare in their awareness of, assessment of, and receptivity to traditional emerging technology-based library services?
6. What is the relationship between student use and awareness of library services and self-perception of technological competency, and receptivity to emerging technologies?

The data collection instrument consisted of a survey containing a mixture of multiple choice (single answer as well as ‘all that apply’ choices), Likert scale questions and three open
ended questions. The original survey consisted of 35 questions. To narrow the focus of the study, the researcher decided to concentrate on discovering what, if any, disconnects between community college library perceptions and technology used in their academic achievements, removing the research component. In an attempt to shorten the survey, the researcher consolidated some of the questions that were identified as being very similar to other questions, as well as the questions regarding research, which were no longer needed. This resulted in a survey consisting of 25 questions, including the three open-ended questions.

The survey was presented in five sections. In the first section of the survey instrument the participants read the disclaimer and identified themselves as over 18 and agreeing to the conditions of the survey when they clicked to continue with the survey. Section two was aimed at collecting demographic information regarding their age, gender, the reason they are attending classes at this institution, the number of credits completed at this institution at the time of the survey, how they found out about the survey, and the campus they primarily attend. Section three consisted of six questions and was aimed at evaluating the respondents’ library use. Section four aimed to evaluate technology and library technology use. This section had ten questions. The questions in section three and four were in multiple choice and Likert scale format. The fifth section had three open-ended questions. The open-ended questions allowed the respondents to provide some personal insight by giving them a chance to describe their own individual library experience. See Appendix B for copy of the survey questions.

The researcher invited students from a very-large southwestern community college to participate in the survey via announcements and handouts distributed to all student life centers, libraries, on bulletin boards and in cafeterias on all campuses. Students working in computer commons or through bibliographic instruction were also personally asked to participate by
librarians. Instructors invited students to participate either with flyers passed out in class or were provided a link in their course management system. It was determined that the best tool should be an online survey, as the students attend classes face-to-face, online or a mix of the two (hybrid). It also met the eight considerations noted in Sue and Ritter’s *Conducting Online Surveys* (2007). The survey was open for two weeks and 257 students entered the survey and 248 answered at least one question.

Findings

**Research Question 1**

What are the technology profiles (defined as technology ownership, use, skill, and adoption status) of students at a very-large southwestern community college? Students at this institution appear to have incorporated some of the more popular technologies in their lives. Their technology ownership appears to be in line with what is reported in national studies. The majority of students own a computer (laptop, desktop or both), spending more than ten hours online each week. At home, they are likely to have high-speed wireless Internet connection. The majority of them also own a mobile phone of some kind, which is used for text messaging, social networking, and accessing the Internet. This data dispels the notion that many instructors at this institution have about their students, believing they have little access to technology outside the school. However, the students while capable of using text messaging, social networking and access the Internet do not always have the technical skills to complete an assignment. This is probably due to the fact that skills needed for digital entertainment applications do not always transfer to skills required for education driven applications.

The most popular activity on their mobile phones is also their most popular activity on a computer. It would not be atypical for a student to use text messaging and using social
networking applications such as Facebook and MySpace several times during a day. Watching videos on YouTube, and reading Wikipedia articles are done on a regular basis. Focusing on social applications, Facebook and MySpace are the most used, however it appears MySpace popularity is decreasing. Google Maps is also a popular social application.

Students were aware of many more applications than they were using, as was the case with Twitter and Skype. One social application which about one third of the students never heard of was Google Docs, which this researcher found interesting as the institution has recently rolled out Google Docs to be accessed through the student portal, promoting it with announcements and training. This appears to be a disconnect between an unexploited opportunity with this technology and student use. Even though the college rolled out Google docs last spring with heavy advertising through the student portal and introductory sessions with faculty, it was a one-time effort (starting just before it rolled it out with the google email system lasting until a couple of weeks after). This leads the researcher to suggest additional marketing and training sessions with both students and faculty, not only to make them more aware and show its relevancy, but also comfortable in using it.

Most self-identified with the statement that they adopted new technologies about the same time as others, with very, very few identifying with the statement that they avoid new technologies. The top technologies used are Facebook, text messaging, YouTube videos which most used daily. Online applications that could have a relationship to their studies were used by very few, and were not known by very many. However, the students indicated that instructors were not incorporating much technology in their classes. The instructors do not appear to be posting content they created for their classes, nor asking students to create online content either. In fact, most students are not creating content for their classes or for entertainment purposes. The
instructors are taking advantage of the library resources, with those applications identified as the most used technology in classes. The instructors’ lack of content creation may be a disconnect that the college could remedy with additional support in both training, but perhaps more importantly, providing a learning content platform that could easily integrate content creation, helping to alleviate the disconnect between technology use and instructors. Currently instructors interested in content creation must go out onto the web, find various tools, evaluate them, and then set them up for their classes. It could be a case of the instructors “don’t know what they don’t know” as they have not been encouraged by the institution to learn and incorporate emerging technologies into their classes. The institution does not mandate or push the use of those technologies, nor provide support for them. Providing the platform would help to alleviate some of that work, and assist those instructors who may have a lower comfort level with new technology.

Research Question 2

What are the library profiles (defined as library use, skill, awareness, and emerging technology receptivity) of students at a mid-size southwestern community college? The libraries on the campuses, or the online library, are used often by students, with students using either one at least once per month. More students access the virtual library in a semester than the physical libraries, however the physical libraries are used more frequently in a semester. This could be explained as students using the virtual library to access some of their resources, but they are still making multiple visits to the physical library either for hard copies of research items or for assistance from the librarians.

Although the majority of students own a computer and have Internet access at home, they also use a computer in the library. They indicated they use these computers to work on their
academics, as they are accessing their student portal, using the word processor and checking email. This supports one of the more frequent comments from the open-ended questions: when asked what they liked most about the library, students responded with computers. (Not having enough computers was also noted in the least appreciative thing about the library.) Activities that are considered less academic, such as instant messaging, watching online videos/DVDs, and playing games are not used very often. This leads the researcher to believe that students are choosing to work on coursework while on campus, perhaps working in the library because the resources are readily available and where they can obtain (librarian) assistance while working. Further research is warranted to understand the research process of students at this institution to better meet their research and study needs.

The students revealed that while they are aware of the wide variety of resources the library offers but they choose to focus more on the research driven services, rather than the service driven ones. They do not use services such as push notifications, or renewing items online. Students are using research driven services such as accessing citation information, using the online databases, and using the research guides to assist them in their studies. These are things that are also focused on by librarians during bibliographic instruction for a class. To eliminate this disconnect between the student and the service driven (or convenience-oriented) technology the library as to offer, additional education and marketing should be done by the libraries. In focusing on features that push information and resources, the libraries can assist them in being more efficient students and help to eliminate two of the disconnects McDonald and Thomas noted (unexploited opportunities and technology) must be addressed in order for libraries to “retain and expand their usefulness for online users in the next decade” (2006, p. 4).
Research Question 3

How do the library and technology profiles of students of disparate demographic factors such as age, gender, digital status, and academic status differ? When it comes to age, this researcher found that it is not a factor in determining library use. The under-30 age group and the over-30 age group indicated very similar frequency regarding their physical and virtual library use (library profile) throughout the semester. However, age is a factor when it comes to technology use (technology profiles). While both groups use social networking applications and text messaging the most, more in the under-30 age group use them, and use them more frequently. This could be because they are more comfortable with technology or perhaps, if we use the thought presented earlier, that more in the older-30 age group have families, it could be the under-30 age group has more time to use those technologies. Additional information would be needed to be conclusive.

Gender plays a role in library use only when determining daily use: males are more likely to use the physical library on a daily basis, whereas females are more likely to use the virtual library. In looking at those who indicated they never used the library, both males and females were represented nearly equally. As in the age comparison, the two most popular technologies of males and females are social networking applications and text messaging. This researcher found the biggest discrepancy between the genders to be the differences in daily use of Wikipedia and YouTube with males being the primary daily users of those two technologies.

Digital status was determined by computer ownership, and those that indicated they owned a computer used the library (physical or virtual) more often. In fact, all but one of the virtual daily users owns a computer, which makes sense as they have the ability to access the library website more off campus. Those who do not own a computer used the physical library
twice as often as those who owned a computer. Interestingly, those who indicated they never used either the physical or virtual library were those that own a computer, indicating they found their research resources elsewhere. Technology profiles using the students’ digital status indicated the majority of daily users for all four applications (social networking, text messaging, Wikipedia and YouTube) were by those who owned computers. Again, this is not surprising to this researcher, as they are the ones with easier access to computers. However, when looking at total number of users, it was the non-computer owners who used those four applications more than computer owners. The researcher also found it interesting that the majority of those indicating they never used any of the applications were also from the computer ownership group. This researcher is recommending additional research to determine how best to reduce the disconnect between the students who own a computer, but do not use the library.

    Academic status appears to be a good indicator of library use. First year students do not use the library regularly as, in all but one category, the majority of daily and weekly, physical and virtual, library users were second year students. First year students indicated they were infrequent users of the library and more than twice as many first year students than second year students indicated they never use the physical library. This could be attributed to the type of research papers and projects being assigned to first year students. Additional research on the type of assignments and source of resources first year students used would help to determine how the library needs to address these issues to first year students.

    Academic status is also is an indicator of students’ technology use regarding social networking and text messaging. First year students use social networking applications and text messaging more frequently, while second year students indicated more often they never used social networking applications or text messaging. Weekly users of Wikipedia and YouTube tend
to be second year students, while daily users of YouTube tend to be first year students. Overall, more second year students are using Wikipedia. Second year students’ greater use of Wikipedia could be explained that, even though most instructors will not allow it as a primary source, students are accessing it for papers and projects perhaps for background information or to be used in some other way. Further research to understand the research process of students at this institution may reveal their determination in how and what resources are used.

Research Question 4

How can student receptiveness to and awareness of emerging technology library services be characterized? The vast majority of students indicated they would be interested in the library offering a virtual chat reference service and in offering a space for online collaboration. These two technologies fall in line with what was found regarding their technology profiles; that students are more interested in research driven services. It also corroborates with the open-ended comments under what the students least appreciated about the libraries or library website: there are no interactive or collaborative features. This disconnect could be remedied with technology added to the library website of a collaborative tool.

Accessing library services were the least popular applications students’ do on their mobile phones. The students’ top two uses on their mobile phones are text messaging and using social networking applications. Following along those lines, students’ awareness of social sites and web tools had some very familiar responses. The students have indicated openness to some emerging technologies, such as Facebook, MySpace and Google Maps, and while they know about others (Skype and Twitter), the majority has chosen not to use them at this time. It could be that they have tried them but not found them relevant to their life at this time or that they are not confident enough with the technologies to try them. The libraries at this institution have been
the catalyst for new technologies in the classroom. This is supported by the students’ response to
the question inquiring about what technology is used in the classroom: web-based library
applications were the primary ones. This also indicates the majority of instructors’ lack of
confidence in using emerging technologies in the classroom. The library needs to be aware of
this attitude when introducing new technologies, in order to include training and marketing that
will not only show relevancy but also instill confidence to the user, whether they be a student or
faculty member. Further study is recommended to better understand the students’ and
instructors’ reluctance to use emerging technologies to reduce this disconnect.

Technology in the classroom appeared to be primarily library resources, with library
online databases, the online catalog, research guides and the library’s campus transfer service
used most often in the respondents’ courses. Wikis, blogs and online renewal of items (another
library service) were in the second tier of used most often. Most students have taken an online
course, either as a hybrid or completely online.

Research Question 5

How do students of disparate library and technology profiles compare in their awareness
of, assessment of, and receptivity to traditional and emerging technology-based library services?
Library use does not appear to be an indicator of awareness of traditional library services
currently offered. Students using the physical library were able to identify all but two library
services currently being offered (online renewals and full-text books online). The virtual use
students fared slightly better, indentifying all but one (online renewals.) Students’ technology
profiles provided similar results, with most students identifying current library services. This is
very good news, as the libraries have always tried to play an active role in students’ learning.
This has been done through campus library contacts with instructors for the library to come into
the classroom for information literacy and research instruction. On several of the campuses, the computer commons are near or in the library so students find it easy to access. The library also has a presence on the student portal. Recently, one campus library piloted an embedded librarian service to allow the library to have more class time with online courses. This program will be expanded to other campuses in the fall 2010 semester. Based on these results, the library should continue promoting their services, going to where the students are in the classroom and putting a little more emphasis on directing students to their online services.

Both the library profiles and the technology profiles indicate that students’ would be receptive to emerging library technologies (virtual chat reference and collaboration), with the vast majority indicating the library should offer those services.

Research Question 6

What is the relationship between student use and awareness of library services and self-perception of emerging technological competency, and receptivity to emerging technologies? There does not appear to be a relationship between self-perception of adoption of technology and the awareness of library services. It was just as likely that someone who identifies with the statement “I usually use technologies before anyone else” is not aware of current library offerings, as someone who indicated they avoided using new technologies. Virtual reference is the only service not currently offered and it was correctly identified as such more often by those identifying with the statement “I tend to use new technologies somewhat before others do.”

Major Findings and Conclusions

Based on the information found, these conclusions were drawn:

1. Community college students at this very-large southwestern school appear to be in line with other college students when it comes to technology, including ownership and use of
different technologies. Over 82% of this institution’s students reported ownership of a computer (laptop or desktop), which is in line with the 85% (p. 2) reported by The Pew Internet & American Life 2002 report, *The Internet Goes to College*. The OCLC’s *College Students' Perceptions of Libraries and Information Resources* (2006) reported that 20% college students in their survey were reading blogs and accessing e-books. Comparing those to the students in this study, we find 52% using reading blogs and 44% accessing e-books.

The students are also in line with national students regarding downloading music. The 2002 Pew Internet & American Life reports 60% of students download music while 68% of the students in this survey reported downloading music or videos. Some technologies did indicate a gap, such as instant messaging. Only 57% of the students reported using this technology, which the OCLC’s 2006 nationwide report indicated a 70% use by students. (The 57% is greater than the Pew Internet & American Life 2002 report that reported only a 26% use.)

There seems to be a discrepancy between this local group and the national group when it comes to creating content. In *Teens and Social Media the Use of Social Media Gains a Greater Foothold in Teen Life as They Embrace the Conversational Nature of Interactive Online Media*, a Pew Internet and American Life Project report (2007), 64% of online teens identify themselves as content creators (p. 2) but the majority of the students at this institution indicated they did not, with only 17% editing a Wikipedia entry and less than 40% reporting they posted to a blog or even commented on a blog. This is in line with other emerging technology responses of the survey, not only with their self-identification of adoption of new technology but indicates a pattern that students are not comfortable using emerging technologies. This researcher is recommending further research to better understand this indifference, which could be due to several factors, such as students do not find it relevant in their lives, lack of knowledge or
understanding of the new technology, or an apprehension in trying new technology. The answer could be revealed in the research and steps taken to resolve this disconnect.

2. Students at this very-large southwestern community college indicate they use the library, either the physical library or the library website, more often than students in national studies reported. Only 18% of the students at this institution indicated they did not use the physical library and 14% did not use the library website in a semester, whereas 91% of students in a national study indicated they choose the Internet over their library. In looking at the responses of those who indicated they never used the physical library or the library’s website, it was those who owned a computer who selected that answer more often. The researcher speculates that because this institution’s library promotes, and provides instruction on using their services and resources, that students are using those resources more. Speculating further on those who do not use the library, it could be that those who own a computer are more adept (or feel they are) and chose to use the Internet, thus by-passing the library.

This study found that second year students used the library, physical and virtual, more than first year students, which at this institution is when more students are exposed to more complex research projects in which instructors require academic, cited sources, translating into peer-reviewed articles. Peer-reviewed articles typically are not found on the web but in subscription based databases which the library at this institution subscribes to and promotes to their instructors. This is probably true at other institutions, where the work becomes more rigorous at each level as it proceeds to the graduate level. Students at this level are more likely to come to the library for assistance in locating items, and are more likely to be required to use library resources for their papers and projects.
The use of library computers does not appear to be an indication of computer ownership, as 81% of the respondents indicated they own a computer, but only 26 indicate they don’t use a computer in the library to access their student portal account. This would also be true at other higher education institutions, as the computers on campus offer many advantages that cannot be replicated at home, such as readily available assistance (via librarians, tutors or instructors).

3. Collaboration would be a welcome tool on the library website. This application would allow students to have more opportunities to create and exchange content. Detlor and Lewis (2006) indicated academic libraries needed to provide collaborative space to allow students the ability to interact with others to enhance their learning experience, thus changing a library’s focus from accessing information to using information. Collaborating with others would allow students to build on collective knowledge, which Gee (2003) defines as building on one’s knowledge while sharing their knowledge with others. In several courses at this institution, online collaboration is being introduced. Providing collaborative space on the library website would allow students to share thoughts and discern new concepts with students across other campuses. This distributive learning would allow the students to reinforce and expand their knowledge.

4. Students are more likely to use applications that are required for a class or demonstrated in class. Librarians focus on library resources that students can use for their papers and projects, such as formatting citations, online databases and using research guides, which students indicated were used most often. Library services that focus on user convenience such as push notifications and renewing items on line are not discussed much and are used very little during library sessions with a class. The libraries should promote these convenience-oriented applications more, indicating to students that these features can not only save them time, but
make them more efficient students as the information will come to them, versus them hunting for it.

In the same way, students indicated that most instructors did not use much content-creation technology in their classes, and the students also indicated they were not content creators. As a way to introduce these technologies, the libraries could incorporate user-generated content in their regular services to faculty. For instance, a blog could be used for the library newsletter. Or a wiki could be used for collaboration on a research guide. Or a faculty member invited to be a guest speaker for a podcast. Each of these would require the library to take the first step and to assist, or walk the faculty member through the process to help them become more comfortable with the technology. It is expected that over time and with encouragement, the faculty members would become comfortable enough to use it on their own. Additional direction may be needed to demonstrate how it could be used in their classroom. The institution’s instructional designers could help in this endeavor.

5. Students’ receptiveness could be characterized in two ways: they have identified certain activities that they do on certain devices, and they are open to some emerging technologies. For example, they use their mobile phones for activities that allow them to stay connected to others (text messaging and Facebook/MySpace). However, they do not use their mobile phones for the class assignments, such as to access library services. The fact that more emerging technologies are not used in the classroom could be more of a reflection on not only the student’s but also the instructors’ relationship, or comfortableness, with technology.

Limitations

This study had two limitations. First, as the researcher was not allowed to advertise the survey on the student portal or to the students directly via email, other routes were taken, such
as: to contact instructors, student life coordinators, tutor centers, libraries and to advertise on bulletin boards, in an attempt to reach as many students as possible. The researcher had no way of acknowledging that the survey information was passed on unless the instructor indicated they had posted it to their class. This researcher believes that the inability to personally encourage the students to participate and to send a follow up invitation resulted in a small percentage of students at this institution participating in the survey. Second, while the survey could have been printed up on request, the primary way students found out about the survey was through an email or a handout with a link posted. This may have led those students who are not technology savvy to disregard participating.

Recommendations for Future Study

This institution could expand this research by focusing on the students’ use of technology in their research. This would better indicate where and how the library fits in. The more local data that is collected, the better the library can respond in both their physical space, the library website, but also in their bibliographic instruction to better meet the needs of their students. The additional data would also help in resolving the disconnects between what students’ are not using regarding certain library technologies. Some of the questions regarding the research component could be: to inquire into the steps students take in planning their research; where they start their research and why; and the process of their research.

Additional research is recommended for this institution to focus on the instructors’ comfort level with technology, the technology currently used during a semester, research project requirements, and any interest in incorporating more/different technology into the course. Additional research is recommended by this institution to more fully understand the technology needs of the community and the technology expectations for those who will be transferring to a
four-year institution, to learn what the local needs are. This research may assist the institution in creating mandates or incentives to instructors to incorporate emerging technologies in their courses, thus removing the disconnect between instructors and classroom technology. In doing so, the institution could be more active in persuading instructors to incorporate those skills that would transfer into the workplace or their higher education goals. As this institution serves not only those that are transferring to a four-year institution, but also entering the workplace or increasing workplace skills, it is important to look at not only traditional technology skills but also emerging technology skills, as emerging technology could one day be the norm in the workplace. Marketing by the libraries should continue being sure to direct students to their online services, which assist the students in being more efficient as a student.

This institution’s library could expand this research by focusing on the instructors’ perception of online resources. The instructors make the decision on the technology that is used in the classroom and in the course. They also make the requirement as to where the student obtains information for a research project. It is not unusual for an instructor to dictate to the students that only library resources, or peer-review resources can be used in a paper or assignment. Unfortunately there are some instructors who require print only resources, or allow one or two “online resources.” These instructors do not differentiate between resources found on the web and those provided by the library. The library has put much effort into educating these instructors but to no avail. Many times this is a disservice to the student as many resources are available to the student only through the library’s online subscriptions. This is the case for scholarly journals, where the vast majority is purchased through subscriptions with database vendors such as EBSCO and ProQuest. Focusing on the instructor’s perception of different resources regarding their validity and value in their classes would reveal a direction the library
could take to educate instructors that may not have been tried. Other institution’s libraries may benefit from this kind of research if they have a similar situation.

A recommendation for organizations wishing to do similar research would be to find a way to attract more responses. This researcher was not permitted to use the student portal to post a link to this survey, as this was not an official college study. The researcher contacted instructors, student life coordinators, and libraries, to not only advertise the survey but also to promote it. Many instructors posted it to their course portal. While each institution has their own policies regarding research, every effort should be made to use the college resources in an attempt to place the survey tool in the students’ realm. Researchers may also want to have survey available longer than two weeks, as with advertising and contacting instructors, a large portion of the first week was taken.

Teaching Foreign Language and Foreign Culture to Young Learners

Selma Deneme, PhD
Trakya University, ELT Division
selmadeneme@trakya.edu.tr

Selen Ada, MA Candidate
Selen_selen1982@hotmail.com

The study will mainly focus on the teaching of foreign languages (mostly English) and foreign culture to young learners in Turkey. After reviewing the relevant literature, the study will investigate how Turkish children get introduced to foreign language and foreign culture and learn them at different social settings: at home (by their parents, siblings and etc.), in certain social occasions (e.g. birthday parties, other celebrations), through media and technology (e.g. TV, computer, computer games), in social and educational institutions such as kindergarten and primary school (by their teacher and their class-mates, through the coursebooks etc.).

The research is qualitative in nature. The participants of the study mostly consist of young learners, their parents and their teachers. An interview, observations and material analysis will be used as data collection instruments. The collected data will be analyzed and possible ways of teaching foreign language and foreign culture to young learners will be discussed by the help of clear and efficient examples and explanations. Real life situations and applications will be presented and discussed throughout the paper.

“WRITING COMPETENCIES OF TARLAC STATE UNIVERSITY CAMPUS WRITERS: BASIS FOR AN INTERVENTION PROGRAM”

GLADIE NATHERINE G. CABANIZAS  
TARLAC STATE UNIVERSITY  
TARLAC CITY, PHILIPPINES  
gngc90@yaoo.com  

ABSTRACT

Rationale/ Background:

Learning institutions from high school to tertiary levels in the country continuously provide co-curricular activities to promote and harness the skills of students on different categories.

One of these activities is editorial writing, an important part of campus journalism. It provides students with an arena where they could practice their writing competencies.

Therefore, this study determined the writing competencies of the Tarlac State University campus writers for academic year 2005-2006. The writing competencies of the writers were based on the following criteria: organization, context, language, vocabulary and mechanics.

The campus writers constructed two editorials to determine their writing competencies. The first editorials were written before the writing workshop and the second editorials were written after the writing workshop. After finding out the writing competencies of the campus writers, the researcher proposed an intervention program to improve the writing competencies of students.

Statement of the problem

The study aimed to determine the writing competencies of Tarlac State University campus writers as basis for an intervention program.

Specifically, it sought to answer the following questions:
1. How may the writing competencies of Tarlac State University campus writers be described before the writing workshop in terms of the following:
   a. Content;
   b. Organization;
   c. Vocabulary;
   d. Language; and
   e. Mechanics?

2. How may the writing competencies of Tarlac State University campus writers be described after the writing workshop?

3. Is there a significant difference in the writing competencies of the Tarlac State University campus writers before and after the writing workshop?

4. What intervention program may be proposed to improve the writing competencies of campus writers/students?

The conclusions of the study are:

1. The writing competencies of the Tarlac State University campus writers before the writing workshop on content and organization of the first editorials were generally fair to poor. Moreover, the writing competencies of the campus writers in terms of vocabulary and language were good to average. The mechanics used by the campus writers were excellent to very good.

2. The writing competencies of the campus writers on content and organization after the writing workshop based on their editorials were generally fair to poor. Based on vocabulary and language, the writing competencies of the campus writers were generally good to average while the mechanics used by the campus writers in their final editorials were excellent to very good.

3. The statistical analysis and interpretation used to determine the writing competencies of the campus writers showed a significant improvement in the writing competencies of the campus based on content, organization, vocabulary and mechanics.

4. An intervention program which focuses on organization and content is proposed to help improve the writing competencies of campus writers and students in the tertiary level.
1. Title of the submission.

An evaluation of the Project Learning Tree Secondary Module “Forests of the World

2. Name(s) of the author(s), Sarah Haines, Ph.D. and Cynthia Ghent Ph.D.

3. Affiliation(s) of the author(s), Towson University

4. Address(es) of the author(s), Towson University – Biological Sciences; 8000 York Rd   Towson, MD  21252

5. E-mail address(es) of the author(s) shaines@towson.edu cghent@towson.edu

6. Abstract and/or full paper

Project Learning Tree® (PLT) is an award winning, multi-disciplinary environmental education program for educators and students in PreK-grade 12. PLT is a program of the American Forest Foundation and is one of the most widely used environmental education programs in the United States and abroad, and continues to set the standard for environmental education excellence. PLT helps students learn how to think, not what to think, about the environment. PLT meets state and national education standards and the curriculum materials provide the tools educators need to bring the environment into the classroom and their students into the environment. Project Learning Tree and the World Forestry Center have joined forces to create a secondary module that provides a framework for exploring forests around the world. *Forests of the World* provides formal and nonformal educators with a series of activities to help students and educators gain an increased understanding and appreciation of the diversity of world forest environments, with an emphasis on the human interaction with and dependence on those environments. The module activities provide students with opportunities to apply scientific processes and higher order thinking skills while investigating world forestry issues and conducting service learning action projects. The evaluation of the effectiveness of this secondary module as a curriculum is the basis for this study. Teachers from across the country, all of whom have been trained in PLT, taught the module activities to their students. Data were collected in the form of pretests and posttests and the analysis is ongoing. Preliminary results from data collected will be shared.
Title: “THE DESIGN AND DEVELOPMENT OF A PROPOSED ORGANIZATIONAL MANAGEMENT MODEL FOR STUDENT AFFAIRS OFFICES”

Author: GRACE ANNE CANLAS-HASEGAWA, PhD

Affiliation: Office of Student Affairs
Tarlac State University
Tarlac City Philippines

Address: No. 44 Calero, Barangay Tibag,
Tarlac City, Philippines 2300

E-mail: graceannehasegawa@yahoo.com

ABSTRACT

Rationale Background:

The study focused on the Student Affairs practice of Higher Education Institutions in the Philippines particularly in Central Luzon - Region III. It examined the various components and services of the student affairs office of selected State Universities and Colleges, and, Private Higher Education Institutions which are considered Centers of Excellence and Development in various academic fields.

Based on management models and theories, an Organizational Management Model was designed for the implementation and use of student affairs offices. It was validated by authorities in the field of student affairs and education based on a set of criteria. The Organizational Management Model comprises
of six components namely: Strategic Framework, Yardsticks and Key Success Indicators, Structure, Teams and Human Resources, Environmental Culture and Management Practice (SYSTEM).

The respondents for the study consisted of heads of offices and the heads of the departments under the student affairs offices. The model was used to describe the management systems utilized by the respondents in their respective places of work.

**Statement of the Problem**

This study aimed to design an organizational management model for Student Affairs Offices of higher education institutions (HEI).

Specifically, it sought to answer the following sub-problems:

1. How may a proposed organizational management model be designed?
2. How may the proposed organizational management model be validated in terms of:
   a. Clarity
   b. Applicability
   c. Comprehensiveness
   d. Functionality
3. How may the proposed organizational management model be utilized in describing the management systems of student affairs offices of selected state universities and colleges (SUCs) and private higher education institutions (PHEIs)?

4. What are the implications of the results of the study for educational management?

The conclusions of the study are:

1. The organizational management model was validated and rated as excellent.

2. There is no uniformity as to the titles and names of offices used to indicate student services and affairs.

3. The respondents' statements of their VGMOs are aligned to their student services.

4. The respondents' focus of OSA programs is centered on students' welfare, growth and holistic development.

5. SUCs utilize a plan-per-unit strategy while PHEIs make use of Management by Objectives.
6. SUCs' top three most important are the OSA staff, Administration and students respectively.

7. PHEIs rated the Administration OSA staff and support systems / groups as the top three collaborators in activity planning and implementation.

8. PHEIs utilize success or performance indicators for their programs.

9. PHEIs confirm the presence of Standard Operating Procedures in the performance of work.

10. PHEIs indicate the presence of manuals per unit to guide their activities.

11. PHEIs show clear explanations of instructions regarding jobs and roles of employees.

12. The respondents use a per-activity-evaluation system.

13. The common key performance measure used by respondents is quantitative in nature.

14. The services stated in the CHED memorandum are handled by the respondents except for cultural programs in the case of PHEIs and multi-faith services and safety and security for SUCs.
15. PHEIs practice consultation and approval of programs by the administration and the presence of student leaders in the organizational structure.

16. Detailed job descriptions are provided for the OSA personnel.

17. The OSA personnel are able to manage conflicts and build positive relationships.

18. SUCs believe in the qualifications of their personnel and the possession of appropriate skills and competencies are fit to their line of work.

19. SUC unit heads and heads of Student Affairs possess Master’s Degrees and Doctorate Degrees.

20. PHEI unit heads and heads of Student Affairs possess Bachelor’s degrees and Master’s degrees.

21. The respondents give extraordinary effort, enthusiasm, and motivation in conducting activities and achieving goals.

22. Student affairs offices have different position titles for their heads.

23. OSA unit heads handle more than one student service
24. Both groups of respondents agree on the characteristic environment of OSA as to togetherness and harmony.

25. PHEI respondents encourage insights and ideas, continual challenges in setting goals, OSA culture as a guide in staff behavior, good OSA working atmosphere, the presence of OSA core values and a sense of family and unit at OSA.

26. The description of OSA environment that need improvement are the following: funds are not sufficient for their activities and programs; also, facilities and equipments need to be updated and upgraded,

27. Positive descriptions of OSA environment include: work is financially and emotionally rewarding, and the constant enforcement of monitoring systems.

28. The respondents are still in the development phase of formulating their core values.

29. The most common core values are the following: Integrity, Innovation, Team work, and Social Responsibility.

30. The two groups of respondents agree on the active support of the OSA head in activities and programs.
31. PHEI respondents gave high levels of agreement on the following: staff opinions are considered in making vital decisions, staff motivation is done for setting higher goals, improvement opportunities and research on best practices are done, and monitoring systems and regular reports are done to meet targets.

32. Management model is descriptive of management systems for Private Higher Educational Institutions.
Title: Creating the conditions for professional learning communities: Reconceptualizing the facilitative role

Abstract:

Professional learning communities provide fertile environments for school improvement, especially when they reach beyond their organizations for external knowledge and lateral capacity building. Yet professional learning communities do not happen by accident. They require facilitation and support. When schools and universities collaborate in support of the development of professional learning communities, they can form powerful connections and new collegial roles. The resulting learning and leadership development can be powerful for all members, school educators and university staff alike. This paper presents a documentary account of a co-constructed model of a school-university partnership. Built around the development of a network of professional learning communities within and amongst the partners, this partnership is grounded in socio-cultural and constructivist theories of learning and knowledge. PLC development was further enhanced with ongoing data gathering using a capacity-building evaluation model. Project findings have identified the following salient and necessary supports for developing and sustaining a PLC network: 1) using research-recognized tools such as logic models to integrate, focus, and improve staff efforts around
understanding and using data, assessing student growth and achievement, and improving instruction and learning; 2) applying a capacity-building model within schools and across schools to design, implement and evaluate effective school improvement strategies within a culturally responsive framework; 3) establishing protocols that engage the wisdom from partners across the entire network rather than rely on external expertise, and serve to flatten the perceived hierarchy; and 4) developing an inter-disciplinary PLC for facilitators. Together, these supports have enabled us to reconceptualize our role as facilitators in ways that create the conditions necessary to deepen and develop collaboration, engagement, and the examination of practice that has led to pedagogical change.
MENTORS AS CHANGE AGENTS: A CASE STUDY OF A LATINA FIRST GENERATION COLLEGE STUDENT

MENTORS AS CHANGE AGENTS: A CASE STUDY OF A LATINA FIRST GENERATION COLLEGE STUDENT

Abstract

This case study examines the experiences and educational barriers faced by a Mexican-American first generation college student. This study follows the life experiences of a student who was able to overcome significant obstacles in order to become the first in her family to graduate from college. The major findings include the importance of cultural and social capital in the college application and college choice process. Other findings include the impact of teachers and high school counselors as gate keepers that either grant or deny access to higher education. The importance of mentors and college counselors as change agents in breaking the cycle of social reproduction in public schools is discussed. Implications for practice and policy are discussed.
Introduction

Students throughout the United States are told and believe that those who work the hardest will achieve the best results. However, what most working class students often fail to realize is that although they are running the same race as their middle class peers, their peers have begun with a sizeable head start. In looking at college attendance rates, students whose parents have attended college are given a significant advantage by virtue of the cultural capital that is passed on to them by their parents (Bourdieu, 1986; Lareau, 2003). Parents who are college educated know that in order to attend college one must complete certain courses, attain a respectable GPA, and score well on standardized tests. In addition, these parents know about the college application process including how to fill out an application, how to apply for financial aid, and how to prepare for an interview. These skills are in turn passed on to the benefit of their children giving them the head start that gives them an advantage over those who are the first in their families to attend college.

This case study is the result of an interview with a thirty-one year old Mexican-American doctoral student. Although both of her parents never finished school, she was able to graduate as the valedictorian of her high school. She went on to graduate from a highly selective private college in the East Coast with a dual major in Business and Spanish. She later completed a Master’s degree in Educational Administration and is currently pursuing a Ph.D. in Education. Although she was born in the United States, she spent her first years of schooling in Mexico and did not begin school in the United States until the fourth grade.
This interview focuses on how she was able to overcome her family’s limited experiences with formal education to become the first in her family to attend college. I investigated how she was able to use the social capital of college counselors and mentors to navigate her way through high school and the college application process. The interview focused on how her participation in a mentoring program made a significant difference in her decision to apply to and attend a prestigious college that was a great distance from her home. In addition, I studied how the cultural capital she gained through this process is now being passed on to her younger sisters who are both currently pursuing college degrees in Nursing and Psychology (Bettie, 2002). Through this interview I hoped to gain a better understanding of the obstacles that face many first generation college students and how they are able to use their social capital in order to overcome them.

This paper draws on research by Bourdieu (1986) that cultural and social capital play an important role in the educational attainment of students. Bourdieu defined cultural capital as the forms of knowledge, skills, education, and advantages that a person has. This cultural capital gives a person a higher status in society. Parents can provide cultural capital to their children by transmitting the attitudes and knowledge needed to succeed in the educational system.

Bourdieu (1986) defined social capital as the resources available to an individual based on group membership, relationships, networks of influence and support. He went on to say that social capital relationships are useful to us because they allow us to achieve things that we would not be able to achieve without them. He explained that all social groups possess social and cultural capital, but that the capital of lower socioeconomic
groups is not valued by the dominant group. He also found that those who have higher levels of cultural capital are more inclined to maintain it and increase it with time.

In addition to Bourdieu’s (1986) contributions regarding cultural and social capital, this paper also draws on his idea of habitus. Habitus is the accumulation of our everyday activities that become our habits. Our habitus is shaped by our peer reference group, educational experiences, and cultural practices. In this paper I will discuss the habitus of both individuals as well as organizational habitus. Organizational habitus is the habits and practices of organizations that result in certain ambitions and expectations for those who are a part of the organization.

**Born in the U.S.A.**

Lucero* was born in 1978 in Northridge, California. She was the second of four children. Her parents were immigrants from the small town of Degollado, Mexico who had moved to the San Fernando Valley region of Los Angeles one year earlier. Her mother had left school after finishing third grade and her father discontinued his education after completing the sixth grade. Although Lucero was born in the United States, her family returned to Mexico when she was four. They remained in Mexico for the next five years. During this time Lucero and her older brother attended elementary school in Degollado. Her parents had run a successful tienda (family store) in Mexico, but they decided to leave Mexico to return to America. Lucero believes that her parents’ motive for moving back to the U.S. was so that she and her brother would have the opportunity to learn English and so that they would have better opportunities for their future.

* All names used in this case study are pseudonyms.
Upon her return to the United States Lucero enrolled in the local elementary school as a fourth grader. I came to the U.S. when I was in fourth grade, so that’s probably like 9 years old. And I came to Reseda in the Valley. The community was mostly recent immigrants. I would describe it as a low socioeconomic area and it was an apartment and there were four of us kids and my parents and we were living in a two bedroom apartment.

Although she had been born in the U.S., she had spent the last four years living in Mexico and had never previously attended American schools. Lucero remembers finding it difficult to understand what her teachers were saying and often felt left out of the conversation. She reported some negative experiences with classmates as a result of her limited English language abilities and sometimes felt as if they were talking about her in English so that she wouldn’t understand. She remembered participating in a pull out program for English Learners that was taught by a bilingual teacher. She enjoyed participating in this program because she was able to understand the teacher and the teacher could understand her.

I remember at the time when I went to elementary school I didn’t speak any English obviously so it was hard because I didn’t understand anything the teacher was saying and sometimes I would think they were saying things about me not speaking English at my table cause they would blame things on me. Like I remember one time that the teacher would give us like table points for whoever got ready first and um everybody was like getting ready and I remember like specifically they blamed me that I wasn’t ready because I didn’t cross my hands or whatever because that was like what the teacher asked but I didn’t understand that was what she wanted us to do. So I felt bad that they were blaming me that I didn’t get ready and I made them lose a point. Pero the other thing I remember from elementary was that there was a bilingual teacher who used to teach us things in Spanish and she would take us out of the classroom to just teach things to us in Spanish and I remember that I liked going there because I understood what was going on.
“Habitus” Are Hard to Break

Although Lucero experienced some difficulties adjusting to school during her first few years attending an American elementary school she found success despite her limited English skills. Yet, despite her academic success, her parents remained largely uninvolved in her education. She reported that although her parents wanted her to be successful they were not involved in her schooling as much as other parents.

I always felt that my parents wanted the best for us obviously they wanted us to do good. They were not very involved like in school. I don’t remember them being involved or even like asking you know do you have homework or what did you learn in school. So I don’t remember like anything like that. They never went to like parent conferences or open houses. I think like either they didn’t know about them or the information never got to my parents or it was never written in Spanish. The only time I remember they came was one time and it was for my graduation in elementary school.

Research indicates that immigrants and other working class parents often defer to teachers as educational experts and often feel intimidated about talking to teachers about the education of their children (Lareau, 2003). Not only can this be a norm of working class parents, but it is also a cultural norm for many immigrants. This custom is particularly common among immigrants from Latin America. Although working class parents want their children to succeed academically they are often less likely to engage in educational opportunities provided by the school such as parent conferences.

Not only do working class parents view their role in their child’s education differently than middle class parents, they also have different ways of raising their children as well as different educational aspirations for their children. Lareau (2003) calls the way that middle class parents raise their children concerted cultivation. In this
method of child rearing the children are engaged in a variety of structured activities that help train them in the rules of middle class society. They work with adults and learn to address them as equals. Through these interactions they develop a sense of entitlement that stays with them as they mature. In many ways this form of parenting provides children with some advantages that allow them to make the rules work in their favor as they grow up. Although Lareau explains that concerted cultivation has many advantages, she does not claim that it is the best way to raise children. She does however concede that it matches the best with the culture of schools.

In contrast, Lareau (2003) explains that working class parents favor a different method of child rearing which she calls natural growth. This method of child rearing involves allowing children more freedom and less restriction in their development. It is characterized by giving children time for free play and often involves more time spent with members of the extended family than is typically found in middle class families. There is less of an emphasis on structure and children are left to develop in a more natural way. This method of child rearing does not emphasize children interacting as equals with adults and is often characterized by a separation between the adult world and the child world. Although this method of parenting has some advantages, it is less valued by schools and can in some ways put the children of working class parents at a disadvantage when it comes to success in school.

When asked about her parents aspirations for her future, Lucero explained that they would have been happy as long as she found a job in an office. They did not speak to her about college and she felt that they were not very well informed about the application process. College was not a part of her parents’ habitus.
They were not informed about any of that stuff because they didn’t know about college options or that like college was like gonna be an option for me. So they were not informed at all. They never talked to me about college. I don’t think you know they knew about college.

Research on the aspirations of working class parents also indicates that they differ from the aspirations for their children by middle class parents (Lareau, 2003). Middle class parents tend to have little doubt that their children will go to college, while working class parents hope that their children might attend a state college. Lucero communicated that the aspirations of her parents for her did not involve college, but rather her finding an office job after high school.

I remember that when I was like in high school their aspirations were like for me to work in una oficina, like work in an office. My mom used to think that it was nice to have an office job so they used to say don’t be like my dad working in the sun cause my dad works construction and its like a hard job. So she used to say like as long as you work like in an office that would be like a good job for you. So like after high school if I had just worked in an office like as a secretary or a bank teller that would have been like a good job for them.

**Gate Keepers and Change Agents**

Unlike students in many affluent communities, working class students tend to have less interaction with teachers regarding college and college preparation (Lareau, 2003). Although she had many positive relationships with teachers, she had a hard time thinking of many examples when teachers spoke with her about college. She did report one instance when her PE teacher encouraged her to attend college despite her own lack of college knowledge.

I just remember I had one friend Olga and I always said like we wanted to go to UCLA together and I think one of the reasons we kept saying that
was when we were in middle school we had a PE teacher who went to UCLA and she always would wear T-shirts that said UCLA. She would just tell me oh you know you are gonna go to college. I used to tell her oh no I’m not gonna go because my mom would never let me go away to college and she would say well if you want to be the boss you have to go to college. And I would tell her I’m not gonna go to college because I’m gonna get married after high school and she would say if you go to college your gonna meet a nice college educated man over there in college.

Research on working class students has revealed that teachers and guidance counselors do more than just teach and organize class schedules. They are key participants in the social networks of low status students and play a determining role in reproducing or interfering with the reproduction of class, racial, and gendered inequality. In essence they act as gate keepers to higher education by either granting or denying access to students (Stanton-Salazar, 2001). In addition to her limited experiences with teachers regarding college and college preparation, Lucero also reported that her high school counselor did not play a large role in preparing her for college.

In high school I remember meeting my counselor not very often. I feel like her main concern was to make sure that I took classes to finish high school. So she would call me when it was like towards the end of the semester and she would ask me oh how are you doing in your classes. But honestly I don’t remember talking to her about college. I just think its funny that like somehow I was taking the right classes preparing to go to college. I guess like not knowing that I was taking the prerequisite classes that I had to take to get ready for college.

In addition to the fact that teachers and counselors at her high school did not play a significant role in assisting Lucero in the college application process, she also reported a disturbing trend among some of her teachers that resulted in lowered expectations for students in the regular program as opposed to the magnet program at her high school (Gonzalez et al, 2003). Lucero was tracked in the regular program and felt that her counselor was mostly concerned with helping her graduate high school, but that she did
not talk to her about attending college. In addition, some teachers seemed to have lowered expectations for students in the regular program, especially ESL students. This general lowering of expectations became a part of the habitus at her high school that lowered the expectations and aspirations of students (Bourdieu, 1986).

I had another teacher who also taught the magnet students and I always felt like he didn’t make the curriculum as rigorous because he probably thought that we were not going to be able to handle it.

Despite limited support by teachers and counselors from her high school, there was one individual who played a crucial role in helping her prepare for and apply to college. While she was in middle school, Lucero was recognized by her teachers as a student with limited resources but having great potential. She was referred to a local mentoring program that matched up successful professional adults with low income students from groups that were typically underrepresented in college. This program matched her up with a middle class elementary school teacher named Ellen who became an advocate for Lucero as well as a trusted friend. Ellen would play a very important role in encouraging Lucero to attend college and to broaden her aspirations for which college she wanted to attend.

I think who had the biggest role was a mentor I had that I was matched with in this mentoring program. She was the main person who made a difference in helping me with the college application process. I remember staying up late working with her just filling out the applications and just running around to get things for the applications. She was the one who told me to talk to my teacher cause you’re gonna need like recommendation letters. I think that without her I wouldn’t have made all those deadlines. She would just like give me a list of things to do. Sometimes she would even like talk to my counselor. She would be the one like calling her and tell her like Lucero is gonna come and talk to you make sure you provide her with the information. So like by the time I went to talk to my counselor she would be like oh Ellen already talked to
me and she said you were gonna come and pick this up so here this is what you need.

Just as many of Lucero’s teachers and counselors had acted as gate keepers and done little to change the cycle of reproduction that exists in many urban schools, Ellen had become a change agent (Bourdieu, 1973; Stanton-Salazar, 2001). She saw the potential that was in Lucero and took action to break the cycle of social reproduction that would have resulted in Lucero being shut out of the college process and may have lead to her remaining a member of the working class. Ellen took on the role of teacher, counselor, and even parent in providing Lucero with the cultural capital that she lacked in regards to college.

In addition to being provided a mentor, the mentoring program also had a college counselor assigned to Lucero. In contrast to her high school counselor who was only concerned with Lucero graduating from high school, her college counselor at the mentoring program spoke with Lucero exclusively about college. While the habitus of her high school revolved around the concern for helping students to graduate high school, the habitus of the mentoring program was that students would attend college (Bourdieu, 1986). Not only did the mentoring program expect all students to go to college, there was a particular emphasis on attending highly selective colleges and universities. Lucero’s college counselor helped her to identify schools that might be a match for her and assisted her in navigating the college choice process.

Through the mentoring program that I was part of that was the first time that I like had a college counselor or advisor. My mentor would bring me in the office and I would talk to my college advisor. She would ask me like what interests you and I was like I wasn’t sure what interests me so I wasn’t sure like what to say.
Lucero’s college counselor also played a role in exposing her to college options that she did not even know existed. Prior to meeting with her, Lucero had aspired to attend a local state college. However, her college advisor exposed her to a range of colleges that she never even knew about. She encouraged her to consider colleges that were out of state and far from home. She also recommended attending an all women’s college to satisfy her parents’ fears that she would get pregnant if she was living far away from home. Lucero also tapped into the social capital made available to her by her association with the college counselor. The counselor was able to connect Lucero with a relative who had attended Franklin & Marshall College, a small highly selective liberal arts college in Lancaster, Pennsylvania.

I remember that the college counselor there had a niece and the niece went to Franklin & Marshall and she came to talk about Franklin & Marshall to me and how much she loved it. So she was like maybe we should suggest that to Lucero to go to Franklin & Marshall. So that’s how it started. Then like later in the year Franklin & Marshall sent a representative to the mentoring offices and that was a great opportunity for me to go talk to them in person. So the college counselor from the mentoring program set up an interview for me to go talk to the representative from Franklin & Marshall.

Although the mentoring program had helped Lucero by setting up an opportunity for her to meet with a college representative, they did little to assist her in preparing for her interview. Having come from a working class family where college interviews were not a part of their habitus, she did not know what to expect from the interview. Instead of preparing questions ahead of time and thinking of ways to impress the college representative, Lucero showed up to the interview with her whole family with no idea of what the interview would be like.
The funny thing is *de que* I didn’t really know about interviews cause I had never been to no interviews. So I remember that when I went to this interview everybody from my family came. Everybody was looking at us weird because everybody was sitting there from my whole family. At the time I didn’t know anything was wrong with it. The college counselor ran to get a camera to get a picture because we were all just sitting there. Nobody taught me to think of questions ahead of time or to come with some questions ready or told me to kinda like to show interest in the school or say that I really wanted to go there. And now thinking back I came up with like stupid questions like oh do the boys and the girls sleep in the same dorm or are we gonna have food there. But I don’t think that’s like some of the normal questions that people ask.

Lucero’s lack of cultural capital resulted in her showing up to her interview without any preparation or even the realization that she could or that she should prepare. In contrast to Lucero’s experience with the college application process, many middle class and upper middle class students benefit from the cultural capital provided to them by their parents as well as that provided by private college counselors who can help by preparing them for interviews and telling them what to expect (McDonough et al, 1997).

**College Life**

Despite her many obstacles, Lucero finished with a 4.12 GPA and was the valedictorian of her high school class. Despite what she considers a poor score on her SAT’s she applied exclusively to highly selective colleges. Like many working class students, Lucero applied to only a handful of schools (McDonough, 1997). She remembers applying to Pepperdine University, UCLA, Wellesley College, and Franklin & Marshall College. Despite having her choice of schools to attend, she ultimately decided on Franklin & Marshall. Although she knew little of the other colleges and had visited only the F&M campus prior to applying, her decision to attend F&M was largely a financial one. Interviews of college applicants have shown that financial considerations
tend to play a much larger role in the college choice process for working class students compared to middle class applicants (McDonough, 1997).

They gave me a lot of money to be able to go there. A lot of people, especially like my mentor, they told me you know this is like a very expensive school and the package you’re getting is a big deal. And I was like really it’s a big deal? At the time I wasn’t really sure, but coming from them I believed them that it was like a big deal.

Yet despite receiving a great financial aid package, Lucero was faced with the task of convincing her parents that it was a good idea. Once again her mentor and college counselor stepped in to help convince her parents.

One of the main reasons I decided to go there is because um they gave me a big financial aid package. They provided me with um considering that it was, and it still is, a very expensive school they gave me a lot of money to go there. And so I almost said no once again because my parents, especially my mom, would not allow me to go away. And she would say you know I’m gonna die, I’m gonna die, if I don’t know where you are and I don’t know what you’re doing. But my mentor and the college counselor in the mentoring program, you know, wrote letters and they had someone translate them for her to kinda like let her know that she was gonna be okay and that she was not gonna die and those kind of things.

Once she arrived at Franklin & Marshall, Lucero experienced a sort of culture shock. She realized that there were people who did not have to worry about the financial considerations that concerned her and her parents. She found that most students at F&M could rely on their parents to assist them financially rather than having to do work study to pay for expenses.

It was different because like I said there were a lot of rich people and I would just like sit in the cafeteria sometimes and just listen to their conversations and they would say things like oh I have to call my dad and you know get more money in the bank account and I like didn’t even have a bank account. And they just had like a special bank account where they
could just like get money whenever they needed and they would just like say things like that.

In helping Lucero adjust to her new life in college it was not her parents who helped her. Once again her mentor played an important role in helping her navigate the college experience and adjust to college life. She gave her advice that would help her be successful in college classes. She provided the kind of guidance that many middle class children receive from their parents, but is not a part of the habitus of working class parents (McDonough, 1997). In many middle class families, the cultural capital that helps one succeed in college is transferred from parents to their children (Bourdieu, 1986). However, since college is a new experience for most working class students, parents are unable to transmit the cultural capital that will help them succeed.

At the beginning when I first got there my mentor was the one who helped. I mean she even came. She came like my first year and my parents never came to my school till the very last day I was there, pretty much for graduation. But, my mentor came to visit me like on parent weekend and you know she came and she was very interested to know like how the school was. It was the first time that I got like out of the school. She took me to like the Lancaster community and then we went and we visited the Amish and I saw like the wagons and all that. She got me started you know like my first year there. She helped me open my first bank account. She told me you know take notes, ask questions, talk to the professors if you have problems.

Not only did Ellen help her to learn strategies that would assist her in being successful in college, but she also provided emotional support by visiting her when she was so far away from home. In many ways, Ellen played a role that middle class parents play in the lives of their children. Ellen again broadened her experience by showing her places in the college community that she might never have enjoyed if it wasn’t for her.
Looking back on her own experiences, Lucero was able to reflect on the impact that her mentor had on her during high school, throughout the college application process, and during her first year of college. She believes that if it were not for her mentor she would not have gone away to college. She felt that she probably would have followed the habitus established for the students in the regular program at her high school and attended a local state school.

If I had not had a mentor I think I would have still gone to college. I think I would have definitely gone to CSUN cause like the friend that I had who we said we’re gonna got to UCLA she ended up at CSUN. And she ended up you know working part time and I’m pretty sure I would have done the same thing and since you know I was kinda doing that in high school already.

When looking at Lucero’s college journey it was her mentor, Ellen, who took on the roles that are typically played by parents, teachers, and guidance counselors in the lives of middle class students (McDonough, 1997). Ellen saw the obstacles that existed and the potential that was within Lucero and made a decision to act as a change agent to break the cycle of social reproduction that exists in schools (Stanton-Salazar, 2001). It was through her actions that this cycle was broken which allowed Lucero to achieve what is typically beyond those coming from the working class habitus.

By breaking this cycle Ellen created a new path that not only has lead Lucero to achieve, but has now allowed her younger sisters to also benefit from the cultural capital that was gained by this experience. Today Lucero has not lost her hard working nature. She works as a full time teacher at a Los Angeles elementary school while she simultaneously continues to pursue her education as a doctoral student in the field of Education. Lucero’s success has also impacted the lives of others by transmitting the
cultural capital that she gained to her younger siblings who are both currently pursuing college degrees (Bettie, 2002).

Conclusion

This case study sought to explore the experiences of a Mexican-American first generation college student. My conversation with Lucero revealed a hard working woman with a strong commitment to her family. Learning a new language, lack of support from teachers and counselors, low expectations, and lack of parental involvement have all played an important role in her educational process. Yet despite these obstacles, Lucero has achieved what most working class students do not even know is possible. Although her path has been rough and beset with hurdles she has kept pace with her middle class peers and has even surpassed many who had begun with a sizeable head start.

Lucero is a prime example of what is possible when educational players make the decision to be more than just gate keepers and become change agents (Stanton-Salazar, 2001). Had it not been for the intervention of her mentor and college counselor, Lucero would likely have followed the same path taken by her high school peers. Had she decided to attend a state college, it is unlikely that she would be a doctoral student today. Research has shown that not all college degrees are the same. Those who attend third and fourth tier colleges and universities do not gain the knowledge connected with substantial intellectual work including theory, extensive writing, and independent research. Graduates from these schools generally do not receive the prerequisite skills that allow them access to top graduate schools (Aronowitz, 2004).
Although Lucero was able to overcome her class status to achieve tremendous results, what about the thousands of working class students like her who do not have the benefit of being matched with a mentor and college counselor? We should take steps to make sure all students are not shut out of the college of their choice simply for lack of information. One way that we can hope to achieve this result is by increasing the number of college counselors at our nation’s public schools. These counselors should serve the role of providing college access to those students who lack the cultural capital that is supplied by college educated parents (Stanton-Salazar, 1997; Valadez, 2002).

In order to improve American schools, we should seek to improve our urban schools so that students are not the victims of teachers’ low expectations. One way that we can improve our nation’s schools is by making sure that all students are informed about what is required to gain acceptance in selective colleges. We should make sure that all students are given the chance to complete a college track curriculum and have the option of college attendance upon graduation from high school.

In addition, we should be certain to make sure that all youth are given early, frequent, and positive contact with teachers, counselors, and administrators (Padilla & Duran, 1995). This could be accomplished by making sure that adequate numbers of counselors are present in our schools that have large numbers of working class and immigrant students. We should also make sure that every child in every school has an adult at the school who they can go to for support or advice. This can be achieved by allowing students to choose the teacher or counselor they want as their college advisor, similar to the way graduate students are free to select the faculty members they wish to work with. This would help to ensure that those students who are most in need of a role
model or caring adult in their life receive the support that will help them in the
application and college choice process. In this way we can work to break the cycle of
social reproduction that exists in schools and give all students the cultural capital that will
make college an option for all.

khsuz@hotmail.com

6. **Abstract:**
This works-in-progress aims to test the hypothesis that text written with L1 (first language) explanatory notes will increase the quality of subjects’ L2 (second language) oral participation. This research will use a quasi-experimental design consisting of a control group and a treatment group. Both groups will take Nation’s (1990) Vocabulary Levels Test to ensure that the subjects’ are operating at a novice level (2000 – 3000 word level). Additional selection criteria for subjects includes their L1 being Korean, being between the ages of 18 - 45, and their strong desire to learn English. All subjects will read a short article on health in the poor and rich worlds (Nassaji, 2006), but only the treatment group will have Korean explanatory notes written above low frequency words (between 1 and 49 occurrences per million words), as determined by Thorndike and Lorge (1944). The reading time of all subjects will be timed in order to calculate their fluency of reading. The subjects will then be asked to orally recall the experiences of the article’s narrator and to include their own experiences/opinions as well. This narration will be audio-recorded and transcribed for analysis. The analysis of the transcript will be exploratory in nature to determine any effects of L1 explanatory notes on L2 oral participation. The following are some of the features of the subjects’ L2 oral production that will be analyzed: comprehension of the article, oral fluency, number of low frequency words used, functionality of grammar used, and operation within Bloom’s Taxonomy (1956). The findings of this research may further refute the claims of the monolingual principle (Howatt, 1984) and encourage a more multilingual approach to language instruction (Cummins, 2009). EAL (English as an Additional Language) students in mainstream classrooms struggle with discussion formats, especially when they are not confident in their understanding, thus utilization of their L1 may be a route for their “legitimate peripheral participation” (Lave & Wenger, 1991).
Student Assistants in Elementary School Physical Education Classes: An Action Research Study

Stephen Berg, PhD
University of British Columbia Okanagan
3333 University Way
Kelowna, British Columbia
Canada
V1V 1V7
stephen.berg@ubc.ca

The purpose of this action research was undertaken to study the experiences of elementary school generalist trained teachers and students when student assistants were used in physical education classes. Using Herr and Anderson’s (2005) outsider in collaboration with insider action research methodology, the study utilized the combined efforts of all participants involved in a grade one/two class and a grade five/six class to implement the use of student assistants into their physical education classes.

Data collection techniques included experiencing (observations and field notes), enquiring (interviews), and examining (journals, videotapes, photographs) (Mills, 2003). All data collected were transcribed and chronologically ordered to facilitate the finding of codes and themes.

Self-esteem, teaching responsibility, active participation, enjoyment, relationships, and teacher practice for the grade five/six teacher only, were positive benefits when student assistants were utilized. Timing and teacher practices for the teachers, and embarrassment and treatment from some assistants were regarded as limitations of utilizing student assistants into the physical education lessons.

Comparative Case Studies of the Development of Third Graders’ Conceptions of Nature of Science: Student Understandings after a Year of Instruction

Valarie L. Akerson, Vanashri Nargund, Ingrid Weiland, Khemawadee Pongsanon, Indiana University

This study explored 24 third grade elementary students’ conceptions of nature of science (NOS) over the course of an entire school year as they participated in explicit reflective science instruction. The VNOS-D was administered pre instruction, mid school year, and at the end of the school year to track growth in understanding over time. The Young Children’s Views of Science was used to describe how students conversed about NOS among themselves. All science lessons were videotaped, student work collected, and a researcher log was maintained. Data were analyzed by a team who sorted the students into low, medium, and high achieving levels. Three representative students were selected as case studies to provide an in-depth picture of how instruction worked differentially and how understandings changed for the three levels of students. It was found that all students improved their conceptions of NOS and were able to converse among each other using the NOS terminology they learned without prompting by the teacher. However, those who were at the higher achievement level could provide definitions for NOS terms and examples of where they are illustrated in science that were not provided by the teacher, whereas those at lower levels could not provide examples.
Comparative Case Studies of the Development of Third Graders’ Conceptions of Nature of Science: Student Understandings after a Year of Instruction

Rationale/ Problem

Studies have shown that elementary students do not naturally develop adequate understandings of nature of science (NOS) as a result of inquiry instruction (Author, 2005). However, elementary teachers can positively influence their students’ views of NOS with appropriate instruction (Smith, Maclin, Houghton, & Hennessey, 2000). It seems that people may underestimate the learning capabilities of students, and if they actually receive NOS instruction they can learn the ideas. This study explored the kinds of NOS conceptions students developed as a result of explicit-reflective NOS instruction that took place over an entire school year. The research question became “what NOS conceptions can third graders develop after a full year of participating in explicit reflective NOS instruction?” A second question became “how do students’ NOS conceptions differ depending on whether they are considered low, medium, or high achievers?”

Conceptual Framework

In thinking about the approach to improving students’ NOS conceptions we knew from prior research in informal settings with young children (e.g. Authors 2010) and in traditional classroom settings with older children (e.g. Khishfe & Abd-El-Khalick, 2002) that the explicit reflective approach has been found to be effective. Explicit reflective instruction refers to the notion that the learner’s attention is intentionally drawn to the NOS aspects as well as the learner
is asked to reflect orally and in written form on NOS aspects in the context of science lessons. We therefore elected to use explicit reflective NOS instruction, embedded in the science content, to teach NOS aspects to third grade students. While a review of prior research illustrates that children can indeed improve their conceptions of NOS, we included case studies of low, medium, and high achieving students in order to illustrate how such instruction may differentially improve student conceptions.

_Nature of Science_

NOS refers to the epistemology of science, science as a way of knowing, or the values and beliefs inherent to the development of scientific knowledge (Lederman, 1992). Some important aspects of NOS have been advanced in recent reform documents including _Science for All Americans_ (AAAS, 1990, especially chapter one) and the position statement from National Science Teachers Association ([NSTA], 2000). These aspects include that (a) scientific knowledge is both reliable and tentative, (b) no single scientific method exists, but there are shared characteristics of scientific approaches to science (e.g., scientific explanations are supported by, and testable against, empirical observations of the natural world), (c) creativity plays a role in the development of scientific knowledge, (d) there is a crucial distinction between observations and inferences, (e) though science strives for objectivity, there is always an element of subjectivity (theory-ladeness) and (f) social and cultural contexts play a role in the development of scientific knowledge. These aspects were the target of the current project.

Exploring how elementary students come to know NOS has been the target of research for several years, and we are still studying best practices. Smith et. al. (2000) found that students with a teacher who emphasizes NOS over the course of their elementary science classes improved their NOS conceptions. However, it remains to be seen the nature of those conceptions
for young children particularly given that most teachers of young children do not teach NOS. In research with teachers (Author, 2006) we have explored first graders’ conceptions of NOS as a result of explicit instruction, and noted that these students improved their understandings of several NOS elements. We have (2007; 2009) also found that elementary students of different grade levels improved their understandings of NOS elements, and that children as young as five were able to conceptualize various elements of NOS that are advocated by the NSTA position statement (NSTA, 2000). Khishfe and Abd-El-Khalick’s (2002) study with older students found that elementary students who participated in explicit reflective NOS instruction could conceptualize NOS aspects better than those who participated in scientific inquiry, but without explicit NOS instruction. Common to all of these studies were explicit reflective activities that connected students’ NOS understandings to the science content, as well as provided them with specific activities designed to introduce them to the targeted NOS elements. We believed that elementary students who are unfamiliar with NOS ideas would need to receive explicit instruction in the terms as well as use those terms within their science investigations. Therefore we intended to use contextualized NOS instruction that enabled the students to explore NOS along with their science content (Clough, 2006). Contextualized NOS instruction would mean that NOS would be connected to the science content students were learning, and would be explicitly noted through discussion and reflections. Exploring this instructional approach will shed light on the effect of explicit reflective NOS instruction through an entire school year, and provide an in-depth look at the conceptions held by low, medium, and high achieving students.

Method

This study explored the NOS conceptions held by a third grade class prior to instruction, at mid-year, and after a school year of explicit reflective NOS instruction. It explored overall
NOS conceptions as well as three representative cases (Merriam, 2009; Yin, 2008) that were
developed from students who were high, medium, and low achievers to illustrate the kinds of
changes in conceptions that took place over the year. Creswell (1998) supports the use of case
studies as a way to collect detailed, in-depth data involving multiple sources of information rich
in context. In our current study we purposefully selected cases to show a spectrum of students’
understanding of NOS. We have collected data from variety of sources to develop in-depth
understanding of students’ conceptions. The case study approach allows us to portray students’
understandings and misconceptions in detail over time.

**Context.** There were 24 students in the class at an at-risk school. Eighty percent of the
students in the class were on free or reduced lunches. The class itself was divers, with five
African American and two Latino American students, and one Native American student. The
remaining students were white. There were five students who were identified as ADHD, one of
whose IQ was so low that they were concerned whether he would ever be able to finish school.
There were continually students moving in and out of the classroom as they changed schools
usually within the district. It was an interesting and challenging environment in which to teach.
We selected three students from which to build case studies of NOS learning over time—one
high, one medium, and one low-achieving student. **James John** was our low-achieving student.
Though he was bright, he often missed school due to his mother being ill with cancer. He
claimed to love science and did very well in math. He was from a low socio-economic family.

**Morgan Millie** was our medium achieving student. She was from a high socio economic family
and claimed to hate everything about school except recess and lunch. She stated several times
that she hated science. **Cole Chad** was a Native American student who was very enthusiastic
about school. He loved animals and being involved in all school activities.
**Intervention.** Because explicit reflective NOS instruction has been previously found to be successful in improving learners’ conceptions of NOS, this is the kind of instruction that was used. Contextualized (Clough, 2006) NOS instruction was used to connect the NOS aspects to the science content being taught. The school district used the Full Option Science System (FOSS) curriculum to teach science. FOSS is an excellent curriculum, but does not have an explicit focus on NOS concepts. The teacher incorporated NOS throughout science instruction, and embedded it into the FOSS curriculum. For example, while discussing the topic of ‘states of matter’ with the students, author one focused on concepts of solids and liquid as well as talked explicitly about observation and inference, how students made observations creatively and had drawn inferences creatively. She required students to use their senses (except for taste, generally) to make observations, and then connect these observations to inferences they make. She further asked students to share examples of solids and liquids they encountered in their daily lives and discussed NOS concept of background knowledge (Subjectivity) while associating ideas or interpreting data.

Following each science lesson a discussion ensued that drew the students’ attention toward the NOS aspects, such as the teacher stating “Where do we find scientific tentativeness in our investigation?” or “What NOS aspects do you see in our investigation?” In addition, science notebooks were used in the classroom. These notebooks enabled students to record their scientific data, as well as record their NOS understandings and reflections over time. Children’s literature was also used to teach and emphasize NOS aspects. For example, during an investigation on observation and inference the book *Earthlets As Explained by Professor Xargle* (Willis, 1994) was read. The book was used to emphasize the distinction between observation and inference, as the students were listening to the book they talked observations made by Dr.
Xargle, and the inferences that he made. We talked about why his inferences were funny to us, though they were reasonable to him. One student stated during the story “He is trying to make inferences from the data he is collecting—he is a scientist!” After the story the students engaged in an activity that required them to determine what might be inside a sealed bottle. Students made various observations, and when we came back together as a group they discussed the inferences they made and the observations that lead them to those inferences. We concluded with another story that day, *Seven Blind Mice* (Young, 1997) and students were able to note observations and inferences within the story, as well as the role of subjectivity. For instance, one student (Parvati) said “They bring their data together and compare it. They heard the other mice’s inferences so they had more background knowledge and had different ideas.” Another student agreed, stating “You need background knowledge to make inferences.” See Figure 1 for a listing of science lessons and corresponding NOS conceptions taught through those lessons throughout the school year.

**Data Collection**

To determine students’ NOS conceptions, we administered the VNOS-D2 in pre (August), post (mid year—December), and post-post (end of school year) questionnaires and interviews of all students who had informed consent to participate (Lederman & Khishfe, 2002). The VNOS-D2 is an open-ended instrument that elicits ideas about certainty in scientific knowledge, characteristics that distinguish science from other fields, creativity in science, and scientific subjectivity. These interviews lasted approximately 30 minutes each. We conducted small group interviews in the spring semester using the *Young Children’s Views of Science* (Lederman, 2009) protocol. These interviews allowed us to consider how children think and express ideas about science among themselves and allowed us to elaborate on our understandings.
of their NOS conceptions. We collected student work such as written work and science notebooks to further track changes in student NOS conceptions over time. We videotaped all science lessons and the lead researcher kept a researcher log of each day of instruction in which she recorded impressions of student learning and events each day.

In addition to student responses on the VNOS-D as well as the *Young Children’s Views of Science* instrument, to identify low, medium and high achieving students we collected student work in the form of their science notebooks as well as other written work. We also used videotapes of classroom interactions to note the kinds of responses to teacher questions and statements students made regarding NOS aspects in science.

**Data Analysis**

To formally track student NOS conceptions the VNOS-D2 was analyzed pre (August) post (December), and post-post (May) by two researchers, seeking patterns of individual student responses and then comparing analyses. Discrepancies were resolved through further consultation of the data. We then compared pre, post and post-post data to note change in NOS conceptions over the course of the school year. For example, we determined students’ conceptions of the distinction between observation and inference as being something that scientists directly noticed—no room for inference in the creation of scientific ideas—in the pre data. In the post data, a greater number of students recognized that scientific claims were inferential, and by the end of the school year all students but one recognized the importance of making inferences of observations on scientific claims. We also analyzed the *Young Children’s Views of Science* interviews to enable us to discern how students talked among themselves about science and NOS ideas.
We then identified high, medium, and low achieving students partially by noting their scores on the VNOS-D2 at the conclusion of the school year. From these students we selected one to serve as a case to represent each group. We selected students who were overall classified as “bright” by the teacher, meaning they did not struggle academically and did well in most subjects in general, and for whom we had the most complete sets of data. We reviewed these three students’ notebooks and other class projects, and reviewed the videotaped lessons to determine the kinds of conversations each student had regarding NOS during science lessons. We used their VNOS scores, class work, and videotaped analyses to develop case studies. At least two authors reviewed each set of data and determined the kinds of interactions each student held with the teacher and with peers, as well as the kinds of examples they provide of NOS aspects present in science lessons. We identified Chad as high achieving because he could clearly describe accurate responses to the VNOS questionnaire, including providing examples of ideas that were not previously shared by the teacher. Millie was identified as medium achieving because she could provide accurate descriptions of most NOS aspects as well as provide examples of the ideas, though some examples had been previously provided by the teacher or she struggled with providing examples. John was identified as low achieving because, though he could provide appropriate definitions of most NOS aspects, he often could not provide examples of these ideas.

Results

In this section we provide results regarding the NOS conceptions held and developed overall by students in the class. Pre-conceptions, mid-year understandings, and end of year conceptions will be shared. Following the overall conceptions case studies of a low-achieving, a
mid-achieving, and a high achieving student will be shared, to illustrate how students developed ideas differentially.

**Overall Development of Students’ Conceptions of NOS**

The first author interviewed all students whose parents consented pre instruction, mid-way through the school year, and at the end of the school year. The VNOS-D2 was used for the pre and post interviews, and end of the school year interviews. The second author aided in conducting group interviews of the students using *Young Children’s Views of Science* at the end of the school year. The first author was also the lead teacher in the class, and found it was not easy interviewing students while also being the lead teacher. She decided to interview the students while the other teacher instructed the students in different content areas. Table One shows the number of students in the class who held various conceptions of NOS and how those conceptions changed over time. The analysis of this data was conducted with another research team member who had experience working with the VNOS-D2 and analyzing the data for young children to ensure valid interpretation of student responses. In the sections below we will describe the students’ preconceptions of NOS, mid-year conceptions, and end of school year conceptions. It is clear to see that the students’ conceptions continued to improve over the course of the school year. We will conclude the results section with case studies of the low, medium, and high-achieving student.

**Students’ pre-intervention conceptions of NOS.** At the beginning of the year, four out of sixteen students believed that scientific knowledge is absolute, indicating an inadequate conception of the tentative NOS. For example, when asked to elaborate on their responses, one of students (Danielle) said that, “They [science content] always don’t change.” Moreover, among those students who believed that scientific knowledge is subject to change, five of them (of 12
students) could not elaborate on the idea of how or why it could change. Only three students described that scientific knowledge changes as either new evidence is discovered or scientists try new inventions. However, their responses did not illustrate their informed views. For example, J.T. answered that, “[Scientists] probably [change their ideas] because they learned more stuff.” The other two students simply referred to scientists changing their ideas because of inventions.

Regarding the empirical NOS, student responses indicated that they realized that scientists use empirical data collected from the natural world to form a conclusion. For example, fifteen students out of 16 believed that scientists used dinosaurs’ bones, footprints, and fossils, as evidence to make a conclusion dinosaurs existed in the past. Students recognized that scientists collected data in their investigations and used that data to develop scientific knowledge. However, often they stated “scientists get the data and then they know stuff,” implying that the data “speak for itself” rather than leaving openings for interpretation of the data.

Prior to the intervention, some of the students were not aware of the role of inferences in scientific work. Among the students who believed that scientists use evidence to make inferences about how the natural world works, only 60% of them indicated that scientists make observations to get some empirical data and make inference from this data; therefore, they are not certain about their findings. Russell stated, “[Scientists] have bones and they put them together to make a different creature.” When asked for an explanation for what makes scientist unsure about their conclusion about what dinosaurs look like, the same student said, “[Scientists] only have the bones. They don’t have the skin or the eyes.” Another student (Rupert) also referred to dinosaur skin when asked the same question. These responses indicate that at least some students recognized that scientists need data to make claims, yet do not recognize the role of collecting data in making inferences about missing or difficult to obtain evidence.
Ten out of sixteen students believed that scientists use their creativity and imagination in their scientific work. Most of them elaborated in the interviews that scientists have to think and that is how they used their imagination. However, six participants were not aware of the roles of creativity and imagination in scientific work or had any prior understanding of what do these concepts mean and are associated with science. Some students not only did not understand the role of imagination, but were very against the idea that scientists make use of it. One student (Tom) stated in the interview that “Why [scientists] don’t use their imagination, if they already know something, they just use the answer instead of having to lie.” Another student responded on her questionnaire that “if [scientists] use their imagination, they might get the answer wrong.”

Students held inadequate views of subjective NOS prior to instruction. Five out of sixteen students either provided irrelevant answers or did not provide their responses to the question in relation to this aspect of the NOS. Three students thought that different evidence used by different scientists lead them to disagreement about dinosaurs’ extinction. Only four students were able to relate the disagreement to different ideas or opinions held by different scientists; however, they had difficulty making a connection to the influence of scientists’ background knowledge to their conclusions. One student Rupert stated in his interview that “[a scientist] has heard different stuff and they just think that some stuff is more reasonable and some scientists are about different ideas.”

**Students' post-intervention views of NOS (December).** The results from the interviews showed improvement on students’ conceptions of the tentative NOS. While four students believed in absolute science at the beginning of the year, after one semester, only two of them still held that view. However, the students who changed their beliefs could not elaborate the reason of the change in the responses. Moreover, data from Table One shows that the majority
of students believed that scientific knowledge is tentative because scientists continue
experimenting and discover new evidence. Students still did not conceptualize the idea that
scientists could change their claims in light of looking again at the data.

Responses to the post survey and interviews indicated that students were more aware of
empirical data used in science. At the end of the school year most students understood that
science is different from other subjects because scientists collect data, illustrating an improved
understanding of the empirical NOS. Moreover, when asked what scientist is, one student
illustrated his improved view of the empirical NOS by responding “[scientist is] a person who
has a question they don’t know the answer, he tries to think about it and make observations and
inferences and explore….then they can figure it out.”

All students recognized the role of observation in scientific work. They understood that
scientists use fossils and bones as evidence to show the existence of dinosaurs in the past.
However, some the students still held an incomplete view of the role of inferences. Two students
demonstrated their informed view of this aspect of the NOS. When asked how scientists know
there were dinosaurs in the past, one student said, “[scientists] find those [fossils, rocks, and
bones] and then they study them and figure out that there were huge animals used to live a long
time ago.” He also believed that scientists were not sure about shape of dinosaur because
scientists do not have dinosaurs’ skin and he said, “[scientists] might have mixed up the bones.
The T-Rex might actually look like a long-neck or something.”

The results from the mid-year interviews indicated a huge improvement on students’
view of creativity in science. There is only one student who retained his naive belief that scientist
use only empirical data to make inference. Five students became aware of the critical role of
creativity and imagination in scientific work. Most of the students who held the adequate view of this aspect of the NOS believed that creativity play a big role during interpreting data. Two students were able to explicitly say that scientists imagine what their inference will be. Two students (Parvati and Rupert) developed an informed view of this aspect of NOS. When asked when scientists use their imagination one student (Parvati) responded, “[scientists use their imagination] when they study dinosaurs. They like to use their imagination because they could not really have a dead dinosaur, so they used the bones to imagine what the dinosaurs looked like.” Another student Rupert not only understood that scientists use their imagination when they make inferences and conduct experiments, but he also stated that science differs from other school subjects because science is creative.

Students had difficulty developing their understanding of the subjective NOS. Some students still provided irrelevant responses during the interviews. The results from the mid-year interviews indicated improvement in student participants’ understanding of subjective science as seven out of sixteen students were able to articulate that scientists’ different opinions cause disagreement regarding data interpretation among scientists. However, they were not able to elaborate why these disagreements about data interpretation took place.

**Students’ post-post-intervention views of NOS (May).** The results from the May interviews indicated improvement in students’ conceptions of tentative NOS. All ten students who were interviewed believed that science can be changed. While eight students showed adequate views of tentativeness, two students demonstrated their informed views of this aspect of NOS by stating that science can change when scientists discover more information or if they look at existing evidence differently.
All students understood that empirical data is a crucial part of the development of scientific knowledge by May. When asked how scientists know that dinosaurs existed in the past, they all said that scientists had found bones and fossil. Additionally, when asked how science is different from other school subjects, nine out of ten students referred to the prominent role of empirical data by mentioning that in science they have to collect and record data, but they do not need to do so in other subjects.

Regarding the distinction between observation and inferences, all students recognized that scientists make observations and use evidence to form inferences. One student (Candice) said that science is different from other school subjects “because we make observations and inferences.” Moreover, all students knew that scientists found bones, put them together and inferred the shape of dinosaur.

Nine students out of the ten students believed that scientists are not certain about their inferences. They understood that the bones and fossils found are parts of dinosaur and there are other parts that have not been discovered such as skin, and the unseen parts make inferences uncertain. When asked whether scientists are positive about the shape of dinosaurs, one student Rupert said, “[Scientists] are not positive. They knew what [dinosaur’s] bones look like….but they can’t ever find out what [dinosaur’s] skin is like.”

Nine out of ten students recognized the roles of creativity and imagination in the development of scientific knowledge when scientists form inferences or explanations. Five of out nine demonstrated informed views. When asked when scientists use their imagination, one student (Parvati) responded, “They use their imagination when they try to figure out stuff to see where it fits.” Moreover, the notion of what scientists know about dinosaurs has been frequently
used as an example of how imagination could fit into scientific work. For instance, one student (Candice) said, “[Scientists] use imagination because they don’t know for sure what dinosaur looks like.” Another student (Rob) mentioned that scientists use their imagination when they imagine what kind of skin dinosaurs have. Moreover, the same student explicitly mentioned that scientists are not sure about dinosaurs although they found dinosaur bones. They still have to use their imagination for other characteristics such as skin and eyes.

However, one student (Tom) did not change his conception of the creative and imaginative aspect of NOS. He retained the belief that scientists have to be true to the facts or information that they collect and if they used imagination they would not form reasonable explanations.

By the end of the school year, all of the students realized that scientists could disagree because they are different persons. When asked to elaborate on their responses of what makes scientists have different perspectives, five students demonstrated their informed views of subjective NOS by stating that scientists have different ways of thinking and different prior knowledge. For example, one student (Candice) stated, “[Scientists] have different ideas about [why dinosaur extinct] because they are different scientists and they know different things.” Another student said, “We do not really know what it looks like. We just see bones and use what we already know to help us figure it out.”

During the middle of the second semester we were able to interview small groups of students to enable them to converse about science together. The following examples show students’ perceptions that science is not absolute, and scientists use the empirical data available at that particular time to form the possible inference, which could be wrong:
Interviewer: “Okay. Do you ever learn about science in school?”

Rupert: “We studied dinosaurs with pieces of paper, trying to make observations of the bones, and inferring the animal. We made predictions, and there were no answers! She just made us figure it out.”

J.T.: “The owl pellets were the same way—she just had to figure out what owls might eat from the bones. But we never knew for sure.”

In addition, another student (Rob) illustrated his informed view of tentative NOS during the discussion about the role of creativity in scientific work. He said, “Some scientists think dinosaurs evolved into birds, [and] that is creative. Some think dinosaurs started as sea dinosaurs then became land dinosaurs and then flying dinosaurs.”

The results from the interviews at the end of the school year indicated an improvement of students’ understandings of the empirical NOS. All students differentiated science from other school subjects using this aspect of the NOS. For example, one student Rupert said, “In math you just solve problems, you don’t collect data, you collect data in science. In reading it is just reading, you don’t collect data.” Another student (Candice) responded to the same question that “[we] collect data in science. If you don’t have observations and inferences you are not doing science.” They all said that in science classroom, they learned to collect data, make observations and inferences.

Not only was there evidence of informed understandings of the role of observation and inference found in the post-interview, but the ability to differentiate the two ideas were also evidenced. There were much less confusion between scientific observations and scientific inferences. The transcript below illustrates the improvement:
Interviewer:  “Can you tell me something you know about science?”

Russell:  “In science it is different than everything else because you collect data. “

Millie:  “You find bones and stuff and investigate them to see if they might be from dinosaurs.”

Russell:  “Also, in science you don’t just say what something is if you don’t know what it is, you have to think about it and figure it out.”

Rob:  “And to help you figure it out you make observations.”

Candice:  “In science you have to collect data and figure things out. You have to be creative.”

Russell:  “The difference between observation and inference is that an observation is what it smells, hears, tastes, looks, feels like.”

Candice:  “An inference is what you think about it.”

Case Studies

We now share insights from our case studies. We identified low, medium, and high achieving NOS students by exploring how students explain NOS aspects and whether they can support their understandings with appropriate examples. We provide background regarding their typical school work, personal information, NOS conceptions, and classroom interactions that supported their grown in NOS conceptions.
John. Our low student, John, held improved NOS understandings by the end of the school year. John was a white male student from a low socioeconomic family who had difficulty with spelling and writing, but had no difficulty in mathematics, nor in thinking about ideas, for example, ideas to write about. His mother was hospitalized for breast cancer, and so he missed a substantial amount of school, which certainly inhibited his conceptualization of not only NOS, but other content he would learn in school. He had “gaps” in his understandings due to missing school on occasion. When in class, John was generally on-task, and claimed to “like” science.

From watching videotapes of classroom instruction, it is apparent that John was involved in science investigations when he was there, and was glad to share his ideas during class discussions. For example, during the first unit of the school year on rocks and minerals (from the FOSS curriculum) he shared “it is going to be easy to tell if rocks have calcite in them if they have the same reaction as the calcite itself.” This statement illustrates that John recognized that he would need to make some observations of reactions calcite made, and compare them with the reactions made by other rocks, leading to an inference regarding the absence or presence of calcite in the rock. As the school year progressed, he continued to share ideas regarding observation and inference, stating in a fossil activity (second half of school year) that “we are looking at bones to infer what animal we probably had.”

John had a good understanding that science was empirical, and that scientists need data to support claims. For example, he stated “science is where you get data, put it together and compare it with other data, just to figure something out.” He shared in a science lesson in the second half of the school year “if a scientist came across something that they didn’t understand, they would examine it—look for data.” (mystery samples lesson).
John did not have a good understanding of the tentative NOS. Early in the school year he claimed that “science does not change.” When asked why he thought that, he responded “Because no one would read a book about stuff that was just going to change,” implying that scientists needed to published, and would not publish something that were not “true.” His ideas did not change substantially by the end of the school year, when he noted that scientists would only change their ideas if they found out something was untrue or “weird, like there may still be dinosaurs.”

He similarly retained incomplete understandings of the role of imagination and creativity in the development of scientific knowledge. For example, mid-year he stated that “scientists don’t use their imaginations because they have facts. Why would you have to imagine it if you can use your data?” His statement implies that scientists simply collect the data, and the data speak for itself without the need for imaginative or creative interpretation by the scientist. Indeed, at the end of the school year John had a similar idea, stating “they don’t use their imagination because I’m guessing if you’ve got the facts you most likely don’t need your imagination,” with a similar implication that there is no need for further interpretation of data that presents facts on its own.

Despite the fact that John did not recognize the role of imagination and creativity in the development of scientific knowledge, he did acknowledge the subjective nature of science. For example, in the yeast investigation he stated “well, from other tests we did, we knew certain things would not grow the yeast, like the alcohol. So we had background knowledge that helped us make predictions for what would work.” Indeed, at the end of the school year, he continued to acknowledge that scientists have different kinds of background knowledge and opinions when he stated that scientists don’t always make the same conclusions from similar data sets, stating
“well, you’ve got your opinion, and I’ve got my opinion. I am pretty sure it’s more likely the ice age that caused the dinosaurs to go extinct. That’s what I think of the data.”

It is clear to see that John did have some adequate and developing conceptions of NOS aspects, and that most of his discussions and comments included an emphasis on data and evidence. It seems that John saw science as evidence-based, and that actually, the evidence “spoke for itself” in terms of not needing creativity or imaginative interpretation, yet the scientist’s background knowledge still influenced the claims made about the data. Indeed, John held some incomplete conceptions of NOS.

Millie. Millie was our medium-achieving student and was a white female from an affluent family. She claimed to “hate science” but was an excellent writer and enjoyed writing many stories, and also enjoyed writing in her science notebook. She said the only thing she liked about school was recess and lunch. She struggled with mathematics, having a difficult time finishing her mathematics work in the time allotted. Millie was able to distinguish the differences between observations and inferences in most cases. Early in the school year, Millie was able to state during a lesson “My observation is it is green and blue, and my inference is that it is a solid and a liquid because it acts like a solid sometimes and a liquid sometimes..” (Oobleck activity). Later in the school year she stated that when they were making circuits “we build a bigger circuit and observed and inferred how to make one, we used data to help us.” In her final interview of the school year she stated “scientists can figure out there were dinosaurs by looking at the bones—they might get them underground, they might see feather stripes, or something, or look at the size of the bones, and figure out what size they might have been.”

Indeed, Millie also held good conceptions regarding the empirical NOS. By mid year she was able to state that scientists “found bones and studied them. They looked at the bones and
thought, well, the animal must look something like its bones, and figured out about dinosaurs.”
By the end of the year she also added to her explanation that “scientists figure out about
dinosaurs from their bones, and other stuff they find, like feathers or marks on the bones, and
where they find the bones. But they aren’t sure about how dinosaurs looked or lived because they
never actually saw one.” Through this statement we can see how Millie’s conceptions grew more elaborately, and how she was able to explain her ideas through examples she gave. Similarly,
early in the year during the rocks and minerals unit Millie was able to state that one way to examine rocks is to “observe them—do a scratch test to see if they are hard.” A little later in the year during an electricity unit Millie shared that we were collecting empirical data through “testing ways to light a bulb.” And later in the year, during a story on dinosaurs, Millie stated that “scientists collect empirical data—you can see that they used the feathers’ imprints in the bone as evidence.” She clearly continued to recognize the empirical NOS throughout the school year.

She conceptualized the tentative NOS, but did not describe how those changes in science are based on evidence. Instead, in her final interview of the year (May) she claimed that “scientists use different clues, so they might change their minds if they think about other clues different scientists looked at.” In essence, she thought that scientists may choose to look at certain parts of the data, but when directed to look at other parts by someone else, they may change their minds. For instance, during the electricity unit she stated “we might change our ideas about what lights the bulb when we see what other kids have done.” Therefore, this idea remained solid throughout the school year.

Millie understood that scientists used their creativity and imagination when thinking about the inferences they make of data. For instance, at her midyear interview (December) she
stated “scientists and artists are both creative, but science is different. In science, you are creative with your mind.” This idea carried through the investigations in which Millie was engaged, as was illustrated in the fossils activity when she stated “We were creative like scientists when we thought ideas about bones, when we tried to figure out from the bones what animal it must have been.” It was clear to see that she had a strong conception of scientific creativity, and how it was different from artistic creativity.

She believed that science is subjective and by midyear stated that “Scientists see different things—because there are lots of ways of looking at data, and there are lots of ways that dinosaurs can die. Maybe scientists see something else in some data that others didn’t see.” She was clearly focused on the differences that scientists saw in the data, and by the end of the school year, recognized that scientists had different ideas about the data, as is evidenced by her statement “Even though scientists have the same data to look at, they have different ideas. They look at the data differently.” Her idea clearly is connected to the differences in scientists, as well as emphasizing the connection to empirical data.

Clearly Millie held strong conceptions regarding the NOS aspects that were taught in class. She was able to use the terminology and provide examples of her ideas. She was able to share her ideas verbally and in writing, and was clearly involved in the investigations and with sharing her ideas.

**Chad.** Our high student was a Native American male who enjoyed school and excelled in most subjects. He was high-achieving in mathematics as well as writing, spelling, and reading. He claimed to “enjoy” science, and from viewing videotapes of classroom interactions it was clear that he was active in science investigations as well as in sharing his ideas. He also talked
about what it was like to go to Native American events, and shared with his classmates costumes that he wore and told about events with his family that took place outside of school. He even talked about wearing “skirts” as part of his dress, but was not at all embarrassed about these things he shared; indeed, he seemed proud of them and also proud of his achievements in school.

Chad conceptualized the distinction between observation and inference fairly well, recognizing that scientists make inferences from the data that they observe. For example, during the jumping bean investigation Chad was able to state that he was inferring it is a jumping bean by his observations. The teacher mentioned that we could make even better inferences if we had more information. Chad stated “we could get more information from reading the bag they came in.” This comment led to an interesting discussion regarding increasing our background knowledge to make better interpretations of the data. In fact, the bag was not labeled, but the envelope held a return address, so we read the address and realized that the contents of the envelope had come from Mexico! This new information did lead to a discussion of the kinds of plants and animals that might live there vs. live in the Midwest. In the final interview of the year, Chad stated, “well in science you make observations, then you’ll like guess, or really predict what it is going to be like, and then you figure it out. These are inferences of your observations. You can try it out.” His comment shows that he connects inferences to data, and to making predictions that are not certain (he initially states “guess” which he changes to “prediction”).

Chad conceptualized science as being based on data, noting early in the school year during the rocks and minerals unit that scientists “look for more information” when they are collecting their data. He recognized that scientists collect that data, and make observations of it so they could infer what is happening.
Chad also held an informed understanding of the subjective NOS. When asked how science was different from other subjects he was studying in school, he stated “in science I make observations and inferences, and there is subjectivity,” which certainly does not share his definition of subjectivity, but shares his notion that it is part of science. When thinking about his definition of the role of subjectivity, he notes in his final interview that scientists look at the data in different ways, and that influences how they see the data. He recognizes the role of background knowledge, as he states in the second part of the school year during the fossil investigation that he states “I am making an inference—I am taking this fossil and I have seen pictures of T-Rex before and I am using background knowledge to help me with the inference.” He went on to say “A lot of scientists have different ideas, then they start thinking the same. It ends up they share ideas and discuss, and then sometimes they agree on their new ideas. Sometimes they don’t agree.” He certainly understands that background knowledge and subjectivity influences interpretations of data, as well as the tentative NOS.

Regarding the tentative NOS, he held a fairly good understanding of this aspect. He realized that scientists cannot be 100% sure of the inferences they make of their data. For example, he realized that scientists look at weather patterns to forecast future weather. He stated “They are pretty sure about the weather, but not 100%—they look at other weather, like to see if it is coming our direction. They can’t be sure because it could move around in a different way.”

He held good understandings of the creative and imaginative NOS. For example, in response to the teacher’s question of “What aspects of NOS do we see in this book (dinosaur book)” Chad responded “We can see the creative nature of science. Scientists create ideas about dinosaurs and birds from evidence.” From this statement we can see that he understands scientific creativity as being different from artistic creativity, and that scientific creativity is the
creation of ideas from evidence. In his final interview of the school year he also showed his good understandings of creative and imaginative NOS by stating “When they want to figure out something, they have to figure out a way to study it, like explore some kind of liquid, or mineral or rock. They have to figure out how to study it and how to say what you found out.”

Chad also asked questions that lead to his further understanding, such as when he followed up this statement with “Did they [scientists] use their social and cultural context when creating ideas about dinosaurs?” It is clear that this expressed curiosity helped Chad refine his ideas about the subjective NOS when he discussed how his background knowledge about T-Rex, for instance, influenced how he was interpreting the fossils he was observing. He recognized that scientists’ knowledge influenced how they interpreted data, as it influenced how he interpreted data himself.

After looking at the spectrum of students’ understanding of NOS conceptions in depth, we think students develop better understanding of certain aspect of NOS than others at the elementary level. For example John, Millie and Chad had strong understandings of observation versus inference, creativity and imagination and empirical evidence and lesser understandings of subjectivity. We think at elementary level focusing on concrete aspects of NOS is beneficial for students to develop their understanding of NOS as well as science concepts. John may have struggled with explaining tentativeness because in the course of discussing different science concepts because we did not conduct an experiment where students collected data over time to see changing patterns of data, though we did talk about how scientists may change their ideas with collection of new data and thinking about the old data in new ways. We think if we would have used some activities where students could make observations of differing outcomes of investigations more than once, John may have had a better understanding of tentative NOS.
Millie had difficulty in understanding empirical nature of science. She had a good understanding of the difference between observation and inference but she could not see a bigger picture of how different observational and inferential pieces make evidence based science to create explanations. Throughout the school year we conducted a variety of experiments focusing on observation and inference but again doing one long time project where students would have had the opportunity to see pattern in the data to generate explanations may have helped them to better conceptualize the empirical NOS.

JohnChad showed very good understanding of NOS aspects. Almost at all instances he could provide examples while explaining the meaning of aspects of NOS. We think the reason why JohnChad could develop better understanding of NOS aspects was because associated himself with many of the examples which provided him with strong real life context for making associations with different aspects of NOS. Millie, John and Chad had the opportunity to learn about science and NOS through science and literacy connections, science notebooking activities, hands on activities, class oral discussions at the beginning, during and at the end of the science investigation supported with formative assessment strategies. These different representations helped these students to develop understanding of NOS and provided the teacher with insight into what needed to be further emphasized.

**Discussion**

Our study provides further evidence that NOS instruction can be successfully embedded into science curriculum, and students of varying ability levels will be able to better conceptualize these ideas. The instruction that was successful in improving the NOS understandings of these third graders was a combination of contextualized (Clough, 2006) explicit instruction, that was embedded in inquiry instruction. NOS instruction in this class was embedded in each science
lesson throughout the entire school year. This instruction included the adaptation of *Full Option Science System* (FOSS) curriculum, use of children’s literature, student writing about NOS through science notebooks, and class discussions that debriefed each science lesson with not only science content, but NOS content to emphasize NOS aspects in each lesson. The teacher initially prompted students to discuss NOS aspects as part of each science lesson, but withdrew the prompts as the students began to use the terminology accurately and within each science lesson on their own without prompting.

Indeed, the students began taking more control of their learning of NOS as the year progressed. The teacher did not need to prompt them to debrief lessons with NOS aspects by the second half of the school year because they began to do so in discussions themselves. Additionally, as they were videotaped while engaged in inquiries we noted that students used terms such as “empirical data,” “observation and inference,” and “tentative (e.g. my ‘explanation is tentative until I look at the data more’”) appropriately in conversations during the second half of the year.

Students in this class all improved their understandings of NOS aspects, but did so differentially in terms of the kinds of examples they could provide and the definitions they gave to the various NOS aspects. Young children can learn NOS when taught throughout the year and embedded in science lessons. Contextualized explicit reflective instruction is effective at helping all students conceptualize NOS aspects, though differentially by ability level. John, the low-achieving student, was able to develop several good conceptions of NOS aspects. For example, he realized that scientists need evidence, but also once they made their claims they would not change these ideas. He believed that the data speaks for itself—that scientists understand it better if they have more background knowledge, but there was no room for interpretation through
imagination or creativity. However, he also held good understanding of the distinction between observation and inference, and definitely understood that science is evidence-based. The medium achieving student, Millie, was able to define the NOS aspects that were emphasized in her class, and could write about them in her notebook, providing examples from her investigations of NOS aspects she recognized. She conceptualized thinking and making inferences as scientific creativity, and realized that science was tentative and scientific claims could change, though she could not describe influences on this change. Like John, she recognized the importance of evidence in making scientific claims, but more so recognized the role of the scientist in interpreting that evidence. The high-achieving student, Chad, was able to integrate the ideas surrounding the NOS aspects, as well as raise questions regarding the ideas to further his own understanding. He began using these NOS terms during investigations with other students earlier than others did. He talked about his NOS ideas in terms of doing science himself—how he was undergoing changes in his ideas and interpretations of data. He connected the subjective NOS as a way scientists gain more information that can change their interpretations of existing data, and recognized the role of cultural context in interpretation of data. He recognized the role of creativity and imagination in scientific knowledge, and talked about scientists “creating ideas from evidence.” It is apparent that through participating in scientific investigations in which NOS aspects were connected to content being explored students’ ideas improved.

Implications

Implications from this study reinforce the idea that explicit reflective instruction is an important strategy to use to help young children learn about NOS. Indeed, this study emphasizes that contextualized NOS instruction is effective in improving NOS conceptions of students of varying ability levels. From this study we recommend modifying existing science curricula in
ways that allow the teacher to debrief NOS aspects as part of each science investigation. In
addition, the reading curriculum at this particular school included science topics and enabled
further ways to embed NOS into reading as well. In this particular study we focused on
integrating science and reading to help students understand NOS. In the future we recommend
integrating different subjects such as art and math with science to help students further
understand NOS. Such integration of different subjects would be beneficial for discussing
similarities and differences between science and other subjects as well as show how scientists in
real life merge different subject to develop better understanding of science concepts.

We employed a variety of teaching strategies such as continuous class discussions,
journaling, charts to show NOS aspects and formative assessment strategies. All these strategies
collectively were effective for developing better understanding of NOS concepts. For example,
while discussing different science concepts, author one employed whole class discussions
through out the lesson. The discussion before even starting a lesson acted as leverage for
knowing what students have understood about NOS and science concepts so far. Every lesson
began with whole class discussion, which allowed students either to summarize the previous
day’s discussion or to understand what students know so far. KWL charts were one of the
effective strategies. Author one also made a point to have regular discussions while students are
exploring different science materials. For example, during instruction on the topic of states of
matter author one asked”Can you tell me what do you notice about this cotton? How do you
know it is solid? So now can you tell me when you were making observations and when you
were making inferences?” These kind of prompts used while students were exploring helped
students make connection between science concept and NOS. After exploration further
discussions were conducted with the whole class during this explain/summarize session, author
one again made an attempt to bring science concepts and NOS together through questioning prompts and by drawing students’ attention to NOS chart (See appendix). The use of this NOS chart habituated students to refer to it as a reference when they could not explain the meaning of certain ideas and they used it as resource during discussions.

Science notebooks also were effective strategies especially for noting down observations and inferences. Students recorded their observations in the science notebooks regularly. They also recorded which aspects of NOS were discussed that day in their notebooks. During classroom discussions they referred to their notebooks and answered questions. They also noted the meaning of NOS concepts in their own words. Different productive questioning strategies was another instructional strategy employed to gauge students’ understanding. These different strategies helped students develop NOS understanding.

We used the science as well as reading curriculum to reinforce NOS ideas. Based on our results, we recommend introducing NOS aspects early in the school year and continuing to reinforce these ideas in each science investigation throughout the remainder of the year.

Profiling Career-changers: Exploring Characteristics and Motivating Factors in Selecting Teaching as a Second Career

Bonnie L. Rabe

Western Connecticut State University
Abstract

As teacher shortages continue to plague American school districts, especially in urban settings, alternative route to certification programs have developed across the nation. Exploring creative approaches to entice highly qualified individuals from other professions in shortage areas, these programs encourage individuals to make the transition to teaching.

This study explores one such program at a state university in a highly diverse urban community. By examining the characteristics of two groups of career-changers transitioning to teaching, the author explores whether career-changers share common demographics, personal, educational, attitudes, or professional attributes; and seeks to identify the barriers, real or imagined, which influence these career-changers. Career-changers describe their motivation to become a teacher and what made them finally initiate the process.

A profile of a career-changer is constructed and patterns influencing their choices to become a teacher emerge. This study identifies the career-changer as only slightly more likely to be a female rather than a male, is 39.4 years of age, Caucasian, is married with 2 or 3 children attended a public high school, attended 1-4 universities, and holds a Bachelor of Arts degree. The vast majority of career-changers come from a background in management.

The greatest barrier for these career-changers in making the transition was financial, followed by family responsibilities. The rationale for teaching was primarily focused on wanting to make a difference, the responsibility to educate and prepare for the future, a deep interest in content, and relating the content to real world issues.
Although alternate routes to teacher certification have been in place for some time across the nation, research on these programs and the career-changers who elect to participate in them is now truly emerging. This study is primarily focused on the career-changer (candidate) rather than the program in which they were enrolled. The issues guiding this study contributed to the formation of the conceptual framework, focusing the search of the literature. The author explores whether career-changers, electing to become teachers, share common demographics, personal, educational, attitudes, or professional attributes. In addition the author investigates how career-changers describe the motivation to become a teacher and what made them finally initiate the process. Finally, barriers, real or imagined, which influence these career-changers, are explored.

**Background and Purpose of the Study**

In the review of the literature and development of the study, several influences surfaced repeatedly. Three areas of interest drive the overall organization of the study: The teacher shortage, the stages of adulthood, and the change process. In reference to the teacher shortage, the necessity for increased numbers of highly qualified teachers and the possible sources of these teachers are discussed. Why people consider changing careers is discussed through the frame of the stages of adulthood. Finally, the change process is viewed through a discussion of quality preparation of the alternate route teacher.

**Teacher Shortage: The Need for Increased Numbers of Teachers**

Nationally, one in five new teachers will leave the field within the first three years of teaching and nearly three-quarters of a million teachers are projected to retire by 2009, according to the National Center for Education Statistics.
While turnover rates for...all college graduates are difficult to calculate in a meaningful way, it is apparent that if even 5 percent of teachers left the profession each year, schools would still have to hire 180,000 replacements annually.

Traditional teacher certification programs are producing about 150,000 graduates annually, leaving a shortfall of at least 30,000 teachers each year. Numerous federal and state agencies made it easier and more attractive for people to change careers and become teachers.

Nationally, 51% of our current teachers are teaching in elementary schools and, over the next 10 years, just over half the predicted 700,000 retirements. In 2004, 9 percent of elementary and secondary teachers (333,000) left the public and private schools where they were teaching. Undergraduate teacher education programs produce 150,000 teachers annually (NCES, 2009).

With the current fiscal situation, universities throughout the nation are reporting record increases in applications from displaced professionals who desire to re-tool themselves for a new career. More applicants are looking to local Institutions of Higher Education because of their affordability (Wright, 2009).

**Who Will Replace These Teachers?** The National Center for Education Statistics project that first professional degree holders will increase by 22 percent overall through 2017. According to the Bureau of Labor Statistics, postsecondary teachers are expected to grow by 23 percent between 2006 and 2016, at much faster than the average for all occupations. Because of the size growth rate of this occupation,
postsecondary teachers will account for 382,000 new jobs, among the largest number of new jobs for an occupation.

By 2007 every state in the country had developed some type of an alternate route to teacher certification. In the 2006-07 academic year, alternate route to certification programs prepared 57,000 educators.

The Master of Arts in Teaching (M.A.T.) program at this university utilizes a cohort model which has been shown to reduce attrition (Dinsmore, K., 2006, Koeppen, K., Seifert, K. & Mandzuk, D., 2006). Graduate cohort candidates in education are more likely to graduate and to feel that their academic performance is improved (Seifert & Mandzuk, 2006), and they will build professional and support networks. Cohort learning can improve individual performance, increase self-esteem, and enhance mutual attraction among group members (Johnson, Johnson, and Scott, 1978).

The majority of the classes within the M.A.T. program (with the exception of the student teaching semester) accommodate the needs of working professionals by scheduling courses at night or by utilizing a hybrid online model. Candidates complete the program in 15 months. Participants in this study were applicants and cohort members.

**Why People Consider Career Changes**

As we investigate what motivates a person to make a change in their career, several related bodies of research must be explored. Whether we look at early or middle adulthood, there are the variations in characteristics demonstrated by individuals in various periods of life. Individuals think about change, but what factor(s) cause them to move from thinking about change to acting out that change?
Daniel Levinson (1978, 1996) identified the “seasons of adulthood”, as a series of transitions followed by periods of reassessment and adaptation, ultimately resulting in stabilized life structures. The age ranges for these seasons are 17-22, 28-33, 40-45, and 50-55. The mid-life transition period 40s-50s are a time where people begin to reflect on their own mortality, they take stock of their lives and often begin new directions which may include personal and career changes.

**Barriers to Changing Careers**

According to Heppner, Wampold, and Kivlighan (2008), little is known at this time about the barriers to changing careers. Lent, Brown and Hackett (2000) observed that career barriers are often described as objective or perceived. Kenny, Blustein, Chaves, Grossman & Gallgher (2003) view constructs such as career barriers within a dynamic person/environment process, where an individual processes an environment experience, gives meaning to that experience, then acts on these interpreted meanings to further shape the environment.

Albert & Luzzo, (1999) questioned the available literature because of the modest effects of perceived barriers on career choice which were reported. Lent and his colleagues (2000) suggested that a distinction be made between expectations and perceived barriers. Measures of perceived barriers should be specific to the population of interest, and the developmental task being contemplated (Lent et al., 2000).

**Deciding to Make the Change**

Rita Serotkin (2006) profiled the motivations, perceptions, and profiles of midlife career-changers choosing teaching as a second career. Teaching is a career that people may enter at any time, attracting people who are intrinsically motivated. She
noted that many “[r]espondants noted the importance of their ability to move into teaching from another career in later life and their ability to continue in their previous career until they were ready for student teaching or the intern experience.” (Serokin, p. 223).

Rhodes and Doering (1993) attempted to isolate the process of thinking about making a change to actually making that change. In the thinking about making a change, a process of withdrawal occurs between the thinking and intention. The decision to make a change also appeared to be influenced by issues such as opportunities for growth, salary, status, security, perception of opportunities. Many participants thought about the change for a long time and made the change when another change in their own lives made it possible (family support, availability of caregivers for children, financial support, etc.). It appears there is a convergence of time, opportunity, and self-realization. It is important to note that even though these studies were done with teachers thinking about leaving the profession, there is value in their identification of the process in making the shift from wanting to change to doing it, which appears to be transferrable to this situation.

The advantages and disadvantages of various teacher preparation programs, including alternative routes to certification and appropriate coursework, are vigorously debated. In a review of significant studies of alternate route programs, C. Emily Feistritzer and Charlene Haar (2008) observed, “The research… indicates that the route one goes through does not seem to matter all that much as far as effective teaching goes. Experience and effective mentoring seem to be the most important variables for becoming a competent teacher”. (p. 145).

- Choice of Program
Program Selection

In September 2008 the Peter D. Hart Research Associates conducted interviews for Woodrow Wilson National Fellowship Foundation. Interviews were conducted to identify a target audience of adults, between 24 – 60 years of age, with at least a Bachelor’s degree. Two thousand telephone interviews were conducted and two hundred ninety-four interviews targeted “harder to reach groups”. The results of the interviews determined that a significant number, 42% of the sample population, would consider teaching in the future.

In a report released by the National Center for Education Evaluation and Regional Assistance, *An Evaluation of Teachers Trained Through Different Routes to Certification Final Report* (Constantine, J., Player, D., Silva, T., Hallgren, K., Grider, M., and Deke, J., 2009),

The study caused traditional teacher preparation programs to take a closer look at what the essential elements of teacher preparation should be. The main findings of the study concluded that: There was no statistically significant difference in performance between students of AC [alternate program certified] teachers and those of TC [traditionally certified] teachers and there is no evidence from this study that greater levels of teacher training coursework were associated with the effectiveness of AC teachers in the classroom.

The study included the following teacher candidate profile characteristics: Personal background, age, race/ethnicity, gender, academic ability, professional background, education, nature/extent of previous work history, preparation to teach, prior classroom experience, motivation to teach, and motivation to select route.
**Methods**

This study explored the motivating factors behind the decisions of career-changers to become a teacher. The need for more research in the area of motivating factors to aid recruitment of new teachers is evident in the light of projected retirements, attrition, and changes in educational needs. Seeking to add to the limited literature as to why these career-changers make the choice to teach, this study uses a mixed-methods design allowing for in-depth analysis in the context of one current and one pending teacher training cohort.

**Participants**

The university, a mid-sized university in the northeastern United States, offers traditional undergraduate programs in elementary and secondary education; and a new Master of Arts in Teaching (M.A.T.) program, offering candidates coursework, field, and clinical experiences leading to a Masters degree in Education and coursework qualifying them for certification in Secondary Biology, Mathematics, or Spanish, Education.

The university is located in one of the most diverse urban communities in the northeast on the border of two northeastern states. The city has a population of 75,000 and its' diversity is reflected in 75 national groups where over 60 different languages and dialects are spoken.

For the purpose of this study, the actual candidates accepted into the program have been separated as a group from all other applicants. This group is referred to as Cohort I. The second group contains applicants to the program who have not yet been accepted to the program, who have elected to attend a different program, or who have delayed in enrolling for a program at that time. The second group is referred to as
“Other”. All applicants participating in the study have earned at least a Bachelor’s Degree in their content area and several hold advanced degrees.

The initial cohort was diverse from many perspectives. Ages ranged from 22 through 54. They were diverse by gender (evenly split, 11 males and 11 females) and represented several ethnic backgrounds, with one candidate from Pakistan. Content areas represented: 2 Spanish, 9 Biology, and 11 Mathematics. Two candidates were from an urban setting in another state.

Backgrounds of the candidates include recent college graduates, a pharmacist, cancer researcher, neurophysiologist, landscape design, manager of a resident facility at a psychiatric hospital, stay-at-home Moms returning to the workforce, computer scientist, psychology major, karate school owner, administrator from the pharmaceutical industry, paraprofessional, and corporate executives. Several candidates hold Masters Degrees in other areas.

**Procedure**

Data for the study were collected from a variety of sources using a variety of methods: An essay from the graduate program application, the applicant interview, a survey containing responses formatted in a Likert scale as well as open-ended responses, and a post survey interview. The application essay, *Why I Want to Be a Teacher*, became the basis for the identification of barriers and the development of the questions in a survey, *Profiling Career-changers: Exploring Motivating Factors in Selecting Teaching as a Second Career*, the primary source of data. A semi-structured post survey interview further clarified responses to the open ended question at the end of the survey.
Why I Want to Be a Teacher Application Essay. Along with the typical application demographics, candidates were also required to submit a mini-portfolio containing two essays:

1. Explain your personal and professional reasons for desiring to become a teacher. Be specific as to knowledge base, skills, and dispositions (attitudes) you hope to develop.

2. Describe a difficult or challenging situation that occurred in your personal life or in a career setting. Discuss the role you played in the resolution of that situation. Include a description of each of the following personal attributes or characteristics that you employed: problem-solving, conflict resolution, interpersonal relations, initiative-taking and attention to diverse needs of individuals.

The content of the first essay for each candidate was transcribed (through data processing) from the graduate application packet into word documents for analysis. For the purpose of this study, the first application essay entitled Why I Want to Be a Teacher was then reviewed to identify barriers to and rationale for becoming a teacher. As Lent and his colleagues had observed, the measures of perceived barriers should be specific to the population studied (2008).

The following barriers (b) were identified and coded in the first set of Cohort I applicants' essays. In reviewing these identified barriers, four categories emerged: Financial, emotional, age, and family responsibilities. The contents of the essays were revisited and appropriately coded by these categories (code): Financial (f), emotional (e), age (a), and family responsibilities (f). These categories were used in a question at the end of the demographic section.
As a result of a second read through to identify the rationale for becoming a teacher, 5 emerging themes were identified by the researcher: (h) I want to help others, (i) I want to work with and inspire children, (j) I have a love of learning, (k) I want to make a difference, (l) I always wanted to be a teacher. These emerging themes became the basis of the questions which were developed for the Rationale for Teaching section of the Profiling Career-changers Survey.

**Initial Applicant Interviews.** The notes from the initial applicant interviews form Cohort I were reviewed to identify the barriers to changing careers identified by the applicants. The interview question asked was, “Why do you want to be a teacher?” Each candidate spoke about why they were making the change at that point in his or her and why he or she had decided to make this transition at this time. These rationales for delaying the decision to change careers were identified as barriers. As a result of this review of the interview notes, four barriers to becoming a teacher were identified in this group of applicants: Financial, emotional, age, and family responsibilities.

These identified barriers were then included within the developed survey in the form of a Likert scale to evaluate to what extent each of these barriers had on the initial cohort I from which the barriers were derived as well as the extent of the impact these barriers had on other applicants.

**Survey Development.** Since the initial data source of applicant demographics was the graduate program application packet and since this application had limited data about the applicants’ characteristics, an additional data source in the form of a survey was developed.
The questions developed for the survey, *An Exploration of Motivating Factors in Selecting Teaching as a Second Career*, were created by the researcher based on the themes identified in the reading and coding of the application essays. Using accepted standard categories outlined in each section, the researcher constructed the survey consistent with federal or state collection categories as noted. Once the questions were developed, they were reviewed and validated by a group of six peers who all have knowledge and experience in working with demographics.

The Survey consisted of four sections: Informed Consent, Demographics, Career History, and Rationale for Teaching. The Informed consent section identified if the applicant was a willing participant. Participation in the survey was voluntary and every applicant affirmatively completed the informed consent. The survey was constructed so that data collection could not proceed unless this question was completed. Only those applicants agreeing to participate were included in the study. Respondents could stop the survey or recall their submission at any time.

In the demographics section, participants were asked to disclose their gender, age, degree information, marital status, high school and university information, and barriers experienced. The U.S. Equal Employment Opportunity Commission, with the addition of the category *Bi- or Multi-racial*, an area currently under study at this university. The barriers which were identified at the end of this section were based on those barriers identified consistently in a review of the research and presented at the end of the demographic section in a Likert scale to identify degree.

In the Career History section, candidates were asked to select both their most recent career experience and search of their other career experiences. The categories
for the career history components were based on Connecticut Department of Labor: Labor Market Information, Occupational employment and wages. A final set of two questions focused on whether the applicant had worked in the teaching profession before and, if so, in what capacity.

The fourth section, The Rationale for Teaching, was divided into three sections: Why I want to be a teacher, looking back, and looking forward. The categories for first section, why I want to be a teacher, were based on the categories which surfaced in the review of notes from the original interviews for Cohort I: Financial, emotional, age, and family responsibilities. A four-point Likert scale was implemented to force the choice: Strongly disagree, disagree, agree, strongly agree. The looking back and looking forward sections of the survey were also based on an analysis of the graduate application essay. In addition, candidates were asked an open ended question: What was the one motivating factor that finally caused you to make the decision and act on that decision to become a teacher?

Data such as gender, age, race, marital status, number of children, were collected. Additional qualitative data were collected from the graduate application essay, biographical information, interview notes and anecdotal information, and transcripts.

The validated survey was then submitted to the university’s Institutional Review Board and approved. The survey, An Exploration of Motivating Factors in Selecting Teaching as a Second Career, questions were entered into Survey Monkey, an electronic tool for electronically disseminating and analyzing the survey. The survey was distributed electronically by way of personal e-mail to all 56 candidates who had applied to the program during the application process accepted to cohort 1 and those in
the process of applying. The Survey was sent to every applicant received for the program between the Fall of 2008 and the Fall of 2009 when the survey was administered (n=56).

Of the 56 applications distributed, 37 applicants responded. Of these responses, participants were classified by a field in the survey as Current Cohort I Members (12) and Other Applicants (24).

**Follow-up Interviews.** Based on the candidate responses to the optional open-ended sections of the survey, some of the responses, when reviewed, indicated to the researcher that additional information would be helpful to provide clarification to the study. In all, the reviewer selected four participants in follow-up interviews. These interviews were conducted by the researcher over the phone or face-to-face, and audio-taped. The contents of the follow up interviews were transcribed, reviewed for patterns, coded, and analyzed.

All information has been treated as confidential and is stored in a secure location.

**Data Analysis**

This ethnographic research study employed a mixed-methods design, integrating the analysis and interpretation phases with emphasis on the qualitative aspects. The qualitative data was interpreted by constant-comparative methodology. The essays, *Why I Want to Be a Teacher*, were analyzed through line by line coding which generated numerous categories. Themes emerged and were used to develop the survey.
The survey results were considered along with other qualitative data sources such as participants’ demographic information, transcripts, and standardized test scores; as motivating factors were analyzed and the profile was assembled.

**Trustworthiness**

Judgment as to trustworthiness of a qualitative research project is based on whether the study conforms to standards for acceptable and competent practice as well as meeting standards for ethical conduct. To that end, all contact with participants was conducted professionally and acceptable standards of etiquette applied.

Trustworthiness was achieved through the triangulation of multiple data sources, constant comparison methodology, and recursive data collection. The follow-up survey instrument was validated by a group of higher education colleagues prior to administration.

The confidentiality of participants and the districts was maintained through the use of pseudonyms thus reinforcing trustworthiness.

**Results**

**Demographics**

**Gender.** As the data were collected and analyzed, a profile of the career-changer began to emerge. Of the 37 respondents, 40.54% were male and 59.46% female.

**Educational Level.** Of the participants, 78.38% had attended public high school and 16.22% of the participants had attended a Community College. When the participants attended institutes of higher learning to complete their Bachelor’s degrees, 45.95% attended a state university and 54.05% attended private universities. The vast majority (75%) had completed their Bachelor’s degree in 4 years, 19.44% took more
than 4 years to complete the degree, and one candidate (5.56%) completed the Bachelor’s degree in 3 years.

The participants all had earned Bachelor’s degrees and, for 72.2% of them, this was the highest degree earned. In addition, 22.22% of the participants had gone on to earn a Master’s degree, one candidate had earned a second Master’s degree, and one candidate had earned a PhD in Biology prior to applying to the M.A.T. program. It was reported those participants already holding a Master’s degree, 37.5% completed the degree in 2 years, 50% in 3 years, and 12.5% in 4 years. In all, 7 participants (18.92%) also attended this university as undergraduates.

Pressing more deeply into the profile of their higher learning experiences, when the participants were asked how many institutes of higher learning they had attended. Overall, the respondents reported that 18.9% had attended one, 35.14% had attended two, 27.03% had attended three, and 10.81% had attended four institutes of higher learning.

**Age.** During two post survey interviews, participants questioned if their age would impact their marketability upon graduation from the program even though there were no references to age presented at any time during the application process. Three of the six participants who are over 40 years of age reported that age was a barrier for them in their survey responses.

The overall mean age for the 36 participants responding to the age query was 39.4. For the 15 male respondents the mean was 39.2 years and for the 21 females the mean age was 39.5 years. Although the participants’ ages ranged from 24 to 54 years, the distribution is positively skewed toward the age of 40.

Note: Adapted from 2009 Western Connecticut State University Institutional Report, Table 9.
Racial/Ethnic Backgrounds. Although the university is located in a very diverse community, the representative participants applying for the program did not reflect the demographics of the community but rather, were reflective of the general graduate community of the university.

The racial categories used in this study were taken from the categories of The U.S. Equal Employment Opportunity Commission, with the addition of the category Bi-or Multi-racial, an area currently under study at this university. The population applying to and enrolled in this program do not reflect the racial diversity of the community, but do represent the racial breakdown of the university student population. The respondents to this survey demonstrate a dramatically increased Hispanic population due to the fact that Spanish is one of the three content majors of the program. Whereas the Hispanic graduate candidate enrollment is 2.6%, the responding Hispanic candidates represent 18.92%. The ethnic/racial diversity of the responding candidates does not reflect the range of diversity of the undergraduate university population, but is slightly more diverse than the university’s traditional graduate students.

Motivating Factors. Many of the candidates referred to parenthood as motivating factor in deciding to become a teacher. In the application essays candidates cited activities supporting children as motivating factors in making the decision to become a teacher. Candidates referenced supporting children in their school experience through volunteering as well as coordinating and attending functions. Candidates also reported being involved in extra-curricular events such as sports and scouting.
**Children.** Because of the number of candidates referencing the influence of being involved in activities with their children (77.3% of the candidates have children), additional data were collected on marital status, parenting, and number of children. It is important to note that a majority of the candidates (64.8%) were married at the time of the survey and of this group, 83.3% of them had children. Note that 13.5% of the candidates are single parents.

Additional demographic data were collected on the respondents to broaden the scope of the profile of the career-changer. Data were extracted from candidates’ application files for the program and reported standardized test results. These data are treated with confidentiality and kept in a secure location.

**Barriers in Making the Transition to Teaching**

In the review of the literature we addressed the observation by Rhodes and Doering (1993) that there is a period time between thinking about a change and actually making that change. Since Lent et al. cautioned us that measures of perceived barriers should be specific to the population of interest and the developmental task being contemplated, the four categories were identified from the original application interviews.

Question 14 on the survey instrument tried to get at what is going on during that period by asking, “Which of the following barriers have you experienced in making a transition from your current position to entering a program to become a teacher?” The survey instrument asked candidates to rate four barriers to starting the transition to teaching: Emotional, Age, Financial, and Family Responsibilities, using a 4-point Likert
Scale, of which 1 was strongly disagree and 4 was strongly agree. It is also important to note that these are barriers as perceived by each of the individual candidates.

To better understand the variances by the demographic of age, the following four tables have been broken out into the following age groups: 22-25, 26-30, 31-35, 36-40, 41-45, and 46 and above. Note each of the age ranges include 5 years with the exception of 22-25 which represent the newly graduated candidates (Bachelor’s degree), and those candidates who were 46 and over. Some interesting differences in responses emerged in the analysis when shown by age.

</table>

**The financial barrier.** Overall, candidates reported the greatest barrier in making the transition to entering a program to become a teacher was financial. In fact 80.6% either strongly agreed or agreed that finances were an issue, leaving 3 candidates (19.4%) reporting that financial concerns were not an issue.

Respondents discussed the need to continue earning an income as they trained to be a teacher. Most did not have a sufficient alternate income or savings to support their current financial needs. Many reported they had or were soon to have college age...
children which would require additional financial commitments. Approximately 25% reported receiving financial aid of some type.

The overall mean calculated for responses to the issue on financial aid is 3.47 (3 being Agree and 4 being Strongly Agree) with no significant variation among the mean, median, and mode. The standard deviation is relatively small (0.577 to 1.08) and may be influenced by the small sample size.

Only three participants disagreed or strongly disagreed that finances were not an issue. Two participants strongly disagreed in the age range of 36-45 and 46 and above; and one candidate in the age group 36-45 disagreed.

The family responsibility barrier. The majority of respondents are married, have children, an established career, and, in considering making a career change, needed to continue working to support the family. Therefore, it is reasonable to comprehend why the second greatest barrier was family responsibility.

Approximately half (45.95%) of the candidates agreed or strongly agreed that family responsibilities were a barrier, yet the overall mean was 2.89 (2 being Disagree and 3 being Agree). There was little variation among the mean, median, and mode and the standard deviation was small.

By looking more closely at the break down by age, it is important to note that 68% of the candidates are parents, which appears to suggest this may be a factor in the 26-45 year categories. 100% of the candidates, albeit a small sample group (n=2), in the age bracket 31-35 reported they strongly agreed. Both are parents.

In the post survey interviews, two candidates from Cohort I reported they had an especially difficult time keeping up with family demands, a full time job, and academic
expectations. Although the university clearly articulated the level of commitment required for such a program, some candidates were more successful than others in organizing their time and prioritizing.

**The emotional barrier.** With an overall mean of 2.20, the emotional barrier was the ranked third. All respondents reported they either strongly agreed or agreed that there was an emotional barrier.

Several candidates referenced that they had been thinking about changing careers for a time, but were not ready. In follow-up interviews, respondents spoke about how the emotional barrier was interlinked with the financial and family responsibility barriers.

Looking more closely at the age distribution for the emotional barrier, it should be noted that the mean increases steadily with the exception of the new graduates, the sample population of which was small (n=2). Respondents expressed that it became more difficult to make the decision to actually act on the career change as they got older. Factors disclosed by respondents related to the emotional barrier included having a comfortable income in the current job, achieving a level of competence and respect in the current job, concerns about family income, or paying for college for their children.

Even though the standard deviations are higher, they are not significantly so.

**The age barrier.** Most candidates (72.22%) did not indicate that age was a barrier. Only three of the six candidates, as previously discussed, reporting that age was an issue, are over 40 years of age.

The overall mean is 1.78, with no large difference between the mean, median, and mode indicating there was little variation in the pattern of responses. No consistent
pattern of increasing or decreasing is observed in this perceived barrier as age increased.

Career History

Most Recent Employment. When the most recent employment experiences of the participants were analyzed, the most frequent employment categories reported were: Business and financial operations (27.03%), computer and mathematical occupations (16.22%), management occupations (10.81%), and education, training, and library occupations (10.81%). (See Table 2: Career History.) Logical results because the minimum educational requirement in these occupations is a Bachelor’s degree.

The following categories were not represented by candidates’ recent employment: community and social services, building and grounds cleaning, office and administrative support, installation and maintenance/repair, production, and transportation and material moving.

Overall Career Experiences. When candidates were asked about their overall career experiences, all job categories were represented. The most frequently indicated career experience categories were management (64.86%) and business and financial (51.35%), sales and related (27.03%), and computer and mathematical (21.62%). This is not surprising when we consider that of the three secondary areas of concentration are Biology and Mathematics.

Of interest is even though the highest frequency career overall was Management (64.88%), however, only 27.03% of candidates listed it was their most recent employment. A similar shift occurred in the Business and Financial Operations Occupations category where 51.35% of candidates reported having worked in the field
and only 16.22% of candidates listed it as their most recent employment. Not
considered here are job interruptions, whether they be layoffs, job reductions, or
decisions to parent full time.

Note: Calculations are based on the percentage of candidates responding to each item
as compared to the number of respondents.

* Source: Connecticut Department of Labor: Labor Market Information. Occupational
employment and wages.
Work in the Teaching Profession. At the time of the survey 32.43% of the responding candidates reported they had worked in the teaching profession in some capacity, while 67.57% reported they had not. Of those candidates reporting that they had worked in the teaching profession, 10.81% were working as teachers but held no teaching certification, 66.67% were working as substitute teachers, and 33.33% were working as paraprofessionals.

Rationale for Teaching

The rationale categories for why the candidates were motivated to become a teacher were inspired by the essays written as part of the program application. The essays were coded and analyzed for patterns. In this portion of the survey, responses were shifted to a Likert-type scale ranging from strongly disagree, disagree, agree, strongly agree, as well as an N/A (does not apply) response. A four point range was selected to force choice.

Why do you want to become a teacher? In the analysis of the application essays, five themes emerged: 1) I always wanted to be a teacher, 2) I enjoy helping others, 3) I enjoy working with and inspiring children, 4) I love learning, and 5) I want to make a difference.

These themes became the initial queries for the survey section on rationale for teaching. Two additional categories related to the motivation for making the career change to teaching were categorized as looking back and looking forward.

It is commonly accepted among public school personnel that teaching candidates who have the potential to become a really good teacher often say, “I always wanted to be a teacher”; but not so with these respondents. In fact ten of the respondents (five in
Cohort I, one in Cohort II Participants, and four in the other group reported that they \[did not\] always want to be a teacher and two responded that they \[do not\] love learning.

Of the initial five query options, an unexpected response took president: \[I want to make a difference\]; with 83.33% of the current Cohort I candidates and 86.36% of other respondents strongly agreeing. Two other categories demonstrated equal weight: \[I enjoy helping others and I love learning\] (77.27%).

**Looking back.** Looking back at why the candidates made the choice to become a teacher, five themes were presented to respondents: 1) I have been a mentor or role model and that inspired me, 2) Difficult concepts came easily to me, 3) A teacher impacted me in a positive way, 4) My previous job was no longer rewarding, and 5) I have a deep interest in the subject that I want to share.

The Cohort I respondents (83.33%) agreed or strongly agreed to the query, \[difficult concepts came easily to me\]; whereas the other respondents were more divergent, reporting at the rate of only 76.19% that they agreed or strongly agreed to this query. It is interesting to note that 16.67% Cohort I and 23.81% group of the other applicants disagreed or strongly disagreed.

The best compliment anyone could give a teacher is to tell that teacher “You motivated me to become a teacher”. The fact that it is commonly accepted that good teachers motivate some of their students to become teachers was supported by this study where 90.91% of applicants either agreed or strongly agreed with the query; \[a teacher impacted me in a positive way\].

Cohort I responded they agreed or strongly agreed (68.75%) to the query: \[I have a deep interest in the subject that I want to share and inspire students’ interest in the\]
subject with 45.45% specifically agreeing. The affirmative response rate was 86.36% for other applicants (with 40.91% agreeing).

Responding to *My previous job was no longer rewarding*, 63.64% of Cohort I candidates either agreed or strongly agreed compared with 77.27% for other candidates. No applicant strongly disagreed with this query.

**Looking forward.** The motivating factors listed in the looking forward section of the rationale for teaching included:

- *I want to work with at risk students,*
- *I have a passion and talent for working with young people,*
- *There are a wealth of opportunities in teaching to relate the subject matter to real world issues,*
- *Teachers have a responsibility to educate and prepare children for the as future world/community citizens, leaders, and educators,*
- *Teaching is rewarding,* and
- *There are available positions in my area of teaching*

The responses of the three groups were very different in response to this set of motivating factors. Cohort I candidates (83.33%) responded they strongly agree with the statement: *Teachers have a responsibility to educate and prepare children for the as future world/community citizens, leaders, and educators.* The remaining 16.67% of the Cohort I candidates agreed with the statement, whereas the other applicants strongly agreed (22.73%) or agreed (77.27%) with this statement.

It is also interesting to note that Cohort I (16.67%) and the other applicants (23.81%) disagreed or strongly disagreed to the query, *difficult concepts came easily to*
me. This raises an interesting series of questions: Are these candidates willing to work hard to master these concepts? Do they perceive this career change to not require mastery of these difficult concepts?

All applicants responded they either agreed or strongly agreed with four of the five statements: *I have a passion and talent for working with young people*, *Teaching is rewarding*, and *There are a wealth of opportunities in teaching to relate the subject matter to real world issues* and *Teachers have a responsibility to educate and prepare children for the as future world/community citizens, leaders, and educators*. The statement in which applicants varied their responses was *I want to work with at risk students*.

When asked if they wanted to work with at risk students 18.18% of Cohort I and 28.57% of other applicants that they did not want to work with at risk students by selecting the level *disagree*. It would be interesting to discover whether their desire not to work with at risk students changed by the end of the M.A.T. program for those specific candidates. However, this was not a measure of this study.

**The ultimate motivating factor.** Candidates were asked, in an open-ended question, to describe the one motivating factor (Event) that finally caused them to make the decision to begin training for a career in teaching and act on it. Responses were varied and aligned with the motivating factors listed on the survey. An in-depth analysis of selected responses can be found in the discussion sections.

A Cohort I candidate said, “My interest in learning more about my culture sparked an interest in teaching. I am very eager to learn more about the Spanish culture and language and ultimately share the knowledge with my students”. Another Cohort I
candidate reflected the research on how so many people delay in making the decision to make a change through her response as well as falling in the minority about always wanting to be a teacher, stating

[I applied to the program] to make my dream come true. I always wanted to be a teacher but for different circumstances in life, I never pursued my dream. Now I am at a point in my life where I believe I want to go for my dream and I want to make it a reality.

A third Cohort I candidate had a very different perspective, aligning with the survey item stating that the previous job was no longer rewarding, “I am tired of everyday feeling like I do not care about what I do. I don't impact anyone, I don't have any passion for it, and I do not feel inspired anymore.”

Addressing financial barriers, another applicant stated, “I finally was able to save up to continue with my education. Also, [because of] the convenience of the schedule for the program. I will be able to attend to classes after work hours.” Yet another applicant addressed a different angle of the financial barrier:

Being laid off from my long time position in marketing. In the past, I wanted to always make the move to become a teacher, but it was not possible due to financial and family restraints. With my layoff, the timing is a little better (children are school age now), and I considered this to be my last real chance to finally make the move to what I always wanted to do.

One of the respondents said, “the timing was right”, actually (and most likely unknowingly) citing the research on change. Following up on the convergence of time, opportunity, and self-realization (Rhodes & Doering, 1993) and demonstrating there
often is an incident that actually triggers the change (he actually used that word), another applicant stated:

The main motivators had been present for a while. The catalyst that got me "over the hump" was a generous severance package that gave me the time, opportunity, and financial security to pull the trigger. The WCSU MAT program was a perfect fit for my needs and timing.

Finally, one applicant addressed the age barrier, “Age-I realized that if ever I wanted to make this career change that I should make it now.”

**Discussion**

Even though the size of the sample population was small, it is possible to frame the characteristics of career-changers who are becoming certified as teachers. The career-changer is 39.4 years of age, Caucasian, attended a public high school and universities as he or she earned a Bachelor of Arts degree. The career-changer most likely had management or business and financial operations somewhere in his or her background. The career-changer is only slightly more likely to be a female rather than a male, but is married with 2 or 3 children. In making the transition to teaching, the greatest barrier faced by the career-changer was financial followed by family responsibilities.

Their rationale for teaching is primarily focused on wanting to make a difference, feeling a sense of responsibility to educate and prepare children for the future, a deep interest in their content, and the perception that opportunities in teaching exist to relate the subject matter to real world issues.
As is stated in the research of Rhodes and Doering (1993), many participants thought about the change for a long time and made the change when another change in their own lives made it possible (family support, availability of caregivers for children, financial support, etc.). The decision to make a career change also appeared to be influenced by some of the identified issues, such as opportunities for growth, status, security, and perception of opportunities. This study also reinforces the convergence of time, opportunity, and self-realization.

Candidates in this study reported they made the choice to become a teacher based on one or more of five identified themes: I have been a mentor or role model and that inspired me, difficult concepts came easily to me, at teacher impacted me in a positive way, my previous job was no longer rewarding, and I have a deep interest in the subject that I want to share. The most significant of these responses, which have been reinforced in various aforementioned aspects of this study, were: I have a deep interest in the subject that I want to share followed by being a mentor or role model to children in various settings.

Because no applicant strongly disagreed with the statement: My previous job was no longer rewarding, this might indicate that only those people experiencing a perceived “lack of reward” or dissatisfaction with their jobs were motivated to seek out the possibility of another career.

The identification of profiles for these career-changers and the motivators that propelled them to make their career change has implications for recruitment of second career teacher candidates, teacher education program and curriculum design, as well as pre-admission counseling and academic advisement. Recruitment efforts directed
toward potential career-changers into teacher certification programs could be focused on a more clarified target population.

The university is committed to the success of enrolled candidates in this certification/Master’s program. Since two candidates in Cohort I had an especially difficult time keeping up with family demands, a full time job, and academic expectations; the university is considering how to adjust the program, provide additional support for organizing time and prioritizing with future candidates.

In the final, open-ended, question on the survey, respondents were asked, “What was the one motivating factor (event) that finally caused you to make the decision and act on that decision to become a teacher?” A multitude of answers addressed various aspects of good intentions, but a few responses were unique or memorable. There was no one consistent event.

This study profiled a cohort of candidates applying to a Master of Arts in Teaching Program at a state university in the northeastern United States, the demographics (race, age, gender, standardized test scores, marital status, children, degrees earned, and area of degree held), and their motivations to change careers may have limited generalizability to the larger population of career-changers across the country due to the varied nature of the programs and entry requirement.

Conclusions

This study focused on the characteristics of two groups of applicants interested in a program leading to a Master’s degree in Education and secondary level teacher certification. Quantitative data collected from a survey, application documents, as well as qualitative data from individual interviews, helped to complete the profile.
As patterns of personal characteristics, previous positions, educational experience, and motivating factors influencing their choice to become a teacher emerged; the profile of a career-changer was constructed. The career-changer is 39.4 years of age, Caucasian, attended a public high school, attended 1-4 universities, and holds a Bachelor of Arts degree. The career-changer is only slightly more likely to be a female rather than a male, but is married with 2 or 3 children. In making the transition to teaching the greatest barrier was financial followed by family responsibilities. The vast majority of career-changers came from a background in management. This profile will assist with recruitment of future candidates to the program.

The rationale for teaching cited by these career-changers was primarily focused on wanting to make a difference, having a responsibility to educate and prepare children for the future, a deep interest in their content, and relating the subject matter to real world issues.

Further study interests would include a longitudinal analysis over several cohorts and expansion of this initial case study to a broader range of programs as well as placement information and information on career progression. Of special interest is how the motivating factors and demographics act as predictors of long-term teacher retention.

In addressing retention, the university has developed an extension of the program with additional coursework in the area of Special Education. This state requires all teachers to earn a thirty credits beyond the Bachelor’s Degree within 5 years of certification. Since these candidates will already have a Master’s degree, there is no requirement to continue their formal learning experience. This extended learning
opportunity at the university continues to support the program’s evolving novice teachers’ continued professional development, providing new skill sets and learning which are tested and applied in their own classrooms.

Consistent feedback from new teachers and cooperating teachers will inform the profile characteristics and necessary instructional decisions. Attention must be directed toward to the development of an extended Professional Learning Community with partner districts which consistently analyzes, reframes, and supports teachers from the point of entry to the teacher preparation program throughout their careers.

Abstract

Preparing New Administrators for the Current Challenges of Fiscal Leadership

Today’s new administrators face challenges of academic accountability coupled with less resources to reach school goals. The faculty in educational administration programs focus not only in providing aspiring administrators basic fiscal and budgeting knowledge, but also providing them with practical real life opportunities to learn the skills to effectively use the scarce school fiscal resources to meet goals in their school plan. California, in particular, has been hard hit in recent years with massive budget cuts that have lead to significant cuts in programs, staffing, facilities, and materials. This paper will review the essential fiscal and budgeting skills necessary for new administrators to be effective school leaders from the perspectives of current district Chief Business Officers, principals, and aspiring administrators in an educational administration graduate program. Instructional materials, strategies, and techniques will also be highlighted that have been successfully utilized in school finance courses.
bei-Constructions are not the Basic Passive in Modern Chinese
--Dispelling Myths in Chinese-English Translation Studies

Shane Cao
School of Languages & Translation
Macao Polytechnic Institute
shanecao2006@hotmail.com

Abstract

This paper disputes the assumption of the bei-construction as the basic or standard passive in Chinese, as is the be-passive in English. This is a fairly pervading misconception or myth in the context of Chinese-English contrastive and translation studies in China. A detailed analysis is given on each of the following four points against this misconception: i) The VP of a be-passive is simple but that of a bei-construction is not; ii) the bei-construction is a semantically loaded passive, but the be-passive is not; iii) by is a preposition but bei is not; and iv) short and long bei are not structurally related, deriving from different sources. The paper concludes with a proposal that some parallels can be drawn between the short bei-passive and the get-passive for translation studies between Chinese and English.

Key words:
bei-construction, be-passive, get-passive, basic passive

1. Introduction

A widely practiced view of passive constructions in Chinese is this: since particle bei2 is the canonical passive marker in Chinese, the bei-construction should be taken as the basic or standard passive in the language, as is the be-passive in English. This is a misconception, however. It is this misconception that has misled many writers to a series of myths about the bei-construction in the context of English-Chinese translation studies. One of these myths is that “Chinese distinguishes itself from

1 The research presented in this paper is supported by an IPM grant (RP/ESLT-1/2008) to the author.
2 The particle bei here is taken to be a neutralized term, generalized to its more or less colloquial variants such as jiao(叫), rang(让), and gei(给) on the one hand, and its more formal variants such as “wei /bei(为/被…suo(所))”, on the other. Therefore, a passive clause that features a variant of bei, say gei(给) as in (i) below, is treated just as an instance of the bei-construction: (i) 屋里已给小福收拾好. (老舍:骆驼祥子)
English by using fewer passives” (Chen 1998:145), or more straightforwardly, “passive structures are less used in the Chinese language than English.” (Xu 2003:93). This is indeed one of the most explicit universal teaching theses in all the textbooks that I have ever consulted as a classroom teacher of Chinese-English translation for the past eight years. Accompanying this grand teaching myth is the treatment of the particle bei as the Chinese counterpart of by in English passives, and this latter myth then in turn leads to still one more. That is, a neat and tide parallel in passive structure between English and Chinese: just as there is distinction between a long be- and a short be-passive in English, so Chinese distinguishes between a long bei- and a short bei-passive. Certainly, it is a lopsided comparison, since the long and short be-passives in English are structurally related, but it is not the case with the long and short bei-passives in Chinese.

With these misconceptions in mind, all these translation studies writers have come to find themselves in dire strait: on the one hand, taking the bei-passive as the basic passive in Chinese, they declare that “Chinese distinguishes itself from English by using fewer passives”. But on the other hand, their native intuition tells them that Chinese is a language that is never parsimonious with passive expressions, the overwhelming majority of which do not take the form of bei-construction. Out of the force of this native intuition on the openhandedness of the Chinese language with passive expressions, all of these writers have to admit that Chinese uses more passives than English, a nullification of the their initial teaching that Chinese uses fewer passives than English. As an effect to dissolve the tension between theoretical teaching and native intuition, literally more than half dozen turns of phrases has been created in current textbooks in Chinese-English translation textbooks for the passive expressions that do not take the form of bei-construction. Among these turns of phrases are: completely covert (劉宓慶 2006), incomplete (熊文华 2006), inherent (连叔能 1993), logical (譚衛國 2005), notional (周志培 2003), simplified (张震久 & 孙健民 2009), object-first structures (Xu 2003), and unlabeled (Chen 1998) passive. All these creative terms are descriptively glowing but lack the theoretical rigor of a scientific study, causing quite bit of conceptual and methodological confusion in current Chinese-English translation studies of passive expressions.

This state of theoretical confusion in Chinese-English translation studies is, to simplify the matter a little, all because of the misassumption, implicit or explicit, of the bei-construction as the basic passive in Chinese. The concept of basic passive as a typological construct has been around for a while. But it seems that this typological idea is invisible to the mainstream Chinese-English translation studies community in

---

3 This ever-present proposition has been articulated in slightly different wording in different authors (e.g. Guo & Li 2003:80; Liu 2006:311; Pang 1997:364; Tang 2005:266, Zhu 2004:94; Wang 2006: 61, just to name a few)
the present-day China. This paper is designed as an effort to make this typological idea visible to the translation studies community by drawing on the recent linguistic insights into the bei construction. In what follows I shall start with a sweeping comparison between bei-constructions and be-passives (section 2), raising the issues for subsequent discussion in the paper. My arguments will deploy along four lines: a review of syntactic disparity in the internal structure of VP in bei-passives and be-passives (section 3); a survey of semantic disparity between bei-construction as an adversative structure, as opposed to be-passives as a semantically neutral structure (section 4); separating long bei from short bei in light of a derivational analysis (section 5); and a constituent-based analysis against the treatment of bei as a preposition (section 6). The present paper is concerned only with the issue of why the bei-construction is not the basic passive, as comparable to the be-passive in English, without committing itself as to the question of what it is that constitutes the basic passive in Chinese. Thus instead of proceeding to attempt at an answer to the question of what makes up the basic passive in Chinese, this paper concludes by proposing a study between bei-constructions and get-passives, a cross-linguistic parallel that can be expected to yield some practical results for contrastive and translation studies of passive between Chinese and English.

2  be-Passives and bei-Constructions: Raising the Issues

In the simplest cases, be-passives in English can be illustrated in (1) below:

(1)  a. The thief was caught by the police
    b. The thief was caught yesterday

The sentences in (1) are usually known as be-passive, to be distinguished from other forms of passive in English, say the get-passive as in John got fired, which is a type of passive that is syntactically and semantically very different from its be-passive equivalent John was fired.

English linguists distinguish between two types of be-passives: the long passive and the short passive (e.g. Biber et al. 1999). This terminological distinction is simply based on the presence or absence of the by-agent phrase: In the long passive, the agent, the police in the (1a) case, is expressed while in the short passive the agent is left suppressed as that in (1b).

To all appearances bei-constructions in Chinese exhibits the same pattern, as illustrated below, where the agent NP 警察 ‘police’ is present in (2a) while the agent drops in (2b):

4 The terms Agent and Patient are used here in Dowty’s (1991) sense of proto-role.
Modeling bei-constructions on English be-passives, we thus seem to have every reason for a similar dichotomy of passives in Chinese. That is, like English, Chinese also makes a distinction between a long and a short passive, or long a bei-(construction) and a short bei-(construction) (I henceforth drop the term (construction)).

However, this cross-linguistic parallel between the be-passive and the bei-passive is quite misleading. For this comparative model has as its direct consequences a number of (mis)matches in passive constructions between English and Chinese: i) bei-constructions are basic passive in Chinese as be-passives in English; ii) long bei and short bei are structurally related constructions, as are long be- and short be-passives in English; iii) the particle bei is a preposition, the Chinese counterpart of preposition by in English. These three cross-linguistic matches are both theoretically and practically unworkable in spite of the fact that they have widely been practiced in the current mainstream works on contrastive and translation studies in English and Chinese. It is against these three mismatches that this paper contends that the bei-construction should not be conceived of as the Chinese counterpart of English basic passive, namely the be-passive.

2.1 Short be-Passives are Preferred in English while Long bei-Passives in Chinese: Distributional Mismatch

There has been a consensus among English linguists - that the short be-passive is preferred to the long one in all syntactic positions and across a variety of registers (e.g. Huddleston et al. 2002). This pattern of usage of the short passive over the long one has been confirmed by a number of corpus findings. Biber et al. (1999: 938), for example, find that the ratio of occurrence of the short passive as opposed to the long passive in daily conversation context is 8:1.5

Coming to the long bei and the short bei in Chinese, we find the picture is just

5 More elaborated corpus-based statistics can be seen in Huddleston 1971/2009 (pp.120-125).
the opposite: the long *bei* is used substantially more frequently than the short *bei.* Historically, the short *bei* appears as early as 300 BC (何乐士 2000). However, since the Tang-Song dynasties it is the long *bei* that has been dominant in usage (唐钰明 1988). The relative occurrence ratio of the long *bei* to the short *bei* is 5.7:1. This rate is getting higher from late modern to contemporary Chinese.《儿女英雄传》 is a novel in late modern Chinese, in which a total of 188 *bei*-constructions are identified (陈昌来 & 李琳 2006) with long *bei* accounting for 85%. Lao She’s 骆驼祥子 can be considered as a more or less contemporary writing, where a total of 105 *bei*-passives are identified with long *bei*-form making for 87% (蔡建光 2008).

Given the data on the relative frequencies of occurrence of short *be*-passives in English and long *bei* in Chinese cited above, it should be safe to say that long passives are preferred in Chinese while it is short passives that are preferred in English. How would we interpret this distributional discrepancy between *be*-passives and *bei*-passives from a comparative perspective? This question takes us to a typological taxonomy of basic and non basic passives in subsection 2.2.

### 2.2 *be*-Passive is Basic Passive while *bei*-Passive is not: Typological Insights

Keenan & Dryer (2007) have the following typological remark on the relative distributional pattern of long vs. short passives

(3) …it is also generally the case that agentless passives are preferred even when the language syntactically permits agent phrase (2007: 332).

Needless to say, agentless passives are short passives, and agentive passives are long passives. At this point we have to bring in Keen & Dryer’s distinction between basic and non-basic passives, complicate the matter a little. For Keenan & Dryer, agentlessness is one of the defining properties of what they mean by the notion of basic passive (pp.328-329). Agentless passives are basic passive not only because they are usually shorter than agentive passives, but mainly because they are more passive in nature than agentive ones. By ‘more passive’ it is meant that basic passives are the most prototypical passive in the sense that the ultimate force behind the formation of a passive is to foreground the expression of Patient role at the cost of the expression of Agent role. So a chain of reasoning emerges here: an agentless passive is the most prototypical and thus most basic simply because the Agent is completely suppressed in order to give a full expression of the Patient.

Having explained the correlation between agentless, short, and basic passives, we are now ready to examine the *be*-passive and the *bei*-passive in light of Keenan & Dryer’s generalization in (3). Since the dominant form of *be*-passives is agentless, the
be-passive, as opposed to other types of passives (say get-passives for example), should be deemed the basic passive in English. In contrast, since the dominant form of be-passives is agentive, it then follows that the bei-construction should not be the basic passive in Chinese. In what follows, I present four lines of evidence in support of the above observation that the bei-construction is not the basic passive in Chinese.

3. **be-Passives are Simple while bei-Passives are Not: Syntactic Disparities**

Short be-passives are usually unadorned in the sense that its main verb is simple and plain: simple because it consists of a singleton lexical verb; plain because it doesn’t take a direct object. (4a) is a short be-passive, where the main verb paid is bare and plain. No direct object is allowed as a syntactic adornment, as showed in (4b) below:

(4) a. The bill was paid
   b. *The bill was paid two hundred dollars.

Note that a standard passive subject is nothing but a permutated active object. In other words, when the object of the verb in its active form has been rearranged as the subject of the same verb in its passive form, the verb has syntactically been deprived of its object. This is exactly the case with the passive verb paid in (4a-b): it has been deprived of its object which has become the subject. Given this syntactic deprivation, any passive object to the passive verb cannot be accepted, as illustrated in (4b) where the passive direct object *two hundred dollars* is not permitted. It is in this sense that an English be-passive must be unadorned and simple.

In contrast, the main verb of a bei-passive can be highly sophisticated for two reasons. First the passive verb can take a direct object; second, it can be serialized into a complex. For example, the predicate VP of the passive sentence in (5) consists of a host of lexical verbs of ‘arrest’ plus ‘write’ plus ‘fine’ and plus ‘send’ in a series:

(5) 这个外省小偷被警察逮住 (arrest), 写(write)了一个检讨书, 罚(fine)了两百块钱, 送(send) 回到当地政府去了

In addition, the main verb of a bei-passive, unlike that of a be-passive, can take a direct object. The NPs 一条腿 ‘one leg’, 陈圆圆 ‘Chen Yuan-yuan’ and 衣服 ‘clothing’ in (6a-c) are all a passive direct object, respectively, of the main verbs 打断 ‘break’, 抢走 ‘rob’ and 脱光 ‘strip’. This kind of object is not permitted in be-passives, as showed in their near English translations in (6d-f):

---

6 This sentence is composed from two examples in Lu (2004: 10)
There are three points to note about the characteristics of the main passive verbs in (6a-c): first, they are all mono-transitive verbs in active; second, they all take a passive object; third, the passive objects are thematically related to the patient subject of the sentences in one way or another. The direct object 一条腿 ‘one leg’ in (6a) is the body part of the patient subject 西门庆 ‘Xi Men-qin’. The semantic relation between the object NPs 衣服 ‘clothing’ and the subject NP 潘金莲 ‘Pan Jin-lian’ in (6b) is one of possessor and possessed, and roughly the same can be said of the passive direct NP 陈圆圆 ‘Chen Yuan-yuan’ in (6b). All these three traits indicate that the VP of bei-constructions can be anything but simple and plain in passive, disqualifying the constructions as basic passive.

There is more evidence that indicates that the bei-construction is of non-basic passive. Consider the following sentences that have been termed impersonal passives (Keenan & Dryer 2007; Payne 2006). These sentences are so called because they are formed from semantically intransitive verbs as illustrated in (7): the main passive verbs 叫 ‘shout’, 来 ‘come’, and 爬 ‘climb’ in these bei-constructions are all intransitive.

Even without going into all the syntactic details of the impersonal passive, it is conceptually clear enough that an impersonal passive is necessarily of non-basic. For a basic passive is a construction that is prototypically derived from a transitive verb and thus necessarily with a patient subject. However, the impersonal passive is a subject-less passive (Keenan and Dryer 2007; Payne 2006). This is the case with all the impersonal bei-constructions in (7).

4. be-Passives are Neutral while bei-Passives are Non-neutral: Semantic
Another defining property of the basic passive is related to affectedness of the subject. That is, the subject of a basic passive is understood to be neutrally affected whereas the subject of a non basic passive is either negatively or positively affected. For example, Vietnamese distinguishes between three types of passive, namely negative, positive and neutral passives (Keenan & Dryer 2007:341). It is neutral passives, not positive or negative passives, that are deemed basic passive.

English distinguishes between two types of passive as regards subject affectedness. The get-passive, as in John got fired, can be said to be a negative passive, expressing an event that is detrimental to the subject John. Unlike get-passives, be-passives are neutral, being non-committal as to subject affectedness. For example, John was fired is not bound with a negative effect on the subject John.

Unlike be-passives, bei-constructions are, in both its long and short forms, negatively loaded passives as to the subject referent. The following examples from Lao She are illustrative for what we mean by the term ‘negatively loaded.’ In the case of (8a) below, for example, being thrown out (撵出去) is definitely something detrimental to the whole family. In this sense, bei-passives have acquired the label adversative passive.

(8) a. 房钱交不上，全家便被撵出去，而且被扣了东西.  
    b. 夏太太因为买了四盆花，而被女仆杨妈摔了一盆.  
    c. 一切可以换作金钱的都早晚必被卖出去.  

《骆驼祥子》

Following the reasoning of the recent constructionist theory (Goldberg 2006), the semantics of negative affectedness in a bei-construction should not be explained as a contextual imposition. In other words, the semantics of negative affectedness is simply what the bei-construction is designed for, where either the main verb or its resultant complement of a bei-construction must be semantically negative. This point has independently been confirmed by findings from 范晓(2006). Readers are referred to this excellent paper for a full list of negative lexical verbs (e.g. 吃、咬、打、撞、批评、欺负、压迫) and negative complement elements (e.g. 坏、漏、断) that make, in collaboration or alone, bei-constructions an inherent adversative passive.  

By inherent I mean the construction would fit into a negative environment better than a neural one. This point can be illustrated in the contrast of the following paired sentences in grammaticality:

---

7 There are quite a few text-count studies in support of bei-construction as inherent adversative passive, e.g. 李临定(1980) on 《骆驼祥子》and 王还 (1983) on 《三里湾》and 《创业史》.
(9) a. 那辆车被修烂了
b. 那辆车被修好了

Since the main verb 修 ‘repair’ is semantically neutral, it is the resultant complement 烂 ‘kaput’ in the VP of (9b) that fits appropriately into the adversative frame of bei-construction. The complement 好 ‘well’ in (10b) is however inappropriate for an inherently adversative structure. This accounts for the reduced grammatical acceptance for the sentence in (10b).

It should be clear enough that it is the inherent adversative property of the bei-construction that prevents us from drawing a parallel between the bei-construction and the be-passive: the former is non-basic while the latter is basic.

5. Separating Short bei from Long bei: Derivational Speculation

In Sections 2 through 4 we have dismissed the assumption of bei-construction as basic passive in Chinese, comparable to be-passive in English. As noted in the Introduction section, two theoretical myths have resulted from this misassumption. The first of these two myths is about the particle bei that is treated as a Chinese counterpart of the preposition by in English. The second myth is that the short bei are perceived as shorthand for the long bei without the Agent NP in the way the short be-passive for the long be-passive. In what follows I deal with the second issue, i.e. the alternation between long and short bei. In the next section I will take up the question of whether or not the particle bei can be treated as a preposition.

It has been reasonably assumed that the alternation between long be- and short be-passives in English as a matter of deletion or addition of the by-agent phrase. Thus the alternation is a two-way lane, as diagrammatically illustrated below:

(10)  Long be-passive $\xrightarrow{\text{short}}$ Short be-passive

Then what about the alternation between long and short bei constructions? One of the best known answers to this question is: the short bei is derived from the long bei via deletion of the agent NP, as illustrated in the following diagram:

(11)  NP$_1$ + bei + NP$_2$ + VP $\xrightarrow{\text{short}}$ NP$_1$ + bei + VP

The above diagram actually represents a claim, explicit or implicate, that practically pervades the overwhelming majority, if not all, of the current published textbooks in contrastive and translation studies. This claim seemingly does capture native intuition.
about the relationship between the long and short *bei* forms.

But note that, unlike the two-way derivation between long and short *be*-passives in (9), the alternation between long and short *bei* is a one-way derivation in (10).

Deriving the short *bei* from the long *bei* via deletion of NP2 entails treating the *bei* in the two forms is grammatically identical. If the two forms of *bei* is grammatically one and the same thing, then the alternation between the long and short *bei* forms might be postulated the other way round. That is, the long *bei* is obtained from the short *bei* by addition NP2 after the short *bei*, as illustrated in (11) below:

\[
\begin{align*}
(12) & \quad \text{NP}_1 + \text{bei} + \text{NP}_2 + \text{VP} \quad \leftrightarrow \quad \text{NP}_1 + \text{bei} + \text{VP}
\end{align*}
\]

Then one may ask: is (10) or (11) the right derivation? There is in principle no telling which is which, unfortunately.

This paper holds a different view: the long *bei* and short *bei* are distinct structures, deriving from different sources. In particular, we propose that the long *bei* is derived from an object-topicalized construction in the literature (e.g. Li & Thomson 1981) like that in (12a) below. The short *bei* is derived from what has been called patient-subject construction in the literature, as illustrated in (12b) (e.g. 龚千炎 1982; 王灿澜 1988; 陆俭明 2004):

\[
(13) \quad \begin{align*}
\text{a.} & \quad \text{老虎武松打死了} \\
\text{b.} & \quad \text{老虎打死了}
\end{align*}
\]

Departing from Keenan & Dryer’s analysis of passive formation as a syntactic operation only at the VP level, we contend that there are other avenues for constructing a passive. In particular, passives can be formed at either phrasal or lexical or clausal level. Readers are referred to Payne (2006) for passives at lexical level. In the case of *bei*-passives, we propose that they are formed at clausal level with the particle *bei* as a passive marker for the patient subject (邵敬敏 & 赵春利 2005), rather than as a periphrastic verbal marker. One piece of evidence in support of passive formation as a sentential operation is from a coordination test on the following paired sentences:

\[
(14) \quad \begin{align*}
\text{a.} & \quad \text{你被地主害死爹, 我被地主害死娘} \\
\text{b.} & \quad *\text{你被地主害死爹, 我地主害死娘} \\
\text{c.} & \quad \text{老六被老四打了两拳, 被老三踢了三脚} \\
\text{d.} & \quad \text{老六被老四打了两拳, 老三踢了三脚}
\end{align*}
\]
The grammatical contrast between (13a) and (13b) shows that *bei* is a clausal passive marker: two instances of *bei* each are needed for two separate passive clauses. Since a clausal passive marker is missing in (13b) it is ungrammatical. Since (13b) and (13c) are both coordinated clauses, the omission of *bei* is then optional.

It is reasoning along this line we argue that long and short *bei*-passives are derived separately from the structures in (13a) and (13b). That is 老虎被武松打死了 is derived from 老虎武松打死了 while 老虎被打死了 from 老虎打死. One of the desirable consequences of this derivational analysis is that neither the long *bei* nor the short *bei* are the basic passive in Chinese.

The above proposal for separate derivations for long and short *bei*-passives involves the category status of the particle *bei*. A variety of the grammatical categories have been assigned to “*bei*” over the past 30 years or so. The particle has been analyzed, for example (see 刘升东 2008 for a detailed review), as a preposition, or an auxiliary, or a light verb, or a lexical verb. Given the purposes of the present writing, we are not obliged to commit ourselves to any of those analyses. However, if we start with an analysis of “*bei*” as a preposition on a par with the preposition “by” in English, then we are surely on the wrong track, a point we now turn to presently in the next section.

6. *by* is Preposition but *bei* is not: Constituent –based Tests

In this section we present two analyses against the assumption of *bei* as preposition, comparable to *by* in English. The first of our analyses rests on a constituent test. The second on coordination test. The two tests presented here are heavily based on Huang et.al (2009:112-152). Coming to the constituent test, our argument is this: if *bei*-NP were a prepositional phrase, it should be permitted to move around the sentence. But an inspection of the contrasts among the sentences in (14a-f) immediately reveals that the *bei*-NP sequence cannot form a constituent at all:

(15) a. 老虎被武松打死了
b. *被武松老虎打死了
c. *老虎打死了被武松
d. The tiger was killed *by* Wu song
e. It is *by* Wu song that the tiger was killed
f. It is the tiger that was killed *by* Wu song
g. 在景阳冈老虎被武松打死
h. 老虎在景阳冈被武松打死
i. 老虎被武松在景阳冈打死
j. 老虎被武松打死在景阳冈
(14a) is a standard long bei-passive. The ungrammaticality of (14b) and (14c) indicates that the bei-NP, namely 被武松 (by Wu Song), is not permitted to move around the sentence as a single unite. This lends strong support to the fact that bei is not a preposition and the Agent NP is not its object. In contrast, this is not the case with the sequence by-Wusong in their near translations in English (14d-f). In other words, the string of by-agent NP does form a constituent headed by the preposition by. This accounts for why the by-NP is movable in (14e) and (14f). Similarly, this is the case with the zai-NP, namely 在景阳冈, in sentences (14g-j), since zai 在 ‘in’ is a preposition in Chinese, which takes its object 景阳冈 to form a movable constituent.

A second line of evidence against the supposition of bei as Chinese counterpart of by is based on coordination test. As showed in (15a) and (15b), the particle bei can be detachable from the following agent NP. The detachability of the bei in a string of bei-NP indicates that bei-NP is not a structured sequence. In contrast, by-NP in English is a structured sequence. This means that preposition by is in a tight bond with the following Agent NP. This accounts for why (15c) is grammatical while (15d) is not:

(16) a. 老六被亲人怀疑，被外人指责．
b. 老六被亲人怀疑，外人指责．(李临定 1980: 406)
c. John was slapped by Mary but kissed by Alice
d. *John was slapped by Mary but kissed Alice

More examples from 李临定 (1980) are cited below to lend further support to the grammatical alternation between (15a) and (15b), in which the particle bei and the following NP do not form an independent constitute.

(17) a. 被人踏被马踩：被人踏马踩
b. 被杀伤被击毙：被杀伤击毙
c. 被责问被考验：被责问考验
d. 被照顾被呵抚：被照顾呵抚
e. 被保存被记录：被保存记录

5. Conclusions
In this paper I have laid out four lines of evidence against the assumption of bei-constructions as basic passive in Chinese, comparable to be-passives in English. It is this misassumption that has led to some myths about the parallelisms between Chinese and English, such as the lining up of long and short bei with long and short
be-passives, and of the particle bei with the passive proposition by. My analyses presented here is basically intended as dispelling these myths of parallelism in the context of English-Chinese contrastive and translation studies, leaving open the question of what it is that constitutes the basic passive in Chinese.

By way of conclusion, I propose a more productive parallel that can be drawn in passive structures between Chinese and English. This is the parallel between the bei-passive and the get-passive, both of which are of non-basic passive. The point of bei-construction as non-basic passive in Chinese has been argued for in the body of this paper along the distributional, syntactic and semantic grounds. These three lines of augmentation may neatly apply to the case of the get-passive as non-basic in English. First of all, in terms of distribution, the get-passive is marginal as compared to the be-passive. The marginality of the get-passive should set it apart immediately as a non-basic, as opposed to the be-passive as the basic.

Second, there is some syntactic evidence that it is be-passive, but not the get-passive, that should be treated as the basic passive. It has been noted (Keenan and Dryer 2007; Cart & McCarthy 2006) that, for example, the get-passive is used exclusively with dynamic verbs or in the dynamic sense of the passive main verb. This implies that the get-passive enables a clear distinction between a dynamic event and a state of situation. Thus the get-passive in (17a), according to Cart and McCarthy (2006:800), is clearly interpreted as an event, while be-passive (17b) is ambiguous between a state and an event:

(18) a. The fence got damaged.
   b. The fence was damaged.

The third line of argument for the get-passive as non-basic involves affectedness of the passive subject. A typical get-passive is a “problematic” (Payne 2006) passive in the sense that the passive subject is responsible for or negatively affected by the event of the main verb. In (18a) below, for example, the subject of the get-passive is understood to be adversatively affected by the event of being locked out, whereas this interpretation of the subject of the be-passive in (18b) does not obtain:

(19) a. She got locked out
   b. She was locked out

Alternatively, (18a) can be interpreted in light of intentionality involvement of

---

8 I feel strongly inclined to follow 张志公 (1982) and others (e.g. 熊学亮 & 王志军 2002) in taking the patient- subject clause as the basic passive in Chinese, though there is an analysis of patient-subject passive as the middle (Cheng & Huang 1994) in the literature.
the subject. In particular, being locked out is part of the intention of the subject of the get-passive in (18a). This semantic coloring of the passive subject is not available in (18b), as illustrated in the contrast in grammaticality between the following paired sentences (Huang et al 2009: 115):

(20) a. The pedestrian deliberately get hit.
    b. *The pedestrian deliberately was hit
    c. John intentionally get fouled by Bill
    d. *John intentionally was fouled by Bill

Huang et al use these sentences to make their point that the bei-passive behaves on a par with the get-passive, as illustrated below:

(21) 张三 是 故意 被 (李四)打了.
    ‘Zhangsan intentionally got hit (by Lisi).’

The semantic of the phrase 故意 ‘intentionally’ indicates the subject 张三 ‘Zhangsan’ is the person who is intentionally involved in the event of hitting.

To sum up, both the bei-passive and get-passive are of non-basic in their respective language. The points proposed above for a comparative study between the two structures should promise a productive line of investigation into Chinese-English contrastive and translation studies.

Senior Academic Development Advisor/Senior Instructional Designer: Academic Development Centre, North West University, Mafikeng Campus, South Africa

This discussion notes that the provision of academic advising and counseling by the Academic Development Centre (ADC) at the North West University, Mafikeng campus, South Africa, is being met with mixed reaction hence a lot still needs to be done to ensure that lecturers and students appreciate the concept. ADC is mandated to ensure that quality teaching and learning as envisaged in the university’s ethos is provided and adhered to. To achieve this, through its diverse arms, ADC should work closely with the teaching staff members so that whatever they need to execute their core teaching and research activities is provided. This entails requesting the teaching staff members and students to attend different capacity building workshops designed to improve their teaching and learning/studying skills respectively. Conversely, ADC is yet to receive maximum support from its major stakeholders. The prevalent challenges ADC has to navigate through range from stakeholders’ failure to appreciate its strategic role in the improvement of throughput, non attendance of dully called for capacity building workshops, disregard of deadlines, non-implementation of suggestions, lack of resources among others. To circumvent these, ADC is calling for stakeholders’ mindset change, dialogue and proactiveness in view of the emerging teaching and learning trends characteristic of the 21st century.
Heritage language can be defined as any ancestral language that may, or may not, be spoken in the home and the community in formal and informal settings (UCLA Steering Committee, 2000). Heritage language loss refers to lack of first language development, delayed first language development, or a progressive loss of previously acquired language ability (Collier, Ovando & Combs, 2004). For the purposes of this research, I will refer to language loss as the lack, decline or gradual shift of language proficiencies in the first language. The Spanish language, as spoken by people in Texas, fits this definition. Spanish language and proficiencies, which are the spoken and written forms of the language, vary within Hispanic communities in the Southwest. Bilingual education teachers are influential in retention of heritage languages in their classrooms however; indications are that many do not take advantage of their influence.

Many societies in a global economy benefit from the multilingual aspects of commerce, not just economically but culturally with one another. Current examples of the multilingual diversity needed to function effectively in rapidly growing economies are exemplified by methods used by the European Union and mandates by the United Nations (Spring, 2004). The European Union, which was officially organized in February of 1992, recognized the need for promoting unity within the various nations, not by promoting one language, but by emphasizing a multiple language policy in which the objective for education is to “develop proficiency in three European languages” (Spring, 2004, p. 79). This program allows students to participate in a language exchange program to any university or college within a member nation of the European Union. As part of the agreement, the student must demonstrate knowledge of the language of the host country in return for social security protection and health care in the host country. If a student is not familiar with the host country’s language, another program provides special language training and textbooks before the student travels to that country. This agreement ensures that students have every opportunity to share cultural and multilingual perspectives and values. In the U. S. multilingualism is not a concern and the effects have been language loss and lack of academic proficiency in English.

Generational language loss occurs after a language has completely shifted to English or has maintained only a semblance of that first language after the second generation of speakers (Tse, 2001; Ovando, Collier & Combs, 2004). The Pew Hispanic Institute (2006) considers the second generation of heritage language speakers as anyone born in the United States of immigrant parents. Using this definition, third generation Hispanics, or the children of the first generation born in the United States, experience complete heritage language loss. According to several researchers (e.g., Ovando, Collier, Combs, 2004; Yamachi, Ceppi & Lau-Smith, 2000), loss of one’s heritage language also seems related to the low academic achievement experienced by Native Americans and Hawaiians in the United States and can account for the continual rise of Hispanic dropout rates in the Southwest. For Spanish speakers in the United States this loss can take place within two generations (Crawford, 2004; Snow & Hakuta, 1988). Language loss is also associated with the loss of cultural ideals that are embedded within every language and as such can cause the loss of a culture.

There is a need to study the methods and language used by bilingual education teachers in programs in which high populations of Spanish-speaking children are enrolled. Guerrero (2003)
argued that bilingual education teachers are hired by districts under the impression that they are fluent in a language other than English, when in reality many teachers with bilingual education certification are not proficient in any language but English. Their Spanish language proficiencies may be inadequate to teach content area instruction in Spanish. Research (Cummins, 1996; Fishman, 1991; Ovando, Collier & Combs, 2004; Ramirez, 1991) indicates that children retain information and learn concepts best and are able to transfer to English effectively when taught academic content in their heritage language; it is therefore imperative that their teachers be academically proficient in the learners’ heritage language.

By studying the factors that contribute to heritage language loss and shift, this research will gain knowledge about some of the attitudes toward using Spanish as the language of instruction in bilingual education classrooms. Analysis of Spanish speakers’ public school backgrounds and social views will allow this researcher to learn about subtractive as well additive bilingual programs from the teacher’s perspective. I will explore the prevailing attitudes toward the schooling backgrounds of Spanish speakers and attitudes toward bilingualism by bilingual education teachers. Attitudes toward school and school experiences are often determinants of higher education attainment and of the decisions made to retain a heritage language (Ogbu 1978; Mehan 1997; Valenzuela, 2005).

Participants

Bilingual education teachers within their first through third years of teaching in a TBE program will be the focus of the study reported herein. The participants were new teachers whose backgrounds included experiences with subtractive school policies as well as lived experiences in their backgrounds meant to acculturate their language. In order to gather adequate data from surveys and interviews with Spanish speakers it is important to point out that the participants represented varying socioeconomic as well as generational backgrounds. The survey used in this study will be the Multigroup Ethnic Identity Measure (MIEM). Although the MEIM does not measure the use of a heritage language, it does consider and attempt to quantify a concept such as “commitment” to one’s ethnicity which leads to maintenance of the heritage language (Phinney, 1999). Interviews with semi-structured questions were also used in order to gather enough information about the participants’ background schooling, education and Spanish language experiences.

Teachers from both TBE program schools and dual-language program schools were chosen for this study. The participants chosen are an adequate representation of people who have retained all or part of their heritage language in spite of or as a result of their backgrounds and school experiences. This study will reveal the attitudes of these teachers toward teaching in their heritage language and relate those attitudes to their own language learning backgrounds. The consequences related to the loss or shift of Spanish language do not always prove detrimental to the economic success of the participants, but do prove that the processes of that loss create a negative attitude towards all that is “Mexican” (Ovando, Collier & Combs 2004; Ogbu 1978; Valenzuela, 1999).

Through the use of interviews with new bilingual teachers, this study explored teachers’ own heritage language loss and their interest in using native language instruction. The supposition is that the participants’ information about their teaching goals and their experiences in the educational programs they attended will reveal a pattern of socio-political subtraction of heritage language though the use of transitional-types of curriculum. The interview and questions should also give more insight into the candidates’ own attitudes towards their
heritage language. Reform of subtractive educational practices will be the central solution in this study with an emphasis on additive programs for Spanish speakers in this area.

Another supposition is that government policies and mandates for learning the English language are a factor in heritage language loss and shift. According to the No Child Left Behind Act of 2002 (NCLB), the main language goal for schools in the United States, should be proficiency in English. NCLB does mandate that school districts with high numbers of low-achieving students alleviate this problem by showing adequate yearly progress (AYP) on test scores (Texas Education Agency, 2009). This educational mandate leaves schools and districts with high numbers of second language learners at a disadvantage in view of the fact that a significant amount of research confirms that it takes from 4 to 10 years to learn English well enough to pass an academic test (Cummins 1996; Krashen 1996; Ramirez 1991). The assumption is that the use of transitional bilingual programs seems to be set up for failure of attainment of academic English.

The participant group for this study involved six new bilingual education teachers, who were in their first through third years of teaching, in grades kindergarten through fourth grade. Three participants were chosen from a school that uses Transitional Bilingual Education (TBE) as their program for second language learners, and three were from a school that used a Dual Language Program for instruction. Only Mexican American teachers educated in the United States, or raised in the United States from early childhood, were asked to participate. The rationale for the aforementioned criterion is that this study explores whether new bilingual education teachers are still using teacher training principles learned in their education programs or whether the delivery of instruction in their classrooms may have been influenced by early schooling experiences in the United States. Foreign-born Hispanic teachers were also excluded from this study because Spanish acquisition is usually attained in their country of birth, and their educational experiences will be significantly different from those born or raised in United States. For these reasons, the interview and survey responses were directed toward understanding the participants’ perspective on their experiences in school, the community, and home as such experiences pertain to their use of heritage language and English.

The participants for this study must have been educated in the United States in order to effectively answer questions of heritage language loss (Guerrero, 1997, 2003). The participants were from two West Texas school districts that include both transitional and dual-language education programs. In as much as there were six participants chosen for this study, three of the participants were from one school district, while the other three were chosen from another school district about 20 miles away. A university’s certification office provided a list of bilingual education certification completers between 2005 and 2007 who met the following criteria for new bilingual education teacher interviews:

1. The teachers were within their first three years of teaching.
2. The teachers speak or have spoken Spanish at varying levels of proficiency.
3. The teachers were certified to teach bilingual education in Texas public schools.
4. The teachers were born in the United States or have been in the U.S. since early childhood (before the entering school at age 5).
5. The teachers were educated the United States.

The purpose of this study was to examine the views of bilingual education teachers regarding their use of Spanish in their classrooms. Within the study, the focus was on the motives bilingual education teachers have for the methods and languages used in their classrooms, but the types of bilingual education programs that influence their motives were also considered. Within
the findings examined are included the schooling and educational backgrounds that influence the teacher participants’ use or non-use of native language instruction in their particular bilingual education program.

Methodology

The potential participants were contacted by phone or e-mail and asked to participate in this study once it was determined that they met the aforementioned criteria. In order to gain employment in the local districts the teacher candidates must have taken the two required exit exams and the Texas Oral Proficiency Test as well as completed student teaching or a year as an intern. I looked up each teacher’s name on the list of school websites provided by each school district. Each name was searched, from the list of completers, and each teacher was contacted by leaving a message with the school in which they were employed and asking them to contact the researcher. Times and dates were set up for meeting with the researcher for at least 2 hours. A consent form was signed and each teacher was asked to fill out the Multigroup Ethnic Identity Measure (MEIM).

Texas Oral Proficiency Test

The TOPT is currently used by Texas to assess oral language proficiency in Spanish. The bilingual teacher candidate must take the test, by recording answers to specific questions, before the end of his or her teacher training program. The TOPT is considered a criterion-referenced test and the results are determined by three types of questions. The questions are meant to correspond to specific communication tasks such as giving directions, narrations or giving instructions at the intermediate level, while the advanced level consists of supporting opinions or hypothesizing on an impersonal topic. In order to perform successfully on the TOPT, the teacher candidate must score at a level of three or higher by two independent scorers who use a scale of 1 to 4/5. The score assigned by each scorer is one of four proficiency ratings with one being the lowest and 4/5 being the highest, which means that two raters could easily add a tester’s score to a minimum passing rate of six. The scores from the two raters must correspond for a combined score of six or higher. It was therefore determined that a score of six is the minimum score needed to be considered proficient in Spanish (State Board for Educator Certification, 2007).

The data for the TOPT was obtained from the university once the participant has signed the consent form to obtain those scores. The TOPT scores were used to point out the Spanish oral proficiency, according to state standards, of each of the participants in this study. The scores from the TOPT will be considered only with regards to the participants’ oral Spanish proficiencies as a possible comparison to their use of native language instruction in the classroom. According to research (Ovando, Collier, & Combs, 2004) the use of content area instruction in a heritage language is only considered important to the teacher when they feel comfortable teaching in that language. It is also important to understand the participant’s view of his or her own ethnicity and how this view plays a role on the impact that heritage language loss or shift has had. Phinney’s (1992) Multigroup Ethnic Identity Measure (MEIM) should be able to assess the participants’ self-identification, or the ethnic label a person gives himself.

The Multigroup Ethnic Identity Measure (MEIM)

The Multigroup Ethnic Identity Measure and interview questions in this study were used to show a minor relationship to what participants self-identified about their ethnicity and their views concerning their heritage language proficiencies. The MEIM survey was taken at the time of the first interview with the participant and, although the MEIM does not measure the use of a heritage language, it does consider and attempt to quantify concepts such as commitment to one’s ethnicity and what survey takers’ ethnic membership means to them, which may lead to
maintenance of the heritage language. Phinney’s (1999) MEIM survey includes details on coding the responses into the concepts of *affirmation of one’s ethnicity*, *belonging to one’s ethnicity*, and the commitment one may have to his or her own ethnicity (p. 160). For reliability of participant response, the researcher-generated questions include consideration of the language, schooling, and developmental backgrounds of the intended participants. The six semi-structured interviews were conducted in the participant’s choice of settings before or after their school day, so as to keep the atmosphere familiar and friendly to the participant. Because of the number of questions and the depth of the possible answers, each interview took between one to one and a half hours, and each participant was asked for a second or follow-up interview time that was intended to take from thirty minutes to one hour. Although the MEIM survey and TOPT scores include the participants’ names, all forms of identification will be kept in separate files for confidentiality. Both the survey and the TOPT scores were used as general information on oral language proficiency and ethnic identity for each of the participants. A semi-structured interview followed the MEIM survey while meeting with each participant. The interview was used to gain insight into the participant’s background and language attainment experiences that may influence his or her own teaching practices and how they view their ethnicity. Responses from the MEIM survey and interviews with the participants were gathered within the school calendar year in order to locate and contact new teachers in the schools in which they are employed.

**Data Analysis**

Concepts gathered from the MEIM, the TOPT and interview questions were categorized by coding the answers into themes that included attitudes toward the participants’ language and ethnic backgrounds and the support or lack of support for their language and ethnicity during their school-age years, when optimal attainment of more than one language is most promising and likely (McLaughlin, 1992). The coding process created the best venue for accessible and comprehensible themes and patterns to be revealed during the course of the data analysis. An advantage to using this technique of transcribing and categorizing was the accessibility of the data within the themes and patterns of the text (Berg, 2004, McMillian & Schumacher, 2006). Interview questions about the participants’ backgrounds also helped establish a more phenomenological approach by describing the participants’ lived experiences (McMillan & Schumacher, 2006).

The six new bilingual education teacher participants in this study taught in grades kindergarten through fourth grade within two cities in West Texas. All of the participants were within their first three years of teaching. Their names were obtained from the school directories and appointments for interviews were confirmed through phone conversations. In order to better understand their attitudes and beliefs about bilingual education and Spanish language proficiencies, the bilingual teachers took a short survey of their understanding of their ethnic identity and participated in a semi-structured interview.

Misconceptions about the methods used to teach Spanish speakers in the classroom abound among political and media opinions. Blame for the high Hispanic dropout rates and low achievement scores has also been misplaced with programs for English language learners being cited as the main problem. To fully understand the attitudes and problems of teachers who teach within these programs, face-to-face interviews and surveys regarding views of ethnicity were conducted and are interpreted.

Their names have been replaced by the order in which they were interviewed with the purpose of maintaining confidentiality and anonymity. The bilingual education teacher
participants also granted permission to access their Texas Oral Proficiency Test (TOPT) scores in order to include Spanish oral proficiencies determined by this test. To that end, this part of the study introduces the bilingual education teachers and their perceptions of their own schooling backgrounds, language proficiencies, and attitudes as they pertain to teaching in their native language. Included with each participant is a short summary about the school in which each one teaches. Each school’s information was gathered from an Academic Excellence Indicator System (AEIS) report from the Texas Education Agency website and included 2007-2008 reporting data.

New Bilingual Education Teachers

Table 1 includes information as it pertains to each bilingual education teacher’s background while considering the type of bilingual education school program in which each teacher was employed. Three of the bilingual education teachers taught in dual-language or two-way developmental school settings while three taught in transitional bilingual education settings. The definitions used for the titles in table 1 are indicated above the table and show the family generation for each participant as well as the type of program, whether Transitional Bilingual Education (TBE) or Dual Language (DL), in which they teach. Average scores for the Multigroup Ethnic Identity Measure (MEIM) and Texas Oral Proficiency Test (TOPT) scores are also included for each participant.

The second section of these findings include more detailed information gathered for each of the participants on the MEIM. This survey provided an average score from a questionnaire using a Likert scale requiring the respondents to answer questions about their attitudes toward their culture and cultural practices (Phinney, 1992). The answers ranged from a 4, meaning the respondent strongly agreed with the statement to a 1, which meant the respondent strongly disagreed. All participants also took the TOPT in order to be certified as bilingual education teachers. The test reports a score of six or above as a measure of oral language proficiency in Spanish. A score of six is the lowest a bilingual teacher candidate can score and still pass the test (State Board for Educator Certification, 2007).

**TOPT** = Texas Oral Proficiency Test  
**TBE** = Transitional Bilingual Education  
**DL** = Dual Language
The six bilingual education teachers included as participants for this study had a few common concerns about their bilingual program type. Table 2 gives an overall view of the common themes that occurred and responses to questions from the interview and the survey. Included in their responses are the commonalities of the teacher’s backgrounds and the fact that they, with the exception of one, considered themselves as having come from lower middle-class backgrounds. The responses are listed in the order in which they were asked in the interview and answered on the survey questions with the most frequency. Only those responses and experiences that were answered by a majority of the teacher participants were included in this table. The teachers’ attitudes toward their ethnicity, which includes responses ten through twelve, did not show a strong relationship to what they believed about using Spanish as the language of instruction in elementary school classrooms. While most of the respondents stated that they had positive feelings and a sense of pride in their ethnicity, they did not equate that with the use of native language instruction in their classrooms. Themes one through nine, which were answered similarly during the interview, and are included using the number of respondents in Table 3.

Table 3 shows the three major concepts gathered from the 13 reoccurring themes. The concepts included the responses from the teacher participants that were specified most often. Although the numbers suggest that some disagreement occurred, the majority of the themes and concepts were gathered using the most frequent responses. Major concepts are included from the research questions and were the focus of the interview questions and survey. Using this table as an integral part of the findings, each concept is described in terms of the bilingual education teachers’ views and responses made by most of the teacher participants.

</table>
The Value of a Heritage Language

The responses from some of the Multigroup Ethnic Identity Measure and the concerns the teachers had for using Spanish as the language of instruction in their classrooms seemed to have very little in common. When considering the Texas Oral Proficiency Test (TOPT) scores, two-thirds of the scores were at the lowest passing score (six). Two of the teachers said they were surprised by their scores either because they felt the score was not as high as expected or because they were surprised to have passed. This means that the teachers did not gauge their Spanish proficiency on whether they would help their students with Spanish retention. Although all of the teachers agreed with statements of positive feelings for their ethnicity, they did not mention a connection between the reasons for becoming a bilingual education teacher and Spanish language retention in their classrooms. With regular frequency, the teachers, even those teaching in dual-language programs, admitted that they were only somewhat comfortable or very comfortable teaching all subjects in Spanish. One of the teachers reported that she was very uncomfortable with using Spanish in her classroom for any reason, and one reported that she was completely comfortable using Spanish. The information gathered is not completely reflective of the value bilingual education teachers place on Spanish language maintenance, but it does seem to relate to how their students will learn English. Almost all of the teachers, with the exception of one, said that they considered careers as bilingual education teachers because they were offered a grant to pay for college and since they spoke Spanish decided to take advantage of the monetary offer.

Ethnic Identity and Teaching in Spanish

The Multigroup Ethnic Identity Measure (MEIM) consisted of 12 items that relate to how a person feels about his or her ethnicity. This survey particularly was used to find out if there could be a relationship between how teachers feel about their ethnicity and using Spanish in the classroom as an approach to Spanish retention. With the exception of one teacher, all seemed positive about the ethnic group they belonged to and responded that they felt pride to be Hispanic. All the teachers except one self-identified as Hispanic, with one labeling herself as a Latina.
The teacher with the lowest average score on the MEIM, surprisingly, teaches in a dual-language program. She also admitted that she “loves the Spanish language” and enjoys learning it along with her students each day. The score on the MEIM for this teacher was an average of 2.6 out of four on all questions answered. The disparity between how this teacher feels about her ethnicity and how she teaches in classroom may be due to the differences of her experiences growing up in Illinois. When compared to the other teachers, all of whom were born in Texas, her attitude toward her ethnicity and her view of Spanish language instruction seemed almost contrary. Opposing this view, the other teachers seemed positive about their ethnicity while opining that Spanish retention was secondary to academic English learning.

Attitudes toward TBE or Dual Language

Interestingly the responses every teacher had regarding what to do about program improvement, whether TBE or dual language, was to have access to more materials in Spanish. The overarching consensus among the teachers as the mitigating problem to being bilingual education teachers was the lack of sources for Spanish materials and the lack of resources in their schools. According to the teachers, the principals and assistant principals were all supportive, but could not help with location of materials in Spanish when they did not know where to look either. Two of the six teachers, one from a TBE program and one from a dual language program, stated that their principals did not understand their bilingual programs.

The teachers in the dual language programs all reported that although they taught the curriculum in Spanish, they did not agree with how the program was implemented in their schools. One dual language teacher did not have an opinion about how the program was implemented; she liked the idea of using and learning Spanish along with the children. She also happened to be the teacher from Illinois, who had a very different view of the Spanish language than did the other teachers. She stated that she believed it was “not difficult to teach” and that she “loved the Spanish language.” It became clear during the interviews that the TBE program teachers felt that their job was to make sure the students understood content area and literacy in English, while the dual language teachers felt that their programs were not set up efficiently enough for biliteracy to occur. Although the dual language program teachers, with the exception of the teacher from Illinois, conceded that their program was a little better than teaching in a TBE program they admitted that that there was considerable pressure to ensure literacy in English.

Influence from Background Experiences

With the exception of one, teacher respondents stated that their lower middle income upbringings may have been related to the level of Spanish and English academic acquisition they had attained. Interestingly, the one teacher exception was also one of only two of the six teacher respondents who scored a seven, or higher rating, on the Texas Oral Proficiency Test (TOPT). Based on the differences in agreement on most of the MEIM survey questions, the respondents’ backgrounds and lived experiences seemed to influence what they considered important to language learning in their classrooms. Their generational status also seemed to play a role in how the teachers viewed the use or non-us of Spanish instruction in their classrooms. Three of the teachers were third-generation, or children of parents born in the United States, and either believed they should not be bilingual education teachers or looked at bilingualism as an outsider. The one dual language program teacher from Illinois who said, “I love the Spanish language,” also stated that she did not mind learning “correct Spanish” as she taught it to her students, admitting that she could be “more or less comfortable” speaking it as long as she could continue learning it. Although this denotes a positive attitude toward
retention of Spanish, her MEIM survey responses were almost always in disagreement about how she felt about her ethnic group membership. All of the third-generation teachers recalled negative experiences while attempting to speak Spanish in school. The other two third-generation teachers were certain that teaching English only in their fourth grade classrooms was what would be most effective for their students. Both of these teachers stated that their parents spoke a mix of both Spanish and English, with English considered correct and Spanish spoken as either “Spanglish, Tex-Mex or incorrect.”

Of the remaining three teacher participants, one was first-generation and the other two were second generation. The teacher respondent considered first-generation or born in Mexico but educated in the United States, has a very positive attitude about using Spanish as the language of instruction in her fourth grade classroom but considered her TBE program very subtractive. She stated that she “had always wanted to teach in Spanish,” and so far her teaching situation had not allowed it. She is also looking forward to being able to teach in Spanish in a dual language school setting next year. The two second-generation teachers both teach in dual language schools and both grew up hearing, what they referred to as “Spanglish, Tex-Mex or incorrect Spanish.” One teacher stated that she had negative experiences in school while the other witnessed negative events over speaking Spanish, but did not experience them herself. The only second-generation teacher who reported negative experiences in school is also the only one who admitted that she grew up poor. Of the six teachers interviewed, four considered their father’s influence over retention of their Spanish language most important while two teachers said they had grown up without their fathers and therefore experienced no influence on language retention from their fathers. One of the two teachers with no paternal influence of Spanish retention admittedly spoke what she considered “Tex-Mex” while the other said her grandmother was the main person that influenced her retention of Spanish because her mother only spoke “broken Spanish.”

This study focused on six bilingual education teachers’ attitudes toward and beliefs about using Spanish as the language of instruction in their classrooms and the impact that a background in heritage language loss, shift, or retention has had on them. The results of the research questions indicated that heritage language loss, shift or retention from the teacher participants’ background experiences have contributed to how the teacher participants view their teaching practices. According to Fishman (1991), acculturation and assimilation of languages into a dominant language all lead to factors prevalent in the loss of heritage languages. Through the use of narrative inquiry in qualitative methods, this study provided more detailed insight into the type of language loss as this phenomenon is explained by the models of acculturation and assimilation experienced by Spanish-speaking bilingual education teachers in West Texas.

According to Freeman (2001), language involves much more than the acquisition of phonology, semantics, and pragmatics; it also involves the culture and life experiences of people, and therefore their perspective and worldviews. Most of what is known about heritage language loss does not include the viewpoints of teachers in bilingual education programs as they enter into public service. With the exception of one teacher participant in this present study, all of the other teacher respondents said they did not come from poor family backgrounds, yet they all worked in schools with high numbers of economically disadvantaged children. It is also important to note that society, ethnicity, and most importantly, class socio-economic structures play major roles in the indoctrination of negative attitudes toward cultures and languages other than English (Campbell, 2004). As society
molds the policies and programs that are used in public education, schools become the socialization agents that represent society’s goals (Freire, 1987). At least 30% of all families living in poverty in the United States are of Mexican origin and usually speak very little or no English (U.S. Census Bureau, 2000). Most families of students living in poverty do not typically feel that they have influence over the programs or curriculum of public education, but heritage language development, attainment, and shift are highly influenced by the families (Crawford, 2004; Ovando, Collier & Combs, 2004).

Spanish Language Use

All of the teacher participants in this study admitted to feeling “uncomfortable” or “somewhat uncomfortable” with the use of content area Spanish in their classrooms, and all the teacher participants thought that all children should be academically proficient in English by the time they reach fourth-grade. This indicates that their use of the students’ heritage language was not a central part of the curriculum for most of them. All of the teacher participants stated that they were schooled exclusively in English and although they did not experience a complete loss of their heritage language, acculturation or acquiring another group’s values as their own, became apparent in how they viewed the heritage language of their students. According to researchers (Ovando, Collier, & Combs, 2004) the use of content area instruction in a heritage language is only considered important to the teachers when they feel comfortable teaching in that language. It is also important to understand the participant’s view of his or her own ethnicity and how this view plays a role on the impact that heritage language loss or shift has had. Heritage languages, when considered as equal in status to English, have been proven to enhance cognitive abilities (Banks 2006, Cummins 1996, Ovando, Collier & Combs 2004).

The consequences related to the loss or shift of Spanish language do not always prove detrimental to the economic success of the participants, but do prove that the impact of that loss can create a negative attitude toward the culture associated with the language (Ogbu, 1978; Ovando, Collier & Combs, 2004; Spring, 2007; Valenzuela, 1999). For this reason, bilingual education teachers may have more influence on the attitudes of their students toward their native language than they have indicated in the interviews. As a form of assimilating their heritage language into that of the dominant language, these teacher participants viewed their students as being at fault for not having learned enough English in previous primary grades. The bilingual education teachers’ own goals for language retention in their students reflected their backgrounds in school and not necessarily those of any teacher certification programs in which they had been enrolled. This illustrates Freire’s (1987) phenomenon of ideological reproduction, or the idea that the U.S. educational system simply reproduces its own hegemonic ideas of a curriculum without consideration for differences in language and culture (p. 126). With this expectation, teachers often teach the same way they were taught.

Generational Loss and Ethnic Identity

Language loss or shift among the bilingual teacher participants seemed to increase with each generation born and schooled in the United States. According to Valenzuela (1999), first and sometimes second-generation students academically outperform third-generation counterparts. Two of the three teacher participants who reported being third-generation residents also reported negative experiences in school. While their parents did not involve themselves much with the teachers or schools, both of the teacher participants said their parents considered learning English most important. The other third-generation teacher thought that “learning Spanish along with the students” was a positive experience and
considered her own schooling background as being very different, and somewhat worse than that of a Hispanic born in Texas. She commented on feeling how much more accepted Spanish seemed to be in Texas than it had been in Illinois. The results of the interviews seemed to point to the idea that the higher on the generational ladder a teacher was, the more she implied that English was more important to emphasize in her classroom. This is symptomatic of the subtractive schooling backgrounds and parental influence each of the teacher participants had experienced. They all said they were sure they would not be expected to use Spanish as the language of instruction in their classrooms.

The three third-generation teachers in the study did not have the same view of their ethnicity as the other participants although all participants agreed that they were proud of being Hispanic and all self-identified as being Hispanic from the choices of Hispanic, Latina, or Mexican American. Interestingly, the term Hispanic seemed to be the primary connection the participants had to their ethnic identity. Their answers were varied enough to conclude that they did not consider their ethnicity as equal to their language, but they all stated that they were not active in any social groups that included only their ethnic group. This information leads to the conclusion that the third-generation teachers questioned on the Multigroup Ethnic Identity Measure (MEIM) were more involved in society or social events outside of their language groups, but had pride in their heritage if not their language.

Generational language retention did not seem to have an impact on who influenced the teachers’ language most. Four of the six teachers stated that their fathers seemed to have more influence over their retention of Spanish while two of the teachers said their fathers had no influence over their language. The four teachers that credited their fathers with having retained their Spanish language used statements like, “he was an avid reader, which made me want to read in Spanish,” or “he could speak English, but preferred to speak Spanish at home and insisted that his children do the same,” and “my dad spoke more Spanish than my mom.” The two teachers who said their fathers had very little or no influences over their Spanish acquisition were second- and third-generations. Of the two teachers, the third-generation teacher was also the one with the lower passing score of six on her TOPT while the second-generation teacher had one of the higher passing scores on her oral proficiency test. It is noteworthy to mention that the third-generation teacher was the only one who stated that she was surprised when she saw her passing score on the oral proficiency test because she did not think she spoke Spanish well enough to pass.

*Teachers in Transitional Bilingual Education Programs*

The participants’ information about their teaching goals and the history of the educational programs they attended revealed a pattern of sociopolitical subtraction of heritage language though the use of transitional-types of curricula and the candidates’ own attitudes and backgrounds in their heritage language. Three of the teacher participants in this study taught in transitional bilingual education (TBE) classrooms. Although two of the teachers expressed regret for not using Spanish as the language of instruction, they thought their fourth-grade students should all be proficient in English. Since these teachers’ schooling backgrounds were in an English only environment, it is not unusual for them to consider that this will not harm their students since they themselves had not been harmed. The TOPT used to assess the oral language proficiency of bilingual education teachers can be considered part of the low expectations the state has for native language instruction. It seems that by not asking that all bilingual certification candidates be academically proficient in Spanish, the true intent of the state is monolingual learning. This expectation is disguised as the method with which to
teach English to limited English proficient (LEP) students when there is research on learning a second language that indicates that those who read well in their heritage language will read well in their second language (Krashen, 1998; Ovando, Collier & Combs, 2004).

Of the six teachers interviewed only two had majored in Spanish in college, but the others admitted that, in hindsight, they would have liked to have enrolled in Spanish courses in order to gain more proficiency in academic Spanish. They all expressed the view that all teacher certification programs should allow more time in actual classrooms in order to gain a better understanding of the curriculum and of how to be able to effectively communicate with the Spanish speaking parents. Two of the three TBE teachers thought their students did not do well in their fourth-grade classrooms because they had not learned enough English in their primary classrooms. Although this is a blame-the-victim attitude among the teacher participants, studies have shown that the highest priority for TBE is transition into all English instruction (Garcia, 2009; Ovando, Collier, & Combs, 2004). The students have accomplished the English-only language goal, but to the detriment of maintaining their first language (Crawford & Krashen, 2007; Cummins, 2008). One TBE teacher did not agree that the fault lay with her students, but with the subtractive school situation in which she found herself. She stated just the opposite and considered that her students did not do well in English because they had not learned enough in their first language. She said she felt miserable in the school in which she taught and had decided to transfer to a dual language school in another city. Teachers who find themselves disliking their jobs are usually at odds with the philosophy of the school’s curriculum, principals, or colleagues which can be a highly stressful situation in which neither the student or the teacher gains positive educational experiences (Lindsey, Lindsey, Robbins & Terrell, 2006).

An example of the bilingual education program differences creating subtractive attitudes is of the two teachers with opposing views of the issue of Spanish use in their classrooms. One who was not comfortable with Spanish had no desire to teach it or use it to communicate with her students, but did disclose that she wished she was more proficient in Spanish. The other teacher who admitted she was uncomfortable using Spanish took a more positive view and said she could always learn more Spanish as she taught her students. The difference between the two teachers’ views was that the latter taught in a dual language school which emphasized the importance of both Spanish and English.

**Teachers in Additive Dual-Language Programs**

Additive models of teaching and instilling the value of heritage languages can be gained through knowledge of factors that have been determined to remove or replace a heritage language. Much research in the area of language acquisition proves (Cummins, 1996; Garcia, 2009; Krashen, 2000; Ovando, Collier & Combs, 2004) that more than one language can be learned simultaneously with cognitive advantages, in the primary grade levels.

The major goal of additive models of bilingual education programs is biliteracy for all students enrolled in such a program. Schools have implemented various models of this type of bilingual program with varying results, but the outcomes of tests in dual-language programs have always surpassed those of a TBE program (Bennett, 2006; Cummins, 1996; Garcia, 2005; Ovando, Collier & Combs, 2004). The main influence in the success of the schools has been the teachers and their beliefs, expectations, and levels of confidence in the ideals of a dual-language model. The three teacher participants in this study had positive views of dual language programs; however, only one of the three exhibited excitement when talking about learning and teaching Spanish with her students. The three dual-language...
program teachers taught kindergarten and first grades, which they all agreed were critical grade levels for language and literacy development.

Two of the dual language teachers had seen a program change from a two-way developmental model, or half the day in Spanish and half the day in English, to a *subject-determined* model in which some subjects are taught in one language and other subjects in the other. Literacy was separated by the dominant language of the child and not taught simultaneously with the target language. In other words, the English dominant children were taught literacy lessons in English separate from the Spanish dominant children. Research tells us that the goal of this model of dual-language education is biliteracy, because “once we are literate in any language, we are literate and we don’t need to learn to read each time we learn to read a new language” (Krashen, 1998; Lessow-Hurley, p. 95). According to Garcia (2009), this model of dual language education is best used after students have an understanding of content in their first language, or at about middle school age. The two dual language program teachers were not happy with this model and thought the school should return to the two-way, developmental model, because they felt as if they were teaching in a TBE model when they separated the students for literacy lessons. They both felt that the school’s ambiance and acceptance of Spanish among all the teachers had changed. They were not as likely to address each other in Spanish in the hallways or during breaks because they felt they were not the language models for Spanish anymore.

The year prior to the change, all students had been tested in both Spanish and English versions of the TAKS so that progress could be assessed in both languages although the teachers reported that only the English scores could be turned in. The previous principal at that time had expected the teachers to model the language they taught throughout the day no matter where they were. One of the teachers remarked that the school may as well go back to a TBE model since it seemed Spanish was not given the same status as English anymore. She commented on the idea that when the students hear their teachers model Spanish in the classroom and revert to English in other areas of the school, their impression is that English is the most important language because adults speak it to each other. Neither teacher felt they could complain about how they felt about the new program because they were new and looked to the veteran teachers to ask for changes or be the intermediary with the principal.

The dual language program teacher who was happy with her teaching position considered it a privilege to be able to teach in Spanish without repercussions. She had grown up in a subtractive schooling situation and did not see the problem with a program in which some students could be enrolled in the dual language programs and others in the school were not. Although her views of teaching Spanish in her classroom were positive, her Multigroup Ethnic Identity Measure (MEIM) was the lowest average of all the teachers surveyed. Her answers to belonging to her ethnic group were mostly in disagreement with the statements about belonging to the group with which she self identified. However, since teachers’ attitudes about teaching in their heritage languages need to be additive and positive in order for the students to gain biliteracy, this teacher, who considered herself an *outsider* of the Spanish language community, will most likely be successful with her teaching. According to research, the revitalization of heritage languages has succeeded when the teachers’ interest is in language maintenance and addition of English rather than subtraction of the heritage language for replacement by English (Banks, 2006; Crawford, 1996; Yamauchi, Lau-Smith & Luning, 2008).
This double tracking system for a dual language school depends on parental interest. Teachers reported that if parents enrolling their children in this particular school did not want their child to learn two languages they could opt out of the dual language program. The school’s academic excellence indicator system (AEIS) report shows that the parents who chose not to enroll their children in the dual-language program were mostly Hispanic. Although the Hispanic parents may have had varying reasons for not encouraging their children to learn in two languages, it seems that many of them, judging from the school’s percentage of reported low socioeconomic status had either suffered their own subtractive schooling experiences or may not have been aware of the cognitive advantages of learning in two languages. Parents are aware of their children’s need to learn English and often choose English only programs without realizing the cognitive problems caused by the subtraction of their heritage language (Crawford & Krashen, 2007; Fishman, 1996; Garcia, 2009; Valenzuela, 1999).

Overall the dual-language program teachers had a positive view of retention of Spanish in their classrooms. Although two of the teachers thought their program models could be better by going to a fifty-fifty model, or using English and Spanish as languages of instruction equally, they were still in favor of using both languages for instruction in their classrooms. Like the teachers in the TBE models, these teachers were also uncomfortable teaching in Spanish. Unlike the teachers in the transitional models, the dual-language program teachers were willing to step out of their comfort zones with the use of Spanish and learn the language along with their students or considered that they already had enough proficiencies for the grade level they taught. Teaching in additive programs such as the dual-language model helped the bilingual education teachers understand the importance of language retention and how it relates to the equal value that both languages should comprise in a bilingual education classroom.

The Hidden Curriculum

The dual language teacher who translates English reading program worksheets into Spanish in order to keep the curriculum equal thinks she is considering her students’ best interests, but admitted that she would not use the teacher-made worksheets if she had equal material in Spanish. The English reading program reflected the dominant culture and skills valued by that culture. According to Freire (1987), although this teacher may think she is equalizing the curriculum by translating a reading program into Spanish, she is really perpetuating the skills that do not emphasize critical thinking and are reflective of a hidden curriculum. Cummins (1996) referred to bicultural ambivalence as an attitude attributed to negative feelings for one’s culture as well as the dominant culture. Banks’ stages of cultural identity similarly state that in stage one or the cultural psychological captivity stage, an individual internalizes all he believes is wrong with his language and culture. The same can be said for a language that is considered marked, or not necessarily the language of learning in a society (Fishman, 1988). The marked language is generally considered a lesser status than the dominant language; yet dominant language speakers often admit that they would like to learn a second language. The bilingual education teachers in this study exhibited these contrary views in the methods they used for delivery of literacy lessons. All of the teachers were concerned over the lack of materials in Spanish, and all expressed doubt over the equality of the curriculum with English mainstream classrooms, but not one of the teachers interviewed considered looking for materials on their own or outside of what the school provided. Public schools are creating the secondary characteristics described in Ogbu’s
(1991) study of involuntary minorities as a part of the hidden curriculum. Secondary characteristics include the idea that education is meant only for the dominant language group and therefore cannot fully include anyone from a culture that includes other languages.

The statements made by the teachers regarding their own schooling experiences and the assimilation they encountered caused their attitudes of resignation toward the bilingual education of their students. The fourth-grade bilingual education teachers all said that their students had not done well on the Texas Assessment of Knowledge and Skills (TAKS) testing in English because of lack of knowledge of English. While this is not an untrue statement, it is by most critical standards unjust. Having the view that bilingual education is for teaching English means these teachers believe the students failed to gain English, no matter that no other language was tested for bilingual students. The No Child Left Behind (NCLB) Act has also been instrumental in the growth of subtractive programs for Spanish-speaking children in the U.S. There is no mention in any of the mandates for adequate yearly progress (AYP) of the use of languages other than English. In fact the NCLB mandate goals are for the increase of English for speakers of other languages.

Recommendations

Bilingual Education Programs in Public Schools

Schools have often modified and revised curricula used by bilingual education teachers in attempts to improve students English language skills. While curriculum changes for improvement of the English language have always been important, curriculum for Spanish-dominant students has mostly been ignored. Spanish should be used to transition students to English. The view that English should be learned easily and without the use of the heritage language as a resource however prevails (Cohen, 1982; Cummins, 2008; Ovando, Collier & Combs, 2004). Teachers helping to empower their students by using their heritage language in the primary grades emerged as the most important suggestion for public schools as this study progressed. Although all of the teachers, except one, alluded to the idea that their principals were open to suggestions about their classrooms and easy to get along with, most research suggests that educational leaders can direct the ambiance of their schools to match their own values and beliefs about a program (Larson & Ovando, 2001). The principals did not seem to encourage the use of Spanish in their schools. Veteran bilingual education teachers should be given a chance to understand how they may be contributing to students’ language loss and the long term effects of that loss. Research proves that when bilingual education teachers show academic proof of success, it is usually because of the methods and strategies they are using in the heritage language and not from the lack of English (Cummins, 1996; Garcia, 2009; Krashen, 2000; Ovando, Collier & Combs, 2004; Tse, 2001). Through the knowledge of the factors that cause language loss there can be curriculum methods that acknowledge the need for social change in the education of Spanish speakers enrolled in Transitional Bilingual Education (TBE) programs.

Transitional bilingual education programs that do not bring their students to an equal standard as that of a mainstream English classroom should be replaced by additive programs that have demonstrated academic gains by their students. There are many examples of successful additive programs that can be implemented instead of the transitional methods that are currently popular. However, it will take the bilingual education certification programs and the public schools working together to bring about the needed changes in the attitudes of teacher candidates and mentor bilingual education teachers who will actually help educate
English language learners. The goal should be biliteracy, or learning English while maintaining academic proficiency in Spanish.

Replacement of the LEP Label

Another suggestion is to replace the use of the subtractive label of LEP, a label used by all participants in this study as well as the state. Although this will take replacing at the state level as well as by the school districts, it should be disallowed as soon as possible by the districts. This type of labeling of students initially indicates a language deficit without allowing for the students’ knowledge and cognitive familiarity of a language other than English. Two of the dual-language model teachers stated that their program did not raise the status of both languages when few teachers in their schools modeled the use of Spanish outside the classrooms. The view of language as a deficit closely relates to the belief that a cultural deficit exists. This view emerged in the 1960s as a way to devalue the linguistic backgrounds of minority students (Bennett, 2006; Ovando, Collier & Combs, 2004). Through this view, lack of English language skills can be used an excuse to ignore the proficiencies a student has in another language and simply label them limited in English. Proponents of this deficit view also seem to rely on teaching for remediation rather than academic gains which leads to more testing of skills and placing the blame for failure on the students’ lack of language proficiency. Testing in an individualistic culture is used to measure each student but is meant to gain the same results for all students. If the melting pot or assimilation ideals were truly adhered to within the American monocultural educational system, individualistic testing would not be considered best practice as a measure of knowledge acquired since this leads to heritage language loss. Finally, the publishers of educational material should produce more Spanish-language materials, especially for the primary grades, and make them more available to the teachers and textbook- adoption committees in school districts that educate large number of Spanish-speaking students. Indeed all schools should make languages other than English accessible for biliteracy and beyond as a measure of global awareness in a pluralistic society. For children who are learning English the term LEP does not adequately describe their language proficiencies.

The Culturally Proficient Principal

Five of the six teacher participants in this study stated that the problem with the program in which they taught was not the principal’s attitude or lack of understanding of their program, while all six cited lack of enough materials in Spanish as the core problem. New teachers are apt not to blame their principal, but contend that the system’s inadequate and unequal dispersal of school curriculum material is at fault. Principals can often communicate their own values and interests through the use of test data that make programs such as bilingual education appear to be failing. When the students in a bilingual program do not do as well as students in the regular school program, then the principals may contend that they are not learning English quickly enough. In a society that espouses assimilation, the answer will not be more heritage language instruction, but less. The principals, however, retain the main role of advocates for all the students in their school, not just those in need of materials in English. The principals of all the teacher participants were aware of the failures of their English language learners, but blamed the lack of English proficiency on the parents’ and teachers’ lack of English use. This indicates a lack of understanding of what Terrell and Lindsey (2009) refer to as cultural proficiency or advocating for students identified as underserved and needing to be taught differently. In order to achieve the cultural proficiency needed to guide all students to success, the principal must first realize that issues of social justice play a part in
how best to implement program for English language learners. He or she must also be aware of best practices and research data that demonstrate success for all students.

*Bilingual Education Teacher Certification Programs*

Teacher certification programs for bilingual education teachers in Texas currently have one pre-assessment of language proficiency to gauge whether or not a teacher is ready to teach bilingually. By the fall of 2009, the Texas Assessment of Oral Proficiency Test (TOPT) will be renamed the Bilingual Target Language Proficiency (BTLP) and include a written portion. This is a good indication of higher expectations in Spanish proficiencies for bilingual certification candidates in the coming years, but it does not excuse the low expectations of the previous certification measures. In the meantime, however, public schools have hired hundreds of bilingual education teachers who needed only an oral proficiency in Spanish in order to teach academic content.

A critical look at certification programs for bilingual education teachers is necessary in order to educate the type of teachers who will use progressive methods of teaching by using heritage languages, which will yield a biliterate populace. For too long, bilingual education certification programs have certified teachers who do not all understand the best practices in bilingual education for their students. Whoever has sought to become a bilingual education teacher has been allowed to enter the public school arena with only an oral understanding of the first language of their students. This is evidenced by two-thirds of the teacher participants in this study which considered English as most important to learn by fourth grade with very little consideration of how much Spanish had been attained. Bilingual certification candidates should be held to the same standard as that of the *highly qualified* teacher within the No Child Left Behind mandate. According to Yell and Drasgow (2009), the NCLB standard for a *highly qualified* teacher includes the teacher’s ability to “demonstrate subject matter competency in the core academic subjects in which they teach” (p.45). In order to effectively meet this standard, certification programs must include courses that help the candidate gain academic proficiencies and critical literacy in the heritage languages they expect to teach. Five of the six teacher participants agreed that the bilingual certification programs they went through needed more time in a bilingual education classroom and more courses that helped develop academic levels of Spanish. Unlike universities and bilingual teacher certification programs in South Texas, the teacher certification programs in West Texas have not had to include courses in academic-level Spanish. They do not have to major in Spanish, nor take any Spanish courses in order to become a certified bilingual education teacher (Rodriguez, 2007). When research in bilingualism has been taught in bilingual certification courses, it has been taught in English. Certification programs typically prepare bilingual education teachers in English-only courses.

Language programs such as TBE and dual-language have an impact on how bilingual education teachers view teaching methods and strategies in a second language, but a measure of their attitudes toward their own ethnic identity yielded no relationship to the methods of native language instruction used in their classrooms. Additive or subtractive views of language learning depended on the language backgrounds as well as the language program in which the teachers were employed, but certification programs seemed to make very little impact on those views. Research on how much influence veteran teachers have on the educational outcomes of their students should be conducted in order to gain insight on whether the phenomenon of language retention, shift, or loss has long-term effects on their Spanish speaking students.
The additive programs, which influenced teachers” views, also depended on the type of language acquisition methods used. Additive programs with which the teachers did not agree, such as the subject-determined dual-language program also seemed to cause concern for second language attainment not seen in more established two-way programs. The bilingual education teachers interviewed showed that Spanish speakers, who later become teachers, are more influenced by their background and schooling practices, which are influenced more by the community attitudes than by their level of education.

Reform of subtractive educational practices was the central recommendation of this study with an emphasis on additive programs for Spanish speakers in this geographic area. It is also suggested that the best method by which to save Spanish heritage language from loss is for the speakers of the Spanish language to understand, through social changes and dialog, that retaining their heritage language facilitates and does not impede, but rather improves, the chances for a better life in the United States. Additive bilingual education programs need to be implemented with the teachers” pedagogical knowledge and Spanish proficiencies taken into consideration. Teachers who do not believe that keeping the students” native language and acquiring English should not become certified to teach in bilingual programs. The guiding principle of all bilingual education programs should be biliteracy.

Using Desk-Top Virtual Environments in Transitioning Students from Elementary to Middle Schools:

A Proposed Study at Prague Middle School- Prague, Oklahoma

Ina Agnew, Susan Carrillo, Danny Claborn, Vallery Feltman, Holly McVay

Oklahoma State University
Introduction

Transitioning from elementary to middle school is fraught with many challenges. Some of these challenges include the change from the traditionally taught classroom with one teacher, to multiple classes each having a separate teacher for each subject; adapting to a variety of teaching methods and styles; an increase in homework; and, sometimes, a larger, more overwhelming environment (“Transitioning from Elementary to Middle School,” 2003).

In addition to the stressors of maneuvering in an unfamiliar physical environment, students must also learn to respond to and handle social pressures and cues. Without adequate coping mechanisms (many of which can be learned), counselors and other school personnel often see students move into a high anxiety state, leading to the manifestation of physical symptoms such as headaches, stomachaches and onward to a refusal to attend school (“Middle School Marks Most Critical Time to Start Ongoing Conversations About Drug and Alcohol Use with Kids,” 2007).

Understanding how students learn, adapt to and navigate in new and unfamiliar environments is critical to the creation and implementation of an effective virtual orientation program. Discovery learning and Wayfinding provide researchers with the means to explore how students may become acclimated to the rigors of their new school without ever leaving home.

Purpose of the Research

Starting a new school can be intimidating when one is unfamiliar with the structure and environment. Adults entering into a new university often spend several days in orientation to help them become familiar with their surroundings and school procedures. If this transition is intimidating for an adult, imagine how intimidated young adults might be when they have to change environments. The transition becomes much more frightening for adolescents in the age
range of 10-13 when they switch from one traditional classroom to multiple classrooms a day.

Desk-Top Virtual Reality may be an inexpensive way to help reduce young adults’ fear of acclimating to a new environment. This proposal will review several theoretical foundations as it relates to adolescent behavior and transitioning, and how this work correlates with and complements implementing a Desk-Top Virtual Reality program for school transition.

**Problem Statement**

Studies have shown many students experience difficulties and struggles, along with anxiety which at times may be severe, when transitioning from elementary to middle school. Desk-Top Virtual Reality may be a significant resource to help ease and reduce those anxieties and stressors, as well as having the potential to make the transitional process much smoother for students, families and school staff. Even though virtual reality is well known in health care as a tool for professional education and practice, there is little literature directly relevant to the proposed research. This lack of literature reflects the view that although virtual reality is recognized as an effective vocational training tool, much research still needs to be performed to develop an explanatory theory base that is applicable to a wide variety of environments (Ausburn & Ausburn 2008).

**Significance of the Research**

The transition from elementary school to middle school raises many concerns for adolescents. They are maturing from childhood to adulthood and are about to encounter numerous environmental changes in their educational process. Some of those changes include new friends, new teachers, multiple subject integration, a variety of instructors and instructional methods and an unfamiliar building with multiple rooms which must be learned and navigated. Given the complexity of these adjustments, the school transition can be stressful and may affect the

Understanding social cognitive theory and the concept of self-efficacy is important in that it helps to explain how students reach a sense of well being. It also explains how students make adjustments from elementary to the middle school level. This transition requires students to adapt to uncomfortable situations and deal with their feelings of self concept.

Self-efficacy, as defined by Bandura, is how people’s thoughts affect how they feel, think and motivate themselves to act in certain situations (Bandura, 1994). Meaning, students’ confidence to perform tasks or be successful in the academic realm predicts their ability to achieve tasks and succeed in activities. Self-efficacy also affects other personal characteristics such as self-concept, principles, anxiety, nervousness, apprehension and self-control practices which ultimately impact their academic achievement (Pajares, F. and Grahma, L, 1998). Until students become adjusted to their environment, it is difficult for them to focus on their academic and service commitment, or to acquire new knowledge. An effort to help students adjust to their physical environment is one way educators can begin to tackle stressful situations that may impede learning. Virtual Reality (VR) is a tool that may be used to mitigate impediments to learning caused by transitional challenges. Virtual Reality has been defined by Gaddis as follows: “a computer-generated simulation of the real or imagined environment or world” (Mantovani, 2003).

Virtual Reality has been proven to be an effective tool in the learning process in many areas. When using VR, learners are engaged active participants. VR requires the users to interact— they cannot be a passive learners (Mantovani, 2003). Students/trainees have the freedom and ability to move and control the VR and engage in self-directed activities within their learning contexts. These individuals can make as many mistakes as they need to in order to
learn the concept. They can attempt the same task as many times as necessary to gain understanding (Standen, 2001). This is an active process allowing the students, or trainees, to reach and understand the world by creating their own version of reality as opposed to someone else’s. Virtual Environments are visual, and one can literally go into the impossible--explore the inside of the human body, the outskirts of space, etc.

Virtual Reality is motivating, fun, allows for collaboration and discussions, is adaptable and may even be used as a valuable tool for assessment (Mantovani, 2003). In comparison to real environments, the virtual environment provides opportunities where learning from mistakes can occur without adverse effects on pride or safety (Standen & Brown, 2005, 2006; Wilson, et al., 1997). Virtual Environments can be engineered in ways the real world cannot (Standen, 2005).

A Virtual Environment also provides educators with the ability to manipulate the environment in order to control its complexity to match the skill level of the learner, both initially and as training proceeds, and assistive scaffolding can be added or deleted from the environment as required (Standen & Brown, 2005, 2006). Further, computers are completely objective and infinitely consistent. Desk-Top Virtual reality may be one of the ways to help students adjust to their new environment, ultimately allowing students to move forward in their academic learning and social interactions. Anxiety levels decrease, self-confidence and self-assurance may increase, resulting in a well-rounded adolescent and a successful transition from elementary to the middle school.
Conceptual Framework and Research Questions

Specifically, this research proposes to answer the following questions:

1. Does the use of Desk-Top Virtual Reality reduce anxiety when navigating a new environment?

2. Was the experimental group better able to navigate the new environment through the use of Desk-Top Virtual Reality?

In order to examine these research questions, a research conceptual framework has been developed. See Figure 1 below. Along with the research questions, this framework depicts the entire process of the proposed study. The emphasis will be on how Desk-Top Virtual Reality will impact the student’s anxiety level and, ultimately, the way it affects his or her self-efficacy through transfer of knowledge and discovery learning from the virtual reality to actual navigation of the new environment. In addition, this research will examine prior research completed in this area, pros and cons of using Desk-Top Virtual Reality in the classroom and attempt to provide meaningful data on whether using virtual reality as a method of orientation will increase the student’s security when entering a new school. We contend that access to repeated Desk-Top Virtual Reality orientation, as compared to traditional orientation methods, will have a significant bearing on the learner’s anxiety level and his or her self-efficacy.

Figure 1 – Theoretical Framework for the Proposed Desk-Top Virtual Reality Enhanced Transition of Fifth to Sixth Grade Students Entering Prague Middle School
Literature Review

There are several theoretical anchors utilized in this proposal including Maslow’s hierarchy of needs, Piaget’s cognitive development, discovery learning, wayfinding and transfer of learning. Understanding how students learn, develop coping mechanisms when encountering new situations or environments, and what drives them to master these situations is critical to the creation of a virtual orientation program. These theories will be explored and discussed as to how they relate to the proposed research.

Maslow’s safety quadrant best represents adolescents’ fears about transitioning into a new school environment and structure. In the safety quadrant, Maslow defines a person’s needs as a sense of security and access to resources. Desk-Top Virtual Reality for school orientation would help address this need by acclimating adolescents to their new school environment from the safety of their own home, or deemed safe place. As young adults navigate through the desktop orientation, they will become familiar with their new surroundings without having entered into the real school, thus helping to reduce the fear of an unknown environment. Progressing through the safety quadrant will bring the child to the belonging needs quadrant and forward into the esteem needs quadrant as they enter into their new environment with the confidence of knowing their surroundings and structure.

While Maslow’s hierarchy of needs addresses what motivates students, Piaget’s cognitive development theory defines how students learn. The ultimate goal of desktop VR is to enable the students to formulate mental representations of their school environments, and to link these images when they enter into the school building for the first time, helping to reduce or even remove their fear of new surroundings. These images or schemas are blocks of knowledge such as mental representations or pictures used to guide people through unfamiliar situations.
According to McLeod, 2007, we use schemas to understand and respond to situations. By using schemas, adolescents move directly into assimilation and accommodation according to Piaget’s theory. Assimilation is the concept of applying or changing the environment so that it can be put in previous cognitive structures. Accommodation is the process of changing cognitive structures in order to accept something from the environment. Both processes are used at the same time and alternately throughout life (Huit and Hummel, 2003).

Discovery learning postulates that students learn more readily and retain more information when they are the ones pursuing facts, experimenting, and puzzling out solutions to problems. They draw from a variety of resources including their senses, past experiences, and current/existing information to arrive at their own conclusions (“Discovery Learning”). However, without oversight or instructor guidance, learners may be at a disadvantage, gathering and interpreting information, but arriving at false conclusions. The development of any type of virtual orientation program should include a facilitator component in which the facilitator may be a parent, trusted adult, or teacher.

An effective orientation program must also incorporate the means by which students will navigate (engage in wayfinding) in the virtual orientation program. According to Mark Denton, in order to develop an effective Wayfinding program, the designer must first seek to understand the visitor's perspective and what he/she needs. In relation to middle school students, this would mean the developer would need to plan the program from the students’ perspective, seeking to understand first the concerns and key issues of the student (Denton, M., 2009). Denton identified six common elements of a Wayfinding system. These components make it easier for visitors to navigate and locate where they would like to go or what to experience (Denton, M., 2009).
Similar to discovery learning is the Transfer of Training Theory, also referred to as the Transfer of Learning Theory. Transfer of training refers to the ability of an individual to take a skill and knowledge learned in one context and apply it in a separate context (Pennington, 1995). Transfer of training and its effectiveness has typically been studied in the educational arena. This research will determine if the information learned through traditional methods carries over to current needs. However, the transfer of training from a virtual reality environment to a real life experience is limited and will be discussed throughout this proposed research study.

Transfer of Learning Theory is important because transfer leads to performance change; a change that will hopefully reflect the desired training outcomes (Hutchins and Burke, 2007). In a previous study, skills learned from VR were transferable from the virtual environment to the real environment (Standen, 2001). “Additionally, the goal of transfer is the full application of newly learned knowledge and adapted skills to improve individual and organizational performance” (Song, 2008). Lim and Morris (2007) state,

From a comprehensive review of literature, Baldwin and Ford developed a training transfer construct composed of trainees’ characteristics (ability and aptitudes, personality, and motivation) and work environment variables (supportive organizational climate, discussion with supervisor, opportunity to use knowledge and skills, and post-training goal setting and feedback) that may support transfer of training. This model explains the transfer process in three phases: (1) training input factors, (2) training outcomes, and (3) conditions of transfer. Training input factors include training design, trainee characteristics, and work environment characteristics. Training outcomes refer to the amount of original learning that occurs during a training program and the retention of the learning after the training program is completed. In conditions of transfer, both the
generalization of learning to the job context and maintenance of the learned material over
a period of time on the job influence the transfer process.

For the Desk-Top Virtual Reality to be an effective training tool, the VR should be filmed in
the actual work setting (Kim, 2001). One of the primary characteristics of virtual reality is the
“trueness” of its presentation of the reality of a 3D environment and the spatial relationship of
items within it, lending itself to a more accurate and realistic experience of a complex visual
scene than would be possible with still imagery. Due to the “trueness” of the desk-top virtual
reality, students utilizing the Desk-Top VR, will be able to demonstrate thorough knowledge and
transfer of learning.

Research Design and Methods

Primarily, the approach of this research is experimental research. This type of research will
be used in order to manipulate and control assessments so as to recognize underlying processes.
This will allow the researchers to maintain control over all factors that may affect the result of an
experiment. In doing this, the researcher will attempt to determine or predict what may occur. In
conducting the research the following steps will be taken: compilation of sample subjects,
assembly of subjects, identify and control non-experimental factors, choose and create valid and
reliable instruments to assess results, perform pilot studies, establish location, time and length of
the experiment, perform the experiment, assemble the data, and analyze outcomes. There will be
a control group (students using traditional face-to-face orientation) and an experimental group
(students using Desk-Top-Virtual Reality for orientation).

Students will be placed in two groups: group one will be one-half of the sixth grade class.
Group two will be the remaining one-half of the sixth grade class. Students in the control group
will visit the school on the night of orientation and go through the standard procedures given by
the school. Students in the experimental group will be taken to the computer lab and will be guided through the desktop virtual reality of the school guided by the researchers. Students in the experimental group will access the Desk-Top Virtual Reality as many times as they wish in the allotted time. Both groups will complete the orientation approximately one week prior to the first day of school.

**Data Collection**

The target population, which will be assessed to draw conclusions, will be sixth grade students in a small rural Oklahoma school. The sample will be taken from the entire fifth grade classes at Prague Elementary School transitioning into sixth grade at Prague Middle School. In order to study the effects of Desk-Top Virtual Reality on students’ anxiety levels and navigational abilities, a virtual environment that simulates the students being present in the building will be delivered to the experimental group. Before school, the control group will proceed through the traditional face-to-face orientation provided by the school in a morning session. This orientation will have the students physically visit each classroom for approximately ten minutes for a total of about one hour.

The experimental group will be guided through the desktop virtual reality program the same afternoon and will be allowed to navigate through the building via interactive desktop virtual reality for approximately one hour. Simple random sampling is the basic sampling technique where groups of subjects (a sample), are selected for a study from a larger group (a population). Each individual is chosen entirely by chance, and each member of the population has an equal chance of being included in the sample. Every possible sample of a given size has the same chance of selection; i.e. each member of the population is equally likely to be chosen at any stage in the sampling process (Easton and McColl, 1997).
**Instruments**

Several methods such as surveys, interviews, observations, etc. will be used to collect data for this study. Since this study is a mixed method study, both qualitative and quantitative data will be collected. Qualitative data using interview questions and observations will be used to determine if the students felt the VR helped them in their navigation and reduced their stress levels. The students’ perspectives and feelings when using VR will be a very important factor in this research. Quantitative data will be gathered through surveys to statistically confirm the results of utilizing virtual reality.

**Data Analysis**

Analyzing Research Question One: Does the use of Desk-Top Virtual Reality reduce anxiety when navigating a new environment? Quantitative methods will be used to compile data through an anxiety stress level survey. Then, Research Question Two: Was the experimental group better able to navigate the new environment through the use of Desk-Top Virtual Reality? Observations through the use of a checklist will be made during the first couple of days to see how the participants navigate the building. Interviews will be conducted using random sampling from both the control group and the experimental group. An interview will be used to achieve greater depth of understanding of how students felt about the methods they used to orient themselves to the new environment. The goal of the Desk-Top Virtual Reality is to understand how the students used the VR to transfer knowledge, discover the elements of their new environment and how this affected their self-efficacy.

This research will be conducted in August of 2011 – prior to the beginning of the 2011-2012 school year. After all research has been collected and analyzed, graphs and charts will be created to analyze the results of the research, and a final report will be compiled. Limitations such as
timeframes, age, and ability to access the Desk-Top Virtual Reality program will be examined.

Further areas of investigation include examining if the VR program would be a way to eliminate the physical orientation program, to see if the VR program fills a void for parents who are unable to attend the physical orientation programs, and if the effectiveness of the VR program is impacted by the size of the facility being navigated.

EDUCATORS’ PERSPECTIVES ON CURRENT PARENT INVOLVEMENT ACTIVITIES AND PRACTICES IN K-12 SCHOOLS

Section I: Abstract

Abstract

This research studies the perceptions of K-12 educators on current parent involvement practices in their schools. Parent involvement in education is well known as important and has been linked to academic achievement; however it continues to be weak in some communities. This study contributes to the field of education by exploring current parent involvement activities that parents currently attend and those they would benefit the most. Thirty three K-12 educators completed a survey. Out of the thirty-three participants twenty-seven are employed in Los Angeles County K-12 schools. This analysis revealed that teachers believe it is important and necessary to provide more resources, services, and parent involvement activities in schools. However, they agreed and were overall dissatisfied with their current parent involvement in their schools. Educators overwhelmingly agreed that it is necessary to offer parent workshops that explicitly teach reading and homework skills. Finally, this research will provide future educational school practices, policies, and reform.
Section II: Significance of Topic

Introduction

In the United States today, approximately one in five children under 18 years of age lives in an immigrant-headed household (U.S. Census, 2000). Furthermore, an analysis conducted by the Census Bureau, the Current Population Survey (CPS) for the month of March 2000 reported the following findings. The Current Population Survey conducted by the Center for Immigration Studies indicated that 28.4 million immigrants now live in the United States, the largest number ever recorded in the nation’s history, and a 43 percent increase since 1990. As a percentage of the population, immigrants now account for more than one in 10 residents (10.4 percent), the highest percentage in 70 years. In addition, in the last few years, a good deal of attention has been focused on the dramatic increases in enrollment experienced by many school districts across the country. The Department of Education recently reported that the number of children in public schools has grown by nearly 8 million in the last two decades (U.S. Department of Education).

One of the fastest growing groups in California is the immigrant population. In ranking the states by the size of their immigrant populations California came first with 8.8 million immigrants, which accounts for 30.9 percent of the nation’s total immigrant population. Furthermore, the March 2000 Consolidated Metropolitan Statistical Areas (CMSA) reported that Los Angeles has one of the largest immigrant populations in the United States.

However, the primary concern to educators is the existing gap in the academic achievement gap between White and Latino students. Latinos are the largest minority group in the United States. Within the next twenty years, it is predicted that “the number of Latino children ages 5 to 13 will double, and by 2030 Latino students will comprise one-fourth of the
total K-12 school population” (Gibson, 2002). With this increasing population of Latino students, particularly in Los Angeles, the education of this group has grown in importance to educators in Los Angeles County School Districts. The latest 2009 California Standards Tests Scores for Los Angeles County Schools revealed that Latino students continue to struggle with reading and language arts skills; thus not graduating from high school prepared with adequate skills for college. For instance, in Los Angeles County 12% of 11th grade Latino students scored advanced in Language Arts in the 2009 CST and 19% far below basic. Their White counterparts scored 35% advanced in Language Arts in the 2009 CST and 5% far below basic (California Department of Education).

**Background**

Although the United States “No Child Left Behind Act” (NCLB 2001) makes educators primarily responsible for increasing student reading achievement, the involvement of parents are also taken into account. As a result, schools receiving Title I funds must implement programs and activities for parent involvement. According to the NCLB Act of 2001 schools must jointly develop such activities with parents and distribute the policy in order to be in compliance. There are numerous studies that have concluded that such involvement creates community partnerships and home-school connections (Epstein, 1996). However, researchers have also found that these school-centric activities do not incorporate parents’ leadership in designing school reform (Lawson, 2003; Warren, 2009; Lareau, 2000; Warren et al, 2009). By the same token, studies have been conducted to debunk the idea that “those parents just don’t care”. According to Delgado-Gaitan (1992), Quiocho & Daoud (2006) Latino parents value education because it is a means of economic mobility for their children. Such a discrepancy is worth solving because the Latino population continues to grow in the United States and educators ought to be prepared on
how to educate the Latino youth and involve parents in the educational process of their children. In this study it was hypothesized that the majority of the student population among the districts where the participants work was predominantly Latino. For this reason it is important to continue fostering parent involvement activities that will lead to uncovering ways in which parents’ behaviors and beliefs about learning will influence students’ academic achievement.

**Purpose of the Study**

Many studies have shown that there is a correlation between parent involvement and academic achievement (Epstein, 1996; Chavkin & Gonzalez, 1995). In addition, studies have found teacher-parent interaction being praised and considered valuable (Comer, 1986; and Fruchter, 1984). However, Becker and Epstein 1981, mentioned that there exists a disconnect between the desired parent-teacher interactions and actual parent-teacher interactions. Therefore, the purpose of this study is to garner K-12 educators’ perceptions of parent involvement and evaluate the current parent activities and practices their schools have in place to encourage parent involvement. This study will contribute to the field of education because it will provide insightful information regarding the parent involvement activities that are ranked as most important by educators, missing components of parent practices, and recommend future research and educational practices.

**Section III: Literature Review**

**Parent Involvement**

It is needless to say that the involvement of parents in students’ education is vital for their achievement and success. There are federal, state, and local mandates that require schools to jointly create parent involvement activities and partnerships (NCLB, 2001). Furthermore, A Nation At Risk (1983), published by the National Commission on Education had a strong impact
on parental involvement concerns. Latinos comprised about 11 percent of the student population and are expected to increase to 28 percent by 2020 (U.S. Census, 2000). In other words, as the demographics continue to change, our classrooms will significantly include Latino youth. Although, Latino parents have shown interest and studies indicate that they value education (Delgado-Gaitan, 1990, 1992; Delpit, 1996), many of them are still not sure how to get involved. In her book, Other People’s Children, Delpit mentions that “school personnel fail to understand that if the parents were members of the culture of power and lived by its rules and codes, then they would transmit those codes to their children (Delpit, 1996)”. Delgado-Gaitan (1990) found that Mexican American parents in the Portillo School District in California were also similar. She concluded that the successful participation of parents “is dependent on the ability of the schools to incorporate the parents and the culture of the home as an integral part of the school instruction plan.” This is what Delpit would refer to as keeping the Heritage way while learning Formal English. However, many times parents face obstacles that make it more difficult for them to be involved in their children’s schools. Some of these barriers may include the lack of proficiency with the English language, little familiarity with the American educational system, and demanding work schedules (Chavkin, & Williams, 1987). Hoover-Dempsey and Sandler (1995) attributed such low levels of school-centric parent involvement to challenges associated with living in poverty.

**Literacy Programs**

Parents who get involved in literacy programs can become more effective and gain valuable resources. Epstein (1996) has developed six different types of parent involvement that have proved to be beneficial in creating family and community partnerships. One of the school’s goals is to promote parent involvement activities by engaging families in literacy events. In
these family literacy events the parents who participate will gain or enhance their reading strategies and tools which they can continue to implement with their children at home.

One strategy that schools have used to improve parent involvement is the use of parent tutoring in reading. One study by Smith, Stoner, Shian & Good, (2000) investigated a parent tutoring program in reading and its impact on student reading achievement. They compared the use of literature books with the use of classroom basal reading materials to determine which would have a greater impact on student achievement. The study found, however, that no significant changes occurred with either program. However, the parents, teachers, and students involved in the study indicated that they believed the parent tutoring program was worthwhile. Studies, such as this one, indicate that although mixed results have been found in literacy programs, parents do demonstrate interest in being involved in their children’s education.

Social Learning Theory

According to Vygotsky (1978) social interaction plays an important role in the development of the learning process. One important aspect of his theory is the zone of proximal development. The zone of proximal development is defined as the learning that can be achieved as a result of having adult assistance. This type of learning is beyond what the child can attain on his/her own. Building on Vygotsky’s findings, Bandura further developed the idea of social learning. According to Bandura’s findings children are more likely to imitate and copy behaviors modeled by adults. This phenomenon was more pronounced when the adults were their parents. Other researchers found that this modeling effect also occurs towards parent values in education (Marchant, Paulson, and Rothlisberg, 2001). This model reflects that when parents model behaviors that are consistent with the valuing of education the children imitate the behavior.
Most people learn by observing models (Bandura, 1977). Bandura claims that children learn through observation. In his famous Bobo doll study, Bandura et al. (1961) showed how children were able to learn and imitate the behavior they observed. In this experiment children observed adults interacting with a doll, Bandura found that the children tended to imitate the behaviors of the adults they observed.

A model created by Bandura (1977), Social Learning Theory, helps one to understand that anyone can learn observationally through modeling. As a result, parents who are engaged and involved in school activities will gather ideas and learn new skills to later transmit them to their own kids. The parents in turn will serve as models to their children at home.

While the definition of parent involvement might vary from family to family, studies have shown that parents that read with their children perform better in school. Vygotsky emphasizes the importance of having a “more able guide” model reading as the zone of proximal development (Vygotsky, 1978). In addition, for one person to be able to acquire new knowledge a prominent model displaying the desired behavior must be present. In other words, observational learning and social modeling in human learning takes place by following the modeling process (Bandura, 1977).

**Theoretical Rationale**

Abundant and extant literature on the benefits of parent involvement is available; such benefits include improvement in academic achievement, encourage learning at home, better attendance, higher graduation rates, and good behavior (Epstein, 2001; Hoover-Dempsey & Sandler, 1995; Chavkin, 1993). However, parent involvement might have different meanings to educators and parents. In a traditional parent involvement context it examines the scope of school-centric parent involvement activities which are structured and defined for parents by
schools. In many instances the schools have their own agendas and parents have very little input, power, or influence over school decision-making processes especially in low socioeconomic schools.

In his article, School-Family Relations in Context: Parent and Teacher Perceptions of Parent Involvement, Lawson found that parents viewed parent involvement as a desperate fight for their children’s lives and futures. One of the parents said:

You know, most of us, we’re concerned with what’s gonna happen to these kids after they leave school each day. I mean, some of us are scraping to put food on the table, clothes on their backs. You know, keeping kids off of the street corner. That’s our job, you know (Lawson, 2003).

Even though teachers’ parent involvement responses varied Lawson categorized their responses as either school based or home based concerns. One of the teachers explained, “Parent involvement, in my mind, is having parents who are interested in their child’s education and are willing to cooperate with the school.” (Lawson, 2003). Consequently, Quiocho and Daoud found recurring parental involvement themes from teacher interviews in a case study. They reported that teachers believed Latino parents were unreliable and refused to volunteer in the classroom, parents did not support the school’s homework policy, and Latino parents did not care about schooling. On the other hand parents reported that their primary concern was help for their children and themselves, learn academic content, improve communication, and want to be informed about the work their children are doing. It is interesting to note that besides the dissenting views between parents and educators they both feel that it is important for both parties to be partners in learning (Quiocho & Daoud, 2006).

Needless to mention misunderstanding and conflict emerges when educators and parents have different, perhaps competing, perceptions of the meanings and functions of parent involvement (Lightfoot, 1978). In short, these conflicting views are hypothesized to frame discontinuities, disconnects, and blaming cycles between families and schools that are hurtful to
children, families, and teachers alike (Lightfoot, 1978). In fact, Waller, refers to the parent-teacher relationship as ‘natural enemies.’ Each group holds different concerns for the child. The teachers have a universalistic concern, having to take responsibility for all of the children in the class, and parents hold a particularistic concern, having to be responsible with a single child in a class (Waller, 1932).

**Section IV: Research Questions/Hypothesis**

**Research Questions**

This research will investigate the following questions. What are the perceptions of K-12 educators on parent involvement? Which parent activities are important to offer to parents? Is there a disconnect between educators’ perspectives and parent involvement in schools? What are the contributing factors for the lack of parent involvement in schools? How can educators improve parent involvement? This study seeks to identify some key elements of parent involvement. It was hypothesized that the majority of the student population in which the participants work consisted of Latino students. With the increasing changes in demographics that are mentioned in the previous section American institutions, citizens, and educators must not resist to the changes that must occur in order to accommodate the changing make-up of the United States. For this reason and the alarming statistics that Latino students continue to depict this study focuses on Latino populations.

**Definition of Terms**

Before we continue it is important to define the terms that will appear in this study.

- In this study educators are referred to K-12 teachers, out-of-the classroom teachers such as coaches, coordinators, or counselors, and administrators such as assistant principals and principals in K-12 schools.
For the purpose of this study Latino is referred to the dominant minority ethnic group in Los Angeles.

In this study parent involvement activities are defined as the avenue by which parents are brought to participate in their children’s schooling. These could be formal or informal events for the purpose of involving the parents (Delgado-Gaitan, 1991).

Section V: Methodology

Sample

This study used a survey to collect its data at Claremont Graduate University (CGU) which is located in Claremont, California. Claremont Graduate University is comprised of nine graduate programs, which serves approximately 2,261 students, 35% who are White, and 12% who are Hispanic, 9% who are Asian, 6% who are Black, and 21% who indicated Other. Fifty-two percent of the students are women.

The sample for this study consists of 33 students who are taking doctoral courses in the Education Department. Although the survey was distributed to 43 students, only 33 students met the criteria. The criteria for participation in this study was as follows: an educator either as a teacher, out-of-a classroom teacher, or administrator in a K-12 school. The purpose of this study was to gather information about educators’ perspectives on parent involvement in their respective schools. All of the students who met the criteria were asked to complete a survey that took approximately ten minutes during one of their evening or Saturday courses at CGU. Students’ participation was voluntary and a professor distributed and collected the surveys at end of his/her class session. The professor then returned the surveys to the researcher. The majority of the sample is comprised of women which constitutes for 82% and 18% men. The participants' age ranges from 25 to 55 or older. In this study, 66% of the participants reported to
be between the ages of 25 to 39 years old and 34% reported to be between the ages of 40 or older.

The method used to find participants was through a notification (Appendix B) sent to all of the professors who teach evenings or Saturday post-graduate courses in the Education Department in CGU and include themes and topics about salient issues in the history of urban education and/or teaching and pedagogical practices for K-12 educators. The letter informed the professors of the purpose of the study and criteria to participate in this study. The researcher provided the professors with surveys for all of the students in their classes, but only selected the ones that met the criteria, this equals a 77% response rate. In order to control for selective bias the participants were given the survey by their professor in class and gave it back to him/her. Then the researcher picked up the surveys from the professor or at a designated place.

K-12 educators such as teacher, out-of-the classroom teachers, and/or administrators were selected for this study for the following reasons. One of the reasons for selecting K-12 educators is because these are the primary group of people who are responsible and are in direct contact with parents on a daily basis in our K-12 schools. Further, the researcher specifically selected K-12 educators because they are the most knowledgeable in regards to the type of parent involvement workshops and activities that are present in their schools.

**Instrumentation**

The data for this study was based on a survey with 32 items (Appendix A). There were 21 Likert Scale questions in which 1 = Strongly Disagree, 2 = Disagree, 3 = Agree, and 4 = Strongly Agree. The survey included questions about the perceptions on parent involvement in K-12 schools. It asked the participants to rate the importance of parent involvement workshops and information, perceptions on parent involvement, and parent involvement workshop/activities.
attendance on a 4-point scale (1 = strongly disagree to 4 = strongly agree). The participants
surveyed were asked twenty one questions about workshops, information, and their perspectives
about parent involvement. There were 11 demographic questions and they were coded as
follows.

Demographics Variables

1. **Position/Title:** The position/title of the participants was coded as a dichotomous variable. The variables of teacher, out-of-the classroom teacher, and administrator had the value of 1 for yes and 2 for no.

2. **Parent Involvement Workshops/Activities/Events:** The workshops/activities/events that are present in the participants’ schools were coded as a dichotomous variable. The variables of Annual Parent Workshops, Open House, Parent Conferences, Parent Center Workshops, Family Math/Literacy Nights, and Advisory Committee Meetings had the value of 1 for yes and 2 for no.

3. **Gender:** Females were coded as 1 and Males were coded as 2.

4. **Age:** Under 25 was coded as 1, 25-29 years of age was coded as 2, 30-34 years of age was coded as 3, 35-39 years of age was coded as 4, 40-44 years of age was coded as 5, 45-49 years of age was coded as 6, 50-54 years of age was coded as 7, 55 or older years of age was coded as 8.

5. **Ethnicity of the majority of students in the school:** Latino or Hispanic was coded as 1, Black or African American was coded as 2, White was coded as 3, and Asian was coded as 4. These variables were also coded as dichotomous. The converted dichotomous variable had the value of 1 for yes and 2 for no.

6. **Type of School:** The types of schools the participants work in were coded as a dichotomous variable. The variables of Program Improvement, Title I, High Performing, Distinguished, Magnet, and Charter had the value of 1 for yes and 2 for no.

7. **Type of District:** Urban schools were coded as 1, Suburban schools were coded as 2, and Rural schools were coded as 3.

8. **School Level:** Elementary schools were coded as 1, Middle/Intermediate Schools were coded as 2, and High Schools were coded as 3.

9. **Years as an Educator:** These years were coded as the number of years the respondents reported.

10. **District:** The participants’ districts were coded as the name they provided.
11. **Students in the District**: These numbers were coded as the number of students in the district the respondents reported.

In order to ensure that the instrument measures what it intends to measure, the survey was evaluated by an expert.

**Procedures**

Participants were selected from a convenience sample recruited using the university’s doctoral list of classes for the Spring. The researcher sent an informational letter to professors and students in post-graduate courses who take evenings or Saturday classes in the Education Department which subject matter includes the history of urban education and/or teaching and pedagogical practices for K-12 educators. If the students met the criteria they voluntarily took the survey. The survey did not collect names, or any personal information that would in any case identify their identity; thus protecting the confidentiality and anonymity of the participants.

**Measures**

For the purpose of this study, it is necessary to operationalize three themes that emerged from the data: parent involvement workshops and information, perceptions of K-12 educators on parent involvement, and attendance of parent involvement workshops/activities. A detailed description of emergent themes used in the analyses follows.

*Parent involvement workshops and information.* As Table 1 indicates, the researcher identified seven measures that dealt with inquiring the participants’ schools level of parent workshops occurrence and the type of information provided to parents in these workshops.

*Perceptions of K-12 educators on parent involvement.* Participants were asked to report and rate their level of leadership in designing parent involvement workshops/activities, their desire to facilitate parent workshops, and perceptions of parent involvement activities.

*Attendance of parent involvement workshops/activities.* As Table 3 shows, the participants were asked three questions regarding the best times for parents to attend workshops, during the day or evenings and if childcare is provided during these times.
Section VI: Results

Descriptive Statistics

The data in this study measured K-12 educators’ perspectives and perceptions of school-designed parent involvement workshops and its importance of offering such workshops to the parents in their schools. The participants completed a survey during one of their post-graduate courses at CGU. After the data was tabulated some themes began to emerge: parent involvement workshops and information, perceptions of K-12 educators on parent involvement, and attendance of parent involvement workshops/activities. These items were measured by using a Likert 4-point scale, 1 = strongly disagree 4 = strongly agree (Appendix A). In addition, the participants reported demographic information.

Table 1 shows the mean scores for the seven items in which participants rated the importance of providing certain type of parent workshops and information. The participants agreed that it was important (M = 3.66, SD = .658) to offer workshops in which parents explore career choices for their children. The participants also felt that it is necessary to have workshops that discuss students with special needs (M = 3.61, SD = .589). The participants did not agree (M = 2.15, SD = .489) with the statement that advisory committee meetings do not provide relevant and meaningful information to parents. Although, the participants on average agreed (M =3.11) with the overall statements pertaining with the importance of parent involvement workshops, they stated a mean of 2.71 for having someone as the primary contact person for the parents. This indicates that not every participant’s school has a central person or place where parents can bond, create relationships, and bridge ties among themselves and other staff in the schools.
Table 2 shows the mean scores for the eleven items in which participants rated their perceptions and knowledge of parent workshops offered in their schools. These figures further corroborated with the preponderance of evidence found in the literature review that both parents and educators agree that there is a need to continue encouraging parent involvement and available resources to parents. The participants agree (M = 3.80, SD = .402) that there is a need to see more available parents support, resources and services. In addition, they agreed (M = 3.28, SD = .902) that it is the school’s job to teach parents how to be involved in their child’s classrooms. Additionally, the K-12 educators placed an emphasis and agreed (M = 3, SD = .597) that it is necessary to provide parent workshops in which parents gather ideas on how to help their children with homework. Although, the participants felt that there was a need and that it is important to have more resources available for parents they disagree (M = 2.25, SD = .786) that parents in their school volunteer in their child’s classrooms. Further, overall the participants said they were not satisfied (M= 2.23, SD=.889) with the level of parent involvement in their schools.

Table 3 shows the mean scores for the three items in which participants believe are the best time for parent workshop/activities attendance. Many times schools schedule workshops during the day, thus enabling working parents to participate at parent events. The participants were asked to rate when parents are inclined to attend more workshops. The results show that parents are more likely to attend workshops during the evenings (M= 3.00, SD = .632) than during the day (M=2.05, SD=.887). In addition, it is important to provide childcare for parents, but not all of the participants’ schools provide such service to their parents (M=2.95, SD = .864).

In this study 61% of the participants reported they were teachers, 12% were out-of-the-classroom, and 27% were administrators. In addition, 82% of these educators are females and 18% are males. The participants were asked to check all of the different parent involvement school-designed workshops their schools offer. They indicated the following results: 95% hold advisory committee meetings, 91% shared to have open house, 86% have parent conferences, 48% indicated having annual parent workshop, 38% have parent center workshops, and out of the participants 33% have family math/literacy nights.

As Table 6 indicates the participants reported that the majority of the students in their schools were Latino 76%, followed by White 19%, and out of the participants 5% said Asian was the majority of the population in their schools. In addition, the average amount of students in these participants’ schools was 1654. In this study, 50% of the educators work in high schools, 40% work in elementary schools, and 10% work in middle schools. Further, participants were asked to indicate which type of category best described their school. They reported the following: 62% Title I, 38% Program Improvement, 29% Distinguished, 19% High Performing, 5% Magnet, and 5% Charter. On average the participants have been K-12 educators for 14 years.

Section VII: Discussion

Interpretations

In this study the perspectives of K-12 educators on parent involvement activities were investigated. The results of this study indicate that educators agree in the importance of offering resources, services, and support for parent involvement in schools. However, educators are not highly satisfied with the overall current parent involvement in their schools.

The results indicate that participants believe it is important for schools to offer workshops that teach parents how to read to their kids. In addition, participants believed that it was very important and necessary to provide workshops in which parents learn how to help their kids with homework. This is consistent with research that has found that implicitly teaching reading skills to parents improves scores. Cotton (2000) found that the most impressive study results have been from programs which involve parents in reading with children, supporting their work on homework assignments, or tutoring them using material and instructions provided by teachers. This study also shows that participants believe and agreed that it is important and the school’s job to teach parents how to be involved in their child’s schooling.

Recommendations

Delgado-Gaitan (1991) asserts that “the majority of parents fail to participate in school interactions for reasons such as language, values, and practices that differ from the white mainstream group” (p. 26). It is recommended that schools continue to provide services in the parents’ native language and make them feel welcome when they visit schools. In addition, parent involvement activities should seek to understand parents’ cultures and values. Educators ought to view students and their parents who come from different cultures as gifts and strengths.
Delgado-Gaitan (1991) reports that “parents who are knowledgeable about the schools’ expectations and the ways in which the schools operate are better advocates for their children than parents who lack such skills” (p.21).

It is recommended that educators draw on the participants’ funds of knowledge which is defined as the participants’ meaningful historical and cultural background knowledge (González, N., Moll, L., and Amanti, C. 2005) to design parent involvement activities. In addition, schools should continue offering parent involvement activities which explicitly teach parents skills such as reading with their kids so that they can in turn transmit these skills to their children at home. As a result these parent involvement activities will be taught through the use of the modeling process. The modeling process consists of paying attention, ability to store information, perform the behavior observed, and be motivated to imitate the behavior that was observed (Bandura, 1977).

**Limitations of Study**

In this study the researcher studied the current perceptions of K-12 educators on current parent involvement activities in their schools. While this study was small in scope, it provides considerable evidence that supports other existing research that the prevailing current approaches of parent involvement needs to be challenged and expand the possibilities to include other forms of parent involvement.

There are limitations to this study that provide directions for future research. First, the design and small sample of this study precludes conclusions about its effects of parent involvement; thus not able to generalize its results to other populations. In addition, future longitudinal designs that include multiple measures of parent involvement will allow exploration of parent-teacher relations over time. Such analysis will illuminate strategies that were
implemented and worked and different patterns will emerge. Further, these findings pertain to a specific small sample of K-12 educators taking post-graduate courses, expanding this research to study more educators at multiple sites from different geographic locations will generate a better understanding of current parent involvement activities in schools.

In spite of all of the limitations that this study encountered the researcher decided to use this research design. After collecting and analyzing the data, the researcher is able to use the outcomes to assess current parent involvement activities in schools and use these data to continue adding and seeking ways to further develop parent involvement practices for K-12 schools.

**Future Research**

Although parent involvement is positively linked to school success, many parents are not as involved in schooling as educators would like. It is not only imperative to continue exploring strategies for increasing parent involvement, but also what are the many factors that allows for such discrepancies. Future research that explores the differences of parent involvement or family-school relationships between the working-class and upper-middle-class communities needs to be conducted.

Furthermore, scholars ought to continue investigating the causes that involved and not involved parents have for attending or not attending parent activities at schools. Future research might include exploring the obstacles and barriers that might prevent parent involvement in schools. In search of better effective strategies to involve parents in school or in the community ethnographic interviews are needed to include both parents (ostensibly “uninvolved” and “involved” parents) and teachers’ perceptions on parent involvement worldviews. Educators will benefit from understanding the underpinnings that prevent or make it harder for parents to be
involved or not involved in schools. Finally, future possible research studies should challenge
the traditional parent involvement methods and investigate if other models such as community-
based organizations improve parent involvement in schools.

**Conclusion**

Educators and policymakers continue to scrutinize and analyze students’ achievement
scores. Alarmingly, the results indicate that there is still a lot of work to do in order to close the
achievement gap among Latino students and their counter parts. Data depict the drop out rates
that affect many of the Latino students in public urban high schools. For this reason, it is
imperative to continue to focus, implement, and involve parents in early grades’ literacy
programs so that achievement scores may increase. Many studies have shown that parent
attitudes towards reading and parent involvement may change when they are engaged and
involved in their child’s education. This study investigated the perspectives of K-12 educators
on parent involvement and rated which parent involvement activities are important to offer to
parents.

In addition, the study purports that even though the results might not be generalizable, the
study will be able to provide new insights beneficial to educators who are the primary actors in
designing and implementing parent involvement activities in K-12 schools. This study provides
a point of departure for the multiple opportunities that exist for searching and exploring the best
curriculum and parent involvement activities to empower and engage parents in K-12 schools.

Dear Prospective Participant,

My name is Veronica Gonzalez. Currently I am a graduate student at Claremont Graduate University working on my Ph.D. in Urban Education. One assignment for my quantitative analysis class is to design and conduct a research study. The purpose of this study is to measure K-12 teachers and administrators perspectives on parent involvement. If you agree to be in this study, I will ask you to answer questions on a survey about your school’s parent involvement.

I expect your participation to take about 10 minutes to complete. I expect this research to benefit the evaluation of parent involvement programs. To ensure that the information you provide is comprehensive and includes the input and perspectives of essential persons like yourself please answer all of the questions on the survey. However, if you rather not answer a question, you may leave it blank.

I will use the information I obtain from the survey to report themes that emerged from the data. Your responses will not be identified with you in any way and you will not be named in any report. In other words, your individual privacy will be maintained.

If you have any questions or would like additional information about this research, please contact me at veronica.gonzalez@cgu.edu. Thank you for your participation.

Sincerely,

Veronica V. Gonzalez, M.A.
Ph.D. Student in Educational Studies
Claremont Graduate University

Abstract

Students’ cultural association may affect the use of learning and study strategies. So this study aims to explore the effect of cultural differences on students’ strategic dispensation. The main objectives of the study are to investigate the study strategies Pakistani students employ while learning and to compare them with those employed by American students. Data on Learning and Study Strategies Inventory (LASSI) was collected from 465 university students in Pakistan. Independent sample t-test was applied to compare their performance on the LASSI scale with already established American norms. Analysis of data reveals that in only two out of ten subscales of the inventory, Pakistani students’ performance was better than American students. In rest of eight subscales, American students performed better than their Pakistani counterparts. This difference was significant for seven subscales which are anxiety, attitude, motivation, self testing, test strategies, time management and selecting main idea. The study implies to administer the LAASI on a large sample of Pakistani students to make a more convincing comparison.

Key words: Learning and study strategies, cultural diversity, norm.

Introduction

Efficient and effective use of learning strategies makes academic success possible. Carrel, Gajdusek and Wise (2001) define strategies as the acts deliberately selected to attain certain goals. Vermunt and Vermetten (2004) assert that structures of learning pattern may be affected by cultural differences in academic practices. Most of the researchers agree that cultural specificity should be considered when investigating students’ learning strategies (Braten & Olaussen, 2000; Richardson, 2005) as it deems indispensable to establish the generalizability of hypothetical frames for learning built up inside cognitive psychology (Braten & Olaussen, 1998). Pillay, Purdie and Boulton-Lewis (2000) describes that “as we move towards a "global village"
concept, the need for cross-cultural understanding of the relationships between conceptions of
learning and the use of learning strategies is becoming increasingly important because of the
changing cultural mix of our classrooms and society at large” (p.65).

The learning strategies which American students employ have been studied extensively
during the last thirty years (e.g., Weinstein & Mayer 1986; Pintrich, Smith, Garcia &
McKeachie, 1991; Braten & Olaussen, 1998; Iqbal, 2005) while strategic dispensation adopted
by students studying in other cultures especially in Asia has not been given much consideration.
This is one of the reasons to investigate what learning strategy profiles Pakistani university
students have, and how do their profiles compare with American students’ profiles?

A few researchers have attempted to explore this phenomenon in different cultures. For instance,
Braten and Olaussen (1998) investigated the learning strategies of 173 freshmen studying in
Norway and compared the results with the mean scores of American students. They found
incredible similarities between the two profiles with the exception of motivation subscale. In
another study Bråten and Olaussen (2000) further explored the reasons behind students’ low
score on motivation subscale by administering only LAASI motivation subscale on 15 students
and then interviewing them. They found their students to be autonomous and intrinsically
motivated. Learning strategies used by students of two groups, European Americans and Asian
Americans were investigated by Schommer-Aikins and Easter (2008). They found that difference
in use of learning strategies between both groups was significant on anxiety, motivation,
information processing, selecting main ideas and test strategies.

Olivarez, Tallent-Runnels, and Lin (1996) reported different learning strategy profiles of
Hispanic and American students. Alexander, Murphy and Guan (1998) explored the learning
strategies of Asian and American students. They administered LASSI-HS to 139 Singaporean
and 197 American grade 9 students. They reported almost similar profiles of both the groups.
Nenniger (1989) as cited in Braten and Olaussen (1998) has described that students studying in
German and Swiss universities employ learning strategies more than American students by
showing the only difference on motivation subscale. Pillay et al. (2000) administered MSLQ to
222 Australia and168 Malaysian high school students to investigate what learning strategies they
use. They found that Malaysian students scored high as compared to Australian students regarding use of learning strategies.

Iqbal (2005) investigated learning strategies of Pakistani students studying in American Universities and compared their scores with American students’ scores on LASSI scales. He administered LASSI scale on 73 students. He found that Pakistani students scored better than Americans on four scales which were motivation, information processing, study aids, and self testing. The significant difference was on three scales. Pakistani students scored significantly higher score on the study aids scale and American students scored higher on test taking strategies and attitude scales. Iqbal, Sohail, and Shahzad (2010) using the same instrument on Pakistani university students found that self testing, information processing and use of support techniques and materials were the sub scales on which the students’ score was between 75th and the 50th percentile. Their score was below 50th percentile on remaining seven subscales. Faculty wise comparison revealed a statistically significant difference only on self testing subscale.

The present study is an attempt to enrich the existing literature on persuasion of cultural association with students’ use of learning strategies. This study aims to examine the learning strategy profiles of Pakistani students and to compare these profiles with the profiles of American college students.

**Method and Procedure**

**Sample**

465 students from a metropolitan university in Pakistan, studying in different faculties, were selected as sample of the study.

**Instrument**

2nd edition of LASSI (Weinstein, Palmer, & Shulte, 2002) was adopted to collect data for the study. There are ten scales in this inventory. The scales are information processing (INF), selecting main ideas (SMI), attitude (ATT), motivation (MOT), anxiety (ANX), concentration (CON), time management (TMT), test strategies (STS), self testing (SFT) and study aids (STA). Standardized scores and national norms (USA) are given in the manual for this instrument. There
are eight items on each scale. To get total score for each scale students’ responses were added up. As there are 8 items on each scale developed on five point scale so the minimum score against each scale may be documented 8 while maximum as 40. The range of coefficient Alpha is from .68-.82.

Analysis of data

Mean score was calculated for all the scales. Independent sample t-test was applied to compare Pakistani students’ profile with that of American students.

Results

![Comparison of Pakistani and American students’ mean score on LASSI scales](image)

Figure 1. Comparison of Pakistani and American students’ mean score on LASSI scales

Pakistani students scored higher on self testing and study aids whereas American students performed better on rest of the eight scales i.e. anxiety, attitude, concentration, information processing, motivation, selecting main idea, time management and test strategies.
Table 1. Comparison of Pakistani and American students’ scores on LASSI scales

**p < .01, * p < .05

Results of table 1 reveal that Pakistani students scored better than their American counterparts on two sub scales i.e. self testing and study aids while it is the other way around on eight subscales. This difference is significant for seven subscales which are anxiety, attitude, motivation, self testing, test strategies, time management and selecting main idea. The difference is significant in favor of Pakistani students on only self testing sub scale. On rest of the six subscales American students have reported using more strategies.

**Discussion**

Understanding students’ use of learning and study strategies is indispensable for the implementation of an appropriate instructional intervention (Weinstein, 1994) as “teaching is only half of the story in the college classroom; helping students understand and more efficiently use their learning strategies recognizes the importance of this other half of the equation”
(Pintrich & Johnson, 1990). Use of learning and study strategies may be linked with students’ cultural association. Consequently, it is imperative to discover the strategies which students from different cultures employ to facilitate their academic needs fittingly. Following the American rules of strategy teaching unsuspectingly, we may not be able to fulfill students’ needs in a different cultural context (Braten & Olaussen, 1998). That is why this study aims at exploring the learning and study strategies used by Pakistani students to avoid this undue importation and draw the principles of strategy instruction accordingly.

The findings from this study showed the difference between learning and study strategy profiles of Pakistani university students and American students on LASSI scales. Pakistani students scored lower on eight of the ten subscales of LASSI which are anxiety, attitude, concentration, information processing, motivation, selecting main idea, time management and test strategies. They scored higher only on two subscales i.e. self testing and study aids. Pakistani university students are better on self testing which reflects their ability to review and observe the methods to comprehend in order to establish the level of perception of learnt information. They are also better on study aid subscale which indicates their ability to make resources helpful for obtaining information. This difference is significant for seven subscales which are attitude, anxiety, motivation, test strategies, self testing, time management and selecting main idea. The difference is significant in favor of Pakistani students on only self testing subscale. On rest of the six subscales American students have reported using more strategies.

On the other extreme, German and Swiss students overall have been found to report more use of learning strategies than American students except motivation (Nenniger, 1989 as cited in Braten & Olaussen, 1998). Consistent with this, Braten and Olaussen (1998) in Norwegian perspective found a large difference in the favor of American students on the Motivation subscale of the LASSI. These countries allocate a better part of their budget for education and education for masses is available over. As compare to this Pakistan is spending less than 2% of its GDP on education which is less than UNESCO’s recommendation (i.e. Minimum of 4%) (Ghani, 2008). Purdie, Hattie, and Douglas (1996) mentioned that Asian students are less assertive, less willing to ask questions in the classrooms and to explore options of thinking. They are mostly used to learn through memorization. Pell, Iqbal and Sohail (2010) also indicated that even science at elementary level is being learnt in Pakistan through rote learning. Pakistani
education system is not compatible with that of advanced countries where the students are taught learning and study strategies in most of the schools and universities. Pakistani students are not made aware of these strategies at any stage. Hence, they do use them but unintentionally and improperly.

It is recommended that learning and study strategies should be included in teacher education curriculum so that teachers could assess students’ cognitive processes. Resultantly, it would help diagnose student’ weaknesses and adopt remedial measures to make them strategic, independent and self regulated learners. Secondly, students should be made aware of these strategies at an earlier stage so that they could monitor and control their own learning. These strategies should be inculcated in their minds in such a way that they “become generated and applied automatically as skills” (Carrel, 2001, p.230). The study implies to administer the LAASI on a large sample of Pakistani students to make a more valid comparison.

From Novice to Expert: Efficient, Effective Online Course Development

Description of the Trend

A national trend among colleges and universities in the United States reflects the increasing use of the Internet as a means for delivery of instruction via online courses. The popularity of online instruction as an alternative to the traditional classroom is evidenced by record numbers of students who are enrolled in online courses. A five-year study supported by the Alfred P. Sloan Foundation defines online courses as “those in which at least 80 percent of the course content is delivered online” (p. 4). The report reveals that nearly 3.5 million students in higher education participated in online instruction in the fall of 2006. This represents a 9.7 percent rate of growth in online course enrollment as compared to a 1.5 percent growth in the total population of students in colleges and universities (Allen & Seaman, 2007). While the percentage of students enrolled in at least one online course in the fall of 2002 was only 9.7, enrollments in the fall of 2006 reached a high of 19.8 percent (p. 1). As evidenced by these figures, the trend toward the increased use of online instruction is clear.

Two- and four-year institutions reported increased student accessibility as the primary reason for increased offerings of online courses, the rate of increase varies according to institutional type (Allen & Seaman, 2007). Two-year associate degree granting institutions comprise over 54 percent of all online student enrollments with a 24 percent annual growth rate. In contrast, baccalaureate degree granting institutions have a sluggish growth rate of only 8 percent. All other types of institutions report growth rates that are only slightly lower than those of associate degree granting institutions (pp. 6-7).
Such exponential growth is unlikely to be sustained for an extended period. According to Allen & Seaman (2007) three quarters of all higher education institutions already offer online courses of some type, and the remaining one quarter report no plans to incorporate online learning in their long-range plans. As institutions reach levels of engagement in online course offerings that are commensurate with their long-term strategy plans, growth will begin to slow.

**Implications for Higher Education**

While online education is clearly an established trend in colleges and universities in America, one must question the quality of education provided by this form of instruction. Even though delivery of content through online instruction provides instant access to massive amounts of information from online sources such as libraries, museums, and computerized data bases, the cost to the time-honored principles of the collegiate ideal and development of the whole individual may be great. In order to effectively evaluate the implications of online instruction one must return to the basic mission of colleges and universities in the United States.

The collegiate ideal reflects a rich tradition in higher education through which colleges and universities have the distinct responsibility to educate the whole person. This implies that true education comes from intentional development of all areas of learning including cognitive, physical and social/emotional domains. The college, writes Alexander Meiklejohn (as cited in Goodchild, 1999) is a “spirit, a way of life, a manner of being” with a purpose designed to “start men on the way to learning” (p. 7). Accordingly, the collegiate experience is a time-
honored tradition of relationship building. In this manner students and teachers work together to find answers, discover new information, solve problems, and resolve conflicts.

When considering the role of online instruction in today’s colleges and universities, one must reflect upon the outcomes that are to be most highly valued. Obviously, the simple transfer of knowledge is not sufficient for the education of the whole individual. The inclusive goal must be the development of “interpersonal skills, group process skills, moral or ethical development, individual and social responsibility” in addition to cognitive skills (Chickering and Kytle, 1999, p. 113). If scholars accept these interpretations of the goal of higher education, they must also ask how such ideals are being realized through use of computerized online instruction. Over a century before the birth of the word-wide-web, Newman (1854) brilliantly embraced the value of face-to-face learning when he observed that no book could convey the meanings that people derive from looking one another in the eyes as they exchange ideas in everyday conversations. Without a doubt, human discourse, language and communication are more than the exchange of words; rather, they are comprised of a combination of body language, intonation, and facial expression all working together to allow true expression and transference of concepts.

In the rush to embrace technology and its unlimited possibilities for enhancing instruction, institutions must consider the rich tradition and value of face-to-face interaction between teacher and learner that develops when students and teacher interact with one another on a personal basis. The challenge for the online educator is to use available technology to develop courses that encourage discussion participants to engage in discourse, reflection, and the sharing of ideas.
Regardless of the challenge to the collegiate ideal, the trend of offering web-based or online instruction in some form by most institutions of higher learning in America today is well established. Easy access to a wide variety of courses is one of the most obvious benefits of this form of instruction. In addition, classes can be accessed at all times, so students can participate according to their own personal time restraints and preferences. Further, student evaluations of their online educational experiences are generally quite favorable (Singh, 2006). With so many positive aspects, one might assume that online education is a panacea for the fast and highly complicated life-styles of today’s college student, but other implications related to web-based delivery of courses must be considered.

Important implications for the online instructor are the characteristics and needs of the typical online learner. These traits often differ from those of the traditional classroom student (Sieber, 2005). For example, online students are frequently those with more professional experience, plus they are more likely to have families and careers. The goal for many of these students is not to obtain a degree, but to acquire the competence and knowledge necessary to rise within their professions. For these reasons, the online instructor must monitor quality from both an academic perspective and a professional one. Because a large proportion of these learners do have additional responsibilities, their academic performance is sometimes influenced by their simultaneous obligations. This creates an additional challenge for the instructor to find a balance between maintaining high standards and providing a degree of flexibility in view of the additional responsibilities these students face (Jobin & Leh, 2002).

Another consideration for student success in online education includes technological prerequisites for enrollment. These should include a minimum level of technological expertise
along with student access to the internet and other resources such as basic hardware and exceptional bandwidth (Jobin & Leh, 2002). Koch (2000) indicates that accessibility is not equal to all would-be students. Networks of fiber optic cables that provide broadband or high speed internet service tend to cluster around downtown business districts and outer suburbs where corporate offices or government campuses are located. This pattern leaves those in low income and rural areas with limited access to high speed internet connections. The result is what has been termed a digital divide or gap in internet accessibility related to income, race, geography, and education.

Accessibility in terms of students with disabilities is an additional concern for institutions of higher education. Federal legislation pertaining to students with disabilities includes:

1. Section 504 of the Vocational Rehabilitation Act passed in 1973, which requires that institutions who receive federal funding not discriminate or exclude people with disabilities.

2. The Americans with Disabilities Act (ADA) passed in 1990 which applies to programs and services offered by both public and private institutions of higher learning.

3. The Assistive Technology Act, passed in 1998 which requires that accommodations be made for individuals with disabilities as it pertains to technology.

Unfortunately, these regulations provide no specific guidelines regarding what institutions must do to make online courses accessible to students with disabilities (Edmonds, 2004).
Consequences

In spite of its popularity, questions concerning quality in online education abound. The Sloan Foundation survey report (2007) indicates the following areas of known concerns:

- When students get their degree on the Internet, they miss out on the collegiate experience targeted at development of the whole person.
- Businesses will not value the online degree as much a traditional degree with regard to potential employment.
- Students graduating from virtual colleges miss the daily interaction with their peers.
- Due to a lack of interaction with other students and the instructor, students feel isolated and uninvolved in the learning process.
- The prevailing perception of online education is that it is inferior to traditional education.

This survey also reveals that 69 percent of academic leaders believe online education will be critical for long-term planning in higher education. If this trend continues, traditional colleges and universities will find it necessary to offer quality online courses in order to remain competitive (Allen & Seaman, 2007).

Additionally, since partnering the Internet with modern course management systems makes it possible for universities to offer coursework on a global basis, faculty impact must be considered. More faculty members will be required to develop and teach online courses. This will include long-term faculty who may not have the technological skills or the enthusiasm to adapt to this form of teaching. These conditions imply that an increase in online courses may influence the number of faculty retained or hired (Dykman & Davis, 2008).
It is imperative that institutions along with the general public be cognizant of the issues surrounding online instruction in order to become informed consumers. Online instruction is not a universal remedy for the complicated life-style of the twenty-first century student. It is, however, an option that when used appropriately can be an effective part of the collegiate curriculum. With this view in mind, the following recommendations for the development of an effective online course should be considered.

Recommendations

The successful online course is one that is designed and delivered effectively. Sieber (2005) cautions that those new to online instruction often fail to consider the basic differences between the pedagogy of delivering instruction online and traditional face-to-face classroom instruction. At the most basic of levels, the instructor must be cognizant that online instruction entails much more than simply putting an instructor’s notes, lectures, assignments, and PowerPoint presentations on a web page. The online instructor must facilitate a collaborative learning environment which promotes inquiry and includes students as active contributors to the course content. Nevertheless, many institutions promote online instruction as a student friendly, cost effective, space saving method of course delivery without providing the infrastructure to support the technology and/or the instructor. Predictably, student course evaluations of this form of online course indicate high levels of dissatisfaction (DiBiase, 2004). For these reasons, it is necessary to provide training for prospective online instructors in technology application, methodology, and instructional design in relation to the online classroom.
Regardless of the learning medium, effective teaching has principles and practices that research has suggested produces the greatest learning. In the book *Effectiveness and Efficiency in Higher Education for Adults* (Keeton et al., 2002), eight principles are described that can be modified and implemented in an online course to increase effectiveness (Sieber, 2005).

Keeton describes the first step as one that creates an institutional environment that supports and encourages inquiry. One way to encourage inquiry online is to develop threaded discussions, chat rooms, and/or individual communications between class members and the instructor. These opportunities for dialogue welcome student questioning of the instructor’s views and those of other class members (Beldarrain, 2006).

The second principle is to broaden learners’ knowledge of the subject matter by encouraging them to incorporate their individual experiences into the learning. Instructors can accomplish this by designing class discussion topics that require students to apply course concepts to their own experience backgrounds.

Third, instructors should elicit students’ active and critical reflection on their growing knowledge base. Students can reflect and consider alternative interpretations of learning through collaborative assignments that require problem solving strategies and critical thinking skills.

The fourth principle that can be incorporated into online courses is the use of deliberate practice accompanied by prompt, constructive feedback. Performance should be continually assessed in online courses because students respond and participate more often when instructors are consistent in providing constructive feedback on discussions, chat room posts, and assignments.
The fifth principle includes making the course material relevant and practical by designing assignments around the needs and interests of the learner (Sieber, 2005).

The sixth principle that supports effective instruction is developing learner effectiveness. The instructor should design assignments that are directly aligned with the course objectives and that enhance the learners’ abilities and proficiencies.

Clarifying learning goals and providing the support and resources that empower students to complete them is the seventh principle. Resources and support online can be in the form of rubrics for assignments, documents, websites, and technology support numbers.

The final principle for effective teaching online is to provide an optimal balance of challenge and support that is tailored to individual students’ readiness and potential (Sieber, 2005). In other words, the instructor should know his or her audience and design the course accordingly. Obviously, a course designed for mature learners with many background experiences from which to draw will be different from one designed for traditional freshmen and sophomore students. Younger students often lack the discipline, skills, or motivation to succeed in online courses, and that is especially true if the course is poorly designed (Young, 2006).

It is the responsibility of the institution to ensure the quality of its online courses. One way to do this is for institutions to require that faculty who teach online be certified to use the technology program, such as Web ct or Blackboard, used by the college or university. In addition, institutions can implement policies and procedures that provide standards and rubrics for the structure and components of a course. Faculty development focused upon proven principles of effective teaching and development of technology skills needed for
implementation of the online program will benefit instructors, but more importantly, it will improve student learning and satisfaction with online classes (Ellis, 2003).

Recent Developments

The University of Arkansas – Fort Smith has long recognized the need for online courses to be well designed and taught by qualified faculty. A technology committee comprised of faculty who were interested in teaching online courses together with members of the Instructional Technology (IT) staff worked for several months during the 2006-2007 academic year to compile a checklist of components that they believed were essential for an effective online course (see http://www.uafortsmith.edu/Distancelearning/OnlineCourseReviewRubric). In addition, instructors planning to teach online were required to complete technology training that certified them to use Blackboard software. Once the professors were certified, they developed their online courses with support from IT personnel. The final step before the courses could be offered online related to the deans’ evaluations of the proposed courses using the aforementioned checklist. If components were incomplete or missing, online course designers were asked to revise the necessary components. Once the course content and Blackboard-accessible design shells were approved by the dean, they were added to the online class schedule.

Concurrently with the development of the UA – Fort Smith online course development criteria during the 2006-2007 academic year, the Arkansas Department of Education requested that Colleges of Education in the state plan and provide three courses to extend teacher licensure: Adolescent Growth and Development, Meeting the Needs of Diverse Learners in the Middle Childhood Setting, Middle Childhood Teaching Strategies and Classroom Management
From Novice to Expert

Techniques. These Middle Level Education (MLED) courses offered opportunities for Early Childhood Education (Pre-K – grade 4) majors to earn grades 5 – 6 licensure to teach in self-contained classrooms and Secondary Education majors to teach in middle level grades (4 – 8) in their specific content areas. Teacher/Practitioners and pre-service teachers could add the middle level endorsement by coming to campus and participating in one class during the first summer school session and two classes during the second summer session.

During the first summer (2006-2007) when these courses were offered, there were six students who participated in both summer sessions, but the following year there were only four. In an effort to recruit students for the summer classes, two middle level education professors revised and rewrote the three summer courses to offer them fully online during the summer of 2008. Course enrollment peaked at 25, 24, and 25 in the three classes during the next summer sessions. Students appreciated being able to access the online courses asynchronously during a summer when gasoline prices skyrocketed, and incomes plummeted due to frequent cuts in businesses and industries across the nation.

One of the middle level education professors had prepared web-enhanced courses and found them efficient and effective across her full-time teaching load. While largely self-taught, she participated in the required Blackboard in-service professional development sessions and worked with an experienced Web ct/Blackboard, full-time instructor on format and design principles. Since she had already organized her course content or homepage (see Appendix A) with the syllabus, weekly overviews, assignments, discussion board topics, and assessments, using the graphics recommended in the Blackboard online teacher workshops, she invited her colleague to share the same format in an effort to unify the courses. Together they worked in
one office on two computers using an each one/teach one model (Pereira, 2010) to design the courses.

They also collaborated to ensure that

- Diverse instructional strategies appealed to multiple intelligences and learning preferences (see Appendix B).
- Discussion board topics related to readings from the texts but also connected with undergraduates’ prior knowledge and experiences (see Appendix C).
- Traditional, alternative, and authentic assessments contextualized pre-service and teacher/practitioner learning in their daily classroom lives (see Appendix D).

The above examples show the variety of activities and assessments that aligned with National Middle School Association’s Specialized Professional Association-approved standards for highly qualified middle school teachers under the No Child Left Behind Act (NMSA, 2005).

As the experienced and novice online instructors worked to distribute their course content into the menu tabs and homepage (course content) links, they discussed the importance of learning by doing and developing a new attitude toward teaching. Through reading widely about methods of integrating technology into a meaningful learning experience in online classes, the two professors developed a clear understanding of the role of the online instructor as a guide, collaborator, and instigator (Murchu & Muirhead, 2005). They reviewed additional research literature that stressed the importance of encouraging online learners to perform to the best of their abilities; see the interrelatedness of the complete curriculum; and collaborate to create, innovate, and integrate learning across the content areas in middle schools (Palloff & Pratt, 2007).
They decided to offer an optional orientation for their classes the week before the first summer session began. Students welcomed the opportunity to interact with their instructors, to practice accessing the courses, and to get acquainted with their peers in the computer lab. They learned that even though most of their course work would be completed online, they were expected to collaborate to prepare *PowerPoint* presentations and websites illustrating ideal middle school philosophies and principles in their final, alternative assessments.

Watson, Gerin, and Coffey (2010) found in synthesizing nine studies conducted by 23 additional researchers and 117 faculty members with online teaching experience that faculty acceptance of distance learning plays an important role in its success in higher education. One of the motivating factors that drew the two middle level education professors to work together to teach the summer classes was the possibility of collaborating with teachers/practitioners in area classrooms in action research to determine the most efficient, effective methods of delivering instruction to teachers who were already committed to completing a minimum of 60 hours of professional development per year to maintain their state licenses.

Subsequently, they learned that the teachers/practitioners in their online classes most often completed their assignments in the evenings after their children were asleep and after their summer workshop assignments were finished. The convenience of asynchronous communication and easy access to the *Blackboard*-supported classes encouraged them to e-mail and post discussion board responses frequently and professionally. As the courses progressed, they grew in their abilities to log onto their online courses frequently; keep current with postings; read, research, and analyze; reflect and respond thoughtfully; and rely on and be responsible to their peers and instructor in the courses.
Following an analysis of 30 print and online educational journal articles related to teaching online courses, Kathy Wright, Director of Instructional Support at the University of Arkansas – Fort Smith, suggested several factors that the two professors considered as they worked together to organize and design quality online courses for undergraduate students:

- Communicate in advance with students so that they know that they must demonstrate proficient writing skills, be self-directed, and on time in submitting their online assignments.

- Plan and moderate frequent instructor-student interaction. When faculty involvement increases, distance education programs yield more positive outcomes than face-to-face instruction. However, overly involved instructors found that “hovering” decreases student interest and quality of electronic postings on discussion boards especially.

- Prepare evaluation instruments that encourage students to collaborate online to prepare authentic, team-synthesized assessments that are presented in person on campus as culminating activities heighten the level of concern and improve group interdependence and individual accountability across a six-week summer session (2008, p. 2).

The two-member middle level education team used a combination of the above recommendations and Keeton’s (2002) eight principles to guide their course preparations. Each instructor prepared a welcome page with a picture and details relevant to procedures for submitting assignments and posting online discussion board postings and responses to two peers each week per class. The procedures for all three of the classes were similar to prevent
any confusion about expectations and timely submissions. Students submitted assignments on Thursdays and Sundays by 11:59 p.m. Easy access to the course syllabus and weekly overviews assisted students in organizing their assignments and discussion board postings and responses. Threaded discussions gave students opportunities to question their instructor and their peers and to share their experiences in full-time teaching and/or from practicum or internship classrooms. They grew in their abilities to support conclusions drawn from their texts and to use facts, reasons, examples, incidents, and anecdotes from classroom observations and volunteer work in their communities in their writing.

When the students came to campus to present their PowerPoint presentations and/or websites related to the Ideal Middle School project, they were excited to share their collaborative work. Alternative and authentic assessments such as the design of the Ideal Middle School project, incomplete case studies, and simulations of professional development seminars related to strategies to use in teaching young adolescents with special needs in middle level education motivated students to develop research skills, communicate and collaborate with their simulated teaching team members, and plan together to reach a common goal. From their collaborative online discussions and cooperative planning sessions, they also developed group interdependence and individual accountability.

As they worked through problem-based learning in weekly assignments, the students reflected on what they had learned and helped each other recognize multiple perspectives especially related to a variety of types of literacy integration across the curriculum (Bullen & Janes, 2007). The picture book integrated lesson plan inspired them to find books that would appeal to fifth and sixth graders, such as Sir Cumference and the Great Knight of Angleland and
Walt Whitman: Words for America. They paired/shared lesson plans and used the Praise/Question/Polish method of evaluation in their discussion board responses (Lyons, 1981). The rubric found in Appendix E reflects the qualities of integrated literacy pedagogy anticipated in this assignment.

The ability to connect new learning with prior knowledge and experience along with encouragement to contextualize new skills in daily life lead adult learners and middle school students to use what they have learned in new and unexpected circumstances. This meaning-making is recognized as transfer of learning, but it is especially important in online teaching and learning because of the broad range of expertise that students bring with them to the courses. Some may have difficulty attaching a document to an e-mail or to the discussion board, but it is important to dignify each response and encourage new teachers and pre-service teachers with frequent feedback and specific praise. Others may be ready to engage in online dialogues with more highly competent partners or with those they know need help to master technologies that can be reviewed in teach backs in which competent students re-describe what they have learned to see if it matches their peers’ perceptions (Pask’s Conversation Theory as cited in Andrews & Haythornthwaite, 2007).

As the online courses qualify prospective middle level teachers to take the Praxis II content area tests and meet requirements to teach grades 5-6, their professors continue to grow as facilitators of best practice teaching strategies for middle level learners. They find teachers from their online classes serving as technology leaders in their schools, completing master’s degrees online, and demonstrating their online learning proficiencies for teachers/practitioners who come to campus to participate in technology-enhanced professional
development courses. The new challenge is to connect newly licensed middle grades teachers and their students with their e-learning counterparts around the globe.

Conclusion

Since nearly 20 percent of all higher education students in America enrolled in at least one online course in the fall of 2006 (Allen & Seaman, 2007), online education is obviously a well-established trend. The challenge for colleges and universities today is to address issues related to development, delivery, and public perception of online instruction. Teachers must become aware of and make accommodations for the unique characteristics of the online student. Faculty development is the key to success in online education since the effective online course requires unique skills in development and delivery of instruction. Caution must be exercised in selection of online classes because not all courses are suited for online delivery. While all of these issues are of utmost concern to higher education, the most important consideration of all is the imperative to maintain the ideal that higher education embraces not only the development of the mind, but of the whole individual. This ideal of a collegiate experience that includes collaboration, reflection, and exchange of ideas within a community of learners can be extended to the online environment when proper training and infrastructural support is available.

Appendix B

Providing for Individual Differences (Weekly Overview III: July 19-25)

Objectives: The student will be able to:

- Describe ways instruction for low-ability groups might differ from instruction for average groups.
- Select an approach to individualizing instruction (contingency contracts, mastery learning, matching teacher and learner styles, or a type of ability grouping) or one that is not introduced in Henson’s textbook, research the method, and determine how to adjust it to fit your own preferences.
- Discuss things a teacher in a multicultural classroom should or should not do to adjust to his or her students’ special needs.
- Explain the importance of a teacher holding high expectations of every student in his or her class,
- Use case study analyses to share multiple perspectives of a variety of ethnic groups and then describe how a first year teacher might express high expectations, provide encouragement, and offer opportunities to use intrinsic and extrinsic rewards to motivate a diverse school population to achieve highly and subsequently improve self-efficacy.

Please read the following chapters in Henson’s text:

Chapter 7: Individualizing Instruction and Chapter 8: Teaching in Multicultural Classrooms

Discussion Board Question: Select an approach to individualizing instruction (contingency contracts, mastery learning, matching teacher and learner styles, or a type of ability grouping) or one that is not introduced in Henson’s textbook. Research the method and determine how to adjust it to fit your own preferences. Post this response to the discussion board by 11:59 p.m. on 07/26/10.

Assignment: Read the case study beside which your name appears on the list below. Then write a 3-5 paragraph essay response. Use the “Further Reflection” topics at the end of each case to guide your thinking. Post your essay to the discussion board and respond to your partner’s ideas. Submit this assignment in Assignments, Week III: Case Study Analysis by 11:59 p.m. on Sunday, July 26.

Case Studies

| Chapter 1: Substituting Involvement for Apathy | Chapter 2: Professional Learning Communities |
| Chapter 3: Planning for Student Engagement | Chapter 4: Constructivist Theory and Practice |
| Chapter 5: Classroom Micro-society | Chapter 6: Assessment and Teaming |
| Chapter 7: Doing What Makes Sense | Chapter 8: Role of Dispositions in Teaching |
Week V: Examples of Communications with Parents and Community Members

- Collaboratively planning with colleagues and participating in school activities (math, literacy, science, history nights; family night with a potluck, school-made, or catered meal; school-wide carnival; talent show; co- and extra-curricular(s); open house and student-led conferences, etc.
- Publishing a weekly newsletter (either print copy, e-mail, or Ed-line) that expresses high expectations for students, including the
  - School/Classroom rules, procedures, and policies
  - Specific description of classroom arrangement and management
  - Grading procedures with new assessment methods using rubrics and checklists
  - Specific district, state, and national standards for measuring students’ success
- Creating a teacher website with a discussion board or blog for parents but also offering the opportunity for parents to call the school telephone number during planning or conference time if they have concerns or would like to volunteer to help with a specific class project or activity
- Publicizing PTA/PTO/Parent Advisory Group meetings and holding them at different times (before work in the morning, at lunch time, or after dinner in the evening) so all parents have an opportunity to attend
- Preparing flyers about school activities for businesses to post on bulletin boards or to distribute from their counters (follow district communications policies)
- Sending encouraging e-mails, hand written notes or postcards, brief memos in agendas or planners
- Facilitating focus groups of parents, extended family members (grandparents, aunts, uncles, big brothers and sisters), business leaders, and community members
Appendix D

**Alternative Final Exam: The Ideal Middle School Project**

Instead of a traditional final exam for this course, students will complete a final project. This team effort will require middle level teacher candidates to weave the best of what is known about effective middle schools into a comprehensive plan for the ideal middle level school.

Using your knowledge of young adolescent development and middle level philosophy, organization, curriculum, assessment, and instruction, design the ideal middle school in groups of four. The school should reflect accurate research, theory, and practice regarding the middle school concepts discussed in class. However, this project also will require additional outside research and reading. Middle school designs may be presented as PowerPoint presentations or school web sites.

The following must be addressed in your school:

1. Philosophy (goals, objectives, and a mission statement) of the school should include characteristics of a true middle school.
2. School organization
   - Teaming – what types of teams? How many teachers per team? What provisions will be made for a broad range of special needs students?
   - Grade span or age groupings (i.e., grades 5-6, 6-8, 7-8, etc.)
   - Grouping of students – heterogeneous, homogeneous, same age, multi-age?
   - Scheduling (master schedule shows number of periods; flexible scheduling; block, start and stop times for school)
   - Advisory programs (type, length, frequency, who leads these, number in each group)
   - Physical location of the building (include a floor plan of building plus outdoor areas)
3. Curriculum
   - Around what standards and frameworks will the curriculum be organized?
   - What role will assessment play? What types of formative and summative assessments will be emphasized?
   - Which courses are required at each grade level? Which are electives or exploratory courses? Will AP or honors classes be offered?
4. Instruction
   - How will curriculum and instruction be meshed to achieve desired outcomes?
   - In what specific ways will instruction meet students’ developmental needs?
   - What will teachers do to address learning styles, multiple intelligences, brain research, etc.? What staff development programs will be offered?
5. Teachers (list the qualities required for teachers in a true middle school – personal characteristics, education, certifications, competencies, etc.)
6. Family involvement (show how this middle school purposely involves families beyond the PTA and other typical parent programs)

INTRODUCTION

We report on changes in teachers’ mathematical content knowledge while they were participants in a three-year research project funded by the National Science Foundation that investigated feasible models of implementing formative assessment in mathematics classrooms using networked technology. Although proven to be an effective instructional strategy, formative assessment has been challenging for teachers to implement in their classrooms (Ruiz-Primo & Furtak, 2006; Shavelson, R. J., Yin, Y., Furtak, E. M., Ruiz-Primo, M. A., Ayala, C. C., Young, D. B., et al., 2006; Yin, 2005). Similarly, using technology to implement formative assessment practices has also been a challenge for teachers (Owens, Pape, Irving, Sanalan, Boscardin, & Abrahamson, 2008). Viewpoints differ regarding how to assist teachers in developing facility in implementing formative assessment strategies using networked technology. Thus, our research focused on comparing the efficacy of two approaches: (1) implementing both formative assessment and networked technology simultaneously or (2) implementing formative assessment strategies prior to implementing use of networking technologies.

The project was designed to examine differences in student achievement related to algebraic concepts resulting from two different professional development (PD) models over a two-year period of time. In one PD model, teachers’ learning focused solely on formative assessment strategies, and included attention to topics related to the components of formative assessment, i.e., mathematical tasks, questioning, interpreting students’ work, and responding to misconceptions. In the other PD model, the same formative assessment components and an introduction to classroom networked technology simultaneously. As one strand of the project’s evaluation, established measures of teacher content knowledge were used to determine the effects on teacher understanding of the mathematics used in teaching. The research reported in this paper concerns data on teacher content knowledge for teaching collected at three points in the project: prior to the start of the professional development, at the end of the first year of

---

1 The research reported in this paper was generated by the grant, The Effects of Formative Assessment in a Networked Classroom on Student Learning of Algebraic Concepts (DRL–0723953) funded by National Science Foundation Research and Evaluation on Education in Science and Engineering (REESE) program. The views expressed in this paper are the views of the authors and do not necessarily represent the views of the National Science Foundation.
participant training and implementation and at the end of the second year of participant training and implementation.

It is widely established that teachers need to possess a deep and fundamental understanding of the mathematics they teach. Moreover, teachers need to understand mathematical content in light of the teaching/learning dynamic. For example, when teachers differentiate problems in response to individual variances to challenge and/or provide additional scaffolding for students, they use their mathematical understanding to: (1) listen to students’ explanations of unconventional solution strategies to determine whether or not they are likely to lead to generalizable approaches, (2) probe student thinking through appropriate questioning, and (3) create or select formative and summative assessment problems that are mathematically similar to the work done in class.

Studies in classrooms have found that improving teachers’ mathematical knowledge for teaching significantly affects students’ learning of mathematics (e.g. Hill, Rowan, & Ball, 2005). While teachers’ undergraduate mathematics courses support their learning up to a point, Monk (1994) found that beyond five mathematics courses, the number of mathematics courses their teachers had taken less significantly affected students’ learning. In fact, Adler and Davis (2006) suggest that advanced courses may encourage teachers’ compression and abbreviation of mathematical knowledge. This is problematic, since unpacking mathematical knowledge can provide entry points for students to build understanding, and therefore is necessary for teaching. This notion of unpacking mathematical content has begun to focus research into teachers’ mathematical knowledge as it concerns the depth, connectedness, and explicit articulation of the mathematics of teaching (Ball, 2003; Ma, 1999). Knowing how to respond appropriately to students’ questions and developing the ability to choose or create questions and problems targeting specific mathematical concepts is at the center of the content knowledge needed for teaching (Ball, 2003). Studies involving teachers of elementary students have found that improving their mathematical knowledge for teaching significantly affects students’ learning of mathematics (e.g. Hill, Rowan, & Ball, 2005).

In this study, our interest in teachers’ mathematical knowledge is tied to the formative assessment framework that underlies the design of the PD. The formative assessment portion of the professional development drew from Ayala & Brandon’s (2008) emphasis on the ongoing communication aimed at understanding student thinking within the process. Throughout the PD and follow-up sessions, the project staff emphasized the centrality of the interaction between teacher and student. In this construct, effectively implementing formative assessment requires a teacher to facilitate a student’s understanding by building on where she is in her thinking in order to bridge the gap to where she needs to be in her understanding. This building on preconceptions is an effective path to learning (National Research Council, 2005). The aspect of formative assessment where teachers focus on how students are understanding (or misunderstanding) relies on the teacher’s knowledge of the mathematics used in teaching, and this led us to the examination of teacher content knowledge reported in this paper.
METHODOLOGY

Thirty-two seventh-grade mathematics teachers were assigned to two groups, which for purposes of this paper will be referred to as FA and NAV. During the first summer of the project, the group of teachers in FA participated in five days of professional development on the use of classroom formative assessment. During the same time, the group of teachers assigned to NAV participated in professional development on the use of classroom formative assessment using the TI-Navigator™ classroom networking system.² Project facilitators planned the agendas together with the goal of providing as similar an experience with strategies for formative assessment as possible. In all cases where practicable, the same or very similar mathematics tasks were included. The formative assessment PD in both groups was based on the same framework (Ayala & Brandon, 2008) and the targeted content of patterns and functions and algebraic reasoning addressing several Hawai‘i content standards that teachers were expected to teach during the third quarter of the school year was the same for both groups.

To measure the growth of participants’ content knowledge for teaching, the University of Michigan’s Learning Mathematics for Teaching (LMT) instrument was administered at the beginning of the first summer (Pre-Test), again after one year of participation (Post-Test 1), and finally after the second year of participation (Post-Test 2). The LMT measures have been shown to be a significant predictor of student achievement (Hill, Rowan, & Ball, 2005). Gilbert, Olson, Olson & Slovin (2010) reported on comparisons between Pre-Test and Post-Test 1. This paper reports on comparisons between the Pre-Test and Post-Test 2, that is, comparisons between teacher content knowledge from the beginning to the end of the project.

The items on the LMT test are not released, and so we will describe the mathematical content of the tasks only in general terms and will not directly refer to any specific calculations or tasks. The specific LMT test chosen was Middle School Patterns Function and Algebra – Content Knowledge. Form A was administered as the Pre-Test and Post-Test 1 and Form B administered as Post-Test 2. All items on the assessment are constructed to highlight the content knowledge that is involved in teaching. The content strands of this test include items intended to assess a teacher’s fluency with determining and interpreting patterns, functions, expressions, equations, and representations. The instrument is in the form of multiple-choice questions. The Pre-Test was given at the beginning of June 2008, prior to any professional development activity, and Post-Test 2 was given at the beginning of May 2010 at the final follow-up session for the school year. (This was also the final year for the project.) During all but the follow-up sessions for the last year, project activities were conducted in separate FA and NAV cohort groups. Project teachers had participated in five days of cohort professional development in June 2008; five half-day cohort follow up sessions and at least three coaching visits from project staff during the school year 2008 – 2009; three days of cohort professional development in June 2009; and five half-day combined (FA and NAV) follow up sessions and coaching visits during school year 2009 – 2010. Not all participants were able to attend every professional development session, although a large majority of

² TI-Navigator™ is a networking system developed by Texas Instruments that wirelessly connects each student’s graphing calculator to a classroom computer.
participants were in attendance at every session.

RESULTS

Descriptive statistics for the Pre-Test and Post-Test 2 are given for both the FA and NAV group in Table 1. The two tests had different total scores so percentages are used. The correlation between the Pre-Test and Post-Test 2 for the FA and NAV groups were 0.483 and 0.789, respectively, indicating a stronger correlation for the NAV group. Paired T-Tests between Pre-Test and Post Test 2 for the FA and NAV groups, 0.051 and 0.072, respectively, indicated significant gains in content knowledge at the 0.10 level.

A T-Test indicated no differences between FA and NAV on either the Pre-Test or Post-Test 2, although there was a significant difference (p < 0.05) between the groups on Post Test 1, with the NAV average greater. The correlation was 0.645 between FA and NAV on Post-Test 2. The overall scores were then disaggregated to examine the results on some of the individual test items. There were five questions for which the difference in percentage correct was 20 or more, with the largest difference at 35%. Four questions on the Pre-Test and five questions on Post-Test 2 were answered correctly by all FA teachers. No question on the Pre-Test and one on Post-Test 2 were answered correctly by all NAV teachers. Table 2 shows the relationship between questions answered correctly and the range of correct answers. The FA group answered four of the questions correctly less than 50% of time on the Pre-Test and three questions correctly less than 50% of the time on Post-Test 2. For the NAV group there were three questions on both test answered correctly less than 50% of the time. Thus, there were at several questions that were more challenging for the teachers.

The percentage correct per question for each group on each test, along with the difference between groups is shown in Table 3. The correlations between FA and NAV on the Pre-Test and Post-Test 2 items were 0.717 and 0.645. However, on the Pre-Test there were eight items for which the difference in percentage correct was 20 or greater. The largest difference in percentage was 40%. The differences are reported only as positive values.

**DISCUSSION**

The overall score for the aggregated scores on Post-Test 2 was respectable for both groups and two teachers in the FA group correctly answered all questions, while no teacher did so on the Pre-Test. Yet, there were five teachers in each group who scored less than 60% correct on Post-Test 2. Each group had significant gains at the 0.10 level between the Pre-Test and Post-Test 2. While the mean gain for the FA group, 11, was almost twice that of the NAV group, 6, there were no significant differences between the groups on Post-Test 2.

The overall scores, however, mask differences on specific items. Table 4 presents data on the nine questions that were on both the Pre-Test and Post-Test 2. On the Pre-Test the FA group scored higher on four questions and the NAV group scored higher on five questions. On Post-Test 2 the FA group scored higher on only three questions while the NAV group scored higher on six questions. The largest gain for each group was on the same item, one in which the average on the Pre-Test was less than 40% for each group. The FA and NAV groups scored lower on four and three items, respectively, on Post-Test 2. However, both groups’ scores declined on only one of the questions. Questions labeled 3, 4, 5, and 6 were all part of the same prompt and are related to identifying the type of equation that would be derived from a given pattern. It is interesting that five of the eight scores, two for FA group and three for NAV group, on these four items declined from the Pre-Test to Post-Test 2, dropping dramatically for the FA group on Question 6.

When examining the questions in relation to whether they address content taught in the seventh-grade curriculum, we find mixed results. Questions 1, 2, and 4 dealt with linear functions and the scores on these were high, with large gains from the Pre-Test to Post-Test 2 for both groups on Question 2; a large gain for the FA group and a small gain for NAV group on Question 4; and a moderate gain for the NAV group and moderate loss for the FA group on Question 1. These items align with seventh-grade standards in Hawai‘i. Question 9, examining the solution for an absolute value equation, which is also within the seventh-grade curriculum, was answered correctly 50% of the time or less on each testing, with the NAV group increasing and FA group decreasing from the Pre-Test to Post-Test 2. Question 7 examines solving an equation where division by zero must be considered. This content is not in the seventh-grade curriculum but had the highest gain from the Pre-Test to the Post-Test for each group.

The findings are interesting in light of the content and structure of the professional development that included two summer professional development experiences for a total of eight days, ten follow up sessions over two years, and also coaching for two years. With the emphasis on formative assessment focused on content directly related to the seventh-grade curriculum and the connection between this work and that assessed on the LMT, one might have suspected a larger gain between the Pre-Test and Post-Test 2. However, three considerations are in order. Some of the items on the assessment were less directly related to the seventh-grade curriculum, but still within the realm of expected teacher knowledge. Also, teachers’ prior conceptions of mathematics knowledge are just as difficult to change as are the prior conceptions of seventh-grade students. While the comparison of the same questions give us a starting point, the clustering of questions does not take into account the different modes in which the problems are presented. For example, while one question might look at linear functions from a table, another question might be based on a model or a word problem based in context. It is not surprising that scores on these items are not identical. Further work is being conducted to examine which parts of the professional development in the project may have contributed to positive changes, overall and on specific items, and which may not have played a large role.

Abstract:
In this qualitative study the researcher examined the impact of school structure on Vietnamese senior students’ post high school education & career aspirations. The study sample included 95 students from four different types of public high schools in Northern Vietnam. These included regular urban public high schools, public tracking high school, the center for continuing and technical/vocational education; and regular rural public high school. Based on previous studies, the conceptual framework of this study drew from the influence of the contextual factors of the larger system around the students. Data were collected from individual semi-structured interviews with the students.

Using the qualitative data analysis program, ATLAS.ti, the researcher analyzed how the structure of each type of school influenced the students’ decision-making process and their future choices regarding post high school education and career aspiration. The results showed that there was a disparity between the students of center for continuing and technical/vocational education and the students of the other public schools in terms of the career aspiration and post-secondary educational choices. However, there was a much deeper gap between the students that were from the tracking school compared with those of the regular public schools in terms of the students’ ability to make the well-informed decisions about their future post high school. In conclusion, the researcher suggested an intervention program in the public high schools system in Vietnam in order to help the senior students make sound decisions for their future.
The Impact of School Structure on Vietnamese Senior High School Students’ Post High School Education & Career Aspirations

Thuy T. La

This paper reports the findings of school structure influences on Vietnamese senior students’ post high school educational and career aspirations. Using a qualitative approach, the author examined how these four different types of public high schools in Northern Vietnam: regular urban public high school; public tracking high school; center for continuing and technical/vocational education; and regular rural public high school affected students’ choices of post high school education and career aspiration.

The theoretical framework for this study was based on three conceptual themes prevalent in the research of students and their academic and career choices. These themes are contextual factors, individual factors, and gender. Contextual factors are factors over which students have no control, such as socioeconomic status, school structure, school support, parental and community support, cultural beliefs and peer influences. Individual factors refer to students’ personal values and beliefs, feeling of self-efficacy and academic achievement. Gender, given its unique position in relation to these two groups of factors, becomes a theoretical framework. In this paper, the researcher specifically presents the results on how the school structure had an impact on Vietnamese senior high school students’ post high school aspirations regarding their secondary education and their careers.
Previous research has found that the type of schools students attend, the socioeconomic status (SES), and societal beliefs have considerable influence on their career and academic decision-making (Aypay, 2003; Dang, 1992; Davey, 1993; Gaunt, 2005; Moenjak & Worswick, 2003). Researchers (Moenjak & Worswick, 2003) showed that SES was a factor in the choices of an individual’s general or vocational education. They found that the rate of earnings returned for general and vocational education and the factors affected Thai students’ choices of vocational or general education. The sample population, aged between 15 and 60, was drawn from the Thailand National Labor Force Survey for the years 1989 to 1995. The sample included individuals who had the highest level of education in upper secondary education or vocational education and who were employed in the time frame of the study. The researchers’ empirical model showed that the individuals of higher SES status, regardless of gender, were more likely to pursue higher vocational education than general education. However, in the recent years, fewer individuals chose vocational education because of greater access to tertiary education.

Research also suggested that students who had socio-economic advantage intended to choose non-technical vocational schools more often than students who came from lower socio-economic families (Guant, 2005). The results were based on the analysis of characteristics of socioeconomic background and the academic standing of the students who enrolled in Career and Technical Education (CTE) programs; the students’ perceptions of career and technical education; and the factors that influenced students’ in their decision-making process in career and technical education. Using survey research, the researcher studied a sample of 451 senior public high school students in Michigan. The results showed that non-CTE students had higher grades in comparison with the CTE
students. The results also revealed a significant number of non-CTE students lived with both their parents while the CTE students lived primarily with one parent, relatives or other adults, and the economic situations of the non-CTE students were overall better than the CTE students (Gaunt, 2005, p. 80). The findings suggested that senior high school students in both CTE and non-CTE programs perceived that career and technical education has positive image. The students perceived that “CTE is needed for students of all abilities” (Gaunt, 2005, p.105). Several factors were identified that significantly influenced students’ CTE decision-making including: parents and friends, a tour to the CTE center at 10th grade, the time to travel to the CTE center, and the opportunity to receive college credits (Gaunt, 2005, p.116).

Living in an urban area is an advantage for high school students when it is the time for them to make their choices of general or vocational schools. Aypay (2003) studied the factors that affect the students’ choice of vocational school or general high school in Turkey. Data was collected on background variables, personal and academic variables and parental involvement. The findings showed that there were differences between general and vocational high school students in terms of background, academic variables, family characteristics and occupational expectations. Students in the urban areas were more likely to go to vocational schools. The findings also suggested that mothers’ work had positive influence on students’ vocational school preferences and that academic factor, occupational choices, and living in an urban area had a positive effect on students’ choices of general or vocational high school.

Having limited vocational skill is a factor that contributed to the youth’s career decision-making. Dang (1992) suggested that a pressing concern for the youth in rural
Vietnam is that a majority of them do not have vocational skills. In the rural areas, the traditional belief is that there is no need for people to learn about farming and raising cattle because this is knowledge and experience is passed down by previous generations. This extends to a general diminishment of the importance of education and limit opportunities for any formal schooling. Many youth in rural areas do not have vocational skills and are very unfamiliar with technology. Thus, they are often unprepared for non-agriculture work and unequipped to deal with technology. Finding a job and retaining a job becomes a pressing concern for rural youth. Many youth need jobs but they do not have the vocational skills to qualify for a job. The researcher suggested that solving this problem would require new policies to change the social and employment structure to expand educational opportunities in rural areas. This study emphasized that it is essential that rural youth be provided opportunities for their vocational training and for obtaining employment (Dang 1992).

The change toward market economy plays a powerful influence on students’ educational and career decision-making. Regarding the relationship between students’ occupational aspirations and interests, Davey (1993) found that the majority of students showed a high level of consistency in the interests reflected by their desired and expected occupations, however, other students tended to choose careers with higher income over their interest. This is consistent with a study of Vietnamese high school students. In a study of 300 senior class students in the northern part of Vietnam, using qualitative approach, (Tran, 2002) found that the students identified three main preferences when choosing a career. First was a career with high-income, second was a career that suits one’s ability, and third was a career that is highly valued by the society. This suggests
that most high school students aspire to a career based on the economic reasons rather than on their own interests.

Ngo (2005) identified a number of factors that he believes contribute to the career decision-making of Vietnamese people: the diploma doctrine, the decision between job or income; the career belief; family and society's perspective on career; schools and business organizations and entrepreneurs. Ngo (2005) pointed out that in Vietnam, as other countries, the pressure of getting a diploma exists in education, training and the workplace. The diploma doctrine plays a profound influence on the Vietnamese peoples’ decision-making regarding vocational orientation and vocational education (Ngo, 2005, p. 178).

As Ngo (2005) suggests, historically, the diploma doctrine originated from Confucianism and feudal education. Researcher pointed out that a diploma consists of two important elements, professional certification through training and education, and social status. Traditionally, Vietnamese people have held strong beliefs that society values people with higher educational status. This factor has had great impact on the decision-making of many people regarding their career and educational plans. It is why many high school seniors chose to go to college rather than attend vocational and technical schools. They regarded vocational education lower status in society. Ngo (2005) stated that career conception is a complicated in Vietnam because it is an abstract idea. This is especially true for the people in the metropolitan areas where there are different kinds of jobs and people have difficulty making career decisions (Ngo, 2005, p. 178). Social norms, such as what is considered a career, what is not, what it means to be successful or not successful, what is a noble job, what is not, gender, age, beliefs,
ethnicity all influence a person’s decision about his/her career (Ngo, 2005). Overall, previous studies suggested the more support students receive, the higher the family’s SES, and students from urban areas tend to choose higher education and professional careers, while those from rural areas, homes with lower SES or little parental support choose to go to work or pursue a vocational occupation.

In this study of the school structure influence on Vietnamese senior high school students’ education and career aspiration, the researcher interviewed students from the four types of schools, urban high school, tracking high school, center for continuing and technical/vocational education, and rural high school. There were total of 95 students. The four types of schools were selected for the study since they are representative for the general public high school system in Vietnam. Although using the same national curriculum, these schools differ in the approaches they deliver the curriculum to their students and in the organization of the programs and students’ placement. In the regular high schools, including rural and urban high school (trường phổ thông trung học công lập), students take general courses dictated by the national curriculum. Students have to pass an entrance exam by the provincial Department of Education in order to enter this school and matriculate for three years. Students do not specialize in a specific area of study.

In the tracking high schools (trường phổ thông trung học chuyên) which are similar to American magnet schools, students take a specialized course of study over and above the general curriculum. The standards are higher and more rigorous that than of the national standard. Students must pass an advanced admission exam organized by the provincial department of education instead of a regular high school entrance exam.
Students in the tracking school are expected to achieve above average academic progress and participate in the national and/or international academic contests. The program of study lasts three years. Depending upon the school, the specialized study academic study areas vary. In this study, the selected three tracking schools offered different subjects to their students. Two tracking schools offered six tracking subjects: Mathematics, Physics, Chemistry, Biology, English, and Literature. The third tracking school offered nine tracking subjects: Literature, Mathematics, Computer, Physics, Chemistry, Biology, Russian, English and French.

The center for continuing and technical/vocational education (trung tâm giáo dục thường xuyên và dạy nghề) is exclusively for adults who want to pursue a high school diploma but did not pass the entrance exam for the general public school, or for adults who are older than the general high school students’ age. The curriculum is nationwide but the standard is less rigorous and shorter in comparison with the regular high school and tracking high schools. The matriculation period is shorter as program runs two years.

All nine schools were chosen based on the diversity of their locations in terms of socioeconomic situations, and their school types. They range from urban and rural general education schools to vocational education. Tables 1, and 2 below present the demographic information of the participants.

The researcher sought to determine whether upon their high school completion the school structure influenced students’ education and career aspiration, and which type of school provided more support to their students regarding their educational and career
choices. The analysis was based on the interview transcripts using a multi-level coding with the use of Atlas.ti software, a qualitative data analysis program. Analysis revealed the most influential codes to the research questions: the School Support, and Teacher Advice.

The results showed that there were extremely limited student support programs in the regular public high schools helping them make post high school educational and career choices. Occasionally, the school would invite parents and community members to talk with students about careers, however this rarely occurred. For example, in school A, Province A, students had a one-time opportunity in a year shortly before their high school graduation exam to attend a meeting about career and educational opportunities from several community members. Majority students perceived lack of student support an obstacle to their ability to make a sound decision for their future. However, a small number of students did not see this as a problem. As this student put it.

“My school might have the vocational, technical and career guidance activities, but I don’t really care about because I have already chosen a career for myself.” (P31: HS0321, male student, regular urban high school, interview transcript)

Other students credited their teachers with providing information and support. One student said: “In my school, there are some teachers who help us with educational and career guidance. They help us choose a suitable school and a career… based on their knowledge about our ability” (P 3: DHA0424, male student, interview transcript). “Sometimes teachers will talk with us and give us helpful advice”. (P 4: DHA0524, male student, rural public school, interview transcript)
Among the four types of schools, students in the tracking school received more support from their schools and their teachers than their peers in other schools. More than half of students in the tracking schools indicated that they received advice from their teachers in making decisions for their future. The tracking high schools also provided support through organized meetings for their students. The students reported that tracking high schools and the centers for continuing and vocational/technical education provided more support and advice for students more than the regular urban and rural public high schools. Students in the tracking high schools and centers for continuing and vocational/technical education high schools mentioned that they had some form of vocational, technical and career guidance in their high schools. As this student stated about her vocational school:

The center for continuing and vocational/technical education has many different vocations we can pursue, such as tailoring, cooking, auto repair. Students can immediately get a job and earn money after they take these [vocational] courses at my high school. I think my school show that going to college is not the only choice. Students can support themselves financially by taking vocational courses (P80: CHS0413, female student, interview transcript, center for continuing and vocational/technical education).

However, a majority of students indicated that they did not received adequate support from their schools to help them in making their post high school’s education and career decisions. As this student said:

In my school, sometimes we have meetings and some people in community are invited to talk to us about career, but the meetings are too infrequent and vague. I
want more information about educational planning and career possibilities. For example, I want to know if I study this field, what will be taught in the college, what I can do with that kind of degree. At this time, I know just a little about some careers, basically from people who are my acquaintances (P30: HS0312, male student, interview transcript, tracking high school).

A rural public school girl echoed similar sentiments:

I think students in urban areas have more advantages than we do here. We even do not know what to do if we go to college. What can we do with those degrees? We just want our school administrators to provide us with more updated information about universities and colleges, and more materials so that we can read and learn about those schools in order to make our choices about our educational plans and career” (P114: HS0114, female student, rural public high school).

Students in urban and tracking schools expressed different choices when compared with the students in the center for continuing and vocational/technical education and rural schools. Students in urban public high school and tracking high schools chose careers that were oriented toward the economic sector, accountant, banker, economist, finance specialist, foreign trade, and polytechnic engineer. Other popular careers were law, travel, architecture, research, diplomacy, translation, customer officer, marketing agent, and journalism. On the other hand, students in the rural schools and centers for continuing and vocational/technical education chose the careers oriented toward social sectors. They aspired to become medical doctor, construction engineer, business administration, beauty
salon worker. Less popular careers among this group were actress, actor, interior designer, nurse, cook, auto electricity mechanic, entertainer, and agriculture specialist.

In summary, students in the urban and tracking high schools aspired to the careers that required at least four-year college degrees. These students need to take entrance exam to prestigious colleges, in order to pursue and be successful in their careers. On the other hand, students in the rural public high schools and centers for continuing and vocational/technical education tended to choose careers that do not necessarily require a college degree. Except for few students that aspired to become medical doctor, business administrator, and as construction engineers, majority students chose the professions that they only need to attend some professional training instead of going to four-year college.

Students in the urban areas reported to have more access to information and resources regarding educational and career plans they aspired to. This understandably leads to having more advantages in knowing which colleges or vocational technical schools they could choose to study, or which careers are available and popular in society. Rural students, on the other hand, have limited resources and limited information access. More than ninety percent of students in rural area do not have access to computers or printed media. They mainly learn about the educational and career opportunities from their schools and their peers.

The findings from the study suggest that unless students can see the benefits of taking vocational and technical education for their future plans, they will not perceive it as a viable career path or option to pursue. The results suggested that an intervention program is necessary to help Vietnamese senior high school students change their values and beliefs about educational and career choices. The intervention will require new
practices at schools, both in the middle and high school levels. These intervention should include the need to have a counselor with adequate knowledge about vocational and technical education, and with adequate skills to help support, provide guidance, information for students to aid them in their educational and career decision-making process. The intervention should involve middle school and high school teachers in a training program specialized in helping teachers gain the knowledge and skills necessary to advise their students in planning for their futures. It is suggested that counseling program and teacher professional training in vocational and technical education and career guidance training should begin as soon as possible when students begin their middle school. Through appropriate teacher and counselor training, and activities such as workshops or seminars for parents and students on topics of educational and career choices, this intervention will assist students and parents to become more aware of current educational and career opportunities and to be able to help the senior high school students make well-informed decisions regarding their future upon high school completion.

6. **Abstract:**

This presentation explores the relationship between the professional development (PD) experience of teachers and the learning outcomes of their ELL students. Through a 15-week online course, teachers in K-12 learned the Actual Community Empowerment (ACE) Reading methods and applied them to 1-7 selected ELL students for their case studies. In Fall 2009 and Spring 2010, 44 teachers participated in our PD courses and implemented ACE Reading programs with 103 students. The teachers’ learning outcomes were measured by their portfolios and survey responses submitted at the end of the semester. The students’ outcomes were measured by reading fluency for younger students and also by reading comprehension for older students. The overall data demonstrates that the PD course has a positive effect on the teaching practices of the teachers as well as the reading achievement of students across a range of grade levels, schools, and contexts. A short video clip on a tutoring session will be presented, and representative data from teachers’ responses and case studies will also be shared.
The Road Less Taken:

A Qualitative Study of Christian Homeschooling in Taiwan.

Abstract

In the homeschooling literature, a wide range of studies have been conducted to investigate homeschooling in the United States; however, only a few studies found are related to homeschooling in the Eastern Asian contexts. With regard to homeschooling as an increasingly popular educational choice in Taiwan, particularly among Christian families, this study attempts to examine how Christian homeschooling works in Taiwan by investigating the intentions, challenges and implications of homeschooling practice. The qualitative research method of Elliot Eisner’s educational criticism is used to collect and analyze the data. Through this qualitative inquiry, several important themes emerged from this study, including learning by homeschooling, family involvement, time flexibility, character training, uncertainties about the future, and the combination of family, religion, and education in homeschooling, among others. Furthermore, this study indicates the challenges of homeschooling and discusses this educational choice as the road-less-taken in Taiwan.
Introduction

Among various kinds of alternative education in the USA, homeschooling has been prevalent for decades. Between 1999 and 2003, both the number and the proportion of homeschooled students increased: there were approximately 1,096,000 homeschooled students in 2003, an increase from the estimated 850,000 students in 1999 (Princiotta & Bielick, 2006). In response to this phenomenon, numerous studies have been done on homeschooling in the United States since 1919, according to Dr. Robert Kunzman’s review (2009). However, based on the results of the database of ProQuest Dissertation & Theses (PQDT), only a few studies found are related to the homeschooling in the East Asian contexts, particularly in Japan, South Korea, and Taiwan¹. Therefore, this study is designed to explore how Christian homeschooling works in an East Asian context like Taiwan and what kind of challenges the homeschoolers face in their homeschooling. It attempts to reveal the practice of Christian homeschooling in Taiwan and will hopefully contribute towards the enrichment of the relevant literature.

Research Questions

With regard to homeschooling as an increasingly popular educational option in Taiwan, especially among Christian families, the following primary questions are used to guide and this study:

1. What are the reasons and goals of Christian parents in Taiwan to choose homeschooling for their children?
2. What are the important themes which emerged from this study?
3. What are the educational implications of Christian homeschooling for education in Taiwan?

Methodology

The qualitative research method of Elliot Eisner’s educational connoisseurship and criticism (Eisner, 1998 & 2002) is used to collect and analyze the data. Educational connoisseurship and criticism requires the researcher to play both roles: to appraise the qualities of homeschooling as an educational connoisseur and to make the appreciation public as an

¹ By the end of 2009, the only dissertation found about Japanese homeschooling is “A case study of the drop out problem in Japan and homeschooling as a possible policy response” (Aso, 2005), which is case study that suggests Japanese educational policy makers should consider homeschooling as an alternative to alleviate the persistent drop-out problem in Japanese schools. The only dissertation found about Korean homeschooling is “Contested motherhood: Self and modernity in South Korean homeschooling” (Jung, 2008), which is an ethnographic study of how the homeschooling mothers transform their motherhood and develop their potentials through homeschooling in South Korea. There is no homeschooling study found in relation to homeschooling in China or North Korea in the East Asia area.
educational critic. The structure of educational criticism, including description, interpretation, evaluation, and thematics are applied to appraise the information of homeschooling. Besides, the qualitative research technique of participant-observation is largely employed in this study. Along with the observations, the results of interviews with the homeschooling parents are also used for data analysis.

**Data Sources and Expected Outcomes**

Four voluntary Christian homeschooling families in Taiwan were studied. Only one of the families is presented for in-depth analysis in this paper, while the others were used as other data sources in triangulation to increase the validity of this study. I chose the family who has been homeschooling their four children for ten years.

After explaining my study to the homeschooling parents and then obtaining their consents, I spent almost the whole week to interview the parents and to observe their homeschooling. In addition to the scheduled visits, I was invited by them to join their family activities, including biking and family worship time.

**Discussion of Emergent Themes**

After analyzing the data, several emergent themes are found in this study, including learning by homeschooling, family involvement, and uncertainties about the future (not in the order of importance).

**Learning by Homeschooling**

Homeschooling is not simply an educational experience for the homeschooled children; it is also a great learning experience for the homeschooling parents based on my interviews and the observation. The parents are also in the process of learning to better their homeschooling. For the homeschooling schedules, for example, Chelsea’s family had a less structural schedule when they started homeschooling, as they used to cross out the items on the to-do lists (only the subjects were written). However, they found it would be more efficient if they added the timetables on their daily schedules, so their time schedules became more structural with both subjects and time written.
In addition, the parents can also learn something new from or with their children in homeschooling, literally. In this family, I noticed that Chelsea was learning skating from her daughter and Phil was learning the violin with his son in the first family.

**Family involvement-Housework**

Chelsea kept working after marriage, but she quit her teaching job after the parental leave for her oldest child. She mentioned that her family chose their current home in accordance with their homeschooling. It seems the homeschooling mother thinks more highly of education and the time with her children than of her careers. So she would give up her teaching career for education as she indicated that the time the parents could spend with their children is limited.

The parents also train their children to do housework at home. Chelsea’s children always have to do the housework together (except for the youngest) after lunch during the week. In contrast, it is not uncommon that many parents in Taiwan would do all the housework in order to save time for their children to study or do schoolwork. In homeschooling, homeschooled children are given more opportunities to do housework than schoolchildren.

Based on my observation, the homeschooled children tend to have a positive and caring attitude toward younger children. The three oldest children in this family enjoy waking up their youngest brother and playing with him. The older children are also willing to help their younger siblings in times of need. When the youngest boy wanted to go to the bathroom or need some help, the older sibling would be active to give him a hand. Because the homeschooled children spend most of their time at home, they are given more opportunities to observe the growing process and the needs of a younger sibling. Thus, homeschooling allows the children to be focused on the family and be familiar with the child development process.

**Time Flexibility**

In the book, *The Christian Home School*, Gregg Harris indicates that one of the strong advantages in homeschooling is “the flexibility it allows in the educational process” as he explains, “In school, teaching is strictly confined to the classroom setting and the prescribed hours of attendance. In the home, however, there are constant learning opportunities” (Harris, 1995, 61). Likewise, time flexibility is demonstrated to be one of the greatest advantages revealed by the homeschooling family I studied.

The use of time can be individualized for children’s learning. Time flexibility is also related to the characteristic of one-on-one instruction in homeschooling. This individualized
instruction has become a considerable advantage of homeschooling. Compared with schoolteachers who have to take care of a class of students, these homeschoolers have more time flexibility for individualized instructions to fit each child’s needs in teaching and learning.

In addition to time flexibility in learning, homeschooling is flexible for family time. The focus of children is on the family and they are following the family’s schedule, rather than the schools’. The family may go for trips during the school year according to their family schedule.

**Freedom to Include Religious Education and Character Training**

In Taiwan, religious education has been omitted consciously as “null curriculum” in schools in Taiwan (Gong, 1998) owing to various political and cultural factors (Tung, 2004). In order to maintain the separation of church and state, religious education is officially prohibited in public schools of Taiwan (Huang, 1994), not to mention Christian education. Thus, many Taiwanese homeschoolers resort to homeschooling in order to provide their children a better religious or moral education (Lee, 2005; Kung, 2005).

In my study, the parents revealed the advantage of being able to cover religious education and character training in their homeschooling. Their religious education include daily reading of the Bible, memorizing biblical verses, attending Sunday services, joining church groups and activities, and giving tithes. The homeschooling mother hopes to mold her children’s character based on the teaching of the Bible through homeschooling. The homeschooled children are asked to give tithes, as one of the Christian religious practices for example, after they receive pocket money or salary. Moreover, the parents also agree that the reading of the Bible along with the character training should be prioritized to the study of knowledge, as the homeschooled children have the Bible reading on a daily basis.

The family simply uses the school curriculum at home. They can get textbooks from local public schools for free, though they are not given answer keys or teachers’ guides. Nevertheless, the homeschoolers have the freedom to select or change the content of the school curricula based on their needs or beliefs.

**Burnout Situations**

On the recommendation of the mother, I added a crucial question about how the homeschooling family deals with burnout situations, because she saw many families were unable to continue homeschooling because the parents did not deal with their fatigue in homeschooling properly.
In facing burnout situations, Chelsea said she would spend quiet time in the morning to regain her energy and refresh her motivations for homeschooling, “Every morning I have a walk and pray in the garden for about 30 minutes before kids get up by 7:00 am. If I’m too tired to get up earlier, I’ll take Tony [the youngest child] out for a walk in the evening instead. By doing so, it decreases my frustration and distress levels. It’s kind of exercise too….. “ Chelsea also mentioned that on Saturday morning (except for the weekend I visited, because her husband attended a church event, Fathers’ School), her husband would take care of all the children, so she could go to the prayer meeting in church and renew her strength then.

As an educational minority group in Taiwan, the homeschoolers strive to look for resources and support. They also have to keep strong motivation for homeschooling and to deal with their burnout situations effectively, so that they can continue in spite of the challenges or pressure encountered.

Uncertainties about the Future

The parents think highly of their homeschooling and they would like to homeschool their children through the 9th grade, if possible; however, it is found that they have uncertainties about the homeschooled children’s future education in Taiwan, especially for senior high school and higher education. Chelsea shared that her oldest daughter went back to school in the 6th grade and then she graduated from elementary school with honors (as one of the top students in her class). Chelsea pointed out a fact: if the girl had remained homeschooled at that time, she would not have received any award when graduating from elementary school. Chelsea expressed her appreciation for doing homeschooling as a calling entrusted by God, but she is also concerned whether her children can go back to regular public schools without any administrative problems in Taiwan in the future. She further indicated, “I’m often wondering whether diploma is important or not, because it may be risky to homeschool in Taiwan. We’re so concerned that our decision to homeschool may ruin my children’s future.”

In Taiwan, it seems both the homeschoolers and the homeschooled children have to make a choice by themselves when it comes to education: whether they choose to continue homeschooled or not. In contrast, schoolchildren can simply follow what their teachers prepare for them: taking exams after exams and passing the centralized exams to get into top schools and receive diplomas as an advantage for getting a good job. The homeschooling families in Taiwan also may need to face the pressure because of choosing homeschooling, as people around
(relatives, schoolteachers, and the public) may not always understand or accept homeschooling as a desirable educational choice. Accordingly, the homeschooling families in Taiwan have to think their educational choice thoroughly; in addition, they need to keep clear and strong motivations for their homeschooling decision, as it is revealed in the family I studied.

Support Groups

The family participates in a Christian homeschooling association in Taiwan. In addition, all of them also join church services on Sunday and various church groups as well as activities, such as the family groups, worship team training, Sunday schools. It is noticeable that church life has become a crucial part of these homeschooling families both in their family life and homeschooling. Constructive aspects of the family relationships are reinforced, such as love, respects, obedience and responsibility etc.

For all of the children (except for the youngest), they participate in diverse homeschooling study groups or enrichment classes. While waiting for their children in classes, some homeschooling mothers have also established relationship and share their homeschooling experience as well as resources with one another.

Chelsea mentioned that she has learned from other homeschooling familise, including the parts of teaching and discipline, for a more effective homeschooling. For example, she’s learned to prevent her children from saying bad words by spraying vinegar on their tongues if her children do so. She also consulted with more experienced homeschooling parents how to teach certain subjects in more effective ways.

Family-Religion- Education are Combined Together in Homeschooling

The parents mentioned that the primary reasons for their homeschooling include religious education and family concerns. Phil used a metaphor of putting stones of different sizes into a bottle to explain his idea about homeschooling: the order should be big stones first, then small ones, and last sand. “During the homeschooling days, we can put the biggest, the most important stones as the foundation first. Both my wife and I feel that we don’t put the big stones properly in our children’s lives yet,” Phil said. When asked what the big stones are, Phil pointed the following out: good character, loving relationship among siblings, passion for learning, and development of individual talents.

According to the literature review, the religiously motivated parents in the USA tend to consider secular humanism and student immorality as characteristics of public schools, so they
choose to take the responsibility of education and intend to operate home schools as a better educational environment for their children (Knowles, Marlow & Muchmore, 1992, p. 196-197). In a similar way, the parents in my study also shared the idea that the responsibility of children’s education is in parents, not in the government.

In addition to the awareness that educational responsibility for children is on parents, these homeschooling families also emphasize a family-centered lifestyle. The family has regular family religious activities, including attending Sunday service together and weekly family worship time on Sunday night. The parents indicated the important influence of family on children while they are growing; therefore, they would like to take advantage of time with their children and to be actively involved in their children’s education.

Furthermore, being family-centered and Bible-based are the two most fundamental characteristics of homeschool education in the family. In other words, homeschooling is chosen and developed by these families to be a holistic education merged with family-centered education and religious education. In terms of being holistic, the parents agreed that character training along with reading the Bible as a part of religious education is more significant than academic learning. The idea of “studying is the only noble thing to do” under the influence of Confucian tradition is still prevalent in the Taiwanese society; accordingly, school students place their main focus on academic study and receive test-taking skill training. Contrary to the focus on studying and test-taking in school, the homeschooling parents prioritize the character training and learning of the Bible in their homeschooling. To be more specific, their character training is primarily based on the teaching of the Bible.

The parents also have to cooperate and support one another throughout their homeschooling operations as they share the homeschooling duties as well as housework. In this family, the father is responsible for teaching the children math and abacus calculation (along with grocery shopping and making breakfast), while the mother takes care of teaching the rest of the subjects, including Chinese, English, history etc., along with making meals and doing laundry. The divisions of homeschooling teaching may vary in different families; however, the leading of the family worship and the ultimate decision making are always done by the fathers in each of the homeschooling families, as they are following the teaching of the Bible, “For the husband is the head of the wife as Christ is the head of the church…” (Ephesians 5:23).
In conclusion, the combination of education, family (family-centered lifestyle), and religion (Christian belief) in homeschooling can be illustrated as a Venn diagram below:

![Venn diagram](image)

Figure 1: A: Religion; B: Education; C: Family; the center: Homeschooling

**Social Relationship**

On top of diploma issue, another commonly asked question is socialization in homeschooling. Based on my observation, the family has a positive parent-child relationship and that between the siblings. The parents think that the foundation of social relationship is in family. As they indicated: they believe that once their children can get along with their family members who they can not choose, they can get along with any friends who they may be able to choose.

One of the most important socialization lessons for the homeschooled children is to share the space with their siblings. For instance, when Cindy was playing the piano in the living room, her youngest brother was playing with his toys quietly by himself. Meanwhile, two other siblings, Lily and Jimmy, were studying by themselves regardless of the sound from the piano. The homeschooled children have to learn to perform different tasks at the same time sharing the space.

Besides, I also noticed the homeschooled children know how to coordinate when there is time conflict in sharing the space. For example, I observed when Lily was listening to the English CD by using the audio equipment in the living room, her brother, Jimmy, chose to work on his English at the dining table.

In addition to good relationship at home, the homeschooled children seem to have a good relationship in school when they are back to school. Cindy went back to school for a whole year.
According to Chelsea, she got along with her classmates during the time in school. As mentioned, the homeschooled children also participate in study groups and relevant activities. Since all of these study groups are mixed-aged, the older children are exposed to many opportunities available for taking care of the younger ones as part of their socialization development in various study groups and activities.

**Conclusion**

Though homeschooling is not the mainstream educational choice in Taiwan, it is worthy of notice that it is becoming increasingly popular. More parents show their interest in homeschooling and some of them already chose homeschooling as a better educational way for their children. Besides, good character, loving relationship among siblings, passion for learning, and development of individual talents. These reasons and the increasingly popular homeschooling movement can be taken as an opportunity to examine public school education in Taiwan and hopefully to improve some of the existing deficits in school.

In addition, many homeschooling parents interviewed indicated that the focus of school education in Taiwan is primarily academic performance and test-taking skill training. It would be a great waste if education is limited to the studying of books as emphasized in Taiwanese traditional education.

In conclusion, the Christian parents attempt to raise faithful children with good character and high motivations for learning through homeschooling. Besides, the family continued to homeschool for time flexibility, freedom to provide their children with religious education, and the fact that homeschooling is family-focused. Nevertheless, the homeschoolers are also concerned about their children’s future in the educational environment in Taiwan because they expressed a sense of uncertainties for whether their children are able to go back to regular public schools without any problems with administration, particularly above the 9th grade.

The findings of this study about Christian homeschooling, including the emphasis of a family-centered education, the close relationship between family members, and the fact that socialization is not a problem in homeschooling, also provide new empirical evidence for a better understanding or further acceptance of homeschooling in Taiwan.

The homeschooling parents in this study are not anti-school or holding unschooling attitudes; on the contrary, they are highly concerned about their children’s education. They are adding or prioritizing something good in education with an attempt to make it more holistic by
means of homeschooling. It is significant to clarify because the relationship between regular schools supported by the government and self-dependent homeschoolers should not be competitive or in a tension. The ideal scenario is to have a cooperative and supportive relationship between schools and parents (homeschoolers) for the best profit of children, particularly for the homeschooled children, as they choose a less-taken road (homeschooling) in Taiwan.

A Study of 8 Fundamental Moral Characteristics among Thai Undergraduate Students

Patariya Ngammuk, Ph.D.
Bangkok University International College
Bangkok, Thailand

Abstract
The objective of this study is to explore the eight fundamental moral characteristics of undergraduate students in order to benefit instructional model development. The eight moral characteristics are diligence, frugality, honesty, discipline, politeness, cleanliness, unity and generosity. The study findings rank these eight moral characteristics from the highest to the lowest as follows: politeness (4.35), generosity (4.14), honesty (3.96), unity (3.90) cleanliness (3.883), discipline (3.72), diligence (3.48) and frugality (3.46). With the moral characteristic data provided by this study, teachers can develop instructional models and activities inside and outside of the classroom in a more targeted manner.

Introduction
The Thai Ministry of Education has established an urgent policy reforming the education system with moral characteristics having priority over knowledge. With a sense of awareness of the sufficiency economy philosophy, harmony, peaceful actions and democratic practices, it is believed that students will mature into content, knowledgeable, morally sound individuals. To this end, educational institutions of all levels are required to instill in their students the following eight fundamental moral characteristics:

1. Diligence: A diligent person is the one who is determined to engage in positive and proper endeavors. He is hardworking, perseverant, willing to face obstacles and appreciative of the work he is in charge of.
2. Frugality: A frugal person is the one who leads a simple life and in awareness of one’s status. He thinks before spending and knows how to save.
3. Honesty: An honest person is the one who remains true to his duties and profession. He is punctual and carries out his duties to the fullest.
4. Discipline: A disciplined person is the one who acts within the boundary of regulations imposed by the educational institution, other agencies and the nation.
5. Politeness: A polite person is the one who acts humbly in accordance with the circumstances. He is the one who is not aggressive.
6. Cleanliness: A clean person is the one who keeps his body and mind clean.
7. Unity: A united person is the one who has his mind open to the opinions of others. He is aware of his role as a good listener and follower.
8. Generosity: A generous person is the one who does not concern himself with only himself and his business. He is considerate to others.

Teachers are important individuals who can influence changes of behaviors in the students. One of their responsibilities is to instill in the students an appreciation of moral characteristics and morality, as well as the proper values. The same is true for teachers at the university level. In fact, it is even more important for them to help in this area inside and outside of classrooms. Teachers need to pay attention to their students and be perceptive to signs indicating the urgent need for intervention in order to ensure that the students are not lacking any moral characteristic. The following ideas should be observed by the teachers when engaged in this effort:

1. All teachers are a role model for moral characteristic. They are a living instructional material the students can readily imitate.
2. Moral characteristics should be taught integratively in other lessons. All learning activities need to incorporate a basic moral characteristic such as diligence, honesty and frugality.
3. A supportive environment is required for the development of moral characteristics. Praises and recognition provide valid meaningful incentives to encourage most students to elevate themselves to the social norm of the institution.
4. The politeness, gentleness and kindness offered by the teachers will help the students open up and develop moral characteristics more easily.
5. Teachers need to be perceptive and able to identify normalcy or signs of threat in the students in order to implement a preventive or corrective measure in a timely manner.

Given the above reasons, the researcher is interested in the study of eight moral characteristics of undergraduate students in order to obtain the data necessary for the development of instructional activities and virtuous, competent students in accordance with the policy of the government.

**Study Design and Data Collection**

This is an exploratory study where the researcher studied all conceptual frameworks, literature and textbooks on the eight moral characteristics; analyzed the contents, and, developed an evaluation questionnaire which is then used with 50 students. The Cronbach confidence obtained is 0.97. The 100 copies of data collected from undergraduate students were analyzed using a standard statistical
software which yielded percentage, average and standard deviation. The researcher collected the data by herself.

**Findings**

The data collected reveals the eight moral characteristics of undergraduate students as follows:

Table 1: Average of eight Fundamental Moral Characteristics

<table>
<thead>
<tr>
<th>Eight Fundamental Moral Characteristics</th>
<th>Average</th>
<th>Order from the highest to the lowest</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Diligence</td>
<td>3.48</td>
<td>7</td>
</tr>
<tr>
<td>2. Frugality</td>
<td>3.46</td>
<td>8</td>
</tr>
<tr>
<td>3. Honest</td>
<td>3.96</td>
<td>3</td>
</tr>
<tr>
<td>4. Discipline</td>
<td>3.72</td>
<td>6</td>
</tr>
<tr>
<td>5. Politeness</td>
<td>4.35</td>
<td>1</td>
</tr>
<tr>
<td>6. Cleanliness</td>
<td>3.83</td>
<td>5</td>
</tr>
<tr>
<td>7. Unity</td>
<td>3.90</td>
<td>4</td>
</tr>
<tr>
<td>8. Generosity</td>
<td>4.14</td>
<td>2</td>
</tr>
</tbody>
</table>

The study has found that students have politeness the most and frugality the least. Therefore, all those who are involved with the management of education at the higher education institutions need to collaborate into the technical and the extracurricular activities with the hope to help students become aware of the need to be frugal and mindful of one’s status so that they will learn how to save, spend, rationalize and lead a simple, modest way of life.

**Summary and Discussion**

The study findings rank these eight moral characteristics from the highest to the lowest as follows: politeness (4.35), generosity (4.14), honesty (3.96), unity (3.90) cleanliness (3.83), discipline (3.72), diligence (3.48) and frugality (3.46). Apparently, the teachers and the institutions need to realize the need to promote the eight moral characteristics in the students as required by the Ministry of Education. They have to establish a guideline with activities inside and outside of classrooms to encourage the desired behaviors of savings. The educational institutions need to define their roles clearly and position themselves as a good model for the students. They need
to have a policy highlighting the significance of the sufficiency philosophy, with practical activities and programs to help encourage income generation and savings, as well as activities with relevant third parties. Another moral characteristic with average below 3.5 is diligence. The teachers and the institutions need to work together and help the students become determined, hardworking, perseverant, willing to face obstacles and appreciative of the work they are in charge of. The eight fundamental moral characteristics cannot be taught efficiently in class. Nevertheless, one can arrange for encouraging ambience and environment to help create awareness in the students.

Recommendations

Based on the study findings, the researcher has recommendations as follows:

1. Recommendations from the research

   Students should be developed in terms of frugality, diligence and discipline. The guidelines suggested by the researcher are as below:

   1.1 Policy: Higher education institutions need to plan for the development of the desired moral characteristics. The administrators need to be determined to succeed, aware of the significance, focused on academic and extracurricular activities, and, build a network of collaboration with the community (e.g. savings program and income generation program). The ambience and the environment within the institutions must be accommodating to the development of discipline and diligence in the students.

   1.2 Curriculum: Develop integrative curricula where students are encouraged to cultivate their intellectual potentials with discipline and diligence so that they will know how to allocate their time for study and other activities. Students should be encouraged to explore themselves and to enroll in courses where the sufficiency economy philosophy is explained.

   1.3 Activities: In order for the moral characteristic development activities to be efficient, the institutions need to create a mutual understanding with all concerned parties and concentrate on more proactive and diverse activities such as demonstration, exhibition, sales of local products and awareness creation program.

2. Recommendation for future research

   2.1 Conduct a research to identify the format of activities that will help develop the eight fundamental moral characteristics.
2.2 Conduct a research to improve the curricula towards an integrative model for the elevation of the eight fundamental moral characteristics.

Abstract

The education and training of students to become culturally competent and globally aware is a priority in higher education. Faculty hold the keys to international experience for students by offering an international curricular focus, coursework, and enrichment projects. Utilization of the Internet as a portal for international collaboration holds promise to broaden the ability of faculty to facilitate global education and research. This pilot study assesses the current participation in, support of, and barriers to Internet-based international collaborations of 34 faculty from 13 different countries. A high level of personal experience with Internet collaborations utilizing primarily e-mail and online chat was reported by 82% of the faculty. Common barriers cited to Internet-based collaboration were the lack of administrative and financial support to begin or maintain the activity. An overwhelming majority (90%) of the respondents indicated the need for an Internet-based portal for the purpose of international collaboration and education.

Introduction

In this time of global economic expansions and innovative technology, it is important for educators and students to be aware of the similarities and differences among the various cultures and nationalities. Achterberg provides a compelling argument that today’s higher education graduates must be globally prepared, regardless of study discipline. Thus our focus must expand beyond student competence in their individual domestic disciplines to encompass all skills necessary to communicate with various people groups with which they may be interacting. To this end, Brustein states five major challenges facing higher education: 1) redesigning the curriculum, 2) achieving faculty buy-in, 3) financing study abroad, 4) integrating international students, and 5) rethinking how foreign languages are taught (p. 382). He went on to say “Without global competence, our students will be ill-prepared for global citizenship, lacking the skills required to address our national security needs, and unable to compete successfully in the global marketplace” (p. 382). Effective implementation of global perspectives need to be woven through all aspects of higher education and embedded in the curriculum through activities designed by enthusiastic faculty and recognized at all levels including the discipline, academic, department and institution.

The term internationalization, (describing physical border-crossing activities) is a term that is more currently replaced by the term globalization due to world-wide trends and global competition. Globalization can be viewed in four different perspectives: 1) geographical, 2) authority, 3) cultural, and 4) institutional. Edwards speaks of the leading role American educational institutions play based on a number of factors, including the use of English language globally. However, others confront the problems encountered when studying in environments that are very different from one’s home country, such as opposing philosophical views of the world and variations among long-standing social traditions.

Historically, international education has primarily focused on faculty and/or student exchanges or internships in foreign countries. These types of exchanges typically vary from one year of education to a short term designated assignment. One common objective of all types of exchanges was to promote cultural immersion, thereby enhancing the student’s cultural competency. “Cultural competence may be defined as a set of academic and interpersonal skills that allow service providers to increase their understanding and appreciation of cultural similarities and differences within and between groups so that they are able to draw on a particular community’s values, traditions, and customs in developing effective and appropriate interventions” (p. 16).

In an effort to prepare students to compete globally, educational institutions have encouraged some form of international education in the curriculum. However, face-to-face interactions and culture immersion has been somewhat hindered due to international travel and security concerns. Other obstacles to international exchange include financial concerns, family commitments, and other circumstances that require academic studies and professional training activities to be place bound. For example, foreign language instructors may choose to live for a period of time in a foreign country to develop both “cultural and linguistic competence” (p.1) to better prepare even the non-language major student who may, at some point in his/her career, find a need to work, study, and live in a foreign country and/or within a different culture.

Other career disciplines are also exploring the need for and implementing international collaboration opportunities. In the area of science, graduates may find themselves collaborating with individuals from various countries, traveling to other countries for conferences, or both. Guest, Livett and Stone found that science students who do participate in exchanges do so in fulfillment of the nonscience components of their degrees. In a study of science graduate students, Ynalvez and Shorum found the students to be more domestically collaborative than internationally. Two over-arching reasons for science students not to participate in exchange programs could be lack of awareness of exchange programs and cost. Faculty support the idea of international experience, however, they do not support it as compulsory (p. 386). As higher education trains executives and technicians, “the main growth is in globally mobile degree in business studies and computing” (pg 7). International collaboration in organizational behavior and management is evolving from reading others research to designing projections and practices that are of global nature, but can be applied locally.

The Runestone project was a virtual international collaboration, involving students and faculty from four educational institutions in three different countries (USA, UK and Sweden), where computer science students were assigned problem-solving tasks.
projects to be remotely coordinated among student groups to include representatives from each institution. The primary objective of this project was to provide the students with international contacts and prepare the participants with skill sets to interact on a professional level with colleagues from different cultures and educational backgrounds.\textsuperscript{16} Among the problems reported by students were the six-hour time difference, delays in response time, procrastination, poor communication, lack of technical skills, and differences in motivation (p. 130). Also cited was the lack of facilitation on the part of the group leader, which suggests that perhaps faculty did not have the time to devote to this type of educational exercise (p. 131).

The University of Pittsburgh Global Academic Partnership Program (GAP) is an example of another Internet-based academic portal. The strong international support of this University led to the design of the GAP to entice faculty to become “engaged in the efforts to internationalize the campus” (p. 387).\textsuperscript{2} GAP supports the exchange of interdisciplinary research and information between faculty and their international counterparts thus minimizing the barrier of the participants’ time needed to develop and maintain such a portal.

Another University of Pittsburgh product is the “Supercourse” which provides "freeware" streaming voice-video presentations via the Internet for medical, nursing, dental, and veterinary schools. Similarly, the Association of Schools of Public Health (http://www.aphs.org/document.cfm?page=1084) is currently in the early process of establishing globally accepted curriculum for global health programs and competency requirements for masters-level global health programs. The need for and work toward core health education competencies is also exemplified by the Galway Consensus Conference. This consensus group is the joint effort of the International Union for Health Promotion and Education, the Society for Public Health Education and the US Centers for Disease Control. First organized in 2008, the purpose of this group is to stimulate dialogue among those who represent the various domains of global health care.\textsuperscript{17}

In area of healthcare, faculty, students, and clinicians have experienced various opportunities to be involved with international exchanges. Ease of travel and relocation throughout the world has prompted health professionals and health educators to more carefully examine their sensitivity to the differences in cultures. Cultural competency is also being integrated into curricula and professional activities to better prepare the health professional. Typically, student/faculty health practitioners primarily practice short-term immersion into other cultures and countries as advisors or educators to improve health through programs such as “train-the-trainer” courses or to extend “helping hands” in disaster situations. Other health professionals travel more for personal quest to “see the world.” At the other end of the spectrum is the use of telemedicine and teleconferencing where patients may be “treated” by a specialist via computer technology and practitioners can “consult” with little regard to geographic borders.

To more fully assess types of internationalization in the healthcare field, a search of the literature, using keywords allied health, education, global collaboration, and associated phrases was conducted. Results were primarily related to global health education reported through international student and/or faculty exchange. There appears to be a plethora of data describing international experiences related to nursing education programs in the United States (US). The primary objectives for international experience were developed for the purpose of enhancing the student’s professional, cultural and personal development. This practice has been ongoing among nursing programs for a number of years.\textsuperscript{18-21} According to Goldberg & Brancato,\textsuperscript{22} “nursing is a universal profession challenged by global issues, … by discussing mutual knowledge and developing a shared mission and objectives, nurses in an international partnership can assist in affecting changes for nursing practice, education, and research” (p. 30). In more recent years, medical schools have implemented similar experiential opportunities to increase the future practitioner’s awareness of cultural differences.

The field of dentistry has likewise employed similar international exchanges as the medical field though on a much smaller scale. In an effort to improve dental hygiene practice in Australia from a global perspective, Luciak-Donsberger and Aldenhoven\textsuperscript{23} found varying levels of education as well as professional autonomy. This gave the international dental hygiene community a baseline assessment needed to understand similarities and differences. International research collaborations were examined by Catalanotto et al\textsuperscript{24} who found that dental-related global collaborations were primarily based on individual relationships between faculty from different countries working on specific grants. Dental faculty and practitioners have advocated for the development of a global oral health course intended to broaden the student’s understanding of global oral...
Healthcare Faculty Interest in Internet-based International Education Collaboration

Having et. al

health needs and programs. This would be a positive step towards global awareness for future dental professionals leading to possible international exchanges.

A position paper was developed by a work group from the American Dental Education Association Leadership Institute advocating for an increase in global collaboration and standardization in dental education. With unmet national and international oral health needs, rapid growth of “dental tourism” and the reality of the dental materials and supplies produced by international companies, a global mindset is essential. These authors go on to say “An ideal approach to the globalization of dental education is for all countries to work together to identify common challenges, share experiences, and pool intellectual resources” (p. 409).

Existing mechanisms of international pooling of intellectual resources include the MedEdPortal (www.mededportal.org) designed to be a depository of peer reviewed educational materials for both the medical and dental educators. In 2006, the World Health Organization formed the Global Health Workforce Alliance. The goal of this group, representing “governments, civil society, international and regional institutions, professional associations, academia and the private sector” was to create a “joint platform for consolidated action on the health workforce crisis” (www.who.int/workforcealliance/about/history/en/index.html). One of the members of the alliance is the Global Health Education consortium (http://globalhealtheducation.org/SitePages/Home.aspx). The objectives of this group of health care educators include international exchange opportunities for faculty and students as well as development of culturally sensitive health education modules to be shared globally. Another member of the alliance is the Global Healthcare Information Network (www.ghi-net.org). The goal of this organization is to serve as a repository of health information which can be freely accessible to medically underserved areas world-wide.

The interest and involvement of university faculty plays a key role in the globalization - or lack thereof - in higher education. Stohl makes a strong argument that “Our challenge is to convince faculty that their scholarship and teaching will benefit from these (globalization of higher education) efforts by considering the risks and reward structure within our institutions and faculty structure” (p. 359). He goes on to explore the difficulties in engaging faculty in his institution to embrace globalization and found that the international educational or research activities in his institution were done by one or two key faculty. Through years of work to internationalize his campus, he came to the conclusion that it was the lack of faculty interest and involvement that killed student interest. Though barriers to globalization in education were not specifically discussed, the associated need for time and funding may be an underlying reason for low faculty involvement. Stohl made a strong appeal to capture faculties’ attention and convince them that globalization is in their students’ and professional best interest.

Another potential deterrent to participating in global exchange is the current international climate of economic and political instability. Also, institutional funding for international exchange is dwindling within the US. Given the current economic and political environment, educators are looking to technology to connect students and faculty regardless of time and place. Globalization is today a reality owing to advances in information technology and the innovation of businesses worldwide. Where exchange programs to develop cultural competency may not be feasible, an Internet-based collaboration and exchange portal may provide a pedagogical alternative.

The Internet has increased the ability of individuals throughout the world to link with each other without the time and expense associated with traveling. It has also enabled the public to receive information from other media resources such as television and newspapers. Recently a number of different organizations have banded together to collect and disseminate educational materials through open Internet access (See Table 1). Most of these organizations further explain on their websites that educational research, collaboration and exchange are promoted, as well. The focus of information varied from agricultural/environmental issues to public health information. There were no website portals that included allied health in its focus population found, however. For purposes of this discussion, allied health professions will be defined as persons “involved with the delivery of health or related services pertaining to the identification, evaluation and prevention of diseases and disorders; dietary and nutrition services; rehabilitation and health systems management, among others. Allied health professionals, to name a few, include dental hygienists, diagnostic medical sonographers, dietitians, medical technologists, occupational therapists, physical therapists, radiographers,
respiratory therapists, and speech language pathologists” (www.asahp.org/definition.htm).

Beyond nursing and medical school student international exchange, little information was found in the literature related to exchange programs or Internet-based educational portals for the allied health student and/or faculty. The global sharing of educational curriculum, research and exchange among allied health programs will not be without challenges. Miller and Gallicchio suggest that primary obstacles may be the international variations on educational and training standards from one country to the next. Nevertheless, “the new millennium brings the potential for an integrated clinical, research, and educational collaborative environment that must consider economic, demographic, environmental, social, epidemiological, political, and technological change.” (p. 236).

Given the need to increase international collegiate collaboration, we wanted to gain insight into current international activities of faculty from various countries. Though we were aware of face-to-face exchange programs, we did not know the level of interest or current use of the Internet for international collaboration activities.

The purpose of our study is to determine the following:

1) Is there current participation in any type of Internet-based educational collaboration and exchange on an international level?
2) What are the perceived barriers related to integration of Internet-based educational collaboration and exchange?
3) Is there an interest in Internet-based global educational collaboration and exchange on an international level?

Purpose of Study

The purpose of this study was to investigate present usage; perceived barriers to Internet-based educational collaboration and exchange on an international level; and personal interest in Internet-based international education.

Methods

Procedure

A twenty item, multiple choice/short answer questionnaire written in English language and translated to the Arabic language was developed by the researchers. The instrument was tested for content construction by three international faculty and received institutional human subjects approval. The survey was distributed to consenting university healthcare faculty who were attending various professional meetings in Europe and the Middle East. Once completed, the survey was placed in an envelope and handed back to one of the researchers. The surveys were free of personal identification and therefore anonymous. Two demographic questions identified the respondent’s primary job description and country of residence. The remaining questions addressed 1) the respondent’s personal level of experience with global collaboration/exchange; 2) degree and types of institutional participation in international collaboration; 3) significant barriers to international collaboration and actions implemented to overcome these barriers; 4) level of interest in participating in an Internet-based international collaborative effort; 5) types of activities one might like to utilize via Internet-based international collaboration; and 6) identification of web-sites currently being utilized for international collaborative efforts. The quantitative results were analyzed utilizing frequency distribution. Respondents’ short answers were assessed for common themes by question and reported as representative quotes.

Results

Respondents

This study was conducted using a convenience sample of 34 university faculty attending one of three international conferences held in Zagreb, Croatia; Cairo, Egypt; or Rome, Italy. In addition, surveys were administered during face-to-face meetings held in Palermo, Italy, and Ljubljana, Slovenia. These international conferences and meetings garnered responses from 13 different countries including: Canada, Croatia, Egypt, Greece, Germany, Italy, Netherlands, Romania, Saudi Arabia, Slovenia, Sweden, the United Kingdom, and the United States. The professions represented by participating university faculty included dentistry, dental hygiene, medicine, public health, epidemiology, and social work.

Existing Level of International Collaboration

Personal Experience

When responding to personal levels of experience with global collaboration, 41% (n=14) reported a
Healthcare Faculty Interest in Internet-based International Education Collaboration

Having et al.

high level of personal experience with global collaboration, 27% (n=9) reported a moderate level of experience, and 32% (n=11) reported a low level or no experience (see Table 2). Personal experiences described were, for the most part, personal international visits or face-to-face interactions. Over 82% (n=28) reported a high or moderate level of experience with Internet-based collaboration, primarily utilizing e-mail and web-based chat. When asked about personal experience with web-based curriculum, only 9% (n=3) had a high level of experience while 67% (n=23) reported either low or no experience with this medium (see Table 3).

Institutional Participation and Reported Barriers

International collaboration activity was high (94%) among the institutions represented by the participants. Types of activities included workshops, distance learning, research projects, teacher and student exchanges and projects. Institutional activities utilizing the Internet were primarily online courses or continuing education. Those respondents who had indicated their institution had participated in international collaboration were asked whether the following barriers were encountered: administrative support to develop; administrative support to maintain; financial support to develop; and financial support to maintain. The responses were fairly consistent across the four categories. Program development, program maintenance, and financial support for program development was reported by 56% (n=19) of the respondents. A slightly greater number (65%, n=22) reported financial barriers to maintain international collaboration activities.

One respondent commented on their institutional barrier experience stating “This is an important area, but [it is] not seen as an institutional priority.” Another simply said “Work, work, work.” Lack of time, work load, computer literacy problems and lack of proficiency in foreign language were also cited as personal barriers that hinder more involvement with international collaboration.

Though there were a number of barriers reported, faculty also noted numerous actions taken to overcome the problems or barriers cited. Creative problem-solving and determination were exemplified by statements that included:

“Some of the fees were delegated to applicants.”

“We applied for additional grants and finally supported the collaboration within the University.”

Several respondents expressed a strong need for faculty and staff training and development to cope with the additional workload involved with international collaboration. Some respondents simply commented “none” when asked what actions were taken to overcome the stated barriers.

Interest Level for International Internet-based Academic Collaboration

Respondents were then asked to indicate perceived level of interest their institution had in Internet-based international education. Of the 29 educators who answered this question, 29% said their institutions had a high level of interest, 50% moderate, and 6% indicated a low level of interest. When asked to describe their personal level of interest in Internet-based academic collaboration and international education, high levels of interest were expressed in both topics with respondents reporting 47% and 53% respectively (see Table 4).

Imagine an Internet-based Portal for Collaboration and Education

When asked if they envisioned the need for an Internet-based portal for the purpose of international collaboration and education, 90% responded in the affirmative. Respondents provided a wide variety of activities they would like to see included in a portal such as: the exchange of curriculum, research projects, evaluation resources, innovative approaches to teaching, lectures, seminars, guideline dissemination, chat and exchange of behavioral techniques. One respondent described the need for “academic research project ‘matchmaking’” by bringing together units and researchers in the IT [information technology] education field”. The verb “exchange” was repeatedly used to express their interest in how the Internet could facilitate international collaboration and education. Typically, respondents described one or more activities for this question possibly affirming the high level of interest reported in the previous question.

Even with a high level of interest, educators have some concerns with an Internet educational web portal. As with reported institutional barriers, faculty expressed that they would not have enough time to utilize this tool. Examples of faculty comments were “Time... e-mail is busy enough” and “[It] must not
substitute everything else.” Other comments identified personal preference issues such as “I prefer personal contact for initial discussion”, “User friendliness is a concern” and simply “Privacy”. Acceptance by other faculty members was voiced by some, described as “It might be restricted by the more traditional faculty members” and “Barriers with professors or universities and students” Language and time zones were also listed as potential deterrents.

Though 43% of respondents indicated that they were not aware of any existing Internet-based educational portal, 50% reported that they were aware of one or more and went on to list existing sites. The Association of American Medical Colleges and the American Dental Education Association’s MedEdPortal was mentioned along with Blackboard and Tobacco Free! Curriculum as examples of existing Internet educational portals. Awareness of other sites was indicated although the exact name or web address was not known.

Several respondents expressed interest in obtaining the results of this study and requested a re-print of the findings once published. Overall, the depth of responses provided to the open-ended questions reflected a high level of interest elicited from this group of voluntary respondents.

**Discussion**

The purpose of this study was to investigate present usage; perceived barriers to Internet-based educational collaboration and exchange on an international level; and personal interest in Internet-based international education.

**Present Usage**

Overall, the majority of the respondents had experience with international collaboration and primarily face-to-face. Although the majority did have experience with the Internet, e-mails, and other forms of electronic global communication, close to half of the participants reported low or no experience with web-based curriculum. Likewise, when asked about what was available in web-based curriculum, the three sites stated were generated from American sources (MedEdPortal, Blackboard, and Tobacco Free! Curriculum). This may demonstrate a lack of awareness or familiarity with similar web-based healthcare curriculum sites originated from and utilized in other countries.

**Perceived Barriers**

Over half of the respondents indicated barriers to international collaboration as being institutional in nature, such as program development, program maintenance, and financial support. As with other pedagogical projects, faculty members need to have the time and resources to develop, implement, and evaluate. The written comments by the respondents provide even greater evidence of these barriers as primary concerns with international collaboration. Once initial contacts are established, it is difficult to maintain these relationships when there is a lack of financial commitment needed to support these exchanges.

Other reasons for non-participation or discontinuing international activities are more on personal and professional levels such as language barriers, lack of computer skills, workload, and time. Reflecting the comments of Stohl stressing the importance of motivating and encouraging faculty, participants also expressed the need for “Keeping up the spirit and finding the right enthusiastic person” as an important aspect of continuing international collaboration. Faculty are gate-keepers for student interest in and opportunity for international experiences. An important strategy for the expansion of Internet-based education and collaboration may lie in ease of faculty access to an allied health Internet portal to better facilitate international collaboration.

**Personal and Perceived Institutional Interest in Internet-based Education**

Encouragingly, over half of the respondents reported a high level of personal interest in Internet-based international collaboration and a need for an Internet-based educational portal. During survey collection, several participants expressed enthusiasm and excitement in the concept of an Internet-based educational portal which was reflected in the range of projects suggested including curriculum exchange, research activities and just chatting with faculty in other countries. The opportunity to easily exchange information and resources with faculty having similar interests across the globe may be an important element needed to encourage faculty buy-in. Faculty involvement must be nurtured and supported in order to implement international collaboration in higher education.
Future Directions

The literature affirms the need for secondary and post-secondary education to include cultural competency to better prepare the graduate for global citizenship. The utilization of Internet portals, such as the GAP or MedEdPortal, could be an answer to solving some of the restriction placed on face-to-face international collaboration. Several of the restrictions could be eliminated through institutional initiatives. First, the issue of time and money required to move faculty/students from one place to another would be addressed, although it does limit the richness of cultural immersion derived when one can actually live and work in a foreign country. Second, a wider range of individuals could be reached and served through a global network. Third, administrative support for an Internet collaboration portal may be enhanced by the knowledge that the individual faculty member would not be physically absent - reducing the need for coverage of faculty academic responsibilities. However, supplementary administrative support in non-financial avenues such as acknowledgement in merit, tenure, and promotion documentation should be addressed. Workshops for faculty and staff members could be offered to enhance the pedagogical resources available via Internet in the classroom. Undergraduate and graduate students are often more competent with computers than faculty members due to their life-time exposure and socialization with technology; these individuals should be utilized in reverse roles. Grants and other funding sources within an institution, a profession, and a geographic location or culture need to be investigated along with federal and international agencies that support international education.

Conclusion

The literature affirms the need for secondary and post-secondary education to include cultural competency to better prepare the graduate for global citizenship. This pilot study sought to assess the current participation in, support of, and barriers to Internet-based international collaborations through a convenience sample of 34 dentistry, dental hygiene, medicine, public health, epidemiology, and social work faculty from 13 different countries. The results suggest that there is an interest in developing an Internet-based educational collaboration and exchange at the international level.

The interpretation of the findings, however, is not without limitations. This paper was written from the perspective of university faculty teaching in the United States and may represent a single country bias. Another limitation is the self-reporting methodology used in the surveys. The results can only be as accurate as the input from the respondents. The misinterpretation of the question, given the multi-nationality of the respondent group, is also a possible limitation. For example, there may have been differing opinions and perceptions (subjective interpretation) when choosing from the “high, medium, and low” survey selections. Results were limited by participants’ level of interest in full completion and submission of surveys. Lastly, this convenience sample does not represent the entire global population of university educators. Admittedly, university faculty who are able to attend an international conference may enjoy a greater level of university support and experience than faculty who lack adequate resources to attend such meetings. Internet communication has the potential to provide resources to a more diverse population of allied health educators.

This study provides a unique and interesting snapshot of health care faculty level of interest in globalization of education via the Internet. As this concept is moved forward and adopted by faculty and institutions, new models of education, collaboration and research can be developed and expand this important endeavor. A follow-up study to include a more expansive cross-representation of international allied health educators is recommended. Further studies to collect data on personal and institutional facilitators to Internet-based international education collaboration and exchange are also suggested.

Effects of Multidimensional Concept Maps
Web-based Courseware on Fourth Graders’
Learning of Computer Program

Abstract

This study explored the effect of multidimensional concept maps (MCMs) on fourth graders’ learning performance of computer program. In order to evaluate the effect of MCMs on students’ learning performance in a computer program, computer learning websites with MCMs and Novak concept maps (NCMs) were set up. The participants were 103 students from three classes of fourth grade at one elementary school at Changhua County in Taiwan. One class was assigned as MCMs group, while the other two classes were assigned as traditional linear textbooks (TLTs) control group and NCMs group individually. Four weeks of computer teaching were conducted on the three groups. The results indicated that students in the MCMs group produced significantly higher learning achievements compared to those in the TLTs and NCMs groups, and students in the NCMs group had higher learning achievements than those in the TLTs group. Furthermore, when TLTs, NCMs and MCMs students’ learning satisfaction on computer program were compared, MCMs students had significantly higher satisfaction with computer program than TLTs and NCMs students, while NCMs students were more satisfying with learning computer program than TLTs students.

Keywords: Cognitive Overload, Computer Program, Concept Maps, Disorientation, Multidimensional Concept Maps Web-based Courseware
1. Introduction

After 1990’s, the technology of computer software and hardware have been rapidly developed with the current trend - utilizing internet to convey information. Beneath the world wide web (WWW), multimedia and hypermedia can transfer and present innovative approaches in teaching and learning. These new approaches will be the pioneer to broaden the path of e-learning in the future. E-learning activates teaching and learning in traditional classroom, in which learning takes place in a computer connected to internet without the limitation of time and space (Harris, 2001).

However, learning via the world wide web might lead to certain problems as cognitive overload, disorientation, learner’s over-control, and knowledge structure can not be integrated (Chiou, Huang, & Hsieh, 2004; Dias & Sousa, 1997; Liu, 1994). Such problems would reduce learning achievements (Beasley & Waugh, 1995; Begoray, 1990; Chang, Sung, & Chiou, 2002; Conklin, 1987; Dias & Sousa, 1997; Komers & Lanzing, 1997; Lee & Baylor, 2006; Liu, 1994; Tripp & Roby, 1990). In order to solve the above problems and enhance learning achievements in e-learning, good navigational methods will be necessary in the courses of e-learning. For instance, e-learning materials presented by navigation maps or concept maps could reduce disorientation occurring in nonlinear learning structure of hypermedia and improve learners’ learning achievements (Chiou et al., 2004; Chang et al., 2002; Lai & Waugh, 1995).

The navigation map is regarded as table of contents presenting the hierarchical structure of the hypermedia document. Each table links up the hypertext with the original linear-presented text (Chang et al., 2002). Therefore, the main frame of the navigation map is linear with text-based format; accordingly, this e-learning approach can merely improve learner’s disorientation to a limited extent (Calvi, 1997; Dias & Sousa, 1997).

Concept map, proposed by Novak in 1972, is the representation of two dimensions and the illustration of hierarchical connection among concepts which facilitates learners to diminish learner’s disorientation as browsing linear-organized materials (Chang et al., 2002) and integrate and organize knowledge in learning processes (Chiu, 2008, 2009; Novak & Gowin, 1984). However, the concept map still remained in two dimensions for last four decades (Beyerbach, 1998). Traditional concept map presented knowledge structures in a plane dimension had difficulties in coping with great amounts of concepts or complex combinations of concepts and possibly led to cognitive overload (Chiou et al., 2004; Huang, Shiu, Wang, & Chang, 2005). Multidimensional concept map systematically reorganizes different plane concept maps and arranges complex and difficult ideas to other dimensions in order to
simplify it. With the function of hyperlink in internet, the multidimensional concept map provides the teaching material and extends its depth and breadth towards learning achievements (Chiou, et al., 2004; Huang et al., 2005).

Since internet and technology has been generally adopted in teaching, many previous studies showed that e-learning materials designed by concept maps could successfully eliminate learner disorientation and enhance their learning achievements (Chang et al., 2002; Ferry, Hedberg, & Harper, 1997; Kennedy & McNaught, 1997). While various complex concepts embedded in two-dimensional concept map can not be presented in one frame, learners’ cognitive overload may occur and therefore reduce their learning efficiencies and achievements (Chiou, et al., 2004; Huang et al., 2005). The multidimensional concept map in this study is developed to solve these problems. Therefore, this study aims at comparing the presentations of multi-dimensional concept map, Novak two-dimensional concept map, and traditional linear e-learning materials, and their effects on primary school students’ learning achievements and interests in computer courses.

2. Theoretical framework

2.1. Multidimensional concept maps’ application for e-learning

Multidimensional concept maps apply design of divided and conquer (Bshouty, 1995), showing a simplified concept map version of the traditional Novak concept map. It is the method which separates the original difficult and complex concept map into several parts of the map, as shown in Figure 2 (Chiou, et al., 2004; Huang et al., 2005). For display of knowledge structure, psychologist Miller (1956) addressed the human brain short-term memory capacity limitation theory. It clearly points out that the human brain short-term memory capacity is seven, plus or minus two, which also means that the short-term memory capacity for numbers (or vowels, syllabus, phrases) are plus and minus 2 from 7. In Miller’s short-term memory limitation theory, Novak two-dimensional concept map have its flaws and weaknesses. Thus, this study’s concept map system tends to follow Miller’s (1956) short-term memory capacity limitation theory and indicate each screen picture in an easier method. Each picture does not exceed students learning capability; enabling students learn and understand in an easier way for a better learning efficiency. This method is applied onto web-based courseware structuring process. It can simplify the complexity on the screen picture. Students can learn in a proper progressed schedule (Chiou, et al., 2004). The following is introduced as the structuring steps of the multidimensional concept maps.
2.1.1. Establish individual fundamental learning unit for multidimensional concept map e-course material

Figure 1 is the traditional Novak concept map e-course material. The traditional Novak concept map arranges all concepts in the single screen picture of the computer, which will cause the screen picture to be unable to hold the intact course content. The learner will not study unless utilize and spur the roller bearing way. When course knowledge must increase and upgrade constantly as time, Novak concept map will be unable to change flexibly to maintain the integrality of course knowledge. Thus, it is difficult for the learner to understand intact course knowledge structure. However, the multidimensional concept map e-course material, according to the design principle of divided and conquer, resolves the complicated concept map into the specific small unit, and then classifies and recombinates the knowledge in accordance with the actual demand process, and finally carries out the deepened and broadened function design. Figure 2 is the multidimensional concept map e-course material. It classifies and recombinates all concepts through network hyperlink skill. The learner’s main study screen picture is a basic conception unit of some simpler, easier study, and according to the learner’s unit test score or learning interests, he (or she) can learn advancedly in the deepened or broadened learning unit picture.

Figure 1. Traditional Novak concept map e-course material.
2.1.2. Establish the broadened learning function for multidimensional concept map e-course material

As Figure 3 shows, concept A represents a concept of inclusive nature in the main learning picture. Concept B and concept C are also concepts of rather inclusive nature. If concept A, concept B and concept C are material-related, then they can be used the hyperlink function to transform to broadened learning on its hyper-plane. Also, by broadening linking, each topic concept can develop to one complete knowledge frame, rather than pieces of individual nodes. Hence, learners are able to learn the complete and entire knowledge structure. Learners already have the ability to understand the basic and fundamental concept A on the main learning picture. Learners can also, after the concept A, learn according to their interests and learn, through the techniques of hyper-link, the broadened concept B and concept C.
2.1.3. Establish the deepened learning function for multidimensional concept map e-course material

When learners get well learning performance for the topic concept A and show interests of deepened learning over a certain group of concept nodes, multi-dimensional concept maps can be learned deepened according to learning paths. As Figure 4 indicates, the concept E which belongs to Concept A represents only as the elementary introduction. For learners that are of higher achievements, concept E can give a broadened learning path through its hyper-link function. Concept E can be taken to another new screen picture so that the complexity can be reduced on the picture, which also enables learners to choose learning unit dependence on their abilities.
3. Method

3.1. Research design

This study attempts to apply multidimensional concept map to e-learning, and investigates its effect on learners’ learning achievements and learning satisfaction. This study further adopts quasi-experimental method to explore whether there are differences of learner’s learning achievements and satisfaction among diverse approaches such as traditional teaching approach, Novak concept map, and multidimensional concept map.

Three classes taught by one of the authors were randomly chosen through elementary fourth grade. They were assigned respectively to traditional teaching control group, Novak concept map group and multi-dimensional concept map group. The Novak concept group applies the Novak concept map e-course material. The multi-dimensional concept map group applies the multi-dimensional e-course material. Traditional control group applies the regular traditional linear e-textbook material. The dependent variable of the study is learning achievement and learning satisfaction measurement. Learning achievement is tested based on the participants’ course objectives while the learning satisfaction measurement is based on the surveys done.
by students in order to understand students’ opinions on using the concept map materials. The main research structure is listed in Figure 5.

![Figure 5. Research structure.](image)

### 3.2. Participants

The participants of this study were students from an elementary fourth grade at Changhua County in Taiwan. Three classes were chosen randomly. They were divided into three groups, traditional teaching control group, Novak concept map group and multi-dimensional concept map group. The total number of students is 103. Traditional teaching control group has 33 students. Novak concept map group has 35 students. Multi-dimensional concept map group has 35 students.

### 3.3. Design of teaching material

This study conducts the design of the teaching material in accordance with its purpose of this study and the outcome of reviewing literature records. The multidimensional concept map, in accordance with the short-term memory theory, can be decomposed from the larger and complex map into smaller and simpler components. It will exhibit different subjects of the e-learning concept map programme through recombining the smaller components, which can also offer an easier and suitable way for learning and it simplifies the learning outcome. Design of teaching material is listed in Figure 6.
The first type of courseware applies traditional linear textbook material; that is, using on-line textbook to set up the courseware. The second type of courseware applies Novak concept map method to handle editing teaching materials, as shown in Figure 7.

Figure 6. Teaching material design process.

Figure 7. Novak concept map courseware partial illustration.
The third type of courseware uses digital courseware of multidimensional concept map. It classifies and recombines the teaching materials that Novak concept map materials built, which can simplify the complexity of the materials that the computer screen appears, as shown in Figure 8.
The instrument which this study uses in the process of the materials’ editing is the second section of the internet course material from the fourth grade of elementary school, network navigator – the browser. As for the set-up of learning websites, it mainly uses Microsoft Office FrontPage 2003 to process editing. The learning websites’ main function is to provide students to learn with the material of the second section of the internet course, network navigator – the browser.

3.4. Teaching experiment and the procedure of activities
3.4.1. Experiment procedure

This study’s teaching experimental procedure is shown in Figure 9.

Figure 8. Multidimensional concept map courseware partial illustration
3.4.2. Procedure and purpose of the teaching activities

This study’s teaching procedure, from the pre-teaching phrase to the final teaching experiment, is generally divided into three stages.

Stage one of teaching activities:
This stage is the pre-teaching preparation phrase. It mainly includes three working items:

a. set-up Novak concept map web-based courseware.
b. set-up multidimensional concept map web-based courseware.
c. set-up traditional linear textbook web-based courseware.

The main purposes in the stage mainly include:

a. set-up e-learning material for internet learning.
b. multidimensional concept map material can recompose Novak concept map material and simplify the complexity to be fitted onto computer screens.

Stage two of teaching activities:
This stage is the pre-test phrase before the official teaching experiment. It mainly involves two working items:

a. grouping.

---

**Figure 9. Teaching experiment procedure.**
b. conducting pre-test computer basic skills.

This stage has two main purposes:
a. placing students randomly into three groups of traditional linear textbook, Novak concept map and multidimensional concept map.
b. conducting pre-test, evaluating three group’s pre-course knowledge.

Stage three of teaching activities:
This stage is the official teaching experiment. It mainly involves four working items:
a. students learn the ‘network navigator – the browser’ unit through computer.
b. the three groups proceeds post-test.
c. filling out post-learning satisfactory level survey.
d. interviewing students sampling.

The purposes of this stage mainly include:
a. experimental group and control group proceed unit learning.
b. comparing the learning outcomes of the three kinds of courseware.
c. interpreting the learning satisfactory levels of the three kinds of courseware.
d. interpreting students’ opinions on the experimental teaching activities.

3.5. Experimental Instruments
3.5.1. Pre-test

The purpose of conducting the pre-test is to understand whether the ability of the experimental group and control group to learn this particular subject is any different before this teaching experiment. The pre-test handles the traditional teaching group, the Novak concept map group and multidimensional concept map group’s average grades in the first semester. The pre-test testing questions are the results of different reference books in accordance with the course learning objectives. The test is finalized after the computer information panel of the faculty discussed different factors including the academic levels of the student. The credibility reference of the test draws from the Kuder-Richardson reliability, formula calculated as 0.82.

3.5.2. Post-test

When the teaching experiment is finalized, to understand student’s learning outcome, the learning achievement testing is designed. The purpose of post-test is to compare three groups of students’ absorption degree to content of studying after teaching. The test is also finalized after the computer information panel of the faculty discussed different factors. Its credibility also draws from the Kuder-Richardson reliability, formula calculated as 0.85.
3.5.3. Teaching materials satisfaction survey questionnaires

The teaching materials satisfaction survey questionnaires are finalized from the reference of Chiou et al. (2004), totaling 15 questions. The questionnaires rate on a five-point Likert scale from ‘strongly disagree’ to ‘strongly agree’. The scoring scope ranges from (+5) strongly agree to (+1) strongly disagree. The questionnaires are given to three groups of students. The questions are generalized for the three groups; for example, question 2 says, “I am fond of this material helping me learn about the Internet”. The questionnaire also uses factor analysis method to form the three factors such as the teaching material content, the knowledge characterization, and individual differences. The result of degree of reliability analysis of the three groups shows Cronbach’s Alpha of the traditional linear teaching control group is 0.707. Cronbach’s Alpha of Novak concept map control group is 0.777 while the Cronbach’s Alpha of multi-dimensional concept map group is 0.893. Students were asked to fill out satisfaction questionnaires after post-test was finished. The main purpose of the questionnaire is to understand whether there is an eminent learning satisfaction differences in regard to the traditional teaching control group, Novak concept map control group and multidimensional concept map experimental group of students after carrying out the teaching experiment.

4. Result

4.1. The effect of various e-course material display methods on learning outcomes

4.1.1. Pre-test scores comparison

The main purpose of the pre-test is to see whether the computer pre-course knowledge and levels of the traditional linear control group, Novak concept map control group, and multidimensional concept map experimental group are the same. The pre-test result shows that the traditional linear group’s average score is 80.91, Novak concept map group’s average score 80.59. The multi-dimensional concept map group’s average score is 81.29. One-way analysis of variance (ANOVA) shows the result in Table 1. It shows that the pre-test scores of the three groups do not have a significant difference, $F(2, 100)=0.019$, $p=0.981$, which shows computer pre-course knowledge and levels of the three groups of students are approximately the same before the experiment.

4.1.2. Post-test comparison

The main purpose of the study is to compare using traditional linear textbook, Novak concept map, and multidimensional concept map e-materials to conduct practical teaching and see whether those teaching methods could cause different learning results. After the teaching experiment it shows that the traditional linear textbook material group’s average score is 81.97. The Novak concept map group of students’ average score is 86.43. The multidimensional concept map group of students’ average score is 90.00. ANOVA is further applied to analyze whether there is an eminent different between the scores of the three groups. The result is shown as in Table 2, which shows that a significant difference exists between the three groups’ post-test score, $F(2, 100)=21.733, p<.01$. It shows that using different digital course materials to conduct teaching will cause students to get different learning achievements.

To further understand different course average scores are caused by which factors between groups, this study uses Turkey HSD method to conduct a post hoc comparison. Table 3 shows that, with the different application of different digital course teaching strategy, the difference in means for post-test scores between the multidimensional concept map group and Novak concept map group is 3.571 point, $t(68)=2.973, p<.05$. It means that the multidimensional concept map material group academically performs better than the Novak concept map material group. The difference in mean scores between Novak concept map group and the traditional
linear teaching control group is 4.459 point, $t(66) = 3.658$, $p < .01$. It shows that the Novak concept map group academically performs better than the traditional linear teaching control group. The difference in mean scores between the multidimensional concept map experimental group and the traditional linear teaching control group reaches 8.030 point, $t(66) = 6.587$, $p < .01$. It means that the multidimensional group performs far better than the traditional linear teaching group. Hence, the students who use the e-course material based on concept maps can perform better than those who use material based on the traditional linear textbook. Furthermore, using the e-course material based on multidimensional concept maps can benefit students’ academic achievements more than the material based on the Novak concept maps.

* $p < .05$  ** $p < .01$

Since the pre-test scores among three groups are not entirely equivalent, and to avoid pre-test scores interfering the effects of experiment, this study uses the post-test scores as a dependent variable, the groups were an independent variable, the pre-test scores are a covariate, conducting one-way analysis of covariance (ANCOVA). It achieves the actual difference among the three group’s post-test scores excluding the pre-test scores interfering. As Table 4 shows, the main effect of the ANCOVA reaches the significant statistical level, $F = 31.231$, $p < 0.01$. This result indicates that post-test scores among the three groups achieve prominently different level after the pre-test scores are controlled.

4.2. The effect of various e-course material display methods on learning satisfaction

This study further compares the opinions of students’ on the teaching carried out by traditional e-digital material, the Novak concept map digital material and multidimensional concept map digital material. Learning satisfaction survey shows the average score of the multidimensional concept map group is 67.91, the Novak concept map group’s is 64.63, and traditional linear teaching control group’s is 61.88. To understand whether the degree of learning satisfaction resulted from different teaching strategies reaches significantly different level, this study continues to conduct the ANOVA on the three groups’ degree of learning satisfaction. The results are shown in Table 5. As the table shows, the three groups’ learning satisfaction points reach significantly different level, $F (2, 100) = 14.813, p<.01$, showing that different e-digital material can influence students’ learning satisfactory levels.

Table 5. Analysis of variance in learning satisfaction scores for traditional linear, Novak and multi-dimensional concept map group.

**p<.01

To further understand the discrepancy levels among the three groups, a post hoc procedure using Tukey HSD method is conducted. The results are shown in Table 6. It shows that the difference in mean scores of learning satisfaction between the multidimensional concept map experimental group and the Novak concept map control group is $3.286, (t(68)=3.001, p<.01$, reaching significant level. It shows the multidimensional e-course material has a higher satisfactory degree than the Novak concept map e-course material. The difference in average scores of learning satisfactory degree between the Novak concept map group and the traditional linear
material group is 2.750, \( t(66)=2.473, p<0.05 \). It shows that the Novak concept map group has a better learning satisfaction than the traditional linear teaching group. The difference in mean scores of learning satisfaction between the multidimensional concept map group and the traditional linear teaching group even reaches 6.035 point, \( t(66)=5.427, p<0.01 \), indicating that the multidimensional concept map group has an even better satisfaction level than the traditional teaching group. Hence, it proves that students have a higher degree of learning satisfaction toward the e-course material based on concept maps. Also, using the e-course material based on the multidimensional concept maps can even better promote students’ learning satisfaction than the e-course Novak material.

4.3. Students’ interview outcomes analysis toward teaching material

The purpose of interviewing is to understand in depth how each individual student feels and thinks about the teaching material. This study applies stratified random sampling method, placing students into three strata of advancing the most, the moderate and the least advancement. Some of the shy students only nod instead of answering during the interview. The greater part of students’ answers were roughly the same. Below is a section of conversation between the teacher and student.

1. The Novak concept map teaching group

The following is dialogue between the teacher and the student with moderate advancement.

Teacher: *Do you like the computer course during this period of time?*
Student: Yes, I like it.
Teacher: *Why do you like it?*
Student: I like computer courses.
Teacher: *Then what is special about the course’s teaching material?*
Student: It looks a little complicated.
The following is dialogue between the teacher and the student with the most advancement.

*Teacher:* What impressed you the most in the computer course during this time?

*Student:* The concept map in the course.

*Teacher:* Why?

*Student:* The content that the teacher teaches is all on the screen.

*Teacher:* Do you think the computer class got easier or it is the same as before after you learned the concept mapping?

*Student:* I think it got easier

*Teacher:* Then would you use the mapping anywhere else after you learned it?

*Student:* Yes, it helped homework become better organized

2. Multidimensional concept map teaching group

The following is dialogue between the teacher and the student with moderate grades advancement.

*Teacher:* Do you like the computer course during this period of time?

*Student:* Yes, I like it.

*Teacher:* Why do you like it?

*Student:* The teacher uses a different type of teaching method.

*Teacher:* Then what do you think is special about the course material?

*Student:* I don’t have to learn a lot at a time to remember the course content.

The following is dialogue between the teacher and student with the most grades advancement.

*Teacher:* What impresses you the most during this time period’s computer course?

*Student:* The concept map that the teacher uses in the course.

*Teacher:* Why?

*Student:* I remember at once in class and will not forget it.

*Teacher:* Do you think the computer class became easier or it is the same as before after you learned the concept mapping?

*Student:* I think it became easier.

*Teacher:* Then would you use the mapping anywhere else after you learned it?

*Student:* Yes, it helped homework become easier.

Combining different students’ opinions, this study sums up two results. First, the reason why students prefer the Novak concept map teaching is that the teaching material of the course is well-stated. However, students still tend to mention the teaching material being somewhat complicated. This result proves this study’s discussion point of views. Novak concept map uses two-dimensional model to feature knowledge structure. The larger or more complicated concept components which are
limited to fit onto the computer screen might create problems of cognitive overload for students. Second, the reason why students are fond of the multidimensional concept maps is that the material is easy to understand. This result corresponds with the motive of the study, which is the fact that the multidimensional concept map teaching material can simplify the fashion of expressing its knowledge. Thus, concept map is able to promote student's interests. In addition to enjoying computer courses, students are able to grasp the ideas of concept maps, which results in a more positive attitude toward computer courses due to the fact multidimensional concept maps make the course content even easier for them to understand. While students have more control over grasping the notion of the multidimensional maps, computer courses have become easier for them.

5. Conclusion

Summing up the outcomes of experiments, this study has the following conclusions:

1. Using multidimensional concept map e-course material for teaching process can enable students to academically perform better than Novak concept map and traditional linear e-course material. Novak concept map e-course material can perform better than the traditional linear e-course material.

2. As for learning attitude, students’ learning satisfaction levels are higher using multidimensional concept map material than using Novak concept map. The level of Novak concept map is higher than the traditional linear e-course material.

3. Students prefer the concept map material because its course material is easy to understand. However, as for students preferring multidimensional concept maps material than Novak concept maps material, the reason is that the multidimensional concept map can simplify knowledge structure features better than Novak concept maps.

LEADING INNOVATION AND CHANGE (School Improvement through accredited Continuing Professional Development)

In order for schools to become more effective there has to be professional leadership at all levels within the institution. These leaders need a shared vision and agreed goals in order to transform their school into a professional learning community as characterized by an environment fostering cooperation, emotional support, personal growth, and a synergy of efforts.
This study investigates the impact of accredited leadership CPD in the form of Masters Degrees delivered in schools; developing communities of practitioner learners among groups of teachers. The course is premised on the General Teaching Council for England’s assertion that professional learning offers teachers the opportunity to take a leading role in school improvement and in developing their own and others’ practice. The programme is designed to allow educators in school to challenge and change working practices in ways that enhance the efficacy of their institutions. Participants provide evidence of managing educational change through systematic consultation, collaboration and leadership. Within each school a minimum of 5 teachers engage in systematic enquiry in support of leading innovation and change initiatives in order to have impact on practice and to develop a climate for ongoing professional development. Participants include staff at all levels in the school structure including head teachers, experienced teachers and newly qualified teachers. Delivery is facilitated in diverse school settings and requires teachers to reflect systematically and to work collaboratively within their institutions. In addition individuals' research informs strategies for teaching and learning and enables teacher practitioners to undertake action research in areas relevant to their own roles. Research addresses the development priorities within their organisations and individual research projects are linked to the School’s Improvement Plan. All participants are involved in the generation and dissemination of professional knowledge. This knowledge exchange further emphasizes the significance of participants’ professional values, concerns, priorities and actions in sustaining school improvement. It is too early to state quantitatively that there are sustainable improvements in pupils' curricular grades or achievements. However, feedback from teachers indicates strongly that pupils’ learning experiences within the curriculum are being enhanced and that there are noted increases in pupils’ capacity to learn in different subjects. Sustained continuing professional work over time is enabling teachers to experiment, to share and apply findings to their practice, particularly relating to pupils’ learning. Collaboration in teams both within schools and across schools (networks) is helping schools build social and intellectual capital. Sustainable outcomes included increased self confidence, motivation and awareness of themselves as learners among the teacher
participants. Furthermore, the intended developmental outcome of improving the efficacy of schools, particularly in relation to enhancing pupils’ capacity to learn is being met throughout the diversity of school settings. Supplementary outcomes include research and knowledge exchange that enhances the work of the whole school; improving learning capacity, meta-cognition and attainment and also increased staff moral and retention, which is in turn causing a transformation of their professional roles.

Key Terms: Teacher professional development, learning communities, education policy and leadership, sustainable improvement, practitioner research, improving learning, school efficacy.
Competitive Shooting: A Correlational Analysis Between Flow and Imagery

Abstract

The purpose of this study was to examine the relationships that exist between competitive shooters, flow, and imagery. The Event Experience Scale (FSS-2), developed by Jackson & Eklund (2004) was used to determine if a flow experience, as defined by Csikszentmihalyi (1975) existed during their competition. The Sports Imagery Questionnaire (Hall, Stevens, & Paivio, 2005 was used to assess the amount of imagery shooters used during their competition.

The data was collected from participants at the national competition of the International Defensive Pistol Association. Each participant randomly volunteered to be a part of the data collection for the study. Participants in the study filled out each questionnaire within 1 hour of having completed the course of fire for the competition.

The Pearson Bivariate Correlation Statistic was used to analyze if a relationships existed between the shooters score, total FSS-2 score, and the mean sports imagery score. A two tailed test of significance was chosen when running the analysis. The analysis revealed no statistical correlations between the items examined. Discussion for further research is presented.

(abstract on following page)
Abstract:

Use of nutritional supplements and ergogenic aids among various user groups has been well documented over the years. One area that is lacking in current research is the use of these nutritional supplements among campus recreation facility users. This population is a prime target market for those in the sport supplement industry. There are many reasons people participate in campus recreation facilities and most would benefit from the use of nutritional supplementation if the claims made by the manufacturers of these supplements is true. However, the nutritional supplement industry is not very strictly regulated and the potential for risk to users is ever present. Obviously the risks vary among manufacturers and also with the type of supplement being taken. It is in the best interest of anyone contemplating taking a nutritional supplement to research the risks, benefits and potential side-effects. It would be beneficial for campus recreation administrators to have an understanding of what types of nutritional supplements their patrons are taking and the risks involved with such. It would also be of benefit to have an understanding of where the patrons obtain information regarding nutritional supplements so that nonbiased educational interventions can be developed with the goal of reducing risks associated with patron of these products. 200 users of a campus recreation facility were surveyed using an instrument designed by Scofield & Unruh (2006) to assess the prevalence of use of nutritional supplements, the types of supplements being used, and where they obtain their information regarding these supplements.
Results on the ACHA-NCHA II at a Midsized University in the Southern United States

Abstract  
The purpose of this presentation is to report the results of the NCHA II for a midsized (estimated enrollment of 20,000) university in the Southern United States. An additional purpose includes comparing the national results to those of the midsized university in the Southern United States and draw conclusion about any similarities and differences found. The American College Health Association (ACHA) is the nation's principal advocate and leadership organization for college and university health, represents a diverse membership that provides and supports the delivery of health care and prevention and wellness services for the nation's 18 million college students. The ACHA-National College Health Assessment II (ACHA-NCHA II) is a national research survey organized by the American College Health Association (ACHA) to assist college health service providers, health educators, counselors, and administrators in collecting data about their students' habits, behaviors, and perceptions on the most prevalent health topics. The ACHA-NCHA now provides the largest known comprehensive data set on the health of college students, providing the college health and higher education fields with a vast spectrum of information on student health. The categories included on the ACHA-NCHA II include General Health of College Students, Disease and Injury Prevention, Academic Impacts, Violence, Abusive Relationships and Personal Safety, Alcohol, Tobacco, and Other Drug Use, Sexual Behavior, Nutrition and Exercise, Mental Health and Sleep.
A “Deaf” Society In A Musical World: Contemplations Of Awareness

**Introduction**

Ancient Chinese philosophers found that through the act of listening, humans could educe creativity and help develop an awareness and interconnection with the universe (Lawson, 2009). Greek philosophers, such as Plato in his work the *Republic*, found that a balance between physical and intellectual education was a primary precept to an ideal city (Bloom, 1968). Many ancient philosophers, both Greek and Chinese, have proposed that education should be concerned with more than just nurturing the intellect; education should place an equal value on the body, mind and soul. This sentiment is alive and well 2500 years later in the writings of the philosopher and educator Jiddu Krishnamurti (1992): “education should be concerned with the totality of life and not with immediate responses to immediate challenges” (p. 84). As a music educator, I feel that the role of music within North America has become a way to propagate a mentality that is ‘deaf’ to the acoustic environment; this deafened society is only aware of a constrained meaning of music.

In studying modern education and curriculum, I am inundated with an overemphasis on the use of visual stimuli, such as writing, as the primary tool towards engaging the learner, while the other four senses, such as hearing, are overlooked. Due to society embracing a technological focus, music education has become classified by parameters that concentrate on producing students that can best benefit from an economic-based system; this system facilitates a continual cycle of *desire* to obtain commodities and achievements. I feel that in the process of the categorization of music, music education has become a part of a quota to fulfill within the curriculum and a vehicle to educating students in a self-centered manner, void of a bodily, spiritual or environmental awareness. One of the main tenets of Buddhist teachings is that life is perpetual dissatisfaction or *suffering*, and the origin of this discontent or discomfort is from an obsession with human *desire* (Singer, 1993). The implications of a desire-driven mentality on music education have created a restricted awareness or deafness to musical sound. I will delve into and question
the relationship between the cycle of desire/discontent within modern society and how it affects music education. I will then pose potential ways to open our awareness of our musical environment by finding equilibrium between our perceptions, intellect and embodiment of our musical practice, without getting ensnared in our obsession with desire.

History, Perception & Musical Sound

Philosophical Perspective

The importance of musical sound derived by nature and humans has been a continuous theme in ancient Chinese writings: “No other culture seems to have valued sound as a heavenly source for and barometer of proper governance” (Lawson, 2009, p. 22). Ancient Chinese texts also discuss music’s ability to “enhance circulation in the physical body and sharpen the sense organs” (Wang, 2004, p. 100), and from this I deduce that sound has the ability to provide a connection between the mind and body. Daoist philosophers deemed music as having the capacity to expand intelligence while augmenting the human connection with nature⁴, as “listening is one of the best means for understanding our profound physical interconnectedness with the natural world, and the ability to listen is the source of human creativity and intelligence” (Lawson, 2009, p. 21).

While ancient Eastern philosophy values music for its various educational abilities, a quick glance at my own community and I observe a deterioration of the connection between music and human life. A majority of the populous is naïve to music’s ability to shape disposition or strengthen a connection with the physical environment, due to being exposed only to a limited styling of music within their own education and experience. How can we expect children and subsequently adults to see the value in music unless we change the way they perceive it⁵ (Regelski, 2006)? The popularity of music in education “is directly related to the public perception of the value of music” (McCarthy, 1999, as cited in Gluschankof, 2004, p. 183). Schools place a higher value on knowledge that can be empirically tested or externally
recorded than on knowledge that cannot be externally recorded. This lower valued knowledge encompasses many of the skills, such as cooking, music performance or navigation, which are respected by orally based cultures (Rasmussen & Akulukjuk in McKenzie, Hart, Bai & Jickling, 2009).

As a music educator, I suspect that music education and appreciation within society has become a dying field. Music education curriculum within K-12 has changed from actually learning the art of music to learning about music (Fung, 2010). It seems that modern curriculum values an education that provides students with the tools and skills to be successful in the economic based society, and the perceived lower value of music forces it to no longer be viewed as educationally viable.

Music education has become a means to an end – a checkmark on the required curriculum list. Within Regelski’s (2004) work it becomes evident that educators are reluctant to incorporate music into curriculum, as music can be an alienating activity due to the lower value placed on music. This lesser quality assigned to music is reflected in how children are educated about the value of music. If musical awareness was incorporated into everyday life, we could change our perceptions of musical sound by our newfound comprehension of our acoustic environment.

**Subjective Perception & The Limitations By Defining Musical Sound**

Mothers sing lullabies, children sing songs, and music can be found in almost every culture, yet how that musical sound is perceived and valued can vary. “No society yet studied is without music” (Perris, 1985, p. 1), yet it appears that the role of music within modern society is limited to early childhood educational curriculum and entertainment. We have aestheticized music as an entity on its own, to the point that we ignore the rest of its value (Regelski, 2006). How can we separate the sounds of music from their expression and embodiment? Words do not convey an entire communicative account; humans rely on body language and expression as complementing data and just "like words and morphemes, songs are form-meaning units to be included in any complete language description" (Turpin & Stebbins, 2010, p.
1). Music isn’t simply sounds combined into patterns and frequencies; modern Western culture seems to have lost the ability to hear the deeper levels of musical sound, due to an over categorization of reality. Modern society defines items, thoughts, and actions into discreet categories, using binaries and empirical research (Boyce-Tillman, 2004). Do we really need to deconstruct music into scientific terminology to validate it? In our quest to define each detail of life, turning to physics, biology and psychology to summate our universe, we may have lost crucial information within the dissection. Musical sound has limitless definitions, but due to the rigidity of the parameters of modern computer language, musical sound has been forced into the confines of binary audio signals (Dannenberg, 1993). Science can only explain the aspects of music that we can quantify; yet what about what we cannot see, perceive or understand?

Music is a subjective perception, as “music is an observer relative” (Regelski, 2004, p. 21). While music can be defined as “organized sound” (Swanwick, 1979, p. 8), the definition limits the potential of what is considered music; if pitched organized sound is a possible definition of music, then music could be found in the howl of a dog, while a tambourine would be considered noise (Swanwick, 1979). In this process of classifying music, subjective interpretations challenge the very perceived definitions (Regelski, 2004). John Cage, a minimalist composer, composed a piece named 4’33”, which consists of four minutes-thirty-three seconds of a pianist at a piano bench, playing nothing at all. The auditory environment of the hall, the creaking of the chairs, the coughing and the breathing of the audience, and all the other sounds that occur create a musical score of silence. This piece of music shows that improvisation is a test in randomness; we build something out of nothing. This composition was instrumental yet controversial in changing the perception of what was defined as music back in 1952, as the piece itself posed the question of whether it was music or not.

A trained musician and a layperson may have different interpretations of the sound of wind, yet
both would be justified in their own way, due to their perceptions being shaped by experience, expectations and physiological differences. The sound of the wind can be construed as noise, a function of the weather, or even a catalyst for a symphony of connected sounds. Envision the sound of wind rustling through trees creating a creaking noise that is accompanied by the crackling of dried leaves; by opening our acoustic awareness, I posit that we can build a new set of tools to interpret our acoustic environment instead of simply remaining deaf to our surroundings. “Human beings have a fundamental need to experience a sense of connectedness to the natural world” (Wilson, 1996, p. 16), and by finding a way to connect our minds, bodies and musical practice, without expecting musical learning to help us achieve materialistic goals, our understanding of music education could potentially change.

Buddhist Teachings, Desire & Music

Smith & Novak (2003) discuss how the human condition is perpetually seeking happiness and the avoidance of suffering, and that with the Buddhist teachings of the Four Noble Truths, a student can learn how to find the path to enlightenment. The Four Noble Truths can be found repeatedly through the fundamental teachings of Buddhism. Within the Pāli canon, the Four Noble Truths are described as the “four convictions of life” (Smith & Novak, 2003, p. 31). The First Noble Truth is that life is dukkha, which is a discontent, uneasiness or suffering due to various aspects of human life, from pain, despair, or anguish (Singer, 1993; Smith & Novak, 2003). The Second Noble Truth is the cause of suffering, which is tanha – desire, craving or attachment. Tanha or desire describes the human “drive for private fulfillment” (Smith & Novak, 2003, p. 38). In the Third Noble Truth, it may become possible to eliminate suffering from one’s life. The Fourth Noble Truth is to follow the Path to eliminate suffering (Tsering, 2005). The Path, as noted by Smith & Novak (2003) is “a series of changes designed to release the individual from ignorance, unwitting impulse and tanha” (p. 39). Buddhism is not simply about rejecting material goods, but rather using them as building blocks for “mental and spiritual ecology” (Hattam, as cited in Eppert &
Wang, 2008, p. 129), instead of as trophies of accomplishment. Within this paper, I focus on the Second Noble truth – *desire*, as the instigating factor in modern society’s restricted view and grasp of music education. In this desire to place an extrinsic value on and quantify music education, it is possible that there are aspects of musical sound and the acoustic environment that have been lost in the commotion of our consumerist lifestyles.

**Modern Education, Society & Musical Awareness**

**The Search For Attainment of Achievement and Commodities in Society**

The belief that the consumption of goods, happiness and achievement are intrinsically tied together as the primary tenet of the modern Western World is a mindset that is even infiltrating formerly comparatively ascetic societies. This mentality reinforces a cycle of desire, desperation, and need of stuff\(^8\), which then results in what Buddhist teachings would call *suffering*. The *suffering* and desperation for happiness are concealed by the societal obsession with obtaining excessive commodities and achievements; this could be categorized as consumerism\(^9\). The early 19\(^{th}\) Century author Thoreau noted this sense of desperation:

“*The mass of men lead lives of quiet desperation. What is called resignation is confirmed desperation. From the desperate city you go into the desperate country, and have to console yourself with the bravery of minks and muskrats. A stereotyped but unconscious despair is concealed even under what are called the games and amusements of mankind*” (Thoreau, 1962, p. 117).

Desires and subconscious urges form a large part of how our personality and actions are expressed. The id, ego and super ego\(^{10}\) are the three constructs of the human psyche, according to Sigmund Freud. The id contains urges, drives and avoidance of pain, the ego is a somewhat conscious process that helps organize our reality, and the super-ego contains the sense of right and wrong, providing the mind with the
potential for spirituality, while keeping desires under control (Habicht, 2001; Strunk, 1960). Using the premise of Freud’s theoretical constructs of the id, ego and super-ego, is the id simply winning the fight against the ego and superego? Buddhist teachings could describe this situation as a struggle between the id desiring material goods, yet through the insecurities of acquiring these goals or goods, the ego classifies these feelings as anxiety and fear (Eppert in McKenzie, Hart, Bai & Jickling, 2009). In the search to avoid suffering, the mind forms new perceptions that are once again transmitted to the mind as a different form of suffering; this perpetuates a cycle of discontent that only leads to a self-centered fixation on relieving the feelings of suffering and unhappiness once again.

**Self-Centered Values**

With increasing urbanization there seems to have been a shift from a collectivist culture to an individualistic existence where obtaining achievements takes precedence over a sense of community. My own experience with modern group activities, such as soccer or orchestra, have found a promise of community and collective well-being, yet prestigious awards are handed out for the elite performer, while most co-operative awards have become the booby prize of the world of group activities. While this self-centered view is not blatantly broadcasted, it is the underlying theme to a majority of activities in modern society, including music education. Choir and orchestra classes seek to win competitions and obtain the highest rankings, and while a sense of comradery is evident due to the nature of the activities, the overwhelming need to compete and produce the ‘best’ performer prevails.

Music education only caters to a small population of learners, a "musical elite among the general population" (Regelski, 2006, p. 5), and within that selection of music students, only a narrow selection of music history is taught (Sands, 2007). Only information that has been deemed appropriate by authors, editors and publishers gets included within the textbooks. There is a “misleading portrayal” (Sands, 2007, p. 57) of the definition of music, and while I do not have a conclusive definition, I know from my own
experience as a music composer, that the definition of music that is derived from textbooks only contains a limited scope of the musical experience.

There is no wonder there is a difficulty in illustrating the value of music, when current music education is overpowered by individual success. In this respect, I propose that music rarely is able to sate the need for material or attainable commodities that are hailed within our industrial economy. In observing modern media, it becomes apparent that musical celebrities have little connection to their music, mass-producing music to attain their acceptance. If music and music education have been reduced to an obsession of achievement, then the value and role of music in human lives have become ambiguous. This is in line with Buddhist philosophy, as in my opinion this yearning to attain achievements and material goods are a futile exercise. I have witnessed children who are no longer interested in learning music for their well-being or even the amusement and joy they might find, rather they are stuck in perpetual loops of demanding the training and tools to become famous and to then gain riches. From my perspective, the futile aspect of this endeavor is found in the reality that even once gaining fame or fortune, there will always be another desire to pursue; happiness and achievement always just out of grasp.

A bird chirping, a jackhammer, a car driving by honking, these sounds could potentially be construed as the music of urban environments, yet in our focus of making money to feed our consumerist subsistence, we typically define those sounds as environmental noise. While one cannot ignore the basic needs for shelter, food, and security as emphasized by Maslow’s hierarchy of needs, our obsession with obtaining our desires goes beyond the demand of basic necessities. This consumerist order of our economic society dictates a mindset that demands us to work to obtain perceived happiness. The question now becomes, how can we disentangle from our consumerist lifestyles, how have they affected our educational institutions, and has that affected how we perceive our acoustic world?
The Purpose of Music Education: Drones or Aware Citizens

“The great secret of education is to use exercise of mind and body as relaxation one to the other” (Rousseau, 2007, p. 176), yet modern day education focuses specifically on the subjects and skills that will make the students successful in the industrial world, not more attuned to their environmental, emotional or corporeal well-being. Are we trapped in Plato’s cave of subjective reality, unable to see the truth of music’s potential? Modern society possesses a narrow scope of what defines music education, which seems to be keeping us figuratively and literally deaf to the possibilities of musical sound.

Just as ancient Chinese and Greek philosophers, such as Plato, hypothesized in their writing that “improper music can result in disobedience and contempt” (as cited in Wang, 2004, p. 91), current educational researchers note “music can help create a good moral environment that […] channels emotions and shapes the soul” (Kilpatrick, 1995, p. 30). The content and intentions of music education then not only become relevant to the educational system, but significant when considering what types of music education children are exposed to.

There has been recognition of the limitations of traditional schooling by organizations or businesses that are "concerned that students are insufficiently prepared for the increasing demands of the workplace and globalization" (Regelski, 2006, p. 3). I postulate that the purpose of modern education is to produce efficient and productive worker drones to fuel the economy rather than to help educate students in their growth and transformation into mindful and knowledgeable citizens.

Drawing on the lessons found in Plato’s Republic, excessive desire or lack of moderation is the downfall of an ideal citizen as it interferes with self-control and rational pursuits (Bloom, 1968). Instead of taking the positive lessons from Plato’s ideal city, our society has embraced a narcissistic mentality that has infiltrated our educational system. One could argue that Plato sought an ideal city of citizens that were drones that followed the rules of moderation and provided to the needs of the guardians. I would contend
that Plato’s ideal education of his citizens incorporated an education of the intellect, spirit, and body, which varies greatly from our society’s developing focus on sheer intellect for contributing to the cycle of economic productivity.

Modern schools have become a place to inculcate the “necessary skills and social relations for the functioning of a socio-economic status quo” (Schmidt, 2005, p. 3), where children are only given the basic tools of music education to fulfill the curriculum requirements. In my experience, this format does not promote a life-long dedication to music, but provides a superficial application of music to a child’s life. By obsessing over the superficial aspects of music education, an elusive goal is consistently fabricated, removing the joy and the potential for growth from the experience and replacing it with a carnal desire for achieving a boastful accomplishment. Is the purpose of learning musical improvisation to become famous, or to learn and master the instrument, benefiting from the positive psychological and physiological responses that are elicited by musical sound?

Musical Awareness

A music composer or performer has the ability to practice the Buddhist concept of impermanence, by not becoming attached to particular theme, sketch or motive. A composer may write hundreds of versions of a piece of music, only to throw away them all. It is a meditation in imagination and creativity. Modern society seems to thrive on getting things correct the first time, yet if something is achieved the first time without error, there is no room to learn from or perceive it differently. Value is not placed on the transformation of one's character/mind/spirituality, only on their accomplishments. Where is there room to create a connection between the environment and the self?

It is possible to foster a connection between curriculum and one’s awareness of their acoustic environment. Positive experiences with nature help develop aesthetic development, and creating a relationship with the natural environment at an early age can potentially help shape the learner’s mental
construction of their environment (Wilson, 1996). When given the opportunity, a child’s plasticity will allow them to use their natural environment to create music, dance and art. Yet, due to the assumptions of our society, children aren’t given the chance to discover the potential of their acoustic environment. From an early age, children witness what their culture defines as music, and form attitudes and values about what are relevant (Wilson, 2007), it is up to educators to facilitate an alternative definition.

**Noise & Becoming Aware of the Environment**

Song as a form of communication and music has been altered by the abundance of noise within the urban environment (Halfwerk & Slabbekoorn, 2009). While Halfwerk & Slabbekoorn (2009) were researching the effects of urban noise on bird songs and communication, they noted drastic changes in bird songs due to city noise. If birds and animals have altered communication patterns due to the excessive sounds of urban environments, it is plausible that there are ramifications on the adaptation of human communication.

Noise is a part of our everyday society, yet how we interpret and become aware of “noise” is dependant on our readiness to perceive things differently. Eastern philosophy has traditionally made it a lifelong process to open the mind to the environment and note the importance of music, yet modern culture seems to have systematically ignored this in developing educational curriculum. Humans have become accustomed to noise, constant drones of sounds from the hum of electricity, or the sound of people talking. Due to this continual input of sound, urbanized societies have become habituated to ignore their environment and have been desensitized to details that they once might have heard. The saturation of the acoustic environment is not limited to non-musical sounds, musical sound is a constant drone in metropolitan societies. The ears cannot be muted or blindfolded; they are subject to hearing sounds broadcast around them. In this sound-inundated culture, it is essential to find a way to contend with the sounds that the ears are bombarded with. By learning to awaken the senses, to let go of cravings and to
embrace the uncomfortable notion of silence, it could become possible to finally become aware of the acoustic environment, as “[when] we are afraid to touch our suffering, we will not be able to realize the path of peace, joy and liberation” (Hanh, 1998, p. 45).

**Lack of Respect and A Narrow Scope for Music Education**

By teaching children at an early age about their acoustic environment, we are providing them with the groundwork for a life long transformative learning that they will need to avoid becoming numb to their sense of hearing. Rousseau’s *Emile, or On Education* (2007), highlights the difficulty with putting an educational curriculum into practice: “thus one kind of education would be possible in Switzerland and not in France; another would be adapted to the middle classes and not to the nobility” (p. 9). Finding a way to accommodate different learning styles, cultures and curriculum continually poses a problem for educators. Incorporating music education into a curriculum that finds little value to the topic thus becomes a daunting task.

“Contemporary research confirms the view that young children learn most efficiently when they are engaged in interaction rather than in merely receptive or passive activities” (Katz, 1987, p. 2), yet a majority of music education curriculum does not seem to attend to this research assumption, with written learning of notation and instrumentation leading the curricula agendas. Children spend more than 95% of their time indoors (Cohen, 1984), where they miss out on experiencing an acoustic environment outside of the confines of urbanized noises. Finding a balance between traditional and non-traditional music education could benefit the learners, for instance, allowing children to explore sounds and music outside of the traditional seated context of the music class through exploring a multisensory education outdoors could help them refine their sense of environment through sound (Deans, Brown & Dilkes, 2005).

Modern society’s understanding of music, which as already noted has its limitations and constraints, regiments music education curriculum. Within grade school, children are taught music only to
fulfill the required curriculum; upon reaching the teen years, music education is only for those who are able to excel; upon adulthood, music seems to have no place within the average workplace, aside from background music. Creativity is stifled to make room for efficiency and productivity, the keystones to an urbanized and consumerist culture. Instead of asking music educators, ‘how can we use music education to further our consumerist agenda and our reproduction of social and economic dependence?’, the question of music education should be, ‘how can we break free of the parameters and limitations of our society’s definition of music?’. I propose to answer this by taking advice from a Daoist teaching:

“Who can (make) the muddy water (clear)? Let it be still, and it will gradually become clear. Who can secure the condition of the rest? Let movement go on, and the condition of the rest will gradually arise” (Lao Tze, 1997).

By giving up the assumption that the current definition of ‘music’ is correct, and letting the music simply exist without the agitation or expectation of definition, a true definition and understanding will arise.

**Conclusion**

In the perpetual search for happiness through material goods and achievements, modern society has become deaf to the sounds of their acoustic environment. While ancient Chinese and Greek philosophy reinforced the potential influence of music on the development of values and disposition, the cravings and desires of a commodity-driven society have shaped music curriculum to educate students to become productive economic contributors. As Buddhist teachings explain, this continuous desire to obtain goals and commodities will only result in a Sisyphean cycle of suffering or discontent. Figuratively and literally stepping outside of the noise of the urban environment could provide students with an opportunity to hear a completely novel acoustic environment, and create their own awareness of musical sound, free of the limitations of categorization. While I do not have a definitive answer on how to change modern
society’s priorities, I feel that through understanding what our society currently values, and how that is limiting our ability to perceive a grander scope of musical sound, music education has the potential to develop a curriculum of a musical awareness that could incorporate all the senses.

Footnotes

1 By the term “acoustic”, I am referring to the sense of hearing that is performed by the human auditory system. While sight, smell and taste can be definitively explained, the molecular basis of touch and hearing is still vague (Kung, 2005). The human ear is capable of differentiating between pitch, rhythm and quality of sound, and also has the ability to hear a wide range of frequencies (Bowsher, 1975). Sound is a vibration that is transmitted through a medium that then creates an oscillating sound wave that is then received by the listener’s ear. Upon the ear receiving the sound wave, it is then translated into nerve impulses that are perceived by the auditory cortex in the brain (See Bowsher, 1975). This perception of sound by the brain is then translated into something we can understand: music.

2 The term “deaf” refers to the human inability to hear or use the sense of hearing. Within the context of this paper, “deafness” refers to the human desensitization or numbness and inability to be aware of their acoustic environment, rather than a physiological inability to hear.

3 For the ease of brevity, I will primarily use the term suffering within this paper to encompass this concept of human discontent or dissatisfaction.

4 The term nature within this paper references the non-human world, which can encompass the biological environment through the technological and mechanical environment. (See Abram, 1997).

5 The use of the term “our”, “us” and “we” within this paper denotes human beings living within North America, with a focus on those involved in the traditional education system. The author is included within this term, as the author is subject to the same cultural and societal influences that are discussed within the paper.

6 Jarvis (2008) defines Western society as those who live in the Western hemisphere of the world, more specifically North America. Western society is also “a consumer society and argues that the need of global capitalism to sell its commodities in the market place is the fundamental force behind consumerism” (Jarvis, 2008, p. 12).

7 The Pāli canon is the collection of scriptures of Buddhist teachings (See Smith & Novak, 2003)

8 Within this paper, the term “stuff” refers to the a range of items, from commodities, material goods, emotional desires, or anything that could be classified as something that humans would want to obtain or desire.

9 The word “consumerism” is a controversial term, as there are various definitions and uses. For the purposes of this paper and its arguments, the term consumerism is assumed to encompass the theory that the excessive consumption of commodities, goods and services is fueled by an economic and social desire and attachment to these goods.

10 Freud’s conceptual model of the human psyche has been used as the basis for psychological and personality theory for over one hundred years. While various philosophers, psychiatrists and researchers have made their own alterations to Freud’s initial definitions and explanations, the use of the terms, ego, superego and id are still commonly used (See Dallmayr, 1993).

11 Pinal-Cabra (1993) notes, “the booby prize [is] awarded to the person who comes last in [a] competition” (p. 105). Also, the term booby prize can mean a prize given to an idiot or a dunce (See Wikipedia, 2010).

12 Maslow’s hierarchy of needs are constructed of five psychological factors that humans seek, starting with 1) physiological: breathing, food, sex, and water, 2) safety: protection and safety in one’s home, job security, and security from war etc., 3) love: friendship, family, intimacy, and belonging, 4) esteem: self-esteem or self-respect, and 5) self actualization: making use of one’s skills, gifts and experience, to attain one’s ultimate potential. (See Hagerty, 1999).
13 Within Plato’s *Republic*, Plato discusses a metaphor of a cave: There are individuals imprisoned in an underground cave for their entire lives, where they face a wall. There is a fire within the distance that only illuminates the shadows. The prisoners come to know the shadows and distant voices as reality. If a prisoner was brought into the sunlight, Plato believed that the prisoner would be confused at first to see the world, but come to know that the shadows were not in fact the reality (See Bloom, 1968). This is important to this discussion of musical awareness, as our sensations shape our perceptions of reality, yet we must question whether or not we are seeing the reality outside of the cave, or rather only viewing the hypothetical shadows.

14 There are three classes of citizens within the *Republic’s* ideal city. The people were valued for their role of contributing to the greater good, and were expected to exhibit the virtue of moderation. The warriors were the defenses against internal and external enemies, and were expected to exhibit the virtue of courage. The leaders of the city were the guardians, who were the elite class that made decisions; they exhibited the virtues of wisdom (See Plato, 399a, as cited in Bloom, 1968).

15 Within Buddhist teachings, the concept of impermanence is a focal point; existence is continually changing, in a constant state of fluctuation. Learning to acknowledge the existence of a moment, yet finding a way to release one’s reliance on it can lead towards understanding true reality. Through the practice of impermanence, a true awareness of the internal and external self becomes cognizant in the practitioner. If our desires were simply attachments to impermanent events, items or cravings, this desire would likely cause further suffering or discontent (See Burton, 2004). In regards to music education, if existence is continually changing, then there are unlimited possibilities to how music could be taught; each moment moving forward contains a new and unique opportunity.

16 Sisyphus is a character in Greek mythology, which had a punishment of perpetually rolling a rock up a hill, only then to have the rock roll back down the hill, and then to have to roll the rock up the hill once again. This task is a demonstration of exercise in futility, with no apparent end or achievement (See Homer, 1999).
Research objectives:

This study is intended to add to the thin research base that considers teacher and pupil responses to global education at the upper elementary level. Merryfield (2002) provides a frame for global education which includes addressing stereotypes, highlighting multiple perspectives, and experiencing cross-cultural learning through technology. This frame provides the basis for exploring the experience and outcomes of two fifth grade classrooms, in South African and the United States, sharing global education curriculum via technology.

At the turn of the millennium, the National Council for the Social Studies called for effective social studies programs that includes global and international education in line with the “transnational, cross-cultural, multi-cultural and multi-ethnic interactions” (NCSS, 2001) that impact the daily lives of average citizens. Social studies educators have long highlighted the necessity of global education in the K-12 classrooms, teacher preparation, and professional development programs in order to prepare the next generation for an increasingly interconnected world (Merryfield, 1998, 2002; Myers, 2006; Thornton, 2005; Wilson, 2001). Over the last decade much of the research on global studies has been focused on the teachers’ experience in the K-12 classroom, with very little research considering the impact of global education on pupils. The empirical work that does exist largely focuses on high school classrooms with very limited attention given to the use of global education in intermediate or middle school settings (Zong, Wilson, Quashiga, 2008). This study addresses the questions of whether and how students and teachers alter perceptions of identity, culture, and global education while participating in shared curriculum through technology, with classrooms in other nations. This ongoing qualitative research is continuing and expanding over the next academic year to include classrooms in Hong Kong and Ireland, as well as the classrooms from South Africa and the United States included in this initial project.
Proposed Methodology:

This qualitative study was conducted in two 5th grade classrooms, one in the United States and the other in South Africa. Students and teachers participated in a six week unit focused on addressing national stereotypes, culture, and identity. Students responded to a series of writing prompts, with responses shared within classrooms and in online exchanges in a limited access website. Each class also sent representations of their schools, community, and culture to their partner school in an artifact exchange. Finally, students took part in an online meeting with their partner school through skype. Teachers to part in pre- and post unit, semi-structured interviews intended to document their understandings of global education, as well as their experience in shared curriculum through technology. Data sources included student artifacts and discussions, online responses, skype exchanges, and teacher interviews. Data was read in three ways: in the chronological order in which the data was produced; organized according to whether data was generated by student, teacher, or researcher; and by type of data sources (artifacts, observations, surveys). Memos were made through each reading and themes identified from recurring topics. Matrices were generated to further develop and collapse themes, as well as identifying key evidence from the data.

Outcomes:

Preliminary analysis of data indicated that findings in three broad areas: program implementation, pupil learning, and professional development in teaching. Key issues in program implementation included differences in technology available in classrooms, access and restrictions in technology use in schools, and challenges posed by calendar/time differences. Programs were supported by the teacher investment in the project and administrative support for global connections. Finally, tensions from demands of mandated testing in both schools posed challenges with time constraints and lack of flexibility in curriculum content.

In considering pupil learning, data indicated that students at this level had preconceived notions about other cultures/partners nation that had been developed through media rather than school experiences. Contrary to suggestions in current literature, students were capable of discussing and grappling with issues of culture and stereotypes. Students also demonstrated new understanding of their own cultural context and the role media plays in promoting stereotypes. Further, data suggests that students at this level did not have other authentic experiences that promoted in-depth understandings of culture and stereotypes despite school level concerns with preparation for 21st century global education.

Teachers reflected on the experience as collaborative professional development that enriched their content knowledge and authentic use of technology, pressing them to work outside the boundaries of current knowledge and skills. Teachers also utilized the opportunity to consider issues of social justice that connected local challenges of equity to global concerns and their role in whether and how these issues could be addressed in the intermediate classroom.

Abstract
Over the course of the last decade, there has been a discernable upswing in the amount of literature describing the importance of pronunciation in second and foreign language learning as well as the positive effects language learners receive when exposed to target language pronunciation instruction. In order to facilitate ways of bringing pronunciation instruction into the language classroom, the present article details the rationale for using audio recording and visualization software (ARVS) with language learners, presents some of the more common functions found in most ARVS, and reviews some of the more useful freeware ARVS.
During the height of the audiolinguistic method of language teaching, a considerable amount of attention was paid to pronunciation instruction. This was because effective language learning was thought to come about by learners mastering how to assemble the building blocks of language (e.g., vocabulary, phonemes, morphemes). Thus, mimicry and repetitions were mainstays of many lessons. In time, however, the audiolinguistic method gave way to other teaching methods, most recently those that focus on developing communicative competence in language learners.

When audiolingualism fell, it took pronunciation instruction with it. Most institutions expunged explicit pronunciation training from their curricula. As a result, in most cases, learners were only taught pronunciation if it happened to be the focus of a course (e.g., Phonetics 101) or if learners' pronunciation was so unintelligible or problematic that remediation was required (Makarova, 2000). Why pronunciation instruction was discarded so quickly has left some researchers like Celce-Murcia, Brinton, and Goodwin (1996) baffled, for, as they state, both empirical and anecdotal evidence exists to show that there is a threshold level of pronunciation for non-native English speakers. Speakers who fall below this threshold will have communication
problems regardless of the extent of their knowledge and control of English grammar and vocabulary.

Indications exist, however, that point to a possible comeback in pronunciation instruction. First, research conducted within the last decade has shown that language learners are actually concerned about their pronunciation (Kikuchi, 2005). This is understandable, for as Kashiwagi and Snyder (2003) note, studies investigating language learner beliefs have found that language learners give high priority to improvement of their pronunciation. High priority topics for learners become high priority topics for instructors.

Second, it has been realized that it becomes essential for learners who interact with other L1 users via the target language, either in the workforce or for personal business, to have reasonably intelligible speech as well as oral communicative development (Morley, 1991). In fact, dedicated L2 (second language) students expect their teachers to help them reach target language pronunciation levels because they know pronunciation may be the deciding factor for an employment position (Riney, Takada, & Ota, 2000). It has been found that non-native speakers’ pronunciation, if not intelligible to a certain degree, can have a negative impact on their job prospects (Carlson & McHenry, 2006; Sato, 1991, as cited in Munro & Derwing, 1999). This final point should be of immense concern to language instructors who are preparing their students to work in an increasingly global society.

Finally, there has been a discernable upswing of pronunciation research conducted over the last decade, particularly research involving the effects of pronunciation training. Since the late 1990s, researchers have discovered that learners can actually improve their pronunciation of the foreign language under study if
provided pronunciation training, especially if they are initially familiar with the target language’s pronunciation (Derwing & Munro, 1997; Derwing, Munro, & Wiebe, 1998; Kashiwagi & Snyder, 2003; Kenworthy, 1987; Munro, Derwing, & Morton, 2006).

Considering that improved pronunciation and increased intelligibility can also boost learners’ confidence in speaking situations (Avery & Ehrlich, 1992), it seems logical for instructors to find ways to make pronunciation instruction a mainstay of foreign language courses, particularly those involving speaking, listening, and intercultural communication.

**Rationale for recording**

A wealth of instructional material exists should instructors become interested in adding a pronunciation component to their teaching. However, instead of (or in addition to) using another textbook in class, it might be more edifying – not to mention more enjoyable – for all concerned to see students’ pronunciation as well as hear it. To this end, instructors should consider utilizing audio recording and visualization software (ARVS), much of which is inexpensive or freely available for computer operating systems typically found in homes and classroom environments.

Computers in the classroom have long been praised for their ability to make information psychologically and cognitively accessible (cf. Pennington, 1996). In this way, by using ARVS, learners can be exposed to their own and others’ pronunciation in new and exciting ways. For instance, as it is possible to digitally record and archive utterances, students’ pronunciation can be recorded and saved at the beginning and end of a course. Playing back the recordings for comparison purposes makes it easier for students (and instructors) to mark their pronunciation progress.
More importantly, ARVS allows for sophisticated yet illuminating analyses of human speech. These analyses are carried out by examinations of (a) waveforms, (b) spectrograms, and (c) pitch contours, for these present visual experiences of exactly what was pronounced and provide a clearer understanding of what needs to be done for pronunciation improvement.

**ARVS functions**

The first function to be discussed is the waveform. Most ARVS will automatically record and display input via a waveform. Waveforms show the pulses produced when the vocal cords vibrate. Generally speaking, waveforms do not make it easy to interpret utterances (i.e., to see which phonemes were uttered), but they do display both frequency and amplitude of sounds, that is, the speed and loudness of utterances.

The second function, the spectrogram, presents more information than waveforms, as they indicate the formants of produced speech. Formants are the prominent bands of frequency that determine the phonetic quality of a sound, most notably that of vowels. Reading formants from spectrograms allows viewers to interpret things like vowel height and backness and can indicate if two phonemes (e.g., /r/ and /l/) were pronounced similarly or differently.

The audiolinguistic method made much use of pronunciation instruction that involved practice with minimal pairs, that is, words that differ from each other by only one sound (e.g., “light” and “right”). Though minimal pair drills have been criticized for focusing only on *segmentals* (i.e., single consonants or vowels), as such drills involve practice with individual words spoken without context outside of connected speech,
some researchers nevertheless assert that pronunciation problems between non-native speakers are most striking at the segmental level (Jenkins, 2000) and that training with minimal pair instruction still has a positive effect on pronunciation (Derwing & Munro, 1997; Rubrecht, 2007). Spectrograms, which can be viewed and “transcribed” to indicate what phoneme was uttered when in a word, have been found to be extremely useful in pronunciation instruction and can even bestow positive motivational effects (Dandou, 1991, as cited in Nakai, 2005).

The third function, pitch, is categorized as a suprasegmental feature, or that which lies above the segmental level (e.g., tone, stress, intonation). As defined by Ladefoged (1993), the pitch of a sound is the audible property that allows one to place it on a scale from high to low without any consideration of its acoustic properties. Changes in pitch cannot be used to distinguish words in English but they can affect the meaning of an utterance (consider that the name “Lisa” would sound different when uttered in a roll call, when one is trying to get that person’s attention, and when one is calling that person in a taunting manner, even though there is no variation in the uttered segmental features). Because looking at and counting waveform peaks is tedious and time-consuming, ARVS with pitch contour displays allows for quick and easy visual representations of utterance frequencies. Viewing pitch contours therefore makes it possible to get an indication of how an utterance was spoken and allows for a higher degree of accuracy in the interpretation of the intention behind it.

Though it is widely believed that suprasegmentals are more important to intelligibility (i.e., the degree to which an utterance is understood) than segmentals, few studies actually support this belief. Because those who recognize the benefits of pronunciation instruction acknowledge the positive effects of practice with both
segmental and suprasegmental features (Derwing, Munro, & Wiebe, 1998) and support instruction that balances the two (Celce-Muria, Brinton, & Goodwin, 1996), instruction with ARVS should ideally include both spectrograms and pitch contours.

**Putting ARVS to use**

Because many institutions have classrooms or language laboratories furnished with desktop computers (not to mention the ubiquitous nature of laptops and other portables), most teachers are equipped to use ARVS in the classroom, the only technical problem being which software program to use. Before engaging students in pronunciation learning activities that will increase their awareness of pronunciation as both a speaking and listening component of communication and help all involved visually diagnose any extant pronunciation problem areas, it is necessary to acquire one or more ARVS programs. The following is a brief explanation of the positive and negative aspects of some of the better or more commonly known free ARVS available for download.

Program: [Audacity](http://audacity.sourceforge.net/download/)

Platform: Mac, Windows, Linux

Details: Most people know this audio recording program, as it is free and available for all major platforms. Audacity has the power to import from and export to a variety of formats, and it comes replete with numerous built-in effects (e.g., change speed, fade out). Playback and editing is easy and intuitive. This is an ideal program for simply recording and visually inspecting sound input via waveforms or for recording and later importing into another program.
Drawbacks: Its spectrogram and pitch visualizations are almost worthless, as the resolution of these displays is embarrassingly sub-par. Also, unstable (read: latest) versions tend to be prone to glitches and crashes.

Program: Sonic Visualiser (http://www.sonicvisualiser.org/)
Platform: Mac, Windows, Linux
Details: This program displays waveforms as well as various types of spectrograms, that is, regular spectrograms, melodic range spectrograms, and peak frequency spectrograms. What makes this program noteworthy is its ability to allow the user to compare data by overlaying one set of data onto another or display the same data in multiple ways simultaneously. Its simplicity and adjustability of displays (spectrograms can be viewed in “Fruit Salad” colors!) make it worth checking out.

Drawbacks: This program cannot record audio, and spectrogram layers or panes are initially displayed up to 21000Hz, which is far higher than necessary to look at the formants of consequence to human speech. These displays can be tweaked to show target ranges more clearly, but this must be done manually for each imported file.

Program: Spectrogram (http://www.visualizationsoftware.com/)
Platform: Windows
Details: This program (currently at Version 16.0), true to its name, presents spectrograms. That’s it. Display parameters can be adjusted but are initially capped at a sufficient 6000Hz. Spectrograms can be viewed in various ways. Though simple and straightforward, its most outstanding feature is its ability to save screen images of viewed spectrograms, making printouts for students effortless.
Drawbacks: This program is a one-trick pony. Users are best off recording samples with other software, import them, and then let Spectrogram do its thing.

Program: Sonogram (http://www.christoph-lauer.de/)
Platform: Mac, Windows, Linux, others
Details: Few other free programs support a fuller range of algorithms for examining recordings (more than most instructors would ever need). Identifying formants is easy because spectrograms are presented in large displays (up to 4000Hz) that can be color adjusted.
Drawbacks: Without letting users record sounds and with a user interface that lacks polish, this program might be best off in the hands of seasoned veterans. Furthermore, it requires the Java and Java Media Framework installation to run (downloadable at http://www.java.sun.com), so some additional steps are required before the software can be used.

Program: Praat (http://www.praat.org/)
Platform: Mac, Windows, Linux, others
Details: Praat is a program that does nearly everything. In addition to spectral and pitch analyses, Praat will actually draw lines on top of spectrograms, indicating their formants and pitch peaks. This feature, above all others, makes this program outstanding. With its ability to record, some instructors may not use anything else.
Drawbacks: Like many robust programs, Praat has functions that even a full-fledged phonetician would not venture near in regular classroom situations. These should be avoided, as the general interface is not as intuitive as it could be.
Program: Raven Lite 1.0 (http://www.birds.cornell.edu/brp/raven/RavenOverview.html)

Platform: Mac, Windows, Linux

Details: Saving what might be the best for last, Raven Lite is a program that can record, play back, and present views of both waveforms and spectrograms (real-time displays are shown during signal acquisition). It allows the viewing of multiple windows simultaneously, it can import from and save recordings in most common sound file formats (e.g., AIFF, WAV, MP3), and it can also open and visualize tracks from audio CDs if necessary. Best of all, it includes intuitive controls (most of which are in convenient moveable toolbars) that allow for editing, cropping, magnification, and the fine tuning of spectrogram views so that nearly any spectrogram can be read with ease. There is also a full-featured version, Raven Pro, which provides configurable views and advanced analysis tools.

Drawbacks: As Raven was intended as software meant for analyzing animal sounds (particularly birds), displays reach 21,000Hz. Not an insignificant amount of time is often required to whittle spectrograms down to a manageable size and make them viewable so that useful information can be extracted from them. Licenses for the pro version run as high as $800, but discounts are available to researchers, instructors, and students, the latter on a per-semester basis.

Conclusion

The aim of this article was to present readers with a list of free ARVS that may be used for pronunciation instruction purposes. Certainly, other programs exist (some of which are shareware, others require a fee), but the ones listed here are
nevertheless powerful and if used in tandem should be more than adequate for most instructors’ needs. The only major remaining topic of concern revolves around instructors obtaining a decent microphone for recording purposes, but high-quality ones can be acquired easily and cheaply. That should sound good to anyone’s ears.

Biodata

Brian G. Rubrecht works in the English Department of the School of Commerce at Meiji University in Tokyo, Japan. His research interests include language learning motivation, affective factors, and individual differences in learning.

High Stakes Tests and Mandates: Improvements or Hype?

Mary Anne Weegar, National University
Helen Anderson-Cruz, San Diego State University

Background of the Problem

In an attempt to hold the public education system responsible for providing equal educational opportunities to all students regardless of ethnicity or socio-economic status, a series of reforms were implemented during the mid-20th century. Arguably, the most significant statute governing the role of the federal government in education has been the law known as No Child Left Behind (NCLB) implemented by the Bush Administration to address the low expectations for non-mainstream students and children of poverty.

The NCLB law has resulted in the federal and state government assuming increased authority over local educational communities giving the state and federal government the authority to oversee school funding, curriculum, and assessment. The advocates for taking power away from local communities believe that this is the only way to ensure equal educational opportunity. Those who oppose giving the state more power over educational policy believe increased state power will lead to sanctions such as withholding resources (funding) from local education agencies (LEAs) if students fail to meet the state academic standards.

A review of the debate over legislative policies from both points of view suggests there is a certain degree of legitimacy for each interpretation. An analysis educational accountability policies in four states (i.e., New Jersey, Massachusetts, Vermont, and Connecticut) found that although policy makers had intended to make the public education system more equitable, the result of abiding by these policies has created a significant gap between aspirations and results (McDermott, 2007).
Statement of the Problem

In K-12 education, standards-based initiatives focus on student achievement. Advocates of mandated tests view this as a viable means of informing the public on how well their students are doing. Standards-based reform polices such as NCLB, have resulted in using standardized tests to measure how well students in each grade of every school in the United States perform in reading and math. The rationale for testing was to determine the number of schools in the nation whose students were making “adequately yearly progress” in reading and mathematics (CEP, 2010). However, some researchers have suggested using multiple measures because using one test to measure student achievement would not provide an accurate assessment and would result in “an over reliance on a single outcome measure, lack of validation of tests, an undue emphasis on quantitative measures, and failure to educate the public concerning the meaning of labels such as proficient” (Fitzpatrick et al., 2004, p. 49).

Significance of the Problem

With the enactment of the No Child Left Behind Act in 2002, many teachers have been quick to express their concerns that the mandated tests could result in “teaching to the test”. Although teachers are generally proponents of holding schools accountable for offering a quality education program, teachers have questioned the decisions by politicians to focus exclusively on improving basic academic skills. Rothstein and Jacobsen (2006) suggested that focusing entirely on reading and mathematics highlights the discrepancy between on low income and minority children and their mainstream counterparts and points to a disparity among urban and suburban schools in adherence to high standards of achievement. The goal of NCLB is to provide all students with a solid foundation of academic knowledge and skill but may be leading to an undue narrowing of curricular choices and the kind of learning opportunities for academically at-risk students (Rothstein & Jacobsen, 2006, p. 266).
A survey conducted by the Center of Education Policy (CEP) in 2005 found that “97% of high-poverty districts had new minimum-time requirements for reading, while only 55% of low-poverty districts had them” (as cited in Rothstein & Jackobsen, 2006, p. 266). In a previous study, the CEP found that one-half of the districts that had adopted minimum-time policies had significantly lessened the time spent on social studies, art, music, and physical education.

A multi-year review and analysis over a four-year period by the Center on Education Policy identified the following ten significant effects of the NCLB Act: (a) student achievement in reading and mathematics is rising; (b) schools are devoting more time to reading and mathematics, sometimes by reducing the amount of time spent on other subjects; (c) schools are spending more time aligning the curriculum and instruction and are focusing more attention on analyzing test scores; (d) schools that are low-performing are undergoing makeovers; (e) schools and teachers are doing a better job in meeting the law’s academic requirements: (f) the number of schools on the state “needs improvement” lists are not increasing. The next five effects were more controversial: (g) students are being required to take many more tests; (h) schools are focusing more time on narrowing the achievement gaps and the needs of specific students (i.e., English Language Learners, Student with Special Needs); (i) the federal government is assuming a larger role in education; and (j) state governments and school districts have taken a more active role such as expanding testing programs for students in grades 3 to 8 and one year of high school (Jennings & Rentner, 2006).

A Review of the Literature

Role of Mandated Tests and Standards in Curriculum Development

The writers believe that a “symbiotic” relationship exists between mandated tests and curriculum standards. Both mandated tests and standards are directly related to curriculum development. Content and performance standards are used by school districts to define expectations for meeting grade-level criteria. “Curriculum development reflects those standards,
delineating by grade the content and strategies for teaching and assessing what is taught. The
instructional process should include the same types of inquiry that students will encounter in
subsequent testing for school or national assessments” (Castleberry, 2007, p. 20). In other
words, mandated tests are supposed to assess students’ understanding of the uniform state
curriculum standards as taught to them by their “highly qualified teachers”.

No Child Left Behind (NCLB), mandates challenging and clear standards of achievement
and accountability for all children, and strategies for reaching these standards (U.S. Department
of Education, 2007). Accountability measures include benchmarks for adequate yearly progress
(AYP) that guide states in meeting NCLB in language arts/reading, mathematics, and science by
2014. The benchmarks include state and local assessments aligned to state content standards and
are measured according to state achievement standards. The results are disaggregated by student
ethnicity, race, home language, disability, and family income. It should be noted that assessment
under NCLB is not intended to be a high stakes test from a federal policy perspective nor from a
legislative perspective but rather a measure of students’ ongoing improvement on an annual
basis.

High stakes tests are intended for determining whether a student will be promoted from
one grade level to another or for determining whether a student has met the requirements to
graduate from high school (Mele-McCarthy, 2007). Assessment under NCLB is designed to
measure adequate yearly progress and test results will not determine promotion or retention.

The Role of Testing in Public School Education

In public schools, tests are measures used to collect data to assist with evaluating
achievement and knowledge acquisition. There are four approaches to achievement testing:
norm-referenced-testing (NRT), criterion-referenced testing (CRT), objective-referenced testing
(ORT), and domain referenced testing (DRT). These tests are similar in many ways but the
interpretation of the test results may be quite different.
Norm-referenced tests are primarily used to compare students' test scores. These tests are used by school districts to assess the progress of their students in meeting grade-level standards. Examples of norm-referenced tests are the California Achievement Tests, the Comprehensive Test of Basic Skills, and the Iowa Test of Basic Skills. The major value of these tests is that they allow for comparison with other norm groups and are used to determine how well a school is doing in comparison with other schools across the nation. The major weakness of these tests is that they may not evaluate the curriculum that is being taught (Fitzpatrick, Sanders, & Worthen, 2004).

Criterion-referenced tests are used to measure student performance against an established set of criteria. These tests are presently used in 49 states to measure standards that have been adopted by each state to determine the performance of schools and/or school districts. Criterion-referenced tests are generally used to measure students’ progress in meeting the curriculum standards for selected academic programs such as language-arts, mathematics, and science (Fitzpatrick, Sanders, & Worthen, 2004).

Objective-referenced tests are used for formative evaluation. Teachers are able to use these tests to determine how well their students are meeting their course objectives. The information that these tests provide enable the teacher to adjust her/his course content to improve student learning (Fitzpatrick, Sanders, & Worthen, 2004).

Domain-referenced tests are used to measure students’ knowledge in a particular subject area. The items in this type of test are not connected to a curriculum but to a content domain such as American history or economics. These tests are useful in determining how much information students who graduate from high school have acquired in relationship to a particular subject area (Fitzpatrick, Sanders, & Worthen, 2004).
The Standardized Testing and Reporting (STAR) Program in California

The Standardized Testing and Reporting (STAR) Program is part of the California assessment system. The STAR Program measures how well students in California are learning the knowledge and skills identified in the California content standards. The STAR Program is authorized under the California Education Code Section 60640 until 2011. Tests in the STAR Program are administered annually to students in grades two through eleven and include: the California Standards Tests (CSTs), the California Achievement Tests, Sixth Edition (CAT/6 Survey), the California Alternate Performance Assessment (CAPA), the Standards-based Tests in Spanish (STS), and the Aprenda, La prueba de logros en español, Tercera edición (Aprenda 3). The CSTs measure the achievement of state content standards in English-language arts, mathematics, science, and history-social sciences. The CAPA is an alternate assessment for students with severe cognitive disabilities. The STS is administered to Spanish-speaking English learners and measures the achievement of state content standards in reading-language arts and mathematics in Spanish for grades two, three, and four. The Aprenda is a nationally norm-referenced achievement test of general academic knowledge in Spanish for Spanish-speaking English learners for grades five through eleven in (California Department of Education, 2007).

Conclusion

The pending reauthorization of the Elementary and Secondary Education Act, which is presently known as the No Child Left Behind Act, is creating a great deal of lively discussion between the politicians and the educators over whether the new version is going to be an improvement over the last rendition of this legislation.

The Bush administration placed the reauthorization of the No Child Left Behind Act as a priority for continuing to improve education in the United States. In stark contrast, there are many professional educators who argue that the Bill was flawed and is in need of fixing. For example, the testing of students should be kept in perspective. Few would argue that testing is
important in education, because teachers and the public need to know how students and schools are progressing in mastering the curriculum standards. Hence, the public should be provided with a snapshot of how successful students are doing in meeting the benchmarks that have been established by the state curriculum standards.

Standards-based reform policies have resulted in using standardized tests to measure how well students in each grade of every school in the United States performed in reading and math. The rationale for testing was to determine the number of schools in the nation whose students were making “adequately yearly progress” under NCLB (CEP, 2010). The teachers need test data to have a comprehensive view of how students are progressing.

The Center for Educational Policy (2010) has recommended eliminating AYP because otherwise “in some states nearly all the schools could be labeled as failing by school year 2012-2013” (p. 2). The AYP system has “over identified public school for improvement and makes no distinction between schools in which one group of students missed one or two AYP targets and those in which students missed multiple targets” (p.2). The Center for Educational Policy also suggested that the current practice of singling out underperforming schools could overburden the state departments of educations who are responsible for providing assistance to these underperforming schools (CEP, 2010).

The current administration has proposed a sweeping overhaul of the law to eliminate the current accountability system. The new “blueprint” focuses on the 5000 lowest performing schools in the nation. This may result in returning the power and responsibility for students’ academic growth back to local education agencies.

**Abstract**
Since the diffusion of personal computers and the advent of consumer scanners, digitizing paper documents has become increasingly simple and cost-effective. Even so, it is suspected that many teachers and researchers do not use scanners to their full potential. In order to help others realize the benefits of using scanners for teaching and research purposes, the present article outlines the many uses of scanners and illustrates how scanner use can increase productivity and aid in organizing information.
Yes we scan! Using consumer scanners

for teaching and research

Brian G. Rubrecht, Ph.D.
Meiji University

In many ways, educators have benefited greatly from advances in computer technology. Numerous tasks like contacting colleagues at far away institutions via e-mail and registering for conferences online are now everyday occurrences. It may even be surmised that most educators cannot imagine teaching or conducting research without the use of personal computers.

However, to say that educators possess and wield a wealth of technology is not necessarily to say that such technology is used efficiently and effectively. As discussed by Keengwe and Lawson-Body (2008), though many campuses provide their faculty with a vast array of technological resources to aid in student instruction, it is incumbent on faculty members to learn about and experience this technology for themselves so that they may effectively integrate this technology with their instructional duties.

In an effort to make current technology even more useful, the current article describes a method that, if used regularly and consistently, will help both teachers and researchers to (a) produce tests and other handouts easily and without major modifications, (b) clean up their offices, which are likely filled with various paper
documents, (c) organize documents by making them centrally located and thus more easily accessible, and (d) store documents safely in a minimal amount of space. This method involves using a peripheral device that most people already own or have easy access to: a scanner.

Background to Scanning

According to Gray (2006), it has become imperative to “recognize that we have become a society of information managers” (p. 2263). Because of improved search engines, both online and embedded within personal computer operating systems, the tasks of searching for and retrieving information have never been easier. The clear drawback, however, is that these searches require information to be in electronic form. Such searches cannot locate information found in physical documents, such as in handouts received at conferences or in photocopies of journal articles. It would be of incredible use if such information could be transformed into a digital format. Scanning those physical documents into a personal computer would certainly allow one to take advantage of the computer’s abilities to search for and locate information.

If one considers the sheer number of papers the average educator accumulates over the course of one academic year (e.g., papers obtained from faculty meetings), it would appear a daunting – if not outright impossible – task to scan them all. Only those lucky few with teaching assistants may be able to accomplish this feat. However, it is not the case that all documents need to be scanned, nor should they be. One must be selective about the scanning process. Nevertheless, it may be generally stated that scanning documents provides three clear advantages:
(1) *Scanning aids in handout and test construction.*

Numerous are the times the author has seen colleagues photocopying, cutting, and pasting pictures or images onto word-processed tests. While this is one way to create tests, it makes it difficult to make alterations or improvements to those tests once they are made. What is more, there is then the matter of filing away that physical test if it can be used, either in whole or in part, at a later date, which only adds to office clutter. Since most tests are word-processed to begin with, it makes sense to scan pictures or images and insert them into the word-processing document where appropriate.

(2) *Scanning places important documents close at hand.*

It may be ventured that most if not all educators use their computers on a near-daily basis. If this is the case, it would be wise to scan documents that are very useful or that are often needed, with examples being class rosters, teaching timetables, and colleague email addresses and phone numbers.

(3) *Scanning helps in the procurement of library-use-only information.*

Scanning such information can generally only be done by those who own or have access to laptop computers and portable scanners. Many journal articles can only be obtained from bound volumes that are marked “Library Use Only.” Of course, articles in these volumes may be taken to the copy room and photocopied, but in addition to the disadvantage of adding to office clutter, these physical photocopies use up tremendous amounts of paper and can quickly become a significant financial burden, especially when one is involved in a major research or writing project. Using a laptop computer and portable scanner within the library allows one to avoid these disadvantages. In fact, in many cases, the money saved by scanning documents instead of photocopying them can quickly meet and surpass the cost of the computer and
scanner.

Needless to say, those who deem library scanning an option should be aware of two things. First, silent scanners are few and far between. As a matter of etiquette, scanning should only be done in study rooms, in isolated areas away from others, or in the photocopy room (if space allows). Taking advantage of scanners and the scanning process does not give anyone the right to unnecessarily disturb other library patrons.

Second, there is the matter of copyright laws. These laws exist to protect the intellectual property rights of others. Most libraries post signs like the following, which serve as guidelines when making copies:

Users may only copy materials within the limits of copyright laws.
- Copy only up to half of a book.
- Copy only up to half of a journal article from the latest issue. Articles in issues older than three months may be copied in full.
- Copy only for academic purposes.
- Do not copy for others.
- Do not distribute copies for commercial purposes.

The Pros and Cons of Scanning

The Cons

Before teachers and researchers begin scanning documents into their computers, they should be fully aware of the drawbacks inherent in scanning:

1. Scanning is a time-consuming endeavor.

Scanners are never as fast as the person doing the scanning would like them to be, especially when there are hundreds or even thousands of pages to be digitized.
Scanner speeds do vary (see below), but few consumer-level scanners will produce scans as quickly as a photocopier produces photocopies.

(2) Scanners do not fully mimic the output provided by photocopiers.

All things considered, photocopiers produce better results than scanners. Certainly, scan resolution can be increased and color scans can be made with a quick setting change, but scanner users must be aware that consumer scanners are not constructed – and therefore are not quite as precise – as industrial photocopiers. The most obvious result of this difference is that it is sometimes difficult to fully copy text that is printed near the spine of an open book (particularly large books like reference materials or bound periodicals). While a photocopier can handle the downward pressure that must be applied to have all the text on a page copied, consumer scanners, being more delicate, cannot be treated the same way. If an inordinate amount of pressure is applied, the scanner glass could break or become warped, thereby preventing the moving parts below from functioning properly. In either case, the end result is an unusable scanner.

(3) Scanning does not translate into instant organization.

Though scanning lends itself to increased organization, this organization does not come automatically. It is up to the user to develop a system of scanning and storage that facilitates the locating of those digitized documents, even without the help of a computer’s search functions.

(4) Anything that has been digitized should be backed up.

As mentioned, scanning takes time. As such, it also takes effort on the part of the user to go through with the digitization process. To make sure that those efforts do not go to waste, it is important to back up all scans. Ideally, such backups should be
made on a regular basis. Backups can be created in a number of different ways (e.g., by using an external hard drive, by creating a data DVD). How backups are made is ultimately up to the user. Of course, there is an additional financial element involved in making backups, but little can be done should the computer one is using crashes or is stolen and the original documents that were scanned have been thrown away or are no longer accessible to the user.

The Pros

Even with these drawbacks apparent, it can be argued that the advantages presented by scanning far outweigh the disadvantages.

(1) Document location no longer becomes a concern.

Whether one is at home, at the office, or traveling, one will always have access to the digitized documents (this is certainly the case for those with laptops, only slightly less so for those with portable external hard drives or remote access to a computer or files). Access despite location is definitely a plus because (a) documents need not be transported from place to place in order to get work done and (b) one can have access to information as needed (e.g., one does not have to carry a physical list of colleague phone numbers and contact information to a conference on the off-chance that such information will be needed).

(2) The process of locating information becomes quicker and more efficient.

Those who consistently and correctly use scanners will find that they no longer have to upset shelves or sift through drawers and filing cabinets to find that one piece of information they know they have. If scanned documents are properly labeled
and “filed” on a computer’s hard drive, this information can be retrieved quickly and easily.

(3) Nearly all of one’s information is stored in one convenient place.

This advantage, though self-explanatory, was clearly demonstrated to the author during the process of dissertation writing. All the information from the literature sources being used for the dissertation were literally at the author’s fingertips when it came time to actually write the paper, and it made it extremely easy to check things like page numbers, quotations, and book publishers from the scans during the proofreading stage. Because nearly every piece of information was stored on the author’s laptop, the references could be checked whenever and wherever it was most convenient, which at times included on trains, in the back of a car, and in an airport lobby when waiting for a flight.

(4) Scanning + backups = superfluous original documents.

As stated in the equation above, if a document is not absolutely imperative to keep, it may be thrown away after being scanned and backed up. The most salient advantage to discarding physical documents is that it clears up valuable home and office space. Another advantage, which is of likely interest to world travelers (e.g., those who change research or teaching locations often), is that it is considerably easier and far less expensive to pack up and ship a case full of data DVDs than photocopied articles. A further benefit not to be overlooked is that multiple copies of such data DVDs can be made and stored in various places. An unfortunate incident in one location (e.g., a fire, an earthquake) will not spell total disaster if copies have been stored elsewhere.
Consumers today are faced with many considerations when it comes to purchasing a scanner: the size and type of the documents to be scanned, scan output color and resolution, and image compression, just to name a few (cf. Raby, 1998). While different scanners are manufactured to meet different needs, most current consumer scanners (often called either desktop or flatbed scanners) use a USB 2.0 Hi-Speed interface, which typically allows low-end consumer scanners to produce roughly two or three scans per minute. Most people would probably be satisfied with this speed, but some may consider this too slow, especially if high-volume scanning is required. High-end scanners that are dedicated to document digitization are equipped with sheet-feeding capabilities for automatic double-sided scanning (in some cases allowing 150 scanned pages or more per minute), but gains in speed usually come by sacrificing economical pricing and portability. Some scanners are USB powered, meaning that they do not need an external power supply. Such scanners tend to be compact, lightweight, and inexpensive, thereby making them the perfect companion to laptop computers because (a) neither the scanner nor the laptop require an electric outlet (which may be off limits to library patrons in some situations. In others situations outlets may simply be nonexistent) and (b) there are fewer cables to transport from place to place.

Nowadays, one would be hard-pressed to find a scanner that lacks function buttons. These buttons allow for quick and easy scans, “photocopies,” and the emailing of scanned documents. This automation speeds up the often tedious and boring task of making scans, but one always has the option of being entertained (i.e., distracted) during the scanning process by doing other things such as watching television, talking on the telephone, chatting over the Internet, or even perusing other documents that one is
considering scanning.

Before one begins scanning a document, it is important to consider the type of scan (e.g., black and white, grayscale, color), resolution, and scan format that would best match the document at hand. Not considering these aspects of the scan could result in either illegible scans, scans that take an inordinate amount of time to complete, or scans that take up far more disk space than necessary. While different documents require different settings, personal preferences also play a part. In the author’s experience, in terms of resolution, most scans for text or figures require no more than 150 or 200 dpi (dots per inch). This resolution, when done with a grayscale setting and saved in JPEG format, provides the perfect balance of small file size and clear resolution, even in the event that it is deemed necessary to enlarge or print the scan at a later date. More complicated documents may require higher resolutions or even color (e.g., if documents contain color graphs), but in general it is recommended that high resolution or color scans be avoided whenever possible due to their longer scanning times and larger file sizes.

Most scanners manufactured today come with OCR (optical character recognition) software features. OCR allows the text on a page to be transformed into computer text. In other words, instead of making a scan that is similar to a picture or a photocopy of a document, an OCR scan reads the document and “types” what is written on the page into a word-processing program. OCR, while convenient, may not be the best scanning choice for archival and retrieval purposes, the main reasons being (a) one cannot immediately tell what page the scan came from, (b) OCR does not always scan and copy text perfectly, which can result in computer text that is full of odd or apparently “mistyped” text, and (c) when it comes to checking quotations or names
from a source, it is preferable to refer to a near-perfect copy of the original document rather than just computer text on a screen. In any event, scanner users are strongly encouraged to experiment with and explore a scanner’s configurations so that they may find the scan setting that best suits their scanning needs.

Scan Retrievals

When one begins to scan documents, how one names said documents becomes key when it later comes time to retrieve the documents from a computer hard drive or disk. In order to more easily locate those scans later, it is recommended that users name each scan with a short abbreviation of the scan. For instance, suppose that a researcher wishes to scan the following journal article:

It would not be feasible to scan each page and name each resultant scan in full (e.g., Rubrecht 2003-Literacy Across Cultures-p11, Rubrecht 2003-Literacy Across Cultures-p12). Naming scans this way produces too many results when a search for the article is later conducted. Instead, it is recommended that one create a folder with a comprehensive name (e.g., Rubrecht 2003-Japanese English writing-Literacy Across Cultures) that can be searched for and easily located. The individual scans should still be named, but their names should be generic yet indicative of the article that they came from (i.e., Ru2003-11, Ru2003-12, etc.). How each scan is named is, of course, ultimately a matter of preference.
Occasionally, it may become necessary to print documents that have been scanned, such as when one is making notes or calculations. In such cases, users should avoid printing a multi-page article one scanned page at a time. Rather, a much faster and easier way to get a printed version of an article, if the scan viewing software one uses does not allow batch printing, would be to insert those scans into a word-processing program (e.g., Microsoft Word), particularly by drag-and-drop method. Printing one 20-page document is certainly easier than printing 20 one-page documents. Be sure, however, to set the margins in the word-processing program as narrow as possible. Narrow margins increase the available page space where the scan will be situated, which in turn increases the print size in the scan, thereby making the print more legible.

Scanners and the Researcher

*Using the Screenshot Method*

Having scanned articles on hand makes the task of article writing much more simplified, for when it comes time for researchers to take notes for the literature review, it is essentially only a matter of copying and pasting select screenshots of sections of the article one is reading. These screenshots can be taken with either keyboard or mouse shortcuts within a computer’s operating system or by using dedicated screenshot-capturing software. After a screenshot is taken, it should be placed into another application (hereafter, target application) such as a word-processing or a digital asset management (DAM) cataloging program. As the basic goal of notetaking is to obtain a brief yet clear understanding of writers’ ideas, screenshots that are limited to only a few lines (i.e., sentences) are more effective for notetaking than are screenshots of entire windows or pages, though screenshots of larger sections such as article
abstracts or entire paragraphs can be taken if necessary.

**Screenshot Advantages**

The advantages of taking notes by using screenshots are many:

(1) *Exact wording is kept.*

When used judiciously, direct quotes from literary sources lend credence to one’s own work. Furthermore, direct quotes can often present information succinctly, sometimes far more so than paraphrasing. When including a direct quote from the literature, a screenshot of the original text (taken from a previously scanned document) helps to ensure that no typographical errors are introduced into one’s own work during the notetaking process. Additionally, the original text can be easily referred to during the actual article-writing phase. This allows the writer to ascertain that the quote, when being typed, is mistake free.

Such screenshots as these can also be used when paraphrasing is preferred over direct quotes. The passage in question can still be found quickly and the original wording checked. Of course, though a citation is still required when paraphrasing the work of others, plagiarism can be more easily avoided, for writers can effortlessly ascertain that their wording is sufficiently different from that of the original.

(2) *The input of complex information becomes simplified.*

One of the biggest obstacles in notetaking comes when one attempts to incorporate information found in illustrations such as charts, graphs, or tables into one’s notes. If such information is deemed important enough to be included in an article that one is writing, it is possible to make such information handy by taking a screenshot of it and placing it in the target application. These screenshots allow any non-standard text
(e.g., diagrams, lists, figures) to be more readily accessible for article incorporation.

(3) Typing required for notetaking is reduced.

Traditional notetaking, either hand-written or typed, requires a significant amount of time and effort for the notetaker. This screenshot copy-and-paste method means that less typing is required, which translates to time saved and reduced physical stress. Even so, as each screenshot captures the information one desires to utilize, more information can be made available in the target application for later consideration and usage.

It goes without saying that using screenshots in this manner is only possible if the relevant literature has already been scanned. While journal articles found in bound volumes that are marked “Library Use Only” will most likely be what have been scanned, there is still the matter of what to do with information found in books, such as those found on researchers’ office shelves. In such cases, it becomes necessary to scan the relevant sections, often in an ongoing manner, as one reads each book. If one keeps copyright laws in mind, as delineated above, this is usually not a problem. OCR scans become one viable option in these cases, for the scanned text areas are transformed into blocks of editable text, and the original text can more or less be referred to easily. This scanning of book areas does increase the amount of time required for notetaking, but making OCR scans arguably reduces both the time and effort needed to input information, especially when compared against the traditional method of typing out that same information. As an aside, proper OCR scans present text characters that are often easier to read than the text found in regular scans, as the text is computer text, not a “picture” of text. As will be discussed, such computer text can be recognized by
text-searching software, which itself provides further advantages, but of course, it is up to the user whether or not to create scans or utilize OCR.

*Words of Warning about Screenshots*

Screenshots need not be taken simply from documents that have been scanned. It is possible to download and take screenshots of articles (which are usually in PDF format) from journals that provide online subscription access. Though these downloaded articles tend to be superior to typical scans in that they present high-quality text that is often searchable, some PDFs downloaded from databases are password protected. Without the password, text copying – and in some cases even taking screenshots through a PDF viewer such as Adobe Acrobat Reader – becomes, by design, impossible. The workaround in such situations is to take a screenshot through the computer’s operating system itself or by use of a dedicated screen capture program.

*Screenshot Notetaking Suggestions*

The drawback to screenshot notes is the inability to conduct searches for specific text, as the screenshots are essentially only pictures or snapshots of document pages. Nevertheless, there are ways to take advantage of the target application’s text search functions when screenshots are involved:

1. *Manually type complete reference information.*

   This should be the first step before placing screenshot notes of a literature source into the target application. Including reference information in full (e.g., author, year, title) makes it easier to find the notes to a particular author’s work and reduces potential confusion when citing the literature, as it is often the case that writers must cite multiple works from an author.
(2) Manually type page numbers for screenshots.

When one decides to take a screenshot from a literature source, manually type the page number to note where exactly that screenshot came from. This location indicator will become invaluable later for several reasons. First, page numbers are necessary should direct quotes be used. Without a page number, it would later become necessary to read back through the entire original literature source to find where that quote came from. Second, because screenshots should be as short as possible, it may sometimes become necessary for one to refer back to the original literature source for clarification of screenshot information (i.e., relevant information adjacent to the screenshot’s information). A page number made handy means that there is little difficulty involved should a return to the correct page be required.

(3) Manually type a succinct screenshot summary.

Screenshot summaries are text searchable. This means that the task of organizing and grouping one’s notes when it comes time to enter the article-writing stage will be greatly simplified. Summaries should be kept to essential key words but may be as lengthy as is required to make later text searches effective.

(4) Spell-check all manually-typed information.

Part of the reason to manually include information about screenshot contents is that it allows writers to take advantage of the text-searching function of the target application. As such, one must be assured that the text is spelled correctly, especially author names. Anything that is spelled incorrectly will be missed during a text search, the result of which is information found within screenshots not being located and subsequently going unused.
Researchers’ Other Data

Beyond aiding researchers with their literature review, scanners provide an additional salient advantage that should not be overlooked: they can be used to digitize data collection materials such as questionnaires. Scanning questionnaires one has administered provides digital copies of the information found in those questionnaires. A calamity of any kind (e.g., a fire) would destroy any data one has collected, some of which could have come at great cost or from research participants one no longer has access to. Having scans of the data – and the recommended backups in different places – means that the research with that data could be continued at a later date. If the questionnaires and the data they contain are lost, it could very well spell the end of a research project.

This scanning and archiving of data presents its own further advantages. First, it makes it easy to return to the data to double-check something, rather than sift through stacks of papers. Second, it helps to have the scan of a questionnaire on one computer monitor while the data is extracted and put into a word-processing program or spreadsheet on another. This keeps one’s desk clear of clutter, it allows the researcher to store the digitized data in a safe place, and it eases data input, for both incoming and outgoing data is right before one’s eyes.

Third, it allows researchers to more easily delve back into the research data at a later date. For instance, researchers may be most interested in a particular topic when engaging in a research project. However, later, based on the initial research results, the researcher may find it necessary to go back to the data (e.g., the original questionnaires) and extract data that was not pertinent to the initial research but that have become important, such as if a researcher decides to conduct a longitudinal study and requires
the first set of data for comparison purposes.

Finally, scanned archives present proof. If, at some point, someone challenges a researcher’s data, the scans – and the data they contain – are there as proof. Many researchers destroy all records of their research to preserve the anonymity of their research subjects. While definitely a good idea, this is often done because it is too difficult or expensive to store the mountains of data (e.g., questionnaires, audio recordings) under lock and key. As many types of data in the social science and education fields can be digitized, it is very easy and practical to digitize and store this information in a password-protected computer file or on disk in a safe and secure physical location such as a lockbox or a safe deposit box.

Conclusion

Not everyone will agree that the advantages of scanning outweigh the disadvantages. If done in a methodical manner, and if used in conjunction with additional software (e.g., referencing applications), document searches are expedited and article citations can be conducted with a minimal amount of effort.

It is hoped that readers will come to experiment with scanners and find more creative ways to use them for instructional and research purposes. Although this article does not provide specific details, there are resources available that provide more in-depth explanations about scanners and the scans they can produce (cf. Cohen & Robins, 1999; Huss, 2003). Some may consider these and similar “how to” texts overkill, as they discuss everything from how to use scans to produce professional-looking publications to how to use photo editors to improve resultant scans, but there are enough explanations and tips that go beyond even what has been described.
in the present article to allow educators and researchers to maximize the potential of their scanners.

As a final note, it is highly recommended that scanner users utilize password protection for all scans created. The scans (e.g., from literature sources) are technically only for the person who made them. Copyright laws, as mentioned above, should not be ignored. Also, if a scanned document is truly important, then the original should of course be kept. It is better to be safe than sorry.

Biodata

Brian G. Rubrecht works in the English Department of the School of Commerce at Meiji University in Tokyo, Japan. His research interests include language learning motivation, affective factors, and individual differences in learning.

Comparison of Intrinsic and Extrinsic Motivation Between Now and 20 Years Ago in Japanese Elementary School

Frederico Jose Martins Carreira
Junko Matsuzaki Carreira

In Japan, a relaxed education policy has been introduced into the school education system since the mid-1980s (Nozaki, 2006). In 1997, the program for educational reform was released by Monbusho (Ministry of Education, Science, Sports and Culture, now Monbukagakusho or Ministry of Education, Culture, Sports, Science, and Technology [MEXT]), aiming to change the teaching methods resulting in students' passive learning to one encouraging their autonomous learning (Ministry of Education, Science, Sports and Culture, 1997). In 1998, Monbusho released the National Curriculum Standards Reform, with the aim of helping children (a) cultivate rich humanity, sociality and identity as a Japanese living in the international community, (b) develop the ability to learn and think independently, and (c) acquire basic abilities and skills and be able to develop themselves (Ministry of Education, Science, Sports and Culture, 1998). Further, MEXT (2001) drew up the Education Reform Plan for the 21st Century, which urges teachers to make classes more enjoyable, free of worry, and easy to understand. Then, the comprehensive five-day school week system started in April 2002, aiming at letting children spend more time free from pressure at home and in the community, and engage in socially beneficial activities in order to foster "Ikiru Chikara" (the zest for living), including the abilities to learn and think on their own (MEXT, n.d.). School education has been shifting from cramming and competition to creativity and a more relaxed approach for the last 20 years.

Then, how has pupils' motivation, "the process whereby goal-directed activity is instigated and sustained" (Pintrich & Schunk, 2002, p. 5), changed during the last 20 years? This paper focuses on intrinsic motivation, referring to "motivation to engage in an activity for its own sake" (Pintrich & Schunk, 2002, p. 245) and extrinsic motivation, referring to "motivation to engage in an activity as a means to an end" (Pintrich & Schunk, 2002, p. 245). Several researchers (e.g., Harter, 1981; Lepper, Sethi, Dialdin, & Drake, 1997) have investigated pupils' intrinsic and extrinsic motivation for learning. They found that elementary school pupils decreased in
intrinsic motivation with age, although with slight differences among them. In Japan, Sakurai and Takeh (1985) examined the developmental trend in intrinsic motivation among Japanese elementary school pupils.

To elucidate development and gender differences in motivation between 20 years ago and now in Japanese elementary school, this study investigated intrinsic and extrinsic motivation using a questionnaire developed by Sakurai and Takano (1985). Thus, the purpose of the present study is to compare (a) motivational components of elementary school pupils, (b) their developmental trends, and (c) their gender differences between 20 years ago and now. It is hoped that this study will lead to a number of implications for elementary school education in Japan and expand its scope.

Definition of Intrinsic and Extrinsic Motivation

There have been mainly two types of definitions of intrinsic and extrinsic motivation in psychology. First, Kruglanski (1975) introduced endogenous-exogenous attribution, which refers to means-goal categories. That is, endogenous action means an end in itself. For example, persons who have endogenous attribution enjoy learning English without special reasons (Carreira, 2006). Their goal is only to learn English. Exogenous action refers to “a means that mediates a further goal, one exogenous to it” (Kruglanski, 1975, p. 390). For example, individuals who have exogenous attribution study English for external reasons such as entrance examinations and careers (Carreira, 2006). Kruglanski stated that endogenous action is linked with intrinsic motivation.

Secondly, Heider (1958) introduced perceived locus of causality (PLOC), referring to actions or outcomes which can be perceived as personally caused or as a result of impersonal causes. Personal causality refers to “instances in which P causes x intentionally” (Heider, 1958, p. 100). For example, individuals who have personal causality do it on their own (Carreira, 2006). Impersonal causality refers to instances in which “P may cause x unintentionally merely because his physical or social being exerts some influence on the environment” (Heider, 1958, p. 100). For example, individuals who have impersonal causality do something with unconscious motivations (Carreira, 2006).

Moreover, deCharms (1968/1983) expanded Heider’s concept and proposed origin and pawn. “An Origin is a person who perceives his behavior as determined by his own choosing; a Pawn is a person who perceives his behavior as determined by external forces beyond his control” (deCharms, 1968/1983, p. 273). An origin is
intrinsically motivated, whereas a pawn is extrinsically motivated (deCharm, 1968/1983).

Developmental Trends of Intrinsic and Extrinsic Motivation

Several researchers (e.g., Harter, 1981; Lepper et al., 1997; Sakurai & Takano, 1985) found that pupils’ intrinsic motivation decreases with age. Harter (1981) conducted research on intrinsic and extrinsic motivation in Connecticut, New York, Colorado, and California. Over 3,000 pupils (third through ninth graders) participated in her study (Harter, 1981). Harter investigated five subscales: challenge, curiosity, mastery, judgment, and criteria. She (1981) defined them as follows:

Five separate dimensions are defined by an intrinsic and an extrinsic pole: preference for challenge versus preference for easy work, curiosity/interest versus teacher approval, independent mastery attempts versus dependence on the teacher, independent judgment versus reliance on the teacher’s judgment, and internal versus external criteria for success/failure. (p. 300)

Harter’s questionnaire forced children to decide which of the options was truest for them. There were two sentences in one item: one was based on intrinsic motivation and the other on extrinsic motivation. Children were asked to decide which kind of child was like them and then asked whether this description was only partially true or completely true for them. Each item was scaled ranging from 1 to 4. Scale 1 indicated the maximum extrinsic motivation and 4 indicated the maximum intrinsic motivation (Harter, 1981). The challenge, curiosity and mastery subscales changed from intrinsic to extrinsic motivation with age (Harter, 1981). In contrast, there was a shift from extrinsic to intrinsic motivation on the judgment and criteria subscales (Harter, 1981).

In Japan, Sakurai and Takano (1985) developed a questionnaire, Scale of Intrinsic versus Extrinsic Motivation (SIEM), based on Harter (1981). The participants in Sakurai and Takano were 486, second (7 or 8 years old) through seventh (12 or 13 years old) graders, who lived in Nagano, located in central Japan. There were 240 boys and 246 girls. Sakurai and Takano changed some items, including perceived locus of causality, endogenous-exogenous attributions, and enjoyment as well as curiosity, challenge, and mastery which were used by Harter. Six factors were extracted as follows: curiosity, causality, enjoyment, mastery, challenge and attribution. Sakurai and Takano found three types of developmental trends. First, the curiosity,
causality, and enjoyment subscales declined gradually from second through fifth grades, but increased in sixth grade and decreased in seventh grade again. Secondly, the mastery and challenge subscales decreased with age. Thirdly, the attribution subscale increased with age.

Regarding gender differences, Sakurai and Takano (1985) revealed that the curiosity and causality scores of girls were significantly higher than those of boys in all the grades except sixth grade. The enjoyment scores of girls were significantly higher than those of boys only in second grade. The challenge scores of boys were significantly higher than those of girls in sixth and seventh grades.

Present Study

Purpose

As has been shown above, Japanese school education has been shifting from cramming to a more relaxed approach for the last 20 years. It can be predicted that the intrinsic and extrinsic motivation of elementary school pupils now will be different from 20 years ago. Thus, this study employed the SIEM developed by Sakurai and Takano (1985) and attempted to explore differences in (a) components, (b) developmental trends, and (c) gender of intrinsic and extrinsic motivation of Japanese elementary school pupils between 20 years ago and now.

Research Questions

The present study has addressed the three following research questions:

1. Are there any differences in the components of intrinsic and extrinsic motivation of Japanese elementary school pupils between 20 years ago and now?
2. Are there any differences in developmental trends in intrinsic motivation of Japanese elementary school pupils between 20 years ago and now?
3. Are there any gender differences in intrinsic motivation of Japanese elementary school pupils between 20 years ago and now?

Method

Participants

Third (8 to 9 years old), fourth (9 to 10 years old), and sixth (11 to 12 years old) graders in one public elementary school and one private school were selected to
participate in the present study. The total number of participants in the present study was 385: 137 third, 129 fourth, and 119 sixth graders. In the case of missing values, cases were excluded listwise. Boys and girls were 59.2% and 40.8%, respectively. The informed consent statement, where each participant was assured of anonymity and confidentiality, was received from the pupils’ teachers in each school.

A Elementary School

A Elementary School, located in a suburb of Tokyo, is a public school. There were 454 pupils in A Elementary School. The total number of participants from A Elementary School in this study was 209.

B Elementary School

B Elementary School, located in a suburb of Tokyo, is a private school. There were 360 pupils in B Elementary School. Parents in B Elementary School are relatively eager for their children to study. Most of the students in B Elementary School take entrance examinations in order to attend other prestigious private junior high schools. The total number of participants from B Elementary School in this study was 176.

Instruments

The SIEM was used in this study. The SIEM, based on Harter (1981), was created by Sakurai and Takano (1985). The SIEM consisted of 30 items. There were two sentences in each item: one was based on intrinsic motivation and the other on extrinsic motivation. Children were asked to decide which kind of a child was like them. Each item was scaled as 0 and 1. Scale 0 indicated extrinsic motivation and 1 indicated intrinsic motivation. The content of the initial six subscales was as follows: curiosity, causality, enjoyment, mastery, challenge and attribution. Each subscale contained five items.

1. Curiosity. A high score indicates that students study for the sheer pleasure that they experience while learning something new. Sample: “I always want to know as much as possible” as intrinsic choice versus “I do not want to know many things” as extrinsic choice.

2. Causality. A high score indicates that individuals study voluntarily. Sample: “I study because I want to” as intrinsic choice versus “I study because my parents tell
me to” as extrinsic choice.

3. Mastery. A high score indicates a higher desire to work independently. Sample: “I try to solve difficult problems by myself” as intrinsic choice versus “I ask a teacher soon when a problem is difficult” as extrinsic choice.

4. Attribution. A high score reflects that individuals study because they feel studying is fun. Sample: “I study because studying is fun” as intrinsic choice versus “I study in order to get a good grade” as extrinsic choice.

5. Challenge. A high score indicates that individuals have more desire to engage in challenging schoolwork. Sample: “I like to solve more difficult problems” as intrinsic choice versus “I like to solve easier problems” as extrinsic choice.

6. Enjoyment. A high score indicates that respondents enjoy schoolwork. Sample: “Schoolwork is fun” as intrinsic choice versus “Schoolwork is not fun” as extrinsic choice.

**Data Analysis**

The returned questionnaires were coded. The collected data was analyzed using the Statistical Package for the Social Sciences (SPSS) computer program. In the present study, exploratory factor analysis was used for extracting the underlying factors behind the motivation of the elementary school pupils. Based on the results of factor analysis, subscales were created by adding the scores for the items within each factor. A multivariate analysis of variance (MANOVA) was conducted to detect the effects of grade and gender on the SIEM. When necessary, post-hoc tests were conducted to determine the precise contrasts in which the observed significance occurred.

**Results**

**Motivational factors**

To determine the interrelationship among the questionnaire items, all the data collected from 385 respondents were factor-analyzed using varimax rotation. Three variables (items 11, 16, and 19) were excluded because these items were loaded on two factors. Factor analysis yielded six factors, which accounted for 56.62% of the total variance.

Factor 1 is determined by appreciable loadings on four variables (items 5, 17, 23, and 29). All ask about preference for challenge versus preference for easy work. Thus, Factor 1 can be labeled Challenge following Sakurai and Takano (1985). The six
variables (items 2, 8, 14, 20, 26, and 28) loading on Factor 2 ask whether children decide what to do by themselves. Although item 28 was categorized into attribution in Sakurai and Takano (1985), item 28: *I study because I don’t want to be scolded by my parents* can be considered as causality. Therefore, Factor 2 can be labeled Causality, following Sakurai and Takano. The five variables (items 6, 12, 18, 24, and 30) loading on Factor 3 primarily ask whether children enjoy studying or not. Thus, Factor 3 can be labeled Enjoyment, following Sakurai and Takano. All of the variables (items 1, 7, 13, and 25) that load on Factor 4 ask whether learning is motivated by curiosity. Therefore, Factor 4 can be called Curiosity, following Sakurai and Takano. Factor 5 is defined by positive loadings on five variables (items 3, 9, 15, 21, and 27) and asks whether children prefer to work independently or depend on teachers. Factor 5 can be called Mastery, following Sakurai and Takano. Factor 6 is determined by appreciable loadings on three variables (items 4, 10, and 22) and clearly asks whether their reason for learning is for their own enjoyment or for external reasons such as good grades. Thus, Factor 6 can be called Attribution, following Sakurai and Takano. In the present study, six factors identical to those of Sakurai and Takano (1985) were extracted, although only item 28 was loaded on a different factor from that of Sakurai and Takano.

Based on the results of factor analysis, the scores for the items within each factor were added up to create the six subscales. The cronbach’s coefficient alphas for curiosity, causality, enjoyment, mastery, challenge and attribution were, .84, .80, .76, .66, .72, and .67, respectively. Table 1 indicates means and standard deviations (SD) of the third, fourth, and sixth graders and all the subjects for measures of the six motivation variables.

**Effects of Grade and Gender on the Variables of SIEM**

MANOVA was performed in order to examine the effects of grade and gender on the six motivation variables extracted from the SIEM: curiosity, causality, enjoyment, mastery, challenge and attribution. Table 2 provides means and SD as a function of grade and gender. As shown in Table 3, results of the multivariate tests revealed a significant effect of grade, Pillai’s Trace = .12, $F(12, 718) = 4.45$, $p = .00$, partial eta squared = .069, gender, Pillai’s Trace = .09, $F(6, 358) = 6.16$, $p = .00$, partial eta squared = .094, and grade by gender interaction, Pillai’s Trace = .07, $F(12, 718) = 2.31$, $p = .01$, partial eta squared = .037. As a result, the six scales could be analyzed individually using univariate F-tests.

There was a significant interaction effect between grade and gender in the two variables: challenge, $F(2, 363) = 3.59$, $p = .03$, partial eta squared = .019, and attribution, $F(2, 363) = 6.91$, $p = .00$, partial eta squared = .037 (see Table 3). To break down this small interaction, simple main effect analyses were performed. As indicated in Table 2, fourth-grade girls ($M = 2.96$) are significantly higher in challenge.
than fourth-grade boys ($M = 2.43$). Challenge scores of sixth-grade girls ($M = 1.85$) were significantly lower than those of third- and fourth-grade girls ($M = 2.56$ and $2.96$, respectively). Fourth-grade girls ($M = 2.04$) are significantly higher in attribution than fourth-grade boys ($M = 1.23$). Attribution scores of fourth-grade girls ($M = 2.04$) were significantly higher than those of third- and sixth-grade girls ($M = 1.41$ and $0.96$, respectively).

*Note. F ratios are Pillai’s Trace’s approximation of Fs. MANOVA = multivariate analysis of variance; ANOVA = univariate analysis of variance.*

$p < .05$. **$p < .01$.

There was a significant main effect of grade in the six variables: challenge, $F (2, 363) = 5.10$, $p = .01$, partial eta squared = .027, causality, $F (2, 363) = 6.05$, $p = .00$, partial eta squared = .032, enjoyment, $F (2, 363) = 12.78$, $p = .00$, partial eta squared = .066, curiosity, $F (2, 363) = 13.89$, $p = .00$, partial eta squared = .071, mastery, $F (2, 364) = 11.43$, $p = .00$, partial eta squared = .059, and attribution, $F (2, 363) = 7.76$, $p = .00$, partial eta squared = .041 (see Table 3). In the case of significant main effects of grade, Tukey’s post hoc test was performed to identify statistical differences. Challenge scores showed statistically significant differences between third and sixth grades and between fourth and sixth grades. Causality scores showed statistically significant differences between fourth and sixth grades. Enjoyment scores showed statistically significant differences between third and sixth grades and between fourth and sixth grades. Curiosity scores showed statistically significant differences between third and sixth grades and between fourth and six grades. Mastery scores showed statistically significant differences between third and sixth grades and between fourth
and sixth grades. Attribution scores showed statistically significant differences between third and sixth grades and between fourth and sixth grades.

As seen in Table 3, gender had significant effects on the two variables: causality, $F(1, 492) = 27.26$, $p = .00$, partial eta squared = .070 and curiosity, $F(1, 492) = 9.62$, $p = .00$, partial eta squared = .026. Girls had higher scores than boys in the two variables (see Table 3).

Discussion

*Research Question 1*

*Are there any differences in the components of intrinsic and extrinsic motivation of Japanese elementary school pupils between 20 years ago and now?*

The results concerning the dimensionality of intrinsic motivational factors are informative and generally support the findings of a previous study by Sakurai and Takano (1985). Both Sakurai and Takano and the present study found six dimensions of intrinsic motivational factors that were labeled: curiosity, causality, enjoyment, mastery, challenge, and attribution, although only one item was categorized on a different factor from that of Sakurai and Takano. Thus, the components of intrinsic and extrinsic motivation of contemporary Japanese elementary school pupils are almost similar to those of 20 years ago.

*Research Question 2*

*Are there any differences in developmental trends in intrinsic motivation of Japanese elementary school pupils between 20 years ago and now?*

Sakurai and Takano (1985) found that the mastery and challenge subscales decreased with age. The present study also found that the two variables generally decreased with age. However, post hoc tests on the grade x gender interaction show that the challenge scores of sixth-grade girls were significantly lower than those of third-and fourth-grade girls, but there were no significant differences among boys.

In Sakurai and Takano (1985), causality declined gradually from second through fifth grades, but temporarily increased in sixth grade, decreasing in seventh grade again. However, the students in this study increase causality in fourth grade, which might be because contemporary elementary school pupils are mentally precocious, compared to their counterparts 20 years ago. However, there may be other persuasive
reasons, which should be explored in the future.

Further, enjoyment and curiosity in Sakurai and Takano decreased gradually from second through fifth grades, but temporarily increased in the sixth grade. In this study, such an increase was not observed. It might be said that the students 20 years ago had higher expectations for entering junior high school than contemporary elementary school pupils.

According to Sakurai and Takano (1985), the attribution subscale increased with age. This study, however, shows that attribution scores significantly decrease from fourth to sixth grades. Elementary school pupils 20 years ago were more intrinsically and autonomously motivated to learn than contemporary pupils.

In sum, there are rather differences in the developmental trends of motivation between 20 years ago and now. The students 20 years ago temporarily increased curiosity, causality, and enjoyment in sixth grade, but such an increase cannot be found in this study. Although Sakurai and Takano (1985) found the attribution subscale increased with age, this study shows that attribution significantly decreases from fourth to sixth grades. That is, this study has shown that contemporary elementary school pupils have a greater developmental decline in intrinsic motivation than those of 20 years ago. Then, what causes these differences?

As has been said above, the Japanese school education system has been shifting from a highly competitive to a more relaxed approach for the last 20 years, which might have influenced contemporary pupils’ intrinsic motivation. Contrary to our expectations, the more relaxed approach might not be doing well in enhancing the intrinsic motivation of elementary school pupils, especially, in the case of higher graders.

Moreover, it is often said that contemporary elementary school students tend to play computer games indoors and not to play outdoors. Since the mid-1900s, many researchers (e.g., Anderson & Dill, 2000; Dill & Dill, 1998; Sakamoto, 2005; Sakamoto, Ozaki, Mori, Takahira, & Ibe, 1998) have discussed the bad effects of video and computer game. For example, Sakamoto explored the relationship between video game use and children’s psychological development. It might be said that such changes in play styles affect pupils’ intrinsic motivation.

Then, what can be done about the developmental decline in intrinsic motivation? A first approach for combating the developmental decline in motivation involves promoting perceptions of autonomy (Lepper & Henderlong, 2000). Intrinsic
motivation derives from students feeling a sense of control over their learning environment and activities (Lepper & Hodell, 1989). It is important to create an autonomous climate in the classroom. One of the ways to enhance perception of autonomy is to provide opportunities for pupils to control and choose different activities within a range of activities that fit into the curriculum.

A second potential response to the developmental decrease in motivation is to encourage pupils to have clear and specific goals in the classroom. According to Csikszentmihalyi and Rathunde (1993), flow experience, referring to a subjective state of being completely involved in something, forgetting time, fatigue and everything else but the activity itself, usually happens when there are clear goals one can reach. According to Pintrich and Schunk (2002), clear and specific goals promote motivation better than vague general goals such as “Do your best”. Pintrich and Schunk also said that proximal or close-at-hand goals enhance motivation better than distant goals, because individuals can judge progress toward the former.

A third potential response to the developmental decrease in motivation is to provide activities that are challenging but reasonable in terms of students’ capabilities (Lepper & Henderlong, 2000). According to Deci and Ryan (1985), pupils should be given activities that are difficult and challenging, but not outside their range of competence. Lepper and Hodell (1989) said that optimally challenging activities are ones in which goals are of intermediate difficulty and attainment is uncertain. Csikszentmihalyi and Rathunde (1993) also state flow experience happens when an appropriate balance between skills and challenges is achieved.

Research Question 3

Are there any gender differences in intrinsic motivation of Japanese elementary school pupils between 20 years ago and now?

Sakurai and Takano (1985) found the curiosity and causality scores of girls were significantly higher than those of boys in all the grades except sixth grade. The present study also shows that girls have higher scores than boys in the two variables. In Sakurai and Takano, the challenge scores of boys were significantly higher than those of girls in sixth and seventh grades. In this study, the challenge scores of girls are significantly higher than those of boys only in fourth grade. Gender differences are almost similar to 20 years ago, although there are some differences in challenge.
Limitations and Conclusions

A few more limitations of the study and suggestions for future study need to be addressed. First, the data was collected only by means of a questionnaire. Qualitative research, including interviews with students and teachers and classroom observations, would provide significant further layers of analysis.

Secondly, data collection was cross-sectional. A cross-sectional study is less effective in identifying individual variations in growth or to establish causal relationships (Cohen, Manion, & Morrison, 2000). Longitudinal studies are particularly appropriate in research on human growth and development (Cohen et al., 2000). To investigate the change in motivation with age more precisely, longitudinal data collection should be conducted.

Thirdly, whereas the participants in this study lived in the suburbs of Tokyo, those in Sakurai and Takano (1985) lived in the Japanese countryside. These contextual differences may affect the results. To compare more precisely motivation of elementary school pupils between 20 years ago and now, research should be done in Nagano as conducted by Sakurai and Takano. Moreover, inferences drawn from the results of this study are limited by the nature of the particular sample used, which consisted solely of students who live in the suburbs of Tokyo. These results may be specific to one group and not generalizable to Japanese elementary school pupils as a whole. As with all studies, then it is essential to replicate this study to determine the applicability of the results to other contexts.

Notwithstanding its limitations, this study does make a contribution towards revealing and understanding the motivation of Japanese elementary pupils. This study reveals that the components of intrinsic and extrinsic motivation of Japanese elementary school pupils now are almost similar to those of 20 years ago, but that there is a developmental decline in intrinsic motivation among today’s Japanese elementary school pupils, compared to pupils 20 years ago. This study narrows its focus down to motivational studies and this is obviously just one aspect of the picture representing elementary school pupils. Thus, other areas like cognitive development and socio-cultural factors will have to be investigated in the future.

Abstract

Institutions of higher education have traditionally attempted to construct functional and innovative facilities to meet the needs of their stakeholders. Over the past few decades, the concepts of green design and sustainability have evolved as mechanisms to deal with limited resources and reduce environmental impacts. Architects, engineers, and consultants have begun practicing social responsibility by incorporating green design concepts and technologies into new construction and renovations of existing facilities. This presentation will provide a narrative for the sustainable measures initiated in the recent 12 million dollar expansion/renovation of the Raymond B. Preston Health and Activities Center at Western Kentucky University. Other highlights include an explanation of WKU’s Energy Policy, the architect selection details, descriptions of renovation and building improvement standards, a list of potential sustainable initiatives for renovation projects, and suggested measures for maintaining green facilities.

Abstract

The authors lead a study abroad trip to Beijing, China during the 2008 Summer Olympic Games representing Western Kentucky University and Winston-Salem State University. In desiring to provide participants with an unparalleled experience, we embarked upon a year-long planning process for an academic/cultural experience in a foreign country. In all, forty-one faculty, staff, students, and alumni took a 15 day trip from Bowling Green, Kentucky to Beijing, China and back. The country of China and all of its historical landmarks had a great impression on all persons involved. The Olympic Games were a life-changing experience, from the Opening Ceremony to the events attended. In all, it was a thoroughly worthwhile adventure we hope to replicate every four years. This presentation will highlight the overall learning experience, travel and logistical considerations, difficulties encountered, curricular issues, and the Olympic experience.
The Relationship of Leadership and Employee Collegiality

Abstract

The purpose of this study was to examine the relationship between park and recreation directors’ leadership styles and collegiality among subordinates. The Multifactor Leadership Questionnaire 5X (Avolio & Bass, 2004) was used to determine the leadership styles of the directors and the Culture Triage Survey (Phillips & Wagner, 2002) was used to assess the health of the park and recreation department’s organizational culture. Departments were asked to participate in the study based upon information garnered from the Kentucky Recreation and Park Services Study (2007-2009). Surveys were mailed to 479 potential respondents and 134 were returned (28%).

A bimodal method of data collection was used to administer the survey to employees of participating park and recreation departments. The organizational culture behavior of collegiality was found to be significantly related to the transformational leadership behaviors of individual consideration, inspirational motivation, and intellectual stimulation. Collegiality was also found to be significantly related to the transactional leadership behaviors of contingent reward and active management-by-exception. Collegiality was also found to be significantly related to the passive-avoidant leadership behaviors of lassiez-faire and passive management-by-exception.

Focus on Teachers: The Committee on Prospering in the Global Economy of the 21st Century ("Committee") supports summer camp education programs for classroom teachers that focus on increasing content knowledge. Many school children are systematically discouraged from learning science and mathematics because of their teachers’ lack of preparation, or in some cases, because of their teachers’ disdain for science and mathematics. This project addresses the lack of content knowledge and work to resolve related issues with teachers in grades 5-9 who teach units of chemistry. Stipends and curriculum materials are provided to teachers who participate in summer camps and follow up activities focusing on chemistry content and pedagogy which involves active learning.

Scope and Content of Project. Students learn chemistry over several years through a vertically aligned curriculum. Chemistry in SC is first introduced in Grade 5 through the unit called Properties of Matter. It is re-introduced in Grade 7 (middle school science) and Grade 9 (physical science). A startling 93% of physical science teachers in grades 5-8 have inadequate content preparation. (See Committee report above). In grades 9-12, 63% of physical science teachers and 61% of chemistry teachers have no major or certification in the area they teach demonstrating inadequate content preparation. In addition, content will include teaching active learning pedagogy and learning through inquiry.

Inquire to Engage in Chemistry (ITEC) serviced sixteen 5-9 grade teachers in four low performing school districts who teach units of chemistry through three Super Saturday
workshops and a week-long summer camp in which strategies for teaching chemistry to middle level students as well and hands-on laboratory activities were mastered.

Evaluation of the effects of this project on both teachers and students are presented.
Evidence of the Demonstrated Need for the Program

In 2000, 93% of US students in grades 5-9 were taught physical science by a teacher lacking a major or certification in the physical sciences (chemistry, geology, general science, or physics). An implementation action resulting from this report is to “Strengthen the skills of 250,000 teachers through training and education programs at summer institutes… training programs.”

The SC Department of Education report cards for four nearby school districts demonstrated the need for a program to address (1) science teachers’ lack of content knowledge, understanding and, consequently, enthusiasm for chemistry and physics for grades 5 – 9; and (2) further study of best practices and preferred pedagogy to teach children afflicted by poverty. Specifically, the report cards for the aforementioned school districts illustrate the high level of student poverty (as demonstrated through the free and reduced lunch statistics) and the high level of below basic scores in science on the 2006 and 2007 PACT tests.

The needs of the school districts were determined by conversations with the district leaders and through the district report cards as published on the SC Department of Education website. The three districts had both high levels of (1) PACT scores in the categories of below basic and basic in science and (2) poverty.

Roles Played by Partners in Establishing Needs & How Needs Established Project Design

Dr. Cindy Johnson-Taylor, Chair of the Department of Education at Newberry College, initiated contact with the four school districts to determine their level of interest in participating in the
summer and Saturday workshop program. Dr. Cindy Johnson-Taylor and the three school district contacts spoke at length over the phone and communicated through email to establish the needs of the districts. It soon became clear that there was a dual need to increase content knowledge of teachers in science in grades 5-9 and to provide further study of pedagogy to better engage students, especially those with backgrounds of poverty. Newberry College has a strong chemistry program, in great part due to Dr. Christina McCartha, Chair of the Chemistry Department. Dr. McCartha has significant experience working with students in grades 5-9, serves as a Girl Scout Leader, and has co-written the Chemistry Education curriculum which recently received approval by the Professional Review Committee of the State Department of Education. Her input as a chemist also helped establish needs and possible curriculum available to address the needs demonstrated by the district representatives and the report cards. Dr. Johnson-Taylor’s experience as an educator in the public schools, coupled with her experience teaching pedagogy, enabled her to work together with the district representatives and Dr. McCartha to evaluate data collected by the districts, district report cards, and needed content knowledge in chemistry. This collaborative evaluation helped to establish the Inquire to Engage in Chemistry (ITEC) program design.

**Purpose of the Project**
The purpose of the Inquire to Engage in Chemistry (ITEC) program is to increase general chemistry knowledge and proficiency of science teachers in grades 5 – 9 through inquiry based instruction, thereby increasing competency and enthusiasm for science.

**Research Base**
Research on teaching and learning over the past several decades has provided a better understanding of how students learn and the teaching methods that are most effective in supporting student learning in the sciences. “There is mounting evidence that supplementing or replacing lectures with active learning strategies and engaging students in discovery and scientific process improves learning and knowledge retention”. (Science, 2004, 304, 521-2)

Teachers at all levels need to become aware of these results and learn how to incorporate new strategies in their classrooms so that all students will learn science and more be attracted to careers in science fields. An effective way to help teachers adopt new methods is for them to participate in workshops that model active learning strategies to help participants learn about strategies as they are engaged in them. (Preparing High School & Freshmen-Level Chemistry Teachers for Teaching & Learning in an Activity-Based Framework). Bell, Jerry, ACS, 2007.

The Committee on Prospering in the Global Economy of the 21st Century (“Committee”) supports summer camp education programs for classroom teachers that focus on increasing content knowledge. Many school children are systematically discouraged from learning science and mathematics because of their teachers’ lack of preparation, or in some cases, because of their teachers’ disdain for science and mathematics. This project will address the lack of content knowledge and work to resolve related issues with teachers in grades 5-9 who teach units of chemistry. Rising above the Gathering Storm: Energizing and Employing America for a Brighter Economic Future, Committee on Prospering in the Global Economy of the 21st Century: Agenda
for American Science and Technology, National Academy of Sciences, National Academy of Engineering, Institute of Medicine, 2005. Footnote and bibliography

Research indicates that Inquiry-Based Learning helps at-risk student succeed in school. At-risk students often struggle to learn in a traditional classroom. Classrooms where learning activities are varied give these students the opportunity to excel. Students become active participants in their learning rather than disinterested. Engaged learners enjoy school and become lifelong learners. Numerous research studies have shown the value of inquiry-based learning, particularly in improving the achievement level of the lowest-performing students and minorities (National Drop Out Prevention Center, 2008). In other words, engaged students have a better chance of staying in school and being successful than those who are disenfranchised in the classroom by traditional teaching methods.

According to the Center for Inquiry-Based Learning (2008), in a science classroom, this type of teaching and learning occurs when a teacher creates situations in which students take on the role of scientists. In these situations, students take the initiative to observe and question data; pose explanations of what they see; conduct tests to support or contradict their theories; analyze data; draw conclusions from experimental data; design and build models; or any combination of these. These learning situations are open-ended in that they do not aim to achieve a single "right" answer. Nevertheless, students work under clear standards to achieve their learning goals.

The professional development aspect of this project is important as well. Almost all school districts have some type of professional development for their teachers. The problem is that very few of these activities are effective in changing teaching practices. Most professional development is fragmented and short-term, and rarely focused on curriculum for students (Southern Regional Education Board, 2008). In a 1998 study, only 30% of teachers participated in professional development activities that required in-depth study of a specific field (Hirsch, Koppich, & Knapp, 1998). Content and duration are very important for effective professional development (Reimer, 2004). As SREB research indicates, for professional development to be most effective it must be focused and sustained over a period of time (2006).

**Objectives of ITEC**

1. Increase teacher content knowledge in science standards for grades 5-9.
   - Coordinate or produce as necessary vertically-aligned curriculum units for teachers to take with them and utilize in their classrooms; make available on district websites.
   - Coordinate or produce series of labs and/or lab manuals that demonstrate labs and their integration from one level to the next.
   - Teachers participate in one-week summer camp at Newberry College where they receive instruction each day on a different strategy for engaging students in science.
   - Produce a handbook for teachers to take with them with examples of strategies that may apply in different classroom situations.
Visits to schools by grant facilitators to assist teachers in using inquiry based teaching.

**Activities to be implemented:**
The chemistry activities are designed to support the national and state science standards for grades 5-9. A cohort of 16 teachers from the four school districts will be served by the grant during years 1 and 2. A different cohort of 20 teachers from the school districts school districts will be served by the grant during years 3 and 4 utilizing the same program.

Prior to beginning with professional development, an in-classroom coach from Newberry College into each of the 16 classrooms to observe. The focus of the first observation will be to assess the level of chemical and lab safety in the classroom and to look for inquiry-based instructional strategies being employed in the classroom.

The first cohort began with three Saturday events held at Newberry College to concentrate on activities dealing with chemical and lab safety both at the college instructional level and for incorporation into the classroom. The state standard for safety for each grade level indicates teachers should “Use appropriate safety procedures when conducting investigations” (state standards). The goal of the first year Saturday Teacher Events is to provide teachers with enough content in the area of safety to feel confident to effectively carry out the chemistry activities. The Saturday Teacher Event implements Safety Instruction. The Safety Content Knowledge included precautionary labels, material safety data sheets (MSDS), using protective equipment, handling laboratory equipment safely, safe handling of chemicals, storage of chemicals, disposal of chemicals, and emergency equipment. (Sarquis, M. *Building Student Safety Habits for the Workplace* Terrific Science Press, Middletown Ohio, 2000.) The teachers participated in several labs to illustrate the content during the Science Safety Workshop. During the safety activities for grade 5-9 students, students will see the necessity of safe practices in the lab and the potential dangers associated with unsafe practices. (Sarquis, M., Ed. *Safe Not Sorry! Chemical Safety Activity Handbook* Terrific Science Press, Middletown Ohio, 2007; ACS grade 7-12; ACS grades K-6) The safety material will be introduced into each grade level in a vertically aligned curriculum so each student is given the information needed to safely complete the chemistry activity for the designated year. The participants will be introduced to several safety websites and technology resources that can be integrated into the classroom.

Inquiry-based learning instruction will include materials developed and disseminated by the National Drop Out Prevention Center (NDPC) housed at Clemson University. The NDPC has commissioned the writing of curriculum which instructs teachers on best practice in engaging students the learning process.

<table>

<tr>
<th>Table I: Saturday Safety Events for Cohort of 20 Teachers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Saturday Teacher Event #1 at Newberry College</strong></td>
</tr>
</tbody>
</table>
At the first Super Saturday 15 people attend both sessions. Both a pre-test and a post-test were administered. A paired t-test analysis on the total scores found that the participants did learn at a 0.01 level of significance.
The pre/post test scores for the second Super Saturday were item by item to determine on which items the participants did not improve. The paired t-test could not determine that the participants’ knowledge increased on questions 1, 5 or 7. However at a 0.1 level of significance, the participants’ knowledge did increase on question 1. The levels of significance for the questions on which the participants did improve were at least 0.05. Using the total scores for both the pre and post test, a paired t-test did show that the participants did gain knowledge.

On the third Super Saturday, no pre/post test was administered since the workshop consisted entirely of laboratory activities demonstrating the concepts covered in the first two Super Saturdays. After completion of the first year of Saturday events, the cohort participated in a weeklong summer camp at Newberry College to increase their chemistry content knowledge. This was done through a vertically aligned curriculum in chemistry for grades 5-9. Each grade level teacher was provided with a non consumable science kit with instructions containing material to work with the grade in which they teach. The Summer camp Activities are summarized in Table II.

“Scientific inquiry is a powerful way of understanding science content. Students learn how to ask questions and use evidence to answer them. In the process of learning the strategies of scientific inquiry, students learn to conduct an investigation and collect evidence from a variety of sources, develop an explanation from the data, and communicate and defend their conclusions.” (NSTA Position Statement on Scientific Inquiry) Inquiry instruction included following the indicators discussed in the state K-12 Scientific Standards and Indicators. Several papers have been written on inquiry in the classroom. Several papers have been written on inquiry in the classroom. (science teacher, 54-58, oct 2005; Science and children, p37-41, feb 2006; science teacher, 42-45, dec 2004; NSTA, Technology-Based Inquiry for Middle School: An NSTA Press Journals Collection; NSTA Press: Arlington, VA, 2004.; NSTA, Readings in Science Methods, K-8: An NSTA Press Journals Collection; NSTA Press: Arlington, VA, 2008.; Jorgenson, O.; Cleveland, J.; Vanosdall, R. Doing Good Science in Middle School: A Practical Guide to Inquiry-Based Instruction; NSTA Press: Arlington, VA, 2004.; McDonald, S.; Criswell, B.; Dreon, Jr., O. “Inquiry in the Chemistry Classroom: Perplexity, Model Testing, and Synthesis”; Science as Inquiry in the Secondary Setting, Chapter 4, 41 – 51.) According to Kelly Deters, “The fastest way to begin using inquiry is to take a fairly straightforward lab and simply delete the procedure, data recording, and analysis sections.” (Science teacher, dec 2004 p 42-45) Many teachers do not use inquiry due to their fear of losing control in the classroom, safety issues, or lack of classroom time. (Science teacher, dec 2004 p 42-45) We incorporated inquiry into activities the teachers can take to their school districts.

Each teacher received vertically aligned activities organized from existing materials on the web and through manuals on inquiry based chemistry activities. A kit for the grade in which the teacher teaches was given to each participant. The kit will contained nonconsumable items to complete the chemistry unit. The content sufficient to teach the grade 5 was presented for grade 5 and as the week progressed the content was built upon, to increase the teacher confidence in the material. As the teacher confidence built in performing scientific inquiry, the difficulty level of the material increased through each grade level. The teachers performed the activities just as the students would and drew conclusions from the data just as the students would. During year
1, each participant received the appropriate grade level kit with activities to address the state standards in chemistry. During Year 2, each participant will receive an additional kit with alternative and extension activities to address the state standards in inquiry/chemistry.

The vertically aligned curriculum activities were taken from several sources including, but not limited to, the following: the Western Piedmont Education Consortium has a resource science curriculum guide for grade 6 and is working on science guides for additional grades (Saluda and McCormick districts participate in this program). Appropriate grade level activities will be taken from *Inquiry in Action*, an American Chemical Society publication (ACS, 2005) that investigates matter through inquiry. National Science Foundation funded projects include Center for Inquiry Based Learning, *Strange Matter* teacher guide and *Demoworks* guide. Terrific Science Press has produced series of books including *Teaching with Toys* series, *Science in Our World* series, *PACT Chemical Technology* series, and *Strive to Thrive* series. All of the resources are aligned with the National Science Standards and/or with South Carolina State Standards.

Along with living together in the dorms and eating together for meals, each evening the participants participated in an activity to build relationships and encourage collaboration within the cohort. During the summer camp year #1, each district planned a Saturday event for their school district or select school within the district to have a science fair or a fun science activity day using selected activities from the week. The Saturday event is a way the teachers within the district have a scheduled time to collaborate and promote science education in their district. The Saturday events will be implemented at each district between summer camp #1 and summer camp #2.

</table>

A thirty-nine question pre/post test was administered at the summer camp. The evaluator conducted a paired t-test on each question and on the entire test. The t-test on the total test score demonstrated that the participants did learn at a 0.01 level of significance. Then he analyzed the data on each question. Questions 2 – 7, 9 – 14, 15c, 18 – 20, 22 – 27, 29, 30, 31 c, d and e showed that at least thirteen of the sixteen participants knew the material in these questions.
before starting this camp. Thus, of the 39 questions on this test, all but 3 of the participants knew the material on 26 of the questions before the camp.

As a result of this analysis, in year 2 of this project, a pre-test will be administered in November at the Annual Meeting of the South Carolina Science Council. An item-by-item analysis of the pre-test will be used to ensure that the content topics in Summer Camp II will be topics about which a great deal of the participants feel weak.

This analysis does not show that nothing was learned because a focus group showed that the participants learned much about teaching these concepts and the pedagogy of the labs. Teachers described the laboratory activities as “wow labs” meaning that the results of the experiments were entertaining and awing to the teachers and students. After visiting the camp and viewing an afternoon’s worth of these activities, the evaluator agrees. The labs were organized in such a way that each group could work at their own pace without pressure. However, when the activity was completed, laboratory assistants removed the used materials and wheeled in a cart with the materials needed for the next laboratory. A focus group discussion with the camp participants showed that the participants learned or re-learned much of the content through the labs, became confident in using the same laboratories with their students, and felt much more confident about their abilities to teach these same laboratories to their students.

In discussions with Drs. Johnson-Taylor and McCartha, the participants decided that the offering of Super Saturdays in their districts was counter-productive for many reasons – e.g. the teacher was the only chemistry teacher in the district at her grade level. Instead, the participants will present their activities at the Annual Meeting of the South Carolina Science Council (local National Science Teachers’ Association affiliate).

Dr. McCartha administered the Student Assessment of Learning Gains (SALG) instrument to the participants. SALG is a well known assessment tool for the students to assess what they have learned. Analysis of the SALG showed:

1. In skill areas of communication with administration and working effectively with teachers, the participants were more confident in discussion of the safety material than prior to the Super Saturday sessions.
2. On the post-test Understanding of chemistry, 88% of the participants indicated good or great gain in understanding of the main concepts and relationships between the main concepts explored in the summer camp while 100% indicated a moderate, good or great gain in understanding.
3. The concepts in which one of the participants indicated a great deal of understanding on the pre-test were physical properties, properties of energy, simple machines, atomic number, and mass number. The topics in which two or three participants indicated a great deal of understanding on the pre-test were law of conservation of energy, basic properties and behavior of waves, and difference in molecules and atoms. Participants indicated gains in understanding in all areas after the summer camp.

**Follow-up Activities:** In order to provide high quality professional development, the program offers in-classroom coaching for the participating teachers. Each teacher will have at least two
in-classroom coaching sessions during the year with additional sessions set up to meet the needs of individual teachers. These coaching sessions will provide observation, conferencing, providing logistical and technical assistance and modeling of content and strategies. The fall after the summer camp, in class coaches will go into all classrooms to observe and work with teachers on implementing both the content and the inquiry based learning strategies. The same will occur in the spring. The visiting coach will prepare a set of field notes based on each visit to document any trends, highlights or concerns. These notes will also provide written feedback to the teacher. The in-class coaching is critical to providing the sustained professional development outlined by SREB and others.

It is important that ITEC insure that all school districts receive equal service and representation from Newberry College, even those that are a further distance from the college. To insure this quality of service, each school district is assigned one college faculty member to serve as its liaison. These are full-time faculty, not paid staff or student workers. The faculty member is charged with making sure his/her district receives all of the benefits of the grant.

**Assessment of How Activities have Contributed to Teacher Practice**

The evaluator or his designate visited the classrooms of 16 teachers before the first Saturday session to observe how the teachers teach and to have a baseline for further evaluation. The evaluator will visit the classrooms of at least five participants and use the Education Review Team teacher observation form to determine whether the teachers are using the pedagogy taught to them in the workshops and to observe project staff assisting the teachers to improve their teaching.

**Assessment of the Impact of the Project on Student (PK-12) Achievement**

The evaluator will examine the MAP scores or similar scores of the participating teachers’ classes year by year beginning with the year before entering this project in an attempt to determine whether the workshop activities are impacting student achievement positively.

Title:  SIMMONS COLLEGE SCHOOL OF HEALTH SCIENCES DEPARTMENT OF NURSING: THE DOTSON BRIDGE AND MENTORING PROGRAM  300 Fenway, Boston MA 02368

Topic:  Successful Mentoring Programs

Name:  LaDonna L. Christian MS, APRN-BC: Director of the Dotson Bridge and Mentoring Program

Email: ladonna.christian@simmons.edu

Background:  Although there is a growing need for minority nurses in the health care system, minorities in nursing continue to be underrepresented in colleges and schools of nursing. Many minority nursing students are poorly prepared for college, have family responsibilities and jobs, are culturally different, and English is their second language. These barriers can translate into major challenges, academically and clinically.

Mentoring in nursing has been traced back to great nurse leaders such as Mary Adelaide Nutting, Florence Nightingale, Mary Seacole, and Mary Mahoney, but very little has been written about mentoring minority students. Mentoring can provide that specific and deliberate guidance needed to bridge the gap between the educational, professional, cultural, and personal needs of the minority nursing student. Mentoring empowers the scholar to progress within a compassionate, collaborative, culturally competent, and respectful environment.

The Dotson Bridge and Mentoring Program started August 2009, because of a vision by Dr. Judy Beal and the generous donation from George and Phyllis Dotson, to provide support and change the outcome of graduation and NCLEX passing rates of African, Latino, Asian, and Native American (ALANA) nursing students. The ALANA scholars in the program are committed to learning and developing academically, personally, and professionally. The mentors are nurses, who are community leaders, clinicians, and alumni, that share the vision of helping minority nursing students experience success and improve graduation and NCLEX outcomes at Simmons College.

Presently the Dotson Program consists of a director, a faculty member, 13 mentors, and 40 scholars. The director, faculty, and mentors meet on a monthly basis to discuss the needs of the scholars and to support each other. Each mentor has 2-3 scholars to whom they offer weekly support by assisting them in the development of their goals and skills necessary to be successful in the nursing program. The scholars are enrolled in the generic, DIX Scholars, direct entry, and FNP nursing programs. Throughout the year, the Dotson Program offers several workshops in various learning skill areas. We have also developed a brochure that outlines the services offered by the program.

Outcomes:  In our first year, the Dotson Program has graduated 4 scholars: Presently 3 of the 4 have successfully passed the NCLEX and have a 100% nursing course pass rate.

Purpose:  The program is designed to provide academic, professional, cultural, and personal support to minority nursing students, and improve the graduation and NCLEX outcomes.

Methods:  Qualitative and Quantitative data collected for outcome based evaluation through questionnaires/surveys and interviews.

Future:  Our program is still growing and we are adding 3 new mentors and 8 scholars over the next year.

6. Abstract:
This hands on session focuses on how teams can increase a child with ASD’s access to the
general education curriculum, by improving conversations between special and general
educators who serve students with high functioning autism and the techniques and strategies
that work best. This presentation explores the issues important to educators surrounding
students with autism, including-- features of autism and techniques and research-based
strategies that work in the general education setting. Participants (up to 50) will receive a
complimentary copy of The Puzzle of Autism, written by the National Education Association
with the Autism Society of America.

Participants will be provided materials that will:

- Explain the characteristic exhibited by students with autism spectrum disorder.
- Suggest evidence-based effective strategies for students with autism spectrum disorder
  in the areas of Communication, Sensory Ingernation and Regulation, Socialization and
  Social Skills, Behavioral Issues and Restricted Issues.
- Identify resources.
Julie Moore, NEA IDEA Resource Cadre, Juliem@cksd.wednet.edu, 360-662-2300, ext. 2365
Research Objectives

High stakes testing. Accountability. Highly-qualified teachers. Teachers and other professional educators are being held to higher standards than in the past thanks to federal and local legislation like No Child Left Behind (NCLB, 2002). Given the greater accountability expectations, are teachers skilled in classroom assessment? While high stakes testing has become the primary focus when reporting assessment results for students, teachers, and school districts, it is in the classroom where most assessment activities take place. Nearly two decades ago, Stiggins (1991) reported that nearly 50 percent the activities happening in classrooms involve some form of assessment. These activities include both formal and informal assessments and take the form of tests, quizzes, observations, and homework. Teachers assess student achievement and behaviors all the while attending to the mandates set forth by state and federal guidelines and standards. Just as frequently, teachers report that they are not fully prepared to handle the rigors of assessment and have reported that training in measurement was inadequate due to limited exposure to coursework or experiences in testing, measurement, and classroom assessment (Stiggins, 1999, Wise et al, 1990).

In 1991, a series of grant-supported research studies were conducted to meet the following goals: (1) measure teacher competency levels in the educational assessment of students; (2) identify a topic for the development of a training prototype; and (3) prepare a prototype training module on the selected topic (Impara, 1993). These studies examined classroom assessment literacy as defined by the seven Standards for Teacher Competence in Educational Assessment of Students developed by the American Federation of Teachers, the National Council on Measurement in Education, and the National Education Association (1990). These Standards address seven broad skill areas in educational assessment and include:

1. choosing assessment methods appropriate for instructional decisions;
2. developing assessment methods appropriate for instructional decisions;
3. administering, scoring, and interpreting the results of both externally-produced and teacher-produced assessment methods;
4. using assessment results when making decisions about individual students, planning teaching, developing curriculum, and school improvement;
5. developing valid pupil grading procedures which use pupil assessments;
6. communicating assessment results to students, parents, other lay audiences, and other educators; and
7. recognizing unethical, illegal, and other inappropriate methods and uses of assessment information.

Goal 1 of the original studies was achieved through a two-part national survey of teacher competencies in the area of educational assessment of students completed by 555 teachers representing a 48% response rate and 286 administrators representing a 51% response rate. Goals 2 and 3 were achieved through the development of several training modules originally designed to be delivered through in-service programs. Results of these studies indicated that administrators and teachers indicated weaknesses in several areas as identified by the Standards. The most significant weakness was related to items measuring the teachers’ knowledge about communicating test results (Standard 6). Has anything changed since 1991? Are teachers more competent in the assessment of students given the changes in PK-12 education since No Child Left Behind (2002)? Do teachers and administrators feel prepared to handle the rigors of classroom assessment in the age of accountability?

Current Study--Research Objectives
In the original studies, the overall research goals were to measure teachers’ and other school professionals’ knowledge of classroom assessment (Impara & Plake, 1995; Impara, Plake & Fager, 1993a; Impara, Plake & Fager, 1993b, Plake, 1993; Plake, Impara & Fager, 1993). The overall research objective of this study is to replicate the previous studies to determine whether changes have occurred in teachers’ and administrators’ knowledge of classroom assessment and whether their levels of perceived competence have improved given the federal legislation mandated in No Child Left Behind and other high stakes accountability requirements.

Additional research objectives are aligned with the original goals two and three and will include the development of training materials using available technologies to ensure teachers, administrators, and others have access to information to improve student learning and development of a delivery mechanism to make these materials available to all stakeholders.

Current Study--Proposed Methodology
In 1991 a national sample, employed in two stages, of school administrators and teachers was identified using census and school system databases. Stage one utilized U.S. Census track data to identify six counties, stratified by population size, from each state. In counties with large populations, large cities were selected to represent various school system configurations. The Directory of Public Elementary
and Secondary Education Agencies, 1988-1989 was used in the second stage to locate and verify addresses for the cities and counties identified in the census data (National Center, 1990). When counties and cities had more than one school system, random selections were made from among the districts/school systems that were large enough to employ at least twelve teachers and six administrators. Additionally, accommodations were made to the sampling for Montana (systems were elementary or secondary and cities counted as one system) and Hawaii (system was technically one district). The first four of the six counties or cities selected from each state were designated as the initial sample and the remaining two systems were identified as backups to be used if needed.

At the time of the original studies, the researchers contacted each state’s assessment director/assessment coordinator to endorse the studies. Forty-five of the fifty state coordinators provided information needed for school system participation that included information on whether the system was still in operation and the name of a contact person in the selected districts. The remaining five states were not included in the final sample. By way of initial contact, an informational letter was sent to the contact persons in each of the 180 school systems (four per state from 45 states) that resulted in 90 school systems agreeing to participate. Responses were received from 82 school systems and provided 555 responses from teachers and 300 responses from administrators representing 42 states. The final sample represented school systems from all population categories and locations (i.e., small, mid-sized, and large systems from rural, urban, and suburban areas).

The proposed study described within will utilize similar sampling techniques while benefiting from technologies. During State 1, U.S. Census track data will be used to identify six counties, stratified by population size. Sampling from counties with large populations will use large cities to represent different school system configurations. During Stage 2, contact information for public elementary and secondary education agencies will be utilized from school district websites. The counties and cities identified as part of the sample will be located and contact information will be verified electronically. When counties and or cities have more than one school system, a random selection will be made from among the systems large enough to provide at least 12 teachers and six administrators. Contact will also be made with state and local assessment directors or testing coordinators to inform them of the study and to obtain their support. It is the goal of this study to obtain a sample that represents small, mid-sized, and large school systems from rural, suburban, and urban settings.

The methodology for use in this proposed study must adhere to the original study, however, since 1991 technology has advanced to allow for paperless administration. It is imperative that a sampling procedure be designed that adheres to the original study while using current technologies. To this end, the original instrument will be converted to an electronic version using Survey Monkey or a similar program. Additional questions will be added to ensure all demographic information is collected.
Discussion of Expected Outcomes

What has changed since 1991? Email, the World Wide Web, teacher preparation and professional development via distance delivery, NCLB, etc. Are teachers and other professional educators prepared to respond to the increasing demands of classroom assessment and accountability? It is anticipated that the proposed study described within will be able to answer these questions.

In the original studies, on average teachers answered approximately 23 of the 35 items correctly and demonstrated the highest performances in Standard 3: Administering, Scoring, and Interpreting Test Results. Their lowest performance was seen on Standard 6: Communicating Test Results to Students, Parents, other Lay Audiences, and other Educators. Given the additional requirements expected of teachers, it is anticipated that improvement in all areas will be demonstrated as well as in their overall performance as measured by the 35-item questionnaire.

It is important to note that the results of this study will be designed to stand on their own merit and it is anticipated that they will serve as comparison data to the original studies.

**Abstract:**

We need to do more than just ensure that the fine arts and physical education maintain funding. We need to create environments where students are thinking critically. Physical education and the fine arts are excellent sources of schemata for facilitating thinking. However, to have transfer of learning to another context in order to achieve higher order thinking, there needs to be explicit teaching.

Higher order thinking in the arts and physical education is vital in order to create independent, successful learners who can identify, understand, decide, and act upon external and internal sources of feedback (Lodewyk, K. 2009). In contrast, if students are not prompted to think critically on their own, they may become more dependent on the teacher for direction, information, and emotional support.

Research suggest that if teachers persistently practice higher order thinking strategies, there is a good chance for a consequent development of critical thinking capabilities in our students (Miri, B, David, B, Uri, Z, 2007).

The objective of this presentation is to: (1) show how teachers can facilitate critical thinking by removing themselves from being the controller to the facilitator, (2) how to move from traditional direct instruction to a less traditional indirect instruction, (3) how to use questioning to present unique challenges to the student, (4) how to have students analyze patterns, draw conclusions, provide rationalizations, and support conclusions, (5) show attendees how to rethink how the learning environment is structured.
21st Century Student use of Space in 20th Century Classrooms.

Edward Duncanson, Ed. D.
Associate Professor of Education
Western Connecticut State University
Danbury, Connecticut, USA
(Home) Box 202; Bullville, New York, USA 10915
eduncanson@hvc.rr.com.

“This classroom is just like those my father sat in! They tell us to teach 21st century skills but the space we teach in is rooted in the past.”

Helm, et al., 2010, p. 66

Background:
New goals for education require new opportunities to learn and yet 2011 classrooms look much the same as they did in 1911. Changes in education have focused on adults with little consideration of classroom space and its influence on youngsters learning. Times are changing. “…the old classroom layout of four lines of desks facing the teacher is falling by the wayside” (Horowitz-Bennett, 2006, p. 48). Teacher-centered models featured desks in rows and focused on process. “Traditional teaching/learning models are related to a more vertical classroom layout” (Betoret & Artiga, 2004, p. 355). New models of classroom organization focus on openness and flexibility. “Teachers using a student-centered approach prefer to organize classrooms in a horizontal manner. In this format the workload is shifted to the learner: students are asked to think on an analytical or application level (Betoret & Artiga, 2004).

The focus is no longer on teaching but on student learning. When students learn in different ways, they experience time and space in different ways. When students can manage efficiently and effectively their own learning the teacher can become a guide.

Recent interest in classrooms has focused on reorganizing existing classrooms to address the needs of today’s curriculum and students (Kelly, 2007). Simons and Masschelein (2008) recommend that teachers, “open up spaces in the present in order to think otherwise about pedagogy – beyond the current ideas on instruction in learning environments” (p. 688). Changing the structure of the classroom makes a switch in pedagogy possible.

Teachers in a rural school district have experienced the dramatic changes that can occur when classrooms are designed to focus on student learning.

Purpose:
To discover the effect of planned classroom space on: (1) student achievement, (2) teacher behavior, and (3) students use of space.

Note: The results presented here represent nine years of study.
Theory:

Harlen (1997) identified positive things that happen when classrooms are thoughtfully planned: organization leads to effective practice; teachers can plan their time use; it is easier to establish classroom routines and systems; and a manageable number of teaching groups can be maintained. Her ideas are in line with Getzels and Guba who view space and time as conceptually independent but phenomenally interactive (Alcorn, 2006).

Space is an important factor for both the student and the teacher. “It is difficult, if not impossible, to separate instructional activity from the physical environmental setting within which it occurs” (Lackney & Jacobs, 2002, p. 1). The physical environmental may impede the effectiveness of instruction (Browne-Ferrigno, et al., 2006; Chan et al., 2009). Classrooms remain unchanged despite changes in standards, new curricula, and required new patterns of teaching. “As a result, the program and the setting in which that program takes place are often in conflict with each other hindering both teaching and learning” (Lackney & Jacobs, 2002, p. 4). The allocation of space is a major ingredient for improving teaching and learning (ASCD, 2007).

According to Ouchi (2004), “Structure must change before culture can change” (p. 18). Altering the collection of moveable classroom furniture is necessary to allow student-centered activities to happen. “All furniture should be actively used for some part of each day” (Clayton, 2001, p. 46). Furniture not used on a daily basis should be removed. Less furniture means more space. In a spacious setting, students assume an increased amount of responsibility for their own learning.

Research Design:

A mixture of semi-experimental and case study approaches were used to gather information. A semi-experimental design involved qualitative and quantitative analyses of classroom space and quantitative analyses of student test outcomes.

A case study format was appropriate because the researcher had little control over events in the classroom. This approach required observation in a field setting with a minimum of contrivance. The researcher focused on a contemporary situation for teachers within a real-life context. This was a purposeful study of functioning classrooms (Yin, 2003). A descriptive, cross-sectional, non-experimental research design was used (Johnson, 2001, Type 2).

Participants:

Five classrooms (grade 4) in two rural, elementary schools 70 miles north of New York City were studied to determine the effect of open space on student achievement in science. The remaining studies focused on six classrooms (four in grade 3, two in grade 4) in one of the schools. Classroom observations were scheduled at times mutually acceptable to the classroom teacher and the researcher.

Practice:

Two teachers, Joan (grade 3) and Jim (grade 4) (pseudonyms), volunteered their classrooms as demonstration sites to show how rooms could be planned around space to benefit students. Both teachers moved to a different classroom but are taking their students to the next
grade level. The researcher worked with the teachers to organize their classrooms during the summer. The researcher visited the classrooms for four days staggered throughout the school year. This approach required observation in a field setting with a minimum of contrivance. The measures were unobtrusive so as not to involve or disrupt interaction between researcher and subjects. This follows Stake (1995) who suggested that there was a need to evaluate the functioning of an uncluttered classroom.

Joan and Jim both inherited classrooms that had been occupied by teachers that retired following long careers. Twenty-plus years of collected materials were left behind. The researcher guided Joan and Jim using some tested ideas. To create functional rooms, we identified key factors in room arrangement by focusing on needs rather than organizational convenience: material management, ability to move around the room, and flexibility of layout to meet future needs (Design Council, 2009; Neilson, 2004). The goal was to empower Joan and Jim to learn about, and alter their classrooms to match their particular curriculum and teaching style.

Understanding that all physical design solutions must be owned by their users, all final decisions were left to Joan and Jim: different users have different needs (Higgins, et al., 2005). Joan and Jim were guided using four lines of thought.

**Guideline #1:** Reduce the amount of classroom material.

Classrooms are material intensive spaces but they do not have to be a rummage room. We encouraged Joan and Jim to weed out non-used materials: anything that was not used in the past year. If needed, most curriculum items can be located in readily available websites.

**Guideline #2:** Identify areas needed for instruction and activities.

The first consideration was planning where space was needed. Joan and Jim were asked several questions: “Where do you normally position yourself for direct instruction? Where do you plan to have a large gathering area? Where can students work alone or in groups of 2-4?” Research addresses the importance of these areas. Working in groups gives youngsters the opportunity to express ideas that are valued by the group (Harlen, 2000). There is a need to create separate specialist areas within the bigger space: study bays, work centers, places for group work, displays and learning centers (Nielson, 2004). Classrooms need some degree of flexibility because different room arrangements serve a variety of needs: collaborative teaching, experiential activities, personal learning, cooperative learning, project-based learning, working in different size groups, and multiple activities taking place at one time (Higgins, et al., 2005; Locker, 2007). Micro-environments, created with visual differences, offer choices to inquisitive youngsters. Subtle changes in the room can accommodate other teaching methods: storytelling, projects, teacher-student communication, collaboration, discussion, student performances, special events, hands-on experiments/experiences, and shared learning. Many spaces need to serve a dual purpose (BCSE, 2007). The taught curriculum and the teacher’s personal teaching style heavily influence the size and position of these spaces. Space needs to be protected before it is buried under furniture.

**Guideline #3:** Plan pathways to connect areas for instruction and activities.

Colbert (1997) noted that classrooms must be organized for optimal operation. Wide pathways where two people can walk past each other without touching should connect the instruction/activity areas of the room. This usually means there should be a major access pathway along a chalkboard normally at the front of or on one side of the room. Secondary
pathways should run perpendicularly to activity centers (Duncanson, 2003c). With proper pathways to activities children manage on their own.

**Guideline #4:** Arrange needed furniture.

Only furniture that is used at least every other day to support instruction should be incorporated into the classroom. Too much furniture crowds students together and creates safety hazards (Clayton, 2001). Planning where to place the furniture is easy: it goes in space between the pathways and avoids the gathering spaces. Beyond a place for each student to sit at a table or desk, teachers should endeavor to include less than 15 other pieces of furniture: that includes the wastepaper basket, and technology equipment. Doing so preserves space for student use. When teachers include over 30 pieces of furniture, boxes, and bins, the room becomes overcrowded (Duncanson, 2003b).

To address the premise that classrooms must change, the principal at the Indian Lake Elementary School (pseudonym) introduced teachers to the issue and invited teachers to volunteer to change their presentations to address the challenge. The principal introduced the “Daily Five” program to teachers and suggested they consider using blocks of time for language arts instruction and practice. The “Daily Five” program promotes a daily structure of five one-half hour blocks of time dedicated to five language arts activities (Boushey & Moser, 2006; Online Classroom, 2010). These include: (1) read to self, (2) read to someone, (3) listen to reading, (4) work with words, and (5) work on writing. Teachers are encouraged to move from busy work to centers to workshop to daily five: move from busy work to a high level of challenge. These steps encourage student independence, self direction, and personal responsibility (Boushey & Moser, 2006). In practice, teachers in many schools find dedicating five half hour blocks of time impossible to do: it takes too much time from their regular schedule. Teachers used the idea of students rotating stations in a shorter time frame.

**Data Collections:**

Test scores from the New York State Science Performance Evaluation Test were obtained through the building principals. During classroom observations, the researcher drew student migration maps (the major data collection instrument) to show where students actually worked in the classroom and the pathways they used. Activities students were engaged in at the time of observation were recorded as were the teacher’s activities.

**Findings:**

The effect of creating a classroom planned around space.

Reorganizing my classroom to create space has affected how I use time. I spend more time on lessons when I spend less time on reorganizing my work space. My students are the winners.

Sarah Holloway
Winner of Extreme Classroom Makeover
Jefferson County, Alabama
Personal communication, Sept. 19, 2008
Guideline #1: Reduce the amount of classroom material.
Joan and Jim discarded over 90% of the materials left to them by the previous occupants of the rooms. This included dried up ditto masters, outdated texts, broken equipment, and magazines from the 1980’s. As suggested by Anthes (2000), posters obscuring the windows were removed to reveal the garden outside of Joan’s room and an expansive grassy area outside Jim’s classroom. Space gained by discarding materials was used for displaying materials students used. Learning centers appeared where none had existed before.

Guideline #2: Identify areas needed for instruction and activities.
Joan and Jim talk about how they teach and their desire to create different size spaces for large groups, small groups, and individuals in meeting areas. A mental map is made of where those locations could exist.

Guideline #3: Plan pathways to connect areas for instruction and activities.
Having identified gathering areas for the students, it becomes obvious where pathways must exist.

Guideline #4: Arrange needed furniture.
Joan and Jim were asked if they use their teacher’s desk. Similar to answers from many teachers, they reported they only use the desk before and after regular school hours. During the day the desk area becomes a place to pile paper (Flat Surface Syndrome). They spend time after school using a table to spread out and plan for the next day. It is suggested they place their desk in storage. Both teachers agree to remove the teacher’s desk from the room along with six other pieces of furniture that were used to hold materials they have now discarded. Jim was glad to get rid of his teacher’s desk. “Now I can’t let things go. I am forced to finish things that day. The increase in my organization has been a good thing. The room is neater, I have less housekeeping. I have less work. It’s wonderful.” As suggested by Lushington (2008), when the new classroom arrangement was in place, the teachers were asked to sit on the floor to view the area as kids see it.

The effect of space on teacher behavior.

Teachers used newly acquired time to move away from publisher-produced, often low level activities, to create open-ended, high-level thinking activities that challenged students. Joan reported: “Kids have a greater number of options and the freedom to try things on their own. The students experience less frustration. When students use centers they can be at a table, on the floor, or in the hall. That means that centers don’t need to take up a lot of space: they can be on a shelf. Space gives you options. Six students can use a part of the room for extra help on one subject while pairs of students or small groups of students are working elsewhere. The three big open areas in the room help to make that happen. I can use the different spaces in different ways.
Time was used in new ways. The teachers didn’t worry about definite slots of time for teaching. Class was not run on the clock. Kids were dealt with on an individual basis to meet their needs. Benefits of increased space, time and student-centered teaching went directly to the pupils.

The effect of space on student achievement in science.

The science skills of classifying, manipulating materials, measuring, making non-standard measurements, recording data, and questioning are positively correlated to student density. Collectively, when these six skills are compared to the square feet of space per student, there is a Pearson correlation coefficient of +.881 that was significant at the .048 level (2-tailed) \( r = +.881, p = .048 \). This is a high positive correlation (Hinkle, Wiersma & Jurs, 1998). This means that in classrooms that have greater amounts of open space per student, on average, students scores are higher on six science skills. An increase of one square foot of empty space per student should result in an increase of .9 points in the student score on the grade-4 science Performance Evaluation Test.

The effect of space on the New York State English Language Arts (ELA) Assessment if grade-4.

The NYS ELA assessment is administered in January of each school year. The assessment consists of multiple choice questions and short, written responses. The test is aligned to three learning standards:

- Language for information and understanding,
- Language for literary response and expression, and
- Language for critical analysis and evaluation.

The exams given in grade-3 and grade-4 use different questions but address the same standards. The number of questions on the test varies each year.

An analysis of the exam was conducted to examine student success on each standard. Jim’s students scored below the school average on all three standards in 2008. In 2009, Jim’s students scored below the school average on standard #2 but above the school average on standards #1 and #3. The improvement on standard #1 was not significant. However, a t-test comparing the results from 2008 and 2009 on standard #3 displayed positive results: \( t = -2.303; \) \( df = 38; \) Sig (2-tailed) = .027. This shows a substantial improvement in test results for standard #3:

Students will listen, speak, read, and write for critical analysis and evaluation. As Listeners and readers, students will analyze experiences, ideas, information, and issues presented by others using a variety of established criteria. As speakers and writers, they will use oral and written language that follows the accepted conventions of the English language to present, from a variety of perspectives, their opinions and judgments on experiences, ideas, information and issues.
“Sitting regimented at desks according to predetermined, fixed schedules is no way to treat a primate capable of running up to 100 miles in one day.” Hall, 1976, p. 179

On an alternating day basis, teachers used a 60 to 80 minute block of time with three, four, or five stations. Teachers divided the class into three to five groups of students and allotted a block of time ranging from 12 to 20 minutes for students to work on an assignment. Teachers called this segment of the day the daily five, rotations, or station work. Stations were used for art, science, social studies, and mathematics in addition to literacy activities.

When students had choices of where to work on an assigned activity, they selected a work space based on three decisions.

First students decided if they needed a solid surface on which to work: a desk, table, clip board, or a hard space on the floor. Students had their own preference of where to work when the activity required writing (e.g. working with words, journal writing, story writing, mathematics practice, workbook exercises, playing board games, and working on projects). Manipulatives for mathematics and science that did not roll were effectively used when placed on a desk/table. Rolling objects (e.g. materials for a balls and ramps activity) worked well on the floor.

Students’ second decision addressed their need for physical comfort in a sitting position: soft chairs, sofas, pillows placed on the floor, a rug, and on the floor near a wall were common destinations. Reading to self and reading to a partner worked well in these locations.

A third decision focused on a need for autonomy – a position where they would be as far away as possible from people who were talking. Corners of the room were a prime work location. Pairs of students reading to each other, using flash cards, or math manipulatives, moved to corners of the room not being used by a teacher. Groups of students engaged in conversation moved as far apart from each other as space permitted. When partners reading to each other went to the outside of the room, silent workers positioned themselves equal distances from each other and conversing groups. Individual readers sometimes sat next to each other if they were reading the same book. When students working on projects needed tables, silent workers moved to the margins of the room.

Students developed territorial boundaries (Knowles, 1973). The position of students in the room occupied in different activities formed semi-regular tessellated patterns (Math Forum, 2010). Boundaries could be drawn on classroom maps around individuals or groups; the patterns consisted of regular polygons of different sizes.

Student choice of learning space was hindered by room design. Architecture of the room controlled where some activities took place, thus eliminating student choice. Built in electrical outlets, computer connections, and plumbing dictated where some activities were held. Computer stations and listening centers are normally located along a wall; their position being dictated by connections to hard wiring. Art and science activities that required water are situated close to a sink.
Implications:

“One place to start observing classrooms is to consider space, space use, and the environment or context of the teaching-learning process.”
Achilles, 1999, p. 36-37

The classroom is an appropriate level to observe and evaluate education. Giving teachers permission for removing unused materials, planning instructional space and pathways, and for removing excess furniture revealed space that expanded the number of teaching options. This “found” space contributed to a high level of organization: needed materials became readily available to teachers and students.

Planning space before the placement of furniture expanded the number of teaching strategies used on a regular basis. Teachers must take the initiative to arrange students’ desks in new patterns because students will not do it. Useable space will translate into additional time for instruction and teacher-student interaction. Reorganizing the classroom can be achieved at no cost.

The results of this research suggest a new level of planning for teachers. Teachers can plan the nature of the “daily five” stations so they require a variety of work and comfort locations. The location of work centers needs to be based on voice levels. Five groups of four students will make more noise than 20 students working independently.

There is a need to plan the physical layout of classroom furniture carefully due to its influence on space and student preference when choosing a place to learn. Classrooms with maximum open space, clear pathways, soft areas, space by the walls and windows, provide students with ample opportunities to self-select learning spaces that meet their needs (Duncanson, 2003a). Decisions about classroom organization must be made by individual teachers and their students in the context of pedagogy, task demands, constraints of architecture, furniture, and logistics (Craig, 2009).

The teacher and the learners should spread out and use the entire room. Effective room arrangements provide clear pathways so students can move freely to needed materials so as not to disturb others when working on a project: students will honor personal space with respect to communication distance. Teachers can watch where students position themselves and then follow their lead.

Teachers can change what happens in school. Constructive steps that restructure classrooms and remove obstacles to learning can be implemented (Kelly, 2007). Classrooms do not need to look like the one your father sat in.

The center for school improvement resides in the classroom.

Abstract

The purpose of this study was to examine the direct economic impact of an American collegiate football program at a mid-major conference University. Data was collected using a random interview sampling method. Volunteers collected the data during various games over the course of the season. It was decided to utilize the Money Generation Model 2 (MGM2) short form in estimating the direct and total economic effects of visits to the collegiate football games. The MGM2 model was developed by Ken Hornback, Daniel Stynes, and Dennis Propst at Michigan State University in the United States. A full detailed explanation and free downloads of the program can be retrieved from the following web address; http://web4.canr.msu.edu/MGM2/. The developers of the program (Stynes et. Al. 2000) view the economic impact equation as “Economic impacts = Number of Visitors * Average spending per visitor * Economic multiplier.” (p.4). Multipliers utilized within the software program were developed using several recognized sources. Those sources include the Regional Input-Output Modeling System II (RIMS II) and the IMPLAN input-output model (Loomis & Walsh, 1997). Tables and figures are presented that outline the direct economic impact on the surrounding community.
The Effect of Leadership Styles on Health of Organizational Culture

Abstract

The purpose of this study was to examine the relationship between park and recreation directors’ leadership styles and the organizational culture that exists in the organizations they lead. The Multifactor Leadership Questionnaire 5X (Avolio & Bass, 2004) was used to determine the leadership styles of the directors and the Culture Triage Survey (Phillips & Wagner, 2002) was used to assess the health of the organizational culture. Departments were asked to participate in the study based upon information garnered from the Kentucky Recreation and Park Services Study (2007-2009). Surveys were mailed to 479 potential respondents and 134 were returned (28%).

A bimodal method of data collection was used to administer the survey to employees of participating park and recreation departments. The culture variables examined in this study (professional collaboration, affiliative collegiality, and efficacy) were found to be significantly related to the transformational leadership behaviors of individualized consideration, intellectual stimulation, and attributed idealized influence. These culture variables were also found to be significantly related to the transactional leadership behaviors of contingent reward and active management by exception as well as the passive-avoidant leadership behaviors of lassiez-faire and passive management by exception.
Teacher Instruction and Behavior and Young Children’s Prosocial Actions

Poster Presentation Proposal

Identifying experiences in early education that can help children learn to share, cooperate, and help others may have implications for understanding pathways to adaptive development. Children’s active engagement in prosocial behavior—voluntary actions intended to benefit another (Eisenberg & Fabes, 1998)—associates with aspects of healthy growth and development, specifically empathy (Roberts & Strayer, 1996), antisocial impulse regulation, academic achievement (Caprara et al., 2000), self confidence (Larrieu & Mussen, 1986), supportive relationships (Sebanc, 2003), and prosocial engagement in early adulthood (Eisenberg et al., 1999).

Research suggests effective strategies are needed for guiding children toward prosocial behaviors. Teachers report many students arrive at school without necessary social skills to get along with one another or work together (Rimm-Kaufmann et al., 2000). Of further concern, children from lower-income homes lag behind in socioemotional skills when compared to more affluent peers (Child Trends, 2003).

This study examined whether specific teacher instructional practices and emotional support in early education are associated with children’s prosocial behavior. Indices of teacher instruction and behavior including verbal encouragement of prosocial behavior and empathy, positive behavioral management, encouragement of expressive language, vocabulary instruction, and emotional warmth were explored in relation to prosocial behavior. Our à priori expectation was that children might need more deliberate encouragement of their prosocial behavior in a context; therefore, teachers’ verbal
encouragement of prosocial behavior and empathy was expected to most strongly relate to prosocial action in the classroom. We also examined whether emotional warmth of teachers influences the association of teacher verbal encouragement of prosocial and empathic responses and children’s prosocial behavior.

This study relies mainly on observational data collected on 2,098 children from 124 first-grade classrooms located in 39 schools serving predominantly lower-income families. Principal components analyses indicated the scales of Teacher Encouragement of Prosocial Behavior and Empathy, Positive Behavioral Management, Encouragement of Expressive Language, Vocabulary Instruction, Emotional Warmth, and Children’s Prosocial Behavior respectively had a Cronbach’s alpha of .71, .74, .79, .66, .80, and .73 and a mean percentage observed agreement of 87%, 82.1%, 83.1%, 71.43%, 79.9%, and 78.6%. Linear multiple regression analyses were conducted. Covariates of teacher level of education, years of teaching experience, and classroom size were included in analyses. Preliminary hierarchical linear modeling analysis revealed no between school-variance (ICC = .00); therefore, multi-level modeling was not conducted.

Results indicated teachers’ verbal encouragement of prosocial behavior and empathy most strongly associated with classroom prosocial behavior. A significant association also was found between encouragement of expressive language and prosocial behavior. Positive behavioral management, vocabulary instruction, emotional warmth, and the joint effect of teacher emotional warmth and encouragement of prosocial behavior and empathy did not associate with prosocial behavior. See Tables 1 and 2.

Findings suggest prosocial behavior may be supported by teachers’ deliberate encouragement of prosocial behavior and empathy and their creation of a positive, interactive social environment. This study extends prior research by examining a network of teacher instructional factors that may associate with children’s prosocial behavior; it also suggests the associations that warrant future experimental study for causality.

Abstract:

Quality programs in all areas of higher education need to continually look for ways to improve and update curriculum; creating a collaborative dialogue between those in higher education and those in public sector is one such way (Dorazio, 1996). Collaboration using an advisory board comprised of those in the field of a particular profession, students, administrators, and community members is an opportunity to develop cohesive program preparation goals. For instance, in the field of teacher education, a recent NCATE initiative proposed that to ensure teacher education is relevant to classrooms of the 21st century it is necessary that teacher education programs close the gap between theory and practice, coursework and classroom, preparation and induction (NCATE, 2009).

The focus of this poster session is to provide stakeholders with specific information on how to create, implement, manage, sustain, and be an effective member of an advisory board. There are numerous benefits of such collaboration with an advisory -- the least of which is an alliance of collaborative leaders with the common goal for long-term community support and changes in college curricula and public policy advocating for our profession as educators.

Professional development activities by inservice and preservice teachers are essential for enhancement and enrichment. Schools often provide one-size-fits-all professional development without consideration to the specific needs of instructional situations. This is particularly evident in reference to music teachers. The challenges faced by music teachers are unique, frequently leading to feeling of isolated in their school. Isolation is a common factor in music teaching that is seldom addressed in professional development activities.

This article focuses on experiences of music teachers in their second year of teaching. To provide support for music teachers in their first four years, Kansas State University Department of Music provides on-campus and on-site professional development workshops and offers video conference feedback of classroom instruction. Feedback from teachers involved exposed feelings of isolation in their first year of teaching. Although having been provided with peer mentors, but no one received feedback relevant to particular challenges augmenting a feeling of isolation: “I have a fantastic administration and supportive mentors, but their feedback wasn’t sufficient to help me become a better music teacher.” The nature of the music instruction demands a unique approach to professional development.
Professional Development through Video Conference

Music teachers often need help with discipline-specific concerns and problems. The needs of young music teachers can be addressed through the use of video conference technology. It is not complicated to set up a video conference for observation. Needed at both sites are:

- High-speed internet connection, preferably through Ethernet.
- Permissions granted in the school’s firewall for video conference.
- A computer with digital camera, often built into a laptop.
- A video conference program such as iChat, Skype, Yahoo, or other freeware.

Once connected, the professional development mentor observes instruction with the intention of providing supportive feedback to help the novice teacher through challenging situations or to provide guidance for instructional enhancement. The mentor interacts with the teacher via the computer and video conference technology providing feedback relative to the observations.

Consultation, coaching, mentoring, reflective supervision, and technical assistance are among the variety of ways the video technology can be used to provide external feedback and discussion. Professional development can have a profound impact for music teachers when it is applied in concurrence with the act of teaching.
Professional Development through Video Conference Ensemble Clinics

One of the goals of professional development is enhanced impact on student learning. A vehicle often used by music teachers to learn to become better teachers while improving student learning is ensemble clinics. In a traditional clinic setting, the teacher observes a clinician working with the ensemble.

In a clinic performed through video conference, the teacher does not remove him/herself from the ensemble to observe but is directly involved. The clinician interactively provides instructional feedback to the students while the classroom teacher experiences the strategies offered by directing the ensemble. “This was one of the most efficient clinics that I had ever done because the director is able to communicate with the students more effectively than I could due to his relationship with them.

We used Apple MacBooks with a built-in camera and iChat for the video conference. The students viewed the clinician on a large screen at the front of the room while the clinician interacted through a computer in the technology lab at the university. The technology did not appear to hinder the clinic situation for students, clinician, or teacher. Students were clearly involved throughout the clinic experience and teachers were pleased with the amount and quality of student learning. The teachers also found the student reactions reassuring and confirming of their own instruction: “During the clinic when the students heard comments that were the same as they had heard from me in former rehearsals, they
looked at me nodding that they recognized what they were being told. This was good for me as a young conductor affirming that I was hearing and addressing the same things.”

New teachers not only need to identify areas of improvement, but also need confirmation of successful teaching. Direct interaction with instruction is one area where traditional forms of professional development appear to be lacking.

A traditional ensemble clinic has a focus on performance improvement, but video conference creates a professional development environment equally as instructional for the teacher: “As I watched my students during the clinic, I recognized that I was learning new things too. I would listen to what the clinician was suggesting, then feel the difference as I conducted the new way.” Because the director is actively involved in the clinic, the experience is an effective method of professional development for the teacher.

Perhaps the greatest technical challenge to overcome when using video conference with an ensemble is enhancing the sound quality for transmission over the internet. The small microphones on the laptops are sufficient for speaking but hinder the high and low frequencies of a musical ensemble. After experiencing this challenge during our first video conference clinic, the teacher used microphones that were available at the school, strategically placed them in the room, and mixed the sound with a small audio mixer. The signal was inserted through the mic jack on the laptop. The other problem that may occur is in the amplification of the clinician in the rehearsal room. It is essential to place the speakers in such a way as not to create feedback.
By taking advantage of video conference and other similar technologies, music teachers can address professional isolation with peer mentoring, feedback from teaching observations, and online face-to-face discussion of specialized challenge. This technology can also open doors to enhanced educational experiences including virtual discussion composers, sharing performances among schools, and online master classes for individuals or groups of students.

Examine the *educative curriculum materials* component in the first year of a three-year school-wide professional development model to enriching teacher mathematical and pedagogical content knowledge.

INTRODUCTION

This paper describes one component from the first year of a three-year school-wide professional development project1 to challenge teachers to deepen their understanding of content, teaching, and learning of elementary mathematics in grades K to 5.

Kapālama Elementary School (KES) is the third largest elementary school in the Honolulu District. The school community is multi-ethnic and a substantial number of its students come from outside the school’s normal attendance area. Demographic data related to KES is in Table 1. Of the 630 students enrolled in the 2007-2008 school year, 53% received free or reduced-cost lunch and 16.3% exhibited limited English proficiency. The percentage of families with children headed by a single mother, 26.4%, exceeded the state average of 18.3%; the average family size, 4.2, exceeded the state average of 3.42; the percent of households with public assistance income, 17.1%, was over twice the state average of 7.6%; the percent of families with children living in poverty, 22.8%, was double the state average of 11.2%; the median household income, $44,822, was less than the state average of $49,820; the percent of college graduates in the community, 12.3% was half of the state average of 26.2%, while the percent with less than a high school education, 31.3%, was double the state average of 15.4%. These data give a picture of conditions that identifies KES as a high-needs school.

1 The research reported in this paper was generated through the grant KARES: Kapālama Algebra Readiness Project in the Elementary School funded by the Hawai‘i Department of Education Mathematics and Science Partnership Program with money from the United States Department of Education. The views expressed in this paper are the views of the authors and do not necessarily represent the views of the funding agency.
To address needs identified by Kapālama teachers, project KARES: Kapālama Algebra Readiness Project in the Elementary School, a professional development project designed to promote deeper student understanding by improving teachers’ content understanding and instructional strategies, was developed. The project is funded through a Mathematics and Science Partnership grant awarded by the Hawai‘i Department of Education from the U.S. Department of Education for the period 2009 through 2012. The goals and objectives of KARES are to:

1. have teachers develop a deep understanding of elementary mathematical content;
2. increase teachers’ use of strategies that include problem solving, reasoning, and communication;
3. create, use, and evaluate educative curriculum materials that strengthen teacher and student mathematics content knowledge;
4. develop a professional teaching community in an environment where teaching is reflective and public;
5. as an end goal, use lesson study where teachers plan and teach lessons designed to focus on student thinking and learning; and
6. attend to the adaptation and coordination of curriculum materials and sequencing related to the new series adopted at Kapālama.

KARES supports the culture of Rigor, Relevance, and Relationships already started at Kapālama Elementary, including incorporating the National Council of Teachers of Mathematics (NCTM) process standards (NCTM, 2000) and constructive response questions into instruction. KARES focus on algebraic reasoning and thinking, where justification is based on evidence and reasoning meshes a cohesive network of ideas through the grade levels. The focus on communication, both written and verbal, reinforces learning through collaboration and reflection as well as makes connections with and supports components of the Kapālama’s Language Arts Standards.

Year 1 included four school-wide professional collaboration days for KARES professional development sessions as well as three articulation weeks during which each grade level was allotted time to reflect on and plan their mathematics instruction. An eight-day intensive summer seminar in which teachers generated educative curriculum materials (ECM) and a five-day summer professional development institute that daily featured observing a class of children and examining their work rounded out the year’s KARES experience at Kapālama Elementary. This paper focuses on the process used in the professional development related to teachers’ work on the ECM.

WHY EDUCATIVE CURRICULUM MATERIALS

Curriculum materials for Grades K through 12 intended to promote teacher learning in addition to student learning are referred to as educative curriculum materials (Davis & Krajcik, 2005). The characteristics of teachers’ mathematical knowledge has been shown to make a difference in the effectiveness of their teaching and the way they hold this knowledge affects their ability to use it in teaching (Hill et al., 2007). As researchers and teachers learn more about content knowledge for teaching and how dispositions toward unpacking mathematics develop among teachers, changes may need to occur in curriculum design, teacher preparation, and in-
service professional development to appropriately prepare teachers with the kinds of mathematical knowledge necessary for teaching. Thus, it is necessary to characterize and articulate the nature of content knowledge for teaching and understand how teachers develop this knowledge.

Teacher learning involves developing and integrating one’s knowledge base about content, teaching, and learning; becoming able to apply that knowledge in real time to make instructional decisions; participating in the discourse of teaching; and becoming acculturated into and engaging in a range of teacher practices. Teacher learning is situated in teaching practice including classroom instruction, planning, lesson modification, assessment, and collaboration with colleagues.

The ECM created must be accurate, complete, and coherent in terms of content; and effective in terms of pedagogy with good representations of content, a clear purpose for learning it, and multiple opportunities for students to explain their ideas. It is felt that these materials can help teachers:

- learn how to anticipate and interpret what learners may think about or do in response to instructional activities;
- support learning of subject matter, add new ideas to repertoires, develop knowledge base;
- consider ways to relate units during the year;
- make pedagogical judgments visible;
- explicate the ideas underlying the tasks rather than merely guiding actions (i.e. making rationales for decisions visible moves beyond adding new ideas to help teachers integrate their knowledge base and make connections between theory and practice); and
- promote pedagogical design capacity (i.e. the ability to use personal resources and supports embedded in curriculum materials to adapt curriculum to achieve productive instructional ends).

THE DEVELOPMENT PROCESS

Eighteen Kapalama Elementary teachers met with KARES staff members to work on educative curriculum materials for eight days in the summer of 2010. The participants included two teachers for Grade 1, five teachers for Grade 2, two teachers for Grade 3, four teachers for Grade 4, and four teachers for Grade 5. The school’s mathematics curriculum coordinator also participated.

To guide the development of materials, the following Nine Design Heuristics for Educative Mathematics Curriculum Materials, adapted from Davis & Krajcik, (2005) were distributed and discussed. These heuristics relate to methods that encourage learners (teachers, in this case) to discover solutions for themselves. These heuristics are focused, intentional, and adaptive and provide a valuable foundation for our work. The heuristics are divided into three categories: Teacher Content Knowledge, Pedagogical Content Knowledge, and Mathematics Content Knowledge.
Design Heuristics for Teacher Content Knowledge

Design Heuristic 1: Supporting teachers in engaging students with important mathematical topics at an appropriate level through meaningful tasks:

Curriculum materials should provide teachers with productive tasks that make the mathematics accessible to students as well as rationales for why these activities are mathematically and pedagogically appropriate.

Curriculum materials should help teachers adapt and use these experiences with their students, for example by making recommendations about which tasks are most important and which can be structured for students to conduct themselves and which might be more successful as demonstrations. Curriculum materials should suggest and help teachers think about productive sequences for activities.

Design Heuristic 2: Supporting teachers in using multiple representations of the mathematics:

Curriculum materials should provide appropriate instructional representations of mathematics (e.g., tables, graphs, models, diagrams) and support teachers in adapting and using those representations, for example by noting areas that could potentially lead to inaccuracies with regard to the mathematics content. Curriculum materials should be explicit about why a particular instructional representation is mathematically and pedagogically appropriate and what misunderstandings ideas it might promote if used improperly. The curriculum materials should help teachers determine the most salient features of an instructional representation.

Design Heuristic 3: Supporting teachers in anticipating, understanding, and dealing with students’ ideas about mathematics:

Curriculum materials should help teachers recognize the importance of students’ ideas and help teachers identify likely student ideas within a topic. Curriculum materials should help teachers gain insight into how they might be able to deal with the ideas in their teaching, for example by giving suggestions for potential mathematical connections.

Design Heuristics for Pedagogical Content Knowledge in Mathematics

Design Heuristic 4: Supporting teachers in engaging students by questioning:

Curriculum materials should provide driving questions for teachers to use to frame a unit and should help teachers identify questions that they can use with their students, including focus questions for guiding a class discussion. Curriculum materials should help teachers understand why these are mathematically and pedagogically productive questions.

Curriculum materials should help teachers engage their students in asking and answering their own questions, by providing suggestions of productive questions and ideas about how to guide students toward those or other productive questions.

Design Heuristic 5: Supporting teachers in engaging students with collecting and analyzing data:

Curriculum materials should provide teachers with approaches to help students collect, compile, and understand data and observations, help teachers understand why the use of evidence is so important in mathematical reasoning, and help them adapt and use these approaches across multiple representations.

Design Heuristic 6: Supporting teachers in engaging students in designing investigations into mathematical topics:

Curriculum materials should help teachers recognize the importance of sometimes having students design their own investigations. Curriculum materials should provide guidance for how teachers can support students in doing so, by providing ideas for appropriate designs
and suggestions for improving students’ inappropriate designs (Stiggins, 1997).

Design Heuristic 7: Supporting teachers in engaging students in making explanations based on mathematics concepts:
Curriculum materials should provide clear recommendations for how teachers can support students in making sense of data and generating explanations based on evidence that the students have observed and justified by mathematics that they have learned. The supports should include rationales for why engaging students in explanation is important in mathematics and why these particular approaches for doing so are mathematically and pedagogically appropriate.

Design Heuristic 8: Supporting teachers in promoting mathematical communication:
Curriculum materials should provide suggestions for how teachers can promote productive communication among students and teachers in conversations. The curriculum materials should provide rationales for why particular approaches for promoting communication (e.g., class discussions, student presentations) are mathematically and pedagogically appropriate.

Design Heuristic for Mathematics Content Knowledge

Design Heuristic 9: Supporting teachers in the development of Mathematics Content Knowledge:
Curriculum materials should support teachers in developing factual and conceptual knowledge of mathematics content, including concepts likely to be misunderstood by students. Support should be presented at a level beyond the level of understanding required by the students, to better prepare teachers to explain mathematics concepts and understand students’ ways of understanding the material. Curriculum materials should help teachers see how the ideas relate to real-world phenomena and to the activities in the unit and why strong subject matter knowledge is important for teaching.

We developed the following guidelines for questions that teachers might consider while preparing an ECM for their grade level.
1. How does (the topic selected) engage students in important mathematical ideas?
2. How does (the topic selected) provide students with the opportunity to compare, contrast, and analyze different representations?
3. What are the anticipated ideas/responses of students? Why might students give these ideas/responses? What suggestions are made for dealing with these ideas/responses?
4. What questions are provided to use with students for delving into the mathematics ideas? What questions are provided for guiding group discussion? What suggestions are provided for engaging students to ask and answer their own questions? What questions are pedagogically and mathematically productive?
5. What are the opportunities for students to pose their own questions? What guidance is provided for students to engage in designing their own investigations?
6. What opportunities are there for students to provide explanations and to use mathematical reasoning to justify their thinking?
7. What questions and suggestions are provided for generating student communication (class discussions, student presentations, etc.)?
8. What connections are there to mathematics that has preceded and will extend beyond that required for the students at this grade level?
An eight-day plan of action was generated with guidelines and suggestions for the participants. The plan included:

1. Select topic to be investigated. Teachers were asked to consider a topic that children in their grade level had difficulty learning, whether based on student achievement data, or that they found difficult to teach. By posing the directions in this manner, we opened up the discussion to the difference between focusing on teacher actions and student outcomes. The topics chosen for each grade level were:
   - Grade 1: The many ways to understand addition and subtraction
   - Grade 2: Place value with bases other than ten
   - Grade 3: Attributes and the development of mathematical language
   - Grade 4: Area and perimeter
   - Grade 5: Division of decimals

2. Keep in mind the recommendation from the school’s mathematics committee that Problem Solving would be a focus for School Year 2010–2011. School focal areas also included having students work in collaborative groups. Teachers were asked to revisit their previously developed constructed response questions to make sure they promoted problem solving.

3. Keep the guidelines for ECM in mind while investigating a topic and preparing their ECM. They were asked to pay special attention to teacher learning, make explicit the pedagogy used in the ECM, and remember the bigger picture of where the topic fit in their grade level as well as in the school.

4. Remember the design heuristic questions and use those as a ‘conscience’ when researching their topic and writing their product.

Each person received the book, *Math Matters* (Chapin & Johnson, 2006), providing them a resource on mathematics content for teachers of grade K through 8. The school’s recently adopted mathematics basal program gave teachers a starting point from which to work on their ECM.

There were several critical pieces that emerged during the eight days. Two KARES staff members were available for the five grade level groups, so they faced a challenge to keep abreast of the thinking of each group, to quickly ascertain how to direct a group to think more deeply about either the content or pedagogical strategies being considered, and to select or recommend appropriate resources when a group was stymied in their thinking. Some issues that emerged were:

1. The need to enhance teacher content knowledge. As an example, the grade 5 teachers first contemplated fractions and division as topics. After much discussion on what children could not do, the teachers were given a task to help their group “turn a corner in their own thinking”. Everyone was asked to write a division problem for 286 ÷ 8 and to use each of their stories as the context to work through a solution. They also were instructed to write down every question they asked of themselves and every answer with which they responded until they found a solution. Their ensuing discussions led to different ideas about division, such as whether each story was a “subtractive division” or a “distributive division,” and which of these did the “usual division algorithm” use. When the teachers realized
the massive amount of questions involved and how those questions emphasized place value, they began to understand that problems about this topic were difficult problems for teachers to understand and solve, let alone fifth-grade students.

2. The need to be a reflective learner. The discussions about place value by the grade 2 teachers focused on where to ask which questions to ensure a focus on conceptual development. Their discussions were intense and reflective and they decided to make sure to embed the questions in their materials, along with anticipated student responses and their responses back to the students. Reflecting on the experience of working together on the ECM, on the last day of the session one second grade teacher said, “The understandings were not the same for all of us so we had to do a lot of dialoguing … The process is so important. You know we can always say, ‘Ooo, this is our product and we’re going to give you our product,’ but it was days of processing and dialoguing … that was the valuable part for us.”

3. The first grade teachers examined the pedagogical strategies embedded in Cognitive Guided Instruction (Hiebert et al., 1997). Project staff exhausted their collection of references, including Van de Walle (2004), material on Cognitively Guided Instruction (Carpenter, Fennema, Franke, Levi & Empson, 1999), Second Handbook of Research on Mathematics Teaching and Learning (National Council of Teachers of Mathematics, 2007), and searching the internet, so the two teachers could familiarize themselves with this topic. The teachers were amazed when they read there were at least 11 different models of addition and subtraction and recognized why children have difficulties with some of these forms. They decided to prepare materials to start their instruction with multiple combinations of addition and subtraction strategies. The school’s first grade mathematics program was organized such that one section had problems with numbers 1 through 6 and a subsequent section dealt with numbers 9 through 12. The teachers felt this organization was too contrived and drawn out so decided to use numbers 1 through 12 in their problems from the beginning.

4. Teachers struggled to think beyond the problems and tasks in the textbook. It often took an example like the one mentioned in (a) above before they would delve into the mathematics of the topic. It was also hard for them to take the stance that an answer, whether right or wrong, tells something about the thinking of a student and in order to find out what that thinking is, the child must be asked to explain his/her reasoning.

5. It was a challenge for teachers to change their mindset to get beyond the rules of doing mathematics and focus on the goal of the school to incorporate problem solving. The natural inclination was to view problem solving as something to be added and taught separately rather than as a way to start an investigation and encourage thinking based on what their students already know.

ASSESSING THE PROCESS

As part of the evaluation of the eight days of working on ECM, on the final day of the professional development teachers were asked to reflect on the process. Almost to a person, the comments were very positive, reflected how valuable the experience was for
the professional growth for the teachers, and allowed us to see what they considered important. Four representative comments are given below:

By reviewing long division in the traditional algorithmic method, a realization of just how confusing the process must appear to my students (also to my other team members) helped us review and clarify our lessons. The reexamination of our units is valuable in helping my teaching become more effective because I need to utilize the questions (ECM) in my teaching practices. I also feel working together as a team (valuable collaboration) in particular problems “enhanced” and furthered a deeper understanding of the subject matter.

This PD experience has been the most influential, knowledgeable, inspirational experience in all 20+ years of workshops. Many of us have many years of teaching experience and personal post high-school experience and arrogantly think that we can teach anything. Long explanation short, ... this ECM session was an epiphany. For the first time, I truly struggled and tried to empathize with what my students have to “put up with.” It’s not providing them with all that we have to teach them but how and at what depth. Thank you! I hope from this day on I can be a real teacher!

This professional dev. experience has enhanced my understanding of mathematics beyond any book I could have read. I feel the time and discussion I had with my grade level teachers was the most eye opening wonderful experience. We worked really hard to address our essential math concept and every discussion we had kept going back to “why” do the students need to know this? I’ve learned it is really important to have discussion with students in order to understand their understanding. I felt like I was questioning myself and realizing my understanding of math. I had to “find out” what I didn't know. I had to read and re-read lessons and ask questions to others for my understanding.

This experience has helped me to closely examine the concept that I teach. It gave me time to really think about what I’m asking my students to think about. When closely scrutinized, analyzed, and finally, understood, my deeper content knowledge has helped me to be more effective in planning the learning process for my students. I now take into deeper consideration how I scaffold and present information.

Their comments suggest these teachers felt they had not only learned about the scope and sequence of the mathematics in the grade level they taught, but they gained in-depth understanding about the specific mathematics topics they selected which in turn affected their thinking about how they might help their students learn that content. Teachers learned more about the complexities of the teaching-learning process nurtured by the “teaching with problem solving” approach embedded within this professional development.
development experience. During the eight days, teachers were immersed in the process and came to understand the approach used by the facilitators of “volleying” questions back to the group for contemplation. While frustrated at first, teachers began to embrace the approach as an appropriate teaching and learning style. They saw this as consistent with the ideas in the articles by Berg (2010) and Young (2010) that emphasize children need to work on, struggle with and solve problems; that self-efficacy is being able to tackle difficult situations and succeed and not from writing answers to exercises where no thinking is involved.

In summary, the process of developing ECMs helped KARES address the objectives of helping teachers deepen their mathematical content knowledge, understand how to incorporate processes such as problem solving, reasoning, and communication into their instructional materials, and become more reflective and public about their knowledge about mathematics and the teaching of mathematics.

1. Introduction

The purpose of this study was to examine professional education programs geared toward facilitating the employment and business startup of marriage immigrants in Seoul, especially the education programs provided by the Youngdeungpo Multicultural Family Support Center. The overlapped assistance from different government agencies that are responsible for supporting marriage immigrants results in a waste of budget and detracting from the efficiency of their policies. The government agencies just tries to produce external visible results by holding temporary events, and it's consequently not easy to nurture professional personnels who will assist marriage immigrants. So it's basically meant in this study to urge client-centered policy setting and the development of education programs tailored to the regional and cultural characteristics of clients.

2. Method

As for multicultural education in foreign countries, relevant literature and earlier studies were reviewed to find out general theories of multicultural education. The suggestions of Korean multicultural policies were discussed. What the Youngdeungpo Multicultural Family Support Center taught and how the center did it were examined in detail, and what educational results it produced and what improvements should be done were presented. Data were gathered by making a participant observation from January, 2009, to August, 2010, and what types of tasks the education programs assigned was checked. After the education programs were completed, those who participated in the programs were asked to describe in the form of mind map how much they found themselves to be better able to find a job.

3. Results

The marriage immigrants who immigrated into our country through marriage wanted to learn about the Korean language, Korean food and Korean culture the most, which the greatest number of educational programs provided to them dealt with. Concerning what they considered most important, they wanted to get a job or start their own business for economic reasons, and they consequently hoped for vocational education and wanted to be helped to find a job when they were asked a question what type of education and national policy they preferred. Currently, however, most of them were irregular workers or just did part-time work. Regarding the reason why they couldn't get a job nor start

* Corresponding author: Kee-Jung Barng, wp2848@nate.com
their own business though they wanted to do that, the largest group weren't able to find a job and couldn't speak Korean well. The third and fourth stages of the customized service and support system by life cycle, which is backed up by the Ministry of Justice, include the list of the policies of different government departments, such as providing education geared toward teaching marriage immigrants to be ready for getting a job or fostering them to prepare for jobs especially suitable for immigrants.

But what matters above all is that the immigrants who lacked confidence should receive education like self-leadership education to change their way of thinking to restore their self-esteem. The Youngdeungpo Multicultural Family Support Center has advertised for multicultural education instructors and bilingual instructors to offer professional education programs to help the employment and business startup of immigrants, but the education programs don't work as intended due to a shortage of professional educators, and another reason is the uncertainty of employment, which is caused by the fact that the education programs are conducted just on a temporary basis by advertising for the instructors. This researcher was responsible for the education programs involving image making, appearance management, communication, basic etiquette and manners, and had a chance to find what results the programs produced and what improvements should be done in the future in the course of conducting the programs and teaching the participants to draw mind maps. what educational results it produced and what improvements should be done were presented.

4. Conclusion

The findings of the study suggest that prolonged, sustainable assistance should be offered for marriage immigrants to get a job or start their own business, and that the development of a wide variety of education programs is required. In terms of educational assistance for employment, what matters above all is a change of the way of looking at employment and providing self-leadership programs that could encourage marriage immigrants to improve their self-esteem and confidence. Sustained Korean language education should be provided, and professional educators should urgently be nurtured. Finally, professional programs that aim at fostering experts who can instruct marriage immigrants to get a job suitable for them should be developed, and they should actually be assisted to find a job after participating the programs.

Abstract

This study aimed to (1) integrate relevant language learning models and theories, (2) construct a theoretical model of college students’ English learning performance, and (3) assess the model fit between empirically observed data and the theoretical model proposed by the researchers of this study. 1,129 Taiwanese college students participated in this study. The instruments utilized in this study were designed by the researchers of this study, including Self-regulated Inventory and English Achievement Test. The collected data were inputted into computer for statistical analysis by LISREL 8.72. The results of this study showed that there was a statistically significant direct effect on affection/motivation and academic achievement. Moreover, the statistical result showed a mediating effect of action control in language learning process. Based on the results and findings of this study, the researchers also provided several suggestions for further research and implications for future EFL instruction.

Keywords: Self-regulation, academic achievement, and college students
I. Introduction and Purpose of the Study

With the increase of international exchanges upon globalization and the coming of knowledge-based economy, the enhancement of students’ English proficiency, vision and competitiveness has become the important policy of education in many countries. Unfortunately, according to the Ministry of Education result of English examination survey on the freshmen students of vocational and technological colleges in the academic years of 2000, the English proficiency of vocational and technological college students in Taiwan is inferior and only 15% students meet the primary level of GEPT. Thus, how to enhance these students’ English proficiency has become one of the important tasks in vocational and technological education.

In order to enhance technological and vocational college students’ English proficiency, schools are devoted to constructing a bilingual environment, organizing English camps and contests, and planning remedial instruction. Despite these efforts, many researchers put their emphasis on the filed of English (e.g. Wu and Chang, 2003; Chang and Wu, 2010). This study treated technological and vocational college students as the targets and English as the specific learning field, and validated the theoretical model on technological and vocational college students’ English learning performance by SEM. The research purposes were below:

1. to integrate relevant learning models and theories,
2. to construct a theoretical model on technological and vocational college students’ English learning performance, and
3. to evaluate the quality of the theoretical model on technological and vocational college students’ English learning performance.
II. Literature Review

Recent studies on learning have successfully integrated expectancy-value theory (affection/motivation), action control theory and learning strategy theory, and indicated their importance on learning, as detailed below.

1. Researches Related to Affection/Motivation

Expectancy-value theory indicated that beliefs which influence learners’ motivation include affection, value and expectation. Bandura (1986) suggested that the individuals’ affective self-reaction to their performance could result in self-incentive. Thus, the individuals would construct higher level of goals, and adopt more effective strategies. Value refers to the internal reasons of a person to involve in some jobs (Pintrich, 1989). Current empirical studies (Eccles, 1994; Wigfield, 1994; Wigfield & Eccles, 2000) demonstrated that work value would influence learners’ selection in future courses, use of learning strategies, action control and academic achievement. Expectation refers to the learners’ anticipation to the success of the learning, and includes success expectation and perceived self-efficacy. Success expectation is the estimation of the learning result (Pintrich, 1989). The research of Wigfield (1994) indicated a significant correlation between success expectation and academic achievement. Cherng and Lin (2002) in Taiwan also demonstrated the significantly positive relation between success expectation and academic achievement. Self-efficacy refers to the individuals’ belief in their abilities in specific situations (Bandura, 1986). In the past 20 years, self-efficacy could highly predict the students’ motivation and learning (Bandura, 1997; Pajares, 1997; Schunk, 1989; Zimmerman, 1995, 2000). Thus, this study treated positive affection, success expectation, work value, and self-efficacy as the variables of affection/motivation.
2. Researches Related to Action Control

Recent researches focused on the mediating role of action control between learning intention and learning strategies, and defined action control as the learners’ protection intention and the control to fulfill the goals. According to Kuhl (1985), the mediation of action control in learning process could be observed upon the learners’ action control strategies which are allocated by Kuhl (1985) into cautious selection, coding control, emotion control, motivation control, environment control and information processing. Corno (1989) expanded the concept of action control in learning situation and indicated five action control strategies, including cognition control, emotion control, motivation control, situation control, and others control. However, the empirical study of Wu and Chang (2003) demonstrated that these action control strategies could be combined into cognition control, affection control, situation control, and others control. Cherng and Lin (2002) mentioned that action control is the critical intervening variable between learning motivation and learning strategies. Therefore, based on the statements of Kuhl, Corno, Wu and Chang, this study divided action control into cognition control, affection control, situation control, and others control.

3. Researches Related to Learning Strategies

Learning strategies were the main research issues in information processing theory in Cognitive Psychology in the past 20 to 30 years. Flavell (1971) was the first scholar who proposed learning strategies, and indicted that learning strategies are the cognition of cognition. Brown (1987) suggested that learning strategies include the individuals’ knowledge and control of the cognitive system and the plan, monitoring and evaluation abilities of the cognitive operation. Wu and Chang (2003) pointed out that the correlation among self-monitoring, self-evaluation, self-adjustment of learning strategies and strategy use is significantly high. It would lead to
multi-collinearity. These constructs should be combined. Pintrich (1999) suggested that learning strategies refer to the learners’ planning, monitoring and adjustment abilities in self-adjusted learning process. According to Wu (2003), learners with inferior English reading comprehension would use learning strategies differently. Moreover, the students in Taiwan used significantly different learning strategies when reading Chinese and English. Based on the above, this study treated repetition, organization, refinement, planning, monitoring, and adjustment as the valuables of learning strategies.

**4. A Theoretical Model of Technological and Vocational College Students’ English Learning Performance in This Study**

As to the test of model fit, this study reorganized the related learning theories and those proposed by Wu and Chang (2003), and considered college students’ development characteristics and English learning to further propose the theoretical model of English learning performance, including affection/motivation, action control, learning strategies and academic achievement with regard to technological and vocational college students’ English.

**III. Method**

1. **Subjects**

This study selected 1,129 students, who took the courses of English in freshmen and sophomore years, from 12 technological and vocational colleges in northern, central and southern Taiwan as the targets by stratified cluster random sampling.

2. **Instruments**

The instruments used in this study included Self-regulated Inventory and English Achievement Test. The Self-regulated Inventory is composed of English affection/motivation scale (22 items), English action control strategy scale (22 items),
and English learning strategies scale (26 items). The items in all scales used English as the specific field and rated based on Likert 6-point scale.

The English achievement test was designed based on the General English Proficiency Test (GEPT), College Student English Proficiency Test (CSEPT), and the principles of language evaluation. The evaluation on the oral test is more subjective and it is difficult to quantify the data. Thus, the test only involves the academic achievements of listening, reading and writing.

3. Data Analysis

After the tests, data were inputted into computer for statistical analysis by LISREL 8.72; $\alpha = 0.05$ was treated as the statistical significance level.

IV. Results & Discussion

The parameter estimation in LISREL is based on Maximum Likelihood methods which involves strict requirement for multi-variance normal distribution (Bollen, 1989; Jöreskog & Sörbom, 1993). Thus, before conducting the test of goodness of fit, the assumption of multi-variance normal distribution was validated by PRELIS 2.52. The finding demonstrated that data collected by this study did not meet the assumption, $\chi^2(2) = 1465.254, N = 1129, p < 0.05$. Thus, generally weighted least-square (WLS) method was applied for parameter estimation and test of goodness of fit.

1. Fit Test of English Learning Process Model

Upon literature review (Hair, Anderson, Tatham, & Black, 2006), the evaluation of SEM in this study refers to preliminary model fit, overall model fit and fit of internal instruction, as described below.
(1) Preliminary model fit of English learning process model

As to preliminary model fit, the estimation results did not show negative error variables (0.13~0.93). All error variables reached the significance level (0.05) and there was no significant standard deviation. It met the standard that theoretical model could not involve negative error variables and significant standard deviation. Error variables must meet the significance level (Hair et al., 2006). However, one factor loading was lower than 0.5 ($\lambda_{21} = 0.45$) and it did not meet the standard that factor loading could not be lower than 0.50. Low factor loading would reduce the reliability of the factors. However, for the completeness of the theoretical framework and since all factor loadings reached the significance level, the statistical test is still conducted.

(2) Overall model fit of English learning process model

With regard to absolute fit, chi-square value of the fit between the theoretical model in this study and data observed reached the significance level (0.05). It demonstrated that English learning process model in this study and data observed do not fit. However, in the test of goodness of fit, chi-square value tended to reject the theoretical model due to the increase of the samples. Thus, besides chi-square test, this study also evaluated the fit between the model and data by other measures which were not influenced by the number of the samples. Apart from $\chi^2$ test, the measures of overall model fit demonstrated good fit between the theoretical model and data observed in this study.

(3) Fit of internal structure of English learning process model

With regard to fit of internal structure of model, Hair et al. (2006) proposed the evaluation on fit of measurement model and fit of structural model, as described below:
As for fit of measurement model, factor loadings estimated reached the significance level ($t = 19.37 \sim t = 63.24, p < 0.05$) and it met the standard that factor loading should meet the significance level. In terms of structural model, structural parameters estimated reached the significance level $0.05 (t = 2.19 \sim 29.61, p < 0.05)$. It demonstrated that the structural model was positive.

2. Effects of Latent Variables in English Learning Process Model

According to Jöreskog and Sörbom (1993) and Hair et al. (2006) the effects among latent variables included direct effect, indirect effect and total effect, as described below.

(1) Direct effects of latent variables in English learning process model

a. Direct effect of latent independent variables on latent dependent variables

This study assumed the direct effect of affection/motivation on action control ($\gamma_{11} = 0.81, t = 29.61, p < 0.05$), learning strategies ($\gamma_{21} = 0.25, t = 6.44, p < 0.05$) and academic achievement ($\gamma_{31} = 0.24, t = 3.81, p < 0.05$). The data observed demonstrated that the direct effect was significant. It showed that learners with more affection/motivation tended to frequently use action control and learning strategies, and they would have better academic achievement.

b. Direct effect of latent dependent variables on latent dependent variables

This study assumes the direct effect of action control on learning strategies and direct effect of learning strategies on academic achievement. The observed data indicated that the direct effects were significant: the direct effect of action control on learning strategies ($\beta_{21} = 0.75, t = 19.06, p < 0.05$), the direct effect of action control on academic achievement ($\beta_{31} = 0.31, t = 2.30, p < 0.05$), and the direct effect of learning strategies on academic achievement ($\beta_{32} = 0.34, t = 2.19, p < 0.05$). In other words, in English learning, the students who defended learning intention by action control tended to use learning strategies, which
would enhance their academic achievement. The frequent use of learning strategies would also enhance academic achievement.

c. Residual variance of latent dependent variables

The residual variance ($\zeta_1$) of action control is 0.34, that ($\zeta_2$) of learning strategies is 0.07 and that ($\zeta_3$) of learning strategies is 0.28.

Based on the above, among all direct effect values, that of affection/motivation on action control is the highest (0.81) and the second is that of action control on learning strategies (0.75). The least is that of academic achievement on learning strategies (0.24).

(2) Indirect effects of latent variables in English learning process model

a. Indirect effect of latent dependent variables on latent dependent variables

Indirect effect of affection/motivation on learning strategies and academic achievement was significant (0.05). Through the mediating effect of action control, indirect effect of affection /motivation on learning strategies was 0.62 ($\gamma_{11} \times \beta_{21} = 0.81 \times 0.75 = 0.61$) which was higher than the direct effect (0.25) ($\gamma_{21} = 0.25$) of affection/motivation on learning strategies. It showed that the students with more affection/motivation tended to defend learning intention by action control, which will increase the use of learning strategies.

The observed data indicated that direct and indirect effects of affection/motivation on academic achievement were significant ($t = 3.81$, $t = 10.62$, $p < 0.05$). Affection/motivation indirectly influenced academic achievement through three paths. First, the path from affection/motivation, action control to academic achievement, the normalized effect of this path was 0.25 ($\gamma_{11} \times \beta_{31} = 0.81 \times 0.31 = 0.25$). The second one was from affection/motivation, learning strategies to academic achievement. The normalized effect of this path was 0.01 ($\gamma_{21} \times \beta_{32} = 0.25 \times 0.34 = 0.008$). The
third one was from affection/motivation, action control, learning strategies to academic achievement. The normalized effect of this path was 0.21 ($\gamma_{11} \times \beta_{21} \times \beta_{32} = 0.81 \times 0.75 \times 0.34 = 0.21$). Total normalized indirect effect of these three paths was 0.54. Among the three paths, indirect effect of affection/motivation on action control was the most significant and that of action control on academic achievement was the most insignificant.

b. Indirect effect of latent dependent variables on latent dependent variables

With regard to indirect effect of latent dependent variables on latent dependent variables, indirect effect of action control on academic achievement was significant ($t = 2.17, p < 0.05$).

Through action control, indirect effect (0.61) of affection/motivation on learning strategies was the highest. The second was the indirect effect (0.54) of affection /motivation on academic achievement through action control and learning strategies. The least was indirect effect (0.25) of action control on academic achievement through learning strategies.

(3) Total effect among latent variables in English learning process model

a. Total effect of latent independent variables on latent dependent variables

Normalized total effects of affection/motivation on action control, learning strategies and academic achievement were 0.81, 0.86 and 0.78, respectively. In this study, total effect of affection/motivation on action control was equal to the direct effect. With regard to the influence of affection/motivation on learning strategies, total effect referred to direct effect (0.25) and indirect effect (0.61). In addition, total effect of affection/motivation on academic achievement was .78, including the direct effect (0.24) and indirect effect (0.54). Noticeably, normalized indirect effect of affection/motivation on learning strategies was 0.61 and it was 70% of total effect, more than the
normalized direct effect (0.25). It demonstrated the critical mediating role of action control between affection/motivation and learning strategies.

b. Total effect of latent dependent variables on latent dependent variables

Normalized total effects of action control on learning strategies and academic achievement were 0.75 and 0.56. This study assumed that action control only revealed direct effect on learning strategies. Thus, total effect of action control on learning strategies was equal to the direct effect. With regard to the influence of action control on academic achievement, the observed data indicated that the normalized total effect of action control on academic achievement was 0.56, including direct effect (0.31) ($\beta_{31}$) and indirect effect (0.05) ($\beta_{21} \times \beta_{32} = 0.75 \times 0.34 = 0.25$). Moreover, normalized total effect of learning strategies on academic achievement was .34. Since learning strategies did not reveal indirect effect on academic achievement, the total effect was equal to direct effect.

With regard to total effects of latent variables, that of affection/motivation on learning strategies was the highest (0.86), the second was that (0.81) of affection/motivation on action control and the least was that of (0.34) learning strategies on academic achievement.

V. Suggestions

In this study, except for chi-square test, the rest measures indicated that the good fit between the theoretical model and data observed in this study. Thus, the theoretical model of English learning performance could explain the actual data. The following two suggestions were derived based on the results of this study.
1. In English instruction, the integration of affection/motivation, action control, learning strategies, and academic achievement should be valued.

Past studies on instruction and learning tended to evaluate the students’ learning effect by intellectual and external performance. However, cognitive psychology conducted in-depth analysis on the internal process of human beings’ learning. With new technologies and urgent demand for educational reform, people turned the interest to the internal process of learning. The model validation of this study confirmed the importance of cognition and affection to English learning performance which could be further applied.

2. Including action control training in English instruction and reinforcing the students’ action intention of learning will help students’ English learning.

According to the related studies, “action control” was a critical intervening variable in learning process. Past studies have demonstrated that when learners are more educated, they tend to lose the motivation in learning, be less persistent and be lazy (Cherng & Lin, 2002; Wigfield & Eccles, 2000). Technological and vocational college students do not have significant English proficiency back in the studies in vocational schools. Since English courses become more difficult and the students are not willing to overcome the obstacles, the students would lose their interests in English learning and even totally give it up. It is the situation that teachers, educators, or other stakeholders do not expect. Therefore, it is necessary to include action control training in English courses to allow the students to try to recognize the distraction, probe into and fulfill action control, actively deal with learning by varied strategies, continue learning and be more confident in English learning.

6. **Abstract:**

   Inclusive leadership is a relational approach in which leaders can create organizational cultures that encourage input from staff, stakeholders, and community members. Inclusive leaders achieve sustainable group successes by recognizing social injustices, building relationships, and by leveraging the diverse opinions, experiences, and backgrounds of its members. An innovative graduate course on Inclusive Leadership in a Master of Education program in Canada is the focus of this presentation. The rationale behind the course’s development, its design, and anticipated affects on the professional practice of class participants, who are, or intend to be educational leaders in the school system and other sectors, is being explored in this study.

Introduction

Since the 1980’s, a performance-based reward system has been capable of being an important tool for attracting and retaining quality teachers. Proponents claim that it is possible for a merit pay system to be awarded to more effective teachers (Dee & Keys, 2004). The arguments are persuasive enough to have stimulated various types of programs in Korea and other countries that differentiate teacher pay on the basis of performance. Meanwhile, opponents argue that the impact of pay supplements on supply and productivity will be small, that it reduces morale, and that it is difficult to identify high-performing teachers (Murnane & Cohen, 1986). The issue of performance pay has led to contentious educational debate, particularly concerning whether linking performance and pay is an effective means of improving performance.

A performance pay system is based on motivation theories. Because the employees’ efforts and persistence relate to the quantity and quality of work performed, a teacher’s motivation is a key factor in the learning process that takes place in schools. It is believed that a performance-based reward affects a teacher’s motivation in a way that would reduce turnover and increase student achievement. However, an interesting fact is that in teachers’ responses to performance-based pay, a number of teachers strongly oppose a performance pay system.

Motivation is closely associated with individual perceptions. Nonetheless, previous debates have spurred discussion about a link between performance related pay and teacher effectiveness. But, we have little information regarding the teachers’ characteristics and backgrounds that would be required for performance related pay to work. In this context, this study focuses on teachers’ characteristics and backgrounds instead of entering the debate over the effectiveness of performance pay for teachers.

Literature Review

Performance-based reward assumes two things. First, there is the assumption that teachers affect the
academic achievements of students and second, that differences in students’ achievements are a result of a
teacher’s personal characteristics. Several studies indicate that teachers who have professional knowledge and
skills in academic subjects and in turn link them to effective teaching methods in the classroom are proven to be
more effective in instructing students and improving overall academic achievement (McDiarmid et al., 1989;
Guyton & Farokhi, 1987). These studies support the argument that, in order to motivate teachers to gain new
knowledge and skills for improving students’ achievements, the teacher pay system has to be re-structured based
on the unitary ladder system (Sanders et al, 1997).

Research on performance pay systems is mixed. While efforts by school districts to offer teachers
performance-related pay have been largely unsuccessful in practice (Murnane & Cohen, 1986; Ballou &
Podgursky, 2001; Goldhaber & Anthony, 2005), other research supports the notion that a performance pay
system may have some potential in education (Clotfelter & Ladd, 1996; Lavy, 2002; Dee & Keys, 2004; Figlio
& Kenny, 2007).

With regard to teachers’ motivation, there are arguments in support of and in opposition to a performance-
based reward system. It is argued that teachers who are not motivated by financial rewards can be encouraged
with non-financial rewards (Odden, 2000; Tomlinson, 2000). These rewards can include satisfaction from high
student achievement, recognition, influence, learning new skills, and personal growth. Therefore, a
performance-based pay system is a means of providing motivation by introducing clear goals to the whole
school.

Some teachers have been opponents of performance-based pay policy, while other teachers have been
proponents of a performance-based pay system. Ballou and Podgursky (1993) indicated that teachers surveyed
were in favor of additional pay for additional duties as part of a career ladder where performance dictated the
speed of advancement. Moreover, the level of pay in a school district appears to have no influence on teachers’
attitudes towards merit pay, yet it was more likely to be supported by teachers with low salaries and by ethnic
minorities such as Black and Hispanic educators (Ballou and Podgursky, 1993).

Motivation theories would be useful in understanding how teachers responded to a performance-based pay
system. Most motivation theories depict the differences in teachers’ needs, beliefs, and goals. As far as possible,
most teachers try to personalize their roles in a school so that their motivation is closely related to their
individual characteristics. Among the theories, motivation-hygiene theory, which has been called two factor
theory, has been widely accepted by administrators (Hoy & Miskel, 2005). Motivation-Hygiene theory by
Herzberg and his colleagues (1959) explained that the motivation mechanism can differ according to a person’s
attitude and disposition. Hence, motivation-hygiene theory shows that factors contributing to worker’s job satisfaction and dissatisfaction exist independently. However, satisfaction is not determined solely based on these factors, and Herzberg distinguishes people into motivation seekers and hygiene seekers based on their attitudes and disposition at work. Motivation seekers mainly consider accomplishment, recognition, responsibility and development at work, while hygiene seekers regard work in terms of payment, working conditions, supervision and position. It means that motivation seekers focus on upper desire in the desire system, while hygiene seekers emphasize lower desire.

**Methodology**

Thirty primary, low-secondary, and high-secondary schools were selected from Daegu and the Gyeongbuk area of Korea. A total of about three hundred and twenty teachers were randomly sampled and data were collected through a questionnaire.

Teachers were asked to complete a questionnaire that was composed of three parts: teacher’s background information, characteristics, and their perceptions of a performance pay system. In the first section, teachers were asked to provide information about their gender (i.e., male, female), number of years teaching, school-level (i.e., primary, low-secondary, and high-secondary), and school location (i.e., urban, suburban, rural). In the second section, they were asked to indicate their attitude (i.e., hygiene-oriented, motivation-oriented). In the final section, they were asked to indicate their responses to a performance pay system (i.e., motivation, morale, commitment).

A cover letter, the survey instrument (questionnaire), and a stamped return envelope were mailed to each teacher during the month of April, 2010. The sample population of this study was 320 teachers but only 284 of the teachers completed and returned the survey. This represents a response rate of 88.7%.

The purpose of this study was to clarify if there is a difference in how performance-based reward affects motivation, morale and commitment of teachers according to a teacher’s background. In order to examine data packet score trends across the groups, we conducted an analysis of variance (ANOVA) to investigate whether distributions of teachers’ backgrounds and characteristics differ from one another.

Motivation, morale and commitment, which are the criteria for analyzing group difference, are defined as follows. Motivation is the process of showing one’s concentration, direction and durability for accomplishing goals. Concentration is how hard a person focuses on his goal. If the direction pursued by a person is different from the one laid out by the organization, there is a lack of performance results. Durability is considered
important as an indicator of how long one person can maintain his efforts (Mitchell, 1997). Morale is defined by a passionate attitude and interest in work and it is based on social satisfaction by participating in educational activities and on personal pride and worthiness. Commitment is a degree of psychological connection to a specific object which teachers value as highly relevant to educational activities. Teacher commitment consists of value recognition as cognitive perspective, identification as definitive perspective, and participation as behavioral perspective on how teachers consider their class, students or school organization (Hong, 2007).

Results

An analysis of the effects of reward policy on teacher motivation, categorized by teachers’ backgrounds, is as shown in Table 1. The analysis reveals that there was a significant difference in terms of gender, school level, location, number of years teaching, and attitude.

First, the results show that performance-based reward is more appropriate for male teachers rather than female teachers as far as providing motivation, as it was found that female teachers (2.68) receive less motivation than male teachers (3.23). However, recognition of motivation by male teachers is at an average of 3.23, meaning that it is not realistic in the field. These results are statistically significant at p<.001. Second, the effects of performance-based reward on a teacher’s motivation are larger at lower school levels. Elementary school teachers (3.27) are motivated better than middle school teachers (2.78) and high school teachers (2.19). As a result of the Scheffe test, the differences between elementary – middle school, elementary – high school, and middle – high schools are statistically significant at p<.001. Third, performance-based reward is more appropriate for teachers in urban and suburban areas than for those in rural areas. Teachers working in urban (2.98) and suburban (3.10) areas receive better motivation than teachers in rural areas (2.25). As a result of the Scheffe test, these differences occur between rural areas and urban, suburban areas, and they are statistically significant at p<.001. Fourth, performance-based reward is more appropriate for motivating teachers with more than 10 years of teaching experiences. Teachers with more than 10 years of experience (3.33) are better motivated than teachers with less than 10 years of experience. Lastly, a person’s attitude also has an effect on how they are affected by performance-based reward. Performance-based reward is better for motivating teachers who are hygiene-oriented (4.11) rather than teachers who are motivation-oriented (1.88). Considering the average, hygiene seekers recognize performance-based reward as a positive factor in motivation. On the other hand, motivation seekers consider performance-based reward to be a negative factor in motivation. These results are statistically significant at p<.001.
After analyzing the effects on motivation in terms of teachers’ backgrounds, differences appear in gender, school level, working area, experience, and attitude. However, the fact that variables other than attitude show an average of less than 3 means that teachers with these variables are not actually affected positively. However, effects of performance-based reward on hygiene seekers are actually positive.

*p<.05, **p<.01, ***p<.001

Table 2 indicates the results of an analysis of the effects of reward policy on teacher morale, categorized by teachers’ backgrounds. The ANOVA results reveal that there were statistically significant outcomes.

First, it can be determined that performance-based reward increases the morale of male teachers (3.22) more than female teachers (2.69). This difference is statistically significant at p<.001. Second, reward policy is more appropriate to raise the morale of teachers at elementary and middle schools (3.13 and 3.01, respectively), rather than high schools (2.20). Under the Scheffe test, this difference results from a group difference between elementary and high schools and middle and high schools. The difference between elementary and middle schools is not statistically significant. Third, reward policy works more positively to raise the morale of teachers
in suburban areas. The morale of teachers working in suburban areas (3.19) is raised higher than that of teachers in rural areas (2.50). The Scheffe test shows that this difference results from a difference in average between suburban and rural areas, and it is statistically significant at p<.001. Fourth, the effect of reward policy on teachers’ morale appears to be different according to teaching experiences. The more experienced teachers are, the higher their morale is raised. The Scheffe test shows that this difference is statistically significant at p<.001 for groups of teachers between more than 10 years experience and no experience, more than 10 years of experience and 1-10 years of experience, and no experience and 1-10 years of experience. Lastly, reward policy has different effects on teachers’ morale according to attitude. Reward policy gives out higher morale to teachers who are hygiene-oriented (4.06) rather than teachers who are motivation-oriented (1.92). Considering the averages of each group, hygiene seekers recognize the effects of reward policy on morale as positive, while motivation seekers think of its effects as negative. Similar to its effects on teachers’ motivation, the effects of reward policy on morale are actually determined heavily by the individual’s attitude.

The effects of reward policy on the level of a teacher's commitment are analyzed in Table 3, categorized by teachers’ backgrounds. Significant differences were observed in teachers’ perceptions of performance-based reward.

First, as a result of gender comparison, male teachers (3.50) recognized the effects of performance-based reward on their commitment to be more positive than female teachers (2.93), and this result is statistically significant at p<.001. Second, the comparison between school levels shows that reward policy plays a more positive role in raising the commitment of elementary school teachers (3.35) than in the case of high school teachers (2.80). To analyze the difference between group averages, a Scheffe test is conducted. Differences in average values between elementary-middle schools, elementary-high schools, and middle-high schools are statistically significant at p<.001. Third, teachers working in suburban areas recognize the effects of reward policy on commitment most positively in comparison to working areas. Reward policy affects the commitment level of teachers working in urban and suburban areas (3.12 and 3.36, respectively) more than those working in rural areas (2.75). As a result of the Scheffe test, this difference results from difference between rural-urban areas and rural-suburban areas. Differences between suburban and urban areas are not statistically significant. Fourth, a teacher with more teaching experience recognizes the effects of reward policy on commitment to be positive. A group with more than 10 years of experience has an average of 3.72, which is the highest among the categories. The average of a group with 1-10 years of experience is 2.65, and one with no experience is 1.64. This means they believe reward policy affects teachers’ commitment negatively. Looking at the average values of each group, only a group with more than 10 years of experience considers reward policy to have a positive effect, while the rest of the groups think it has a negative effect. Lastly, teachers who are hygiene-oriented (4.30) recognize the positive effects of reward policy on commitment, whereas those who are motivation-oriented perceive the negative effects of reward policy. This difference is statistically significant at p<.001.

### Conclusions & Implications

This study analyzes the effects of reward policy, categorized by teachers’ backgrounds and attitudes. It turns out that the reward policy has some effect on the motivation, morale and commitment of teachers, but these effects can be increased given certain teachers’ backgrounds and attitudes.

The major findings of this study are as follows: First, this policy has different effects between genders in that male teachers show more positive effects than female teachers. Second, the effects of reward policy appear to differ between school levels. Teachers in elementary schools have a more positive result than those in middle and high schools. Third, the effects of reward policy are different by location. Teachers working in urban and suburban areas have more positive results than those in rural areas. Fourth, more teaching experience is also a factor in the varying effects of the reward policy. Teachers with more than 10 years of experience responded more positively than those with less than 10 years. Fifth, the effects of reward policy appear variable in terms of personal attitudes. Teachers who are hygiene-oriented are affected more than those who are motivation-oriented.

Policymakers have held to the assumption that giving more extrinsic rewards to teachers will improve results. However, the findings of this study indicate that it is necessary to consider the teachers’ backgrounds and attitudes. Therefore, educational leaders should verify individual characteristics, beliefs and needs in order to increase teachers’ motivation.

To this end, the following items need to be taken into consideration. First, a more in-depth analysis is...
necessary to verify the cause for the difference in the effects of performance-based reward in terms of gender, school level, and location. Further studies are needed to clarify which characteristics of school organization create a difference in realizing the positive effects of reward policy among different school levels, what cultural value and norms make regional differences, and which factors in gender lead to different effects of reward policy. If new information is accumulated, compatible policies can be pursued.

Second, future analysis should further consider differences in school levels and location. Elementary, middle and high schools in Korea have their own distinct organizational structures and management systems. In addition, the goals of school education are different according to school levels. Different cultural values and norms are found in urban, suburban and rural areas, and in turn they are reflected in school education. Therefore, based on further studies with an emphasis on clarifying differences in school levels and location, a more adequate analysis can be conducted.

Third, the autonomy of each school has to be guaranteed in order to establish standards for receiving performance-based reward and for practicing the actual evaluation. Because uniform criteria set up by the government do not properly account for the distinct features of school organizations and regional differences, they are not suitable for reward policy. Thus, a policy to grant autonomy to each school that reflects the needs and characteristics of the school and its teachers is an important factor in practicing the reward policy.

ABSTRACT:

The aims of the research are: 1. planning and implementing the general education of Taiwan Hakka culture in university. 2. Realizing students’ motives about choosing the general education of Taiwan Hakka culture. 3. Evaluating students’ satisfaction of the courses of Taiwan Hakka culture. 4. Collecting up students’ opinions about the general education of Taiwan Hakka culture.

The research uses an action research; they make the decision of the courses’ theme and teaching methods after discussion, and they co-operate with school’s Internet teaching platform, also during the process randomly collect students’ opinions and feedbacks after courses, the total is more than 300 sheets. On the other hand, the researchers planed the survey of the evaluation about the courses, and they collected opinions and motives from 58 students in the courses. The researchers used the statistic analysis of depend variables by EXCEL on the results of the survey, on the other hand, they used the qualitative research to analyze the answers form the opening questionnaires and the discussion between teachers and students.

The finding of the research indicates that the teaching method that included the origin and lives (involve food, clothing, housing, transportation, education, entertainment.), and combined with the traditional teaching, the Internet learning, seminars, field trips in Hakka villages, students’ presentations, etc., the acceptance of most students about the general education of Taiwan Hakka culture is high, the evaluation tends to ‘satisfy’ or ‘very satisfy’.
In types of themes, the daily Hakka, Hakka food and Hakka nursery rhymes have higher acceptance; otherwise, field trips in the Hakka village-Meinong also made students to be impressive. The analysis of students’ background revealed most of them (more than 80%) are not Hakka speakers and live in Minnan communities, those students use Taiwanese and Chinese mostly in daily lives, only 1% uses Hakka. Students surf the Internet about Hakka frequently when they take the Hakka culture course, or they rarely visit Hakka websites.

In sum, choosing the course can enhance students to know the Hakka culture and the learning motives. For teachers and students with Hakka background, in addition to the feelings of fresh and exciting, using the native language teaching, discussion in the classroom can also improve the use of Hakka and the rates of the language exposure, inspire the sense of belonging and identification.

Keyword: Hakka culture, Hakka village, native language, race culture, general education
Introduction

The Hakka culture in Taiwan has been well-established, which gradually spreads out its glamour in the integration of multiple cultures through the time and also acquires the respect and recognition. However, because of the change of the time, Hakka culture in Taiwan also forces series problems about the outflow of Hakka speakers and the inheritance and promotion of the traditional Hakka culture. Therefore, how to conserve and promote Hakka culture is a continually serious task for people who strive on cultural development, which should not be neglected.

Reviewing the promotion of Hakka culture, Council for Hakka Affairs (CHA) aggressively and systematically promotes the development and recovery of Hakka culture, besides universities domestically found graduate schools about Hakka and centers for Hakka studies. CHA (2006) further subsidizes universities to promote Hakka culture by setting up programs, speeches and general courses, which is worth praise. Recently, the news reports that the general course of Hakka in National Taiwan University (NTU) is popular for students to enroll, thus setting up a course of the general education in universities is a feasible method to promote Hakka culture. (Wong, 2008) Nevertheless, how to set up a program of Hakka culture in advanced education, plan the learning resources and programs and implement the promotion of Hakka culture should be defined further.

Huang (2004) pointed out the implementation of the general education in universities could be categorized into four types: 1. 2. 3. 4. Through analyzing the programs of Hakka culture in universities, most programs that are categorized into elective courses of the general education are belong to one of programs in the humanities. In order to promoting Hakka culture in universities, besides the traditional programs of the general education, countering the need of themes of the general education through the way of general education speeches can instruct students on more levels. Thus, including the Hakka issues can deal with the insufficient programs of Hakka culture.

Therefore, the study based on programs of the center of general education in Chia Nan University of Pharmacy and Science, and planed three goals: 1. Discuss the instruction of the program content. 2. Record students’ reactions. 3. Implement the survey after programs;
the three goals explored relevant problems about programs of Taiwan Hakka culture that has been implemented in universities, and the result will be a basis for setting up programs in the future, also encourage more discussions further, which is expected to carry out the goal of Hakka culture in higher education.

**Instruments and Methods**

The study used the action research in general education programs of Hakka culture in Chia Nan University of Pharmacy and Science. Before the programs started, the crew decided theme contents and teaching methods after collected references and discussed, and they co-operate with school’s Internet teaching platform, also randomly collect students’ opinions and feedbacks during the process. The researchers planed the survey of the evaluation about the courses, and they collected opinions and motives from 58 students in the courses. The researchers used the statistic analysis of depend variables by EXCEL on the results of the survey, on the other hand, they analyzed and discussed the answers form the opening questionnaires and the discussion between teachers and students.

**Results and Discussion**

**Results**

Culture is a consequence of racial life accumulation, which involves attitudes of things, belief, ceremony, system and the integration of life styles. The origins of culture developments from different races are similar, even though culture developments and contents from different races are not the same. Thus, it is an opportunity for Hakka students to find out the culture origin through the self-consciousness and build up the confidence of Hakka culture; for non-Hakka students, besides the cognition of culture features from races, realizing differences of people who are from diverse cultures is also through re-recognizing process that was from others cultures to ours; therefore, this way will confirm the culture and also tolerate others. Hence, the program design includes: Taiwan Hakka (the background and history), Hakka in Taiwan (the population and habitations), Hakka (Let’s talk in Hakka-daily Hakka), traditional and modern Hakka music, Hakka features, traditional Hakka belief, Hakka food and Hakka ceremony (including weedings, funerals, joyous ocassions and celebrations). Consequently, the study mentioned three contents of theme topics: 1. Taiwan racial integration. 2. features of Hakka culture. 3. differences between diverse racial cultures.
Implication of Programs

From the following students’ reviews, it revealed that students were inspired to reflect on Hakka culture after programs and also recalled a culture connection from their daily lives. Those results exceeded researchers’ expectations, and the following reviews that were cited from students:

Review (1)

In my mind, I have an unbeatable spirit that was made by my ancients and named “Ying-jing.” When I was a child, my family had the same blood relationship, speak the same language and eat the same Hakka food “ban-tiao” that was made with rice, and I could not distinguish the differences between others who were not Hakka. As a school-age student, I felt lonely, because my classmates could not understand Hakka; I had no friend because of misunderstandings caused by languages. Thus, I started to learn Mandarin Chinese and dislike to speak Hakka, because others thought you were weird, not special; I started to find chances to practice Chinese when I was in senior high school, and I also engaged in speech and oral reading competitions. However, now I started to think I am really special, because I love my Hakka culture and the difference between others. Unfortunately, I was not familiar with my culture, and a serious problem in the society was there were more and more invisible Hakka who abandoned their Hakka culture. For Hakka, it may be saved in history after decades, but it may be an extinguished language because of the lack of speakers.

Program evaluation and satisfaction analysis

Part one:

An analysis of sex and races:

There were totally fifty-eight students (eight males and fifty females) to select the program, males were 13.79% and females were 86.21%, so females were obviously more than males in the study. The data shows that most students’ parents are Taiwanese who speak Fukien dialect. Students considered they are Taiwanese (72.41%), which is higher than others considered they are Hakka (20.69%), and the rate of Hakka is similar to the rate of their fathers’ race.

Inhabitation:
Taiwanese speakers are the majority around students’ inhabitations; however, there are also few students live in integrated inhabitations of races, which means that the convenience of transportation makes students to have chances to expose different racial cultures.

**Languages used frequently in lives**

The result showed that students used a language most frequently at home is Taiwanese (53.45%), and the next one is Mandarin Chinese. Mandarin Chinese (81.03%) is used frequently in social lives, and the next one is Taiwanese (17.24%). The investigation revealed that people use Taiwanese and mandarin Chinese as major languages in conversation, regardless of their homes or lives. Only six students (10.34%) use Hakka at home and one of six students use Hakka in his daily life, both of rates are lower than the rate that students considered they are Hakka; because of many factors, the rate of using Hakka in students’ daily lives is not high, even though some of them are Hakka. Participants thought they just could comprehend and speak a little Hakka in Hakk listening and speaking. Only nine students can fully comprehend in listening, and two students can speak Hakka fluently. Thus, we can know how seriously the outflow of Hakka from participants.

**The situation of contact with Hakka culture**

The investigation showed participants never (32.76%) and rare (39.66%) watching Hakka TV programs are major; participants never (40.4%) and rare (47.1%) surfing Hakka websites are major, in addition to the rate of surfing Hakka websites in class.

**Social culture:**

The result revealed most of students never (43.1) and rare (43.1%) actively introduced which races they belong to others people, also never (46.6%) introduce their racial cultures to others. However, participants thought that learning their own racial cultures and languages are important (55.2%) and very important (36.2%). Almost all participants (98%) thought that Hakka culture is very special and valuable and should be protected. Participants expected that primary school students can take a Taiwanese course as their mother tongue as major, and the second choice for students is Hakka; some participants also thought it is appropriate to take a culture course in primary school or kindergarten, and others (13.4%) thought it is appropriate in universities, reasons should be discussed in further studies.
Participants in the program who considered they were Hakka have better Hakka listening competences than others, but their speaking competences do not. The result indicated those participants who considered they were Hakka had more opportunities to receive Hakka from elders, but they only got few chances to speak, this situation also revealed the importance of Hakka programs.

Therefore, participants who considered they were Hakka did not have more interesting in exploring Hakka issues than others (included watching Hakka TV programs, websites and culture), so the result revealed those participants did not have specific interesting in Hakka culture. However, after took the program, participants who considered they were Hakka had higher identifications in Hakka culture than others did in other races, so the result showed it could help Hakka participants to increase their identifications in their culture after took the program. (See Table 1)

**Table 1: One-way ANOVA of different racial students’ Hakka competences, interesting and identifications in the program.**

Theme and satisfaction of the program
After a semester, participants’ satisfactions to the program are ‘very satisfied’ (69%) and ‘satisfied’ (29.3%), they were also glad to learn various themes, and the acceptance of the program from high to low were Hakka food, daily Hakka, nurse rhymes of Hakka and Hakka music. From the result, introducing Hakka culture from participants’ food in their daily lives will be more acceptable by them.

Part two: answers of the opening questionnaire

The timing and rate of using Hakka:

For Hakka students, they used Hakka most frequently was at home and talked with elders in hometown. After left their hometown, students rarely spoke Hakka because others could not understand Hakka, and they even did not talk in Hakka with people form their hometown.

Te following was a student’s reflection

Especially talking with elders, I will speak Hakka as possible if I can, and I will actively talk with others in Hakka because it is seldom to meet Hakka and difficult to meet a Hakka friend out of my hometown. The reason why I actively speak Hakka is that we might try hard to talk with foreigners and do not afraid of their ridicule, even though our English or Japanese competence was low. Now Hakka is one of dialects in Taiwan, and Hakka speakers why not try to speak Hakka in lives. Let’s have a try! Jusf do it, no matter you can speak Hakka or not, the growing starts from learning.

We have to try to make a friendly Hakka environment that can encourage students to speak Hakka in schools, because Hakka students have only few chances to use their mother tongue at normal situation. Hence, this way can make Hakka to have chances to speak, learners to keep practicing and people who cannot speak Hakka to get chances to listen.

Learning experience of the Hakka program

Many students indicated that they had no learning experience of formal Hakka programs, and few students told they had learned Hakka with their family or friends. Participated in the general education of Hakka program was their first time to contact, so we can see the importance of setting up Hakka programs in universities.

Motivations of selecting the Hakka culture program

For Hakka students, they selected the program to enhance their knowledge in Hakka culture, and also prove themselves are Hakka. The following is a student’s description:
for non-Hakka students, they selected the program because they want to know more about different racial cultures, satisfy their curiosity and understand transportation Hakka in lives; there were few chances to know systematically Hakka culture, students hope they can know more multiple cultures of Taiwan through the process.

**How to use Hakka knowledge that learned from the program**

Some students expected they can talk simple Hakka with their family, this way can also make them closely to know more about Hakka culture through watching Hakka TC programs and listening Hakka music. Students who majored in department of childhood education and nursery can use nurse rhymes and songs learned form class to teach children in the future.

**Motivations of learning racial culture**

In order to knowing more our culture, talking with others, understand others’ background, promoting our culture and inheriting the Hakka spirit, those reasons motivate students to learn the culture. The following answer by a student indicated ‘If I do not understand and prove my culture, I cannot convince others that I am a Hakka. Sometimes I cannot define Hakka culture if I am a Hakka, but now I learn the background knowledge of Hakka, even introduce it to others after taking the program.

**Elements could be taken and enrich the program.**

Most of participants thought the program content was sufficient that means there was no more element should be taken into the program, but the content can be modified to take more Hakka element to make participants to practice and learn daily Hakka, such as Hakka food, figures and the 12 Chinese Zodiac animals.

**Discussion**

In order to promoting features of Hakka and cultivating Hakka culture in Taiwan, setting up Hakka programs is necessary and immediate, and students can not only learn Hakka culture, also deliberate the culture during the learning process. This way can expand personal views on cultures and tolerate and appreciate differences of races, and it can also help students to make connection with others under globalization. The result of the study pointed out two important messages: 1. The racial identification of Hakka should be established immediately. 2. Differences between races can be integrated and tolerated. The two messages implicated reflections of different cultures do not contradict tolerance of
different cultures in the youth. Thus, there is no doubt that setting up Hakka programs has progressive and positive influences. It is impossible to fully comprehend Hakka culture in only one semester, but the design and implement of a program can inspire students to learn, we hope this way can make them to integrate their lives, so that they can achieve their life-long study.

E-learning in University-level English

Choosri Banditvilai is an assistant professor in the Department of English at the Faculty of Liberal Arts and Science, Kasetsart University, Kamphaeng Saen Campus, Nakorn Pathom 73140, Thailand.
E-mail: cbanditvilai@yahoo.com

Abstract

This paper presents a case study of using e–learning to supplement classroom learning in the Communicative English for Careers course at Kasetsart University. The purpose of this study is to enable students to study on their own efficiently. It also aims to compare the achievements of two groups of students: The first group studies Communicative English for Careers only in the classroom. The second one studies Communicative English for Careers supplemented by e–learning outside the classroom. The research was conducted using both qualitative and quantitative methods. The statistical methods used are mean values. The findings show that the use of the e-learning program can develop students’ language skills and it could play a positive role in supporting English language learning. The students in this study expressed positive attitudes towards the supplementary e-learning program, both in becoming autonomous learners and in motivating their learning.

Keywords: e-learning, learner-centeredness, learner autonomy, Communicative English for Careers

Introduction

Computer-based training is gathering force around the world as a means of supplementing and supporting in-class teaching. Developed effectively, it can help build the vital skills of critical thinking and self directed learning. This type of learning is conducted on the Internet. It is described as “anywhere – anytime” learning. The learning takes place under two conditions: It is self-directed learning and autonomous. With this kind of learning, learners and instructors can communicate, consult and exchange their opinions as they would in a typical classroom by using modern communication technology, for example, e-mail and web–boards. E–learning is characterized as life long education which is in line with the current Thai Education Plan.

Literature Review

E-learning is a new innovation of technology in teaching and learning which is gaining popularity. E-learning in several universities both in Bangkok and other cities has increased. Chula Online at Chulalongkorn
University and KULN Learning Network at Kasetsart University are examples of University based facilities. In addition to educational institutions, other government institutions provide online learning. For example, the National Science and Technology Development Agency (NSTDA), in collaboration with the Thailand Graduate Institute of Science and Technology, has launched a website called Learn Online, a web portal for web-based courses from leading universities and business organizations in Thailand (OEC, 2004). In 2005, Hanmongkolpipat conducted a study on the development of e-learning using statistical hypothesis testing with the purpose of enabling students to study alone through the use of electronic technology. It also aimed to compare the achievement of students before and after using the e-learning method and to investigate the learners’ attitudes towards using this program. The study also revealed that the adoption of this form of teaching and learning brought with it changes in a number of aspects of teacher and student behaviour. Students were encouraged to develop their skills and think independently. Moreover, the materials which the teacher provided under the e-learning system were relevant to the lessons in terms of language used, sequence of content and examples used for explanation. Rush (2001) investigated an analysis of an intranet-based learning project for the Bangkok Marriott Resort and Spa (BMRS) hotel. The study examined the emerging emphasis of constructivism as an epistemology driving the development of a pedagogy which stresses the relative autonomy of learners and the transformation of teachers from lecturers into coaches. It has noted the merits of such an approach but also recognized that the development of a constructivist pedagogy is still ongoing, especially as it relates to the presentation of materials in online environments. The resistance of some students to the challenge to take on more responsibility for their learning has also been touched on, with particular mention made of the learning environment at the Bangkok Marriott Resort and Spa hotel. The problem is there is also little attention paid to the development of learner communities as nearly all the material emphasizes individual participation. In this sense, the site is reminiscent of an electronic textbook, and does not efficiently promote knowledge construction. However, it is recommendable that the facilitator is presented as a coach who is there to give advice, rather than to show learners how to do things. The findings of these two studies accurately reflect the current state of e-learning today.

Background to the study.

In traditional classroom teaching, students will be taught by a teacher or a team of teachers. Students will listen to the lecture and take notes. However, students are different in terms of intellectual ideas and perceptions. Wasanasomsithi (2000) points out that different learners have different learning style preferences. Some students can learn and understand quicker and easier than others. Therefore classroom
teaching is not enough to suit individual differences, so we need modern technology to serve each student’s needs.

Subjects.

The subjects in this study were Kasetsart University students, Kamphaeng Saen Campus who registered to study 01355251 Communicative English for Careers for the second semester 2009, which is designed for students who have already passed three compulsory foundation courses. This course focuses on improving the four language skills (reading, listening, speaking and writing) to help the students succeed in getting a job. However, most students who register for this course are from different faculties—Agriculture, Liberal Arts and Science, Engineering and Education and Development. Most of them lack the skills to use English effectively because they lack the opportunity to practice it. Therefore, using e-learning to supplement classroom teaching in the Communicative English course will be useful for Kasetsart University students and students from other Universities. E-learning is developed to help students learn on their own at any time and anywhere. It provides the students with an opportunity to adapt themselves to the computer era and equip themselves with the skills to be ready for e-University.

Research procedure

Two groups, each comprising 20 students, were selected after pre-testing to determine homogeneity. In the first group, students studied Communicative English for Careers in a classroom setting. Students in the remaining group supplement their studies at will, using e-learning procedure.

Research instruments.

In order to evaluate the effectiveness of the use of e-learning to supplement classroom learning, the following research instruments were used:

1. E-learning lessons developed by the writer for students who studied Communicative English for Careers at http://pirun.ku.ac.th/~faaschb/engforcareers/main.html through the Internet used by Kasetsart University.

2. The test was divided into two parts: In the first part students read the article and chose the best answer. In the second part students read the article and answered the questions given.
3. Questionnaire: The questionnaire (See Appendix) was used to obtain students’ reactions towards using e-learning to supplement Communicative English for Careers.

The subjects’ responses to the questionnaire were analyzed in terms of mean scores which were interpreted as follows.

- 4.21 to 5.00 = Extremely
- 3.41 to 4.20 = A lot
- 2.61 to 3.40 = Fairly
- 1.81 to 2.60 = Not much
- 1.00 to 1.80 = Not at all

4. Semi-structured interview: To provide further support, 15 students were randomly selected for interviews at the end of the experiment. Students were asked for their opinions on using e-learning to supplement Communicative English for Careers.

Findings from the application of the three research instruments

Findings from the test

The test was done by both groups of students in the allocated time limit of 20 minutes. To reiterate, Group 1 had received no supplementary e-learning program, while Group 2 had received supplementary e-learning program. The test was measured by the number of correct answers from each group. Then the mean values obtained from the two groups were calculated for each exercise, as presented in Table 1.

<td>20</td>
<td>24.28</td>
<td>4.67</td>
<td></td>
</tr>
</tbody>
</table>

Table 2. Comparison of the mean values relating to the test

Table 2 shows that the mean value recorded from the test was higher in Group 2 (with treatment) than values recorded in group 1 (without treatment). The significant difference shown in the mean values comparing the two groups highlighted the potential for accelerated development of language skills through the use of e-learning.

Findings from the questionnaire

In the questionnaire, the subjects were asked to specify their attitudes toward using the e-learning program.

<table>
<thead>
<tr>

<td>4.2</td>
</tr>
</tbody>
</table>
As can be seen from the table the students had favourable attitudes towards using e-learning to supplement their studies in Communicative English for Careers class. They considered the supplementary program interesting and user friendly. There was a favourable response relating to overall content and motivational aspects delivered through the use of the technology. Despite less appreciation for the illustrated content, students saw the e-learning program as helpful in developing their language skills. Finally, students felt that this program could both facilitate and enhance their learning experience. It should be noted that the mean values of question 10 is lower than other items. Students commented that this program doesn’t provide an opportunity to practice speaking like a real communication.

**Findings from the semi-structured interviews**

The results of the semi-structured interviews show that most students had positive attitudes toward using the supplementary e-learning program. Students in the experimental group considered this program to be more interesting than normal classroom learning. They could study by themselves without being bored.

The following are some quotes from students concerning their attitudes towards this program:

“This program helps me develop my listening skills. First I can not understand what they say. So I listen again and again until I can understand. I can listen as many times as I like”
“I like the e-learning program because it is simply accessible anytime and anywhere”

“This program helps me to think and develop myself”

“Traditional classrooms are teacher-centered but in e-learning we did everything by ourselves”

“I like this teaching program because I feel relax and enjoy learning.”

“I think teacher should develop a program which give students more opportunity to practice speaking English”.

“I prefer reading and doing exercises by e-learning because the presentation is interesting and stimulating. There are a lot of visuals and sounds which make it similar to a real communication in the classroom. Moreover, material is easy to follow.”

“The task that I like most is listening to completing the conversation. It is challenging and I find that simultaneously checking the answers by myself is very interesting.”

However, two extracts also highlight negative aspects of the e-learning program:

“Sometimes the computer is so slow that I am wasting my time while I wait to be connected”.

“I can’t find the server, so I can’t use e-learning”.

**Discussion and practical applications.**

The data obtained from all three sources indicates that the supplementary e-learning program helps students develop their language skills.

The transfer of learning emphasis from teacher to student self-help suggests considerable changes in the delivery of language skills. The qualitative data presented above gives evidence of learner-centeredness and a consequent transformation of the role of the teachers from lecturers to facilitators as well as encouraging motivation and learner autonomy.

**Learner-centeredness**
The results from the semi-structured interviews indicate that the roles of the teacher and students had been shifted from being teacher directed to learner-centered. Hedge (2000) points out that the term learner centered has four central characteristics. The first is that learners participate in the whole process of designing the course content and selecting learning procedures. The second is that learners participate in the design of language activities. The third is that learners are encouraged to take responsibility to a great degree for their own learning. The fourth characteristic is that of enhancing learner autonomy.

This focus upon the learner results in a “bottom up” program being developed through collaboration between teachers and learners, rather than one introduced by specialists in a “top-down” or “specialist” approach, (Johnson 1989, cited in Tudor, 1992:32). Through this collaboration, learners are expected to be actively involved in their learning. By the same token, students and teachers are also expected to collaboratively make decisions concerning assessments and evaluation (Nunan, 1998; Tudor, 1992; Nunan & Lamb, 2001).

**Changes in Teacher and Learner Roles**

Due to changes in the roles of teacher and students, classroom interaction in the e-learning program was considerably different from the students usual classroom studies. The role of teacher in their normal classroom can be summed up with Hammond’s (1990) notion of an “authoritative” teacher, and with the principle of interactive approach.

The e-learning program offered students roles as active learners. The students actively participated in learning tasks. The students liked their roles as “active learners” and they were conscious of the benefits of "collaborative learning". Overall, they expressed positive attitudes towards this new learning experience. Students also appreciated the move between the role of the teacher as scaffolding builder to facilitator. Students regarded this program as a helpful tool for them to learn English.

**Motivation and Learner Autonomy**

The data from the questionnaire shows that the use of e-learning can motivate students to develop their own learning. This motivation can often encourage learners to become more responsible and willing to engage in their own learning, which is defined as learner autonomy. (Blin, 1999; Lightbown & Spada, 1999; Toyoda, 2001). In the context of autonomous learning, learner’s interests can be maintained depending on whether they find the materials they use interesting and useful (Frankel, 1982; Hughes, 1982).
It has also been noted that there were some difficulties relating to the computer system and the internet connections. Teachers should be aware of possible technical problems and tackle them by giving CD Rom to learners who do not have an internet connection at home.

Conclusion

E-learning allows students to develop and practice English language skills outside the classroom. It can be used to supplement and even replace in-class teaching material. This move to decentralize learning is becoming a major trend around the world. Most importantly, the success and value of any e-learning program cannot be gauged by the ability to make use of technology but rather the ability to maximize students’ learning effectively.
Appendix 1 Questionnaire

Please write your name and put a cross (x) to indicate your studies. Indicate your attitude to the comments on the grid by putting X under the appropriate number of your choice relating to each comment.

1. Gender (  ) Male (  ) Female

2. Faculty (  ) Education (  ) Liberal Arts and science
   (  ) Engineering (  ) Agriculture
   (  ) Veterinary Medicine

3. Year (  ) 2 (  ) 3 (  ) 4

Please specify your attitude towards using e-learning to supplement classroom teaching in Communicative English for Careers.

Appendix 2 Questions of Semi-structured interview

1. Do you think e-learning helps you in learning English?
   (reading skills, writing skills, listening skills and speaking skills)

2. Tell me about the teaching and learning situations in the program.

3. How do you think the teacher's and students' roles in this program are different from those in your normal classes?

4. Can you identify the aspects of this program that you liked?

5. Were there things about the program that you didn't like?

6. What tasks did you like most in this program and what tasks did you dislike most?

7. Would you like other teachers to use e-learning to supplement English classes? If so, how?
8. Do you prefer reading and doing exercises from a book to e-learning?

9. What do you think about this teaching program?

10. Are there any other comments you want to make about the program or about what you have learned in the program?
Example of the course syllabus
The main objective of the course
1. Study vocabulary used in different situations.
2. Modeled dialogues and role play practiced in pairs and small groups.
3. Practice the four language skills-listening, speaking, reading and writing.
4. Practice listening for the gist of the conversation and to pick up specific points of information.
5. Practice various types of writing tasks.
6. Create self-confidence by using the language.
Unit 1
Introduction

Objective: To become acquainted with people you work with

Tasks:
- to introduce yourself to new workplace colleagues
- to swap information about jobs and responsibilities
- to find out about other people's jobs
- to read a personal profile
- to role-play in different situations

Example of a lesson
Example of an exercise for choosing between formal and informal

Now listen to some more people meeting one another and tick whether it is a formal or an informal greeting. Then write the clues.

Title:

From gifted student to teacher: transferring personal experience into professional practice

ABSTRACT (for Workshop)

Giftedness has traditionally been perceived as an innate, natural talent indicated by remarkably high levels of performance in one or more areas, compared to others of a certain age.

However, cannot giftedness also be created and nurtured?

If the mind is cultivated at an early age, students can expand their minds and enhance their cognitive development at an increased level and rate. Giftedness can be created not only by expanding what is in the box but by expanding the box itself.

This workshop will firstly explore how a unique holistic, educational upbringing can enhance and accelerate giftedness.

My education was not by any means a classic example of an education location: There was no bell signaling the end of classes; no buzzing of the hallways as groups of children gather to discuss what holds a special meaning for them; no rush for the cafeteria in school breaks; no scores of children milling outside classrooms waiting for a teacher to permit them to enter the room that would be their domain for cognitive expansion for the next class period: there was no school with a body of teachers, bands of students, and multiple classrooms.

But, there was one classroom, one teacher, and two students.

The classroom was situated in my house – my home; the teacher was my mother; and the students – I and my twin brother. My home was set in a quiet, suburban, middle-class area with a looming forest behind me and the breadth of an open quarter-acre field of grass before me. The classroom was in a quiet area towards the back of the house, secluded and private but still connected to the goings-on of daily life outside the learning space. A door – the entry to my formal world of learning – on one side of the classroom and a clear window on the other provided a sense of openness in what could otherwise have been a rather closed and ‘busy’ space.

Upon entering the classroom, the primary domain in which my learning occurred, I, along with any spectators, could immediately discern its purpose; its role in the process of my formal education: The teacher’s desk was stationed center front, while my and my brother’s desks were side by side slightly inverted towards each other. The whiteboard hung on the front wall surrounded by a series of graphic organizers as large as posters. The whiteboard and the teacher’s presentations were visible to both students. A stimulating and inviting vision, there was a planned complexity in the classroom with a balance of order and novelty: previously-used advance organizers on the walls, a large world map on
the back of the classroom door, science models hanging from the ceiling, shelves of books combing the back wall, stationary and learning utensils neatly organized in cupboards. All material was arranged to maintain visual order and aesthetic harmony in the classroom, while resources were easily accessible and stored and displayed to encourage independent use.

Throughout my formal education, the learning environment was frequently adjusted. During my secondary years of schooling in particular, the location of my formal education moved beyond the classroom into other areas of the house and outside, where ICT could be more easily accessed and my need for variety in learning places could be satisfied. Discussions, brainstorming, the viewing of educational videos, and general academic study expanded in location beyond the classroom to the lounge room, which included sofas, a larger table at which both teacher and students could be seated, and a kitchen, and increasingly beyond the house. Thus, both the classroom and the lounge room – quiet, stimulating, and visually inviting areas – were integrated into my learning environment, the location of which throughout my formal education was primarily my home. As my formal education was set in an informal setting, the home, when the education location was expanded to increasingly informal settings, a change of perception towards the learning environment was also necessary on the part of the student. Barriers or partitions were initially utilized to indicate the learning area, the classroom. However, in the secondary years of my formal education, an internalized set of barriers developed, in which a space with few architectural features or physical markers distinguishing the area as a learning place was imbued with meaning as a place of learning through psychological rather than physical markers.

The implications of the physicality of my education location for the environment and context of my education were manifold, reflecting a series of ideals and philosophies that surrounded the deliverance of an individualized, home-based, accelerated education in a personal learning environment that served to address my needs as a learner.

The physicality of my primary education location enabled the establishment of a more relaxed, familial, and personal learning environment. The home was not only a model, a natural laboratory for my learning; it was the primary location of a holistic education. The learning space became a learning place, as the home in addition to being recognized as a place for living, became imbued with value as a place for stimulating cognitive, affective and psychomotor development. Far from being relegated to the confines of an age-segregated institution disassociated from the lives of those closest to me, I was dominantly situated during my formal education in a warm, caring, familial environment which encouraged a sense of belonging, safety and security. The learning climate thus allowed me to feel comfortable with explaining my ideas, expressing my opinions, and venturing my personal and creative thoughts about topics.

However, the learning environment not only established order and an atmosphere of warmth and security; it also provided novelty. The learning environment in which I immersed myself during my formal education provided an element of excitement which encouraged intellectual growth, and stimulated accommodation and adaptation to increase development. The high quality, high quantity learning materials and resources which I was fortunate enough to have at my disposal encouraged significant cognitive, affective and psycho-motor advancement. My learning environment was hardly confined to a classroom or home; rather every sight, every sound, every experience was perceived as an opportunity for learning . . . and I was taught to appreciate each experience as an opportunity to expand my knowledge and understanding of the world around me. A clear balance between the construction of efficient routine and allowances for spontaneity provided order yet flexibility, novelty and variety in my educational experiences, to broaden the vista of my world-view and enhance my cognitive, affective and psycho-motor development.
As a child, I was exposed to a nebula of experiences designed to maximize the development of the five senses as well as my “kinetic sense”. These experiences served not only to enhance my academic abilities, but also to develop my character, my sense of aesthetic appreciation, and my understanding of beauty, finesse, and subtle variations. My education was intended to progressively develop all my faculties and abilities, and thus to facilitate my development as a multi-dimensional human being. From an early age, I became involved in the dancing arena – developing my skills in ballet, contemporary ballet, tap, and jazz, as well as singing and acting. I dedicated between twenty and thirty hours a week to dancing – my passion and my primary interest outside of study for the majority of my schooling and tertiary years. Through my dancing and for instance through state-wide competitions, I was able to interact frequently with students my own age. However, I was also able to extend the age boundaries of my interactions with people, as I often performed for church groups and multicultural groups. For instance, in January 2005, my brother and I performed for the humanitarian aid relief concert in Brisbane for victims of the Boxing Day tsunami. Sports activities such as “Little Athletics” and T-Ball, as well as group oriented activities such as Girls’ Brigades, similarly served to simultaneously enhance my social and psycho-motor development.

However, during my formative years and beyond, in what could be perceived as more academically oriented activities, aesthetic appreciation and opportunities for creativity were maximized – whether it was attending science exhibits, exploring parks and botanical gardens, or viewing art museums. Furthermore, I was also fortunate to have had a wide range of cultural and social experiences, in which I was perceived as a respected member of the group with something to offer. These experiences facilitated my interaction with different groups – with people who had the same interests as me regardless of age – whether it involved meeting and having comprehensive discussions with professors from universities such as Australia’s University of Queensland or America’s University of California or discussing the context of exhibitions with the artists themselves.

Even discussions with my own parents – something one might take for granted – served to foreground the importance of an open mind, compassion and understanding with regard to international, multi-faceted communities. As a first generation migrant from Egypt, who arrived in Australia prior to the era of multiculturalism, my mother has been able to offer great insight into the plight of minority ethnic groups in a society. Furthermore, the stories she has revealed to me stemming from her own Greek heritage has made history come alive for me – a major contributing factor to my passion for both learning about and teaching history. Having a highly multicultural family with a strong European heritage has also engendered in me sensitivity to historical crises and their effects on actual people and societies.

Thus, throughout my education, I was encouraged to see all learning places and experiences as opportunities for me to exercise my powers as a meaning-maker, as a problem-solver and as a contributing member of society.

The very nature of the education location – homeschooling with a ratio of one teacher to two students - enabled the construction of a learner-focused classroom. A crucial element of the learning environment was sufficient allowance for individuality. My learning was neither anonymous nor impersonal; rather it epitomized the extreme implementation of the concept of differentiated instruction, allowing for accelerated learning, which could not have occurred in such an extreme manner without the academic confines and freedoms created by the home environment.

Intricately related to my mother’s decision to conduct my formal education in a home-based setting and to implement the pedagogical practice of differentiated instruction through accelerated learning were her philosophies on the purpose and qualities of a ‘good’ education. Education was perceived to be the
right of every human being; however, with that right came certain social responsibility. Motivated by
the search for universal truth and the inextricably related critical analysis of knowledge to discern
inherent power relationships and extract insights on the sources of social inequality, fluency and
flexibility in divergent thinking were encouraged and developed in my education, as were critical
thinking skills and metacognition to critique acquired knowledge and the concept of knowledge itself.
This social element of education, promoted during my years of schooling, required a heightened sense
of agency, as there was an overriding emphasis in my education on the social values of collaboration,
compassion for others, and concern for the qualitative improvement of the status of the disadvantaged.
High expectations, self-efficacy, and aspirations for personal achievement accompanied by future
orientation, an intrinsic motivation for success, and a desire for recognition were also inherent in my
belief system, intricately linked to my constructed view of the purpose of my learning and the desired
outcomes of my education.

However, the comparison of acquired knowledge and ideals with reality in my life and the lives of
those in the wider community as well as my recognition of uniqueness and difference in a social
context were not only influenced by my own socio-cultural background but also by my informal
education, which included frequent interaction with multicultural groups, general social interaction,
documentaries and cultural exposés, and cultural enrichment programs. The exposure to other cultures,
frequent during my informal education, encouraged a new insight into social issues as well as an
empathy and compassion towards other members of society. Both my formal and informal education
were actively directed at providing me with the cognitive and metacognitive skills to address larger
social issues, by recognizing and understanding the depth and breadth of their establishment in
contemporary society, by theoretically criticizing power relationships and their implications for the
welfare of all socio-cultural groups in society, and by actively working towards deconstructing these
power relationships and advancing the cause of those members of society subjected to social injustice
and inequality.

This recognition and understanding of individual differences was modeled by my teacher in the world
of intellectuality and cognitive development. Inherent in the implementation of differentiated
instruction were the positive recognition of learner differences and the acknowledgment of the right of
equal participation in learning environments. As a student with a ‘high intellectual potential’, I
exhibited an above average ability to learn, a high level of creativity, and a high intrinsic motivation to
learn and achieve shown through my level of commitment to the task at hand – qualities which required
conversion into talent. However, such a conversion could not occur without self-confidence and self-
efficacy generated by the belief that my uniqueness as a learner was embraced as an attribute not as a
tendency or as a problem by the teacher. A holistic education which maximized the benefit of
environmental factors such as parental, teacher, encouragement, a positive learning environment and
high expectations and personal factors, such as motivation, interest in acquiring knowledge and self-
efficacy, thus combined to maximize my learning potential, enhance my cognitive development, and
increase the potential benefits of differentiated instruction in a home-based setting at an accelerated
pace.
CONNECTION TO CURRENT PROFESSIONAL PRACTICE AS A TEACHER OF SENIOR HISTORY, GEOGRAPHY AND ENGLISH

My education was by no means a classic example of an education location, environment or context. The nature of the learning environment – personalized, structured, familial - established throughout my education and the context of my education as both modeling and encouraging recognition of individual differences and divergent viewpoints has significantly influenced my path in the post-school academic arena and indeed also my own burgeoning pedagogy and epistemology as a teacher. Having developed a love of learning and in particular a love of history during my secondary schooling, I began a Bachelor of Arts Degree, at the age of eleven, majoring in Australian Studies (History) and with sub-majors in English Communication and Visual Culture. Highly valuing the illumination of interdisciplinary connections, I developed my knowledge in the Humanities arena and my understanding of the interrelationships between specific disciplines such as English, History, Studies of Religion, Visual Culture, and Media Studies. Having completed my Bachelor of Arts Degree from Griffith University at the age of fifteen, I then commenced postgraduate studies in the field of modern history and completed a Masters of Letters in History. Stemming from my postgraduate studies, I authored a book on the economic and socio-cultural relationship between Pacific Islander communities and Queensland, Australia.

Recognizing the importance of the study of History and English for the development of a new generation that is knowledgeable, literate and compassionate as well as the crucial role of members of the teaching profession in imparting that knowledge and understanding to this young and vibrant generation, I focused my efforts on completing a Graduate Diploma of Learning and Teaching, which I began at the age of seventeen.

My personal interest in secondary schooling can be attributed to my belief, supported by literature on the subject, that these years are a critical turning point in a child’s education. I believe that just as the early years of a child’s life are crucial for maximizing neurological development, early adolescence is similarly a crucial stage, during which teachers have the opportunity to instill in students a more positive and open-minded attitude towards education. Consequently, using the Dimensions of Learning framework, I have, while catering to all students along the abilities spectrum, implemented unique strategies to motivate and extend high achievers and gifted and talent students in the Senior Humanities arena. I implement a multitude of innovative pedagogies to make learning engaging for my students and to maximize the effectiveness of the learning experience for students along the range of the abilities spectrum. As an advocate of the Multiple Intelligences theory, I facilitate a comprehensive understanding of concepts, events, and processes and foster the development of skills using a variety of methods, including incorporating music, videos, artworks, written text, and ICT. The incorporation of ICT in particular serves both to enhance the learning experience for my students but also to address their needs as a generation which is highly technologically aware and competent. In addition, valuing the development of interpersonal skills as well as self-evaluative skills, motivation and self-directed learning, I incorporate both group work and independent study in my lessons. While I encourage students to develop their more forthright intelligences, I also provide an open-minded, supportive environment in which students can feel safe in ‘revealing’ and developing their weaker intelligences.
As a strong supporter of a holistic education, I facilitate the development of not only my students’ cognitive dimensions but also the emotional, social, and spiritual aspects of their being. I am a strong believer in the importance of the core Christian values of compassion for others, empathy, respect, justice, responsibility for one’s actions, and belief in the goodness of humanity. Consequently, I endeavour to model these values and provide a supportive environment in which my students can evolve as conscientious citizens. As part of my classroom practice, I focus on my students’ perceptions of themselves and the wider community and their integral role in its transformation. I encourage my students to develop a sense of self-respect, and I empower them to feel unique and to recognise that their opinions are valued. I assist my students in identifying their strengths and maximizing their learning potential; while providing a supportive environment in which they can expose and improve their cognitive and affective ‘flaws’. Modelling a strong motivation to learn, an optimistic outlook on life, and strong social values, I also encourage my students to develop a sense of self-efficacy which aids not only the process of self-improvement and self-understanding but also the process of understanding the perspectives, cultures, and values of other members of society. Furthermore, I provide my student with self-management training, enabling them to understand that learning is a life-long process, that they can enhance the benefits of their learning experiences, and that they can maximize their learning potential and cognitive development. Thus, through a holistic education, my students can develop the skills required to behave not only competently but exceptionally in ‘adult’ life. Furthermore, they can develop a heightened sense of agency, self-confidence and self-efficacy, encouraging them to feel empowered and able to transform society and introduce qualitative improvements.

However, most importantly, I recognize due to my own non-traditional educational upbringing which extended beyond the cultural construct of a typical K-12 education, that each student deserves the opportunity to be motivated, interested and extended.
This workshop will thus also give participants the opportunity to formulate their own conclusions on gifted education and develop a range of strategies for differentiation in the field of gifted education.

In this workshop, participants will have the opportunity to work as a community of inquiry to construct their own definition of giftedness, in the process commentating on the nature versus nurture debate and deliberating on the ‘myths’ surrounding giftedness and gifted education. Participants will also analyse and develop their own conclusions on the work of a highly gifted, accelerated student.

Participants will also reflect on and endeavour to apply to their own sector and specific subject area a range of strategies I have successfully implemented to motivate high achievers and gifted and talented students, sustain their interest and extend not only their cognitive development but also their affective development. Strategies designed to motivate and interest students to be discussed include illuminating interdisciplinary connections, developing individualised curriculum by incorporating student-specific interests, encouraging creativity, incorporating ICTs, connecting humanities curricula with the creative arts, and curriculum compaction and modification. However, while practices such as the afore-mentioned which serve primarily to extend their cognitive development will be explored; so too will strategies I have successfully implemented in order to enhance the affective development of students and bridge the boundaries between cognitive and affective development – which students in their formative years so often perceive to be entirely divergent and disassociated. These strategies to be explored in the workshop include conducting workshops on metacognition and on developing partnerships with other students, parents and teachers, and educational institutions, in-class and extra-curricular philosophy and critical reasoning activities, and service learning.

As well as gaining insight into the implementation of these strategies, participants in the workshop will develop an understanding of how these practices in fact stemmed from my own upbringing and unique holistic education as a gifted student and how they served to enhance cognitive and affective development during my own formative years and beyond.

Thus, through their involvement in this workshop, “From gifted student to teacher: transferring personal experience into professional practice”, participants will be able to gain first-hand information on the experiences of a gifted student during her highly accelerated, unique holistic education and early entry into university. They will also develop an understanding of how one’s own experiences as a student can be reflected on to enhance one’s own professional practice as a teacher. Finally, participants will acquire a breadth of strategies on implementing differentiation for gifted education in the context of a mainstream classroom and as part of an extra-curricular program.

Katherine Alpert
1. Introduction

In all Japanese public elementary schools, all the students in the fifth and the sixth grades will learn English in the period of foreign language activity once a week from 2011. The aim of foreign language activity class proposed by the Ministry of Education, Culture, Sports, Science & Technology (MEXT) is to form the foundation of pupils' communication abilities through foreign languages. Classes of foreign language activity will be carried out orally in principle, and the letters of the foreign language will not be instructed there. Does mainly oral education at elementary school smoothly link to literal education at junior high school? Is letter learning indeed unnecessary for foreign language activity in elementary school? Are children who are learning the content of the school subjects with reading and writing in their mother tongue satisfied with oral instruction in classes of foreign language
activity cognitively and affectively? If literal learning is incorporated in class of elementary
school foreign language activity, what introduction can help children to begin to read? This
study shows that an introduction of literal learning is needed at elementary school, and
proposes voluntary reading in which the child is exposed to contextualized literal input with the
sounds and the pictures at elementary school as one of introductory ways to literacy.

There have been arguments for and against incorporating the instruction of the
letters in elementary school foreign language learning of Japan. Some researchers have been
anxious about instruction of incorporating the alphabet letters in class of elementary school
foreign (here, English) language activity in Japan. Others have proposed that elementary
school children should be familiarized with the alphabet letters or learn to read some
three-letter words. However, it is controversial how the letters of the alphabet should be
instructed and what should be instructed: for example, knowledge of letter names, how to read
words, how to spell words, or how to read sentences. How should the letters be incorporated
into elementary school foreign language activity in Japan?

Generally, reading picture books to children is said to be one of the important factors
in developing their reading ability of their native language. Children look at the pictures and
sometimes follow the letters which are read, by listening to the sound which is read aloud. All
of these three factors, i.e. the pictures, the letters, and their sounds which children hear are
integrated and contextualized in the book and support children’s understanding of the text. In
this way, native children can recognize the letters consisting of the words with hearing the
sounds while understanding the meanings. In other words, the input which is comprehensible
to native children who do not yet learn to read and elicits recognition of letters from them
consists of the letters which constitute words whose meanings are clarified by the context in the book, i.e. contextualized, the sounds as in which they are pronounced, and the visual materials, the pictures, which shows what it refers to in the book. In this paper, what these three factors are integrated in is called contextualized input and exposure to contextualized input in the book is called contextualized reading.

If children who learn a foreign language and do not yet read in the learning language do contextualized reading, can they notice the letters consisting of the words with hearing the sounds while understanding the meanings? The aim of the study investigates whether contextualized input in the book influence on the development of language learning of elementary school children of Japan who do not yet learn to read in the learning language and how they perceive the experience of contextualized reading.

2. Introduction of literacy; Native young speakers and reading

Reading picture books to the child seems to provide them with a stimulus for the start of reading. The child who is read picture books to comes to recognize the shapes, the names, and sounds of the letters gradually. Once s/he is interested in letters, s/he may ask her/his parents to ask how the word s/he is seeing in the book is pronounced, or which the word on the page her/his parent or caretaker is reading aloud now is. In this way, the child learns to read, sometimes to remember how to pronounce the words, or sometimes to analyze the relationship between the sounds and the letters names while her/his parent or caretaker is reading picture books to her/him with no intention of teaching her/him, the listener, how to read the words in the book. Then, s/he gradually begins to read aloud by themselves. In other
words, exposure to letters which have meanings contextualized in the book with the sounds which are read aloud by the reader and the pictures which shows what the text refers to plays an important role to stimulate children’s literacy.

Some researchers have investigated that knowledge of letters of the alphabet is important for the starting of reading. Adams (1990) proposed that having familiarity with the letters of the alphabet, especially knowing letter names, is advantageous to learning to read, as follows:

1. A child who can recognize most letters with thorough confidence will have an easier time learning about letter sounds and word spellings than a child who has to work at remembering what is what.

2. Children who automatically see the letters as wholes will see the words as patterns of letters. Children who do not, will have to work on the patterns of the individual letters as well.

3. There is evidence that a comfortable knowledge of the names of letters hastens children’s learning of their sounds because it mediates their ability to remember the sounds. (1990, p.63)

By having familiarity with the letters, children come to know each letter shape accurately and quickly, and to learn letter sounds and word spellings smoothly. Furthermore, they can automatically recognize a spelling not as a line of individual letters but as a pattern as a whole, and can find that the names of some letters are clues to their sounds, so they can read some words easily (Treiman, Weatherstonn, & Berch, 1994; Treiman, Tinoff, Ruth, & Eichmond-Welty, 1997).
As English native children are surrounded with oral and literal input of their mother tongue, English, they usually come to familiarize themselves with the letter names and shapes of the alphabet, hearing their sounds. Therefore, they can smoothly begin to read words and sentences in picture books by themselves. In other words, exposure to oral and literal input gives familiarity with and knowledge of letters, which can supply children with clues to reading.

3. Introduction of literacy; fifth- and sixth-grade learners of Japanese elementary school and the alphabet letters

As stated above, having familiarity with and knowledge of the letters seems to facilitate children to read smoothly. Do fifth- and sixth-grade students of Japanese elementary school learn about the alphabet letters?

In Japan, letter names and shapes of the alphabet are usually introduced to third- or fourth-grade students as Roman representation of Japanese. This is the first time for most students in Japan to learn them in formal instruction. They learn the letter names, letter shapes, how to write each letter, and how to represent Japanese words by using the alphabet letters with instruction of the phonological system of Japanese, in six-hour classes of romaji of the school subject of Japanese. However, this instruction specializes in Japanese, not for English.

In some elementary schools of Japan, the alphabet letters are incorporated in foreign language activity, while in other schools it mainly focuses on oral communication, not on literacy education. In the latter schools, the fifth- and the sixth-grade students have no experience of learning of the alphabet letters as representation of English in classes of foreign
language activity. Therefore, all fifth- and sixth-grade students in Japanese elementary schools know the letter names and shapes of the alphabet, but not all know them as representations of English.

As Introduction stated, there have been arguments for and against incorporating the instruction of the letters in elementary school foreign language learning of Japan. Some researchers have opposed it. Considering that there are just thirty-five foreign language classes in a year, this objection is a matter of course, because incorporating the alphabet letters in foreign language activity may possibly burden the student of elementary school with load.

On the other hand, Arakawa et al. (1998-1999) reported that some fifth and sixth graders had anxiety in learning English orally, that some stated that they could easily remember what they would say when the alphabet letters were shown to them in class, and that some felt comfortable when the letters were used in class, while the ways of showing the letters to the students were reported to be various. Arakawa et al. (1998-1999) mentioned significance of showing the letters in oral foreign language learning, as follows:

1. Showing the letters in oral foreign language learning satisfies fifth and sixth graders’ intellectual craving.

2. Showing the letters in oral foreign language learning hastens fifth and sixth graders to grasp the sounds consciously and analytically.

3. Showing the letters in oral foreign language learning helps the content to be memorable and accumulated in the children.

Showing the alphabet letters in oral foreign language class seems to facilitate cognitively and affectively development of children’s foreign language ability. However, Arakawa et al.
(1998-1999) warned that to add the letters to orally foreign language activity is not effective and may confuse fifth- and sixth-grade students of elementary school, unless there is enough oral input. Therefore, teachers should be extremely careful about introducing the letters to foreign language activity in elementary school of Japan. In this way, the introduction of letters seems to be effective in foreign language learning of fifth and sixth graders in elementary school of Japan, when children are not forced to read letters, words, and sentences, but shown them with the aid of the sounds and the visual materials from which children can easily guess the meaning of the words.

4. Reading and gaining vocabulary

As stated above, the researchers investigated some clues or introduction to reading either in the first language acquisition or in foreign language learning. People who can read have a lot of advantages. Generally, both in acquisition of mother tongue and in learning of a foreign language, what children/learners should first do is to understand oral input and then they learn to read, although in the past, the students in junior high school of Japan started oral learning and literal learning simultaneously. In each case, language learners must recognize the relationship between the letter and the sound to catch the meaning of a mass of letters they are seeing. Kavanagh and Mattingly (1972) stated that “The process of learning to read is the process of transfer from the auditory signs for language signals which the child has already learned, to the new visual signs for the same signals”(p. 134). “The process” stated by Kavanagh and Mattingly means to a process of recognizing the relationship between the letter and the sound, and this process is letter learning. It is the basis of reading, and therefore,
important. Even if the reader is able to know the sound (pronunciation) of a word, and if s/he does not know its meaning, what s/he does is not really reading. Reading means to get the meanings from the literal representations. Therefore, to increase vocabulary whose meanings the reader know is also important.

Krashen (1989) suggested that “A large vocabulary is, of course, essential for mastery of a language. Second language acquirers know this: they carry dictionaries with them, not grammar books, and regularly report that lack of vocabulary is a major problem” (p. 440). A small amount of vocabulary does not enable the foreign language learner to understand the meaning of utterances in communication, while increasing the amount of vocabulary makes input more comprehensible.

There have been various strategies to gain vocabulary. Memorizing meanings of words independently without context has been one of popular learning strategies for foreign language learners in Japan. However, some researchers doubted its effectiveness (Krashen & Terrell, 1983; Nagy, 1997). Nagy (1997) stated that “Definition-based learning typically involves memorizing (or attempting to memorize) brief definitions representing only a single meaning of the word to be learned, and hence leads to only a shallow level of word knowledge” (p. 73), and that “[t]he abstract definitions that must be postulated to account for the range of contextual specific meanings” are far from “the learner’s actual knowledge of words” (p. 72). Nagy (1997) proposed that a word must be gained when it “is encountered repeatedly in context” (p. 74), because “No single encounter with a word, whether instruction or in the course of reading or listening, can lead to any great depth of word knowledge” (p. 74). The word which is encountered repeatedly in various contexts could be deeply understood and then stored in the
learners’ long-term memory (Krashen & Terrell, 1983; Arakawa et al., 1998-1999). In other words, the more frequently they meet a word in different contexts, the deeper learners’ understanding of it is and they can build up a concept of the word as a mental lexicon. Through this process, they can gain and use vocabulary appropriately. Therefore, gaining vocabulary requires learners to have chances of meeting a word in context repeatedly. One of the chances is reading. Nagy (1997) reported that both L1 and L2 readers can gain vocabulary from context when they read a lot of books. Especially, he indicated that “The benefits of the book flood notion may stem from the fact that second-language readers encounter unfamiliar words at a greater rate, and hence have more opportunities to learn from context” (p.76).

Therefore, reading is one of the best ways the learner can meet words in context. However, the novice or the less proficient learners cannot read through a book deeply and quickly enough to gain vocabulary. Grabe (1991) pointed out that “Less proficient readers often appear to be word-bound, and this phenomenon is often taken as evidence that students are “stuck” on words. … students were not sampling rapidly enough and were afraid to make guesses, to take chances” (p.391). Novice learners tend to adhere their eyes to every word and cannot read on the book with guessing a context, because they do not rapidly elicit the appropriate meanings of words from the present context. In order to solve the problem, extensive reading is helpful. In extensive reading, the reader can start reading books whose level is easier than the levels of her/his proficiency. At the beginning to read easier book, the process of reading becomes rapid and easily automatic. The texts which consist of words known to learners are easy for them to guess, and thus they do not have to stick to every word. In progressing reading step by step, they can get to guess from the context the meanings of
words which they do not know. Successively reading promotes automatic processing of reading and allows learners to guess the meanings of unknown words from the context. In other words, the context helps learners to understand the meanings of the words unknown to them. When learners continue to read books extensively, learners can meet a word in context over and over, guess its meaning from context, and gradually understand the concept of the word. In this way, learners can increase vocabulary through extensive reading. According to Miller (1941) quoted in Krashen (1989), individuality and autonomy in extensive reading also help learners to gain vocabulary.

In addition to reading extensively, reading freely, which means to read what the reader likes to read in her/his own way, seems to be more effective. From the experiments in Krashen (1989), he stated that there were some facts “that those who report more free reading outside of school have better vocabularies” and some facts “that those who participated in in-school free reading programs show significant vocabulary gains” (p.444). As books contain a huge number of words with context, reading extensively and/or freely can provide learners with chances to meet various words in context to gain them.

Finally, when learners do not yet learn to read or can not read on a book smoothly, reading with the aid of sound and visual materials seems to have effect of gaining vocabulary. Wells (1986) reported that children who heard more stories during their preschool years were judged by their teachers to have better vocabularies. Li (1994) indicated from some researches that “Captioned television has been used to enhance language skill development of L2 students. It gives students a chance not only to hear, but also to read what is being spoken” (p. 33). In addition, Li stated that learners of all of the beginning, the intermediate, and the advanced
levels comprehended better when they used captions. Adding reading to hearing facilitates all-level learners’ comprehension. In other words, sound, texts (letters), and visual materials (pictures) in context and seem to be helpful for understanding the input constituted by vocabulary. So this is congruent with what is elicited by reading picture books to children.

In sum, language learning exclusively includes gaining vocabulary. Reading needs mastery of a certain amount of vocabulary while reading is one of the best chances to gain vocabulary. In other words, reading and gaining vocabulary are deeply related with each other in language learning.

5. Research questions

Native children come to read through having familiarity with letters with seeing and hearing picture books which are read aloud by the parents or the caretaker. The literal input whose meaning is contextualize in the book, the sound as in which it is pronounced, and the pictures which show what it refers to play an important role in the start of reading smoothly. Therefore, when novice language learners are exposed to these three factors, they can begin experience of reading, which is called contextualized reading as stated in Introduction. If contextualized reading is one of reading, does it allow novice language learners to gain vocabulary?

Furthermore, showing letters of alphabet in classes of foreign language activity is cognitively and affectively suitable to fifth- and sixth-grade students because some of them, who might are familiar with oral and literal learning of school subjects in Japan, feel anxious about oral instruction in classes of foreign language activity. Research questions come from the
ideas that vocabulary is gained in reading and that some of fifth-grade students feel easier when they are shown letters with aid of oral instruction of foreign language activity, as follows:

1. Can fifth graders of elementary school in Japan gain words from contextualized reading?

2. What kinds of words do fifth graders of elementary school in Japan gain?

3. How do fifth graders of elementary school in Japan feel about contextualized reading?

6. The study

6.1 The participants

The participants were seventy-nine fifth-grade students of Totsuka Dai-ichi elementary school in Shinjuku-ku in Tokyo. They had fifteen-hour English class per a year in the first and second grade, twenty-five in the third and fourth, and thirty-five in the fifth. Totally they had given 115-hour instruction, which is content-based or theme-based. However, they did not yet learn reading formally.

6.2 The materials

In this study, we used The LeapFrog Tag Reading System. The LeapFrog Tag Reading System is an electronic book reader for children, including paper pages and a wireless, battery-operated pen and using proprietary technology that embeds, in a tiny dot pattern on the books' printed pages, about 150 sounds in each book. Each picture plays music and sound effects that vary each time children click. Children pass the pen over the words to hear the story in English, or they can click on a picture for a sound effect. Children are able to control
the reading of the book by placing the book pal on the word or sentence and other images. After children have played, teachers or parents can connect the book pal to the online LeapFrog Learning Path to see the children progress and get printable activities to expand the learning.

We used eight English picture books: *1-2-3 Dora!, The Opposites, ABC Animal Orchestra, Pooh Loves To..., Curious George Color Fun, National Geographic Kids(tm): Activity Cards - Land Animals, National Geographic Kids(tm): Activity Cards - Birds and Sea Animals*, and *Super Speller*. Some of them are translated into Japanese, but whether the participants had read them in Japanese was not investigated.

6.3 The procedure

Before the experiment, the students read the books for ten days in February and March, 2010, when English class was not held. In this reading session, each student chose a different book which s/he wanted to read, with a pen in ten or fifteen minutes every day, while the time of reading was not fixed in a day, but rather different, dependent on the school schedule of each day. Every student had a pen in which all the verbal materials and the sound in all eight books which would be used for this study had been copied from the server of the company which developed the system of the books.

6.4 The method

The experiment was carried out in the students’ classrooms three days after the reading session finished, in March, 2010. In the experiment, the students answered the questionnaire of what words they got to know from the books in the reading session and how
they perceived contextualized reading. The form of the questionnaire is open-ended, and the students described their answers on the sheet. It was not instructed whether their answers could be described in katakana (sounds of English) or in translation to Japanese. The experiment was managed by the students’ homeroom teachers.

6.5 The result

6.5.1. Possibility that the students could gain vocabulary

The participants in the reading session were seventy nine students, while the number of those who responded to the questionnaire was sixty five. Fourteen students were absent when the experiment was carried out.

Sixty students, 92%, mentioned the words that they gained. Thirty-nine students, 60%, mentioned more than five words, and three, 5%, more than ten. The maximum is fourteen words. Five students, 8%, mentioned that they remembered no words or that they did not gain any words.

Some students described all their answers in translation to Japanese, some all in katakana (sounds of English), and others describes their answers in mixture of katakana and translation.

6.5.3 Words gained by reading and hearing books

The words which were referred to the most frequently are included in a category of colors. Most words are both/either in katakana and/or in translation. A girl wrote that she could memorize all the colors and all of the colored things included in *Curious George Color Fun.*
The words which were referred to the second most frequently are names of animals. Especially, twelve boys mentioned a word, ‘king cobra’. It might be that they were at the age when a person is interested in such a mysterious animal as king cobra.

Most students mentioned nouns as words they gained, while some mentioned verbs, adjectives, adverbs, and interrogatives like ‘touch’, ‘run’, ‘dry’, ‘wet’, ‘slow’, ‘where’, and ‘what’. The words ‘run’, ‘dry’, ‘wet’, ‘slow’, ‘where’, and ‘what’ are concerned in the content of the books, while the word, ‘touch’, was frequently heard when the pen explained how to operate in the book. The girl who wrote the word ‘touch’ might listen carefully from the beginning of the book explaining how to operate. Furthermore, a remarkable description here is “ぬれていること”, which expresses the state of being wet in Japanese. The student tried explaining the word ‘wet’, not fitting a word of Japanese to the English word.

Some students mentioned not just individual words but categories of things, like colors, rainbow colors, fruit, numbers, animals, musical instruments, the alphabet, shapes, self-introduction, and greetings. As they are ten or eleven years old and thus they can naturally classify Japanese words into categories, they may transfer their knowledge of categorization in Japanese to in English. Furthermore, as the last two items, which are self-introduction and greetings, are composed of conventional phrases, which the students have always heard in classes of foreign language activity for five years, they could easily grasp the meanings or hear them as a whole when they met them in the books, so that those phases might remain in the students’ memory and mentioned them.

Other items which were mentioned by the students are the words which are written or said in the books, as follows:
6.5.4 Description of the students' perception of contextualized reading

More than half of the students described that extensive reading with sound was of fun or pleasant, and some of them stated that they wanted to read more. A boy mentioned that he enjoyed reading in English as well as in Japanese. Another boy stated that the book of animals was interesting.

Six students mentioned that they could remember some English words and twelve students stated that they could understand what the books wrote or said. A boy wrote that he enjoyed learning and remembering more English words by using the books than in usual English class. A girl stated that she easily understood various words with sound, which facilitated her English learning in the private school of English.

Some students mentioned pronunciation in the books. A boy stated that as pronunciation which the books said was strange, he could understand little. A girl described that although what was said in the books was hard to hear because the native speaker's pronunciation in the books was different from pronunciation of English by Japanese, she could understand by inferring with some words which she had known.

Some students mentioned good points of free or extensive reading. A boy stated that he enjoyed various kinds of books. This may mean that free or extensive reading allows the reader to choose what s/he wants to read voluntarily, not forces her/him to read books in the fixed order. A girl stated that she could hear a word repeatedly until she was able to
understand or remember it. This means that free or extensive reading allows the reader to read on in her/his own style and her/his own pace, not forces her/him to read a book within a limited time. Another girl, who is a returnee, stated that she understood Spanish words in *1-2-3 Dora!*, which said both English and Spanish. This means that free or extensive reading allows the readers of different levels to enjoy reading in different ways.

On the other hand, there are some negative descriptions. A girl stated that she enjoyed reading early in the experiment while she gradually got to lose interest in reading the books. Another girl wrote about a decrease of her interest in reading the books although she first had interest in the books and the pen which could speak. Because the books prepared for the ten-day reading session was just eight kinds, some of the students might be interested in the contents of the books from the beginning of the reading session or some might lose interest in the limited contents. Furthermore, some students stated that they could not understand so much what the books said. Especially, a girl indicated that the pace at which sentences were read was so fast that she had difficulty in hearing and in understanding them. This might mean that it is hard for novice foreign language learners to understand a series of utterances at a natural speed of native speakers. Only one boy stated that he wanted to hear Japanese with English. It might be expected that he could understand what the books said, although he wanted to see whether what he could think to understand was right or not. This is one of the important matters, because some students tend to tolerate ambiguity while others do not. Therefore, the latter may not be fond of guessing the meaning of the word from context, but s/he may be fond of be taught it in formal instruction. Teachers should not overlook each student's tendency (Brown, 2007).
7. Discussion

The study investigated whether contextualized reading, which can supply the reader with contextualized input which consists of written words whose meanings are contextualized in the book, with the sounds as in which they are pronounced and the pictures which show what they refer to, could help the fifth-grade students to gain vocabulary, and how they perceived contextualized reading.

The result, first, shows that 92% students mentioned some words which they got to know in reading of the experiment. Although some of the words which were described in their responses had been already instructed in foreign language activity before the reading session of the present study, the students which mentioned these words might be aware of and pay attention to them just when the students met them in the books in the reading session. In other words, input is not intake until the learner notices it and wants to know its meaning voluntarily. Some students described the words which are not in the books. It is why they might guess the meanings of the words only from the pictures, not from both sound and context, or that the pictures might not appropriately match with the meanings. This is an issue to be considered for future studies. However, from the present study, contextualized reading largely allowed the students to pay attention to the words and to understand their meanings, although it is uncertain whether the gained vocabulary will remain in their memory. Secondly, most students also saw contextualized reading positively. More than the half of the students liked contextualized reading and some of them wanted to continue it. As the written words and the written sentences were contextualized in the books with the sounds as in which they are pronounced and the pictures which show what they refer to, the children could easily
understand the meaning of words and sentences. Furthermore, as some students indicated, in the reading session the students read the books for pleasure or to know the content if they wanted to, in their own ways. They were not asked about the content of the books. This means that they read voluntarily and did not have to read all of the books but could read just parts in the book which they wanted to read. Furthermore, they could read the same books, the same page, the same sentence, or the same words as many times as they wanted to read. This free-style reading might enhance their motivation for their autonomous reading. Some could voluntarily remember some English words, some could remember some Spanish words included in the book, 1-2-3 Dora!, and some could remember all lines on the pages in a certain book.

Finally, the students rarely mentioned that they could read words or sentences without the sounds, and that they could be aware of the relationship between the letters and their sound. Therefore, it is not certain that the alphabet letters with the sounds could give the students direct impetus or clues to letter learning and reading. The quantity of the input in the books might be not enough for the students to notice the relationship between a letter and its sound, or the quality of the input might be inadequate. This issue, henceforth, should be investigated.

8. Conclusion

This study researched whether contextualized reading in foreign language could allow children to gain vocabulary and how they perceived contextualized reading. As a result, most of the participating students could gain vocabulary in contextualized reading and positively saw
it. It is probable that contextualized reading, in EFL environment like Japan, will be one of the ways which provide children with valuable input which will probably become intake.

Gaining vocabulary is necessary for “cultivating children’s communication ability” proposed by MEXT. However, thirty-five foreign language classes in a year are not enough to expose children to contextualized input of the learning language and to allow them to gain vocabulary. Additional ways should be considered to build vocabulary in children in order to cultivate children's communication ability. This study suggests that contextualized reading may be one of them.

INTRODUCTION

The Exercise Science program in the Kinesiology, Recreation, and Sport Department at Western Kentucky University recently underwent a paradigm shift regarding course loads and teaching equivalencies. Previous to 2009, class sizes were capped at 30 students and courses within the major were taught frequently (usually each semester, and during winter or summer sessions at times). As the university wishes to shift from a regional comprehensive institution to one with a national/international presence, the role of scholarly research has been emphasized. Therefore, to align itself with the direction of the university, and to carve out more time in the laboratory pursuing scholarly research, the Exercise Science faculty opted to teach courses with double the student number (60) but less frequently (only once per year, in a set Fall/Spring rotation).

Applied Exercise Physiology is by nature a laboratory-intensive course. Students complete six specific labs at the beginning of the semester including: anaerobic exercise, submaximal aerobic activity, maximal oxygen consumption, lung volume and ventilation, range of motion, and body composition. Throughout the semester, laboratories are incorporated to teach components of an effective scientific write-up (i.e. Introduction, Methods, Results, and Discussion sections). At the end of the semester, students complete a mini-study using the laboratory techniques gained through the course, and culminate with a simulated research conference in which their work is presented to their peers in both poster and oral format.

To overcome the logistical complications of having approximately sixty students in the laboratory all trying to complete experiences, this past year we utilized on-line video lectures to relay information such as laboratory protocols, computations, and to demonstrate procedures. Because instruction was delivered through a web-based format, it allowed us to effectively split the class, where half of the students attended lab on the first day and the remaining students completed the laboratory experience on the second day. The purpose of this abstract is to assess the method of delivery and instruction described above compared to a smaller class (N=31) taught the
METHODS

Data was collected from two Applied Exercise Physiology courses (EXS 325) taught at Western Kentucky University. The first class (N=31 students) was offered during 2009 and the traditional method of instruction was provided, with students responsible for attending class each day. The second class (N=58 students) was offered during 2010 utilizing on-line Tegrity lectures for delivering instruction and split laboratory experiences (i.e. 29 students attended lab on Tuesday, and the remaining 29 students completed the same laboratory experience on Thursday). Students were expected to have watched the on-line video lectures and completed assigned homework prior to their scheduled laboratory day (i.e. on the day in which they were not in class). Each individual was assigned into a laboratory group (with 5-6 students per group), and six groups attended on their assigned lab day. To further alleviate logistical concerns, two graduate assistants took charge of three laboratory groups each and assisted students through a rotation of laboratory experiences. For example, a student completing the anaerobic capacity laboratory would collect data for the 40-yard dash, then rotate to the vertical jump, and finish the rotation with the Wingate cycle test (while being instructed to utilize downtime between stations to complete power output calculations).

For comparison, similar assessment elements from each class were evaluated. Specifically, four laboratory write-ups (representing an Introduction, Methods, Results, and Discussion), two examinations, and the final group project were included in our data analysis. As points for graded assignments and exams differed between classes, we chose to convert raw scores for each student into a standardized z-score. The z-score formula is the raw student score – mean for the class / standard deviation. The combination of the four individual write-up z-scores was summed so that a single value represented the variable (i.e. a write-up standard score), the combination of two individual examination z-scores was added to denote the score for exams, and these were both added to the z-score representing the final project to give an overall class standardized score (write-up + exam + final project = overall).

Differences between classes in the four areas (write-up, exams, final project, and overall) were determined using independent samples t-tests assuming equal variance. Significance was accepted at the P≤0.05 alpha level.

RESULTS

No differences were observed in any of the areas assessed. Classes were statistically similar in terms of write-up assignments (F=0.277, P=0.600), examinations (F=0.133, P=0.716), final group projects (F=0.000, P=0.990), and an overall combination of these areas (F=0.252, P=0.617). Variance in standard scores for each area are displayed in figure 1.
DISCUSSION

The purpose of this investigation was to evaluate the impact of utilizing on-line lectures to replace in class instruction, and splitting class laboratory sessions in a large lab-based course. Our findings show that students performed similarly in terms of laboratory write-ups, examinations, as well as completing group culminating projects. No differences were observed, despite these students not attending roughly half of the classes compared to the traditional instructional method. While more investigation is necessary, subjective comments from selected students indicated that use of on-line modules allowed them to proceed through the material at their own pace, as well as the option to view the instruction multiple times if desired. The on-line materials were particularly useful to students reviewing for examinations, and as a resource leading up to the final group project. Based on the preliminary data provided in this study, we propose that web-based only instruction and splitting laboratory time between groups can be an equally effective mode for disseminating course information in a large laboratory-based class compared to traditional classes with smaller numbers that meet each period.

Predicting National Dental Hygiene Board Examination Success Based on Specific Admission Factors

Lynn D. Austin, RDH, MPH, Ph.D., is Associate Professor in the Department of Allied Health and Director of the Dental Hygiene Program at Western Kentucky University.

Abstract

**Purpose:** The purpose of this study was to determine if there are specific admissions criteria that are significantly correlated with a student’s National Board Dental Hygiene Examination (NBDHE) total score and case-based score. Specifically, the study examined the relation between an individual’s reading acuity and their scores on the NBDHE. Because of the competitive nature of most dental hygiene admissions, selecting those applicants who are more likely to be successful in the academic program and pass the NBDHE is critical.

**Methods:** Total NBDHE scores and case-based scores of 214 students attending Western Kentucky University’s Program of Dental Hygiene between 2002 and 2010 were examined to determine if significant correlations existed. Specific factors examined were each student’s total NBDHE score as well as the score on the case-based section of the examination, age, Microbiology lecture grade, Microbiology lab grade, Anatomy and Physiology grade, college GPA, English grade, Psychology grade, composite ACT® score, and subcomponent scores of the ACT® (Math, Reading, English, and Science).

**Results:** Results revealed that the strongest predictors of total NBDHE scores were the score on the Reading portion of the ACT® ($r = .715, r^2 = .511, p = 0.01$) and the grades in Microbiology lecture ($r = .644, r^2 = .414, p = 0.01$). Results revealed that the strongest predictors of scores on the case-based portion of the NBDHE were a student’s score on the Reading portion of the
ACT® ($r = .673$, $r^2 = .452$, $p = 0.01$) and the Microbiology lecture grade ($r = .637$, $r^2 = .405$, $p = 0.01$).

**Conclusion:** Traditionally, schools have looked at specific science-based pre-requisite courses as a means of determining admission to schools of dental hygiene. Findings from this study suggest that a broader approach may need to be taken, specifically as it concerns a student’s reading aptitude.
Having acknowledged the interactive nature of conversation as a process that requires constant role switching between the listener and speaker and frequent conversational repair, leaders in the field of aural rehabilitation are developing therapies for hearing impaired clients that emphasize conversational management as a tool for effective communication. Conversational management includes the use of an assertive communication style as well as facilitation, conversation, and environmental strategies.

The presenter will share insights and practices from the field of aural rehabilitation as they can be applied to listening and speaking instruction in ESL. Suggestions for practical exercises in the ESL conversation class will be made, and participants will have the opportunity to analyze and engage in ESL classroom exercises.
Use of Audience Response System in Language Courses: Engagement and Comfort

Kimberly J. Hale
Eastern Kentucky University
Department of American Sign Language and Interpreter Education
216 Wallace Bldg
Eastern Kentucky University, 521 Lancaster Ave.
Richmond, KY 40475
Kimberly.hale@eku.edu

Abstract:

Audience Response Systems (ARS), or clickers, are becoming more commonly used in all levels of education with positive results. The literature suggests that students are more engaged when ARS are used and are more comfortable responding to questions. The scholarly literature minimally addresses the use of ARS in language-learning courses. The purpose of this research project is to determine if the use of ARS increases students’ engagement and comfort in a language courses, specifically in courses that use a language immersion approach.

Students enrolled in introductory American Sign Language (ASL) courses at a university in the southeastern United States will participate in this project. Three sections of the ASL course, all taught by the same instructor, will participate. In two sections of the ASL course the instructor will incorporate the ARS technology. In the other section of the course, the instructor will use traditional instructional techniques, without ARS. Course mid-point and end-of-term questionnaires will be distributed to students to ascertain their engagement with the course and comfort in the language immersion environment. Course grades will also be analyzed.

Given the literature of ARS, students will likely be more engaged in the sections of the course that use ARS. Since the ASL language immersion environment does not allow the use of spoken English, the students’ native language, it is expected that the use of the ARS will
correlate with higher levels of comfort in the immersion classroom. Additionally, students in the language immersion classrooms are expected to have higher course grades than those in the non-ARS section of the course. This study is being conducted during the fall 2010 semester. Preliminary results will be shared at the conference.

Localizing MDGs—Fighting Practices Hampering Women’s Development

On the outskirts of the model village, Vieri in the Wa West district, poles are erected in honour of men who have been able to elope with a female. Most of the girls eloped with are pulled from the basic school level. A man from this village could elope with more than one female in a lifetime. The trend is to send the woman home after she has had a number of children, then look for another woman to elope with. Marriages resulting from elopement are not sustainable, mostly, because of their precarious beginning.

Introduction

``The Millennium Development Goals (MDGs) are eight goals to be achieved by 2015 that respond to the world's main development challenges’’ (UN Millennium Development Goals, 2007). The Goals are meant to be intervention to reduce inequalities and sweeping challenges facing majority of the world’s population by the target date. The time limit and desire for results have set the nations making huge efforts to achieve the set goals. The aim is to halve poverty by 2015. Countries have already begun working towards achievements of the goals. For that to happen, however, certain social structures must not only be introduced in these countries, they must be sustained (Michalos, 2009). According to the United Nations Secretary-General, Ban Ki-Moon, “success will require sustained action across the entire decade between [the period of commencement] and the deadline” (UN Millennium Development Goals, 2007). Indeed, such action must become part of the living conditions of people in very poor countries.

Negotiating their own spaces, culturally, socially and economically, has never been an easy task for the feminine gender,
across cultures and civilizations. As the “other”, the female is not considered an agent for change who can “prove and improve [herself]” (Anderson, 1996, p. 215). For many communities across the globe, one herculean task is to shake off paternalistic attitude towards women and grant females the needed space to maximize their potentials and in so doing, break the vicious cycle of poverty. So whilst certain cultures have made admirable strides not only in recognizing feminine strength, but also in allowing females to aspire to their highest potential, “[t]he landscape for women’s right has changed dramatically over the past century” (Women Make History, 2009, p. 2), other cultures seem determined to trample on female initiative and rights. The danger in the on-going struggle for negotiating female spaces lies in the possibility of allowing the increased levels of recognition for women in several areas of human endeavour, to gloss the significantly large numbers who are still heavily and painfully silenced by various unproductive customs and theories (hooks, 1991; Toward a Common Framework, 2007). Indeed, the 2008 Millennium Development Goal (MDG) Report rightly points out the increases gained in female voices heard in public decision making processes but admits that “progress is erratic and marked by regional differences”.

That the world generally recognizes that the silenced majority on the globe are probably females may explain focusing a number of the MDGs on women. Undoubtedly, the silenced majority needs to be heard, even more so for the silenced in low-income countries (Parenting Support, 2009). Hearing may be done in two ways: First, increase the educational campaign for the exposure of practices that hamper the development of women; second, institute radical yet sustainable cultural and socio-economic measures that would compel a change of attitude in low-income communities. The three major
The district was selected for the research for a number of reasons: It is very remote and violence against women may go unreported or get reported too late (UN Study, 2009; Why Focus, 2009). Most of the villages are not covered by telephone services; at the time of this research in September 2008, in Wechau, the District capital of Wa West, mobile telephone services were available only at a particular spot under a particular tree. Such communication challenges in the district contribute to atrocities against women going unreported (Mobile Phones, 2008). Also the poverty rate in the district is extremely high and there is a very high female drop-out rate at the primary level. A Girl may be forced into marriage to generate a dowry for her brother. Where there is opposition to early or forced marriage, girls may elope or be abducted to neighbouring Burkina Faso. Fathers simply do not value girl-child education, to mention these. Due to the enormity of the challenges facing girls/women in the district, and the remoteness of the location, research is the best medium to bring it to the notice of other communities.

Acknowledging that Africa is sometimes underrepresented in global issues, this paper aims at adding to existing--local and international--knowledge of atrocities committed against females in some remote parts of the continent. The information is also meant to echo the warning that poor living conditions of such communities would prevent their respective countries from achieving the MDGs meant to improve quality of life for citizens, though improvement means different things to different communities.
Localizing MDGs, in the context of this paper, implies targeting traditional rural practices which hamper women’s progress in remote areas in order to explore holistic measures through which to effectively counter those.

**Elopement: A Liberatory Concept Gone Bizarre**

Traditional Brifor elopement, like the Western concept, creates a leeway for a couple to get married without the consent of their families. Being an agricultural community, once a girl is betrothed to a man—young or old—the man is obliged to work on the farm of his future father-in-law until the marriage takes place. However, the father in question might be unwilling to part with the free labour he receives from the young man and may keep postponing the wedding\(^1\) of his daughter. As long as the *wedding* has not taken place, the future-son-in-law would continue to labour for the future father-in-law. When the exploitation becomes too much, the girl’s mother may connive with the young man’s family to free the young man. So the young woman secretly sends her belongings—in bits—to the man’s house. When everything is sent, the couple elopes. The man would send a word to the father of the girl that the daughter is with the betrothed. Marriage is deemed to have taken place; the dowry would be provided later. But elopement may occur under different circumstances.

To defy her family, a girl being forced into marriage would elope with a man of her own choice. In a spurt of anger, a married woman may succumb to the amorous advances of another man and elope with him in order to escape the shackles of a tyrannical

---

\(^1\) The term is used rather loosely here. Among the Brifors, a woman stays with a man—voluntary or involuntary—for a period before the dowry is paid; such cohabiting is regarded as marriage.
husband. In the same manner, a woman trapped in a marriage due to an expensive dowry may elope with a rich man in order to end her marriage; the new partner would compensate the husband by replacing the dowry—priced by the husband. Should that marriage also not work out, the woman must endure it till another man of means, prepared to handle an exorbitant dowry, comes along. Thus marriage can be a trap for females in those communities. Nevertheless, in all the instances of elopement cited above, the woman has a voice; the element of consent is very much present. The man does not decide for the woman though he may initiate the elopement plan.

But over the years, elopement has degenerated into a practice in which a man can abduct a girl or a woman and hide her for a period before informing her parents or family of the whereabouts of their child/relative. In some cases, nothing may be heard of the couple until the man asks the woman to return to her father’s house, after a number of children. A man would coax a married woman into eloping with him just to prove his prowess as a conqueror. Sometimes, the abduction is engineered by members of the extended family. Since it is a patriarchal community, an aunt may decide that her son must marry her niece—brother’s daughter—in order to preserve marital property. The aunt could plan her niece’s abduction with her son. The father of the girl may or may not be aware of the planned abduction. Also where a girl has been betrothed to a man and it is realized that the girl has no interest in her betrothed but is rather interested in another man or desires to get educated, the families that agreed on the betrothal could arrange the abduction of the girl in order to prevent her from disgracing the family and also to forestall compensating the betrothed for whatever he may have invested in the girl.

---

2 It is strongly believed that sometimes men cast spells on women to make them agree to elope.
A school girl’s abduction could be arranged so that a male relative could use her dowry--cows--to pay his bride price. In other tribes, to beat other competitors, a suitor would abduct the girl he is interested in. There is yet another crude form of abduction in which two or three young men would pounce on a girl and carry her away on a village market day; the girl in question may be running an errand or on her way to the farm. If she is able to resist her abductor, the accomplices would move in and physically restrain her so that copulation could occur. Sadly, even when abduction is executed in broad daylight, no one goes to the rescue of the girl because in such communities abduction, erroneously referred to as elopement, is a norm. After keeping her for some period, the man would notify the father of the whereabouts of his daughter. In all such circumstances, the woman would already have been coerced into having sex with her abductor; once the family is informed, she is considered married (Sub-theme Forced and Early Marriage, 2009). Yet the situation gets even complex.

In these communities, elopement/abduction--generally a male initiative--would usually precede marriage. Additionally, he who elopes with a female is a hero; he displays an exceptional valour if the female happens to be another man’s wife. A white-flagged pole erected on the outskirts of a village indicates the man in question eloped with a virgin or a single woman; a red-flagged one symbolizes the conquest of a married woman. Fathers are proud of daughters whose beauty attracts enough to motivate elopement; females pride themselves on arousing such desires in men. It is a social stigma on the woman and her family if she does not go through a history of elopement at some point in her life. The situation could assume an international dimension. Some of
the communities are border towns; sometimes, abductors from Burkina Fasso would

cross over to Ghana in search of victims and vice versa, effectively covering their tracks.

Subsequently, once a couple elopes, it is difficult--sometimes impossible--to trace

them. Even if they remain in the country, they relocate to another community, sometimes

a hinterland in Southern Ghana. In the hinterland, the trend is for the woman to become a

farmhand like the partner. In very rare cases, parents may seek the help of the police and

social services to have their abducted girl returned to them so she may continue her

schooling and get the opportunity to pursue her ambitions. Recently, zealous social

workers and community groups interested in girl education and rights have also been

making efforts to resist abduction/elopement. However, the girl in question might be

flattered by the male attention and return to her abductor. Note that the female under

discussion believes that her worth as a human being revolves around marriage though it

hardly qualifies for an equal partnership. Even the forward-looking Brifor males

interviewed could not conceive that a female could take an independent decision not to

marry.

Thus whereas abduction is always an imposition as well as a violation of female

rights, elopement—usually initiated by the man--could be consented or imposed. Where

there is consent, the female may consider elopement as a way out of a domestic

predicament though she may actually be placing herself in another. She could be elderly

or a girl pulled out of school--class six. Whatever the status of the woman involved, one

certainty is that abduction/elopement handicap females in the villages.

First, it prevents the community from achieving gender parity in primary and

secondary education; whilst girls are pulled out of school, boys continue schooling.
According to a Brifor male teacher, girls usually outnumber boys at the enrolment stage--basic school. Starting from primary four, however, families begin to pull the girls\textsuperscript{3} out, skewing the history of female education in the district. If about sixty girls are enrolled in primary one, only five or six may make it to primary six. As at September 2008, only one woman from Vieri had been able to complete post-secondary education. At the time of this research, she was a social worker, at the Gender Desk, in her home district. According to two social workers, in more than a decade, only two girls from the village had finished class six; for the first time in the history of the village, four girls qualified for the Junior High School for the 2008/2009 school year. Sadly, some girls desire formal education but lack support since most fathers do not believe in girl education, and mothers usually have no financial strength to fund their girls’ education.

Secondly, a girl pulled out of class six has no skills, barely any knowledge to guide her in life, in decision making or being assertive (Combating Early and Forced Marriage, 2009). She thus becomes completely dependent on her male partner and must obey him, even in health matters. A health worker’s concern is that girls who are forced into elopement/marriage are not physically mature for motherhood; they are also in no position to negotiate safe sex. The men simply dictate to them. In such circumstances, females become easy prey to sexually-transmitted diseases: “... women represent a growing share of people living with HIV” (Goal 6 Combat HIV/AIDS, 2008). Without knowledge or skills to earn a living independent of her partner, the woman or girl-child is tied to the man until he tires of her and orders her to return to her family home--so he can look for another victim, possibly from class six or below. Once a couple separates, the

\textsuperscript{3} Children start school very late. A thirteen year old girl may be in class one, so by primary four, she has developed physically enough to be given away in marriage.
male would not cater for mother and children; they thus end up destitute or perhaps as farmhands and/or livestock keepers.

Marriages resulting from elopement/abduction are usually not sustainable due to their precarious beginning, yet they invariably produce children. Ironically, whereas families readily negotiate betrothal/marriages and communities pride themselves on elopement, they are not so apt in helping the victimized single mothers upon being deserted by their men though in most cases, the woman cannot cater for her children. The woman is thus placed in a painful isolation in her own home; the nexus of security becomes the source of betrayal. Paradoxically, every such act of betrayal for purely lustful and chauvinistic reasons further entrenches the community in its vicious cycle of abject poverty. Consequently, human and community development are seriously hampered by the practices of elopement/abduction.

For the northern communities, life revolves around this practice of elopement/abduction. Because it is traditional, members—women included—do not consider the harm being done. Yet there are real dangers involved; these are life-threatening situations. One partner could be harbouring infectious diseases such as hepatitis, HIV, other sexually-transmitted or life-threatening diseases; the other partner automatically becomes a victim. Thus this practice could be a contributing factor to the spread of HIV in some of the communities.

The woman’s utter dependence on the man is a threat to her life. Should she contract HIV from her husband or partner, the same factors listed above may prevent her
from visiting the hospital so she could be tested early and put on the necessary medication. If pregnancy occurs, such negligence would expose the foetus to the infection (Expanded Treatment, 2010). During pregnancy, ante-natal clinic attendance is conditional upon the man’s approval. A female in such a situation could carry a full term pregnancy without ever attending a clinic, due to economic reasons or geographical ones. When she goes into labour the same factors may place her in the hands of an unskilled birth attendant, one of the major causes of high maternal/child mortality rate. Should the man be in favour of abortion, the female is likely to attempt to get rid of the foetus through herbs or a quack doctor, either of which alternatives could end her life prematurely.

Abduction/elopement has several adverse implications for the health of women, and which if not tackled diligently and strenuously, have the potential to prevent women in Northern Ghana from attaining sound health, thus prevent the country from achieving goal number five. The urgency of the situation stems from the reality that the practices have intertwining effects which would prevent the achievement of other goals as well, especially, aspects of goals one, two, three, four and six. When these unskilled females burn trees for charcoal, they endanger the environment, thus jeopardize the community’s chances of achieving goal seven (Millions, 2007). Thus eradicating or, at least, reducing the practice of [elopement/abduction] would help achieve “[su]bstantial progress on a number of the Millennium Development Goals” including poverty reduction, child and maternal health, education, the environment, “ health and social justice” (Moving Forward, 2010) in Northern Ghana.

The practice of elopement/abduction also has far-reaching adverse effects on children’s education. There is a constant high probability of children from such broken
homes being deprived of basic education. Because the women are forced into motherhood at tender ages, and because they usually work as farmhands, which work is extremely demanding yet poorly paid, they do not get the opportunity to learn any trade or skills (Million, 2007). As such when they are deserted by their male partners, they have no realistic means of supporting themselves and their children. If she lives in town, the mother would very likely solicit the help of her children in petty trading or offer them as domestic hands to other households, sometimes for a pittance, exposing them to extremely dehumanizing living conditions. Where there is limited opportunity for education, the girl-child would help the mother generate income to fund the boy-child’s education. Ironically, girls who are enthusiastic about education may have their education curtailed for the sake of brothers who may not pursue education to any appreciable level, doubling the losses of the community.

Since women are not entitled to land, such deserted women have very limited chances of getting access to sizeable lands that would enable them to farm at a commercial scale. They are thus left with the option of backbreaking subsistence farming supplemented by equally arduous work such as producing charcoal, brewing local drinks or producing sheabutter. They carry such heavy loads to towns or villages on markets days when they can get competitive bargaining; the day’s sales is used to buy fish, soap and other necessities for the home. There is hardly extra income for other necessities of life or for a rainy day.

As if growing in such needy circumstances may not be enough, a girl in such a family might be married off early to enable her brother start his own family, thus replicating the vicious cycle of poverty. Elopement/abduction and early/forced marriages
are practiced in northern Ghana, though more intensely in some remote communities than others. In view of the impediments in the way of women, it is crucial to scrutinize traditional practices among communities where women’s development is often sacrificed for chauvinism and moribund customs.

**Countering Harmful Traditional Practices Through Systematic Education**

The year 2000 population and housing census of Ghana shows that the Upper West has an illiteracy rate of 75.5%. (as cited in Addai-Mensah, 2008). Of this total, male illiteracy rate is 69.4 % whilst that of females is 80.6%. No details were given for the districts but with social practices such as elopement/abduction and poor attitude towards female education, one can appreciate the high female illiteracy rate. This does not compare favourably with the systematic growth of population in the region, especially, if the illiteracy patterns are replicated. The population of Wa West grew from 60,782 in 2003 to 67,052 in 2009⁴; the trend is the same throughout the region. An educated population is an asset to every community but if majority of a population are illiterates, the prospects of development for that community are gloomy. Efforts must therefore be harnessed towards empowering the ever growing population of Wa West with dynamic knowledgeable skills; it is not the time to replicate ignorant patterns.

To empower indigenous peoples, local customs and cherished practices detrimental to education and human development must be refined to suit community interests (Elopement, 2010). Clearly, the challenge does not lie in merely identifying harmful practices, as important as that step is. Rather, it lies in the local people realizing that the practices no longer serve human and community needs and as such must be refined for community advancement (Family Health, Behaviour change, 2002). Evidently “[a]__________

---

⁴ Ghana Statistical Service, Wa.
collective shift is necessary; change can come only when a ‘critical mass’ of families in a community abandon the practice” (Addressing Violence, 2009)

Because traditions form part of a people’s world view, any call for changes thereof must be characterized by utmost diplomacy in order not to unnecessarily antagonize indigenous people. There is “need to be careful about ‘othering’ indigenous or traditional communities, or religious or ethnic minorities, and labelling their practices unacceptable” (Kiro, 2009). Societies must be respectfully and gently prodded to revisit the philosophies behind elopement/abduction and weigh them against current developmental trends in, health, gender, education, the fight against poverty and environmental degradation, to name five. Consequently, concerned groups must collaborate strongly with the local people who must have the commitment and the willingness to modify harmful ways for quality life (Family life, Theory, 2002).

Indigenous people must reach deeply inwards to find the strength to will themselves into fighting long-held traditions and customs which have metamorphosed over the centuries into agents of abuses and have since seized serving the good purposes for which they have existed and been cherished (Increased Health Risks, 2007; Moving Forward, 2010; Family Health, Behaviour, 2002). One way would be questioning the patriarchal hegemony of the District whenever necessary. Male offences against females are either trivialized or simply ignored or at best, handled at the local palace. Members constituting judiciary committees at the palaces are all men who, out of traditional sentiments and male solidarity, would not handle genuine female allegations of domestic abuses against men objectively. A woman would invariably be prevailed upon to forgive the husband for extreme atrocities against her; she could even be swayed from decisions
that could save her life. The communities must be helped to appreciate that recognition of female rights and dignity and loyalty to community must precede filial and/or misplaced sense of loyalty to gender.

 Achieving the MDGs is already proving to be an evasive task for a lot of the poor countries for whom the whole idea of poverty eradication was conceived. In some cases, even monitoring community progress has become problematic (Tracking MDGs, 2008). The 2007 United Nations Development Programme (UNDP) report on Africa and the Millennium Development Goals states: “sub-Saharan Africa is not on track to achieve any of the Goals” (Millennium Development Goals Indicators, 2007). Though some gains have since been made, if female issues were seriously tackled, it would expedite sub-Saharan Africa’s chances of attaining the goals.

 People whose lives have been seeped in extreme poverty should want to make efforts to escape such limiting conditions altogether. They should invest in the future by engaging in insightful sustainable acts, socially, culturally, economically. However, the communities under discussion here, by their everyday acts, appear to live just for the present. If they educated girl-children, they would be investing heavily in the future. The womenfolk could increase their contribution to the communities many fold if they were educated. By habitually curtailing girl-child education, the males in the communities not only do a great disservice to their communities and perpetuate their poverty-ridden existence, they lay the foundation for the same gloomy future existence for their progeny.
The practise of recycling dowry favours men but further restricts women in a society which has already taken so much away from women. Girls and women are hemmed in by violent social structures, closing opportunities for female initiative. There is urgent need for intensive sustained education against elopement/abduction and to maximize community sensitization for (girl) education. Yet the challenge goes beyond one district.

**Localizing MDGs: ‘Mainstreaming’ Elopement**

Though the research targeted Wa West District some social workers from the other districts participated. During the radio discussion, listeners lauded the initiative and alerted the panellists that elopement/abduction is practiced extensively in some remote parts of Jirapa and urged the researcher to extend the study to those areas. Other stakeholders also informed the researcher that the practice cuts across Northern Ghana. Consequently, there are urgent reasons for systematic research on the issue across the entire north. Such investigation would enable stakeholders to probe the extent to which the practice is destroying female lives. Since elopement carries extensive developmental implications, targeting it would mean giving it a central focus on the development agenda, for district, region and nation. Mainstreaming the fight for elopement/abduction could provide an avenue through which to unearth some effective means to mobilize resources for development.

Indigenous people may be trained as community resource persons plus pressure groups to assist security agencies in pre-empting elopement or help track culprits in the district. In circumstances of searching for victims, such groups may be of immense assistance to the police. Out of sheer distrust, indigenous people may not release
information vital to saving a girl’s life to strangers even if they are the police. The involvement of community groups may thus help expedite proceedings to free a victim. In a country where mobile telephone services are sometimes highly questionable, even in urban areas, the human approach may prove more reliable in those remote communities, when it comes to dealing with elopement. In effect, such a move would create jobs for the local people.

There is also a need for international co-operation between the police forces of Ghana and Burkina Faso since culprits from either border towns sometimes abscond to the other country to avoid discovery. If the forces on both borders were alerted and properly motivated, they could apprehend culprits and save victims the ordeal of rape, maltreatment and other indignities (Protection from Torture, 1998; Respect for Human Dignity, 2005). There could be spill-over effects; such collaboration might even save victims of female circumcision, some adherents of which also cross the borders in order to execute their destructive plans. Executing such a move would be exploring bilateral relations in fighting gender-based violence.

Another way of localizing the MDGs as well as mainstreaming is for the Upper West Region to integrate HIV and AIDS stigmatization education with the campaign against elopement/abduction, since there is a possible connection between the practice and spread of the disease. Abduction is an offence in Ghana; perpetrators must be seriously sanctioned in order to deter others from emulating such bad examples. There is, therefore, need for concerted efforts to counter the practice; the Domestic Violence and Victims Support Unit (DOVVSU), the Social Welfare, the health sector and the Ministry of Education must work hand-in-hand to combat elopement/abduction. Such a move
would also rope in local people, change agencies--civil societies, female advocacy
groups, world bodies, government agencies, security services—to name a few. Yet the
situation cannot be generalized.

The concepts of challenges”, “sustained action” “and “progress” will differ from
one community to another, depending on gender, geographical, economic and socio-
cultural factors, amongst others (Mangahas, 2009). Progress will depend on designing
programmes that could effectively meet local needs, granting ownership to local people,
and above all, sensitizing indigenous people to the fact that willingness and ability to
change unproductive ways for progressive ones constantly human dignity. For the target
communities, one local challenge is the practice of elopement/abduction; and for women
in the communities to be genuinely empowered, that practice, an obstacle to community
and human development must be eradicated. Elopement effectively blocks female
empowerment and perpetuates poverty among women. It renders northern women
susceptible to HIV and AIDS and other sexually-transmitted infections. Worst of all, it
heaps indignities on females by denying them the right to make some of life’s major
decisions. Holistic efforts are, therefore, urgently needed to address those challenges to
women’s progress. Most importantly, avenues of redress/refuge must be opened for
women, especially in remote communities, so that they are not always hemmed in by
stifling as well as unproductive traditional/social practices.

Any sustainable sensitization programme would depend on mainstreaming the
complex practice for a holistic approach towards curbing the practice. Adherents of the
practice must be gently prodded onto the realization that they must change negative
lifestyles for productive ones (Family Health, Behaviour Change, 2002). Regular
reminders of the possible harmful effects of their actions and empirical evidence might gradually yield a change in attitude. For that to happen researchers and female advocates must target the practice in the same manner in which female genital mutilation was mainstreamed (Toward a Common Framework, 2007; UN Study, 2009). Systematic research of elopement would enhance knowledge of the practice and inform stakeholders of the extent of its harmful effects. A thorough study would enable proper documentation on the practice and as well effective approaches to curbing it. Systematic research would enable proper collaboration among various stakeholders for effective tackling of the issue, hence this clarion call for an international collaboration to combat a tradition that blights female existence in Northern Ghana.

ABSTRACT

Much has appeared in the media lately about young adult college students without ADD (attention-deficit disorder) or ADHD (attention-deficit, hyper-activity disorder) using or abusing the same drugs that have been prescribed for those with ADD or ADHD. Colleges and Universities across the nation are struggling with dealing with this latest trend, trying to understand why perfectly healthy students are opting to take a drug meant for students with this condition. Studies will nonetheless come out focused on the impact of this latest craze, and it will be interesting to see if more attention and focus is placed on these student than on the students actually suffering with ADD.

Attention-deficit-disorder or ADD in young adults is still a relatively new area of study, especially as it relates to college students. Unfortunately, there is a belief that if a young person has ADD during their elementary and high school years, they magically are “cured” in the three or so months between high school and college. But this is definitely not the case.

This study reviewed the literature on ADD, in order to create a backdrop to study who would be considered “legitimate” ADD college students. It further investigated the role that colleges and universities play in providing support for ADD students. The primary purpose of this study was not to focus so much on the drugs or medications that ADD students were taking but instead to explore the utilization of assistive technology in support of college students with ADD. The study examined institutions by size, type, degree granted, and availability of both traditional accommodations and assistive
technology, with a hope of finding possible patterns and trends. Because of the exploratory nature of this study, cross-tabulations even without the use of statistically significant testing did enable differences to appear. The study also looked at institutions where students with learning disabilities, including ADD, had been accepted, to see if there was a difference between these types of institutions and other institutions in servicing students with ADD.

One hundred three administrators and 22 college student respondents hardly represent all administrators directing offices of disability services, or all college students with ADD. Although this study explored areas not often studied, both quantitative and qualitative information from this study reflect compliance on the part of institutions relative to dealing with ADD students, and a positive movement in higher education towards a better understanding of college students with ADD, and their obligation to provide these students with accommodations, including assistive technology. This study only serves to start the process of understanding ADD college students, yet encourages all those involved with students with ADD to do what is needed to provide the type of learning environment that will help these students succeed.
INTRODUCTION

A person with a disability is defined by the Rehabilitation Act of 1973 and by the Americans with Disabilities Act of 1990 as an individual who has a physical or mental impairment that substantially limits one or more major life activities, has a record of such an impairment, or is regarded as having such an impairment. According to NPSAS 2000, the National Postsecondary Student Aid Survey 2000, students reporting learning disabilities represented 9.3 percent of all undergraduates or 1.53 million students (NPSAS, 2000). In another study conducted by HEATH, the Higher Education and Adult Training for People with Handicaps Resource Center of the American Council on Education, nearly one-third of all incoming college freshmen reported having a learning disability (HEATH, 2000). Other HEATH reports reflect that since 1985, the proportion of first-time, full-time freshmen with learning disabilities attending college has at least doubled from 15 percent to 32 percent (HEATH, 2000).

Researchers are not sure how many college students are arriving at college with a particular type of learning disability known as attention-deficit-disorder or ADD; estimates range from 0.5 to 5 percent, or 65,000 to 650,000 students (NPSAS, 2000). What is suspected, mostly through anecdotal accounts from faculty and staff, is that the number of college students with ADD continues to increase (Henderson, 1999). Henderson (1999) suggests that this increase is because more children are being diagnosed with attention-deficit-hyperactivity disorder or ADHD. In addition, these
students have gained increased legislative backing and support through Federal and State legislation enabling them to continue on to postsecondary education.

**ADD--One Particular Type of Learning Disability**

ADD is suspected to be a neurological brain disorder that affects both behavior and learning. The direct causes of ADD are still unknown (Quinn, 2001; Weiss, 1992; Purdie et al, 2002). ADD is not thought to be caused by food allergies, excess sugar, too much TV, poor parenting, poor home life, or poor schools (Quinn, 2001).

The frontal lobe of the brain has been identified as a major area responsible for some of the symptoms of ADD. Researchers at the National Institute of Mental Health found that several regions of the brain (the right prefrontal cortex, the basal ganglia, and certain regions of the cerebellum) are smaller in those with ADD than those without it. These brain regions are rich in dopamine, one of the brain's neurotransmitters that conveys signals from one neuron to another and known to regulate motivation, attention, working memory, drive, interest, impulsiveness and motor control, the ability to retain, associate, and manipulate information in real-time as well as the ability to think ahead and anticipate future needs (Barkely & Grodsinsky, 1994).

Imbalances in dopamine appear to be closely related to ADD symptoms and subsequent behavior. Most practitioners in the field now agree that the characteristic problems of people with ADD stem from a genetically based neurobiological malfunctioning (Quinn, 2001). These genes regulate the transport of the chemical dopamine. There is, however, no single lesion in the brain, no single neurotransmitter
system, no single gene that has been identified that triggers ADD (Hallowell & Ratey, 1994); thus accounting for the uneven distribution and variety of prevailing symptoms that make up ADD.

ADD is often associated with hyperactivity. Onset of ADD with or without hyperactivity is normally before the age of seven. Many children are initially diagnosed as ADHD but it is suspected, although not proven, that symptoms associated with hyperactivity tend to decrease as the child emerges from adolescence into adulthood. Beginning in the 1970's several studies were published which followed children who had originally been diagnosed with hyperactivity a decade earlier, and traced their development into adulthood. These studies established that for some attention-deficit-hyperactive children, ADD symptoms persisted into adolescence and even into adulthood. (Weiss & Heckman, 1993; Mannuzza et al, 1993). Wender, et al (2001) contend that one to two-thirds of children continue to have ADD symptoms as adults.

It has been speculated that most ADHD adults are more often displaying signs of ADD rather than the combination of ADHD. An official definition of ADD-RT (Residual Type, which applies to adults) states that an adult first must have exhibited ADD symptoms as a child and after that an adult must demonstrate attention span deficiency, motor abnormalities and exhibit at least two of the following symptoms: poor impulse control, low stress tolerance, poor organization with poor task completion, extreme mood swings in response to events in the external environment, or short excessive temper (Woods, 1986).
College students who still exhibit this disorder, symptoms may include physical restlessness and inability to sit for long periods of time, difficulty following instructions, listening or concentrating, reading comprehension problems, poor time management skills, distractibility, blurting out answers, poor handwriting, difficulty with math problems, inability to listen selectively during lectures, problems with note taking, difficulty in formatting essays and written work, difficulty in preparing class assignments, keeping appointments, attending class on time and turning in assignments when due, distractibility, impulsivity, mood swings, frustration, mental restlessness, forgetfulness and procrastination (Quinn, 2001; Weiss, 1992).

Current Treatment

Current treatment approaches for both adults and children include both pharmacological and behavioral management (McMullen et al, 1994; Pelham, et al, 1998; Barkley, 1990, Wilens et al, 1996). There are a limited number of controlled pharmocologic studies of this disorder as most of the trials have focused on psychostimulants (Wilens et al, 1996). Because desipramine has been found to be effective in treating ADHD in children, the Wilens study (1996) tested its efficacy in adults with ADHD. The authors conducted a randomized, 6-week, placebo-controlled, parallel-design study of desipramine at a target daily dose of 200 mg in 41 adult patients diagnosed with DSM-III-R ADHD. Findings showed a marked difference in the reduction of ADHD symptoms between adults receiving the desipramine and the placebo. These differences accounted for a reduction of between 12 and 14 symptoms including
decreases in hyperactivity, impulsivity, and inattentiveness. Placebo-treated patients showed no differences. The authors believe that they demonstrated the effectiveness of the drug desipramine with adults with ADHD, and were able to isolate its effects from gender, level of impairment, and lifetime comorbidity with anxiety, dyslexia, or other depressive disorders.

Psychopharmacological treatment and the use of psycho stimulants seem to be the most effective treatment for adults with ADD (Wilens, et. al., 1996; Purdie et al, 2002, Halloway, 2002). Studies have shown that stimulant medication such as Adderall, Dexedrine and Ritalin, work by increasing the levels of dopamine in the brain. Dr. Edward Hallowell, Harvard professor and co-author of *Driven to Distraction: Recognizing and Coping With Attention Deficit Disorder From Childhood Through Adulthood*, claims that the use of Ritalin has gone up by 500 percent in the past 12 years (Hallowell, 2002). According to Dr. Hallowell, medications work for about 80 percent of the people (Hallowell, 2002 ). A newer product marketed by Eli Lilly and Co., called Strattara, is fast becoming a popular choice among children and adults suffering from ADD. Other treatments include the use of biofeedback therapy, self-control or cognitive therapy, and also diet and megavitamin theory (Quinn, 2001). It appears that researchers, both medical and academic, are only beginning to understand the nature of ADD in adults, its biological underpinnings, and effective ways to treat it.
Recognition and Legislation that have helped ADD college students

Attention to students, specifically children, with learning disabilities (LD) emerged as a diagnostic category in the 1950's. LD has been termed as Minimal Brain Disjunction, Hyperactive Syndrome, Hyperkinesias, and Hyperactive Disorder of Childhood. Beginning in 1968 the Diagnostic and Statistical Manual of Mental Disorders known as DSM-II, identified minimal brain damage and other problems such as hyperkinesias as a childhood disorder characterized by overactivity, restlessness, distractibility, and short attention span (American Psychiatric Association, Diagnostic and Statistical Manual of Mental Disorders, 1968). The Individuals with Disabilities Education Act also known as IDEA, Public Law 101-476, which amended the Education for All Handicapped Children Act, Public Law 94-142, coupled with the National Joint Committee on Learning Disabilities, focused on learning disabilities. Together they provided definitions more appropriate for children than adults and emphasized skills important to elementary and secondary education such as reading, writing, and mathematical skills.

In 1980, DSM-III reflected and helped facilitate an interest in hyperactivity and attention deficit *beyond* childhood. The range of behaviors included within the official diagnosis became more comprehensive. Furthermore, in 1985, The Rehabilitation Services Administration's definition of a learning disability provided more application for adults by including in its definition the provision for a deficit in attention, reasoning, processing, memory, communication, social competence and emotional maturity. The
1987 revision, DSM-III-R, officially recognized the term "attention-deficit-hyperactivity-disorder" as a mild to moderate learning disability. This revised diagnostic, while not specifically referring to the disorder in adulthood, opened up the possibility of diagnosing adults who may not have been diagnosed in childhood (Wolraich, 1996; Conrad & Potter, 2000).

By 1994, DSM-IV reflected the growing consensus that adults could be diagnosed with ADD, provided they had exhibited symptoms as children before age seven. According to a study conducted by Wolraich & Baumgaertel (1996), changing criteria from DSM-III-R to DSM-IV resulted in an increase in diagnosis of ADHD among children in elementary school. The subtypes created in DSM-IV enabled a clearer diagnosis to take place thereby isolating behavior anxiety and depression, among other factors, from the diagnosis and enabling treatment of ADHD as a separate disorder that could and should be addressed in a more comprehensive manner earlier in student's school life.

Legislation has also played a major role in aiding individuals with disabilities. Section 504 on Postsecondary Education of the Rehabilitation Action of 1973 had a major impact on Americans with all kinds of disabilities including learning disabilities. Subpart A of this document defines terms, general prohibitions, and the obligations of recipients of federal funding to appoint and maintain at least one person to comply with the requirements and the process of an Office of Civil Rights investigation. In addition issues related to admissions, financial aid, housing and most important, academic
adjustments are specifically spelled out. The purpose of this legislation was to enable students moving through the educational system and into postsecondary to be better serviced with accommodations appropriate to their identified needs.

In 1990, President Bush signed The Americans with Disabilities Act (ADA) which prohibits discrimination against people with all kinds of disabilities in areas of private employment, public accommodations and services, transportation, and telecommunications. Much of what appears in the ADA was borrowed from Section 504 of the Rehabilitation Act of 1973, and the Civil Rights Restoration Act of 1983 which requires recipients of federal funds, which includes colleges and universities, to insure that qualified individuals not be excluded from participation in campus programs solely because of their disability (ADA, 1990).

At the postsecondary level, the American with Disabilities Act (ADA, 1990) and Section 504 of the Rehabilitation Act, obliges college and university disability service providers to provide reasonable accommodations to students with documented disability and to provide equal access to the general curricula, programs, courses and activities. Furthermore, a student's individualized educational program (IEP), as mandated by Congress in IDEA and The Disabilities in Higher Education in the United States Amendment, PL 101-476 (U.S. Congress, 1990) must contain information regarding the relationship between a student's plan of study and his/her goals beyond secondary school, and must clarify both the transition services required by the student and the responsibilities of adult agencies to assist in providing such services.
Technology and ADD students

Other legislation has also paved the way for individuals with learning disabilities, including ADD, to have the same if not more opportunities to enrich their lives and be better prepared for the quality jobs that they seek (Wallace et al, 1995). The Technology-Related Assistance for Individuals with Disabilities Act of 1988 also known as The Tech Act, requires States to develop State-wide, consumer-responsive programs of technology for disabled people of all ages and all disabilities. The intent of this legislation was to increase the awareness of the needs of individuals with disabilities for assistive technologies (AT) devices and to increase awareness of policies, practices, and procedures that impact the availability of such services and devices. The Tech Act offered the first federal definition of what constituted an assistive technology device or service. Assistive technologies are applications either hardware or software that are developed specifically to assist disabled individuals in overcoming barriers.

Assistive technology is widely regarded as holding potential for enhancing access, inclusion, productivity and the quality of life of individuals with all types of disabilities. More than 5 million students in grades K-20 with a broad range of disabilities in the United States benefit from this technology. (Garner & Campbell, 1987; Sawyer & Zantaler-Weiner, 1993; Wisniewski & Sedlack, 1992).

Although assistive devices and services are not explicitly stated in the Education for All Handicapped Children ,P.L. 94-142, the Tech Act established a foundation for the
use of supportive aids and services. Definitions from the Tech Act 1988 were incorporated into the passage of the 1990 IDEA, P.L. 101-476.

In 1994, Congress amended the Tech Act of 1988 to address barriers that persons with disabilities experienced in gaining access to assistive technology devices and services. In passing the Technology Related Assistance Act Amendments of 1994, P.L. 103-218, federal legislation also sought to mandate the creation of an infrastructure to enhance the integration of assistive technology devices or services into the lives of individuals with disabilities.

In 1997, reauthorization of IDEA further emphasized the importance of technology in the lives of students with disabilities, and the need to share cutting edge information about advances across the K-12 environment. The reauthorization mandated education programs to consider and include assistive technology for all children, including those with mild or moderate disabilities. It further stated that assistive technology needs must be distinctly considered by every IEP team for students found eligible for special education services. Technology was to be considered a viable instructional tool addressing cognitive needs of students with disabilities (Council for Exceptional Children, 1998).

Statement of the Problem

It is only recently that longitudinal studies have provided the evidence to link ADD to adulthood (DuPaul, et. al. 2001, Weiss, et. al. 1979, Weiss, et. al. 1993; Hill & Schoener 1996). Studies have been conducted on college students with learning
disabilities. Few, however, have focused specifically on college students with ADD as a learning disability or on accommodations provided to ADD college students (Ofiesh & McAfree, 2000; Heiligenstein, et. al., 1998; Wilens, et. al., 1996).

ADD has long been associated as a childhood disorder. Indeed, there is much literature addressing children with ADHD. The focus of much of this literature has been primarily medical in nature or addressed types of interventions and accommodations provided to students in kindergarten through twelfth grades. For example, Purdie, Hattie and Carroll (2002) conducted a review of the research to see what interventions and accommodations worked best with ADHD children. Their meta-analysis examined 74 studies in which there had been an intervention aimed to improve behavioral, cognitive, and/or social functioning of children with ADHD.

A question is raised as to why so few studies have been conducted on older students with this disorder. One answer may lie in a study conducted by Heiligenstein in 1998. Heiligenstein suggests that the degree of ADD in college students may be more modest; students by the time they come to college may have lost much of the hyperactivity associated with ADHD disorder and are better able to cope with their ADD symptoms.

Purpose of the Study

As the apparent trend for students with learning disabilities including ADD to attend college increases, so has the need to provide accommodations, and specifically assistive technology (AT), for these students (Higgins & Zvi, 1995; Lance, 1996; Raskin,
According to a recent student by Ofiesh, et. al, (2000), most studies addressing the use of assistive technology have focused on all students with learning disabilities, without singling out students with ADD.

The primary purpose of the study was to explore what assistive technology (AT) some colleges and universities have available for ADD college students and the utilization of AT by ADD college students. This study also explored what other accommodations colleges and universities have available to ADD college students and what students may be using.

It might be expected that with all of the legislation supporting students with disabilities, especially the Technology Act, that colleges and universities are, indeed, making assistive technology available. It might also be expected that with the integration of technology into the K-12 classrooms, more college students will be using or demanding the availability of technology to enhance their learning capabilities. Furthermore, it might be expected that when a college bound student has a particular condition or need such as ADD, he or she would seek out an institution that will best accommodate that need. Additionally, it might be expected that some institutions rather than others will support and provide more accommodations.

An additional purpose of this study was to examine whether some institutions, that are known to accept students with ADD, would provide more accommodations than others that are not necessarily known for such acceptance.
Methodology

The research that was conducted for this study utilized a combination of both qualitative and quantitative techniques. Two models were used: a dominant-less-dominant design and a mixed-methodology design. Two surveys were created. One survey was administered to a sample of 410 colleges and universities administrators. Although the same survey was administered, the sample was divided into two distinct groups. The first group of 210 represented what is known as a purposeful or judgmental study. The participants in a purposeful study are specifically hand-picked rather than randomly selected. The purposeful sample of colleges and universities that was selected represented institutions that were known to have students with learning disabilities including ADD, apply to and be accepted by them. The second group of 200 was randomly selected from a list of colleges and universities throughout the United States. Dividing the sample into two groups enabled comparison between those institutions to which ADD students have been accepted, and those that are not necessarily known for catering to or providing accommodations to these special students.

While collecting information from these institutions was primary to this study and critical to its completion, also important was to hear from students who are using devices and services to enhance their learning experiences. The second survey was administered to two groups of college students. The first group came from the colleges and universities that made up the first part of the study. Assistance was achieved from the service providers from the 410 colleges and universities receiving their own
questionnaire who were then asked to distribute a survey to ADD college students at their institutions. Additionally 35 LD/ADD college students who were graduates of a special high school with learning disabled students were provided the student survey.

It is important to note that the information generated from the college students was expected to be more exploratory and qualitative in nature due to number of factors. First, the survey sent to the 35 students identified above was sent out by the high school from which they graduated. The researcher had no knowledge of who these people were nor whether they were still attending college or not. Another factor was an unknown number of surveys that college administrators would be able to hand out depending on the number of students who have self-identified or the number of institutions that did not require approval from an institutional review board in order to distribute the questionnaire to the student. Finally, the researcher does not anticipate a large number of completed college student surveys returned.

Due to these distribution methods and the more qualitative and open-ended nature of the information collected, the results from these student surveys should not be considered representative of all college students with ADD and cannot be generalized. Nonetheless, the student perspective provided valuable information relative to their experiences in college and their familiarity with, availability of, and use of, assistive technology and other accommodations.
Research Questions

The research questions sought to gather information that would fill in gaps that exist in the current literature and bank of knowledge relative to ADD college students and their use of various accommodations including assistive technology. Taking into account information from the literature review, the primary data enabled a richer and more comprehensive understanding of this topic. The following represents the primary research questions that were addressed in this study.

1. How do the colleges and universities fit into Categories #1-4 of disability services?

2. Do colleges and universities provide ADD students with accommodations and what type of accommodations are they providing.?

3. Are the purposeful institutions that are known to have LD and ADD students apply and be accepted to them, providing these students with more accommodations than the randomly selected institutions?

4. Is there a perceived gap between student need and actual provision?

Definitions

Learning Disability (LD)

A learning disability or LD is a developmental disorder affecting a realm of cognition, which occurs in the presence of adequate intelligence and preserved skills in other cognitive realms. The specific weakness in cognition can affect spoken language, written language, mathematics, visual-spatial skills, executive functions and problem-
solving abilities, attention, or learning and memory. A learning disability significantly limits one or more aspects of a person’s life including schoolwork, professional work, home and social interactions. Many studies focus on learning disabilities without singling out specific learning disabilities. The reader should be aware of some overlap between the use of this term and the two terms that follow as the ability to separate LD, ADHD and ADD at times is difficult to do.

**AD/HD**

AD/HD stands for attention deficit hyperactivity disorder. “AD/HD is a commonly seen neuropsychiatric syndrome that is characterized by two distinct sets of symptoms: inattention and hyperactivity-impulsivity. Although these symptoms usually occur together, one may be present without the other.”

**ADD**

ADD stands for attention deficit disorder and recognizes that the hyperactivity associated with children is not as apparent in adults. ADD without hyperactivity is the focus of this study as this disorder relates to college students.

**Institution Categorization**

To enable a framework of analysis to be used in the analysis of the colleges and universities that participated in this study, four categories of disability service involvement were identified.
Category #1—postsecondary institutions that fall into this category are those that do not have well defined disability offices or spaces but subscribe to the letter of the laws that are required of them. In other words, there is no “Office of Disability Services” on campus. These institutions provide minimum accommodations and are more reactive than proactive when it comes to accommodating students with learning disabilities. Students often have to go to the Office of the Dean or the Dean of Student Services to make any requests.

Category #2—postsecondary institutions that fall into this category are those that not only subscribe to the law but have a defined office or space that has the words “disability services” in the title. They have “coordinators” of this service who are trained in disability issues. They tend to be more pro-active than Category #1 institutions.

Category #3—postsecondary institutions that fall into this category are those that have a defined office or space, and have a “Learning Disability Specialist” or “Director” and at least one or two staff members. These institutions are more proactive than either Category #1 or #2, and provide more accommodations beyond traditional accommodations, and often include assistive technology devices.

Category #4—postsecondary institutions that fall into this category are those that go way beyond the letter of the law and are considered premier institutions when it comes to providing accommodations for their learning disabled students. They openly advertise their office and location. The director has two to three staff members and most often holds a PhD in a related area such as Special Education or Psychology. This office
applies for and receives grants, and is often looked to as the leader in the field with published research appearing in respected journals.

The Technology-Related Assistance for Individuals with Disabilities Act of 1988

The Technology-Related Assistance for Individuals with Disabilities Act of 1988 also known as The Tech Act offered the first federal definition of what constituted an assistive technology device which is defined as: any item, piece of equipment, or product system, whether acquired commercially off the shelf, modified, or customized, that is used to increase, maintain, or improve functional capabilities of individuals with disabilities.

Assistive Technology Devices

Voice Activation Devices are those that enable individuals to use voice commands to control their computer. Products such as ViaVoice from IBM (www.ibm.com) which is a speech diction product and WordWave from WordWave, Inc. (www.wordwave.com), which enables voice-activated Internet searching using standard Internet search engines, and uses synchronized text with video and audio content, allow students to search digital multimedia such as websites and a variety of software programs.

Touch Control Devices provide the ability to touch the computer monitor to control the mouse and other functions. The TouchWindow from RiverDeep Interactive Learning (www.learningneeds.com) is a touch-enabled monitor that can be connected to any computer. ELO Touch-Systems (www.elotouch.com) added this technology to
iMacs. The Gemini from Assistive Technology, Inc. (www.assistivetech.com) is another computer that can accommodate many different ways of using the computer. It has a touch screen, switch input, on-screen keyboard, external keyboard and mouse, joystick and headmouse.

Speech-To-Text and Computer-Generated Voice Devices convert in real-time, speech-to-text, speech-to-computer generated voice and text-to-computer-generated voice. Dragon Naturally Speaking® Version 5 software from Lerout and Hauspie, Inc. (www.lhsl.com) allows users to dictate into a PC recorder. This recording can be used to create documents and emails, create and fill out forms, retrieve, share, and manage information and browse the web. The Kurzweil 3000™ System from Kurzweil Educational Systems (www.kurzweiledu.com) reads and highlights scanned or electronic text aloud using human sounding synthetic speech. ZoomText Xtra from Ai Squared (www.aisquared.com) is a screen enlargement program that integrates technology for screen magnification and screen reading. This program is a text-to-speech and allows the user to hear controls on the screen. JAWS for Windows 3.0 is a complex screen reader for navigating and reading in a multiwindow screen environment and enables the user to navigate numerous Web pages that include a multitude of graphics.

Alternative Mouse and Keyboards such as AbleNet’s Jelly Bean Switch (www.ablenetinc.com), and Discover Board from Don Johnson, Inc. (www.donjohnson.com) enable individuals to move any body part through an infrared beam of light to click the mouse and operate their computer or use larger keyboards,
which helps in navigating a keyboard. IntelliKeys from IntelliTools, Inc. (www.intellitools.com) changes the way a keyboard looks and functions by sliding different keyboard overlays over a standard keyboard. Standard overlays feature large, well-spaced keys in high contrast colors to make it easier for individuals to locate letters and numbers.

Importance of Study

A lot of attention has been directed toward students in K-12 with attention-deficit-hyperactivity disorder while neglecting these students as they pursue higher education. Today’s students, learning disabled or not, come to college expecting to learn about technology as well as learn using technology (Asen, 1994). Technology products are becoming more abundant and knowledge of their availability and ability to assist students with ADD has become crucial. There is no doubt that research needs to be conducted regarding the use of assistive technology to meet the needs of postsecondary students with ADD. This study has provided a unique and powerful contribution to the literature which is so apparently absent.

The study also built on several studies addressing college students with learning disabilities. One such study is the Ofiesh and McKee 2002 study of service providers and their service decision-making practices relative to college students with learning disabilities. The Ofiesh study focused on whether service delivery decisions are based on information from psychoeducational and neuropsychological evaluations, which sections of these tests were most useful in making service delivery decisions, and provider
satisfaction or usefulness or the tests and measurements used in making service delivery decisions. A second Ofiesh study in 2002 surveyed assistive technology use across disabilities but failed to single out students with ADD and to identify what types of assistive technologies are currently being provided by colleges in support of their student population with ADD and subsequently used by the students.

Limitations

A perceivable limitation lies in the two models that were used as the research design. These designs combine both qualitative and quantitative dimensions and could be criticized by a purist in either camp because of the mixing of methodologies that has taken place. Another limitation to this study is that it is exploratory in nature. As noted earlier, one portion of this study was a purposeful or judgmental study, limiting the generalizability of this study. In addition, the researcher could not be assured that the colleges and universities could or would pass along the student survey to their ADD students thereby further limiting the number of students who could or would provide valuable information pursuant to this study. It should also be noted that there is an acute deficiency in the amount of literature and studies directed specifically at this topic thereby preventing any replication of past surveys or use of other researchers’ questionnaires. Finally, every effort was made to craft the questions and surveys in an understandable form as questions directed at ADD students might have caused confusion to them resulting in an inability or unwillingness to respond.
Organization

This study is organized into five separate sections. The first section serves to introduce the study to be undertaken, the statement of problem, purpose of the study, the type of study, research questions that were addressed in both the literature review and through survey analysis, the study’s contribution to already existing literature as well as limitations to this type of study. The next section provides a review of the literature but notably lacks substantive research on the use of assistive technology by college students with ADD as noted as a limitation. The next section addresses the design and methodology of the study including the surveys that were administered and type of analysis that was conducted on the responses. The next section focuses on the results of the data. The final section provides conclusions and recommendations that include suggestions for future research.
LITERATURE REVIEW

There has been a phenomenal growth in the literature on the topic of attention-deficit disorder with and without hyperactivity. Purdie, Hattie and Carroll (2002) reviewed research on attention-deficit-disorder with hyperactivity (ADHD) and found 1,379 citations in Medline, 2,546 in PsychLit and 436 in ERIC over a period of time from 1990-1999. When attention-deficit disorder was addressed by itself, that is, without hyperactivity or simply ADD, they found 450 citations in Medline, 833 in PsyLit and 82 in ERIC, compared to 40 citations in Medline, 317 in PsyLit, and 35 in Eric just a decade before.

Challenges in finding specific studies relative to this study first surfaced with adequate identification of ADD in adults, which presented problems for several reasons. First because no single, specific diagnostic test exists for this disorder. In addition, issues of comorbidity of attention-deficit disorder with hyperactivity, mood disorders, dyslexia, anxiety, depression and other learning disabilities also make it difficult to single out ADD as a primary diagnosis (Biederman et al, 1991). Furthermore, most of the studies that have been conducted relating to attention-deficit-disorder, do not specifically address college students with ADD. Instead these students have been subsumed under the general category of students with learning disability. Consequently, much of the research centers around the term “learning disabilities” which encompass more than ADD.
Information related to the inclusion and practice of assistive technology is also relatively new and consequently limited (Izen & Brown, 1991; Parette & VanBienwliet, 1990; Parker et al., 1990; Ofish, et. al., 2000). It became equally clear in doing this review that there is relatively little research available concerning colleges students as a segment of the population with ADD as a learning disability (Ofiesh, 2000, Heiligenstein, et. al., 1998, Wilens, et. al., 1996). There is even less research on ADD college students when addressing their use of assistive technology (Ofiesh, 2000).

In order to study college students with ADD and their use of assistive technology a number of different areas of research were considered. First was to study the literature pertaining to children and adults with ADHD or ADD without going too far off the subject of this study by focusing on all adults with these disorders or children. Some review of studies involving children was important in order to better understand how ADD is still a part of the child who is now the adult.

Next was to study the literature on college students with ADD, their experiences at college and to look at what accommodations are being made for students with this or other learning disabilities. Next was to address the topic of assistive technology and its impact on education. Finally the challenge was to determine if any previous studies have addressed ADD college students and their use of assistive technology.
ADD as An Adult Disorder

Traditionally, ADD has been recognized as a disorder of childhood (Quinn, 2000, Weiss, 1992). Most often the disorder was identified as attention deficit hyperactivity disorder or ADHD. According to a study conducted by Wolraich and Baumgaertel (1996), changing criteria from DSM-III-R to DSM-IV resulted in an increase in diagnosis of ADHD among children in elementary school. Their study obtained teacher-reported prevalence rates for ADHD using a draft of the new DSM-IV criteria. The purpose of the study was to compare rates with the prevalence found under DSM-III-R within the same population of elementary school students, to examine the factor structure of the items within this population and to examine the relations between DSM subtypes and perceived behavior and academic problems and demographic variables. In addition the authors wished to examine the current rate of diagnosis and treatment and examine the degree of impairment among the subtypes. Results from the study indicated that changing criteria from DSM-III-R to DSM-IV resulted in an increase in diagnosis of ADHD from 56 percent to 63 percent. ADHD was characterized by academic problems with additional cases also having behavior anxiety or depressive symptoms.

A problem with the Wolraich and Baumgaertel study, however, rests with the fact that the information was derived solely from a teacher questionnaire with no parental information and no information about the pervasiveness of symptoms as required by the DSM-IV. Nonetheless, the subtypes created in DSM-IV seemed to enable a clearer diagnosis to take place by isolating behavior anxiety and depression among other factors,
from the diagnosis, thereby enabling treatment of ADHD as a separate disorder to be addressed in a more comprehensive manner earlier on in student's school life so that more reasonable and appropriate accommodations could be provided in a more timely manner. An assumption might be made that these newly diagnosed students, moving through the educational system and into postsecondary education, could be and should be better serviced with accommodations, whatever the accommodations may be, and with accommodation that are most appropriate to their identified needs.

While the vast majority of studies on ADHD have been conducted with school-age children, it is only recently that longitudinal studies have provided the evidence of attention–deficit disorder in adulthood (DuPaul, et. al., 2001, Weiss, et. al., 1979, Weiss, et. al. 1993). The 1979 Weiss studies followed 75 hyperactive children and 45 matched control children for 15 years. When compared to the control group, the children diagnosed with hyperactivity were found to have clear ADD symptoms that persisted into adulthood with 66 percent demonstrating at least one symptom. Most notable was the persistence of restlessness and poor concentration. Several follow-up studies have also clearly established that children diagnosed with ADHD continue to have symptoms of ADD into adolescence and adulthood (Heilgenstein, 1998; Nadeau, 1994).

Hill and Schoener (1996) conducted a longitudinal study of nine cohorts of children with ADHD who were reexamined 4-16 years after their initial diagnosis and from that study suggest that the rate of ADHD appears to decline by 50 percent approximately every 5 years. Given this decline, they project that the estimated rate of
adult with some form of ADHD or ADD would be expected to range from 0.8 percent at age 20 to 0.05 percent at age 40.

The importance of these studies is in their contribution of knowledge regarding the awareness of ADD in adults.

ADD and The Transition to College

Rojewski (1999), studied occupational and educational aspirations of young adults with and without learning disabilities (LD) 2 years after high school completion. This study is a typical example of research focusing on the larger dimension of learning disabilities rather than addressing specific learning disabilities such as ADD. Rowjewski studied the The National Education Longitudinal Study: 1988-1994 (NELS:88; 1996), which was administered by the National Center for Educational Statistics of the U.S. Department of Education.. Log-Linear analysis was used to examine the potential interactive effects of gender and disability in three areas: the successful attainment of a high school diploma or equivalent; status 2 years into postsecondary education; and occupational aspirations. Analysis revealed that individuals with LD reported lower high school graduation rates and were more likely to aspire to moderate or low-prestige occupations. They were more likely to be employed versus pursing postsecondary education. Higher educational aspirations were noted by those completing Grade 12 especially by those who completed an academic or college-prep program. Problems with delayed or impaired career development and lowered academic performance as adolescence were seem to contribute to lower rates of eventual enrollment in
postsecondary educational programs, as well as lowered levels of employment and less overall satisfaction in employment.

Rojewski concluded that the 2 years immediately following high school are a critical time in the lives of LD individuals. Professionals must be sensitive to the potential influence that high school placement decisions and general teacher expectations have on postsecondary education choice as well as career or occupational preparation and the transition process that must be incorporated. The role of professionals becomes vital at the secondary level advocating selection of educational tracks or possible career options.

Another issue relating specifically to the transition of ADHD/ADD students from high school to postsecondary education is a student's individualized educational program (IEP), as mandated by Congress in IDEA. The IEP must contain information regarding the relationship between a student's plan of study and his/her goals beyond secondary school, and must clarify both the transition services required by the student and the responsibilities of adult agencies to assist in providing such services. However, despite IDEA regulations specifying postsecondary education as an important outcome for IEP teams to address, a study conducted by Shearin, Roessler and Schriner (1999) discovered that a vast majority of the IEP plans that they reviewed contained little if any information about this transition.

The Shearin study (1999) addressed the transition component of IEPs of secondary students with all disabilities and did not single out students with learning
disabilities such as ADHD or ADD. Four raters evaluated the transition content of 68 Individualized Educational Programs (IEP) following the Congressional mandate to include school-to-work and school-to-school goals and linkages using an outcome-skill checklist. Two high schools in a moderate size city in Arkansas were selected for the research. The plans they reviewed included few linkages with adult agencies or with postsecondary institutions. Vocational rehabilitation, for example, was mentioned in only 7 percent of the plans. The study suggests that the key transition stakeholders must participate more actively in determining the transition services a student needs. IEP teams need to monitor their efforts to ensure goals are included and if not, provide a justification for not including this information. The study also suggests that although this particular study was not generalizable, the use of the Outcome/Skill Checklist for Transition Planning should be better used for IEP team training.

While difficult to determine the severity of ADHD or ADD in elementary and high school students, Heiligenstein, Conyers and Andrew (1998) suggest that the degree of ADHD/ADD in college students is more modest and that a cutoff score of 4 for current symptoms of inattention and hyperactivity-impulsivity would be sufficient to identify a college student as distinct from the norm. The Heilgenstein 1998 study used a modified version of the Attention Deficit Hyperactivity Rating Scale which was administered to 468 students at a large Midwestern university. They found no differences in the summation of item scores with respect to gender, ethnicity, education level, and the inattention item score. They did find a significant negative relationship between age and
hyperactivity-impulsivity item scores and the total item scores. The hyperactivity and
total item scores declined with increasing age. The authors concluded that the findings of
the study provided preliminary evidence that the present DSM-IV thresholds for
diagnosis of ADHD are too high when applied to college students. They recognized a
limitation to their study in using one type of college campus and underrepresented ethnic
minorities when compared with a national sample of college students.

For students with ADD, moving from high school to college is particularly
difficult because of the freedoms and distractions of campus life (Weiss, 1994:
Heiligenstein, et al, 1999). In the 1999 Heilgenstein study, psychological and academic
impairments in college students were assessed in a retrospective chart review using
specifically defined diagnostic criteria, which were then compared to a control group.
The primary investigator retrospectively reviewed charts of 508 students seen for an
initial assessment during the 1997 fall academic semester.

The initial review of the Heilgenstein study yielded 69 charts meeting the
inclusion criteria of either a documented diagnosis of ADHD or a request for career
testing. Following further screening for active psychiatric or medical comorbidity, the
final review resulted in a total of 54 charts. The control group consisted of 28 students
who had requested a Strong Career Interest Inventory and did not ask for or require
counseling and accommodations beyond the inventory. Students with ADHD had a
significantly lower mean grade point average, were more likely to be on academic
probation, and reported significantly more academic problems. No significant differences were noted based on age, ethnicity, and level of education.

The Heilgenstein study noted that even though ADD has been increasingly recognized as a valid adult diagnosis, clinicians at college health services continue to struggle with case identification of ADD because of the inherent uncertainties of the DSM-IV definition of impairment as this definition relates to adults, and they suggest that future revisions of DSM-IV should consider linking specific patterns of impairment to diagnosis.

In a study of university students from three different countries (United States, Italy and New Zealand) the researchers actually found that American students diagnosed with ADHD, displayed fewer symptoms of both attention-deficit and hyperactivity when factors such as completing tasks, sustaining attention, forgetfulness, organizational skills, controlling one's self, impulsivity, excess talking and interrupting others were compared to students in the other two countries (DuPaul, et al, 2001).

The DuPaul study sampled 1,209 university students from Italy, New Zealand, and the United States who completed a 24-item self-report measure (The Young Adult Rating Scale) to examine whether their symptoms conformed to the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV) and whether symptoms vary across gender and country. The study expanded upon the preliminary work by Heiligenstein in 1999. Factor analysis supported the bidimensional symptom structure among U. S. and New Zealand students. Participants did not vary significantly by gender. Students from
New Zealand and Italy reported significantly more inattention symptoms than did U.S. students. Italian students reported more hyperactivity-impulsivity symptoms than U.S. students.

The DuPaul study, as directed toward college students, was exploratory in nature rather than diagnostic, however, the results provide initial evidence that a percentage of university students in the three countries studied report clinically significant levels of ADHD or ADD symptomatology and also that the DSM-IV conceptualization of this disorder has some basis of support in this population.

The autonomy and the big blocks of free time associate with higher education can also exacerbate some bad habits. Distractions abound in dormitories and in lecture classes full of other students. Classes scheduled for varying times throw off a regular sleep schedule (Weiss, 2000). The social environment at college can also be an issue for students with ADD. "The biggest problem for me and my colleagues is that there's a real disconnect between the K-12 system and the collegiate system," says Ross Pollack, director of the student-resource center at Manhattan College in Riverdale, N.Y. "We see students who do well before they get to college, and then barely bump along when they get there".

Steinberg (1998) also agrees that LD students with ADD are at greater risk for being placed on probation or dropping out of college. She believes that time management and organization tend to be the weakest areas for these students and are therefore in the most need of proactive and creative interventions. Results from additional studies by
Weiss and Hechtman (1993) indicated that, in comparison with matched control groups, ADD adults moved their residences more frequently, were more involved in car accidents, failed more grades, had more court appearances, abused drugs more often, had more impulsive and immature personality traits, rated their childhood more negatively, had lower self-esteem, and had less efficient social skills.

Research addressing college students with learning disabilities, as well as accommodations provided to these college students resulted in several studies. It is important to remember that legislation, including the ADA, has mandated that college campuses provide "reasonable" accommodations for all disabled students including those with ADHD. However, the term reasonable is subject to a variety of interpretation. Undergraduate, graduate, or professional school students are encouraged to seek out disability support service or person, identify themselves as a student with a LD, and provide the needed documentation to support their claim. This documentation includes psychoeducational and neurobehavior tests. These evaluations are used to establish both eligibility and specific accommodation determinations.

Ofiesh and McAfee, (2000) evaluated service providers and found prior to their research that there is little research available which validates the use of psychoeducational evaluations in making service delivery decisions for postsecondary students or the perceived usefulness of the various components of the evaluations. Ninety-one service providers of college students (2- and 4-year colleges and universities) were surveyed to determine whether service delivery decisions are based on information
from psychoeducational and neuropsychological evaluations, which sections of these evaluations are most helpful in making service delivery decisions, and administrators’ satisfaction with the tests and measurements for service delivery. The findings supported the common, though mostly undocumented, belief that data from psychoeducational and neuropsychological evaluations are used for establishing both eligibility and specific accommodation determinations, that while all sections of the evaluations were deemed useful, test scores were considered the least useful. In this same study, the disability service providers found the recommendations of the evaluators to be the most useful along with the summary of the student's cognitive strengths and weaknesses.

Ofiesh and McAfee point out that those responding to their survey were members of the Association on Higher Education and Disability (AHEAD) and were possibly a bit more biased due to their commitment to the field, therefore, the findings may not be as generalizable to colleges and universities not affiliated with this organization. The study also did not address the criteria used for specific decisions. They suggest that service providers need to know Section 504 and ADA and to keep abreast of relevant litigation, then develop policies regarding accommodations in line with the law and policies of their own institution, and to further investigate the methods that are used to make decisions about service delivery options and accommodations.

Disability support services usually provide tutoring or individual academic assistance, study skills such as test-taking and note-taking, preferential seating in the
front of the class, proofreading services, reduced course load, or time management workshops. Qualitative research suggests that while types of services offered in community colleges and four-year colleges and universities are quite similar, the quality of services varies (Finn, 1999). Finn (1999) studied students with learning disabilities from selected Midwest colleges and universities participated in a study to determine the differences between LD programs at community colleges and four-year institutions, the level of satisfaction with college and LD programming accommodations, and the services most important to students. A series of focus groups were held at five institutions. Students were equally matched gender wise and ranged in age 16 to 56 years and were enrolled in freshmen through graduate levels.

Results of this study revealed the types of LD services offered among the institutions participating in the research were quite similar but the quality of the services varied. Students at large public institutions had difficulty getting note takers, books on tape and tutors, and obtaining assistance from LD staff. Participants from the smaller community colleges and private institutions considered the smallness of their institutions to be a benefit and noted that the LD program was easily accessible and the LD staff were always available.

Finn noted a limitation to the study in gathering qualitative data representing the perceptions and attitudes of LD students in selected institutions. Based on this research method, they conclude that their results cannot be generalized beyond the select group of individuals who participated in the study. By conducting student evaluations of LD
programs, colleges and universities can continue to identify services in need of improvement.

Based on a 1999 study, Ganshow, Coyne, Parks and Antonoff believe that graduate and professional schools are more aware of students with learning disabilities which would include ADD. Their study was a 10-year follow-up study that compared programs and services for LD students between 1985 and 1995. Surveys were sent to the same institutions (n=682) in 1995 that participated in the survey in 1985. Significant changes over the 10 years included a higher awareness about LD, evidence of more compliance with Section 504, a greater specificity of assessments required for the identification of students who are accommodated, improvement in the types and extent of services provided, and increased program visibility. LD programs seem to have garnered more visibility and provided a greater specificity of assessments required for the identification of those who need to be accommodated. There also appeared to be improvement in the types and extent of services provided. The researchers found an increase in the number of LD coordinators and in the use of a written plan. The respondents indicated an increase in the use of a written plan from 38% in 1985 to 83% in 1995.

The greatest change found in the Ganshow study in the type of services made available to LD students was in the provision of tutoring assistance (from 58 percent to 73 percent), note taking (47 percent to 71 percent), exam taking skills (50 percent to 70 percent), use of the library (52 percent to 80 percent) and the use of computers (34
percent to 68 percent). The authors reported that many of the institutions were not able to give exact numbers of students with LD or how many new graduate students they anticipated accepting. They suggest that these findings may possibly point to the students with LD not electing to disclose their learning disability or that the people responsible for coordinating LD services may not maintain adequate records about who these students are. They suggest that there is still need for improvement, especially in publicizing LD services.

Faculty Support

Bourke, Strehorn and Silver. (2000) set out to identify actual practices, versus theoretical models, used by faculty with LD students. Surveys were mailed to 485 faculty members at the University of Massachusetts, Amherst, who received an instructional accommodation form from the office of Learning Disabilities Support Services (LDSS) in the fall of 1995. The purpose of the survey was to identify actual practices used by faculty with LD students in light of the existing research which focuses on attitudes and theoretical models without delineating actual practices. The survey focused on the degree of ease or difficulty in implementing instructional accommodations, their perceptions regarding adequacy of support, and their own beliefs and understandings concerning the need for and the benefit of providing instructional accommodations for students with special needs. Data was analyzed using SPSS.

A significant difference was found between the behavior of tenure-track and non-tenure-track. Non-tenure-track respondents found it easier for them to provide
accommodations and their level of belief about the efficacy of and understanding of the need for accommodations was greater than that of tenure-track faculty. Findings suggest that the stronger the respondent's belief that accommodations helped students succeed, the greater their level of understanding concerning the necessity for such accommodations. Also the stronger the belief that accommodations helped students succeed, the easier it was for them to provide alternative types of exams and additional time for completion of assignments. The level and perception of support provided by the LDSS factored favorably into the ease of providing instructional accommodations. The authors point out the limitations of this study to include focus on a single university, what they considered to be a fairly low response rate and that those who did return the survey may be more self-selecting.

Another study found that faculty at an American university expressed a significantly more supportive attitude toward students with learning disabilities than those at the Israeli institution (Leyser et al., 2000). The Leyser study examined faculty-reported attitudes, experiences and willingness to make accommodations for these students by faculty and compared faculty views and practices in these two colleges regarding students with learning disabilities in teacher education. A related goal was to serve as an impetus for future collaborative cross-cultural studies between universities and colleges in different regions and nations.

Faculty at the American university expressed more willingness to provide accommodations for these students and reported spending more time making
accommodations. Making accommodations for them was not perceived as being unfair to other students. Overall, however, about half of the faculty in both institutions indicated that they had no teaching contact with these types of students suggesting that over the years relatively few of these students were either enrolled in their university courses or came forward to identify their disability. When aware, however, a large majority in both institutions expressed a willingness to provide instructional accommodations such as allowing students to tape record lectures; clarifying assignments on a one-to-one basis; commenting on drafts of papers; modifying the setting for exam taking, changing the timing; or allowing use of assistive technology. They were less willing to provide students with a copy of a lecture outline or with a copy of an overhead; change the presentation format of their exams; and less willing to adjust grading.

The Leyser study also found that many faculty at both institutions reported limited training in disabilities, limited knowledge of resources, limited skills in making accommodations and unfamiliarly with disability laws. These findings suggest a need for better faculty awareness of the needs of special students as well as more faculty development.

Scott and Gregg (2000) found discrepancies in their study between what might be expected of faculty with LD/ADD students in their class and the role that faculty actually played and experienced. This study addressed the evolving needs of faculty in providing access and support for these college students. The term access refers to providing an equal opportunity for students with LD in all aspects of the college experience. For
faculty this might involve the roles of teaching, mentoring, and policy development. The study was able to identify discrepancies between the evolving faculty needs, and current educational practices regarding their roles. The study clearly pointed out the importance of providing faculty with training and ongoing opportunity to apply nondiscriminatory decision-making. Faculty identified a need to having training that is convenient to a range of faculty schedules which would include incorporating the internet, email or CD-ROM all of which enable self-paced instruction. Furthermore, they identified a need for training early on in their careers. Providing some type of incentive or pay-off may also be key to encouraging faculty to work more with these students in unique ways. The authors suggest that if institutions fail to reexamine their assumptions and broaden their questions pertaining to faculty development, then there is the potential to endlessly reinvent the wheel of faculty education approaches pertaining to students with special needs. This study pointed out that lack of training, lack of awareness on the part of the faculty of LD/ADD characteristics, and lack of institutional support contributing to the gap between expectation and reality.

Accommodations

Some students who could benefit from accommodations do not get them because they shy away from informing their professors or their institutions of their disorder. In addition, it does not help that some professors view ADD diagnoses with skepticism, especially when they see such students display moments of high ability. Colleges and
universities alike continue their search to better accept and accommodate LD students with ADD.

Much of the research is showing that disability support service providers usually provide what is expected of them by law to include note-taking, preferential seating in the front of the class, reduced course load, or time management workshops. Some provide more such as tutoring or individual academic assistance, proofreading services, study skills such as test-taking. But some ADD students as well as institutions say that such accommodations often don't help, and that the pressure to finish a test quickly, for example, is what gives them the stimulation they need to focus.

One institution that challenges the conventional wisdom regarding accommodations and supplemental help to ADD students is Landmark College, a private two-year institution in Putney, Vt., that specializes in helping students with ADD learn to manage their time and to study effectively. The college's policy on test-taking is to consider giving extra time only on a case-by-case basis. While many colleges offer ADD students a note-taking service to compensate for their shorter attention spans, Landmark frowns upon that accommodation, arguing that it can reinforce a student's impulse to let his or her mind wander during class. The college has developed a system in which students are taught to take their own notes in a way that holds their attention. They are asked to divide each notebook page into two columns. On the left side, they are to draw diagrams that might help them remember things they hear, and to take "meta notes," recording broad ideas and themes from the lecture. The right-hand column is for
conventional notes. Landmark has found this method along with some unconventional methods to work well and often better than more conventional accommodations.

Assistive Technology

Assistive technology has the potential to help all learners, not just ADD students, to gather, manipulate, understand and use information more efficiently and effectively. Edyburn (2000) suggests that assistive technologies “enable students to complete tasks more efficiently and independently and results in improved performance on a variety of reading and writing tasks which in turn leads to greater academic success” (p. 122). It is widely regarded as holding potential for enhancing access, inclusion, and the quality of life of individuals with disabilities (Wilkes, 2001; Roach, 2002; DeWitt, 1991; Garner & Campbell, 1987; Sawyer & Zantal-Wiener, 1993; Wisniewski & Sedlack, 1992). Edyburn further summits that word processing programs with spelling checkers facilitate writing for students for students with learning disabilities by compensating for some of the students’ difficulties with the writing process. Lewis (1998a) purposes assistive technology as having two main purposes: to build on a student’s individual strength and to enable them to better perform on any given task.

In fall 2001, David Rose, co-executive director of the Center for Applied Special Technology (CAST), testified before the Senate Appropriations Committee on the future of educational technology. He made recommendations to this committee in three areas. First to encourage funding of assistive technologies to school districts so they can be
effective consumers of these powerful technologies; second to focus on ways to increase the use of digital curricula, and third to better address Universal Design of Learning.

In 1997, R. Mace coined this new term, Universal Design, to describe designs that considered from the very beginning the access needs of the broadest possible range of users. Being developed by CAST (Center for Applied Special Technology), The Council for Exceptional Children and others draw on and extend the principles of universal design as seen in architecture. The premise behind this design is that it is both better and cheaper to practice universal design than to retrofit solutions later. There is an enormous expense associated with retrofitting technology. The idea is that as new technologies are developed for schools, they should be made accessible to all the students in the school, right from the start. If learning spaces in schools are accessible to all students, savings will be made both in terms of short-term costs of miss-educating students in the present and the long-term-cost of not educating them for their future. Universal Design requires thinking about the needs of the entire range of learners who are and could be in today’s classroom and then designing materials, methods, and environments that support and challenge each learner as appropriately and consistently as possible.

The Technology-Related Assistance for Individuals with Disabilities Act of 1988, also referred to as the Tech Act 1988, requires states to develop statewide, consumer–responsive programs of technology services for individuals with disabilities of all ages. The intent of this legislation was to increase the awareness of the needs of individuals with disabilities for both assistive technologies (AT) devices and to increase awareness of
policies, practices, and procedures that impact the availability of such services and
devices. The Tech Act offered the first federal definition of what constituted an assistive
technology device which is defined as “any item, piece of equipment, or product system,
whether acquired commercially off the shelf, modified, or customized, that is used to
increase, maintain, or improve functional capabilities of individuals with disabilities”
(Tech Act, 1988). This Act also defined assistive technology services to include “any
service that directly assists and individual with a disability in the selection, acquisition, or
use of an assistive technology device” (Tech Act, 1988).

Assistive technologies are applications either hardware or software that are
developed specifically to assist disabled individuals in overcoming barriers. AT devices
can be categorized as high technology and low technology. Many low tech devices are
available almost anyway and can range from pencil grips, cassette recorders, head
pointers, or workbooks, flow charts, and graphic organizers (Lahm & Morrissette, 1994).
High tech devices most often include some type of computer usage including computer
chips, hand-held calculators and talking clocks (Franklin, 1994).

Although assistive devices and services are not explicitly stated in the Education
for All Handicapped Children, also known as Public Law 94-142, the Tech Act
established a foundation for the use of supportive aids and services. Definitions from the
Tech Act were incorporated into the passage of the 1990 Individuals with Disabilities
Education Act also known as IDEA and Public Law 101-476.
In 1997, reauthorization of IDEA mandated the consideration and inclusion of assistive technology for all children, including those with mild or moderate disabilities. IDEA further emphasized the importance of technology in the lives of students with disabilities, and the need to share cutting edge information about advances in technology across the K-12 environment. This reauthorization stated that assistive technology needs must be distinctly considered by every IEP team for students found eligible for special education services. Furthermore, technology was to be considered a viable instructional tool addressing cognitive needs of students with disabilities (Derer et al, 1996; Council for Exceptional Children, 1998).

In addition to cognitive assistance, Lahm, Bausch, Hasselbring and Blackhurst (2001) noted six key areas where assistive technology could be of benefit to students with mild to moderate disabilities. These included note taking, writing assistance, access to reference materials, materials modification, productivity, and organization. Studies by Bahr, Nelson and Van Meter (1996) point to difficulties in writing by students with learning disabilities. Graham (1998) cautions that too much focus on writing skills may have adverse consequences on the development of higher processing skills such as organization of writing which could lead to less-developed ideas, omission of key insights and illogical progression of information. He supports the use of technology and adds that “technology can [not only]support the basic skills of producing legible text with correct mechanics [but can contribute to] …. the more complex cognitive processes of planning, drafting, and revision of text” (Graham et al., 1998, p.410).
In a study of 39 students aged nine to eighteen, Higgins and Raskind (2000a) found that the use of voice recognition software improved reading comprehension, spelling and word recognition scores over a control group. In addition, continuous use of this type of software was seen to improve the working memory. Montali and Lewandowki (1996) suggest that the use of speech synthesis software may increase a student’s motivation to read by presenting them with a more successful reading experience. Torgesen and Baker (1995) also reported improvements in word recognition and phonological decoding abilities after students used books with a voice component. Other studies by Lundberg (1996), MacArthur (1998) McEwan, (1998), De La Paz (1999) and Hertzroni and Shrieber (2004) support and champion the use of technology such as text-to speech and speech-to text software.

Assistive Technology and the ADD College Student

The use of AT devices in K-12 does not guarantee that these devices or services will be available or provided in postsecondary institutions. The mandated consideration of technology suggests that these students will enter colleges and universities with the prescribed documentation to support their need and desire for AT. Along with the movement to use technology to promote learning for all students, disability service providers have begun to consider AT devices and services for a broader range of individuals with disabilities (Bryant et al, 1994; Higgins & Raskind, 1995, Rashkind & Higgins, 1998).
A question was posted on the Disabled Students Services in Higher Education Listserve about whether a student with ADD was entitled to use a Dragon Dictate system. The conversation centered on whether the functional limitations of ADD could manifest themselves in writing and if so, what were the characteristics. Responses included the recognition of some disability service providers that they had not even considered the use of a voice recognition system with this type of student even though research supports the substantial writing struggles of some students with ADD. Speech recognition software was originally designed for individuals with limited mobility and visual impairment. However, research from MacArthur in 1998 showed success for children with ADHD.

This application of AT directed at students such as those with ADD marks a paradigm shift in how service providers and educators view and subsequently use AT across a broader spectrum of students (Norlander et al, 1987). Lance (1996) not only found that postsecondary disability providers recognize that their students would benefit academically from the use of AT but the students themselves expressed a need for AT training and greater accessibility to AT devices.

A review of the literature revealed only a handful of studies regarding the use and the effectiveness of AT for college and university students. Hecker (2002) conducted a study on the use of assistive reading software with 20 postsecondary students. His findings indicated that the software helped students to complete assignments on time, reduced stress, fatigue and distractibility but did not show significant differences related to reading comprehension.
Ofiesh completed a study in 2002 that was designed to provide a foundation for further investigation into the practice of using AT across categories of disabilities in postsecondary settings. A limitation to their study was that their survey did not adequately represent the use of AT with students with ADD as ADD was subsumed under the category of LD. However, their research did shed light on the most frequently used AT devices in postsecondary disability settings and which devices are used across categories of disabilities. Software programs considered useful for students with language-based learning disabilities include Kurzweil 3000, textHELP, Dragon Naturally Speaking. For those with reading disorders and evidence of deficits in phonological awareness programs such as Lindamood Phoneme Sequencing program, and Phonographix were noted. No previous research from postsecondary settings exists on the actual use of AT across the differing conditions of disability.

Many of these researchers agree that there is a problem in carrying out empirical studies with students other than those with sensory or mobility disabilities. They ascribe these problems to a scarcity of data on the academic characteristics of students with disabilities such as ADD, the heterogeneity within categories of disabilities and nonstandard criteria used to diagnose disabilities such as ADD, and the differing institutional policies regarding the acceptance of documentation of this type of disability.

It appears that college students and providers alike are searching for technology to enhance learning opportunities. The research up to this point on ADD college students is limited yet leaves wide open the possibilities of new studies and a much greater focus on
this very timely topic. The need, therefore, exists to conduct additional research in this area and to find out what colleges and universities are providing and how college students with ADD are using technology in this technology rich society.
DESIGN AND METHODOLOGY

The purpose of this section is to address the specific research that was conducted in order to answer the research questions presented in the first section. It outlines in more detail the design of the research and includes the methods for gathering the information needed and the analysis that was used.

Creswell (1994) suggests that “it is advantageous to a researcher to combine methods of [research] design to better understand a concept being tested or explored” (p.177). Therefore the research that will be conducted for this study represents a combination of both qualitative and quantitative techniques. Two models that were used are known as the dominant-less-dominant design and the mixed methodology design (Creswell, 1994). The dominant-less-dominant model enables the researcher to present “the study within a single, dominant paradigm with one small component of the overall study drawn from an alternative paradigm” (Creswell, 1994, p.177). The mixed methodology design mixes the several paradigms at various steps in the design. This mixture may appear in the literature review, in the purpose statement, in the research questions, and in the analysis (Creswell, 1994).

The advantage to using these two types of design is that it allows for a more comprehensive understanding of the issue, enabling the researcher to collect limited or hard to access information in order to probe another aspect that is important to the study. Additionally, the overall design of the study is better presented by working back and forth between both inductive and deductive methods of thinking. A chief disadvantage
lies in the qualitative and quantitative purists as well as those unfamiliar with this method, who might be concerned with the match or the combination of methods.

**Dominant Paradigm**

The single dominant paradigm was a study using a sample of 410 colleges and universities. Two-hundred-ten of the 410 colleges and universities used in this study represent what is known as a purposeful, purposive or judgmental sample (Creswell, 1994; Patton, 2001; Gall et al., 2003; Bogdan & Biklen, 2003). Michael Patton in *Qualitative Evaluation and Research Methods* (2001) defines purposeful sampling as “the process of selecting cases that are likely to be information-rich with respect to the purposes of a qualitative research study” (as appearing in Gall et al., 2003). He suggests that the purpose is to develop a deeper understanding of the phenomenon being studied and that this type of sampling is not designed to achieve population validity or represent accurately a defined population. The list used for the two-hundred ten colleges and universities was compiled from lists provided by several special schools for students with learning disabilities. These specific colleges and universities that were surveyed were those institutions that are known to have students with learning disabilities apply and be accepted to them.

The second group of 200 colleges and universities was randomly selected from a list of postsecondary institutions in the United States. These institutions were not necessarily known to accept students with learning disabilities. Care was taken to balance this second group so that equal representation of 2-year colleges and 4-year
institutions could be achieved. The purpose of including this group of postsecondary institutions was to find out the same information as those institutions that had been selectively chosen. A comparison could be made between those that are known to accept LD and ADD students and those that are not necessarily known to do so. In addition, the combination of both groups provided a larger, more diverse sample of postsecondary institutions thereby enabling the possibility of generalizing more of the results.

Although part of the sample of 410 colleges and universities represented a purposeful selection, the size of the study as well as the structured instrument that was used to collect the data, was more indicative of quantitative studies. Additionally, analysis of some of the responses was conducted using SPSS for simple frequencies and cross-tabulations, which is also most often used for quantitative analysis.

**Less-Dominant Paradigm**

Collecting information from as many of the 410 institutions as possible was critical to the completion of this study. However, another important aspect was to hear from ADD college students to find out if they are using assistive or other accommodations to enhance their learning experiences. The less-dominant design of the study took the form of a student survey with open-ended questions and was more qualitative in nature. There was a reason for incorporating a qualitative approach. Qualitative research is considered more flexible with respect to sampling techniques than quantitative research. Estimating a desirable number of cases to include in the sample size is entirely a matter of judgment and does not necessarily adhere to any set of rules.
(Gall, et. al., 2003). Michael Patton (as appearing in Gall, et al., 2003) lists opportunistic sampling as a separate type of purposeful sampling. Opportunistic sampling involves the findings from one case to inform the researcher’s selection of subsequent cases. Application of this form of sampling resulted in seeking assistance from a special education high school to do a special mailing of questionnaires to ADD graduates as well as from postsecondary service providers in distributing and asking ADD college students at their institutions to complete a survey.

In this instance, there was no way to determine the sample size that would result from using opportunistic purposeful sampling. Administrators at the 410 institutions were asked on their survey if they would be able to distribute a student survey and those who responded “yes” were asked how many they thought they could distribute. This information, at least, gave the researcher some indication that a certain number of students might complete the survey. To help ensure additional student feedback, ADD college students who were graduates from a special high school for learning disabled and ADD students, were contacted by their high school and asked to complete a student survey. Thirty-five students were sent a survey to complete.

Reasons for Choosing Surveys

Survey design was chosen because it is an efficient and relatively inexpensive way to learn about a particular topic. A self-administered survey is less intrusive when sensitive issues are questioned. Care was taken to protect respondents from individual identification. Surveys, if not too long, can also be taken in a relatively short time.
For this study, surveys were used to investigate what assistive technology colleges and universities had available as well as what ADD college students were using. These surveys also addressed what other accommodations, in addition to assistive technology, colleges and universities have available for use by ADD college students. The student survey sought to identify accommodations and devices students are using and how satisfied they are with them.

Nature of the Survey: Cross-Sectional

The surveys designed for this research were cross-sectional in nature. In a cross-sectional survey, data are collected at one point in time from a sample selected to describe some larger population at that time (Gall et al., 2003; Bogdan & Biklen, 2003). The cross-sectional nature of these surveys constitutes a limitation of the design. Results from the cross-sectional surveys designed for this study are limited to those included in the sample and represent current perceptions or understandings on the part of the respondents as they exist at the time of the responses.

Survey Instruments

A review of research indicated that an instrument to assess use of assistive technology by ADD college and/or high school students did not exist at the time of this project. The researcher was left to develop a survey instrument. The development of the two surveys is described in the following sections.
Survey #1: Survey to Administrators

The purpose of Survey #1 was to find out what college and university administrators are doing relative to students with ADD. Included were mostly closed-ended questions pertaining to traditional and assistive technology accommodations available to ADD students, how service delivery decisions are made whether based on information from psychoeducational and neuropsychological evaluations or other assessments, and which sections of these evaluations were found by administrators to be the most useful in making service delivery decisions. Questions centered on what criteria administrators use to purchase assistive technology devices, and what barriers exist that might prevent either the purchase or utilization of such technologies.

Survey #1 Implementation: Survey to Administrators

The survey to the college and university administrators was administered through two options. Each institution received a cover letter and a survey in the mail. Each administrator was provided with a letter describing the study, informing them that the survey has been approved by the Institutional Review Board for the Protection of Human Subjects at American University, and that their name, school name or any other identifying information could not be traced back to them personally. Administrators were informed that all information provided to the researcher would be kept in confidence and seen only by the researcher. In the cover letter they were invited to participate in this study and given the option to either fill out the hard copy provided to them or to go to an address on SurveyMonkey to complete the survey online. With the overall growing
popularity of web surveys, it was expected that Survey Monkey would be the preferred option and that administrators would opt to complete their survey online.

Survey #2: College Student Survey

The purpose of Survey #2 was to question ADD college students about their use of accommodations and specifically assistive technology. Included were questions pertaining to what accommodations they used prior to going to college and what they are using now, whether these accommodations were of their own choosing or made available through their college, and if they are satisfied with the accommodations they are using. Students were also asked what factors influenced their selection of college, They were also asked about their greatest challenge as a college student with ADD.

Survey #2 Implementation: College Student Survey

The college and university administrators who were part of the administrator survey were asked to distribute questionnaires to the college students who had self-identified as having ADD. Similar to what was presented to the administrators, each student was provided with information describing the study, informing them that the survey has been approved by the Institutional Review Board for the Protection of Human Subjects at American University, and that their name, school name or any other identifying information could not be traced back to them personally. Students were informed that all information provided by the respondent would be held in confidence and seen only by the researcher.
Students were asked to either fill out a hard copy provided to them by their college or university or to go to an address on SurveyMonkey to complete the survey online. It was expected that Survey Monkey would be the preferred option. Each survey asked for the zip code of the institution which helped the researcher determine geographic representation.

In addition to getting information from students at the colleges and universities that were part of the 410 institutions in the sample. ADD students that had graduated from a special school for learning disabled students were contacted by their high school and asked to complete the student questionnaire. They also had the option of filing out the survey sent to them in the mail or going to SurveyMonkey to complete it online.

Research Questions

The following research questions were explored.

1. How do the colleges and universities fit into Categories #1-4 of disability services?
2. Do colleges and universities provide ADD students with accommodations and what type of accommodations are they providing?
3. Are the purposeful institutions that are known to have LD and ADD students apply and be accepted to them, providing these students with more accommodations than the randomly selected institutions?
4. Is there a perceived gap between student need and actual provision?
Several of the concepts included in the surveys developed for this study are based on those which appear in two Offish surveys mentioned in the Literature Review section. Recognizing that ADD as a learning disability was not specifically addressed in either of their surveys has required the researcher to alter questions in order to focus on this disorder. The following content areas were identified as pertinent to the research:

1. Type of diagnostic information used by service providers
2. Accommodations offered to learning disabled students
3. General category of assistive technology services and devices offered to learning disabled students
4. Accommodations used by ADD students
5. Satisfaction with diagnostic information by service providers
6. Use of accommodations by students
7. Satisfaction with accommodations by students

Survey Construction

The two surveys were made up of both closed and open-ended questions, exemplary of the mixed methodology approach used in this study. Particular care was taken with those surveys going to ADD students to make the questions clear and simple. Care has been taken to redirect respondents to branched questions. In order to help address the validity of the surveys, both surveys was submitted to two university administrators who are not part of the study but are in offices that provide special
services to learning disabled students and have ADD students as part of their population. Suggestions for revision resulted in the form that was ultimately provided to the sample.

Use of Human Subjects

The primary data collected relied entirely on the participation of human subjects. Permission for the use of human subjects was granted. Consent to participate in the study was achieved by the respondents’ agreement to fill out the survey. Risks to the participants were minimal. Responses are held in confidence, rather than anonymous, individual identities will not be revealed.

Analysis of Data

SPSS software was employed for some of the analysis of the data collected from the administrator survey. Statistical methods used for study included frequency analysis, descriptive statistics, and cross-tabulation. Specific hypotheses testing using such means as the t test, Anova, Pearson’s r, etc. were not employed due to the exploratory nature of the study. Missing values identified as “no answer” were also noted.

- Frequency tables were generated to analyze nominal and ordinal level variables. These tables provided the frequency distribution of the categories in absolute values and percentage.
- Cross-tabulation determined the relationships between relevant categorical variables.

Anecdotal responses provided in the open-ended questions were sorted and patterns or trends noted, and added to address both qualitative and quantitative findings.
RESULTS

This section provides the results from the college and university administrator questionnaire and responses from ADD college students. The reader is reminded that limited literature and research has been undertaken on college students with ADD. The purpose of the study was to explore a variety of issues as they relate to the ADD college student, consequently no formal hypotheses were created for this study or tests undertaken to determine significance of relationships. Instead the researcher sought to uncover any patterns and trends that could be noted. The results of this study can be used to gain a better understanding of how colleges and universities are dealing with students with ADD.

Questionnaire Response

One hundred and three administrator questionnaires from the list of 410 colleges surveyed were returned representing a 25 percent response rate. Seven of the questionnaires were returned in the mail due to incorrect addresses. The administrator questionnaires were administered both through the mail and online. Sent along with the administrators’ questionnaires were copies of a questionnaire for their college students to fill out. Eighteen ADD college students from these 103 institutions provided their responses to questions regarding their ADD. In addition, 4 college students who graduated from a special education high school provided input.

Generally, the responses that were returned represented a good cross section of the colleges and universities throughout the United States. It should be noted that the
overall response rate of 2-year institutions versus 4-year virtually mirrored the
distribution of community colleges and 4-year colleges and universities that was
originally identified in the samples. While the number of responses expected to be
returned by college students was a complete unknown at the time of distribution, valuable
insight was obtained by the students who did respond. In addition, these responses were
compared to information provided by the colleges and university administrators and will
be further discussed in the last section of the paper.

Administrator Participant Information

Four hundred ten questionnaires were sent to college administrators throughout
the United States. Two hundred ten of these were identified as a purposeful sample. As a
purposeful sample, these colleges and universities were hand selected by the researcher
as a result of a triangulation of lists from three special education high schools, one in
New York, one in California, and one in Washington, DC. These lists represented the
colleges and universities that their ADD students had applied to and been accepted. The
second group of 200 colleges and universities were randomly selected and were done so
without prior knowledge as to the strength or availability of disability services available
at these institutions.

Each administrator was asked to complete the copy of the survey sent to them or
to go online to an address on Surveymonkey in order to complete the survey. Fifteen
administrators chose to respond via the web using Surveymonkey. Using SPSS,
frequencies were calculated for those questions that were structured, close-ended and
could be coded. A number of open-ended questions were posed to administrators as follow-up to the closed-ended questions. These responses helped to further clarify specific areas of interest to the researcher and are presented throughout this section in support of the more structured responses.

In addition, a number of cross tabulations were conducted to identify possible trends and patterns. These patterns and trends were based on the size of the institution (small, medium, large), the type of institution (public or private), the type of degree granted (2-year and 4-year), and whether the information came from the purposeful sample or the random sample.

Simple Frequencies

The text and eight tables that follow help present overall findings of the research based on simple frequencies.

Table 1 shows that the respondents were primarily from small, private institutions, granting 4-year degrees. These results reflect the overall responses of the 103
questionnaires that were returned and do not necessarily reflect any type of conclusion that might be prematurely reached regarding which type of institution provides more accommodations for ADD student. These variables which focused on institution size, type of institution, degree granted, and sample type were later used in conducting cross-tabulations with all of the variables and examined for possible patterns and trends that might exist and warrant further more conclusive research to be conducted.

<td>2.9</td>
</tr>
</tbody>
</table>

Table 2 shows that most of the institutions responding have more than 3 people staffing an office that serves special students. When asked if the staff was trained in issues related to disabilities, 86 percent indicated that they were. Administrators were also asked whether they had seen an increase, decrease or no change over the last five years in the number of students with ADD, 87 percent responded that they had seen an increase, 11 percent said that they did not know one way or the other and 2 percent said that they had not seen a change.

To gain a better understanding about how students learn about accommodations available from the colleges and universities, administrators were asked how a student might come to know about such accommodations. Ninety-six administrators responded
to this question and stated that information about disability services is made available in the school’s catalog, online on their websites, in all admission information, and through displays throughout their campuses. When asked if administrators share information regarding the student’s ADD with faculty who will be teaching the student, 79 percent said that they did. Further comments regarding this issue repeatedly supported what one administrator stated which was

“only if the student signs a document stating that he/she permits the Office of Disability Services to send out a form informing professors of students in their classes who are registered with us. It is the students’ responsibility to share their individual accommodation plan.”

In other cases administrators indicated that they sent out a generic or form letter from the disability office to faculty without any reference to a specific student in case the faculty found that they were in need of such information.

Several questions were asked in order to gain a better understanding of how administrators make decisions regarding the delivery of services to students with ADD. Ninety-two percent of the respondents indicated that they use psychoeducational and neuropsychological evaluations in making service delivery decisions. Table 3 shows that the majority of the institutions that use these tests in making service delivery decisions, use summary reports, followed by recommendations by assessors, and cognitive strengths and weaknesses. The use of test behavior, which basically looks at
how a person behaves during a test and is primarily noted through observation by the person administering the test, was used the least.

</tbody>
</table>

Sixty-one percent of the institutions said that they use other assessments in making service delivery decisions. Further questioning regarding these assessments included a student’s IEP report, the Wechsler Adult Intelligence Scale, Woodcock-Johnson Psycho-educational Battery’s Tests of Cognitive Ability, Kaufman Adolescent and Adult Intelligence Test, Stanford-Binet Intelligence Scale, Nelson-Denny Reading Skills Test, Stanford Diagnostic Mathematics Test, the Test of Written Language, Bader Reading Inventory Slingerland High School Screening Test, Woodcock Reading Mastery Tests, the Brown Attention-Activation Disorder scale, and the Detroit Tests of Learning Aptitude. Aside from using standardized tests as noted above, several respondents also relied on the student’s personal physician or psychologist’s confirming diagnosis or recommendations for input. Many of these institutions also stated that they required documentation that was specifically outlined and prescribed by their institution.
Having determined which components of the psychoeducational and neuropsychological evaluations are most often used in making service delivery decisions, administrators were asked about the usefulness of these various evaluation components. Table 4 shows that test behavior was deemed the least useful while cognitive strengths and weaknesses were found to be the most useful.

Table 4: Usefulness of the components of psychoeducational and neuropsychological testing

</table>
Some students arrive at college without a diagnosis of ADD and either seek help at that time from the institution or have been referred to the appropriate office on campus from an instructor or advisor. When asked if psychoeducational and neuropsychological evaluation is done to determine eligibility for an individual suspected of suffering from ADD, 35 percent indicated that some sort of testing was conducted. Though not specifically asked to do so, other administrators provided additional input in answering this question, and reported that while evaluation was not done at their institution, students were often referred to outside sources for testing but that many of the students, even when referred, did not go ahead and have the testing done.

Another section of the questionnaire asked about accommodations available at the college or university for use by ADD students. The first set of accommodations listed represented what is considered traditional accommodations that is to say, those accommodations mandated by law. Table 5 shows which accommodations were identified as being available to students.

Table 5: Traditional Accommodations Made Available to ADD Students

<table>
<thead>
<tr>
<th>Percentage of institutions providing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extra Time On Tests</td>
</tr>
<tr>
<td>Quiet Room for Test Taking</td>
</tr>
<tr>
<td>Note Taking</td>
</tr>
<tr>
<td>Extended Time for Graduation</td>
</tr>
</tbody>
</table>
This data clearly indicates that most respondents provided extra time on tests and a quiet room for test taking. It is also clear that not all of the above mentioned accommodations are available to ADD students.

The term *assistive technology* was also added to the traditional accommodations. Eighty-eight percent of the respondents said that their institutions provided assistive technology accommodations to ADD students. When asked if the number of students taking advantage of the traditional accommodations had increased, decreased or remained the same over the last five years, 89 percent indicated that more students were taking advantage of these accommodations. Asked if they surveyed their students to determine the level of satisfaction regarding use of these accommodations, about 44 percent indicated that they did.

Respondents were then asked about a second set of accommodations available to ADD students. This set focused specifically on assistive technology devices. Prior to asking about this second set of accommodations, participants were asked if they could define the term assistive technology. Ninety-eight percent or 101 respondents were able to provide a fairly accurate definition of this term which was similar to the definition provided in the first section of this document.

Table 6 shows the percentage of institutions that provide the different types of assistive devices available to ADD students.
Table 6: Assistive Technology Devices Available for Use by ADD Students

<table>

<td>60</td>
</tr>
<tr>
<td>Alternative Mouse</td>
<td>39</td>
</tr>
<tr>
<td>Alternative Keyboard</td>
<td>38</td>
</tr>
</tbody>
</table>

The majority of the respondents indicated that they provide computer generated voice devices for ADD students with fewer institutions providing the use of touch control devices. Though available, the percentage of students actually using these devices was less than 50 percent as shown in Table 7. Computer generated voice devices and speech-to-text devices were used the most, and touch control devices used the least.

</table>
Administrators were asked what other devices or products were specifically available for ADD students other than those listed earlier in the survey. Most answered either that no other devices were available, or referred to Kurzweil 3000 or Read Please. When asked an open-ended question that sought to identify what criteria administrators used to determine purchase of any assistive device, the responses fell into two distinct categories; the needs of the students as expressed by the students, and cost of the device.

When queried, 97 percent of the institutions indicated that they provide some sort of training for faculty who have ADD students in their classes. Open-ended responses on training included brown bag sessions on ADD, newsletters, training for all new faculty, special seminars, individual memos with suggestions sent to specific faculty, individual meetings with ADD students and their instructors, web-links, yearly letters at beginning of fall term, and waiting for the faculty to come forward with questions or needs. Questioned further about faculty training, many of the open-ended responses stated that most training was optional.

Two open-ended questions appeared at the end of the survey. One question asked about the barriers that prevent administrators from purchasing assistive technology for their students. The other question asked about challenges and areas within their own institution as well as nation-wide that need to be further addressed regarding college students with ADD. One-hundred out of 103 respondents took time to respond to these questions even though they were open-ended and at the end of the survey.
Regarding the barriers they believed prevented them from purchasing assistive technology devices, three categories emerged. The most listed was “no barriers at all”, followed by students being unaware of devices available to them and needing to actually and individually come forward to request them, and thirdly cost issues.

Finally respondents were asked what areas they believed needed more focus and attention nation-wide relative to college students with ADD. Multiple responses emerged. Most noted was training and education for faculty and residence hall staff. One administrator suggested

“…a better way to communicate the need of the student from the high school to the college. Coaching students to inform the students at the post-secondary level to self advocate. [Students] are too embarrassed to identify themselves—so their parents do it, and they [the students] rarely request services”.

Another administrator echoed this last statement by saying that

“Students need to be more assertive in getting what they need in college. So I guess they need more training in how their disability affects them and how critical it is that they get help.”

Other comments centered around better disability documentation standards that are followed from the high schools, psychologists, and medical doctors; the need for summer
orientations for these students to get them off on the right foot before they actually start classes; more in-depth look at time management and organizational skills; and much more technology procurement and more utilization of technology in classroom settings so that students feel more comfortable using technology outside of the classroom.

Categorical Framework

To enable a new framework of analysis to be used in the examination of the colleges and universities that participated in this study, 4 categories of disability services involvement were identified. The researcher was able to place the colleges and universities into the categories the categories identified in the first section of this document by examining whether there was a specific office or space that students with learning disabilities could come to on campus, the title of the person in charge of the office, the highest degree in education of this person, how many people are in these offices and whether the people in the office are trained in disability services. The description of these categories are repeated again as follows:

Category #1—postsecondary institutions that fall into this category are those that do not have well defined disability offices or spaces but subscribe to the letter of the laws that are required of them. In other words, there is no “Office of Disability Services” on campus. These institutions provide minimum accommodations and are more reactive than proactive when it comes to accommodating students with learning disabilities. Students often have to go to the Office of the Dean or the Dean of Student Services to
make any requests. Tables 8 indicates that 5 out of the 103 responding institutions could be placed into this category. Tables 9 through 12 provide a further breakdown by size of the institution, type, degree granted and sample types.

Category #2--postsecondary institutions that fall into this category are those that not only subscribe to the law but have a defined office or space that has the words “disability services” in the title. They have “coordinators” of this service who are trained in disability issues. They tend to be more pro-active than category 1 institutions. Table 8 shows about a third of the institutions responding fit this description. Very few of these institutions provided more than what might be considered the normally expected accommodations of note taking, extra time on tests, and quiet rooms. This group also represented the largest gap in having assistive technology devices available to their students.

Category #3--postsecondary institutions that fall into this category are those that have a defined office or space, and have a “Learning Disability Specialist” or “Director” and one or two staff members. Institutions are more proactive than either category 1 or 2, provide study skill interventions, and provide more accommodations beyond traditional accommodations or expectations, which often include assistive technology devices. Table 8 shows that most of the institutions responding could be placed into this category. These directors all had advanced degrees that included masters in vocational rehabilitation, reading, and special education. While citing availability of the most
number of assistive devices, they were also the ones with the least number of students taking advantage of these devices excluding those institutions that fit into Category #2.

Category #4--postsecondary institutions that fall into this category are those that go way beyond the letter of the law and are considered premier institutions when it comes to providing accommodations for their learning disabled students. They openly advertise their office and location. The director has two to three staff members and most often has a PhD in a related areas such as Special Education or Psychology. This office applies for and receives grants, and is often looked to as the leader in the field with published research appearing in respected journals. Table 8 shows that slightly more institutions than those identified as fitting into category 1 could be placed in Category #4. Questions regarding the application and use of grants in relation to research were not addressed in this study, however, those in charge of the offices all held PhD degrees.

Cross-Tabulations

Often cross-tabulations will uncover relationships, patterns or trends that are not recognized through simple frequencies. Several of the research questions suggest the need to go beyond these frequencies and study several of the key variables to determine if these variables give any particular direction to the data. However, due to the exploratory nature of this study and the limited number of responses, tests for significance were not performed rather more reliance was placed on a series of cross-tabulations in identifying any patterns or trends.

The cross-tabulations were conducted using the variables of institutional size as identified by small, medium, and large, institutional type specified as private or public, and degree granted whether a 2-year degree or 4-year degree. In addition, the two types of samples, purposeful and random, were crossed with the survey variables to examine any trends or patterns that might emerge.

Institutional Size

Table 9 address the cross-tabulation constructed for the variable of institution size. Each institution was asked if they were a small institution, medium size or large. Fifty-three institutions responded that they were small institutions, 31 said they were medium in size and 19 said they were large.

In examining Table 9, one sees that more small private schools responded to the survey than medium or large institutions. Small institutions accounted for more 2-year degrees than large institutions and also more 4-year degrees than medium institutions. Small institutions also indicated that they did not always have a defined space for disability services and that students had to go to other offices such as the Office of the Dean or Student Services in order to get assistance with their needs. Small institutions had more offices staffed by 1 or 2 people when compared to medium and large institutions but showed more trained staff when compared to large institutions. Small institutions expressed less knowledge in knowing whether there had been an increase or not in the number of ADD students over the last 5 years as compared with medium and large institutions.

Small institutions along with medium and large schools showed relatively no difference in the use of psychoeducation and neuropsychological tests in making service delivery decisions. Small institutions relied less heavily on the use of cognitive strengths.
and weaknesses, academic strengths and weaknesses, and test scores, as did medium and large institutions. Small institutions along with both medium and large did rely on summary reports and recommendations from assessors.

Regarding the usefulness of the various evaluation components, small institutions found the use of summary reports and recommendation of assessors to be the most useful and the other components to be at least moderately useful. Small institutions also indicated that they used other assessments in making service delivery decisions more so than either medium or large institutions. Small institution said that they did not do as much testing of suspected ADD students as medium and large institutions.

Regarding the provision of traditional accommodations to ADD as noted in Table 13A, students small institutions allowed for lighter course loads when compared to medium and large institutions and also allowed for early registration and extended time to graduate when compared to large institutions. There was no appreciable differences noted regarding small institutions relative to the remainder of the traditional accommodations.
which included note taking, extra time on tests, and providing quiet rooms for test taking, as nearly all of the respondents, regardless of size, responded that they provided such accommodations. Small institutions did indicate they believed over the last 5 years, that either fewer students were actually taking advantage of traditional accommodations as provided by the institution or they just didn’t know whether the number of ADD students using these accommodations had increased or decreased. Small institutions indicated that they did some surveying of students which was about the same extent as medium schools but not as much as large institutions.

In examining the provision of assistive technology accommodations and devices to ADD students as noted in Table 14, small institutions noted less availability than both medium and large. Noticeable differences in availability between institutions seems to occur with voice-activation devices, touch-control devices computer generated voice device, alternative mouse and keyboard when compared to both medium and large institutions. Speech-to-text devices were less available at small institutions when
compared to medium size institutions. Without comparing small institutions to medium or large, it is apparent in this table that less than half the students are utilizing voice activation devices, none are using touch control devices, less than half are using computer generated voice devices, or an alternative mouse or keyboard. Almost all are using speech-to-text devices. However, when compared to large institutions, more small institutions indicated that ADD students are using other devices.

Medium size institutions accounted for the largest response relative to public 2-year schools. They indicated that they had more than 3 people on staff which was much more than was indicated by small institutions and about the same as large institutions. Nearly all of the medium institutions showed that their staff was trained in disability service issues and showed a considerable gap compared with large institutions. There is also a considerable gap between medium size institutions and small institutions in their knowledge of whether the number of ADD students has increased over the last 5 years as medium institutions believe that this number has, indeed, increased.

While admitting to using psychoeducation and neuropsychological evaluations when making service delivery decision, medium institutions appeared to use these to a lesser degree than small or large institutions. They used cognitive strengths and weaknesses, academic strengths and weaknesses more than small institutions and test scores and test behavior more than small but not as much as large institutions. Of the three sizes of institutions studied, medium institutions found cognitive strengths and weaknesses, academic strengths and weaknesses, and summary reports to be very useful.
compared to small and large institutions, and to a lesser degree than small institutions, used other assessments in making service delivery decisions. Medium institutions indicated than they did more testing of students suspected of having ADD than either small or large institutions. This size institution also allowed for early registration and extended time to graduate as compared to small or large institutions.

Medium size institutions, as shown in Table 13A, showed a greater preponderance to allowing early registration for ADD students, lighter course load and extended time to graduate as compared to small and large size institutions.

Differences in making assistive technology devices available appeared more when comparing medium institutions with small rather than large institutions when looking at voice activation and touch-control devices. Whereas medium institutions appeared to provide more speech-to-text and computer generated voice devices than either small or large institutions. When addressing the availability of AT devices and the use of these devices as shown in Table 14, most students are using the speech-to-text devices as compared to using the other devices available at medium institutions. Finally there appears a considerable gap between medium sized institutions and both small and large institutions regarding other devices ADD students are using as it appears that more ADD students are using other AT devices at medium institutions than small or large institutions.

When comparing large institutions with small and medium, it is the large institutions that are most associated with 4-year degrees followed by small institutions
and then medium sized. It is the large institutions that show more than 3 people on staff
followed by small institutions with 1 person and medium institutions reporting 3 people.
Large institutions overwhelmingly claim that the number of ADD students has increased
over the last 5 years followed closely by medium sized believing this to be the case. All
of the large institutions indicated their use of psychoeducation and neuropsychological
evaluations in making service delivery decisions and also their specific use of cognitive
strengths and weaknesses, test scores, and summary reports. To a lesser degree, and less
than medium sized institutions, they are using academic strengths and weaknesses.
However, they appear to be using the components of the evaluations to a far greater
extent than small institutions. While admitting that they are using these evaluations,
comparing their responses to how useful they find each of the components nets a different
result. Aside from finding test scores the most useful, the usefulness of the other
components do not rate very high and often fall below both small and medium sized
institutions. They also indicated much less use of other assessments in making service
delivery decisions when compared to both small and medium institutions. Large
institutions, however, appear to survey their students for satisfaction with
accommodations more than both small and medium institutions and provide less testing
for suspected ADD students. Early registration, lighter course loads and extended time to
graduate do not seem to be offered to the same degree as with small and medium
institutions. Large institutions believe that the number of ADD students taking advantage
of the traditional accommodations has increased over the last 5 years.
Large institutions along with small and medium institutions admit the availability of assistive technology for ADD students. The availability of voice activation devices and touch control devices is comparable with medium institutions but show a wide gap with small institutions. Speech-to-text devices, however, appear less evident in large institutions when compared to both small and medium institutions. Computer generated voice devices appear to be slightly less available when compared with medium size institutions but again the gap is large when compared to small institutions. Large institutions show much more availability of the alternative mouse and keyboard.

Referring again to Table 14 which shows institutional availability of AT devices at large institutions along with use by students of a particular technology, it appears that students at large universities are using voice activated devices, speech-to-text devices, and computer generated voice devices. Whereas, in spite of the availability of an alternative mouse and keyboard, few students are using these particular devices. Large institutions also show a considerable reduction in other devices being used by ADD students when compared to small and medium institutions.

**Institutional Type**

The next cross-tabulation took a look at the type of institution, that is, private or public institutions. Table 10 should be consulted for this analysis. Fifty-six institutions responding were private and 47 were public.

Private institutions accounted for more offices with only 1 staff member when compared to public institutions. They also accounted for more offices that were not specifically designed to handle students with disabilities and also witnessed less of an increase in the number of ADD students over the last 5 years. There was no appreciable difference between private and public institutions in their use of psychoeducation and neuropsychological evaluations but private institutions relied on cognitive strengths and weaknesses and academic strengths and weaknesses less than public institutions. Regarding the use of the other evaluation components there was seen no real differences between the two types of institutions.

Regarding the usefulness of the different components of the evaluations, private institutions consistently found these components to be moderately more useful rather than very useful except concerning the usefulness of the recommendation of the assessors. Private institutions also used other assessments more so than public institutions. Private institutions also indicated that more testing is done on students suspected of having ADD.

As seen in Table 13B, there was no appreciable difference in the availability of traditional accommodations compared to public institutions except regarding early
registration which seems somewhat less prevalent in private institutions and lighter
course load and extended time for graduation which seemed to be allowed more in the
private institutions. Both private and public institutions believe they have seen an
increase in the number of ADD students taking advantage of traditional accommodations
during the last five years. Private institutions appear to survey their students regarding
satisfaction more than public institutions.

Table 13B: A Comparison of Standard Accommodations with Type of Institution
Number presented are in percentages (%)

Private institutions reported less availability of all assistive technology devices
when compared to public institutions as well as less use of what they did have by ADD
students. When compared to public institutions, private institutions indicated that their students were not using other assistive technology devices.

Public institutions accounted for the most responses relative to medium size institutions. Public institutions also accounted for more 2-year degrees being granted and less 4-year degrees. Public institutions indicated that they had more than 3 people staffing disability services offices and that they had witnessed more of an increase in the number of ADD student over the last 5 years than private institutions. Public institutions were shown to rely slightly less than private schools in using psychoeducation and neuropsychological evaluations when making service delivery decisions. However, overall seemed to use all of the components of the evaluations slightly more than private institutions. They also indicated that they found each of the components more useful than private institutions except regarding the usefulness of recommendations from assessors in making service delivery decision. This component of the evaluations they only found moderately useful. Public institutions did not rely on other assessments in making delivery decisions as much as private institutions. Public institutions also did not test students suspected of having ADD as much as private institutions.

Public institutions seemed to provide the same traditional accommodations as private institutions except in the area of early registration, lighter course load and extended time to graduate where they appeared to do less. However regarding assistive technology devices, public institutions provided more of all of the devices including
voice activation devices, touch control devices, speech-to-text devices, computer
generated devices, alternative mouse and keyboard when compared to private institutions.
Relative to usage by ADD students, again public institutions, as seen in Table 14, showed
more students using the devices than students in private schools, especially in relation to
the use of speech-to-text devices. Public institutions also indicated a slightly higher
degree of usage by their students of other assistive technology devices when compared to
private institutions.

Degree Granted

Table 11 capture the cross-tabulations using the degree granted whether it be 2-
year or 4-year. Thirty-four 2-year institutions responded as well as 67, 4-year
institutions.

2-year degree granting medium sized public institutions accounted for the majority of the respondents. These institutions indicated a slightly higher availability of defined office space for disability services when compared to 4-year institutions. They also had offices with three or more people and indicated that their staff was better trained in disability services when compared to 4-year institutions. 2-year institutions believed more than 4-year institutions that they have seen an increase in the number of ADD students at their institutions over the last 5 years.

Both 2-year and 4-year institutions appear to use psychoeducation and neuropsychological evaluations as well as all of the components of the evaluations, however, 2-year institutions appear to use the test behavior component less than 4-year institutions and rely on the recommendations from the assessors in making service delivery decisions a bit more heavily than 4-year institutions. 2-year institutions found cognitive strengths and weaknesses, academic strengths and weaknesses and recommendations from assessors to be more useful than 4-year institutions and test scores and test behavior only to be moderately useful. 2-year institutions also relied less on other assessments in making service delivery as compared to 4-year institutions. 2-year
institutions also indicated that they do considerably less testing of students suspected of having ADD.

Relative to providing traditional accommodations Table 13C shows that 2-year institutions provide early registration, lighter course loads and extended graduation times more than 4-year institutions. There was no appreciable differences between 2-year and 4-year institutions regarding availability of note takers, extra time on tests or quiet rooms for taking tests. 2-year institutions also do not survey their students as much as 4-year institution and do not share as much information with faculty relative to dealing with ADD students that may be in their class rooms.

Table 13C: A Comparison of Standard Accommodations with Degree Granted Institutions
Number presented are in percentages (%)
2-year institutions appear to have more of the assistive technology devices available for ADD students including voice activation devices, touch control devices, speech-to-text devices, computer generated voice devices, alternative mouse and keyboards. Usage wise, as noted in Table 14, more students are using speech-to-text devices more than the other devices. More students at 2-year institutions also seem to be using other devices when compared to 4-year institutions.

The 4-year institutions who responded were primarily small private institutions. They reported 3 or more people on staff in disability offices but also reported slightly less defined disability office space when compared to 2-year institutions. They also indicated that their staff is less trained in disability services issues than those in 2-year institutions. These 4-year institutions say that they have not observed as much of an increase in ADD students over the last 5 years when compared to 2-year institutions and also indicated that some simply do not know if the number of ADD students has increased or decreased. Like 2-year institutions, they make use of psychoeducation and neuropsychological evaluations and rely a bit more heavily on academic strengths and weaknesses, test scores, and test behavior than 2-year institutions and slightly less on
recommendations from assessors. Subsequently they are not finding cognitive strengths
and weaknesses, academic strengths and weaknesses or recommendations from assessors
very useful but rather moderately useful except for summary reports which along with 2-
year institutions, they find very useful. 4-year institutions indicated that students are
better informed of where to go on campus for disability services when compared to 2-
year institutions. These institutions also survey their students for satisfaction more than 2-
year institutions.

Referring back to Table 13C relative to providing traditional accommodations, 4-
year institutions fall slightly short when compared to 2-year institutions especially
regarding early registration, lighter course loads, and extended time for graduation. They,
however, seem to offer note takers to a greater degree than 2-year institutions and also
share more information with their faculty regarding ADD students in their classrooms.
While initially appearing to provide more assistive technology devices as compared to 2-
year institutions, in actuality, when individual devices are compared, 4-year institutions
fall vastly short in providing these devices. However, as noted in Table 14, and similar to
2-year institutions, students at 4-year institutions are making more use of speech-to-text
devices than another other device available but are not using as many other devices as
students in 2-year institutions.

Two Sample Types
Table 12 addresses the results of comparing the purposeful sample and the random sample. Thirty-eight responses came from the purposeful sample and 65 from the random sample.

Both samples indicated that they had defined disability space. The purposeful sample respondents had far more staff members, that is, more than 3 people staffing their offices as compared to the random sample. Both indicated that their staff was trained. Both claim to witness an increase in the number of ADD students over the past 5 years. Respondents from the purposeful sample indicated a greater use of the psychoeducation and neuropsychological evaluations than those that responded from the random sample. However, use of the various components of these evaluations was fairly equal among the two samples with the exception of test scores and test behavior that were used more by the purposeful sample than the random sample. The purposeful sample group found the evaluation components mostly moderately useful except for the use of summary reports, and recommendations from assessors which they found to be very useful. Purposeful
sample respondents also make more use of other assessments in making service delivery decisions when compared to the random sample. When it came to informing students of where to go on campus for disability services, the purposeful sample fell short of the random sample. Both samples seem to test suspected ADD students.

Purposeful sample respondents indicated they provide more opportunities for note taking, lighter course load, extended time for graduation and more assistive technology devices. In addition, purposeful sample respondents indicated that they survey ADD students more than random sample respondents. Each, however, equally share information with faculty relative to dealing with ADD students in their classrooms.

Shown in Table 14, purposeful sample institutions provide more touch control devices, speech-to-text devices, computer generated voice devices, alternative mouse and keyboards than random sample respondents. More students at the purposefully selected institutions use speech-to-text devices than other devices these institutions have available.
for them, and more students at the purposefully selected institutions use other devices than students at the randomly selected institutions.

The responses from the random sample came from small sized, 4-year, public institutions. The random sample respondents indicated that they had more offices staffed by 1 person, or 3 people than the purposeful sample respondents but less offices staffed with 2 people or more than 3 people. Random sample respondents seem to equally provide disability services offices when compared to the purposeful sample, also registered the same knowledge concerning the increase of ADD students over the last 5 years. Both agreed that they had.

Random sample respondents seem to rely on the psychoeducation and neuropsychological evaluations less than the purposeful sample respondents and did not appear to utilize the components of the evaluations to the extent that the purposeful sample used them, most noted in the use or less reliance on test behavior and recommendations of assessors in making service delivery decisions. However, they did indicate that they found cognitive strengths and weaknesses, academic strengths and weaknesses, test scores, test behavior and summary reports to be very useful as compared to the purposeful sample respondents. They also indicated that they inform students of where to go on campus for disability services more than the purposeful sample respondents. There was no appreciable difference between these two samples relative to testing suspected ADD students.
Random sample respondents indicated that they did not provide opportunities for note takers to the degree that purposeful sample respondents said. Nor did they provide lighter course loads or extended time to graduate when compared to the responses from the purposeful sample. There was no appreciable difference between the samples relative to the number of students taking advantage of the traditional accommodations offered by the institutions over the last 5 years as both indicated an increase. Random sample respondents did, however, indicate that they did not survey their ADD students as much as the purposeful sample institutions.

As shown in Table 14, random sample institutions did not provide as much assistive technology devices as the purposeful sample institutions; notably in regards to all of the devices except for voice activation devices which showed slightly more availability. Usage by ADD students, however, of speech-to-text devices was high as was also shown with the purposeful sample. But in general, most of the devices do not seem to used a lot. ADD students attending institutions that were part of the random sample also are not using other devices as much as those attending the purposeful sample institutions.
Student Participant Information

Eighteen college students responded to questionnaires that were distributed by their respective institutions. In addition, four college students responded from a group of 35 who graduated from a high school that focused specifically on students with learning disabilities. The responses generated from these questionnaires were meant to be totally exploratory and due to the relatively low response, responses should not be taken as conclusive or generalizable but do lend more insight into the world of the ADD college student. 16 of the students came from the randomly selected institutions, 6 from the purposefully selected sample. Nine of the students were sophomores, 12 were juniors. One student was finishing up a doctoral program. Fourteen students were female and 8 were males. All 22 responses came from 22 different institutions. When asked at what age they were diagnosed with ADD, ages ranged from 6 to 18. One student was 34 years old. When asked what was the biggest problem they had with their disability prior to going to college, trouble focusing and staying on task were the most noted ones experienced by these students. Additionally, hyperactivity was stated as a problem.

The responses by the 4 students from the special high school compared to the other 18 college students began to differ when asked about accommodations provided to them prior to attending college. The students from the special high school were all provided with accommodations that included such items as the use of a metronome to help them remain focused. Prior to going to college, students from the special high school were not only afforded note takers, and extended time to graduate, but were also
exposed to a variety of assistive technology devices such as voice activation devices, touch control devices, speech-to-text devices, computer generated voice devices, or alternative mouse or keyboard. None of the other 18 students said that they had had any exposure to this technology. All 4 students from the special school had an Individual Evaluation Plan (IEP) along with an Individual Transition Plan (ITP) created for them. Only 1 out of the other 18 students had an IEP created that provided some additional information that helped them transition to college.

When asked what reasons factored into their selection of colleges, multiple answers from all 22 students emerged including the price, location, program, and size. Not one answer stood out as dominant. However, all of the students responded that their parents played the most pivotal role in encouraging them to go to college. Only 1 student out of 22 said the main reason they chose the college they are now attending was because of the disability office/services. This student was the one pursing a doctoral degree. This same student went on to say that not only did the institution have an individual counselor who assisted with education planning, provided special sessions to explore career options, but gave this student full access to a high tech center where they could use programs including the Kurzweil reading program and other equipment to assist in their homework.

Aside from the one student, accommodations the students were using as provided by the college or university consisted solely of note-takers, and extra time on exams in a quiet room and nothing else. Most of the 18 students indicated that they were simply put
on medication and that few if any accommodations were made available to them. However, although noted as being used, note-takers were identified by several students as being the least helpful. When asked about level of satisfaction, most were dissatisfied with the accommodations they receive at college, and one student wrote, “who cares if we are satisfied or not.”

Only two students out of 22 were able to provide a definition for assistive technology. The others simply stated that they did not know what it meant. All but one of the 18 students indicated that they were not using any assistive technology devices provided by the college.

A few of the students responded when asked what they believed has been their biggest challenge at college. Test taking seemed to be the biggest challenge followed by short term memory loss. Several of the students mentioned difficulty with faculty not really understanding their disorder and sometimes humiliating them in front of the class. Adjusting to individual professors was an issue as well as identifying someone to go to for help posed another. One student wrote “Teachers sometimes can be difficult with us in terms of treating us like we have done something wrong”. Another student wrote

“ I study all the time, and I still struggle to get decent test grades most of the time. It would be nice if classes offered a variety of different ways to obtain grades (papers, projects, etc.) so that if someone like me has trouble in one area they can make it up in a different area.”
One student said “trying to forget that I have ADD” was their biggest challenge. Still another wrote, “I have felt so lost in choosing my major. In some ways it is like being thrown into a lake and trying to swim for the first time.” And finally another wrote that their biggest challenge was, “…not giving up when things are too difficult for me”.

CONCLUSION

This section addresses the 4 main research questions relative to the findings and explores the implications for practice, policy and further research that continues to be needed regarding college students with ADD. It is again important to note several issues before reading this section of the study. First, it is important to remember that the information generated from the questionnaires is exploratory in nature even though some quantitative analysis was conducted on the administrator data. Second, the group of college students responding was very small and can only lend a small amount of credibility to the overall findings and subsequent discussion of the findings. Finally, in addressing ADD as a learning disability, it is important to recognize that focusing on this disorder with adults and playing out the consequences in higher education is still very much in the infancy stage.

Research Questions

Research Question #1— How do the colleges and universities fit into Categories #1-4 of disability services?

The researcher attempted to place the responding institutions into 4 different categories. No underlying assumptions were made going into the study as to which category would be most represented. Nor was it assumed that each institution would necessarily fit nicely and cleanly into a particular category. Placing the colleges and universities into a category proved to be a challenge. If the number of people on staff in a disability office had been a key determinant, the research showed that the majority of
those responding, although not a large number, had more than 3 people. If the training of
the staff was deemed more important than some of the other characteristics, a large
number of respondents replied that their staff was trained in disability issues. If the
availability of accommodations played a primary role, nearly all of the respondents
indicated they provided most of the traditional accommodations. A couple of key
determinants were therefore used to separate the institutions. These included the presence
or absence of a defined disability space or office for students, the education credentials of
the person in charge of the disability office, the degree to which the assistive technology
were specified as being provided and the type of comments that appeared in the open-
ended questions. Based on this evaluation made by both qualitative and quantitative
review by the researcher, the research showed that most colleges and universities fell into
Category #3. Category 3 points to more of a commitment on the part of colleges and
universities to address students with learning disabilities and specifically ADD. Directors
of these disability offices hold advanced degrees, more of their staff is trained in
disability issues, all promote their services and provide what they can beyond traditional
accommodations for these special students.

While it is encouraging to see a possible trend of so many of these institutions
being able to be placed into the third category, there is always room for improvement and
movement into Category #4. Unfortunately, colleges and universities placed in Category
#4 were almost the same number that fit into Category #1. With an ever-increasing
number of ADD students going on to higher education, having disability offices that are
considered superlative and exemplary in their endeavors to address these students is growing both in need and importance. These are the offices from which rich research can be generated providing mounting evidence as to needs and successes with various assistive technology. These are the folks who have front row seats in conducting action research and reporting their scholarly findings to the field.

What is clear from this attempt at creating a framework of analysis is that it is difficult to do as there is much overlap in the category characteristics identified. Some may argue that more institutions should be considered in Category #2 rather than Category #3. Also, some of the institutions identified in the purposeful sample suspected as being models for serving ADD college students did not respond to the survey despite several attempts to solicit feedback. If these institutions had responded, possibly more of the institutions would have fallen into Category #4.

Others have attempted to create guides for students and parents in identifying institutions that tend to support students with learning disabilities. Peterson’s guide entitled *Colleges for Students with Learning Disabilities or ADD* identifies colleges and universities that are either Self-Directed/Decentralized programs or Structured/Proactive programs. Structured/Proactive programs go well beyond those services that are legally mandated. The student is provided with a more structured environment which includes a low staff/student ratio. Extra program fees, separate applications and a limit to the number of students accepted into the program allow the Structured/Proactive programs to maintain a larger staff to better meet the needs of these students. These programs would
necessarily compare to categories 3 and 4 as outlined by the researcher. After receiving
and reviewing the administrator responses, 10 percent or about 11 institutions could be
further classified by Peterson’s guidebook as Structured/Proactive.

Sixty percent or 62 institutions responding to the survey could be identified as
Self-Directed/Decentralized according to Peterson’s guide. These programs require
eligibility for services through the provision of disability documentation that meets
institutional standards. There is no guidance under IDEA, Section 504 or the ADA that
requires colleges to accept documentation that does not meet their guidelines. Each
college has the right to develop its own guidelines and adhere to them. Schools within the
same state may have different criteria for determining eligibility for learning disability
services. Comments provided by study respondents often cited use of their own standards
of documentation and assessment when making service delivery decisions. Peterson also
points out that these programs are often coordinated through the Disability Services
Office, and are based on need as specified by the student’s documentation. Services may
also be offered through other offices throughout the campus and some services provided
that are not mandated by laws. Student progress is usually not monitored.

Many parents, students and high school counselors count on the information
provided in the Peterson guide. However, with criteria for assessment and provision of
services appearing to cost families more money on top of ever increasing tuition rates or
on the other hand rather random and at times sketchy, and with student progress and most
likely, satisfaction with services not tracked, a reassessment on the part of these institutions in how they are addressing students with ADD is more than necessary.

In addition to the categorization that was examined as well as the separation of institutions and programs by structured and decentralized as presented in the Peterson guide, a series of cross-tabulations was conducted and included an examination of the size of the institution, that is, small, medium and large, the type of institution, private or public, and two types of degrees granted, a 2-year degree or a 4-year degree. No preconceived formation of size, type or degree granted was constructed prior to going into this study. Obviously more research can be conducted based on these exploratory findings and initial findings. More discussion regarding the cross-tabulation findings will be discussed later on in this section. In addition, a cross-tabulation of the two types of samples studied, purposeful and random was also conducted. A discussion of these findings are addressed under research question #3.

Question #2—Do colleges and universities provide ADD students with accommodations and what type of accommodations are they providing.

Two sections of the administrator questionnaire addressed the question of accommodations. One section addressed traditional accommodations and the other assistive technology. Taken as a whole, a very high percentage of the responding institutions appear to provide the traditional accommodations that basically meet the standards of federal legislation. Better than 50 percent of these institutions provide such accommodations as note taking, quiet rooms for test taking and extra time on tests. A
lesser percentage provide early registration, lighter course loads or extended time for graduation. The data also showed that these institutions, whatever size, type or degree granted, mostly believe that more students are using accommodations with a good number of administrators stating that the number of students taking advantage of traditional accommodations have increased over the last five years.

It is heartening to see that for the most part, colleges and universities are providing traditional accommodations. But what is somewhat disheartening is that not a lot of the institutions survey their students to determine their level of satisfaction with the accommodations. Institution may be providing what they think students need or want, but appear not to have taken the necessary steps to determine this. The majority of the respondents indicated that they believed that the number of ADD students taking advantage of traditional accommodations had increased over the last 5 years. With less than 50 percent of those responding saying that they actually survey their students to determine satisfaction with accommodations, the question arises as to whether or not institutions actually track how many students are taking advantage of these accommodations or are making too many assumptions and not necessarily providing what students need. And students themselves, although based only on a very small number of respondents, say that their needs are not being met even with the seemingly simple task of an institution providing note takers. However, while administrators admit that they are making the necessary traditional accommodations available for use by students, they add that students are the ones that have the responsibility of stepping up
and making known what their needs are. So essentially, what they appear to be saying is that their role is more reactive than proactive, and it is not really their fault if needs are not being met. Obviously with only 43 percent of the respondents actually surveying students, there appears a great deal of room for becoming more proactive and for improvement when it comes to identifying not only how satisfied students are with the accommodations available from the colleges and universities they attend but what their needs really are remain unmet. This study did not fully pursue the issue of student satisfaction and should have asked administrators what they did with the results of the satisfaction surveys as well as if they actually asked students what they needed.

The issue of providing assistive technologies is another concern. Here the data becomes a bit muddy as most of the institutions indicate that they have assistive technology available. One might then assume that it really didn’t matter what size institution a student with ADD attended, what type of institution or what degree they wanted to pursue, assistive technology was available. However, when it came to examining the extent of this availability as well as the usage of the technology by ADD students, other findings surfaced. For example, small sized institutions conveyed less availability when compared to medium and large, private institutions showed slightly less availability than public institutions and 2-year degree granting institutions showed less availability as well.

In many cases, the findings examining the use of assistive technology by ADD students showed quite a gap between the fact that a particular device was available and its
use. This gap may prompt several questions, did the students not know what was available, did the students not care that a particular device was available, or did the student not need that particular device in the first place? These question can only be answered by the students, and getting to them for answers as indicative of this study is hard to do.

Question #3—Are the purposeful institutions that are known to have LD and ADD students apply and be accepted providing these students with more accommodations than the randomly selected institutions?

Some might assume that those institutions that draw special students with learning disabilities and specifically attention-deficit-disorder would be more accommodating than those that are not as well known for doing so. However, in speaking with several administrators, there are a number of factors involved even with those institutions to which ADD students are particularly drawn.

Some believe that the services and programs provided are only as good as the leadership of the disability office. Strong leaders have been lured away from strong programs to help strengthen lesser known or to develop new programs. Sometimes in leaving a strong program, the strong program suffers and though still expected to be strong, has lost some if not most of its strength in loosing its leader. Other institutions have been known to have great programs but do not go out of their way to necessarily advertise it.
Another issue regards the type of accommodations that a high school student wishes to have. Administrators agree that many ADD students do not self-identify once they come to college. Some actually choose not to attend an institution that might single them out with this disorder. As seen in the responses from the small number of college students for this study, only one student actually choose the college they are attending because of the services offered. Obviously the sample responding relative to this particular issue is much to small to draw any conclusions and much more research would have to be conducted to determine the percentage of ADD students who actually seek out institutions that provide specific services.

Having brought to mind a possible assumption that institutions that draw special students to them actually provide more support, it was also important to examine some other issues prior to addressing the data generated. The purposeful sample did show what might be considered a greater focus on ADD students than the random sample. Differences existed between the two samples in several ways. More of these institutions had larger staff, made greater use of psychoeducation and neuropsychological evaluations, used other assessments in making service delivery decisions, surveyed students for satisfaction. More of them shared information about ADD students with faculty. More of them used and found useful every component of psychoeducational and neuropsychological tests. More of them felt the need to also use additional assessments in making service delivery decisions. Regarding accommodations, purposeful institutions provided more traditional accommodations including more opportunity for note taking,
lighter course loads, extended time to graduate and early registration. They also provided more assistive technology devices.

Equally important is to address the areas where there was virtually no difference between the two samples. Both had office space designed for disability services; both claimed that their staff was trained in disability issues; both noted an increase in the number of ADD students attending their respective institutions over the last 5 years. Both tested students suspected of having ADD; both trained their faculty relative to ADD students; both informed faculty of these students in their classes and both indicated that the number of their ADD students taking advantage of accommodations had increased over the last 5 years.

What all this might mean is that specific institutions to which ADD students and other LD students are drawn, do provide more support in various areas but that other institutions provide support as well. To a larger degree, it comes down to what is important to a particular student relative to such things as very specific accommodations that would be available or whether the use of additional assessments in evaluating their need for accommodations plays a major role. For parents, students and school counselors trying to identify institutions that might be a good fit may not be determined as easily as one might think but require the evaluation of a number of factors including the size of the institution, type and degree sought.
Question #4—Is there a perceived gap between student need and actual provision?

To answer this question first requires a brief review of the law which points out an initial area where a gap might exist. As mentioned earlier, a person with a disability is defined by the Rehabilitation Act of 1973 and by the Americans with Disabilities Act of 1990 as an individual who has a mental or physical impairment that substantially limits one or more major life activities (28 CFR Part 36, Sec.104), has a record of such an impairment, or is regarded as having such an impairment. Section 504 of the Vocational Rehabilitation Act of 1973, Public Law 93-112 ensures the right of all qualified individuals with disabilities to equal post secondary educational opportunities and requires educational institutions to accept students with disabilities.

The enactment of PL 94-142 in 1975, provided for free and appropriate public education of all children with disabilities or handicaps. What was once referred to as the Education for All Handicapped Children Act later became know as the Individuals with Disabilities Education Act or IDEA. IDEA was created to protect the learning disabled student in the K-12 years. This act required the school to take responsibility for the identification of these special students and subsequent accommodations needed to enable them to participate in a school environment that is the least restrictive environment possible. An IEP (Individual Education Plan) with an ITP (Individual Transition Plan) is supposed to be written for the student and adhered to by the school during these years. IDEA also dictates that all children with disabilities or handicaps between birth and 21 years of age should be served.
Administrators may say there isn’t a gap because they are providing the traditional accommodations according to the letter of the law and are thus providing what the students need. Yet most of the small group of students who shared information with the researcher indicated that they did not have an ITP as part of any plan to move on to higher education. While this group is hardly representative of all students who should, in theory, have an IEP along with an ITP, it gives pause to wonder how wide spread this lack of practice is. In addition, though small in number, the information supports a study by Shearin, et. al. (1999) which also found an absence of this provision and discovered that a vast majority of the IEP plans that they reviewed contained little if any information about this transition. There appears, therefore, a gap between what high schools are suppose to do to prepare students for college, and what they actually do.

The Rehabilitation Act of 1973, Section 504 also mandated that all colleges and universities in the United States receiving federal aid allows students with documented disabilities to request modifications, academic support, or auxiliary aids that allow them to participate and benefit from all the activities and programs that the colleges offer. Mandated services include the following: extra time on tests, permitting tests to be individually proctored, read orally, dictated or typed; the use of note-takers; the provision of adaptive technology; the provision of materials in alternate media. Adaptive technology includes computer hardware and software that allows students to access materials. This technology may enlarge print, actually read material out loud, type for students as they speak, highlight material, and organize writing material. By law,
colleges are not required to provide any diagnostic services, and the general understanding is that most do not have trained learning disability specialists. However, the results of this researcher’s exploration into these issues point possibly to a new and better direction on the part of colleges and universities in doing testing and having a staff that is trained in disability issues.

In an article by Lydia Block that appears in Peterson’s *Colleges for Students with Learning Disabilities or ADD*, she points out that under law, colleges are required to offer services, that most colleges do not offer remediation (special course work) and that students going on to college are expected to be prepared for the rigors of the course work. Institutions are only required to provide what is called *reasonable* accommodations.

Keim, McWhirter, and Berstein, (1996) suggest that postsecondary institutions struggle to determine what is meant by reasonable accommodations and what is actually required to meet legislated standards for supporting individuals with LD. They may also have difficulty determining which services are most beneficial and how limited funds should be divided among the different types of support.

It should be clear at this point that a gap does exist and that it should be more than just a perception. Where the gap exists and responsibility for its existence can now be addressed. The first place the gap may exist is in the interpretation of the law and the need to recognize that students with attention-deficit disorder are, indeed, people who have a mental or physical impairment that substantially limits one or more major life activities has a record of such an impairment, or is regarded as having such an
impairment as stipulated in the Rehabilitation Act of 1973 and by the Americans with Disabilities Act of 1990. These students need to be recognized as having a learning disability under the federal laws and regulations and eligible to take full advantage of anything any other learning disabled student can.

Peterson’s guide entitled *Colleges for Students with Learning Disabilities or ADD*, separates ADD from the title of learning disabilities and makes the type face the same small size as the word *with*. This separation from the term *Learning Disabilities* speaks volumes in how this disability is perceived. One administrator responding to the survey wrote on the survey that ADD is not considered a disability in her State. So ADD as a learning disability still remains in question, and any laws that might help these students also lie in murky waters.

Few researchers, as evidenced in the literature, have evaluated the impact of learning disabilities relative to college student, let alone students with ADD. Cordoni (1980) suggest this lack of research can be attributed to a lack of research in general on college students with learning disabilities. ADD college students seem to have suffered the most and as a consequence, many services directed toward them lack empirical support, or are presumed effective without a formal evaluation, or in worst cases are discontinued due to lack of evidence.

In addition to the lack of recognition of this disability as a learning disability, the gap between what is provided and what may be needed is again evidenced in the relatively small number of institutions that survey their students for satisfaction. If
nothing is collected, no knowledge is gained and no changes can be made. However, since there was no information collected for this study specifically seeking input on the questions that institutions ask on surveys except whether surveys are administered, there is no way of knowing whether these institutions ask what other accommodations and devices students would like to have and where exactly gaps may exist relative to what is provided and what might instead be needed. Further research in this area may yield results to the contrary and indicate few of any gaps exist but until more institutions engage in survey administration or other measures such as focus groups, meta-analysis and the like, the question of whether students are getting what they need will remain open. While some administrators may still believe there is no need to survey students in order to better address their needs, issues of cost and funding surfaced as barriers to purchase of devices for ADD students and these issues would certainly qualify as contributing to the gap between what is provided and what may be needed.

Another gap may not be so easy to bridge. Once a student enters college, the Rehabilitation Act of 1973 Section 504 and the Americans with Disabilities Act (ADA) take over. When a learning disabled student with attention deficit disorder arrives at college, it is their responsibility, and not the institutions responsibility to identify themselves to the appropriate office in order to access special accommodations. While administrators admit that they have seen an increase in the number of students with ADD over the last 5 years, the question remains, how many more have not self-identified. And how many more need help and are not getting it. Simpson as cited in Vogel and
Adelman, 1993 contends that the majority of young adults with learning problems have failed academically in college because of weaknesses in reading comprehension, reading rate, written language, or mathematics. Ineffectual study habits and lack of organizational and time management skills compound their problems. All of which would be improved if accommodations were more forth coming.

In addition, students by their own admission, are not making their needs known by stepping forward and asking for help especially when it comes to asking for assistive technology. Also under consideration are students’ inability to define and understand what the term assistive technology means when asked, as well as their lack of use or exposure in pre-college education, both of which might contribute to their inability to ask for this type of technology once they get to college.

A recent survey compiled for the Maryland State Board of Education in 2004 by Maryland Business Roundtable for Education, a group that has been tracking technology use in Maryland classrooms since 1996 found that both students and teachers are not doing a lot with technology in the classroom. The report found that 40 percent of the students use word processing, and about half use the Web for research.

These statistics are still troubling given that the report shows a dramatic increase in the ratio of student to computer when comparing 1997 to 2004. The report found a 12 to 1 ratio of student to computer in 1997 compared to a 5 to 1 ratio in 2004. Okpala and Okala (1997) suggest that E-Mail and word processes are the two teaching tools that most faculties are familiar with and have a wide degree of experience with but that fewer
faculty members have knowledge of and experience in software presentation, multimedia, and distance learning. Ely (1989) also noted that computers could be found in almost every public school in the United States. In a 2001 study by Zhao and Czuko, these researchers point out that

“There is an ironic and costly contradiction in the attempt to integrate technology into education. While evidence of the educational benefits of technology abounds and investment in hardware and software has dramatically increased, relatively few teachers use technology regularly in their teaching and the impact of computers on existing curricula is still very limited.” (p.5).

Yet use of technology to assist ADD students, at least according to the ADD students who responded to the study, suggest little if any exposure to use of assistive technology devices prior to going to college. Granted these studies speak more to computer use by pre-college students and teachers, however, given the increased exposure to computers, at least on the part of students in Maryland, one might think that students in need of additional accommodations such as speech-to-text or voice activated devices connected to computers would be seeking these accommodations when they moved on to higher education, or that faculty would be making far more use of technology in college classrooms than they do.

Having addressed all 4 research questions, more questions seem to have surfaced in trying to understand the topic of this study; questions that may cause some to become defensive or even dismissive. However, this researcher hopes to bring hope and closure
to this study leaving the reader better knowledgeable about the challenges facing both institutions and ADD students, with a hope for the future in regards to providing what is needed for ADD college students.

The Future is Now

When one stops to think how relatively recent DSM-IV is, it is easy to understand that the learning curve needed to fully embrace all of the implications relative to diagnosis and treatment of adults with ADD have not been realized. It is also evident that a thorough understanding and application of the expectations and implications of federal legislation regarding individuals with special needs as well as the utilization of technology is still not where it should be.

There is little argument surrounding the provision of accommodations for individuals with a visible disability or those that are hard of hearing or deaf, and those that have an orthopedic handicap. With students who are deaf or blind, in wheelchairs or on crutches, visibly seeing the disability inspires those around to provide the necessary help that these students might need to succeed in postsecondary schools.

However, ADD is a hidden disability, and a great deal of controversy still seems to surround this group of students (Thurlow, Elliott, & Ysseldyke, 1998). Critics of the condition question whether or not a real condition actually exists let alone acknowledging it as a disability. Part of the controversy surrounding ADD is the comorbility of this disorder. Comorbility means there are other issues impacting the clear and true identify of a particular disorder. Often students with ADD suffer from hyperactivity, mood disorders
including schizophrenia, or depression. Often students are placed on a variety of medications, each aimed at targeting one or more of these ailments. Thus knowledge that ADD is most likely an inheritable neurological syndrome that causes many different symptoms such as distractibility, low tolerance for frustration and boredom, and a tendency to say or do whatever come to mind is still not widely accepted. It is small wonder that attention to this disorder is still, in 2005, not meriting the same type of attention and concern as some other disabilities labeled as learning disabilities.

While it is true that all students could benefit from having additional accommodations provided to them, the primary purpose of providing accommodations such as assistive technology is to level the playing field and without these accommodations, any work that these students do may not accurately measure what these students know and are able to do. Computer technology has the potential to help learners gather, manipulate, understand and use information more efficiently and effectively.

It was clear in this study that traditional accommodations are both being provided by colleges and university and used by ADD students. Utilization of assistive technology is another matter. Disappointingly, not as many institutions have these devices available to students. As mentioned earlier, cost and funding seem to set up barriers in the purchase of these products. However, do administrators know the cost of some of these products like Dragon Naturally Speaking or some of the Kurweil products? Are they truly not in a position to fight for a larger budget, or to seek grants or other outside, possibly corporate underwriting of some of these products? Are they not in a position to set up some type of
arrangement with the manufacturers of these products to provide them with a better cost (better than retail) for acquiring or leasing them? Is cost an excuse or really a barrier?

Are administrators even aware of these devices? Some question could be raised as to whether they are, in fact, knowledgeable regarding the array of devices on the market today. Several comments written in by administrators on the survey suggest that maybe they are not. Manufacturer representatives could be invited to postsecondary institutions to share their products. Some may even provide new products as pilot tests.

Also disappointing, even in comparison to the availability or lack thereof, of assistive devices, was the number of students who are actually using assistive technology devices to enhance their learning capabilities. Students also need to be made aware of these devices. But as noted earlier, some students who could definitely benefit from the devices, are not known to disability offices so getting material into their hands would be hard to do. It would be interesting to see how much material and what type of material institutions provide prospective students or high school counselors. Clearly the utilization of assistive technology in support of college students with attention-deficit-disorder has a long way to go.

There is knowledge needed elsewhere too. Why did so many of the administrator responses use the term *optional* when it came to training faculty in matters pertaining to ADD students? In addition, almost all of the administrators admitted to having information out there to make students aware of services available but apparently the word is not getting out to all those who need to hear it, leaving open the question of how
can accommodations and devices that are available to students who need them be communicated more powerfully? Not unlike the Lazurus and Davison (1996) study which surveyed faculty members at four year and community colleges in Michigan, Georgia, Wisconsin, Arizona, and New York about accommodating students with learning disabilities and found concerns about proper accommodations for LD students, lack of training or knowledge in dealing with LD students, issues surrounding the fairness of accommodations in terms of non-disabled students, as well as the future success of students with learning disabilities, the administrators who responded to this survey are still pretty much concerned with the same issues and continue to want these areas addressed nation-wide.

Closing Remarks

This study took a look at a number of variables in hope that a clearer picture of where a student with ADD should go to college. Results have not enabled a truly clear picture to emerge. Should a student with ADD go to a small, private, 2 year institution, a medium size public 2-year institution, a large size, private, 4-year institution, a college or university that only appears on a high school college guidance list for special students, some place close to home and family support mechanisms, an institution that offers the specific type of accommodations they want, one that offers more assistive technology devices than others or some place they have had their hopes and dreams on attending since early on in their life? Seemingly large, public institutions may have more funding available for the provision of a larger staff and smaller staff to
student ratio. They may also have more money or a larger budget to purchase devices that not only can be used by ADD students but also other students with disabilities. Additionally, they may also have more avenues available to them to communicate their services. Small colleges seem to have the challenge of having more assistive technology devices but may be in a better position to know more about their student body than a larger institution. Because of their size, they may be better able to track special students than a larger institution. Private institutions may be able to get more support from their alumni than public institutions.

Colleges and universities, both large and small, 2-year and 4-year, public and private, are claim to be witnessing an increase in the number of students with ADD attending college and are realizing, at least to some degree, their role in providing both traditional and assistive technology accommodations for these students. Also, nearly all have stand-alone, defined space set aside for disability services with trained staff. In a study conducted by Nolander, Shaw and McGuire (1990) and which should hold true now 15 years later, the authors pointed out the necessity for the people who staff these offices to be in consensus regarding a clear, functional, and operational definition of learning disabilities. In a 1989 study, Vogel found colleges and universities overwhelmed by requests for support services and found themselves unable to provide special programs and services to every student claiming to be learning disabled. With well over 1,000 colleges and universities cited in Peterson’s guide, it would appear that since 1989, more
postsecondary institutions are better equipped to deal both with learning disabled students and ADD students.

One-hundred and three administrators and 18 college student respondents hardly represent either all administrators directing offices of disability services or all college students with ADD. Though the study provided for an exploration into areas not often studied, the information still points to movement in higher education towards a better understanding and availability of provisions including assistive technology to ADD students.

Early and clearer diagnosis of students in elementary, middle and high school has done much to improve the situation. More of an emphasis of diagnosis in higher education is called for. By law, colleges are not required to provide any diagnostic services, and not surprisingly, only about a third of the institutions that responded test students that might be suspected of suffering from ADD. But responses also included referring them off campus for testing. However, testing is expensive and time consuming, and students may not have the resources to go through what is necessary for them to receive accommodations. Having more resources available on campus might do much to turn disastrous school experiences into wonderful experiences once these adults are adequately treated.

While it may appear that few students in higher education actually come forward and make themselves known to an disability coordinator, nonetheless, when a faculty stops to think about the make-up of the students in their classes, they will most likely
concur that many more ADD students are actually present in their classrooms and would warrant help if approached and pointed in the right direction. For students with ADD, most experts on the disorder say, it is crucial to "self advocate", that is to tell faculty of their condition and ask for the type of help they need. "The ability of the student to self-advocate, to be articulate about the modifications they need, is more important in determining their success than their IQ," says Sheldon H. Horowitz, director of professional services at the National Center for Learning Disabilities, a nonprofit advocacy group. "But they aren't accustomed to doing that, because it was the school's responsibility [to provide them with services] in high school."

Disability offices can advise students on how to approach professors, but actually doing so is up to the students and with little experience speaking up for themselves and a tendency toward poor time-management skills, they might not ask for help until it is too late for the professors to help them without giving them what might appear to others as an unfair benefit. Weyandt, a psychology professor, who has conducted one of the few surveys of existing research on college students with the disorder, says colleges might need to take some of the first steps. "Maybe we need to develop better interventions to help students move forward…One of the hallmark traits [of the ADD student] is an inability to follow through on things."

Both quantitative and qualitative information from this study reflect effort on the part of these institutions to provide some of the necessities to these students. The
apparent gaps that exist can be closed and warrant further consideration, research and creative problem solving.

The objective of this study was to explore areas that impact the young adult college student with ADD, specifically in relation to the availability and utilization of assistive technology in support of these students. Many of the areas examined had not been previously explored, and much still remains to be learned. On the other hand, this study has at least provided information upon which more studies can be conducted. For example, student needs must be better identified. Such analysis will help ensure that their needs are more appropriately and adequately addressed, and reduce confusion as to how administrators and faculty deal with these students. Parette and Scherer (1990) further suggest that when working with students with unique disabilities, it is important to explore their expectations and readiness to use certain accommodations.

Another pressing issue may be to better determine how to get students to self-identify, and be self-advocates once they get to college. The issues discussed in this study have relevant theoretical and practical implications for understanding and improving the experiences of college students with ADD. Exploratory research is not meant to be conclusive or highly generalizable, but rather prompt additional quantitative research to be considered. The apparent gaps that exist in this study can be closed through additional research and creative problem solving. With that end in mind, a set of research questions within 4 possible research categories appear in Table 28.
Table 28: Proposed Research Related to College Students with ADD

<table>
<thead>
<tr>
<th>Regarding Postsecondary Disability Service Providers</th>
</tr>
</thead>
<tbody>
<tr>
<td>How can college administrators become better aware of what ADD students need?</td>
</tr>
<tr>
<td>What type of tracking are administrators doing to determine how satisfied students are with the accommodations they are receiving?</td>
</tr>
<tr>
<td>Are disability office budgets large enough to meet the accommodation needs of ADD students?</td>
</tr>
<tr>
<td>Do administrators know what technology is out on the market that would be appropriate for ADD college students?</td>
</tr>
<tr>
<td>What materials are provided to perspective high school students regarding accommodations, and what additional strategies can service providers use to better communicate and promote their services to ADD students?</td>
</tr>
<tr>
<td>Are there better strategies that can be used to get information out to students with ADD?</td>
</tr>

</thead>
<tbody>
<tr>
<td>What is the cost associated with purchasing AT devices?</td>
</tr>
<tr>
<td>Why are more traditional accommodations being made available to ADD students when compared to the availability of AT devices?</td>
</tr>
</tbody>
</table>
What are the possibilities for postsecondary institutions to partner with manufactures of AT in order to pilot devices or receive a cost savings on devices?

One hundred three administrators and 22 college student respondents hardly represent all administrators directing offices of disability services, or all college students with ADD. Although this study explored areas not often studied, both quantitative and qualitative information from this study reflect compliance on the part of institutions relative to dealing with ADD students, and a positive movement in higher education towards a better understanding of college students with ADD, and their obligation to provide these students with accommodations, including assistive technology. This study only serves to start the process of understanding ADD college students, yet encourages all those involved with students with ADD to do what is needed to provide the type of learning environment that will help these students succeed.

The Honeycomb Model: Developing, and Maintaining Collaborative Interactions between General and Special Education Faculty in Postsecondary Settings

by: Kathryn A. Newman, Ph.D., Loretta W. Jaggers, Ph.D., Elaine S. Foster, Ph.D., Nanthalia W. McJamerson, Ph.D., Felicie M. Barnes, Ed.D., A.K. Nur-Hussen, Ph.D., & Doris Williams-Smith, Ph.D.

A Paper proposed at the 9th Annual Hawaii International Conference on Education Honolulu, HI
The Honeycomb Model: Developing, and Maintaining Collaborative Interactions between General and Special Education Faculty in Postsecondary Settings

Paper Presentation Objectives

It is hoped that the learners will leave with the following outcomes:

1. Outline future efforts, and how the collaborative efforts can ameliorate budget challenges
2. Outline possible opportunities for “outside” collaboration on various campuses as viable contexts for developing collaborative bridges
3. Recognize and list neutral outside opportunities to build collaborative bridges (e.g. poetry, author seminars, garden centers, etc.)
4. Brainstorm similar activities for their campuses

Literature Review

While special education is continually evolving to meet the needs of students, there is still much work to be done. Manning and Gaudelli (2006) outline how special education programs continue to passively promote stereotypical and destructive myths about the academic abilities of diverse and low-income students through not teaching, demonstrating and modeling that the education of all students is everyone’s business. The authors reiterate that teaching methods need to be multidimensional, and multifaceted in order to meet student needs. An equal and equally involved team of general and special teachers could create and use these multiple methods, yet research by Harbort, Gunter, Hull, Brown, Venn & Wiley et.al. (2007) demonstrated that too often, general and special education teachers do not co-teach, or collaborate in meaningful ways in the classroom. That is, while there were two teachers in the classroom, instructional methods and responses to students were not significantly changed to meet the needs of students, thus potentially preserving the stereotypical notions about students. However, there is positive news. Silverman (2007) reported findings on the beliefs of both general and special preservice
teachers which indicated that both groups had positive beliefs about inclusion. This would suggest that these newest teachers would be the most likely to engage in equal and beneficial collaborations with each other. However, Silverman (2007) proposed that teacher preparation programs monitor beliefs, bolster training, and provide for more learning opportunities where both groups can learn to rely upon each other for support. In short, the program has to do more for the candidates.

Teacher education programs must therefore redesign themselves to demonstrate what this new model will look like. The new model must demonstrate collaboration and inclusiveness from its philosophy to its personnel, to its practices. Anderson, Spooner, Calhoun & Spooner (2007) explored this shift in form as their program was redesigned in preparation for reaccreditation by NCATE. The authors outlined that steps that many accredited college and university teacher education programs followed, including developing an identity, translating their vision into words, getting input from all stakeholders, aligning with best practices, and reevaluating the outcome. One of their findings was that the programs engaged in more dialogue with their partners. Visually, they (and other effective programs) became like skaters who pulled in their arms to spin faster.

It is this process that we seek to convey to our general and special education teacher candidates. We feel that it is our responsibility to demonstrate that inclusive collaborative processes are mutually beneficial, to move one step beyond Anderson et.al. (2007) and put the words into actions. There are many programs that are promoting collaboration among the candidates, such as the study of practice reported by Arthaud, Aram, Breck, Doelling, & Bushrow (2007) as well as Ross, Stafford, Church-Pupke & Bondy (2006). These programs set up collaborative activities within the preservice program that allow candidates to work together in field or clinical settings. The problem is that most of these programs do not allow the candidates to see their general and special education faculty collaborating. It is through the modeling process that candidates see that it is a strength, skill and attitude, and not just a grade (Stang & Lyons, 2008). It is critical that candidates have opportunities to see successful collaborations, not just in classes, but across the educational spectrum. These successful collaborations have similar features to the elements of success described by Ross et.al. (2006) including keeping the focus, doing the work, concern
about the community, flexibility and inclusiveness. The results are collaborations that are more than than simple co-teaching, but are interdisciplinary and transdisciplinary in their outcomes. Interestingly, one electronic literature search for models and research on postsecondary collaborations between general and special education faculty modeling the expected teacher behaviors yielded no results.

Our university has a long history of collaborations between general and special education teacher educators. Out of this history came a model which we named the “Honeycomb Model” to demonstrate the interconnectedness of the model and the components that led to this strong collaborative model. The intent of the seminar is to present how interdisciplinary teaming has strengthened the teacher preparation program of a smaller state university, even as the university is facing budget challenges. These collaborations have been multifaceted, multidimensional and have resulted in program viability and growth as described by Miller & Stayton (2006). We will also outline how we will be using these collaborative models to solve new problems, and rethink solutions to ongoing challenges.

Our unit has a rich and largely informal network of collaborative activities that have strengthened not only the unit, but assisted in recruitment and retention efforts for the university. All aspects of our teacher preparation program, from teaching and supervising candidates to reports, national reaccreditation, redesign to co-teaching and guest teaching have mixed special and general teacher preparation personnel. National reaccreditation teams have general and special education faculty as co-chairs. Special education faculty are certified as both general and special education teachers, and supervise both general and special education student teachers. Special education faculty teach several of the core classes, and work with the general education faculty to infuse special education concerns and perspectives into all core classes. Grant activities have often included both general and special education teacher preparation personnel as participants, co-principal investigators, and facilitators. Professional presentations regularly include and utilize both general and special education faculty as co-presenters. Special education faculty were contributing members of all teams charged with meeting the state mandated redesign of all general teacher preparation programs, as well as meeting the state’s new guidelines on literacy and numeracy. Additionally, the general education faculty assisted the special
education faculty in developing a new Master’s Program in Special Education in 2007 and in redesigning
the undergraduate Special Education/General Education Merged to Integrated program 2007-2010. For
example, general education faculty willingly added special education objectives and activities from the
Council for Exception Children benchmarks to the core classes such as Research Methods and School
Improvement--courses that would be taken by all Master’s candidates. We have redesigned the
undergraduate special education/elementary dual certification program in response to state mandates, and
again, the general education faculty were intricately involved to ensure that not only were the core classes
infused with a focus upon the special needs learner, but all special education classes maintained a focus
on Universal Design for Learning through not only methods, but also through multiculturalism, building
literacy and numeracy skills, and utilization of technologies. All of these efforts are the result of our
model of collaboration.

The **Honeycomb Model of Collaboration**, has worked for us for over twelve years. This model is
based upon a shared philosophy and vision of education as a renewable and renewing resource, creating a
network of collective strength and support with a minimum of waste. The model has six strands (of
course!) that are: mutual support, recognition of strengths, recognition of common and unique interests,
work ethics, collegiality, and humor. **Mutual support** builds collaboration in that one crisis will beget
support from colleagues that lends itself into positive support when the crisis or deadline falls on another
colleague. The second and third facets of the model are **recognition of strengths**, and **recognition of
common and unique interests**. Some of us are idea people, some are organizers, some are analytical
thinkers, some are global, and some are methodical to ensure that all aspects of a project are addressed.
While we have detailed the strengths in the unit, the abilities outside of the unit are also telling. Outside of
work, we recognize that we have published poets and writers, wedding planners, flower arrangers,
counselors, artists, former airport managers and furniture refinishers--just as a beginning. The fourth
element of the model is **work ethic**. Support is mutual, and whether our best work times are mornings,
afternoons, nights or weekends, we will supply the necessary support. The last two elements of the model
are **collegiality** and **humor**. We recognize that we have a lot of strong personalities. Humor, especially in
the throes of a full-blown crisis or deadline, helps to reduce the stress. Collegiality means that if one needs us, we try to be there if we can. This model evolved through work, probably cannot be mandated, but can be encouraged. For those seeking to replicate the model, it must be understood from years of experience and observation that team building activities are a start, but actions will either strengthen or destroy the model.

The papers will outline how the model has affected and enhanced the delivery of teaching through the six strands. The papers will outline the effects in the areas of teacher education in general, special education, multicultural awareness, technology, literacy and securing multiple accreditations. There are three major positive outcomes. The first outcome is that our teacher education program, while smaller than many, has a solid interdisciplinary focus that verges on becoming transdisciplinary. All teacher candidates are able to observe models of collaboration, which they carry into their student teaching and teaching experiences. We have noticed that general education candidates especially in the areas of early childhood education and elementary education are beginning to pick up additional special education coursework in preparation for adding on special education as an endorsement to their regular education certifications. The second outcome is that faculty regularly incorporate and demonstrate the concepts of diversity, multiple learning styles, differentiated instruction and universal design for learning into their courses, and more are tying instruction about reteaching to Response to Intervention (RtI). The third outcome is that we observe general and special education candidates who enter the field with dispositions that welcome the benefits of collaboration for the sake of PK-12 students.

Abstract:

Headstart (HS) is a federally funded program in the United States designed to assist low income children in achieving academic and personal growth and success. It is one of few programs that maintain a comprehensive oral health record for each student, requiring dental exams for enrollment and offering preventive services while in the program. Because access to oral healthcare is especially difficult for low income populations, Head Start enrollment can be a means for increasing access, ultimately improving oral health of children in these populations.

This session will examine results of a small study conducted by the presenter revealing a statistically significant difference in annual dental visits between HS enrolled and non-HS enrolled children of migrant and seasonal farmworkers. The presenter’s implementation of a fluoride varnish program utilizing dental hygiene students at various sites of a regional HS program will also be outlined and discussed. A discussion of past and future implications for education/oral health access among disadvantaged groups will follow.

Abstract
This report summarizes a line of work pursued by faculty as part of the Center for the Study of Mathematics Curriculum (CSMC) to create tools for studying the enacted curriculum in K-12 mathematics classrooms. The work focuses specifically on issues related to fidelity of implementation (FOI), the extent to which a program (i.e., a set of curriculum materials) is implemented consistent with the intentions of its developers. Work on FOI is of particular interest to educators (e.g., teachers, supervisors), curriculum developers, researchers, and evaluators as accountability questions increasingly focus on which programs “work” relative to increased student achievement. The report begins with a brief background of the work of both the CSMC and specifically the Tools subgroup, followed by a brief description of our own work at developing tools to measure FOI. The report concludes with a summary of FOI tools developed by other researchers that will be fully developed in a book to be published by Information Age Publishing in 2011. A consistent theme throughout is the notion that the study of mathematics curriculum materials as enacted can lead to better use of existing materials, better development of materials in the future, and ultimately gains in student achievement when materials are used as intended. Some of the resources associated with this work are available online at the CSMC website (http://mathcurriculumcenter.org).

A Report on the Development of Instruments Used to Measure Fidelity of Implementation of School Mathematics Curriculum
Introduction: The Center for the Study of Mathematics Curriculum

The Center for the Study of Mathematics Curriculum (CSMC) is a collaboration of three universities: Michigan State University, the University of Missouri, and Western Michigan University, with additional partners at the University of Chicago and Horizon Research, Inc., which received initial funding from the National Science Foundation (ESI-0333879) in January 2004. CSMC is a Center for Learning and Teaching committed to advancing the research base and leadership capacity supporting K-12 mathematics curriculum design, analysis, implementation, and evaluation. The work of CSMC is guided by four underlying principles:

- A well-articulated, coherent, and comprehensive set of K-12 mathematics learning goals/standards is necessary for large-scale improvement of school mathematics.
- Mathematics curriculum materials play a central role in any effort to improve school mathematics and their development should be a scholarly process involving a continual cycle of research-based design, field-testing, evidence gathering, and revision.
- Teaching and curriculum materials are highly interdependent and increasing opportunities for student learning rests on better understanding the relationship between curriculum and instruction.
- Research addressing mathematics curriculum can inform policy and practice and in so doing narrow the gap between the ideal and the achieved curriculum.

In addition to the three collaborating CSMC universities, each university developed a partnership with a local school district to identify and address curriculum-related research problems that may be helpful to the partner schools and the field of mathematics education. Over the past six years these educational institutions have accomplished a number of tasks across a wide range of curriculum-related activities designed to achieve the following stated goals of the Center:

- Support leadership development related to K-12 mathematics curriculum design, analysis, implementation, and evaluation;
- Enhance teachers’ mathematical and pedagogical knowledge through curriculum investigation and implementation;
- Investigate the role and impact of curriculum materials on student learning;
- Stimulate communication and productive collaboration and disseminate information related to curriculum design, analysis, implementation, and evaluation.

---

1 This report is based on the work of the Center for the Study of Mathematics Curriculum, supported by the National Science Foundation under Grant No. ESI-0333879. Any opinions, findings, and conclusions or recommendations expressed in this material are those of the authors and do not necessarily reflect the views of the National Science Foundation or other researchers associated with the Center.
When translated into researchable questions and initiatives to be carried out by CSMC, the work encompasses a wide range of tasks that have encouraged and supported CSMC faculty and associates to investigate specific questions that advance the field of mathematics education in many diverse areas related to curriculum. These include: developing curriculum tools useful for school districts as they deal with curriculum-related issues, making sense of current curriculum-related policy issues (such as those related to the impact of State and National Mathematics Standards), and developing an infrastructure for the development of doctoral studies/programs that will continue to insure that future mathematics curriculum related work is carried out by well qualified graduates from the CSMC partner institutions. The scope of the work is evident in its involvement in the publishing of more than a half dozen books, numerous research articles in educational journals, and hosting a number of special conferences dealing with current curriculum issues.

Many of the research tasks carried out by CSMC faculty have been the result of forming subgroups of like-minded researchers who have tackled interesting research questions that will move the field of mathematics education forward in a direction of mutual interest. The focus of this report is on work conducted by the CSMC “Tools Group”谁 have been interested in examining aspects of the enacted curriculum and developing tools to measure that enactment.

**Work of the CSMC “Tools Group”**

The Tools Group was formed shortly after NSF awarded funding to the CSMC in January 2004. It was formed as part of the process of developing a broad research agenda that would guide the work of the Center. Its primary interest is in developing tools for researchers to use when studying curriculum, which may have as its focus teachers using curriculum materials, students using textbooks, or the materials themselves as objects of study. An important first contribution to this line of research was the development of a Curriculum Tools Database that serves to identify instruments that researchers have used in curriculum studies. In development for approximately three years at Western Michigan University, the database is now active on the CSMC website and allows researchers to search for instruments by purpose, age/grade level, cost of use, and target users (e.g., teachers, supervisors, researchers, etc.). The database does not

---

2 The Tools Group consists of Dr. Kathryn Chval, University of Missouri, Columbia, Dr. Iris Weiss and Dr. Daniel Heck of Horizon Research, Inc., and Dr. Steven Ziebarth, Western Michigan University. CSMC research fellows have also actively contributed to the work of the group.
house the actual instruments, but rather provides an annotated description of the instrument, studies that used the instrument, and information regarding how to obtain them. The database is regularly updated by CSMC fellows so that information remains current.

One of Tools Group’s first major tasks as a group was to involve the CSMC partner districts in a Cross-Site Study of curriculum used by the mathematics teachers in their schools. To accomplish this required the development of two survey instruments, one targeted at each of the grade levels K-8 and 9-12. The two instruments were developed during the 2005-06 academic year with administration at the end of that school year. The focus of the instruments ranged from teacher beliefs and practices to use of textbooks and other resources in mathematics classes. Several of the survey sections across grade levels gathered information related to specific content areas or subject matter taught at those grade levels. Our main findings showed differential use of textbooks across the three partner schools, with different attitudes regarding teachers “liking” and following the chosen texts in their schools. Some findings showed pronounced differences in use and attitudes between traditional and “reform” textbooks used in the participating schools. A full report of the study, the instruments used, and the findings is available at the CSMC website under the header: Cross-Site Report.

**Measuring Fidelity of Implementation**

A major interest of the Tools Group has been the development of a suite of instruments that would be useful to school districts for measuring *fidelity of implementation* of curriculum materials in use in their mathematics classrooms. As an area of research interest, fidelity of implementation may be broadly housed under program evaluation or public policy studies where it has historically been the focus of academic interest for much of the past 50 years. For example, among the many standard models used in program/product evaluation is the CIPP (Context, Input, Process, Product) model developed by Stufflebeam (1983) in the 1980s. Focused mainly on understanding and improving the decision-making process inherent in program implementation, the “Process” component of the model attempts to answer questions such as: How well is the plan being implemented? What barriers threaten its success? And, What revisions are needed? (Worthen & Sanders, 1987, p. 78). When data related to such questions are collected, the program/product can be altered as needed to be successful. Similarly, in public policy studies, implementation of public programs has long been of interest to legislators who would like to know the extent to which policies and programs they have funded are enacted as
intended. Questions of importance in this arena are: Is the policy/program being implemented the way it was intended? And, What are the results of implementation when those policies/programs are or are not implemented as intended? (cf. Odden, 1991; Nakamura & Smallwood, 1980; Pressman & Wildavsky, 1984).

Much of the policy research is devoted to the general concern over implementation of government programs ranging from health to human services, yet there is a distinct thread that has historically examined educational policy dating from the 1960s and 1970s (cf. Berman & McLaughlin, 1976; McLaughlin, 1976; Fullan & Pomfret, 1977; Hall & Loucks, 1976). A new resurgence of interest in educational implementation in the last two decades, particularly in mathematics education, stems from the many new mathematics curriculum materials (i.e., textbooks, teacher guides, etc.) created to reflect the NCTM Standards documents (1989, 2000) from which many of the current state standards are derived.\(^3\) At play in this renewed interest is an increased focus on accountability for school achievement performance and perceived shortcomings of American schools in international comparisons. Politicians want to know: What works in achieving better mathematics scores for students? Recent work by mathematics education researchers on evaluating the effectiveness of these standards-based curricula has been positive (Senk & Thompson, 2003) and mixed (National Research Council, 2004), with few studies meeting the “gold” standard (What Works Clearinghouse, 2002) wished for by government policy makers that is distinguished by randomized control trials as seen predominantly in health-related fields of research.

A number of recent research summaries have helped to refocus attention on the importance of fidelity of implementation of mathematics curricula, two of which are particularly illustrative of current thinking regarding instrument development. Remillard (2005) completed an extensive review of teachers’ use of curriculum materials over the past 25 years. She notes specifically two trends that are driving the interest of mathematics educators and researchers; (1) the wide availability of the many newly designed curriculum materials (noted above), and (2) “the tendency of school districts to regulate mathematics teaching practices by mandating the use of a single curriculum” (p. 211). The convergence of these two trends is an emphasis on improvement in K-12 mathematics education; however, “improvement” implies that we know how teachers use the chosen curriculum materials from which they teach. This, of course,

\(^3\) For a summary of curricula developed at the elementary, middle and high school levels consult the websites for the ARC Center, Show-Me Center, and COMPASS noted in the references.
assumes that the materials are in part responsible for gains in student achievement when they are used as intended in classrooms. Remillard’s review is useful for identifying a research framework for studying teachers’ use of curriculum materials and distinguishing differences between the intended (what authors write into textbooks and ancillary materials) and the enacted (what gets taught to students) curriculum. A more recent review of research by O’Donnell (2008) examined links between measuring fidelity of implementation and outcomes of K-12 curriculum interventions. She comments that much of the terminology and methodological groundwork used in educational implementation studies have their roots in research on program implementation in “the public and mental health fields” (p. 37). The purpose of her review was to document which studies, that met her five sorting criteria, could be linked to educational outcomes. Her five criteria were: (1) adherence (whether the program was delivered as designed), (2) duration, (3) quality of delivery, (4) participant responsiveness, and (5) program differentiation. Of more than 100 studies that qualified for inclusion in her study, only 23 qualified as empirical studies and only 5 of these met all of her five criteria. Such numbers give some sense of the paucity of research available when various limitation standards are applied to specific research questions of interest, yet also suggest that there is much room to advance our knowledge base further in understanding fidelity of implementation.

Of particular relevance for this report is the connection of research reviews of the sort described above to include instruments used to study or measure fidelity of implementation. Fullan and Pomfret (1977) produced a classic review of curriculum and implementation research more than three decades ago that included only 13 pre-K-12 studies across multiple disciplines (science, social studies, language arts, and only 2 in mathematics) in the U.K., Canada, and the U.S. Further, only 9 of these studies qualified as involving curriculum changes (the others were labeled as organizational changes). In the presentation of theses studies, Fullan and Pomfret organized the results according to methods/instruments used to “assess degree of implementation of specific curricula” (p. 346). Typical methods employed were direct classroom observations, observations combined with questionnaires, analysis of key curriculum documents and questionnaires, and questionnaires only. Perhaps the most notable difference between the early work by Fullan and Pomfret and the more recent research review of Remillard is the complexity and richness of the phenomena surrounding mathematics teachers as they use curriculum materials. A teacher’s background, environment, resources, belief systems, knowledge of teaching and learning, and experience are only a few of the many factors affecting how they use
their chosen or required curriculum materials. Thus, measuring fidelity of implementation in mathematics classrooms can take on many different forms and employ a variety of instruments. While Remillard’s review does not specifically categorize or list the instruments used, they are embedded within the annotated descriptions of the studies she uses to highlight the different research areas of interest. Classroom observations and multiple questionnaires continue to be standard techniques for data collection, but are routinely supplemented with teacher and student interviews, interviews with curriculum developers, analysis of classroom audio and videotapes, textual and content analyses, case studies of individual teachers that triangulate multiple data sources, and teacher logs that document coverage and opportunity to learn. O’Donnell (2008) included “instruments” as a review criterion in her search of studies focused on fidelity of implementation that sought to find links to K-12 achievement outcomes. Her search included examining the Mental Measurements Yearbooks and UMI Dissertations Abstracts in addition to making personal contacts when instruments were not included in published works. However, despite her exhaustive search, only 5 of 23 studies met her stringent criteria for inclusion in her focused analysis related to student outcomes. She reports that the “methods used to collect fidelity data varied from self-report surveys and interviews to analysis of student artifacts” (p. 49), but that two of the studies also focused on measuring students’ completion of worksheets. Other studies, that did not meet her full criteria, showed “researchers used multimethod, multisource methodologies that included use of video and audiotapes, classroom observations, questionnaires, teacher interviews, and teacher self reports” (p. 50).

In the final two sections of this report attention is focused on the work of the CSMC Tools Group to measure fidelity of implementation in mathematics classrooms, followed by a brief summary of additional tools created by other mathematics education researchers to study the same construct.

The CSMC Tools Group’s Suite of Instruments for Measuring Fidelity of Implementation

The CSMC Tools Group brings expertise from both the curriculum development and the evaluation fields to its approach to measuring fidelity of implementation of K-12 mathematics curricula. As is typical in evaluation work related to curriculum development, instrument development is an important, essential, and expected task to be conducted if research questions are to be answered in a convincing manner. In addition, a primary goal of evaluation work is to make outcomes of that work (e.g., these could be findings or instruments) useful to practitioners
whether they are researchers or other educators working directly in school districts. It was with these goals in mind that the Tools Group envisioned creating a suite of tools for measuring fidelity of implementation in K-12 mathematics classrooms. The suite of tools would be a mix of instruments (drawn from amongst the numerous types described above, but developed from our own interpretations of FOI) from which researchers could choose or adapt to suit their own needs or interests. The group agreed that there were three main purposes for our tools: 1) to identify professional development needs in a school district, 2) to assess outcomes of professional development directed at implementing curriculum materials, and 3) to evaluate or compare the effectiveness of competing sets of curriculum materials. Such comparisons are important for determining which curricula have the potential for improving student achievement outcomes (NRC, 2004).

After much consideration of how other researchers perceived fidelity of implementation, together with our experience with the strengths and weaknesses of the various instruments we had developed or used in other projects, we determined that three important constructs needed to be measured by our instruments. First we considered that extent of use was an important construct that would give us some implementation information at a larger grain size (i.e., at the course level). At issue here is the notion of coverage, or how many units a teacher teaches in a typical school year. If a teacher only “covers” a single unit or two from a given textbook or set of materials, to what extent can one argue that that curriculum was taught with fidelity? Most school districts would expect much more from their curriculum of choice. Our primary instrument for measuring this construct is a survey teachers complete that documents their coverage of materials over two- to four-week periods for lessons, investigations, units, or chapters depending on the format of the curriculum. Figure 1 shows a sample item from our Extent of Use Survey instrument.
The second major construct we attempt to measure is adherence to the mathematical storyline. We argue that each mathematics lesson has a key piece of content that it is designed to have students learn. This is usually stated at the beginning of a textbook lesson in the form of “objectives” that should be achieved by students at the end of a designated time period (often a day or two). A teacher who teaches a different lesson (e.g., from some other source or textbook) or allows their lesson to drift off to a different mathematical topic would likely not be seen as implementing the particular/chosen curriculum with fidelity.4 Our third construct to be measured is referred to as adherence to the pedagogical storyline. Many of the newly developed mathematics curricula have a well-defined pedagogical model that is infused into the materials; usually encouraging students to investigate or experiment with mathematical objects of study. More traditionally formatted textbooks have fewer restrictions on the required pedagogy and typically follow the definition-example-practice-homework model of instruction that has been well documented in classrooms for the past century (cf. Goodlad, 1984). A teacher who foregoes

---

4 The reader should note here that a teacher who does not follow the curriculum may indeed provide a very good teaching and learning experience for students. However, the research question of importance in FOI is the extent to which the chosen curriculum is implemented for a given lesson.
having students work together to come to mathematical understandings inherent in numerous current textbooks, but instead tells students the important or key point of a lesson, again, would likely not be seen as implementing the particular/chosen curriculum with fidelity.

The primary tool for measuring adherence to both the mathematical and pedagogical storylines is a teacher Lesson Log that they are asked to complete over various time periods (or several lessons). Figures 2 and 3 show two sample pages from one of the Lesson Logs written for one of the high school curricula we selected. In developing the Lesson Logs our group made a decision early in our work that we would follow as closely as possible only the materials that were at the disposal of the teachers (e.g., student text, teacher guide, supplemental resources provided as part of the curriculum). Thus, the Lesson Log format parallels material in the student text using the actual verbiage in the published materials. As foils to the items that teachers would record, we looked for plausible alternatives that seem like natural actions that teachers would use in a typical lesson on related content. (cf. Item 5 in Fig. 2 and Item 20 in Fig. 3 as examples.) These alternatives would then allow us to differentiate when teachers were following the curriculum and when they were not. For a district supervisor using the tool, the information would help to identify parts of the curriculum where resources (i.e., professional development) might be directed to help teachers make better use of their materials, especially if the district had recently invested heavily in the purchase of new mathematics curricula. It is important to note, however, that we did not develop the materials as a means to evaluate teachers.

The scope of work of the Tools Group has been to develop a suite of tools for sample lessons from three current curricula at each of the elementary, middle, and high school levels. For each of these levels, we chose to examine two of the recently developed standards-based sets of curriculum materials and one of the more popular traditionally formatted textbooks. For example, at the high school level, we developed a suite of tools for Core-Plus Mathematics: Contemporary Mathematics in Context (CPMP) (Hirsch, Fey, Hart, Schoen, & Watkins, 2008), Interactive Mathematics Program (IMP) (Fendel, Resek, Alper, & Fraser, 2009), and the

Lesson Log

Core-Plus Mathematics 2nd Edition Course 2
Unit 3 Lesson 2 Investigation 1: Modeling Rigid Transformations

The purpose of this teacher log is to gather information about your use of the Core-Plus Mathematics 2nd Edition program for Investigation 1: Modeling Rigid Transformations. Parts of the teachers’ plans and expectations for lessons often play out as anticipated, but lessons sometimes change during instruction for a variety of reasons. Please answer the following questions about what took place during your mathematics instruction in the designated class.
```
1. How long is a typical mathematics period for this course? _______ minutes

2. About how many class periods did it take to complete Investigation 1? 1 2 3 4 5 6 7 8 9 10 or more class periods

**Lesson Launch**

3. Approximately how many minutes did the **Think About This Situation** and **Launch** for Investigation 1 take? _______ minutes

4. During the **Think About This Situation** and **Launch**, approximately how many minutes did students work:
   a. individually? 0 5 10 15 20 25 30 35 40 45 50
   b. in pairs/small groups? 0 5 10 15 20 25 30 35 40 45 50
   c. as a whole class? 0 5 10 15 20 25 30 35 40 45 50

5. How did you introduce the **Think About This Situation** (TATS)?
   - I read the scenario describing coordinate representations to the class from the student text (p. 195).
   - I described the coordinate representations scenario to students in my own words.
   - I allowed students to read the scenario silently.
   - I had students read the scenario in pairs or small groups.
   - I elaborated on the context of computer graphics and asked students to give examples of key aspects of video games or animated films.
   - I introduced the definition of rigid transformations.
   - I outlined the lesson objectives for students.
   - I skipped introducing the TATS.
   - None of these describe how the TATS was introduced.

6. Did you address the questions of the TATS on p.196?
   - Yes □ No □
   If yes, Which TATS questions were addressed?
   - Part a □ Part b □ Part c □

**Figure 2:** Sample Lesson Log Structure for High School

**Share and Summarize (continued…)**

18. During the **Summarize the Mathematics (STM)**, how did students share their ideas and reasoning? (Select all that apply.)
   - In pairs/small-group discussion.
   - In whole-group discussion.
   - Students did not share their ideas and reasoning.

If students shared their ideas and reasoning:

19. How many students shared their work during the **Summarize the Mathematics (STM)**? (Circle one. If pairs/groups shared work, please count all students in those pairs/groups.)

**Figure 3:** Sample Lesson Log Structure for High School

Glencoe Traditional Algebra, Geometry, Algebra II set of textbooks using the most recent editions available. For each set of materials we developed tools for two units of interest with the intent that school districts or researchers could use them as models to construct similar tools for units or lessons that were of particular interest to their needs. Our own testing of developing new instruments from the existing models showed that the work could be completed within a few hours, well within a timeframe typical of teacher professional development days.
As noted throughout this report, the goal of the Tools Group was to develop a *suite* of instruments from which researchers and other educators could pick and mix to suit their research or district needs. In addition to the Extent of Use Surveys and the many Lesson Logs for each of the targeted curricula, we have developed Annotated Unit Guides for each set of materials along with End-of-Year and End-of-Unit Surveys. The Annotated Unit Guides consist of several pages that would help a general (educated) user become familiar with the curriculum if they had not taught from it before. The Lesson Logs together with the Unit Guides could easily serve as observation protocols in settings where observations *were* deemed economically feasible, although our goal in developing the Logs was to find a way to collect valid and reliable data from teachers about their curriculum use *without* the need for observations. As part of the development process, we completed extensive validation of the Lesson Logs by having observers and teachers complete them independently and then making appropriate adjustments to the final versions we now have available. Figure 4 provides a list of our suite of Tools developed thus far for each of the nine curricula (three at each grade level) we considered. The two right-hand columns show specific units and their location within each set of curriculum materials.

The CSMC Tools Group is currently moving forward with its research on three fronts. With respect to the work on the suite of tools, we are examining ways in which the tools, or portions of the tools, can be combined into meaningful “scores” that would allow school districts to use the implementation data better for identifying professional development needs. Other projects (see below) are attempting to do similar summaries with their own suites of tools. On a second front, the Tools Group is in the final stages of work on writing and editing a book that contains detailed summaries of tools that research groups have developed to study fidelity of implementation in K-12 mathematics classrooms. The book is scheduled for publication with Information Age Publishing in 2011. Finally, the Tools Group, together with several CSMC associate researchers, initiated and submitted an NSF proposal to host a conference of researchers that would begin to develop well-defined frameworks for studying the enacted curriculum. The conference proposal was awarded in spring of 2010 and the conference will be held in November 2010.

### Figure 4: Instrument Focus by Grade, Curriculum Program, Year, and Focus Unit

#### A Summary of Other Instruments for Measuring Fidelity of Implementation

As part of the conceptualization and preparation for the forthcoming book, *Tools for Studying the Enacted Curriculum* (IAP, 2011), the CSMC Tools Group invited mathematics education researchers to contribute chapters that summarized their work on various projects designed to measure fidelity of implementation in K-12 mathematics classrooms. This section provides a brief summary of those projects and tools. Interested educators and researchers should contact the project PIs for more detailed information regarding the availability of the tools for their own purposes.

**Project 2061** (Linda Dager Wilson and Jo Ellen Roseman: American Association for the Advancement of Science, AAAS)

The AAAS has been known for creating evaluation instruments and protocols associated with mathematics education for at least two decades. This group’s contribution to FOI related research has been to create an instrument, independent of a specific set of curriculum materials,
to systematically study the mathematics of teaching and learning, using a lesson or class period as the unit of analysis. The research question of focus was: What are the most effective instructional strategies for addressing certain mathematical learning goals? The instrument consists of a web-based version of the developed instrument where the analyst marks precisely the start and end times for each indicated criterion. The five instructional criteria were selected out of a set of 24 research-based criteria originally used in the AAAS middle grades textbook analysis (AAAS, 2000). They include: finding out students’ ideas (pre-assessment), representing ideas effectively, encouraging student explanations, asking guiding questions, and assessment. Video clips are analyzed by the user ratings of: *met,* *partially met,* *not met,* or *not applicable* for various indicators with accompanying comments for each. A list of guiding questions and indicators for how each criterion is met is also provided. Researchers can view the instruments at the AAAS website.

**Surveys of Enacted Curriculum (SEC)** (Andrew Porter and Jennifer McMaken: University of Pennsylvania)

The SEC instruments originated from research on factors influencing teachers’ decisions about what to emphasize when teaching elementary school mathematics. Topics and categories were developed from analyzing K-12 textbooks, standardized tests, state and district standards, national professional standards, and by interviewing teachers about the content of their instruction. Teachers report their instructional content on a 4-point scale based on the time spent covering a topic (in general areas such as number, operation, geometry, etc. with specific mathematics topics within each area) and the relative emphasis given to each category of cognitive demand (based on five levels: memorize; perform procedures; demonstrate understanding; conjecture/generalize/prove; and solve non-routine problems/make connections). The result is a topographical map that shows the intersection of the content and cognitive demand, where the user can compare classroom instruction to content standards, curriculum materials, or assessment maps. The instruments can be used by researchers and school district personnel to measure alignment of instructional content in relation to intended content. In conjunction with other instruments, the SEC can be used to deconstruct patterns of implementation to better understand components of program implementation. There are numerous SECs available across many disciplines.
The COSMIC Project (James E. Tarr and Douglas A. Grouws: University of Missouri, Columbia; Melissa D. McNaught, University of Iowa)

The goal of the NSF-funded Comparing Options in Secondary Mathematics: Investigating Curriculum (COSMIC) Project is to examine student mathematical learning associated with secondary mathematics in integrated and subject-specific curriculum programs. It is currently in the final stages of data collection and analysis in secondary schools where both types of curricula are offered as an option to students. The COSMIC project developed instruments using different lenses and various grain sizes to examine fidelity of implementation focusing on how teachers use textbooks with different approaches to content organization in the ongoing process of mathematics teaching, and the relationship between curriculum implementation and student learning by focusing on content and presentation. The research instruments include classroom observation protocols, which document classroom activities and identify materials used during instruction, a lesson summary form, and a classroom learning environment scale. Teachers also complete surveys that gather background data and information regarding their use of the curriculum materials and a table of contents record that captures content coverage and extent of use of the curriculum materials. A textbook-use diary is also used to provide a daily record of teacher’s use of curriculum materials before and during instruction. The researchers have used various combinations of data collected from these instruments to calculate indices that summarize Content and Presentation Fidelity. A complete presentation of findings from the COSMIC Project is expected in the near future.

Center for Elementary Mathematics and Science Education (CEMSE) (Jeannie Century, University of Chicago)

CEMSE created a suite of instruments to measure fidelity of implementation to draw conclusions about the district’s math and science programs and to measure the extent to which critical components of a program are present when that program is enacted. The suite of instruments was developed to examine FOI of six science programs and one elementary mathematics program, Everyday Mathematics. The suite includes three questionnaires, three protocols, and two logs. One dimension of the developed framework contains the aspects of “structure” and “process” (Mowbray, Holter, Teague, & Bybee, 2003) by including procedural, educative, pedagogical, and student engagement subcomponents, called “critical components” by
the authors. For each instrument, from two-to-nine items may contribute input regarding how well these components were attended to in a given lesson. The other dimension contains categories of differentiation (Dane & Schneider, 1998) that attend to components common to mathematics and science programs. The suite of instruments was developed to be flexible, easy to use, and cost effective for school- and district-based personnel and researchers. The CEMSE Group, through the Researchers Without Borders initiative, has begun hosting a series of Webinars to help promote and examine research on fidelity of implementation.

► Evaluation of University of Chicago Mathematics Project (UCSMP) (Denisse R. Thompson; University of South Florida; Sharon L. Senk: Michigan State University)

UCSMP has a long history of curriculum development and associated evaluation work that dates back to the mid-1980s. It has recently completed revisions on the third edition of its six secondary textbooks that includes pre-algebra through pre-calculus texts. The Project’s fidelity of implementation instruments were developed for research purposes to be used in field-test studies, serving as formative evaluations for revisions of the curriculum materials. Instruments document “how the materials were used and how they worked in the classroom” (author’s communication). As the UCSMP curriculum materials evolved with later editions, the project expanded the number and scope of the instruments used to study implementation. Data are mostly self-reported with built-in checks designed into multiple instruments for reliability purposes. Eight instruments have been used to study the enacted UCSMP curriculum. These instruments include questionnaires, interview protocols, supplements, and guidelines grouped into three categories: documenting content coverage and opportunities for practice, instructional practice from teacher, student, and observer perspectives, and the intersection of the taught and assessed curriculum. The researchers indicate that other researchers and curriculum developers could easily adapt their instruments to use with other curriculum development projects and school and district supervisors could use them to gather information about content coverage and to identify professional development needs.

► Using Innovation Configuration Maps to Study Middle School Curriculum Implementation (Mary Ann Huntley; Cornell University)

This instrument draws upon the Concerns-Based Adoption Model (CBAM) Theory (Hall & Hord, 2006; Hall & Loucks, 1976) and takes the form of Innovation Configuration (IC) Maps (Hord, Stiegelbauer, Hall, & George, 2006). The instrument is a set of five-level rubrics for
assessing implementation of an innovation along a continuum that takes into account the “ideal way” of implementation defined by the developers and variations and deviations from that way. Seven IC Maps have been developed for the Connected Mathematics Project (CMP) and Math Thematics curriculum materials. Two IC Maps measure both teachers’ use of the textbook and their use of Standards-based instructional practices. The other five IC Maps are curriculum specific, corresponding to each phase of the instructional model – three for CMP (Launch, Explore, Summarize) and two for Math Thematics (Setting the Stage, Exploration). The author suggests that researchers and other educators can use the tool to examine relationships between FOI and student achievement and to identify professional development needs. Teachers can use the tool for self-analysis, reflection, peer observation, and coaching.

Endnote: This report has described efforts by various researchers to develop instruments used to measure the enacted curriculum with a focus on fidelity of implementation. Such work has employed many methodologies that are standard practice when doing quantitative and qualitative research. Yet, within these broad categories, mathematics education researchers have developed some unique instruments and approaches to try to answer questions of how faithfully mathematics teachers enact the “intentions” of the curriculum materials as envisioned by the authors who developed them. Attempts to find good ways to measure how, and how faithfully, teachers use the materials they are asked to teach from has the strong potential for helping those same teachers improve their teaching practices and ultimately student learning. Without such instruments and ways to measure curriculum use we have little hope of getting a firm hand on which curriculum materials “work” to enhance student achievement in today’s mathematics classrooms.

Recommendations for Teaching Physical Education to Students with Emotional and Behavioral Disorders

Shawna Young, EdD
Department of Kinesiology, College of Education
California State University Stanislaus
One University Circle
Turlock, CA 95382
syoung@csustan.edu

Abstract
An action research study was conducted during the first year of a pilot physical education program at a nonpublic, special education school predominantly serving students with emotional and behavioral disorders, and who are wards of the state living in group homes and foster care homes. In the role of teacher and principal investigator, the researcher conducted a year-long action research study of this pilot program. The overarching objective of this study was reflected in the initial research question: What is the most effective approach for teaching this group of students with emotional and behavioral disorders? This initial overarching research question evolved into three sub-questions: 1) What is the most effective way to maintain engagement of the students such that they are active for 80% of physical education class time?, 2) What is the most effective way to minimize opt-out during physical education class time?, and 3) What is the most effective way to minimize off-task, unsafe, violent behaviors during physical education class time? Delivery of this pilot program occurred over the course of an entire school year, teaching physical education 2 days per week for 45 minutes to a group of 57 students with emotional and behavioral disorders. Four data sources were utilized to identify emerging themes throughout the duration of the year-long study and to inform decisions related to improving teaching. The data sources included: 1) a teaching journal, 2) incident reports, 3) predetermined random participation observations (tallying the participation ratio and noting the corresponding lesson context), and 4) reflection notes recorded in lesson plans. Following qualitative analyses of the written notes in journals, incident reports, participation observations, and lesson plans, as well as statistical analysis to identify the relationship between antecedents and violent behaviors logged in the incident reports, recommendations are shared for teaching physical education to students who are emotionally and behaviorally disturbed.
Pre-Service Teachers’ Exposure to Using the History of Mathematics to Enhance Their Teaching of High School Mathematics

Barbara A. Burns
Canisius College
2001 Main Street
Buffalo, NY 14208
burns1@canisius.edu

Abstract
The history of mathematics is an important component in the learning of mathematics. This study examines how pre-service teachers view the role of history of mathematics in the high school curriculum. Quantitative and qualitative methods were used. Results showed significant changes in beliefs about how the history of mathematics should be integrated as well as preparedness to incorporate the history of mathematics in teaching.

An Investigation into the Role of Latina Administrators in Public School Settings: What Can We Learn From Their Experiences?
Dr. Patsy J. Robles-Goodwin
Texas Wesleyan University
1201 Wesleyan Street, Fort Worth, TX 76105-1536
problesgoodwin@txwes.edu

The objectives of this investigation were to: capture the unique challenges, successes, and decisions Latinas have experienced in being an administrator in public schools. It is hoped that the results of this study will be used in a variety of ways, especially in aiding aspiring Latina administrators and current school administrators to learn from the experiences of the participants of the study, in light of the rapid growth rates of Hispanic students in public school districts in the U.S.

This quasi-qualitative research examined the leadership experiences of Latina (female) school leaders such as district curriculum coordinators, directors, principals, and even school administrators. Specifically, the focus was an in-depth analysis of their experiences and challenges of being a leader in the public schools when so much change is occurring in terms of immigration issues, rising numbers of English language learners, effective parental involvement, cultural understanding of being able to interact effectively with parents from diverse backgrounds, differentiated curriculum development and implementation, appropriate assessments, and being a school leader during these immense times of transformation. This research highlighted the experiences Latina female administrators have gone through while in a leadership role. Much is known about the art of administration; however, educational administration is changing because “new” administrators from Hispanic roots are now taking on more leadership roles in urban school districts, as well as suburban and rural ones. This research also highlighted the challenges and successes female Latina leaders go through while in
leadership roles. This research attempted to add to the current literature on how best to meet the needs of our diverse schools, especially with high numbers of English Language Learners (ELLS). This research had much relevance for current and future leaders, including administrators and teachers.

The findings of this study suggest the need for review and potential revisions to the training of future school administrators, especially school systems with large Latino populations. Major considerations appear to be the impact of cultural educational understandings in being able to communicate effectively with parents both culturally and linguistically.
Abstract

Population and demographic studies show that the percent of minorities in the United States, particularly Latinos, will continue to increase when compared to the population at large. In order to meet their educational needs, additional training needs to be provided such that more minorities can fill teaching positions in the future. This will provide an opportunity for minorities to serve as role models and provide encouragement for additional minorities to prepare and work in various professional positions that have not always been available.

The Latino Educators of Tomorrow (LET) Program (Farnsworth, B.J. & Pierce, L.E. 2009) is interested in finding minority students who are juniors and seniors in high school that have a desire to be prepared as educators. The aim is to mentor these students as they prepare to begin university work and eventually graduate with a teaching degree from the university. The LET program originated with the Provo School District and has now expanded to the Alpine, Nebo, and Wasatch School Districts.

During the summer of 2010, 95 Latino students from Provo, Alpine, Nebo, and Wasatch high schools participated in the third year of the LET program. As the data was reviewed for the 2010 group of students, it became evident that many Latino students who had indicated an interest in becoming teachers had changed their focus. There were still Latino students interested in becoming educators, but the percentage of those students in the LET program had dropped because of other areas of interest. On a positive note, there appears to be a higher number of Latino students interested in attending the university.
Introduction

Both national and Utah demographic populations continue to change. A recent report that focuses on *Utah’s Demographic Transformation* indicates that from the year 2000 through 2007 the population growth has been 67% white non-Hispanic and 33% minority. While the K-12 school growth for the same period has been just the opposite, 65% minority and 35% white non-Hispanic (Perlich, 2009). The minority population in the U.S. is reported to be 35% in 2010 but is expected to grow to 54% in 2050. In Utah, the percent of minorities is lower but follows the same trend as the nation at large. For example, the minority population is reported to be 19% in 2010 and anticipated to grow to 30% in 2050. In Salt Lake City, Utah, the minority population is higher with a reported 27% minority in 2010 with an expected growth in 2050 reaching 41% (Perlich, 2009). Figure 1 illustrates this minority population growth trend.
It is demographic information such as that mentioned above that has generated an interest in working with minority students; the goal being to help students gain knowledge and skills that would enable them to acquire more productive positions in the job market. In our particular case, we are also very concerned that minority teachers become prepared to serve as role models for Latino and other minority students. We feel that the Latino Educators of Tomorrow (LET) program can offer the impetus for many minority students to become educators and role models for the many students in the university service area. Table 1 shows the number and percent of Latino students in each of our four service area school districts that are currently attending.

In the summer of 2008 the LET program was started at Utah Valley University. The program was initially funded by Brent Brown, the owner of several local auto dealerships. His main interest was to serve Latino students in the Provo, Utah area, the vicinity of a number of his auto dealerships. The initial goal of the program was to identify junior and senior high school students who wanted to become teachers. They would be invited to participate in the summer program. Details of the program were reported at Hawaii International Conference on Education (HICE) in January 2009 (Farnsworth and Pierce, 2009).

The main purpose of the LET program was to help to prepare Latino student to become teachers. Latino teachers could provide not only excellent instruction but role models for an increasing population of Latino students. Many educators feel that there is a need to support Latino students in the schools at a higher level that could be particularly accomplished by having more Latino teachers.
During summer 2008, 36 students participated in the program. In summer 2009, the program grew to 95 Latino students from the four school districts, Provo, Nebo, Alpine, and Wasatch. In summer 2010 there were again, 95 Latino students who participated from the four school districts.

One reason for inviting the nearly 100 students for the summer program was to have a better chance at being able to retain at least 30 students who would graduate from the teacher education program. As program participants, students begin during the junior and/or senior years of high school, then continue the freshmen and sophomore years at the university, and finally are accepted into the teacher education program for their junior and senior years. The culmination of which is graduation with a baccalaureate degree and a professional educator license.

The program numbers have been near 100 students during the second two years of the program, but we have noticed that a good share of the students who have participated have been high school juniors. Many of the students with more experience in the program have decided to move to other bridge programs in fields where they have more interest. The majority of the LET students have indicated that they participated not because they really wanted to be teachers, but because the program provided a great summer experience. They participated academically at little or no cost, experientially through field trips and events, and socially through interaction activities with other Latino students.

Since the beginning the program in the summer of 2008, other content programs have begun at the university. For example, science programs are now underway and a number of students have moved in that direction. We feel that involving Latino students in any of the university programs is a success, but our interest is to build a strong cadre of Latino teachers who will be able to act as role models throughout the school system.

Problem

As we have worked with Latino students during summer 2010 we have identified a new challenge not apparent in the two previous years. Nearly half of the students that initially indicated a desire to be teachers have changed their minds. It appears that some have recently become interested in other disciplines. Likewise we are finding that many students initially indicated that they wanted to be teachers
and now we find that they enjoyed participating in the programs for the opportunities and social activities that were associated with the program but had little to no interest in following through to become a teacher.

We feel that the program has been a success if we can entice Latino students to stay in school and attend the university. However, the goal of the School of Education was to involve students, who had a sincere interest in education, to work through the program, qualify for graduation, and obtain a teaching license. We still believe that having Latino teachers who can serve as role models and act as mentors for young students will be positive. As we look at the data, it appears that approximately half of the students who participate in the LET program actually have little if any interest at all in becoming teachers. Table 2 provides the description of the number of students interested in becoming teachers.

Table 2
*Latino Students participating in the LET program who are Interested in Education as a Career*

</tbody>
</table>

The major objective for the LET program is to increase the number of bilingual Latino students who graduate from the UVU School of Education and become licensed educators who will teach in local school districts. To organize the program in the beginning, a Latino Educators of Tomorrow Planning Team was established involving a high level of collaboration among faculty and administrators at Utah Valley University and Provo School District (Provo, UT). For the second and third year of implementation, Alpine, Nebo, and Wasatch School Districts were
included. There is also ongoing work to involve Latino parents so that they can help to support the efforts of their students.

The program focuses on four main areas:

1. Identification of Latino students who show interest in becoming teachers,
2. Participation in concurrent enrollment pre-program education courses,
3. Experiential learning through school visits where students learn about the role of the teacher,
4. Participation in intensive summer courses, workshops, and social activities. (Farnsworth, B.J. & Pierce, L.E. 2009)

Results and Discussion

Taking into account the students who have returned to other countries and those who are still in high school, there are 68 out of 93 (73%) who are attending the university full time. Of the 68 students who have participated in the bridge program and are attending UVU, 31 (45%) have stated they will continue into either the elementary or secondary education programs at UVU. Currently, there are 55 freshman and sophomores at UVU who plan to major in education. Thirty-one of these students are from the bridge program and 24 are “other” Latinos who have stated they are interested in careers in education. It is expected that these students will take longer than the average UVU student to matriculate into the professional program due to financial and language issues. Of the approximately 55 students who are interested in education, roughly 42 are freshman and 13 are sophomores. Of the 13 sophomores, six plan on becoming elementary majors and seven, secondary majors. During the next two years, we will be able to
report exact numbers of Latino students who actually apply for acceptance into the teacher education program.

Conclusion

Our current information would suggest that fewer students than we had anticipated will actually work toward a career in education. However, it appears that more Latino students will attend the university as a result of the experience with the education LET program. This alone is a very positive note. After several attempts by the university to attract and retain Latino students to the field of education, the LET program appears to be the most successful. Rather than expecting 30 students yearly to graduate, it appears that a more realistic number will be between 10 and 15.

6. Paper Abstract – Submitted to HICE 2011 Conference (Sattler & Johnson)

Education for the 21st Century: A Transformational Model

President Obama and U.S. Secretary of Education Arne Duncan are calling for “revolutionary change” in our educational system with incentive grants such as Race to the Top funding opportunities for states to facilitate change. Preparing our young people is a moral and economic imperative.

What we have learned “nationally” in transforming educational systems

Students today must compete in a global economy; a strong educational system is the foundation and prerequisite to their success. Accessible education is a civil rights issue for all
children to be able to enter the world of work and become educated citizens to support our democracy.

In March of 2010, the U.S. Department of Education published, *A Blueprint for Reform*, outlining five areas of focus. Through the mid 20th Century, the United States was considered a global leader in education. By the end of the 20th Century and into the 21st Century, the United States progressively lost ground in the areas of math, reading, science, and problem solving. This trend prompted The Partnership for 21st Century Skills to develop a vision to strengthen American education focused on changes needed for success in a global society:

Challenging this vision are major issues related to our teaching force in the U.S. These issues will be shared with participants.

**What we have learned “internationally” that will help us transform education**

Hargreaves and Shirley (2009) in *The Fourth Way: The Inspiring Future for Educational Change* provide insightful information about top performing students and their educational communities around the world. They analyzed the performance of elementary and secondary students in academics based on national and international tests, particularly in reading, language arts and literacy, mathematics, and the sciences.

The top performing nation and educational networks and “turn-around districts” around the world will be shared with conference participants. Commonalities will be cited among these high-performing educational systems.
What we have learned about “community collaboration” that will impact local schools

Research supports the need for highly qualified teachers, but explicitly indicates that teachers cannot do it alone. Key to systemic change is collaboration between all stakeholders; legislators, universities, schools, and communities working toward a common goal of preparing teachers who will be highly qualified to practice in comprehensive 21st Century learning environments. Such collaboration supports the model for Full Service Community Schools first conceived by Jane Adams in the late 1800s and promoted by educational leaders such as Dewey throughout the 20th Century. Full Service Community Schools have the flexibility to comprehensively address the needs of children and families. Extensive research supports educating the whole child; physically, socially, and emotionally; as well as providing support for family well-being to strengthen and maintain children’s academic progress.

Additionally, research on Professional Development Schools (PDSs) supports such a collaborative model. The National Council for the Accreditation of Teacher Education defines PDSs as “innovative institutions formed through partnerships between professional education programs and P-12 schools.” The focus is on preparing highly qualified teachers, educational leaders, and health care professionals through professional development directed at improving practice to enhance student achievement. Research on PDSs indicates there is improved teaching quality and student achievement.

Full Service Community Schools actively teaming with PDSs provide opportunity for the entrepreneurial vision of stakeholders. Stakeholders focused on a common vision to bring American education into the 21st Century by implementing 21st Century skills.

Communities around the world are paying attention and are actively engaged in transformational change in education. These collaborations unify the community to provide
school-based services in health care, agency support, technical training, and education to children and families in addition to creating innovative, real world 21st century learning environments.

A transformational model, designed by the authors, will be shared with session participants. We hope to gain feedback and ideas to further refine the model.

Additional index words. Guest speakers, guest lecturers, professional development

ABSTRACT

Teaching experience is important for a graduate student's professional development. However, opportunities are often limited. Our Tropical Plant & Soil Sciences (TPSS) Department has only three graduate teaching assistants per semester, and students can be a teaching assistant for up to two years. Thus, other graduate students lack the opportunity to gain much needed teaching experience. We describe how graduate students were integrated into an undergraduate horticulture production systems course as guest speakers. Certain graduate students were selected to make a presentation in a lecture or laboratory section of TPSS 300 *Tropical Production Systems* based on their firsthand knowledge and experience in topics relevant to TPSS 300. Graduate students spoke on diverse topics including innovative horticultural enterprises in China, American Samoa agriculture, green roofs, orchid nurseries, tissue culture, vermicomposting, aquaponics, hydroponics, campus landscape facilities, Varroa mite problem on honeybees, and beehives and pollination. Speakers used PowerPoint® presentations, tours of laboratories and greenhouses, campus tours, and laboratory exercises. The integration of graduate guest speakers into our undergraduate course worked well, providing benefits to both the speakers and the students. TPSS 300 students learned firsthand from knowledgeable speakers. Graduate students gained some valuable teaching experience. Lastly, this experience helped bridge the social gap between our graduate and undergraduate students.

INTRODUCTION

TPSS 300 *Tropical Production Systems* was designed to serve as a bridge between the introductory course TPSS 200 *Tropical Crop Science* and the upper division crop
productions courses in vegetables, fruits, flowers, and foliage (Kobayashi and Perez, 2009). It is a four-credit course with two 75-minute lectures and one three-hour laboratory a week. It is a required for all TPSS undergraduate students and helps fulfill the credit requirement for a B.S. degree (Tropical Plant and Soil Sciences Department, 2004).

Teaching experience is important for a graduate student's professional development. Teaching skills and knowledge help enhance students' potential performance whether they go into academics, private sector, or government work (McGoldrick et al., 2010). Teaching opportunities are sometimes limited, however. Our department has an average of 20 graduate students each semester (Susan Takahashi, personal communication). We have only three graduate teaching assistants per semester, each assisting in three or four courses. Students can be a graduate teaching assistant for up to two years. Thus, there is a lack of opportunity for the other graduate students to gain some teaching experience.

The objective of this paper is to describe how graduate students were integrated into an undergraduate horticulture production systems course as guest speakers.

METHODS

Certain graduate students, who were in the TPSS 654 Communications in the Sciences course, were asked to make a presentation in a lecture or laboratory section of TPSS 300. Students were selected based on their firsthand knowledge and experience in topics relevant to TPSS 300. If a student agreed to guest lecture, we discussed in person or via e-mail the specific topic they were to speak on (Evans and Marsden, 2009; Nourse, 1995). We also discussed what kind of laboratory experience they could provide such as a tour of their laboratory, observing their experiments in the greenhouse, or going on a campus tour.

In addition, two Plant and Environmental Protection Sciences (PEPS) Department graduate students were asked to speak about their research on the Varroa mite problem in honeybee hives and on pollination.

RESULTS AND DISCUSSION

Topics of the guest speakers

Graduate students spoke on diverse topics including innovative horticultural enterprises in China, American Samoa agriculture, green roofs, vermicomposting, vermicompost tea (Fig. 1), aquaponics using lettuce and tilapia fish, setting up a non-circulating hydroponic system for vegetables (Fig. 2), tissue culture and the operation of a tissue culture laboratory (Fig. 3), orchid production and nurseries (Fig. 4), campus landscape facilities and operations (Fig. 5), Varroa mite problem on honeybees (Fig. 6), and beehives and pollination (Fig. 7). Speakers used a range of presentation formats in which they chose
including PowerPoint® presentations, tours of laboratories and greenhouses, campus tours, and laboratory exercises.

**Figure 1.** Archana Pant, a TPSS graduate student (shown on the left), gave a greenhouse tour of her research on vegetable production using vermicompost tea, a nutrient solution made from earthworm compost.

![Image of Archana Pant giving a greenhouse tour](image1)

**Figure 2.** Jensen Uyeda, a TPSS graduate student (shown on the right), explained his work on vegetable production using non-circulating hydroponics.

![Image of Jensen Uyeda explaining his research](image2)
**Figure 3.** Lee Chaille, a TPSS graduate student (shown on the right), provided a tour of a tissue culture research laboratory, discussing the techniques he is using in the micropropagation of ornamental plants. Lee has extensive experience working in commercial tissue culture laboratories.

**Figure 4.** Peter Wiggin, a TPSS graduate student (shown on the right), explained the details of orchid production. Peter owns a commercial orchid nursery on the Big Island.
Figure 5. Roxanne Adams, Landscape Manager for the UHM and a TPSS graduate student (shown on the left), gave a tour of the campus landscape plant nurseries. Roxanne has extensive experience working in commercial landscape businesses, plant nurseries, and was an owner of a landscape maintenance business.

Figure 6. Tyler Ito, a graduate student in the Plant and Environmental Protection Sciences (PEPS) Department (shown in the middle), discussed his research on the Varroa mite problem in honeybee hives.
Figure 7. Jane Tavares, a graduate student in the PEPS Department (shown in the middle), described pollination of horticultural crops by honeybees and discussed her research on pollination of macadamia nut trees.

Effectiveness of the guest speakers

Course objectives. Integrating the guest speakers into the course helped to achieve certain course objectives (Lang, 2008), namely, that students should be 1) familiar with different crop production systems and crop management systems and 2) be aware how environmental factors and crop manipulations influence crop growth and development in different production systems. As noted by Lang (2008), we were not just looking at using guest speakers as an add-on. Rather, we chose guest speakers whose expertise and experience were relevant to the topics that were covered in TPSS 300 and whose presentations would meet the course objectives.

Classroom ambiance. The guest speakers provided an interactive atmosphere in which students and the speakers asked questions and shared information with each other, as opposed to the traditional one-way flow of information. The guest speakers, being graduate students, often served as peers, unlike professors who are often viewed as field experts by undergraduates. The lectures by the guest speakers may not have seemed as intimidating as compared to lectures given by professors (atmosphere is a little more relaxed/calm).

“Variety is the spice of life” was applicable in the class (Nourse, 1995) with the guest speakers adding “spice” to the class and supporting and enhancing the lecture material presented in class (Evans and Marsden, 2009). Guest speakers added enthusiasm and interest to the class. It appeared the guest speakers helped to improve class attendance and raise the level of interest as demonstrated by increased attendance, interest, and the asking of questions by the students. This may have been due to the students recognizing
that the guest speakers possessed firsthand experience and research knowledge about the topics they presented.

*Teaching opportunity.* It should be noted that the graduate students were given opportunities to teach and that this was not an exercise in teaching the graduate students how to teach. That is beyond the scope of the instructors. Our department has no course in teaching methodology. There is a three-day Teaching Assistant Training program prior to the start of each semester, which is mandatory for new teaching assistants. Continuing or potential teaching assistants are welcome to attend.

*Selection of guest speakers.* Selection of graduate students was based primarily on their firsthand experience and knowledge or research in a particular topic rather than their speaking skills. Although Boyd (2008) mentioned when inviting guest speakers to talk to your class, one should choose those that speak well, this is not always possible even with inviting other faculty to guest lecture in your course.

Typically, in TPSS courses, guest speakers are other faculty, extension specialists or agents, or people from the agricultural industry. In an attempt to try a different approach, we asked graduate students with relevant expertise or practical experience. Experts from the campus community can be tapped to lend expertise and insights on many topics (Nourse, 1995).

**Benefits for the TPSS 300 students**

*Relevant expertise and practical experience.* Guest speakers provided insights into other aspects of agriculture, aside from cultivation, such as insect pollination of crops, vermicomposting, and agroecology. In addition, they provided insights into the agricultural business and possible future career choices such as orchid production, organic farming, operating a tissue culture laboratory, and beekeeping. They supplied up-to-date information and knowledge of local enterprises. Guest speakers provided a sense of the “real world” and practitioner experience (Evans and Marsden, 2009).

The guest speakers’ lectures also provided examples (or blueprints) of how undergraduate students can conduct experiments similar to those of graduate students. As the graduate students discussed how they went about conducting their experiments, the undergraduates were provided with examples of how they can conduct their own experiments.

*Active learning.* When students sit passively as their instructor delivers information by lecturing, they often do not become engaged in their learning. To demonstrate multiple ways of seeing and knowing, Robinson and Kakela (2006) often invited guests from related fields to visit their class. In a similar manner, we invited guest speakers to help provide an interactive atmosphere, in which the students and guest speakers shared information and engaged in lively discussions.
The TPSS 300 students were not like the students in an argument and persuasion course (Lang, 2008) in which the students were extremely reluctant to ask questions and the conversation between the guest speaker and the students was stilted. Our students showed extreme interest in the topics of the guest speakers as seen by their attentiveness and questioning. It should be noted that it is the responsibility of the instructor to guide the guest speaker and the students into a meaningful dialogue by asking questions and providing comments.

*Career opportunities.* Presentations by the guest speakers offered the students a brief survey of other fields related to their major that they could specialize in upon graduation. Through the use of graduate student speakers, we exposed the students to experienced horticulturists and to the types of job opportunities available. Guest speakers were career-information providers in a classroom environment (Metrejean et al., 2002).

*Use of PEPS Dept. students.* At first, only graduate students in the TPSS Department were asked to make a presentation in TPSS 300. We later asked two graduate students from another department in our college—Plant and Environmental Protection Sciences Department. Although these students are not directly involved in crop production research, their studies on honeybees, Varroa mites, and pollination provided valuable information to the students. Honeybees are vitally needed for the pollination of fruit and vegetable crops in Hawaii, honey production, and queen bee exports. The students’ exposure to graduate students outside our department emphasized to the students the interrelationships among the various agricultural disciplines needed in crop production.

*Benefits for the guest speakers*

Benefits to the guest speakers included increased technical knowledge, new perspectives on teaching methodologies, practiced leadership skills, and acquiring a critically needed item for their resumes (Sánchez and Craig, 2007). Giving the graduate students the opportunity to speak to a class—whether it be a lecture, giving a laboratory or greenhouse tour, explaining their research experiments, or conducting a laboratory exercise—helped them to gain experience in public speaking, an important career skill (Boyd, 2008).

The graduate students received no credit for guest speaking. It is not clear why the graduate students participated in TPSS 300. Perhaps, they perceived teaching as having value beyond earning an academic credit or grade (Sánchez and Craig, 2007).

**CONCLUSIONS**

- Undergraduate students learned from knowledgeable graduate students.
- Graduate students gained valuable teaching experience.
ACKNOWLEDGEMENTS

We thank graduate students Roxanne Adams, Adam Baker, Lee Chaille, Ian Gurr, Tyler Ito, Ryan Long, Archana Pant, Alberto Ricordi, Jane Tavares, Jensen Uyeda, and Peter Wiggin for guest speaking. Special thanks to Charles Kinoshita for financial support. Thank you to Kent Sadanaga for his technical assistance.

LITERATURE CITED

Qualitative research is prevalent within educational and management research, yet the methodology remains varied across disciplines. The purpose of this poster presentation is to review qualitative research design, specifically the descriptive case study, as used in sport management research. This presentation will address study design, data collection procedures, research quality, data analysis and the presentation of findings. The presentation will describe the data collection methods of document mining, interviews and participant observation, within an athletic context. Qualitative research refers to validity and reliability as the quality or trustworthiness of the data. A detailed table presents the key considerations of qualitative data quality. However, at no point in case study research are qualitative and quantitative methods less alike than during analysis (Stake, 1995). The presentation describes data triangulation and the inductive approach to data analysis required for qualitative research. Such in-depth case studies of athletic programs can prove difficult but provide a unique insight into the world of sport.
STUDENTS’ CONSTRUCTION OF A VIRTUAL MUSEUM FOR MULTIMODAL MEANING-MAKING: THE CASE OF A PILOT INTERVENTION

STUDENTS’ CONSTRUCTION OF A VIRTUAL MUSEUM FOR MULTIMODAL MEANING-MAKING: THE CASE OF A PILOT INTERVENTION

Caroline M. L. Ho
Mark Evan Nelson

Abstract

This paper evaluates a pilot design research intervention of 12-13 year old Secondary (Middle) students in Singapore constructing a virtual museum within an English Language (EL) curriculum which seeks to engage students through the infusion of authentic, rich multimodal stimuli. 78 students from two classes designed the layout of museum galleries based on their chosen themes, sourced and created multimodal artifacts, and presented their proposals and galleries to an imagined external audience and their peers. The research design and methodology, processes and factors driving the design and implementation of the project are described. Feedback from teachers and students on the benefits and limitations of the study are elicited through semi-structured interviews, survey and questionnaire forms. Recommendations to overcome problems identified are proposed.

1. Introduction

Interest in learning in museums, art galleries and science centres has gained over the years (Jackson & Adamson, 2009; Hawkey, 2004; Prosser & Eddisford, 2004) with advanced creative and meaningful developments in digital and interactive technologies (Sherman, 2009; Song et al., 2005). This has drawn attention to the role of such institutions in supporting and enhancing learning in informal learning environments with formal classroom learning and in promoting lifelong learning (Chung, 2010; Albany Institute of History & Art, 2008-2010). The provision of authentic learning opportunities mediated through various forms of technological platforms offers a challenge to educators, researchers and designers in the design and construct of such dynamic learning environments, particularly in this 21st century of learning.

In this age of rapidly increasing change and development in a globally digitized economy, 21st century skills are acknowledged as critical for individuals to thrive in the workforce (Metiri Group, n.d.). These skills of critical thinking and problem solving, communication, collaboration, and creativity and innovation have been identified to become even more important to organizations in the future (Lang, 2010). In line with the New Literacies movement that extends beyond traditional, print-based notions of literacy to the ‘design’ of meaning-making in multimodal ways, museum-based learning can be seen to offer informal, experiential learning through media rich experiences facilitated by authentic objects and structured into inquiry-led learning (Vavoula et al., 2009). Essentially, these work towards ‘new forms of literacies that emphasize the various modes of meaning-making’ (Tan, Bopry & Guo, 2010, p.15) through a range of semiotic resources (Kress, 2000). Multidimensional learning is encouraged within a dynamic and engaging learning environment (Johnsson, 2003) where learning is activated through engagement with various stimuli (audio, visual, spatial) through specially created museum platforms.
Our study drawn from a larger investigation (Ho, Nelson & Mueller-Wittig, 2008) involves Singapore teenage students in conceptualizing, designing and constructing museum galleries including the design layout and artifacts for a virtual museum which best expresses their self, culture and interests as a community of young people. This involves exploration in the creative, adaptive use of audio, visual, video input, three dimensional virtual and/or augmented interactive, digital resources in the process of multimodal composing of their virtual museum constructs. The student-generated, self-directed virtual museum construction based on students’ choice of themes, use of a mix of semiotic resources with opportunities for ‘hands-on’ exploration, discovery and display of rich, authentic objects, support a learning approach of active inquiry and engagement.

This paper describes our research study and evaluates the pilot intervention carried out with two EL classes. We begin with a literature review of museum-based studies in technologically-mediated contexts before presenting the theoretical underpinnings of the study and the pedagogical principles informing the design. Information on the research design and methodology then follows. The strengths and drawbacks arising from the intervention are discussed with feedback from teacher and student participants. We conclude with the implications and recommendations to overcome problems identified.

2. Literature review

Studies of virtual museums in various contexts have encompassed a range of technologically-mediated interventions with the development of various tools and resources to support learning. Barak et al.’s (2009) MOSAICA web 2.0 based technologies aimed at the preservation and presentation of cultural heritage resources (photos, documents, video, sound, etc.) from Israel, France, and Poland through an interactive, educational experience. Findings indicated benefits in terms of knowledge and positive attitudinal gains towards diverse cultures, ease of use, and attractiveness through hypertext narratives. Vavoula et al.’s (2009) Myartspace mobile phone service for web-based, inquiry-led museum-based learning supported pre-, during- and post-visit learning activities in the museum and the classroom. The potential and effectiveness of the service for enhancing learning between classrooms and museums were examined on a micro level concerned with issues of usability, meso level which examined educational effectiveness in terms of learning breakthroughs and breakdowns, and a macro level which evaluated the impact of the new technology on school museums visit practice. The service proved effective for students’ museum information gathering for subsequent classroom construction and reflection. Concerns included structuring museum visits, issues of viability and costs on a regular service and on a wider level. De Almeida & Yokoi’s (2003) development of interactive, virtual tour guides to online exhibitions establishes a customized, person-to-person dialogue while guiding users through virtual exhibitions. Attention was focused on design of motivational structures, emotional and personality traits and behavior control systems for characters to perform in context-specific environments, with well-defined goals and social tasks. Preliminary results with university students yielded positive gains in general, motivating students to explore the exhibition through the audio and gestural responses of the tour guide, providing adaptive guidance for engaging storytelling and promoting users’ participation throughout the virtual tour.

While these studies on museum-based learning mediated through technological platforms and specially created tools and resources have shown potential for yielding positive
benefits on participant learning and involvement, there remains a dearth of investigations into documented research in educational contexts which involves student-generated design and content for virtual museums constructed primarily by, for and with young people themselves as a multimodal representation of youth culture with the attendant ideals, beliefs, values and perspectives. This study fills a gap in current educational research in the local context and region.

3. Theoretical underpinnings

The study is anchored within the multiliteracies perspective of the New London Group (1996) in extending beyond the constraints of conventional written and spoken language to tie in with the culturally and linguistically diverse landscapes and the multimodal texts traversing these landscapes. As a multiliteracies-oriented project, it seeks to draw on students’ prior knowledge, background life experiences, lived memories and cultural forms of representation in order to project student voice and identity. Meaning-making is thus seen against specific cultural, social or domain-specific contexts. Further, given the characteristic nature of new information and communications media, meaning is created and conveyed through increasingly multimodal representations—written modes of meaning interfacing with oral, visual, audio, tactile and spatial patterns of meaning, and particularly those typical of the new digital media (Kalantzis & Cope, 2008). Virtual museums as learning environments can serve to unlock the semiotic potential of multimodality in promoting students’ attention to meaning through sounds, music, image, movement and text with a focus on writing as a multisemiotic resource to construct meaning and project identities.

The study in facilitating a constructivist (Bruner, 1993; Von Glasersfeld, 1987,1995; Jonassen et al., 1999) learning environment through the use of different modes of knowledge representation and interactive digital media, engages students in an active exploration and co-construction of participants’ own knowledge, beliefs, interest and perspectives. At the same time, as an inquiry-driven (Kuhn, Black, Keselman & Kaplan, 2000; Dewey, 1938,1991) form of learning, students direct their own investigatory activity as they formulate questions, plan their activity, and draw and justify conclusions about what they have learned’ (Kuhn, Black, Keselman, & Kaplan, 2000, pp. 496–497).

4. Research design and context

This study adopted a design research (Cobb, 2001; Collins, 1992; Collins, Joseph & Bielaczyc, 2004) approach with researchers working closely throughout the study with project officers from a specialist computing background and classroom practitioners in designing and implementing the project within a school language curriculum over a specified period of time.

The study is timely in supporting the Singapore Ministry of Education (MOE) 2010 English Language (EL) syllabus, specifically with regard to a focus on its multiltieracies component. It reinforces the EL syllabus philosophy ‘A strong foundation and rich language for all’ (MOE, 2008, p.13) as it works towards ‘enriching the EL curriculum through infusion of authentic, rich texts at all levels’ with ‘extensive opportunities to engage in creative and sustained writing and integration of information and media literacies at all levels’ (MOE, 2008, p.9). The use of technologies developed around a virtual museum is aimed at enhancing students’ creative capacity for designing meaning in digitally-mediated contexts.
The three phases of the intervention comprised the pre-project, main intervention and the post-project phases. Prior to the main intervention, a guided one and a half hour museum visit to a local cultural museum in Singapore was specially arranged for the students. This was aimed at exposing students to a real-life physical museum, raise awareness and stimulate interest in the purpose, design and artifacts of an actual museum. This was followed by preparatory workshops comprising three three and a half hour sessions. The primary purpose of this workshop was to orient student participants to the nature and goals of the project. Discussions and activities were carried out to sensitize students to the types of multimodal literacies required for meaningful 21st century communication.

The ten-week main intervention integrated the content of the school EL curriculum in terms of the language skills required. Formal report writing skills, for instance, was taught to students in the regular EL lessons prior to the project task of writing a formal letter to the Museum Director with their proposed museum gallery proposal. Project tasks and activities were aimed at reinforcing the regular EL curriculum and not viewed merely as additional tasks with no relevance to the curriculum.

The post-project phase comprised final student and teacher interviews reinforced by survey forms and writing tasks in line with the curriculum focus. A combined sharing of presentations of the final museum galleries from both classes was scheduled.

5. Methodology

5.1 Study Site

The pilot study was conducted in the third term of the school year with the consent of the Principal, English Head of Department and 2 staff from the English Department who were teaching 2 Lower Secondary EL classes. The school was a ‘Special Assistance Plan’ (SAP) school in Singapore with a bilingual immersive environment where both English and the mother tongue were taught at first language level. It was also identified as a Lead ICT school which sought to spearhead information and communication technology (ICT)-mediated pedagogic initiatives in various subjects. The students, prior to the period of the pilot intervention, were introduced to different software such as Flash, Adobe Photoshop and ULEAD Video Studio through school-based workshops. The entire intervention for two classes of triple EL periods of one and a half hour weekly sessions over ten weeks was held in two of the school computer laboratories where each student had access to a desktop computer wired to the Internet.

5.2 Subjects

Seventy eight 12-13 year old male and female students from two classes (thirty eight and forty students in the two classes respectively) participated in the study. The majority of the students came from a predominantly middle to lower socio-economic background with an average to above average academic level. Students, parents and teachers involved were informed of the nature of the project and its objectives, and provided signed written consent prior to the implementation. Each of the two classes was divided into eight groups of four to five students each to ensure maximum participation and engagement. A total of sixteen groups of students from the two classes worked on their museum galleries based on selected themes of their own.
A pre-project survey was administered to students to determine their background and exposure to museums and various forms of technology. 84.6% of students have visited at least one museum in the real world before the onset of this study, with the main National Museum of Singapore leading the pack with 80.3%. Of these, 86.7% indicated that they enjoyed their museum visits and found them meaningful as they learned more about the local culture and history. With regard to students’ technology exposure and access, 84.6% of students owned a personal computer/laptop/notebook and Internet access at home. The top three IT-related activities for students were Web-Surfing, Internet Chat and Online Gaming.

6. Feedback from participants

The instruments used to elicit participants’ feedback comprised questionnaire and survey forms, and semi-structured, face-to-face interviews. The pre- and post-project teacher interviews focused on their initial concerns and benefits gained from both their and their students’ participation in the study.

6.1 Benefits for teachers

Multimodality and EL curriculum

Over the ten weeks of collaboration, the teachers felt they progressed from having no prior knowledge of incorporating multimodality into the language curriculum to having the opportunity to be directly involved through a personal classroom experience in using various semiotic resources with their students to enhance their level of understanding of multimodal literacy and engagement.

Interpersonal awareness of students

The teachers felt the project increased their interpersonal student awareness as they became more engaged with students and gained understanding of their students’ interests and presentation skills. During the different phases of group work, teachers also learned more of their students’ group dynamics on intra- and inter-group levels.

6.2 Concerns

Structure and organization

Tighter structure and organization with more explicit instructions and procedures, particularly in the written format for students were recommended. Graphic organizers for the design of detailed and structured plans were recommended with more guidance from teachers and facilitators, and the availability of planning folders prior to lessons conducted with more time for exploration could be built in during the conceptualization and construction phases.

Teacher preparedness

Teachers faced initial anxiety and insecurity in the early stages of the implementation, given their lack of exposure to design research of this nature and also the technical competency to work with specific design software required, particularly for the three-dimensional (3D) modeling required.
6.3 Benefits for students

Awareness of and sensitivity to multimodal expression and meaning-making

Students showed an awareness of multimodal ways of expression and meaning-making. For a group working on Japanese comics, visual and audio effects were cited as critical:

‘Like when you combine audio with a picture, it may actually tell a different story to just a picture. Maybe the audio is something about.. talking about the characters, talking about the other side of the character, like the picture don’t show the good side of the character so the audio will actually give the visitors a different idea of what the character thinks.

This was further reinforced by the role of moving visuals with audio in videos for representing the Music theme:

‘Video clips because it will be like most interesting to the target audience. They don’t have to read and they can watch the moving images, see the pictures and also hear at the same time like listen to the audio’.

There were emergent signs of students displaying sensitivity to the impact of various semiotic resources for specific purposes and contexts. For instance, text was favored for content-description of Korean dramas:

‘I think text is also easy to understand because it is the basic way where people try to communicate. Because sometimes for pictures, people might have different feelings towards the visuals’.

but when it came to the specifics of attractions from the Seven wonders of the world, visuals and color were recognized to play a significant role:

‘Because text is so boring. It is only black and white in color but then pictures have colors because different colors you can convey different emotions to our visitors; for example like white, black and grey are emotions of sadness, and red and pink of joy.. different colors convey different emotions to our visitors so this is more interesting than reading text- black and white text is so boring which cannot attract the teenagers because teenagers don’t like to read’.

For a group working to display aspects of the Youth Olympic Games hosted by Singapore:

‘A person might not be able to imagine, like let’s say for example a person scores a goal and then he is very happy but sometimes words might not…might not also describe how happy he is but a picture can show his expressions and maybe how he reacts.’

Language choice and preference

When it came to the choice and distinctions between EL and Mandarin, some students showed a preference for where their strengths were:

‘I mostly speak Mandarin to my friends so maybe I will be able to explain things better using Mandarin’ Likewise, another said that Mandarin was better to explain things and also being
closer to her heart in terms of cultural and the theme that they were working on. Perhaps familiarity with the language helps to breed the confidence in the application of the language.

This contrasted against students who showed awareness of an audience beyond themselves when they felt that museum visitors who may not be conversant in Mandarin will prefer English:

‘Not all visitors to the museum know Mandarin so English is still the best to help them understand what our gallery is all about’.

These students displayed understanding of the functional role and purpose of each language which accounted for their choice in relation to the perceived wider audience and targeted museum context.

Gains from group work

The positive benefits of group work over a sustained period ranged from teamwork and collaboration, learning more of their peers, exploring different perspectives, communication skills, time management, emotional support. With regard to teamwork and collaborating in a group, students generally felt that they benefited from working with each other:

‘Because each of us has our own ideas right, so when we combine it, it will become like one great idea. So it is like, actually like add more ideas to get a greater one. So for us to accomplish this idea right, it takes more ideas for it to work.’

and learning more about their individual classmates:

‘I got to learn more about my team mates and found out that besides being humorous and full of novelty ideas, he actually possessed the qualities of a leader from the way he moved us together to complete different objectives during this project’.

Further, it allowed them to explore different perspectives and broaden the scope of their responsibilities in mixed gender groupings:

‘Yea I think interacting with the opposite gender tend to be where some sparks will fly and there will be like quarrels and wars so yea war but not really on that scale, but in the end, it will always be back to the normal situation where we’ll work together again. And so it is like he said, we can foster good friendship yeah’.

Communication skills and time management were also cited as gains for students as they learnt to work together efficiently in various areas for their research and take responsibility for specific tasks within their individual groups:

‘One advantage is that actually can divide the work so one person can concentrate on one movie in that area so we don’t have to waste a lot of time to look for irrelevant resources or maybe we are not familiar with the movie and we have to find the pictures of the movie and we ended up finding something else.’

7. Recommendations
Recommendations for addressing problems identified focused on the technical aspects of the implementation, curricular and pedagogical issues.

7.1 Technical issues

The nature of the technology platform adopted, be it virtual or augmented, requires appropriate modeling with adequate sampling from the computing staff right from the initial stage of the intervention. Students could be encouraged to source for and identify actual realia or real-life input relevant to their group’s theme which could serve as a platform for the computing staff to develop the bridging of the real life input with the virtual and augmented reality.

Given the nature of this project with the use of specific software and technological tools and resources, student groups could be assigned to the respective computing staff right from the beginning (e.g. four groups in one class to one staff). This deliberate, strategic allocation of students to specialist staff is to ensure targeted and focused assistance over a sustained period so that students could seek advice, even during the initial stages of gallery floor plan design and multimodal resource selection for their galleries. Regular monitoring also ensures students are kept on task during the development phase of their gallery construction.

7.2 Curricular issues

Pre-project and main intervention links

The pre-project visit to the local cultural museum could be more tightly integrated with project curricular goals in the main intervention for greater reinforcement and support. Students could be briefed prior to the actual museum visit on what to look out for (e.g. museum floor plan; artifacts arrangement and display; interactive components, descriptive captions of exhibits). This extra step will be helpful to students when it comes down to the actual planning, design and construction of their museum galleries.

During the pre-project workshops, more sample galleries and artifacts could be showcased. In addition to the sample artifacts from the computing staff to show concrete realizations of the specific forms of technology adopted, display of the better quality student-generated museum galleries and artifacts from the pilot study would be invaluable input for the next round of intervention.

Multimodal skills, self and critical reflection

Building in more time and providing clearer instructions for students with samples provided through teacher modeling of what is expected would facilitate students’ writing tasks as in the descriptive captions of their museum artifacts. This would enhance their awareness and deepen their understanding of image-text relations in multimodal constructions.

Regular and periodic students’ self reflections in the form of a blog entry during the third, sixth and ninth weeks of the study are recommended. To facilitate easy access and posting to the project portal, student folders for online uploading of their work could be made available by the school technical support staff prior to the intervention. More time could also be built into the
intervention to facilitate individual students’ critical reflections and evaluations of each others’ museum galleries and artifacts towards the end of the intervention.

8. Conclusion

This paper focuses on a pilot intervention of teenage students’ engagement with multimodal meaning-making through constructing a virtual museum within a language curriculum. Museum galleries are designed based on students’ choice of themes with design layout and artifacts created in an attempt by young people to represent their selves, interests and culture. Preliminary feedback shows emergent signs of students’ awareness of multimodality, attitudinal and motivational changes towards language learning, and the development of soft skills of teamwork and collaboration. Concerns raised include the initial technical aspects of the implementation, and the need for a tighter, closer integration of curricular and pedagogical issues with the technological platforms and tools adopted. The study has demonstrated the viability within real world classroom constraints of an exploratory technologically-mediated intervention to enhance multimodal language learning and literacy skills appropriate for the 21st century.

Acknowledgements

The work reported in this paper is supported by the Centre for Research in Pedagogy and Practice, National Institute of Education, Nanyang Technological University, Singapore under research grant OER 26/08CH and funded by the Ministry of Education, Singapore. The authors are indebted to Jun Wei Lim, and all teachers and students who were involved in the study.

Notes

1 Since 1966 English has been a compulsory subject for all schools in Singapore and since 19987 it has been the medium of instruction for all subjects. English is designated the First language (L1) in the national school curriculum although the majority of Singaporean children may not have English as their first language in their home environment. In SAP schools which were well-established Chinese-medium schools in the past, the ethos and environment of SAP schools enable the pupils to be effectively bilingual in both English and Chinese, and inculcate in them traditional values in a Chinese school environment with students taking Mandarin at a Higher Chinese level (MOE, 2010) equivalent to English at First Language level.

The Life Cycle Investigation of e-Learning Technology towards Education

Victor B. Kreng,
Department of Industrial and Information Management
National Cheng Kung University, Taiwan, R.O.C.
1 University Road, Tainan 70101, Taiwan, R.O.C.
kreng@mail.ncku.edu.tw

The widespread availability of digital learning resources in a variety of media formats offers the possibility to make a profound difference in education. The potential of this technology has not been fully realized for a range of complex reasons. Recently, computer-mediated communication (CMC) has been adopted in most e-learning settings, which enhance the participation in online discussions through synchronous communication (1). However, in such fast changing environment, technology life cycle of e-learning has been significantly shortened that lead to the loss of investment in education institute.

Accordingly, technology valuation and forecasting of e-learning technology becomes crucial to obtain insights for educational investment. This study develops a valuation model for e-learning life span based on aging theory to assess the value and possible development so as to support decision making. There are three scenarios proposed by aging theory for technology life span valuation, which are Growth-only, Constant Decay, and Recursive Decay (2). Moreover, this study considers the impacts of two aging parameters, support transfer factor and support decay factor, and nature under different technology life stages to obtain energy function from supporting data. The three different valuation models of e-learning technology life span are constructed. Furthermore, the valuation will be utilized to compare the values of e-learning life cycle between the regular and CMC synchronous practices through simulation.

The simulation with the influences from distinct life cycle, aging parameters, and scenarios are conducted. Owing to the fact that the selection of scenarios for e-learning development depends on the trend of its adoption between current and earlier stages, it is necessary to monitor repeatedly as dynamic detection. In addition, the simulations of S-curve towards substitution of e-learning technology is, then, utilized to illustrate possible situations, which provide sensitivity analysis to review the impacts while input variables are changed. This study has shown that e-learning
with synchronous communication possesses strong potential in future education.

Dynamic Assessment of Early Literacy Skills: Examining the reliability, validity, and feasibility of a play based progress monitoring tool

Research suggests early writing skills may best be tapped through multimodal play-based assessments that afford opportunities to write for different social purposes (Neitzel & Rowe, 2008; Neuman & Roskos, 1990). The Early Literacy Rubric (ELR) is a promising multimodal seven item teacher completed inventory that measures: oral message, reading, writing, picture, name writing, play, and sounds. The current research examined the usefulness of such a dynamic, formative assessment tool, the Early Literacy Progress Monitoring Rubric, for making instructional changes in early childhood classrooms. The rubric was utilized by Early Reading First teachers in Scaffolding Early Literacy (SEL) classrooms to track and make instructional changes that would facilitate children’s literacy skill development.

**Theoretical Context**

An expectation of teachers in SEL classrooms is to monitor children’s progress using the Early Literacy Progress Monitoring Rubric. The rubric serves as a type of dynamic assessment and is an alternative to traditional assessments in which only the child’s current competencies are
measured and the assessor is forbidden to intervene (e.g., explain the prompt in more detail, provide a strategy for solving) in order to maintain the validity of the assessment results. In contrast, dynamic assessment treats the interactions between the child and the assessor as a valuable source of information about a child’s ability. Thus unlike traditional—static—assessments, dynamic assessment takes into account the outcomes of the supports provided by the assessor during the assessment (Sternberg & Grigorenko, 2002) and helps to establish both the child’s current level of achievement and a child’s ability to attain higher levels (i.e., Zone of Proximal Development, or the range of performance a child can accomplish with and without support from a competent other). Through use of the rubric, teachers are able to scaffold children, as well as address particular challenges and specific IEP goals within a regular preschool classroom, including strategies to stimulate and facilitate interaction between children with special needs and their typically developing peers.

The *Early Literacy Progress Monitoring Rubric* is completed as children create daily play plans. Play Planning is a complex strategy in the *SEL* framework that simultaneously supports aspects of play, self-regulation, and early literacy and writing indicators such as phonological awareness and concepts of print. In the *SEL* approach, the Play Planning process supports children wherever their individual abilities may lie on the developmental continuum. Children may plan orally and the teacher may take dictation of what the child has said. Or, as the quality of play and experience in using written marks to communicate grows, many children start discovering the function of teacher’s writing and attempt to write on their own.

The *Early Literacy Progress Monitoring Rubric* is directly aligned with the Play Planning process. Developed by members of the Janesville, WI school district as part of an Early Reading First project using the *SEL* approach, the rubric is an efficient way for teachers to monitor
children’s progress in an ongoing manner on various domains of children’s development, including oral language, reading, writing, play, and phonological awareness and has been identified as a best practice for early childhood assessment (Doing What Works Clearinghouse).

Methodology and Analysis Procedures

Twenty-one teachers completed the ELR on 53 children (ages 3 through 5 years) from 21 Head Start classrooms located in large urban and rural locations. ELR data was collected at mid-year in all classrooms. The same children were assessed on the Peabody Picture Vocabulary Test (PPVT) and PALS PreK at the end of the school year.

The current study examined internal consistency and structure of the ELR. Additionally, correlation and simple linear regression analyses were used to examine the relationship between the ELR and the PPVT and PALS respectively. Item 7 on the ELR (sound) was excluded from analyses due to incomplete data. Finally, the rubrics were analyzed to determine the extent to which teachers’ use of the rubric led to improved scaffolding of children’s literacy skills during the play planning process. Teacher feedback on the Early Literacy Rubric was gathered using an online survey following initial implementation. Survey questions focused on the feasibility of the rubric, the nature of instructional changes that took place, and the potential sustainability of the rubric. Rubrics and corresponding play plans were analyzed using content analysis, to describe and summarize trends observed in these documents. Patterns and themes were used to establish coding schemes. Codes were related but not limited to the identification of evidence of teacher’s understanding of scaffolding and dynamic assessment strategies.

Results

The 6 item rubric was found to be reliable with a reliability estimate of $\alpha = 0.83$. Principal component analysis extracted one composite factor (eigenvalue = 3.28) from the 6
items (see Table 1). A significant positive correlation was found between both the PPVT and the ELR Reading, Writing, and composite score (see Table 2).

Table 1. Factor loadings for Early Literacy Rubric Items

<table>
<thead>

**. Correlation is significant at the 0.01 level (2-tailed).
Results from content analyses of completed rubrics suggest use of the *Early Literacy Progress Monitoring Rubric* assisted teachers’ understanding of how to scaffold children within their zone of proximal development on critical literacy skills such as direction of print and phonological awareness. Additionally, teacher survey data indicated that the rubric was feasible and informative for making instructional changes in early childhood classroom.

**Conclusions and Implications**

Results from the reliability and factor analysis suggest that the ELR reliably measures the construct of literacy readiness. Subsequent analyses will be necessary to investigate the stability of this factor. ELR items were significantly correlated with PALS subtasks and the PPVT and accounted for a significant amount of variance in the PPVT score. These relationships suggest that the ELR may be useful for informing instruction of specific skills such as name writing or writing in general in order to target specific outcomes. Feasible instruments, such as the ELR, are necessary so that teachers can easily incorporate formative assessment into authentic settings. This research will contribute to the body of literature on developing useable authentic assessments in early childhood classrooms for the purposes of informing instructional changes. The combination of dynamic assessment and scaffolding is uniquely suited for providing individualized instruction to children with varying needs in early childhood classroom. Finally, the results highlight the feasibility of using dynamic assessment with scaffolding strategies as more practical than previously thought for classroom teachers.
The Effects of Mathematics Textbooks on Learning Fraction
for the Beginners in the Elementary School

Abstract

The concept of fraction is introduced since the second grade in Taiwan’s elementary school. This paper aims to investigate the effects of mathematics textbooks on learning fraction for the beginners in the elementary school by comparing the performance of fraction concepts between the first and second grade students in Taiwan. The former group consisted of 1252 students who did not officially learn the fraction concepts while the latter group did and had 1210 students. This study adopts a group written test format with 22 questions, each with 5 answers of multiple choices. The Cronbach $\alpha$ values for first and second graders were 0.7646 and 0.7423, respectively which demonstrated good reliability of this test. The results showed that the teaching materials of fraction for the beginners increased the performance of the second graders on continuous quantity for equal sharing problems; however, the teaching materials did not help the second graders consolidate the conceptual connections between ‘half’ and ‘1/2’. Thus, more second graders were likely to be affected by the fraction symbols or the numbers in the fraction for their answers when problem solving.

KW: fraction concepts, elementary school, mathematics education, mathematics textbook

Introduction

In the elementary mathematics curriculum, the concept of fraction is highly related to other concepts such as decimal, ratio, percentage and division (Ministry of Education, 2003) and all these concepts are important ones in the elementary school mathematics. In addition, when learning mathematics, the concept of fraction is the first time for the students to learn about comparisons between two quantities (Kieren,
Therefore, learning fraction concept is very important in mathematics; it is also critical that students can distinguish between base quantity (unit) and comparative quantity (partial quantity) through the learning of fraction.

From the learner’s perspective, the first impression is crucial, if not eternal. The initial learning of a particular mathematical concept can cause long-term effects on the subsequent learning. This is the reason why mathematics educators remind us that the early learning of mathematical concepts should not be discounted. Teachers’ instruction is one of the most important factors affecting the thinking and learning of the students (Rogoff & Chavajay, 1995). The mathematics teachers of the elementary schools in Taiwan depend highly on the textbooks and the teacher’s manuals (Chung, 1996; Gu, 2000). Therefore, this paper aims to investigate the effects of mathematics textbooks on learning fraction for the beginners in the elementary school. The teaching materials and textbooks will be used interchangeably to mean the same thing in this paper.

Literature Review

I. The Teaching Materials of Fraction for the 2nd Graders in Taiwan

Taiwanese elementary students start to learn fraction since the 2nd grade. Therefore, this literature review aims to analyze the teaching materials of the fraction for the beginners. The analysis for this literature review comes from the three most popular textbook versions in Taiwan. The results show that there are three topics commonly shared by these textbooks as follows.

1. Concept of Equal Sharing
   (1) In the mathematics textbooks for the 2nd graders, the number of equal sharing problems on continuous quantity is slightly higher than that on discrete quantity.
   (2) All textbooks introduce the concept of equal sharing from the context of discrete quantity. After the equal sharing concept is established, all textbooks then proceed to the instruction of fraction from the concept of continuous quantity.

2. Concept of Simple Fraction
   (1) The learning objective of simple fraction is to introduce the symbol of fraction. The concepts usually are presented first with the linkage to the daily languages (e.g., equal sharing, one section out of two sections, a half), then the Chinese in the mathematical term (二分之一), and finally the connections with the reading of mathematical language, the Chinese characters, and the writing of mathematical symbols (e.g., one half, 二分之一 and 1/2). Although the
symbolic language of “1/2” is linked to “a half”, the connection between these two is not emphasized.

(2) The contexts on continuous quantity are much more prevalent than those on discrete quantity.

(3) In most textbooks, the activities of simple fraction adopt single object as the content of unit fraction. There is only one textbook that includes activities in which the content of the unit fraction is multiple objects.

3. Concept of Unit

In the activities for simple fraction, it is necessary to employ the concept and identify the unit in problem solving, if the problem consists of two units. However, the design of the teaching materials does not particularly demand the students to distinguish the differences between unit and partial quantity; additionally, the teaching activities for linking the relationships between the units are not emphasized either.

Overall speaking, although the teaching materials of fraction for the beginners in Taiwan cover three major concepts (equal sharing, simple fraction, and unit), the majority of these materials focus on simple fraction, followed by equal sharing, lastly the unit.

II. Studies on Students’ Concepts of Fraction and Their Misconceptions

1. Concept of Equal Sharing

Pothier and Sawada (1983) proposed a five-stage theory to describe children’s development on dividing ability. First, they can divide a continuous quantity into pieces, regardless of their sizes. Second, they can use folding to divide, but they are unaware of the unequal size for each part. Third, they can divide the unit fractions with an even-number denominator. Fourth, they can divide the unit fractions of 1/3 and 1/5. Lastly, they can construct all the unit fractions. Lin, Huang & Leu (1996) also found that when doing problems on “a half” of a continuous quantity, second graders would divide it into two unequal parts.

2. Concept of Simple Fraction

Even though “a half” and “one half” share the same mathematical concept, “a half” is daily language while “one half” is mathematical language. (Note: In Chinese language, they have different ways of expression, e.g., 半 vs. 二分之一. Yet, in English, the terms are used interchangeably.) Thus, students display different abilities in solving problems for these two types of wordings. Some students are capable of doing problems on “a half” but not the ones on “one half” (Lin et al., 1996).

When students doing the fraction problems, they get confused between
denominator and unit fraction; they tend to use the denominator as the answer (Fig.1, Figueras, 1989). They are also vulnerable to the influence of the numerator, thus drew the number of the areas to be the same as the numerator (Fig.2, Yang, 1988).

![Fig.1 Figueras (1989)](image1)

![Fig.2 Yang (1988)](image2)

3. Concept of Unit

When students are doing problems on fraction, they encounter two types of difficulties in identifying unit:

1. Unable to identity unit

In Example One (Fig.3, Figueras, 1989), students circle the denominator number as the unit. In Example Two (Lin et al., 1996), students confuse one half of the unit with one half of an apple.

【Example One】

T: (There are four apples) Please give me one half of the apples.

S: ( ) (a half of an apple).

【Example Two】

![Fig. 3 Figueras (1989)](image3)

(2) Unable to identity the similarity/difference between units

When there are two units in a problem, students mistaken them as the same. (Lin et al., 1996)

Research Methods and Procedures
I. Research Method

This study adopted a group written test to collect data, with 22 questions, each with 5 multiple choices.

II. Research Samples

The samples were randomly selected from the first and second grade of the elementary schools in Taiwan, 42 classes in total. There were 1252 first graders and 1210 second graders participated in this study, of which total number was 2462.

III. Research Tools

The test contained three parts of fraction concept: equal sharing, simple fraction and unit. The contexts for the problems included continuous quantity and discrete quantity. The Cronbach $\alpha$ values for the first and second graders were 0.7646 and 0.7423, respectively. It demonstrated good reliability.

There were 22 questions for the test in this study. Since the first graders did not officially learn the symbol of fraction, the wordings were different for 8 questions which still share the same mathematical concepts. That is, “half” was used for the problems for the first graders, while the mathematics symbol “$1/2$” was used for the problems of the second graders. In other words, 14 questions were identical and the other 8 ones used different wordings, but still with the same options.

IV. Paper-and-Pencil Test

The test was administrated as a whole class test at the end of the 2nd semester, June of 2002, of which duration was about 40 minutes. Since the first and second graders had limited word recognition ability, homeroom teachers read each question to the class, without further explanations and any questions from the students.

V. Data Collection and Analysis

Students’ answers were keyed into the computer, with separate data bases for the first and second graders. The percentage for each option of each question for each grade was calculated. Then the differences of the correct percentage in each question between two grade levels were compared.

Research Results

There were twenty-two questions in the whole test. There were 14 questions that the 2nd graders performed better than the 1st graders, and the differences in correct percentages between these two grade levels stayed within 20%. On the other hand,
there were 8 questions that the first graders outperformed the second graders. Furthermore, the first graders scored more than 20% on 3 questions than their second grader counterparts. As a result, we chose 3 questions with the biggest discrepancy in correct percentages between the two groups in two scenarios mentioned above as examples for the discussions in this paper. If the wordings of the questions were different between the two groups, the questions for the first graders were presented first, followed by those for the second graders with the different parts in the bracket.

I. The Questions that the 2nd Graders Outperformed the 1st Graders on Fraction

1. The second graders are better at judging equal sharing than the first graders.

   Question 19: (      )
   Is the gray area 1 of the 3 pieces divided equally within the circle?
   (In the below figure, does the gray area represent 1/3 of a circle?)

   ① Yes, because there are three pieces.
   ② Yes, because it is one of the three pieces.
   ③ No, because three pieces are not equal in size.
   ④ No, because the colors are different.
   ⑤ Others

<table>

<td>2.40</td>
<td>1.57</td>
</tr>
</tbody>
</table>

   Note: * represents the correct option.

2. If the number of the unit in the content is the same as the denominator, then the second graders are better at solving the “1/2” questions on discrete quantity than the first graders (comparing to the same “half” question for the first graders in which only the symbol “1/2” is replaced with the word “half”).

   Question 14: (      )
   There are 2 moon cakes in a box. Jane ate half box (1/2 box). Which is the correct way to color the part of the moon cakes Jane ate?
The main mistakes for the first graders in Question 14 were options ① and ③. The original meaning of option ③ was that there are \( \frac{1}{2} \) pieces of moon cakes eaten; however, some students thought that the white-colored part represented what was eaten (because if it was eaten, it was gone). Regardless of either the option ① or ③ (a total of 47.76% of students), they confused a half (of a moon cake) with a half of a box. There were some second graders shared the same misconception, although the number (30.50%) was less than that of the first graders.

3. Both the first and second graders have satisfatory performance on choosing the right figure that represents one half of a continuous quantity, but the second graders performed somewhat better than the first graders.

Question 4: (  
Jade bought a pizza. (She) gave a half to Ming. Which is the correct way to color the part of pizza Ming got?

</tbody>
</table>

Note: * represents the correct option.

The error analyses of Questions 10, 17 suggested that the reasons for the poorer performance of the second graders on this type of questions were due to their vulnerability of being affected by the numerator and denominator in the fraction symbol. There were 17.11% and 17.85% of second graders who were distracted by the numerator and chose “1” as their answers in Question 10 and 17, respectively. There were 23.22% and 16.28% of the second graders who were distracted by the
denominator and chose “2” as their answers in Question 10 and 17, respectively. First
graders outperformed their second grade counterparts, of which correct percentages
were 32% and 24% higher in Question 10 and Question 17 respectively. From this set
of data we surmise that the second graders had not built up solid connections
between “half” and “1/2”.

2. Options with fraction symbol are greater distractors for the second graders than
the first graders.

Question 8 (   )

There are 3 pieces of chocolate in a box. Divide equally to Ming, Hua, and Ing. How
many pieces of chocolate did Ming get?

\[ \frac{1}{3}, 2, 1, 3, \text{ Others} \]

<table>
<thead>
<tr>
<th>Option</th>
<th>Grade</th>

</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>First</td>
<td>14.86</td>
</tr>
<tr>
<td>Second</td>
<td>36.78</td>
</tr>
</tbody>
</table>

Note: * represents the correct option.

There were always some “blind” problem solvers regardless of the problem types.
The students were aware that the test was on fraction. Therefore, some students fell
into the traps and chose the option ① as the answer because it was a fraction (1/3).
Surprisingly, more second graders did so than the first graders (36.78% than 14.86%).
This could be due to the fact that the second graders have officially learned the
fraction concepts, while the first graders did not. This fact surprisingly caused the first
graders less distracted by the fraction symbols and unexpectedly scored 30% higher
correct percentages than their second grader counterparts.

**Conclusion and Suggestion**

Based on the performance of solving fraction questions of the first and second
graders, we believe that in addition to the factors of maturation of the students, the
effects of mathematics textbooks on learning fraction for the beginners in the
elementary school is quite evident. The impact for the second graders on learning
fractions is summarized in three points as below.

1. The teaching materials of fraction for the beginners increased the performance of
the second graders on continuous quantity for equal dividing problems. The
correct percentage of this type of problems was 81.82% for the second graders, which was 17.7% higher than the first graders.

2. The teaching materials did not help the second graders consolidate the conceptual connections between ‘half’ and ‘1/2’. In the “half vs. 1/2” contexts for discrete quantities, if the number of unit in the content is the multiple of the denominator, then the first graders (doing the “half” questions) have higher correct percentages than the second graders (doing the “1/2” questions), ranging from 24% to 32%. Based on these findings, we can infer that the teaching materials do not emphasize the connections between “1/2” and “half”. There are some recommended ideas for teaching. After the concept “half means 1/2” has been introduced, more opportunities should be given to students to make an association between “half” and “1/2”. For instance, when students are solving “1/2” questions (e.g., “If a ribbon is cut equally into two sections, what is the fraction of each section to the whole ribbon?”), after students reply “1/2”, the teacher can ask for another way of expression to encourage students to come up with the answer of “half”. By providing students more opportunities to connect “half” and “1/2”, it should help them adopt the old concept of ‘half” from their daily life experiences to learn the new concept of “1/2”.

3. Under the current teaching materials of fraction, the solving strategies of the second graders are more likely to be distracted by the numbers in the fraction and/or the fraction symbol. As a result, they had poor performance (with correct percentages lower than 60%) on the “1/2” situation questions on discrete quantities, if the number of the unit in the content is the multiple of the denominator. We assume that this could be attributed to the fact that most current activities in simple fraction consist of a single number of unit fraction for the content. In this case, the denominator is the same as the number of the unit in the content or the parts of unit divided, while the numerator is the same as the number of partial quantity or the part divided. In other words, other than the fraction symbol, there are only two numbers (the numerator and the denominator) in the question. Consequently, students may develop the misconception that they only have to solve the questions by looking at the number of the numerator and denominator. They neglect to check whether the number of the unit is the same as the denominator. From the satisfactory performance of the first graders on the “half” context questions in which the number of the unit in the content is the multiple of the denominator (with the correct percentage between 75% to 82.43%), there is no doubt that the second graders are capable of doing the same “1/2” situation questions on discrete quantities as well as their first grade counterparts. Lastly, but not leastly, we strongly recommend that more questions in which the
content of the unit fraction with more than one object should be included in the teaching materials of fraction for the beginners.

Abstract

Abstract: ATLAS© (Assessing The Learning Strategies of Adults) is a self-scoring instrument developed to quickly identify the learning strategy preference group to which the respondent belongs. Navigators, Problem Solvers, and Engagers all use diverse learning strategies that are specific to their learning strategy preferences. Used as a guide by which to apply self-directed metacognitive processes in a learner-centered classroom, ATLAS© can facilitate the identification and integration of additional learning strategies into one’s individual “learning toolkit.” The corresponding ATLAS learner-centered lesson plan template provides teachers with strategies to address these diverse approaches to learning.

Introduction

Since the initial Secretary’s Commission on Achieving Necessary Skills (SCANS) report in 1991, industry executives continue to suggest that new hires graduating from a variety of university and college programs are ill-prepared for the demanding learning complexities experienced by new hires (ASTD, SHRM, 2009). The competency-based paradigm, found in technical fields and espoused over recent decades, focuses on preparing students for the work world with the skills and competencies needed as an entry-level employee (Thomson, 1991). The underlying outcome of competency-based education is to produce a society of “doers.” Graduates are showcased as competent, entry-level workers who are prepared to enter the workforce as productive employees. However, many programs lack a critical component and, as such, do not prepare students well for the one skill that will span their entire careers – that of
“learning how to learn.” The paradigm change toward an education that includes self-directed metacognitive processes is to expand upon the competency-based outcomes and to produce a society of “thinkers,” who not only possess competencies relevant to their field but who can also problem-solve in a multi-solution, real-world environment.

The Emerging Learner in Adult Education

Learner-centered teaching has been the locus of change as the field of adult education has evolved over the past decades to focus on adult learning rather than on adult education. J. Roby Kidd (1973) viewed this new emphasis on learning as the implication that adult education was finally moving from a field of practice toward a field of study.

As a field of practice, the emphasis in research and conceptual development had been on providing services, with learning viewed simply as one component of educational programs. But a shift to a field of study with the individual learner as the central concern opened whole new realms, such as self-directedness and individual development, to the field. (Fellenz & Conti, 1989, p.1)

The very term, adult education, suggests a focus on the educator; however, adult learning implies that the emphasis be directed to the learner. Jarvis (1983) recognized the beginning of this change and affirmed that "the aims of the educational process are about the learners rather than about the profession or the wider society" (p. 41).

Malcolm Knowles further developed this learner-centered concept, which has gained much acceptance in the field of adult education. He coined the term "andragogy" for this practice.

It has come to mean an educational mode in which the teacher is viewed as a facilitator of learning. Students are perceived to be self-directed. The relationship
between teacher and student is personal and trusting. The climate for learning is informal and collaborative. Teaching...can be described as dialogical. (Grubbs, 1981, pp.5-6)

A major part of the definition of andragogy stresses the growth of self-direction in learning and the use of experiences of the learner in the educational process (Knowles, 1968). Self-directed learning has been defined as the process by which adults take control of their own learning, in particular how they set their own learning goals, locate appropriate resources, decide on which learning methods to use and evaluate their progress (Brookfield, 1995).

Andragogy is based upon student-centered, self-directed methodologies. As students better understand their own learning processes (metacognition), the more empowered they are to enhance their personal learning. "Trends in adult education and cognitive psychology that advance the understanding of the individuality of learning experiences and that promote learner self-knowledge and control of personal perceptions and judgements provide for potential empowerment of the individual" (Fellenz & Conti, 1989, p. 23).

This notion requires that the learner be able to conceptualize his own learning process and be able to pay some attention to how he goes about learning and thrust himself into managing the process (p. 30). To become successful in this process, learners must also recognize distinct learning strategies, which are specific to their individual learning patterns and behaviors.

**Adult Learning Strategies**

McKeachie, 1978 defines learning strategies are those techniques or specialized skills that the learner has developed to use in both formal and informal learning situations. In any given setting, learners use various strategies to achieve their learning tasks. The strategies are external behaviors developed by an individual through experience with learning, which the
learner "elects to use in order to accomplish a learning task" (Fellenz & Conti, 1989, p. 7).

Learning strategies are "more a matter of preference; they are developed throughout life and vary by task. While the effectiveness of a particular style relates to the individual, the success of strategies depends more on the situation" (Fellenz & Conti, 1993, p. 4).

"The skills or techniques selected to accomplish the task often have a great influence on the success of that learning activity. Adeptness and insight in the use of learning strategies appears to be a significant part of one's ability to learn how to learn (Fellenz & Conti, 1993, p. 3). The learner's ability to select the appropriate learning strategies for a specific task may then well prove a fundamental educational tool to enhance mastery of material.

Fellenz and Conti have focused on the role of learning strategies used in real-life learning situations by adults. As such, they have identified five areas of learning strategies upon which to center their investigation. "The phrase real-life learning has been used to distinguish typical adult learning from the academic learning of formal situations that is usually spoken of as studying or educating (Fellenz & Conti, 1993, p. 4). This approach to learning strategies can be measured with the Self-Knowledge Inventory of Lifelong Learning Strategies (SKILLS) (Conti & Fellenz, 1991). This valid and reliable instrument consists of real-life learning scenarios with responses drawn from the areas of metacognition, metamotivation, memory, critical thinking, and resource management. Each of these five constructs consists of three learning strategies (Conti & Fellenz, 1991; Fellenz & Conti, 1989).

**The Metacognition Construct**

Metacognition is defined as the knowledge and control over one's thinking and learning (Brown, 1985). It is a conscious, reflective endeavour; it is one that requires the learner to analyze, assess, and manage learning activities. The three learning strategies involved in the area
of metacognition in the SKILLS instrument are Planning, Monitoring and Adjusting (Counter & Fellenz, 1993, p. 9).

The Metamotivation Construct

Just as metacognition addresses the concept of one's knowing and understanding one's own learning patterns, metamotivation deals with one's knowing and understanding how or why one is motivated to participate or remain in a learning activity. Metamotivation is the awareness of and control over factors that energize and direct one's learning (Fellenz & Conti, 1993, p. 12). The prefix "meta" is used to differentiate the concept from external motivation prevalent in traditional education institutions. Consistent with all metamotivational strategies, the affective domain is once again the dominant factor in learning with this component and includes the learning strategies of Attention, Reward/Enjoyment, and Confidence (Fellenz & Conti, 1989).

The Memory Construct

Memory is "the capacity of humans to retain information, to recall it when needed and recognize its familiarity when they later see it or hear it again" (Wingfield & Byrnes, 1981, p. 4). The process of learning and memory are so closely related and interdependent that it is often difficult to determine whether we are concerned with one phenomenon or two...one who does not learn has nothing to remember, and without memory there is no evidence of learning (Long, 1983, p.58).

Metamemory is practical knowledge acquired about our own memory capacities and what we must do to remember; or simply, what people know about how they remember. Learners can improve their memory performance and the efficiency of their learning by developing metamemory skills; thus, difficulties encountered in learning may not be due
to the inabilities of the learner but rather may be the result of not using the appropriate
memory strategy for the learning task (Wingfield & Byrnes, 1981).

The mental activities used to store, retain, and retrieve knowledge are called memory
processes. These processes are accomplished either through internal or external memory
strategies. Internal memory aids are strategies in which all efforts to remember are completed by
the individual within their own thought processes. External memory techniques rely on the
interaction of the mental processes of the individual and the manipulation of the environment to
insure recall (Paul & Fellenz, 1993, p. 23). The memory strategies used in the SKILLS model
include Organization, External Aids, and Memory Application.

The Critical Thinking Construct

Critical Thinking is a reflective thinking process utilizing higher order thinking skills in
order to improve learning. The SKILLS model of Critical Thinking strategies is based on
Brookfield's (1987) four components: (a) identifying and challenging assumptions, (b)
challenging the importance of concepts, (c) imagining and exploring alternatives, and (d)
reflective skepticism. The SKILLS Critical Thinking strategies, based on these components
include Testing Assumptions, Generating Alternatives, and Conditional Acceptance of general
knowledge.

The Resource Management Construct

Learning strategies that lead to effective use of resources can have a positive effect on the
learning process (Fellenz & Conti, 1993, p.37), and management of these resources is an
important aspect in finding solutions to real-life, everyday problems. The number and variety of
sources available imply a need to choose wisely so the teaching of learning strategies should
include "techniques for identifying and acquiring appropriate learning resources" (Fellenz &
Conti, 1989, pp. 4-5). The SKILLS model includes the learning strategies of Identification, Critical Use, and Use of Human Resources.

**ATLAS© (Assessing The Learning Strategies of AdultS)**

The ATLAS© Instrument arose out of a need for a tool that was easy to administer, that could be completed rapidly, and that could be used immediately by both facilitators and learners. The instrument which was created has been entitled ATLAS (Assessing The Learning Strategies of AdultS). ATLAS utilizes a flow-chart design. Items are printed on a standard-sized, 8.5" x 11" page. Sentence stems, which are in the top box on the page, lead to options in other boxes which complete the stem. Connecting arrows direct the respondent to the options. Each option leads the respondent to another box which either instructs the respondent to proceed to another box or which provides information about the respondent's correct group placement. Depending upon reading level, ATLAS can be completed in approximately one to three minutes. Although it appears to be a very simple instrument, its contents are based on powerful multivariate statistical procedures (Conti & Kolody, 1998).

**ATLAS© Groups of Learners**

The following profiles of the three groups of learners are the results of qualitative and quantitative research methods including cluster analysis, discriminant analysis, and analysis of variance conducted with each variable when the participants were grouped by clusters. Comments from learners within each cluster collected during focus groups and personal interviews are also included to enrich descriptions.

**Navigators**

Navigators are focused learners who chart a course for learning and follow it. They are conscientious, results-oriented high achievers who favor making logical connections, planning
and organizing activities, and who rely heavily on the learning strategies of Planning, Attention, Identification and Critical Use of Resources, and Testing Assumptions. Navigators prefer a structured, well-organized learning environment in which they have the opportunity to see the whole picture, complete with objectives, expectations, and deadlines prior to beginning the learning activity.

**Problem Solvers**

Unlike Navigators, Problem Solvers prefer ill-defined learning activities that promote experimentation and that allow processes to develop throughout the project. Rather than a structured plan, Problem Solvers reported a preference to “figuring it out as they go along.” Problem Solvers scored high in all three areas of Critical Thinking strategies which includes Testing Assumptions Generating Alternatives and Conditional Acceptance.

**Engagers**

Engagers seek out learning activities that provide the greatest opportunity for engaging in a meaningful connection: interaction and collaboration are major motivators for entering into the learning task. Engagers scored high in the metamotivational learning strategies of Reward/Enjoyment and Confidence. The affective domain is the dominant factor in Engagers’ learning. In their constant pursuit of learning activities that enhance understanding of themselves and their world around them, Engagers monitor the value of the learning experience and the level of motivation on an economy of scale to determine if the expected reward is worth the effort. When an Engager makes a decision to enter into a learning activity, it is usually well contemplated and a commitment is made to achieve the goal originally intended. In evaluating their learning, the Engager’s focus is on meeting their internal needs rather than meeting external standards. Because of the great emotional investment in their learning, Engagers take great pride
in their work and often their self-worth is determined or validated by their accomplishments (Conti & Kolody, 1997).

**Addressing Individual Differences in a Learner-Centered Classroom**

It is important to note that, as with any concepts that have the potential of labeling people, care must be taken not to stereotype or to make assumptions regarding learners in any one specific learning group. Certainly, individual differences will appear within the groups. The commonalities found, however, can provide useful insights to help learners better understand how they go about the learning process. For teachers, these insights can be beneficial in the selection of appropriate methods and techniques used to focus understanding, discussion, and reflective thought about the learner (Kolody & Conti, 1996).

By assessing the preferred learning strategies of an individual, it is also advantageous to determine those learning strategies not commonly used by the learner. Once these strategies have been identified, teachers can provide instruction and examples to help learners use alternate learning methods (Kolody, 2003). By providing learners with additional metacognitive learning strategies, this knowledge can be an important element in addressing individual differences throughout the learning process.

**Summary**

Effective teachers help learners build a “learning toolkit” that contains a variety of learning strategies (tools). Teachers can then coach the learners in ways to identify and select the most appropriate “tool” or learning strategy for each particular learning task. Self-directed, autonomous learners are then well-equipped with a set of learning strategies in their “learning toolkit” and possess the ability to employ appropriate learning strategies for specific learning objectives. These metacognitive processes can then extend beyond the classroom and be applied
to the multi-solutioned complexities within workplace learning opportunities found throughout one’s career.

Peer Assessment and Characteristic of Groups in the Case a Study Support System is Conceived of Through Group Learning

Isao MIYAJI
Faculty of Informatics, Okayama University of Science
1-1 Ridai-cho, Kita-ku, Okayama-shi, 700-0005 Japan
miyaji@mis.ous.ac.jp

The purpose of this practice is to contact peer assessment and remarks through group learning, and to deepen an understanding of intelligent CAI which is the last study item in the knowledge engineering which is an elective subject.

First, in order to give fair knowledge, the lecture of conventional knowledge transfer type was carried out in the first seven times. The system which assists learning a subject which students decided was conceived through group learning in the second six times.

On the first week of the group learning, contents and functions, etc. of a study support system were made to discuss by brainstorming. On the second week, students wrote the content in the tag and stuck it on simili paper. On the third week, students were made to arrange the tags on the simili paper according to items of the system and explain it to other groups. Then, the slide was created about the conceived system. Presentation was carried out about the contents of which each group conceived to share the other groups' knowledge. Lastly, a student was required to write a report.

Then, we analyzed some questionnaires which evaluate the activities. We found that understanding of the learning contents was deepened through group learning, and consciousness changed so that group activity might be performed very enthusiastically. Besides, students came to think that series of activities raised the skill needed in case of solving one problem. The activities which were useful for change of consciousness became clear. It turned out that the developed class was valid.

Moreover, principal component analysis was conducted for 17 variables related to assessment activities. The first and second principal components were named "the vigor of activity" and "the degree which is not good as for evaluation". 23 groups were classified into the following four clusters based on principal component scores: Three groups who are active with sufficient evaluation, seven groups who are active with insufficient evaluation, eight groups who are not so active with insufficient evaluation, and five groups who are not so active with sufficient evaluation.

1. Introduction

It is important not only to be taught knowledge, but also to think it with their heads, to make it by themselves, and to get to know the pleasure. They understand and search by their heads and hearts, and experience excitement of study. For deepening of thought and building of knowledge as experience, it is said that experience of movement from the heart is important [11].

It is said that experience repeating to compare with opinions of others and to analyze them by discussing among several learners is important. Adachi et al. practiced group activity in a comprehensive task and exercise according to groupware [2],[3],[5]. They reported there are two factors which are to understand opinions and grasp work, and to manifest opinions and execute work in evaluations for group activities[1]. Kaneda et al. performed group learning in robot-building, and reported that importance of cooperative work could be made to understand, and importance of communication and the difficulty of making an organization could be made to learn [4]. Nishino et al. practiced the information education by group learning, and reported that the group with higher evaluation for product had higher cooperative or exogenous attitude [8]. Nishinosono is developing guidance which makes students conceive of ideal school on the course of "instructional methods and technology" by learning in teams as a knowledge creation course, in order to train teachers who can take in solving problems, creating knowledge initiatively [9],[10]. These are not what are carried out by group learning through taking up contents which are difficult to understand among courses. These are not the practice which spares a part of course, and carries out by group learning, either. Activity which is useful for change of consciousness of the group learning has not been clarified yet.

It is thought that group learning brings contact for peers' views and remarks, multilateral standpoint, and deep understanding [12]. Furthermore, the group learning causes ideas for an intellectual functioning.
Then, we consider improving the class on knowledge engineering by the group learning [7]. The conventional knowledge transfer type lecture was carried out for the first eight weeks. Fair knowledge was taught, and the class which makes students conceive of a learning support system by group learning was designed for the second six weeks. Students were required to share investigation, to discuss a learning support system which assists learning, and to conceive of the system. Students wrote what they thought of on a sticky. The sticky may be stuck on simili paper and arranged according to items of the system. Each group explained the system conceived to other groups using simili paper. The other groups assessed it. Each group required to put together by the slide of PowerPoint through checking up the evaluation. Presentation was carried out about the contents of which each group conceived to share other groups' knowledge. After practicing such group learning, we analyzed some questionnaires which evaluate activities. We find relationship with the number of tags on simili paper and rating values. Characteristics of groups based on contents of simili paper and evaluations are checked for knowing how to lead groups. We know effects from the skill improved. The reason which brings the effects is found from activities which were useful for it.

2. Instructional Design and Method

The interest course is knowledge engineering which is an elective subject in the second term for the second grade student in department of information science in A university. It was carried out as shown in Table 1. The lesson for 90 minutes was performed 13 times at one week. However, it extended for about 30 minutes on the presentation in the 13th week. Conventional lessons with face-to-face were carried out through projecting slides on the screen until the sixth week. The midterm examination was carried out at the seventh week. At the 8th week, an outside lecturer gives an academic lecture about the current situation on the study support system processing knowledge.

Ninth to 14th weeks is a period for which the study support system by the group learning is conceived of. The theme in this paper was conducted among the period. A report was submitted at the 14th week. The final examination was carried out at the 15th week. Both lectures and group learning were performed by one teacher. However, since the presentation was made at the 13th week at the two classrooms, three students assisted as a chairman and clock charges.

The purposes of this course which was carried out at the ninth to 14th week are as follows: (1) the content of the lectures in the first half is supplemented through a class, "conceiving of a learning support system" by the group learning; (2) groupthink is fostered by causing interaction among students; (3) students who can take in solving problems, creating knowledge is fostered.

A group consists of four students. During group learning, the teacher went around a classroom appropriately. Then he asked questions and gave instructions so as not to become a bystander sometimes. Students were required to contribute some kind or another to the system conceiving by the group. Communication was taken mutually and their idea was expressed in the group. The teacher told that they could respect, compare, develop, extend, and raise each peer's opinions in order to enable them to conceive of the system.

The six weeks in the last half are called the first to sixth time in the following. Scenes of the lesson are shown in Figure 1. An idea is added and written on a sticky at the first and second times. The contents conceived in the end of the second time are summarized on the simili paper. Until the second time, divergent thinking is given priority to so that as many ideas as possible are made to propose. The contents are summarized in the end phase. The system is explained using the simili paper at the third time. Then mutual evaluation is carried out, and contents conceived are modified by referring the evaluation. It summarized through convergence thinking. Slides about the contents are created in PC room at the fourth time. Presentation is carried out in front of everybody at the fifth time, and information about a study support system is shared. Students copy report framework document file which put in explanation and the table of each item from the folder in the server. They are required to describe what were required for each item. A report is divided into items which are written in collaboration with students in the group and are written privately. It is written at the sixth time. It is submitted at the 15th week.

Twelve kinds of evaluation sheets were created and distributed suitably.Self-group evaluation and peer group evaluation were carried out. In order to know the situation of discussions of each group, a sheet of "records in group for discussions" was

distributed each time. In order to know change of consciousness by group learning and discussion, a sheet of "personal record for discussions" was distributed each student. These were submitted in the end of each class.

3. Analysis of Findings and Discussion

Five kinds of results investigated were analyzed in order to know the learning effects gained by the group learning described in Chapter 2. Changes of "personal record for discussions" in five times will be analyzed. We know the grade which worked at group learning and the good quality of how to advance talks in order that a student may conceive of a study support system from the result. The change of the consciousness is found by analyzing investigation for the degree of the consciousness related to skills of 29 items at the first, third and fifth times. We know activities which are useful for change of consciousness from relationship between consciousness and activity.

The significant difference will be judged at the 5% significance level.

3.1. Relationship with the number of tags on simili paper and rating value

The left side in Table 2 shows how simili paper was arranged. The group is arranged in the descending order of the first principal component every four clusters based on principal components analysis. The column of "rating value by other groups" means the value of the peer assessment about explanation using simili paper, content of a study support system, and presentation using PowerPoint, respectively.

While every group discussed, the tag whose size is 75mm in width by 50mm in height was put on simili paper in order to summarize the contents. The number of tags in a group was in the range of ten to 75 sheets, and the average was 34.0 sheets. 90 students attended any class of the groups study. 75 students stuck the tags on simili paper in discussions. The average number of tags for every group was 8.8. The maximum and minimum numbers of tags were 25 and zero, respectively. 15 students did not offer an opinion at all. It is suggested that these students will not much contribute to conceive the system for the group which they belong to.

Drawing figures is helpful to develop an idea, because students clarify overall outlook, or can think concretely. The number of the tags with which the figure was drawn is shown on the column of "number of figures". Here, figures mean what draws window configuration, learning process, and student models in charts. The average number of tags describing a figure was 4.5. The number of figures for the group No.16 is 36 and stands out among them. 13 groups which use the figure are 56.5% of the whole.

Since the number of tags stuck on simili paper represents the number of opinions in discussions, a group with many tags is considered that the group activity succeeded. The correlation coefficients r of the number of tags with the average number of figures, explanation, and evaluation for a system by other groups are $r=0.77^{***}$, 0.44*, and 0.43*, respectively. They have correlation significantly at significant levels of 0.1% and 5%. The correlation coefficients between the number of figures and an average evaluation for the explanation by simili paper are $r=0.43*$. The correlation is significant at 5% of a significance level. These facts show that the explanation of the group which drew many figures on tags is more intelligible. It is shown that the group which uses figures explains concretely and acquires higher evaluation by the other groups.

The teacher evaluated the part of a report written together, and the part written in an individual in five rating values. The correlation coefficients of the number of tags with the rating value of cooperation part of a report, the rating value of an individual part, and the number of characters in consideration ($1/1000$) are $r=0.76^{***}$, 0.59**, and 0.46*, respectively. They had correlation significantly at 0.1%, 1%, and 5% of significant levels. It is shown that the group which had stuck more tags on simili paper had higher evaluations of a cooperation part and an individual part in a report and more characters of consideration in the report. This showed that more ideas were proposed by the group with more tags. It is suggested that multilateral standpoint and deep understanding can be caused by expressing, comparing, agreeing, denying, and analyzing others' opinions, and by repeating discussions. Moreover, it is suggested that the group with smooth group activities at the beginning stage could also make role-sharing of report smoothly, could finish the part...
3.2 Characteristics of Groups based on Contents of Simili Paper and Evaluations

A variable which has almost no amount of information of the principal component and has no effect in characterization of a group was removed from variables of the object to conduct the analysis. In order to know characteristic of the group, principal component analysis was performed for 17 items shown in Table 3 using the correlation matrix. The 17 items are the number of tags on simili paper, the number of figures, evaluations by other group and self-group for explanation using simili paper, evaluation by other groups and self-group for a system, evaluation by other groups and self-group for presentation, the number of submission times of a slide, the rating value of cooperation part in a report, the rating value of an individual part, and the number of characters in consideration, and the rating values of the first to the fifth time in personal records for discussions. However, only one person in the group No.1 attended at the fifth time. The group did not submit the file of the slide, and did not give a presentation. Therefore, the rating scale values by other groups are 1, self-group evaluation at one attendee is 1, and the number of submission times of the slide is 0 time for group No.1.

As a result of principal component analysis, the amount of information of a component 1 is 39.7%, and the amount of information of a component 2 is 15.4%, and these two components will have 55.1% of information on data. A coefficient in the first component is positive about all items in the readjusted component matrix. The following coefficients are greater in positive: the number of tags in the simili paper (0.75), the number of figures (0.55), rating value for explanation using simili paper by other groups (0.73), rating value for a system by other groups (0.77), rating value by self-group (0.79), rating value for presentation by other groups (0.64) and by self-group (0.67), personal records at the third and fifth times (0.72, 0.82), rating value for cooperation part for a report (0.69), and rating value for individual part (0.56).

The following coefficients in the 2nd component were greater in negative: six items of rating value by other group and self-group, and rating value for explanation using the simili paper by other groups (-0.57), rating value for a system by other groups (-0.53), number of characters for considerations (-0.50), and the rating values for personal records at the first time (0.71). Coefficients of principal component are shown in parentheses following above item. The first characteristic is named "vigor of activity" from coefficients of the first principal component. The second characteristic is named "non-goodness of evaluation" from coefficients of the second.

Using the first and the second principal component scores, they are classified into four clusters by cluster analysis and a scatter plot is shown in Fig. 1. The first cluster was groups No.16, 17 and 18 shown by O mark in the lower right. The second cluster was groups No.3, 4, 5, 6, 12, 19 and 21 shown by □ mark in the upper right. The third cluster was groups No.1, 2, 7, 8, 9, 11, 13 and 22 shown by x mark in the upper left. The fourth cluster was groups No.10, 14, 15, 20 and 23 shown by △ mark in the lower left.
This figure shows the following. The first cluster (O) is groups who are active with sufficient evaluation. The second cluster (□) is groups who are active with insufficient evaluation. The third cluster (x) is groups who are not so active with insufficient evaluation. The fourth cluster (△) is groups who are active with sufficient evaluation. The second cluster (□) and fourth cluster (△) have fewer tags and fewer figures than the first and second groups. The average attendance rate of group members of the first and second clusters is 0.88 and 0.91, respectively. The average attendance rate for the third and fourth cluster is 0.73 and 0.74, respectively. It turns out that the groups belonging to the third and fourth cluster are lower average attendance rate.

Thus, whether group activities are active or not is found by looking at the contents of the simili paper in which the result of discussions are arranged. When students summarize the result of groups learning into simili paper, it is thought that it is better to teach how these contents are improved well. Furthermore, it is thought that a teacher should devise so that the attendance rate may also become high.

3.3. Change of the consciousness related to skill

The degree of the consciousness related to skill of 29 items was investigated at the first, third and fifth times (3). An analysis of variance in one-way layout which corresponds for each item carried out for the rating values of 29 items about three times in Table 4. The items with significant differences or significant tendency are shown in Table 4. The items are arranged in descending order of F-ratio. The significance level is shown when the significant differences are recognized. Then, the multiple comparison was carried out about three combination of the rating values among the first, third and fifth times by the LSD method. The results are showed in columns of 1-3, 1-5, and 3-5, respectively.

The analysis of variance was carried out for the rating scale values in each time. The result is shown in bottom row of Table 4. Since the F ratio is

*** p<.001, ** p<.01, * p<.05, + p<.1
14.8, significant difference was recognized. Then, after multiple comparisons were carried out, the significant difference was recognized among the first time vs. the third time and the first time vs. the fifth time. However, no significant difference is recognized between the second and the third time.

Next, the multiple comparisons were carried out for the average rating scale values of each item, among the first vs. third time, the first vs. fifth time, and the third vs. fifth times. The number of items with significance difference was nine, fifteen and one, respectively. This showed that consciousness heightened by gradation with the first time to the fifth time. However, the improvement between the third time and the fifth time was slightly one until the third time. The following can be considered as this cause. After the explanations by simili paper finished at the third time, the study supports system of which individual group conceives will be fixable. Then, referring to advice by other groups, we required students to correct them. At the fourth time, they arranged and summarized it to a side. However, since contents of the study support systems were not modified greatly, it seems that there would be little improvements of consciousness.

Students came to think that many skills needed in case of solving one problem rose since fifteen consciousness is improved among 29 consciousness for the first vs. fifth time.

3.4. Activity which is useful for change of consciousness

In order to know which activity will improve the consciousness related to skill from relationship between consciousness and activity, some activities which are useful for it were filled for each consciousness. When investigating the consciousness related to the skill at the third time and the fifth time, the 26 activities are written in survey sheet. Students chose activities useful for each consciousness among them. The activities useful for improving the perception of skills were totaled by making a cross table.

The number of the activities enumerated at the third time and the fifth time was 2916 and 4488, respectively, and was 7004 in total. The numbers at the third time and the fifth time were united as the cross table for the consciousness and activities.

Many cells in the table had less frequency than five. The cluster analysis was conducted about the table using Ward’s method with perception as a variable, with the activity as a case. As a result, the activity was classified into next four groups.

The group I consists of (16), (17), (18), (19), (20), (26), (28) and (29). It was referred to as ‘consciousness about the problem-solving skill in thinking and improving.’

In the same way, the group II consists of (6), (7), (8), (9), (11), (12), (13), (14) and (15). It was referred to as ‘consciousness about the skill in expressing and explaining.’

The group III consists of (10), (21), (22), (23), (24) and (25). It was referred to as ‘consciousness about communications and cooperation.’

The group IV consists of (1), (2), (3), (4) and (5). These numbers are the consciousness shown in Table 4. It was referred to as ‘consciousness on computer.’

Frequency in the above-mentioned cross table is added up for every cluster about consciousness and activity. Results are shown in left of Table 5. Each expected frequency of cell in Table 5 was more than 70. Therefore, this table was considered to be $4 \times 4$.
contingency table. The $\chi^2$ test was conducted for this table. As a result, the frequency deflection was recognized ($\chi^2 (9) = 1125.8, p<.001$). Therefore, a result of residual analysis is shown in the lower left of Table 5. Significant deflection is shown by a * mark in the cell of the lower right of Table 5. Activities useful for improving the consciousness are explained by significantly cells with greater frequency in the following.

The group 1 "activity related to presentation" is significantly useful for improving the group III 'consciousness about the skill in expressing and explaining.'

The group 2, 'activity related to evaluating,' is significantly useful for improving the group I 'consciousness about the problem-solving skill in thinking and improving.'

The group 3, 'activities related to investigating and summarizing,' is significantly useful for improving the group II 'consciousness about the skill in expressing and explaining.'

The group 4, 'activities related to computer operation', is significantly useful for improving the group IV, 'consciousness on computer.'

### 4. Conclusion

The course in which students construct and create knowledge was conducted by group learning. Information gathering, discussing and conceiving study support systems by group learning caused many interactions among students, such as the inside of a group, and between groups, and the inside of a class. One teacher designed, taught and practiced the course in which about 90 students participated. Although the teacher could not take much time to respond to one group for only one, it is thought that desired purpose has been almost attained.

Results of analyzing the information acquired by this practice showed as followed. Students worked through group learning for the much time of more than 23 hours. That raised motivation, pleasure, planned development, confidence, the explicitness of doing, and usefulness of discussions by causing interests in study support systems. Furthermore, since an opportunity to reflect them could be obtained, the systems which they conceived came to be able to be evaluated objectively.

The followings were found by this practice:

1. The group which was able to perform activities, such as thinking by themselves, in discussions positively, sharing work actively could conceive better system, and was properly appreciated.

2. It seems that difficulty, pleasure, etc. of working in cooperation were able to be known.

3. The group which uses figures explains concretely and acquires higher evaluation by the other groups.

4. More ideas were proposed by the group with more tags. It is suggested that multilateral standpoint and deep understanding can be caused by repeating discussions.

5. Since students who worked positively discussions deepen their thoughts, their understanding and ideas over a study support system are deep and their contents of reports are also substantial.

6. Whether group activities are active or not is found by looking at the contents of the simili paper.

7. The consciousness heightened by gradation with the first time to the fifth time. Students came to think that many skills needed in case of solving a problem rose.

8. Activities which are helpful for improvement of consciousness also became clear as follows: The 'activity related to presentation' is significantly useful for improving the 'consciousness about the skill in expressing and explaining.' The 'activity related to evaluating' is significantly useful for improving the 'consciousness about the problem-solving skill in thinking and improving.' The 'activities related to investigating and summarizing' is significantly useful for improving the 'consciousness about the skill in expressing and explaining.' The 'activities related to computer operation', is significantly useful for improving the 'consciousness on computer.'

We should consider ingenuity in the future so that individual or groups who could not be familiar with group learning and did not do positively participate might not appear.

We appreciate the support of the Grant-in-Aid for Scientific Research, foundation study (C 22500949) given by the Ministry of Education, Culture, Sports, Science and Technology, of Japan for this research.

The Process Leadership Education is part of an EU/EFS financed project, JämBredd, owned by Mälardalens University, Sweden. It is an advanced education for leaders focusing on change processes in multicultural workplaces. The whole project started in February and will ended in December of 2010.

The education consist of nine different theme modules with including lectures by various scholars in gender and diversity issues, seminars, group works and role plays. Around this education is run a research project to examine opportunities and obstacles in intercultural activities. Research methodology is action research and the first step is the implementation of an evaluation of the project’s mid-term. 10 process leaders were interviewed on questions mainly concerning: General experience of the education? How is your own participation in the project? Intentions after completion education?

The result show most participants are very satisfied so far: The education gives time for reflection when it lasting for almost a year. It gives an increasing awareness in dealing with gender and diversity issues. It gives more self-confidence. There is a strength to gain knowledge and tools to support their employees. They also see resistance.
Title: Improving high school reading comprehension through practices from the Reading Apprenticeship Approach: an action research trial project among French-speaking students in Montréal

Topic Area: Reading Education

Authors: Chantal Ouellet, Marie-Eve Massé-Denis, Nadine Barsalou, and Stéphanie Bouchard

Affiliation: Université du Québec à Montréal

Address: Département d’éducation et formation spécialisées, Université du Québec à Montréal, Case postale 8888, succursale Centre-ville, Montréal (Québec), Canada H3C 3P8

Email: ouellet.chantal@uqam.ca

In high school, reading holds a prominent place in the lives of students. High school students must learn to read a variety of texts. High school teachers expect students to have the necessary reading skills to read course materials, but many students have inadequate reading levels to do so. Although the scientific literature in the field has shown the importance of teaching reading comprehension at the secondary level, the fact remains that few reading comprehension strategies are taught to students, and teachers in the Montréal area adopt, in this regard, conventional teaching practices (Van Grunderbeeck et al., 2004). Moreover, secondary teachers feel helpless when it comes to teaching reading comprehension strategies. The aim of this action research project was to provide eight French-language special education teachers, working with 230 students, with training in the principles and practices of the Reading Apprenticeship Approach (Schoenbach, Greenleaf, and Cziko, 1999), developed in California, and to test these in the context of secondary education reform in the province of Québec (Canada). The data for the study was collected among students using a pre and post comprehension test and a questionnaire about their reading strategies after seven months’ trial. The results obtained in terms of comprehension among all students combined were positive but not significant. However, in examining the differences between strong, average, and weak students at pretest, we see significant progress in weak students at posttest. Although the teachers applied only some of the components at different rates and with varying degrees of quality, all students are now aware of the importance of reading strategies for solving comprehension problems and mention using certain ones in particular, which may differ from those used by students participating in the study. In addition, qualitative data reveals that students are more motivated to read and are more engaged in class. Teachers, for their part, say they feel more competent to teach reading comprehension and better equipped to apply this new training program in Québec schools. These results, in addition to improving the performance and engagement of weak students, contribute to increasing the body of research on the testing of the Reading Apprenticeship Approach in different cultural and linguistic contexts. Finally, these positive results can reassure teachers and principals in the Montréal area and other areas of Québec about the choice of this approach for improving teacher competence and student achievement in reading at the secondary level.
The Effects of Concept Mapping Strategy on Statistics Anxiety and Statistics Achievements: The Moderating Effect of Students’ Learning Styles

1. Introduction

Statistical knowledge is applied commonly in the academic fields as well as in practice. As a result more and more undergraduates, or even postgraduates, of different backgrounds are required to include statistics in their compulsory curriculum (Mundfrom, Shaw, Thomas, Young, & Moore, 1998; Onwuegbuzie & Leech, 2003).

However, for many undergraduate and even postgraduate students, statistics is among the most formidable courses in curriculum plans (Feinberg & Halperin, 1978; Onwuegbuzie & Leech, 2003; Schacht & Stewart, 1990). Moreover, many researches indicate that when the undergraduate and postgraduate students encounter such concepts, questions, cases, instructional or test situations as are concerning statistics, they are likely to develop severe statistics anxiety (Feinberg & Halperin, 1978; Onwuegbuzie, 1998; Onwuegbuzie & Leech, 2003; Zeidner, 1991). These research results evidently demonstrate that statistics anxiety is nowadays a prevalent issue deeply vexing the undergraduate and postgraduate students. Such negative outputs may debilitate learning. It has been proved in a great deal of literature published that statistics anxiety or statistics test anxiety is negatively associated with learning (Lalonde & Gardner, 1993; Onwuegbuize & Seaman, 1995; Ziedner, 1991).

However, there is not yet much literature expounding on use of instructional strategies for relieving statistics anxiety. Huntley, Schneider, and Aronson (2000) and Pan and Tang (2004, 2005) indicated that to mitigate statistics anxiety, it is necessary to develop more innovative instructional strategies. Therefore, this study is intended to apply concept mapping strategy in the course of applied statistics and to study whether or not it is conducive to reduce statistics anxiety and improve statistics learning.

Claxton and Murrell (1987) and Sarasin (1999) point out that it is necessary to consider different learning styles between students when teachers use various teaching methods. Furthermore, Budd (2004) indicates that auditory learning style learners might be able to gain benefit through a traditional teaching method while visual learners do well with support of visual sense. However, tactile/kinesthetic learners are able to learn through activities. Oughton and Reed (2000) shows learners of different learning styles demonstrate differently on the number of concepts, nodes, and links in concept maps as well as the depth of concept maps. Therefore, it can be inferred that using the concept mapping strategy should have different effects on students of different learning styles. However, there have been relatively few research studies which have compared the usefulness of concept mapping for students with different learning styles, especially in statistical education. This study has therefore attempted to investigate whether the concept mapping strategy’s effect on reducing students’ statistics anxiety and improving their academic achievement is affected by
students’ learning style types.

2. Method
2.1. Experimental design and participants

The experiment employed a non-equivalent pretest-posttest control group design. The participants in this study were two classes sophomore students enrolled in a business and economics statistics course at the National Changhua University of Education in Taiwan. The two classes were randomly assigned to one experimental class (i.e. concept mapping class) and one control class (i.e. traditional teaching class). The dependent measures were the statistics achievement post-test score and the statistics anxiety post-test score. Since the subjects in the two classes might have different prior knowledge and statistics anxiety, a pre-test measure of statistics knowledge and statistics anxiety served as covariates for the dependent measures. The teacher and the textbook for both classes were the same to reduce confounding effects. None of the students reported previous experience in concept mapping.

2.2. Instruments

A statistics achievement pre-test was applied to evaluate the students’ initial statistics knowledge, and a statistics achievement post-test was administered to measure the experimental effect on achievement. The two achievement tests were developed from the question database of the textbook. Both instruments included 10 multiple-choice and four calculation questions. The students scored four points for each correct answer to the multiple choice questions, and 10 points for each correct answer to the calculation questions. The pre-test range included chapters one through three of the textbook, and the post-test range included chapters four through seven. The KR (Kuder-Richardson) 20 reliability coefficients of both instruments were 0.83 and 0.88, respectively. The subjects were asked to complete both tests in three hours, under test conditions.

Statistical Anxiety Rating Scale (STARS) was used to evaluate students’ statistics anxiety. This survey developed by Cruise and Wilkins in 1980 contains 51 items with 5-point Likert scale (1= strongly disagree; 5= strongly agree). In Cruise, Cash, and Bolton’s (1985) research on statistics anxiety of 1,150 students, six major dimensions were loaded from factor analysis. The factor scores were loaded between 0.48 and 0.86 while the value of Cronbach’s alpha was between 0.68 and 0.94 in their study. The test-retest reliability coefficient was between 0.67 and 0.83 in a 5 week study of other 161 students in the study in 1985. The result in this study showed a Cronbach’s alpha coefficient was between 0.72 and 0.90.

This study adopted Learning Style Inventory (LSI) developed by Kolb (1984) to evaluate students’ learning styles. It contains 12 items with 5-point Likert scale (1= strongly disagree; 5= strongly agree). Blakemore, McCray, and Coker (1984) and
Sewall (1986) pointed out that the instrument has high construct validity, and the suitable target is university student and adult. Blakemore, McCray, and Coker (1984) evaluated the reliability of this instrument with the value of split reliability was between 0.55 and 0.58, and the test-retest reliability coefficient was between 0.49 and 0.60. Kraus, Reed, and Fitzgerald (2001) synthesized a series of the past studies and indicated the instrument’s Spearman Brown reliability coefficient was between 0.54 and 0.83, the Cronbach’s Alpha reliability coefficient was 0.29 and 0.71, and the test-retest reliability coefficient was between 0.34 and 0.73. Veres, Sims, and Locklear (1991) pointed out the instrument is quite valid in measuring learning styles. The result in this study showed a Cronbach’s alpha coefficient was between 0.68.

2.3. Experimental procedure

Several stages were implemented to accomplish the purpose of this study. First, at the beginning of the term, the teacher gave syllabuses to students and spent half an hour doing an introductory lecture about the course. Next, the teacher required students to fill out the LSI. Second, before the pre-test implemented, the teacher spent four weeks teaching all students chapters one through three of the textbook using the expository teaching approach. A pre-test was then administered after finishing teaching chapter three. Students finished the pre-test and filled out the STARS within three hours. Third, after the pre-test finished, the teaching experiment was formally implemented. The students in two classes then randomly assigned to experimental class and control class. The experimental group participated in the concept mapping program and the control group participated in normal statistics instruction.

In the experimental group, the teacher first explained why concept mapping is a useful tool for learning and how concept mapping can be used to show relationships among concepts, and then spent three hours training students to draw concept maps in accordance with the procedures suggested by Novak and Gowin (1984, pp. 32–34, Table 2.3). The teacher then taught from the textbook using teacher-constructed computer-assisted concept maps as the instructional medium. After finishing a chapter, the students were asked to use concept maps to represent what they had learned from the previous chapters. The teacher and the research assistants then corrected student-constructed concept maps together. During the correcting process, the teacher and the research assistants worked together in order to identify any statistical misconceptions and then modified these misconceptions for the class. After going through misconceptions using one hour in-class, students were asked to use the former same concepts to reconstruct their individual concept maps again. The students then used these modified concept maps as review tools for their independent studies. The above procedure was repeated until the end of chapter seven of the textbook, totalling an implementation period of 12 weeks.
In the control group, the teacher gave an introductory lesson that included the objectives of the lesson and how to proceed, and then taught from the textbook using teacher made computer-assisted abstracts as the instructional medium. After finishing a chapter, the students were asked to work on some questions. The teacher then taught the class correct answers to these questions. The above procedure was also repeated until the end of chapter seven of the textbook. The implementation period was the same as the experimental group.

Finally, at the end of the experiment, the statistics achievement and STARS post-tests were administered to the two classes to compare their learning achievement and anxiety level.

3. Results
3.1. The statistics anxiety comparison between concept mapping and traditional teaching classes: The moderating effect of students’ learning styles

Since the statistics anxiety pre-test scores may have influenced the experimental effect, a two-way analysis of covariance (ANCOVA) was applied. The pre-test scores were the covariates, the class, learning style and interaction were the independent variables, and the statistics anxiety post-test scores were the dependent variables. After controlling for the covariates, the main effect for post-test scores attained significance, $F=6.69, \ p<.05$ (see Table 1). The average score of statistics anxiety post-test for concept mapping class is 129.05 while the average score for traditional teaching class is 142.80. The result indicated that the experimental class that was exposed to concept mapping has a significantly lower statistics anxiety than the control class that received traditional expository teaching.

The learning style and the interaction of class and learning style both have not achieved statistically significant level, $F=1.25, \ p=.30; \ F=0.89, \ p=.45$. The results revealed that students with different learning styles have not appeared significantly different in statistics anxiety.

3.2. The statistics achievement comparison between concept mapping and traditional teaching classes: The moderating effect of students’ learning styles

Since the statistics achievement pre-test scores may have influenced the experimental effect, a two-way analysis of covariance (ANCOVA) was applied. The pre-test scores were the covariates, the class, learning style and interaction were the independent variables, and the statistics achievement post-test scores were the dependent variables. After controlling for the covariates, the main effect for post-test scores attained significance, \( F=7.26, p<.01 \) (see Table 2). The average score of statistics achievement post-test for concept mapping class is 72 point while the average score for traditional teaching class is 54.08. The result indicated that the experimental class that was exposed to concept mapping has a significantly higher statistics achievement than the control class that received traditional expository teaching.

The learning style and the interaction of class and learning style both have not achieved statistically significant level, \( F=0.57, p=.64; F=0.21, p=.89 \). The results showed that students with different learning styles have not appeared significantly difference in statistics achievement.

4. Conclusion

This study was intended to apply concept mapping strategy in the course of applied statistics and to study whether or not it is helpful to reduce statistics anxiety and improve statistics learning achievement. This study also investigated whether the concept mapping strategy’s effect on reducing students’ statistics anxiety and improving their academic achievement is affected by students’ learning style types.

The results appeared that no matter what students’ learning styles were, the concept mapping strategy more effectively reduced students’ statistics anxiety and improved students’ learning achievement than the traditional expository teaching.
method. In addition, students with different learning styles have not appeared significantly different in statistics anxiety and achievement.

Abstract:

Literacy in the Science Classroom Project is a multi-year professional development program for supporting science teachers in Canadian minority-language schools. This project is important because international and national assessments of science, reading, and writing have all reported significant differences between the mainstream English-language schools and the minority-language schools across the various regions of the country. Our research team has been working with minority-language teachers in one province to support their use of effective language-based instructional strategies for teaching science. The objective of our research study is to determine how teaching practices changed as a result of the program and how these were enacted in different classrooms. We also wanted to identify the successes and challenges to appropriating these strategies and practices at the classroom, school and district-wide levels. Data collection involved both qualitative and quantitative methodologies. Interim results from the study were presented along several dimensions. The first dimension involves changes in the students and teachers, specifically in their beliefs and practices about reading and text use. The second focuses on the teachers’ appropriation of strategies and practices for helping students read, as well as the successes, pitfalls, and obstacles to using these in the science classroom. The findings should therefore inform researchers studying the use of language-based activities for enhancing science teaching and learning. Moreover, this presentation should also inform educators who are presently faced with disparities between science learners based on the language of instruction, as well as others confronted with issues related to second-language, bilingual, and multilingual instruction.
Abstract
Native American tribes today face numerous challenges and immense opportunities. The ever-changing needs of tribes and Native communities call for a leadership base that is both educated and grounded in tribal values and traditions. As the role of higher education evolves into a place to foster future leaders for Native people, it seems now, more than ever, it is important that we understand leadership development among this particular population. The objective of this study is to examine how the annual Oklahoma Native American Students in Higher Education (ONASHE) conference facilitated the development of leadership skills among Native American student attendees. The researchers utilized criterion sampling to select participants, with the criteria being that participants must have attended two of the three annual meetings. Preliminary responses from participants have demonstrated the positive impact of the ONASHE conference on Native American students, particularly with regard to exploring a deeper meaning of leadership and connecting back to their Native American campus and respective tribal communities. Data collected through this study will further illuminate preliminary findings and provide a deeper understanding of concepts of leadership development among Native American college students.
Abstract

Today’s classrooms are more diverse than ever. In fact, research tells us that there will be a steady increase in Hispanic, Asian Americans, and African American students in the coming years. Therefore, differentiated instruction may be the panacea that educators are searching for. This paper commences with an introduction and then segways into a review of the literature that will elaborate on the following areas: the major principles of differentiated instruction, the essentials necessary for differentiating, ways to implement, the clichés, barriers, and myths surrounding the practice, and the research studies and theories supporting differentiation. The last section explains the results of a survey administered to middle school teachers to determine their level of knowledge in providing differentiated instruction in the classroom.

Introduction
Differentiation is not a novel concept. The one-room schoolhouse is an ideal example of how teachers have attempted to meet the needs of all students centuries ago (Anderson, 2007). Though differentiated instruction seems to be a broad term, it mainly refers to those classroom practices embodying student learning styles, interest, and prior knowledge (Benjamin, 2002). Understandably, state standards represent the knowledge to be taught but differentiated instruction gives us a meaningful way to teach those required standards (Protheroe, 2007).

Today’s classrooms are now defined by diversity. By 2035, students of color will be a majority in our schools with increasing populations of children of immigrant and migrant families. Half of all children will live in single-parent homes at some time during their school years (Tomlinson & Brighton, 2003). In the same way, the major purpose of differentiated instruction is to maximize each student’s growth by meeting each student where he or she is (Hall, Strangman & Meyer, 2003). On the other hand, traditional instruction has been equated with teachers who teach to the middle or use the one-size-fits-all approach (Rock, Gregg, Ellis, & Gable, 2008). One popular way of adopting differentiated instruction has been developed by Carol Ann Tomlinson (1999).

The Review of the Literature

The review of the literature covers the following sections: 1.) Major principles of differentiated instruction 2.) Essential components 3.) Suggestions for implementing differentiated instruction 4.) Myths, clichés, and barriers in differentiated instruction and the 5.) Research studies and theories supporting differentiation.

Major Principles

In order to understand differentiated instruction, the principles for practicing must be articulated. O’Brien & Guiney (2001) clearly enumerated these as major principles of
differentiated instruction: 1.) Every child can learn and every teacher can learn. 2.) All children have the right to high quality education. 3.) Progress for all will be expected, recognized, and rewarded. 4.) Learners in a classroom have common needs, distinct needs, and individual needs.

Other principles that are paramount to understanding differentiated instruction can be traced in Edyburn’s article (2004) entitled, “Technology Supports for Differentiated Instruction.” The principles are adapted from the work of Carol Ann Tomlinson (1999) and simply echo that teachers should focus on the essentials in learning, should attend to student differences, should collaborate with students on learning, and should not separate assessment from instruction. The teacher should constantly modify the content, process, and products produced from learning. Teachers must also allow students to participate in respectful work while maintaining a flexible working relationship.

Essential Components

In conjunction with the principles, teachers must engage in several key components for successfully conducting differentiated instruction in the classroom. Anderson (2007) insisted that the teacher must provide students with choice, flexibility, on-going assessment, and creativity in differentiating the concepts taught. At the same time, a teacher has to understand how students process and develop understanding of concepts and skills. Additionally, the teacher has to know the level of knowledge students must tap into when asked to develop products or projects to demonstrate learning.

Tomlinson identified three components that should be differentiated (Hall, Strangman & Meyer, 2003): content (elements and materials used in reaching learning goals and in teaching concepts, principles, and skills that students will learn), process (how you will teach the content, flexible groups or whole-group discussion of content or small groups or paired groups; groups
are not fixed), and products (students are allowed choices in products or final assessments which should offer a variety of ways for expression, degree of difficulty, and types of evaluation).

Langa & Yost (2007) remind us that three key components for differentiating is to assess each child’s readiness level (where they are in relation to a particular understanding or skill), interest level (their curiosity or passion for a particular topic or skill), and learning profile/style (how students learn as influenced by intelligence, preferences, gender, culture or learning style) before modifying content, process, and products. The teacher should use assessment data gathered from each child during the beginning of the school year. However, the teacher should continue to collect data daily on students’ readiness for particular skills and ideas, their interests, and their learning profiles/styles. Here are some possibilities for modifying content, process, and products (Langa & Yost, 2007):

Content (Materials & elements)

1. Select a variety of books and resource materials for handling variety in reading levels
2. Select specific areas of interest within the focus area
3. Use Learning contracts with students
4. Group students according to readiness levels or interest levels
5. Reteach to small groups who need support or explanations; exempt those who have mastered the material
6. Establish learning centers or stations
7. Allow students to work alone or with peers.

Process (how students gain understanding of main ideas and information)

1. Use tiered activities (a series of related tasks of varying complexity)
2. Use learning contracts based on readiness, interests, or learning profile of student
3. Use independent learning

4. Use choice boards, flexible grouping, reading buddies, learning centers and peer teaching

Products (ways students will demonstrate their knowledge or understanding of a topic)

1. Write a story or a poem

2. Write a book report, a play, or perform a play

3. Debate or investigate an issue

4. Design a model or a game

5. Create a mural or a song

6. Compare or contrast

Suggestions for Implementing Differentiated Instruction

In getting started with differentiated instruction, Anderson (2007) has several easy to follow suggestions. Begin with creating learning profiles. This will require the teacher to collect profiles of each student that include learning preferences, family structure, favorite hobbies, interests, state assessment scores, lexile reading scores and fluency in reading recordings.

Another suggestion deals with introducing students to differentiated instruction by modifying the process of a few lessons. This could include using a choice board in which students choose activities constructed from various reading levels in the classroom. Students could select two out of six activity options to demonstrate skill toward lesson objective. A teacher could very easily introduce differentiated projects for assessments. Suppose students are doing a unit on the state of North Carolina, students might draw a map of land forms or businesses, or could research another state and identify similar regions or create a travel brochure for a primary region to
include points of interest, food, lodging, historical features and fun things to do. The last
suggestion would allow students the right to work in small groups, alone, or with a partner.

Rock, Gregg, Ellis & Gable (2008) have designed a blueprint for differentiating
instruction called *Reach*. The first activity requires teachers to reflect on what it will take to
change to differentiated instruction. The second activity requires teachers to evaluate the
curriculum with a survey including what students should know, what most know, and what
standards they must be held accountable for. The next activity involves analyzing groups and
individual students to determine readiness, interests, preferences, strengths, and needs. The
teacher should then craft research-based lessons that include graphic organizers, opportunities for
students to work in small groups, whole-class, or individualized instruction units. The teacher
would allow for student response through dry boards, choral responses, cooperative learning
groups, class-wide peer tutoring and assistive technology such as, books on tape, talking
calculators, and manipulatives. The teacher should prepare to hone in on the data by using pre-
assessments or diagnostic assessments such as checklists, interviews, surveys, observations at the
outset to collect data on student interests, thinking styles, and readiness for teaching content and
skills. The teacher should use formative assessments during the instruction process through the
use of questioning, quizzes, probing, learning logs, work samples, or think alouds. The use of
summative assessments are also valuable after instruction, for example, the use of unit or chapter
tests, projects, or portfolios.

In making differentiated instruction manageable (Lawrence-Brown, 2004), teachers must
build upon personal strengths and talents (e.g., teacher may have interest in on-line projects or in
the arts, or in botanic garden projects). Teachers should build a collection of resources from
libraries, the department, local professional associations, or the district. Teachers should not try
to do everything at once but start with highest priority first and work with a collaborative team to set goals. Remember that all lessons do not need the same amount of support. Teams can decide which students need various supports.

Clichés, Myths and Barriers of Differentiated Instruction

Benjamin (2002) exposed a number of clichés from teachers on responses to teaching differentiated instruction. First, differentiation was thought of as just throwing the baby out with the bathwater. Second, differentiation means that we are abandoning our basic skills and are trying to reinvent the wheel, but we cannot make things any better than they already are. Third, differentiation is just another phase and the pendulum will swing the other way soon because the emphasis on testing will not last forever. The final cliché dealt with bringing a horse to water but that one cannot make him drink.

Barriers to differentiation according to Carolan & Guinn (2007) asserted that teachers lack the time for it, and teachers do not get the professional development resources and the administrative support needed for these endeavors. Teachers see differentiated instruction as another bureaucratic mandate heaped upon them. For teachers, it means teaching everything three different ways like a dinner buffet.

Tomlinson (1995) summarized the barriers to differentiation as a fear of faddism or just the thing to do this year and as a fear of not being able to manage a classroom with a number of learning activities happening at once. There is a fear of not knowing how to assess the readiness level of students, and how to match appropriate resources with teaching. Finally, there is a fear of concept-based teaching with the pressure of standardized tests. Teachers also fear that there are no teacher models to talk to about this process.
Benjamin (2002) explained that the common myths harboured pertained to the idea that differentiated instruction consisted of students doing exercises in self-correcting workbooks. The others say that teachers do not present any information to student (no whole-group teaching). Differentiated instruction is mainly for students with deficits in learning. Differentiated instruction does not work in a classroom where students need to master information for standardized testing. Brighter students are used to teach other students. The differentiated classroom has to do with dividing the class groups into bluebirds and redbirds.

Research & Evidence

The initial studies will share the results of how differentiated instruction was used in the classroom. The second half of the research will summarize the basic theories and studies on three areas that support the practice of differentiated instruction: readiness, interest, and learning profile (Tomlinson & McTighe, 2006). The final section will summarize another aspect that supports differentiated instruction (Tomlinson & McTighe, 2006), homework research.

Tieso (2001) looked at a qualitative study of teachers and students who took part in a 3-week enhanced unit in math and found that the students evidenced positive levels of engagement, motivation, and excitement about learning. Fisher, Frey & Williams (2003) documented that the average student in their high school read at a 5.9 grade level but moved from 5.9 to 8.2 after 4 years of differentiated instruction. Baumgartner, Lipowski & Rush (2003) used differentiated approaches in reading which included flexible grouping, student choice of various tasks, increased self-selected reading, and access to various reading materials. They saw improvements in instructional reading levels, number of comprehension strategies used, phonemic and decoding skills, and attitudes toward reading. Tieso (2005) examined the effects of curricular differentiation with between-and-within-class grouping on student achievement. After giving a
curriculum-based assessment as a pre- and post test measure, she inferred that the students with
diverse abilities who received differentiated instruction scored significantly higher in
mathematics achievement than those students who did not. Mastropieri, Scruggs, Norland,
Berkeley, McDuffie, Tornquist & Conners (2006) compared quantitative outcomes associated
with classwide peer tutoring using differentiated hands-on activities vs. teacher-directed
instruction for students with mild disabilities in inclusive 8th grade science classes. The results
indicated that collaborative hands-on activities statistically facilitate the learning of middle
school science content on posttests and on state high-stakes tests for all students. Students also
enjoyed using the activities.

Readiness explores the basic knowledge, understanding, and skill a student has
(Tomlinson & McTighe, 2006). Learners need to be challenged, and if their tasks are too easy,
they become bored and do not learn. Motivation is lessened when tasks are consistently too
difficult. Learners should be moderately challenged. Fisher (1980) determined that when
teachers diagnose the skill level and assign appropriate tasks, students can learn more effectively.
Hunt (1971) found that students learn more effectively if task structure is matched with
appropriate developmental level. Csikszentmihalyi (1993) found from a five-year longitudinal
study of adolescents that when students were underchallenged by tasks that they demonstrated
low involvement in learning activities with a lessening of concentration.

Interest is important because it explains a student’s affinity for and engagement with a
topic (Tomlinson & McTighe, 2006). When a student’s interest is tapped, learning is likely to be
more rewarding and the student may become an autonomous learner. Engagement with learning
is maximized and so is productivity. The student is more likely to work hard and work in a
sustained fashion. Hennessey & Zbikowski (1993) concluded that student motivation can be
maintained if teachers allowed time for students to discuss feelings, share ideas, and interests. Collins & Amabile (1999) suggested that, if students are given the freedom to choose questions and topics for study, that it can lay the ground work for creative achievement. Positive influences on learning can occur both short and long term if students are interested in what they study (Hébert, 1993; Renninger, 1990).

Learning profile pertains to modes of learning or the best processes students need in learning (Tomlinson& McTighe, 2006). Keep in mind that one’s learning profile is shaped by culture, gender, learning style, and intelligence preference. A classroom’s environmental, emotional, sociological, and physical features can influence student attitude about learning and learning itself. Attention control, memory systems, language systems, motor systems and higher-order thinking systems affect how students learn. Gender can influence the way people see and interact with the world, including the classroom. A person’s culture shapes his or her modes of communication, sense of identity, cognitive style, points of view, and frames of reference. Dunn & Griggs (1995) reported that when student profiles were addressed for elementary students, secondary students, students with emotional difficulties, learning disabilities as well as for Native Americans, Hispanic, Asian, and Caucasian students, positive learning effects occurred. Delpit (1995) concluded that the success of students from many minority groups is likely to be undermined when cultural differences are ignored. Students achieved significantly better when classroom instruction was matched to their preferred learning patterns (Grigorenko & Sternberg, 1997; Sternberg, 1997; Sternberg, Torff & Grigorenko, 1998).

Homework is another aspect of differentiated instruction. Homework fits well with the concepts of differentiation based on readiness, interests, and learning profile (Tomlinson & McTighe, 2006). Two researchers are discussed here. Harris Cooper (2001) analyzed 17 studies
involving 3,300 students in 85 classrooms and 30 schools in 11 states. He found that the average student completing homework had a higher achievement score than 55 percent of the students who did not complete homework. Cooper also found that the greatest positive effects of homework by subjects were found in mathematics assignments, followed by reading, English, science, and social studies. He also reported that homework effectiveness increases with the age of the child and had its greatest effects on high school students. Cooper suggested that homework should be viewed as a diagnostic tool rather than an opportunity to test. Homework should focus on practice, integration of concepts learned during the day, and simple introductions to the next lessons. James Strong (2002) agreed with Cooper in that homework should be about practice, preparation, and elaboration. He also pointed out that high school students who spend an additional 30 minutes per night on homework may increase their grade point average by a half-point. We need to train early our elementary school children to complete homework each day.

Summing Up the Research

Though differentiation is recognized as a compilation of many theories and practices, unfortunately, little research has been completed on the effectiveness of differentiated instruction (Edyburn, 2004). Based on the literature review, “the package” itself is lacking empirical validation (Hall, Strangman & Meyer, 2002). There is more and more research emerging within the field of education supporting the potential for differentiated instruction but more teachers need to investigate their applications of differentiated thinking toward instructional planning and implementation of lessons through action research projects, professional conference presentations, and other projects (Anderson, 2007). Tomlinson & McTighe (2006) insisted that we need more studies to indicate which elements of differentiation do or do not benefit particular students and to what degree and under what circumstances benefits do not show gains. There is a
need to add to the body of research on factors that encourage and discourage teachers in attending to student differences.

Method

The purpose of this study was to examine what teachers specify as key components of differentiated instruction. It also served to expose what differentiated instruction is or is not. The study was guided by the belief that educators may not possess a clear understanding of what differentiation is, the key components for implementing, as well as, the myths that surround the practice of differentiated instruction. Two questions emerged relating to differentiated instruction: will teachers agree on what is essential to differentiating instruction in the classroom and will teachers agree with the myths surrounding the practice?

Participants and Setting

This study was conducted in a school district located in southeast Georgia. In the spring of 2008, 141 teacher-participants responded to the survey. The examiner visited 5 of ten middle schools in a public urban school system of 33,400 students. Due to preparation for standardized testing, some schools were not visited. Over one-half of the schools in the districts are Title I schools and receive free or reduced lunch. The population of the school system is comprised of 65.8% African American, 28.5% white, 2.2% Hispanic, 1.8% Asian, .2% American Indians, and 1.4% multi-racial.

The teacher-participants in this sample consisted of 38 (26.9%) males with 103 (73%) females. There were 41 (29.0%) Blacks, 89 (63.1%) Caucasians, 7 (4.9%) Hispanics, and 4 (2.8%) Asians. In years of experience, 17% had taught from 1-3 years, 14.1% from 4-6 years, 10.6% from 7-10 years, 14.8% from 11-15, and 43.2% from 16-35 years. The participants taught 5th grade (1.4%), 6th (51.7%), 7th (23.4%), and 8th (23.4%). Their subjects ranged from language
arts (18.4%), math (17.0%), science (14.8%), social studies (15.6%), physical education (4.2%),
special education (9.2%), reading (2.1%), art (2.1%), music (2.1%), band (0.7%), Spanish
(2.8%), technology (1.4%), Latin (0.7%), drama (0.7%), and other courses (7.8 % e.g.
Connections).
Instrument
The qualitative survey used in the study was called Examining Differentiated Instruction
for Novices: Teachers Respond (2008). The survey was based on data gathered from an
extensive review of the literature. It contained 16 questions that pertained to 1.) the essential
principles 2.) the essential components and 3.) the common myths surrounding differentiated
instruction.
The questions were developed from the work of (Jacobsen, Eggen, & Kauchak, 2006; Rock,
Gregg, Ellis, & Gable, 2008; Tomlinson, 1999; Wormeli, 2005). The survey consisted of Section
#1 Demographics. Participants were asked to fill in or check the appropriate items including
these: content area, grade level, years of experience, sex, and race. Section #2 of the survey
engaged participants in 16 questions that asked participants to choose a response and then circle.
Some examples of the survey questions are “differentiated instruction should focus on essential
skills and ideas in each content area” and “differentiating instruction in the classroom will not
prepare students to compete in the real world.” The survey responses contained a likert-style
scale consisting of strongly agree, agree, disagree, strongly disagree, and not sure. The examiner,
for the most part, visited school sites minutes before faculty meetings to conduct the survey. The
survey took 15 to 20 minutes to complete. See appendix for sample. Final note—at the school
sites, principals were very complimentary about the survey and wanted additional copies from
the examiner.
Analysis & Results

Generally, the analysis of this qualitative data required labeling, categorizing, recording, tabulating, calculating, and inferring. This was an exciting task. This process began by sorting the 141 surveys by five schools. The examiner, with the assistance of a graduate student, developed two separate frequency tables (per school) for counting and recording the responses under Section I. Demographics (i.e. grade level, sex…) and Section II. Survey Questions (i.e. strongly agree, agree, disagree, etc.). After counting and recording all responses, the second step consisted of developing another chart for displaying the numbers and the data. Demographics were represented by symbols (e.g. B for Black, F for Female..). Responses to the survey questions were represented by symbols such as Q1 (Question #1), SA (Strongly Agree), D (Disagree) and so on. The third step consisted of recording totals from all data and responses per question and then calculating percentages for each. Finally, in an effort to determine to what degree participants agreed or disagreed per question, this examiner chose to add the sum of strongly agreed to the sum of agreed to get a combined total so percentages could be calculated. This same process was also used for items where participants tended to disagree. Percentages were also determined for those participants counted as Not Sure (NS). See appendix.

Teachers agreed at 94.3% in question # 16 that they must show respect for their learners’ commonalities and differences in many ways in the differentiated classroom. Question # 2 on whether differentiated classrooms should be responsive to individual student differences, teachers agreed at 92.1%. Question # 1 on whether differentiation should focus on essential ideas and skills in each content area, teachers agreed at 89.3%. Question # 15 on whether teachers collaborate with students about their learning in the differentiated classroom, teachers agreed at 85.8%. Thus, these responses are all representative of those vital principles (Tomlinson, 1999)
that differentiated instruction is built on. The results may imply that teachers may understand and do agree on the essential principles.

Secondly, it is also necessary to denote here that teachers agreed that processes (88.6%, question #5), products/assessments (87.2%, question #6) and content and materials (85.8%, question #4) must constantly be modified in the differentiated classroom (Tomlinson, 1999). These responses may imply an understanding of essential components necessary in carrying out differentiated instruction in the classroom. Additionally, teachers agreed with question #14 at 85.1% that teachers should assess the readiness level, interest level, and the learning profile/style of their learners which is another essential component in carrying out differentiated instruction in the classroom (Langa & Yost, 2007).

In reference to myths that surround differentiated instruction, teachers disagreed on two important ones. First of all, teachers disagreed at 90.7% on question #13 that there is only one way to differentiate instruction. This is indeed significant because this myth is considered to be the most prevalent myth surrounding differentiated instruction. Wormeli (2005) asserts that there is no set form or scripted program for differentiated instruction. It is about understanding the developmental level of students and differentiated practices.

Secondly, teachers disagreed at 85.8% on question #10 that all students must demonstrate mastery on the same day of grading. Disagreement with this myth is important because this may say that teachers are beginning to modify their thinking about grading in the differentiated classroom. Actually it does not matter when students demonstrate mastery if they sincerely work along the way for students should be allowed to retest and redo assignments (Wormeli, 2005).

There were other interesting responses to myths. In question #12, there were only 79.4% of the participants who disagreed with the myth that differentiated instruction creates unfair
workloads among students. However, this is worth discussing because apparently some recognize that differentiation is about providing challenges and motivating individual students differently. Also, in the differentiated classroom, students are given fair and developmentally appropriate work and are held accountable for more and they can achieve more (Wormeli, 2005).

On the myth that differentiation is only individualized instruction, 56.0% disagreed, 41.1 agreed, and 2.8% were unsure for question #8. There appears to be a split between teachers on this issue. This myth is simply not accurate. Wormeli (2005) discusses differentiated instruction as utilizing a sundry of teaching methods including whole-group teaching and small groups. Individualization is used only temporarily.

Question #9 revealed that only 76.5% disagreed, 14.1% agreed, with 9.2% unsure on the mistaken point that differentiated instruction does not use whole group instruction (Wormeli, 2005). This myth shows perhaps a lack of understanding of the many teaching processes that can and should be practiced by the differentiated teacher.

Finally, it must be noted that only 73.0% disagreed, with 21.9% agreeing, and 4.9% unsure of the myth in question #11 that differentiated instruction does not prepare students to compete in the real world. Differentiated instruction is not about lowering standards. Teachers do not differentiate all the time but only as needed. In the real world, differentiation occurs, for instance, when military recruits get many opportunities to disassemble and reassemble an assault rifle and when the driver’s test can be taken more than once (Wormeli, 2005).

Discussion

Though this survey shared some positive results, the next area that must be explored here is why more middle school teachers are not agreeing (or disagreeing). Research suggests that teacher education programs are falling short in preparing pre-service teachers for academically
diverse classrooms (Tomlinson, Callahan, Tomchin, Eiss, Imbeau & Landrum, 1997). The points noted from the research revealed that pre-service teachers seldom experienced differentiated instruction in their teacher preparation programs and generally had one class on academically diverse learners with little guidance on what to do with them. It was noted that pre-service teachers were almost never encouraged to differentiate by education professors, university supervisors, or master teachers and had few, if any, opportunities to see multi-tasking classrooms.

The other side of the problem lies with the public school. They must also take responsibilities for teacher-training. They can help prepare teachers by providing according to (Wormeli, 2003; Protheroe, 2007; Gregory & Chapman, 2007; Kise, 2007) resources on differentiating instruction and time for teachers to discuss the process. Schools can provide training in strategies, such as, curriculum compacting and learning centers. Schools can teach concrete details on how to differentiate instruction. Teachers need site visits to schools and teachers’ classrooms plus help on developing on-target assessments. Teachers need the knowledge on the processes involved in differentiated instruction and an understanding that not every part of a lesson or even every unit needs to be differentiated.

Other factors that may be significant to this discussable point of why more teachers are not agreeing (or disagreeing) on differentiating were introduced in these brief studies: From a nationwide survey of middle school teachers, 50 percent said that they do not differentiate instruction based on readiness, interest or learning profile because they saw no need to do so (Moon, Tomlinson & Callahan, 1995). Most general educators feel ill prepared to teach students with diverse learning needs (Schumm & Vaughn, 1991, 1995). General education teachers may also reject adapting instruction for individual learner needs because they feel doing so calls
attention to student differences (Schumm & Vaughan, 1995). Archambult (1993) concluded that third and fourth grade teachers, who were not trained, would not differentiate in their gifted classrooms. This was even true for experienced teachers involved in the study (i.e., average years over 10 years). A study by Sally Reis and her associates (1993) showed that teachers will differentiate if given the support to do so. Specifically, Reis trained teachers to do curriculum compacting (an effective way to eliminate already mastered content through pre-testing or some form of assessment).

Professors must, as often as possible, engage in professional conversations about differentiation by agreeing to serve as mentors to first-year novice teachers and by offering workshops on college campuses and at school sites. Education professors can find ways to incorporate this topic in all education courses. University professors, superintendents, and school administrators and teachers must present at state, national, and international venues to share what works. This examiner can attest to the exorbitant amount of books, articles, and websites available on implementing differentiated instruction.

Conclusion

Differentiated instruction belongs in middle school because this is where student differences are more apparent. Thus it is there, where we can be instrumental in helping our students to reach their heights and potential. Schools have a responsibility to adjust to the developmental needs and levels of our students. The National Board for Professional Teaching Standards (1989) has recognized that good teachers must respond to individual differences in students and must match their teaching styles to fit. We must move away from a pedagogy of poverty (Haberman, 1991)) to a pedagogy of plenty (Hodges, 2001). In doing so, we must choose educators who are risk-taking, flexible, empathetic, organized, tenacious, and are fleet of
foot, that is, they will take whatever steps that are necessary to make ideas clear to their students (Wormeli, 2001). Haim Ginott (1993) reminds us that teachers create the environment in their classrooms and possess the power to make a child’s life miserable or happy but, most importantly, teachers are part of a team that believes that all students are capable of learning.

Appendix A

Section #1 Demographics- Please fill in or check the appropriate items below.

Content Area Presently Teaching: _____________ Grade Level: ____ 5 ____ 6 ____ 7 ____ 8
Years of Experience: ___ 1-3 ___ 4-6 ___ 7-10 ___ 11-15 ___ 16-35 Sex: ___ Male ___ Female
Race: ___ Black ___ Caucasian ___ Hispanic ___ Asian ________ Other

Section #2 Survey Questions- Please choose a response and then circle it- Strongly Agree, Agree, Disagree, Strongly Disagree or Not Sure.

1. Differentiated instruction should focus on essential ideas and skills in each content area.
2. Differentiated instruction should be responsive to individual student differences.
3. Differentiated instruction in the classroom is determined from teacher assessments.
4. Differentiated instruction demands a constant reconfiguring of content and materials to meet individual students’ levels of prior knowledge, critical thinking, and expression style.
5. Differentiated instruction demands a constant reconfiguring of the processes used for teaching to meet individual students’ levels of prior knowledge, critical thinking, and expression style.
6. Differentiated instruction demands a constant reconfiguring of final products/assessments offered to meet individual students’ levels of prior knowledge, critical thinking, and expression style.
7. Using differentiated instruction in the classroom will not prepare students to take standardized tests.
8. Differentiated instruction is simply individualized instruction.
9. Teachers in differentiated instructed classrooms do not use whole group instruction because students work individually or in small groups.

10. In the differentiated instructed classroom, all students must demonstrate mastery on the same day of grading because it is unfair to give them the same full credit if they do not.

11. Differentiating instruction in the classroom will not prepare students to compete in the real world.

12. When teachers differentiate instruction, they create unfair workloads among students.

13. There is only one way to differentiate instruction.

14. In the differentiated instructed classroom, the teacher should assess each student’s readiness level, interest level, and learning profile/style.

15. Teachers collaborate with students about their learning in the differentiated instructed classroom.

16. Teachers must show respect for their learners’ commonalities and differences in many ways in the differentiated instructed classroom.

Abstract

This poster presentation briefly outlines the development of a Distance Education online counseling course developed based on the design of a face to face course within a graduate level counseling program. Developing an online lab course is a challenging activity particularly when the central task of the course is focused on communication, counseling skills, and professionalism. Incorporating the face to face content and particularly the feedback on student practice videos presents challenging and exciting opportunities for learning in Distance Education. This poster will focus on how assignments and student progress are monitored in order to prepare students for a field practicum experience. Methods of providing feedback to students on their counseling skills and evaluating student progress will be identified.
The Changing Nature of Teaching: Contingent Work

The Changing Nature of Teaching: Contingent Work

Abstract

One fifth of teachers in Canada work contingently. This paper explores who this group of contingent teachers are. Workforces are diverse and teaching is no exception. The findings reported in this paper come from a larger study that employed a mixed methods approach of focus groups and an online survey. Specifically, this paper describes the contingent teacher workforce in Ontario Canada. The demographics, education and work experience data revealed two general trends: evidence of an oversupply of contingent teachers and a demonstration of the gendered nature of contingent work. These findings have implications for how we understand the changing nature of teachers work.

Keywords: Contingent Work, Teaching, Canada, Gender, Oversupply.
The Changing Nature of Teaching: Contingent Work

When we think of teachers’ work we often envision a teacher who is hired in a full-time, permanent teaching contract where they teach a specific grade or subject to children at one school site. These teachers are hired with standard contracts that ensure job security and ongoing employment. But not all teachers’ work arrangements are standard. In fact, about one fifth of teachers in Canada work contingently (WALL, 2005). Teachers who work in these arrangements do not have a long-term employment commitments (Bjorkquist & Kleinhesselink (1998) and “the minimum hours are not set” (Connelly & Gallagher, 2004, p.960). The number of contingent teachers in the workforce continues to grow. For example, in Ontario, between 2005 and 2009, an average of 7,500 newly certified teachers have entered the workforce annually. These estimates are greater than the number of teacher retirements replaced annually in Ontario (Ontario College of Teachers, 2009). Both the Ontario Ministry of Education (2007) and the Ontario College of Teachers (McIntyre, 2006) report that many potential teachers spend two to three years working contingently before securing a full-time, permanent contract. Because of the growth in this contingent teacher workforce, government agencies, teacher federations, more researchers and practitioners are now studying the actual work that contingent teachers do (British Columbia Teachers Federation, 2005; Clark, Antonelli, Lacavera, Livingstone, Pollock, Smaller, Strachan & Tarc, 2007; Duggleby, 2007, Duggleby & Badali, 2007, Glatfelder, 2007; Johnston, Myers, Pollock & Zoet, 2008; McIntyre, 2005, 2006; Pollock, 2008, 2009, 2010a, 2010b; White, 2008). This paper continues with this trend. It explores who they are as a group.

Purpose

This paper describes a study that explored how contingent teachers in the English-speaking elementary school division in Ontario, Canada engaged in professional learning. It sought to examine the strategies contingent teachers used to participate in professional learning and the challenges they experienced when attempting to engage in professional learning. An unintended outcome of this study included a detailed description of the general contingent teacher workforce, one which has never been done before now. This paper explores the make-up of the contingent teacher workforce.

Theoretical Framework

Workforces are diverse and teaching is no exception. Acker (1999) argues, “In its search for generalities about teaching and the teaching occupation, the literature on teachers has been guilty of creating a category of “teacher” that does no justice to the diversity contained within the term.” (p. 19). There is an assumption that full-time, permanent contract teachers are the only teaching population and all teaching is the same. This, however, is not accurate. There are differences within the full-time, permanent teacher work arrangements and between full-time, permanent teaching and other work arrangements. Differentiation has always existed within the full-time, permanent teacher workforce. For example, teachers may be differentiated from one another by virtue of the duration of contact with students, grade level taught, curriculum subject, teacher’s first language, teacher’s race/ethnicity, type of student taught, academic success of particular groups of students, and teacher’s gender (Bascia & Jacka, 2001; Little, 1993; Metz,
These differences distinguish full-time teachers from one another, full-time teachers from contingent teachers, and contingent teachers from one another.

**Methodology**

The study employed a mixed methods approach. It used focus groups and an online survey. Focus groups were employed because it was thought that they would be the best way to generate information about an area which little is known (Betts, 2006; Duggleby, 2007; Duggleby & Badali, 2007, Pollock, 2008) and also to assist in developing the online survey.

**Focus Groups.** Eight focus group sessions were held. The focus groups occurred in rural, northern, urban and suburban locations and all included face-to-face interaction. The intended focus group size ranged from 5 to 12; actual sizes ranged from one to 9 participants. The focus group sessions were approximately 2 hours long. In the first hour participants were asked to describe the strategies used to participate in professional learning and to also include some of the challenges they encountered. In the second hour, participants were asked to answer pilot survey questions focusing on contingent teachers’ access to professional learning. They were also encouraged to comment on the survey layout, question design and content. The focus group sessions were audio recorded and transcribed afterwards.

**Online Survey.** In order to ensure a valid survey tool, the survey went through approximately seventeen iterations; once after each of the 8 focus group sessions and after 9 individual reviews by contingent teachers, Elementary Teachers’ Federation of Ontario representatives, PhD students, statistics experts, and academics in two universities. The final survey instrument consisted of 69 close-ended questions (most included an ‘other’ for participants who did not find an appropriate response). None of the participants should have completed all 69 questions as the survey was organized in a manner where a response to a question would bring the participant to a particular related question, skipping irrelevant questions. The only question that **required** a response was the first question, which was not part of the actual data collection, but rather involved participants’ consent. None of the remaining survey questions were forced questions; participants could choose not to answer a question and still proceed to the next question. **SurveyMonkey** was the online survey software program used to house the survey online.

The biggest challenge was finding teachers who work contingently. Teachers who work contingently are marginalized (Betts, 2006; Damianos, 1998; Duggleby, 2007; Duggleby & Badali, 2007; Galloway & Morrison, 1994; St. Michel, 1995). This marginalization can make it more difficult to access them for research. One way of addressing this issue was to work with the Elementary Teachers’ Federation of Ontario (ETFO). ETFO is one of four teacher federation/unions in Ontario. Approximately 76000 teachers and education workers are members of ETFO, of which approximately 12000 are teachers working contingently (www.ETFO.ca). ETFO endorsed the study and announced the launch of the online survey in their provincial e-newsletter in April 2010. The researcher then contacted, by phone, 32 of the 33 ETFO Local Presidents for contingent teachers asking them if they had read the e-newsletter, if they had any questions about the study and if they would support the study by providing potential participants with instructions of how to participate. The phone conversations were followed up with an email message that provided information about how to participate in the study. Electronic invitations
were sent to contingent teachers who were members of the Elementary Teachers’ Federation of Ontario. For anonymity and confidentiality reasons, participants interested in participating in the survey were asked to send an email requesting a link to the survey. The email was received by a third party who then forwarded a link to the potential participant. Each participant received a different link to the survey site. Four hundred and forty survey links were sent out to potential participants. At the end of the survey collection period, June 2010, 371 surveys were completed.

Findings

The online survey was organized in such a way that information about who contingent teachers were could be comprehensively organized around three broad themes: demographic information, education and work experience. These three categories were instrumental in describing the contingent teacher workforce.

Demographics. In terms of demographics, teachers working contingently provided varying degrees of information about their age, gender, and heritage.

Age. Three hundred and thirty-nine participants provided their age on the online survey. The ages ranged from 22 to 69 years of age. While the average was 39.7 (40) years, approximately 52% of the respondents were between 25-39 years of age.

Half of the contingent teacher workforce is 39 years of age and younger. The majority of candidates within the teacher education program in Ontario are under 26 years of age or younger.
(Teachers education application services, 2007, 2008, 2009). These numbers demonstrate an apparent trend from teacher education programs directly into contingent teaching.

**Gender.** Of the 371 occasional teachers that responded, 350 included their gender for a response rate of ninety-four percent. Forty-two (12%) identified themselves as male and 308 (88%) identified themselves as female.

**Figure 2. General Contingent Teacher Population - Gender.**
In some senses this was a surprise as the ratio of males to females in the full-time elementary English-speaking teacher workforce is 1:5 indicating that there are more women who teach contingently compared to men than in the larger full-time teacher workforce. However, contingent employment generally, women tend to be over represented (Cranford, Vosko and Zukewich, 2003); this is another example of this trend.

**Heritage.** Of the 416 responses, 41% identified themselves as British (England, Scotland, Ireland and Wales), 18% as Western European (France, Netherlands, Belgium, Germany, Italy, Sweden, Finland, Austria, Switzerland, Portugal, Spain and Greece), and another 19% indicated that they were Canadian.
Figure 3. General Contingent Teacher Population - Heritage.
A rough estimate from the data indicates that approximately 10.3% of the contingent teacher workforce can be considered visible minority teachers. This percentage is slightly higher than the 2006 Statistics Canada census of 6.9%.

Education. Data collected from the online survey made it possible to determine specific information about contingent teachers’ education such as the year they were awarded their teacher education degree, where the degree was awarded and the language of instruction.

Year degree granted. For 352 participants that responded, the range, in years, for completion of a teacher education program was between 1952 and 2010, a spread of fifty-eight years. A little more than half (53%) completed their teacher education degree between the years 2004 and 2009.
It is not surprising that approximately 50% of those teaching contingently graduated with a teacher education degree within the past six years considering that Ontario has seen a decade of teacher oversupply (Ontario College of Teachers, 2009).

**Place degree was granted.** Of the 350 who responded, 274 (78%) completed their teacher education degree in Canada, with the majority completing an education program in the province of Ontario (88%). The next largest group outside of Ontario received their teacher education in Quebec (7%). Seventy-six (22%) of contingent teachers responded that they received their teacher education outside of Canada, with 57% of the seventy-six from the United States; 18% from India, 11% from Australia and 9% from the United Kingdom.

**Language of instruction.** The language of instruction for the teacher education program was overwhelmingly English (98%) with French at 2%.

**Work.** Prior teaching experience either in a full-time permanent teaching position or years of teaching contingently proved to be important in determining how teachers engaged in their professional learning. The online survey provided information on the number of years of contingent teaching, current employment status, areas certified to teach, actual areas taught, number of school boards that employed them, whether or not they held permanent teacher employment in the past, and if so, the location of that employment and reason for leaving, whether being a care provider for a child or adult was a determining factor in teaching contingently and lastly, whether or not they were seeking full-time teacher employment within the next five years.
**Years of occasional teaching.** Of those who participated, 348 indicated the number of years of contingent teaching. Almost 90% of the respondents have been teaching contingently for ten years or less and of those teaching for ten years or less the majority are within their first three years.

![General Population - Years of Contingent Teaching](image)

**Figure 5. General Population - Years of Contingent Teaching.**

This pattern of the majority of teachers having less than ten years of contingent teaching reflects where the province of Ontario is in the supply-demand cycle for teachers. At the moment, Ontario is in a period of over-supply, so teachers new to the profession will often find themselves working contingently for a few years before securing a full-time permanent teaching contract. But it is not just new entrants who teach contingently for less than ten years. Retired teachers also teach contingently, encouraged to do so when there was a teacher shortage more than a decade ago.

**Current employment status.** Participants were asked at the time of the survey if they were currently working contingently on a day-to-day basis. Almost three-fourths (71%) indicated that they work on a day-to-day (known as daily) basis. Two percent were either on maternity leave, teacher federation release, or had completed the allowed number of days to teach as a retired teacher\(^1\). Others worked in different combinations: 19% were currently completing a long-term occasional teaching contract and 10% were working in a combined work arrangement (combined in the sense that they work on a daily occasional basis in addition to holding a long term occasion (LTO) teaching contract or part-time permanent contract).

\(^1\) In the previous decade when there was a shortage of certified teachers, the province of Ontario allowed retired teachers (who were collecting an Ontario teachers’ pension) to re-enter the teacher workforce and work for a limited number of days without receiving a penalty.
Figure 6. General Contingent Teacher Population - Current Employment Status.
The majority of contingent teachers work on a daily basis. The structure of day-to-day employment is what constitutes this work to be contingent because there are no guaranteed set minimum hours. The amount of work a contingent teacher works can be from five full days in one week to no work at all in another week. Some teachers can also go for a number of weeks with no work (which often happens in the months of September, January, May and June) but have some varying work for a number of other weeks.

Area certified to teach. In Ontario, teachers must have successfully completed teaching methodologies in two consecutive divisions in a faculty of education as part of their certification. Divisions consist of Primary (Grades K-3), Junior (Grades 4-6), Intermediate (Grades 7-10) and Senior (Grades 11-Ontario Academic Credit OAC) (http://www.oct.ca/become_a_teacher/certificates.aspx?lang=en-CA). Almost 70% of respondents were certified to teach primary/junior level.

Figure 7. General Contingent Teacher Population - Areas Certified to Teach.
By nature of how the Ontario public education system is structured, certified teachers tend to initially be certified for primary and junior or intermediate and senior divisions as the two required divisions. ETFO is the teachers’ federation that teachers working at the elementary/primary divisions could be a member of, so it is not surprising that the majority of members tend to teach at the primary and junior level. But the fact that approximately 31% of
contingent teachers work at the intermediate and senior divisions as well could mean that almost a third of these contingent teachers have taken additional qualification courses to receive more credentials to teach in other divisions.

**Areas contingent teachers taught the most last year.** Respondents were asked to indicate at what school level or subject area (i.e. French, Special Education) they did most of their contingent teaching in the past 12 months. Three hundred and forty participants answered this question and this is what they indicated:

![Figure 8a and b. Divisions and Subject/Discipline Contingent Teachers Taught the Most Last Year.](image)

Not surprising, 44% of the general contingent teacher workforce taught at the primary division and 19% taught mainly in the junior division. However, most interesting was that one quarter (24%) of the contingent teachers who responded that they taught mainly in the intermediate division. In terms of subject area, 43% of contingent teachers taught French while another 40% taught special education.
Teaching in areas not certified to teach. Participants were asked if they taught in a division or subject area (i.e. French, Special Education) in which they were not certified. Almost a third indicated that they had not taught in a division or subject area in which they were not certified. Another third indicated that they had taught in divisions for which they were not certified to teach, and the last third indicated the various subject areas they taught but were not certified to do so.

Figure 9a and b. General Contingent Teacher Population - Divisions and Subject/Discipline Not Certified to Teach.

Twenty-five percent of teachers working contingently indicated that they worked at the intermediate division even though they were not certified to do so. Forty-three percent taught in subject areas for which they were not certified and a little over a half (55%) did so in the area of French.

Number of school boards. Because of Canada’s constitution, the province of Ontario has four publically funded education systems: English Public, English Catholic, French Public and French Catholic. There are a total of 72 school districts in Ontario. Geographically, some of the boundaries overlap with the boundaries of other districts. This is particularly so in southern Ontario where most of the province’s population reside. For this reason, many teachers who work contingently can work for more than one school district. When asked how many school districts they have worked for within the last 12 months as a contingent teacher, 350 people responded, with an overwhelming majority (81%) indicating that they only worked for one school district within the last 12 months. Fourteen percent indicated working for two school
districts and five percent indicated working for three or more school districts within the last 12 months.

![General Contingent Teacher Population - Number of School Boards](image)

**Figure 10. General Contingent Teacher Population - Number of School Boards.**

Approximately twenty percent of contingent teachers work for two or more school districts. Having the potential of multiple employers can contribute to the complexity of teaching contingently. Potentially contingent teachers can possess the same credentials, work in more than one district, and receive slightly different compensation such as different wages, benefits, and different working conditions.

**Permanent teaching contract.** Participants were asked if they had held a permanent teaching position previously (including Canada and/or other countries in private or public school systems). Of the 351 that responded, 120 (34%) indicated that they had worked as a full-time teacher.

![General Contingent Teacher Population - Years of Permanent Teaching](image)

**Figure 11. General Contingent Teacher Population - Years of Permanent Teaching.**
The number of years that they taught in a permanent teaching position varied from one year to 37 years. Almost 42% of contingent teachers who indicated they had held a full-time teaching position previously did so for five or less years.

**Location of permanent teaching.** Participants were asked where they held their permanent teaching position. Of those that responded to the question, three fourths (76%) taught in Canada. For those who did teach in Canada, 93% did so in Ontario; others taught in the provinces of Alberta, British Columbia, Nova Scotia and Quebec. Some of this permanent teaching occurred outside of Canada (24%).

**Figure 12a and b. General Contingent Teacher Population - Permanent Teaching Within and Outside Canada.**

Responses to other questions such as where the teacher education degree was granted and heritage that many of the teachers who held permanent teaching positions overseas were not necessarily from that country but actually many have been Canadians who were teaching abroad and decided to return to Canada.

**Reason for leaving.** Respondents who left their permanent teaching position with five or less years of permanent teaching gave a number of reasons for leaving from relocation (from a different country, province, region or education system), not being satisfied with the position,
family reasons or personal choice, to reasons out of their control, such as the position no longer existing (i.e. redundant, being deemed surplus).

Figure 13. Teachers who taught Permanently Less than 5 Years - Reason for Leaving.

In terms of the reasons why teachers left their permanent teaching position, only 15% indicated that it was for reasons within the system such as the position being redeemed redundant. The other 85% gave reasons that it could be argued they had a choice.

Children. Of the 348 participants who responded to whether or not they have children under 18 years of age living in their household, 124 (36%) indicated ‘yes,’ while 224 (64%) indicated ‘no’. Almost half of the respondents (48%) indicated that being a caregiver for a child was a major factor in their decision to work contingently.

Care provider. Three hundred and fifty participants responded to the question: Are you a primary caregiver for an adult? Five percent indicated that they were the primary caregiver for an adult. Of those who answered yes, 8 respondents indicated that being a caregiver for an adult was a major factor in their decision to work contingently.

Intent in five years. Of the 351 occasional teachers that responded, 255 (73%) indicated that they intend to pursue a full-time teaching position within the next five years.

Discussion

Two general trends emerged from the data: evidence of an oversupply of contingent teachers and a demonstration of the gendered nature of contingent work. As indicated in the introduction, the province of Ontario is currently experiencing an oversupply of certified teachers who are registered with the Ontario College of Teachers and are available for teaching employment. A number of items on the survey confirm this oversupply of teachers. For example, half (53%) of teachers working contingently graduated with their teacher education degree between the years
of 2004 and 2009. The remaining years of graduation reach as far back as 1969 with an average graduation rate of three teachers per year prior to 2004. It would appear that the majority of teachers graduating in the years before 2004 had more success in securing full-time permanent teaching, although this cannot be known for sure as the exit data is not currently available.

The oversupply of contingent teachers is also apparent in participants’ responses to how long they have been teaching contingently. Ninety percent reported teaching for ten years or less, but more importantly, 50% have only taught for three years or less. The age ranges reported in this study also points to an oversupply. Forty-four percent of respondents were 34 years of age and younger. The percentage of respondents in the remaining age groups decreases steadily until age sixty-nine. This age pattern is also reflected in annual statistical summaries produced by the Teacher Education Application Service Ontario, Universities’ Application Centre. For example, in 2007, 38.6% of registrants to a teacher education degree program in Ontario were 22 years of age or younger. Seventy percent were 26 years of age and younger. These percentages were consistent for 2008 and 2009. This trend of about 38% of students in teacher education degrees under the age of 22 and about 70%, 26 years of age and younger means those teachers new to the teacher workforce will also be relatively ‘young’. Comparing the age of entrance into the teacher workforce and the current age of teachers working contingently, it appears that the majority of new entrants enter the teacher workforce by working contingently for a number of years before they either exit the profession or secure full-time, permanent teaching position.

Current research fails to acknowledge the place of contemporary contingent work in the life cycle of teachers’ careers. Most of this research makes the assumption that a teacher career commences when a teacher is hired into a full-time teaching position (Bascia & Jacka, 2001; Ozga, 2000). Huberman’s work in the 1980s is often cited as a seminal piece in the area of teacher career cycles and in many cases is used as the foundation for other studies (see Day, Sammons, Stobart, Kington & Gu, 2007; Garton & Richards, 2008, for example). Huberman attempts to “delimit the succession of phases in the teaching career” (1993, p. 4) yet he still uses particular phases to explore, analyze and explain teachers career cycles. This seminal work has limitations, however. Granted, Huberman does acknowledge that some teachers can work contingently at various points within their career. For example, when describing women entering the teacher profession, Huberman mentions that respondents come to the beginning of their career (known as Cycle d’Orientation) through a number of avenues, such as “after a period of substitution and of supply work (gradual path)” (1993, p. 39). In considering the mid-career phase of the teacher cycle, Huberman mentions teachers’ temporary exit from teaching for such things as raising a family (p. 47) and other pursuits such as studying (p. 53). But in each case, the alternate teacher employment arrangement of contingent teaching is included as something ‘other’ and not included as part of the teacher career cycle. It is only when teachers work full-time in a classroom are they considered engaged in a teacher career. In other studies that use Huberman’s framework, the contingent work is largely ignored.

This omission of the contingent teacher workforce has consequences. For example, phase one of Huberman’s teacher career cycle centres around career entry, often described as a time of survival and discovery (p. 5): survival in dealing with the reality of teachers work and discovery of enthusiasm in entering a profession that one has been trained for. It is a mistake to assume that teachers working contingently do not learn anything about their profession or their craft working
contingently is naive. It is not reasonable to believe that teachers coming from the teacher contingent workforce will experience the same insecurities and questioning in the survival component as one who has not come from contingent work. It would be a mistake, however, to assume, as Huberman appears to do, that contingent teachers only have the ‘discovery’ experience working in a full-time teaching position is also inaccurate. Previous studies (Pollock, 2008; Duggleby & Badali, 2007; Betts, 2007) have indicated that teachers working contingently do experience some form of survival and discovery as described by Huberman (1993, p. 5). There is also emerging evidence that the work contingent teachers do is somewhat different than that of full-time teachers (Pollock, 2008; Jennings, 2001). They also see their contingent work as part of their career journey (Pollock, 2008) and more importantly, for those who go on to secure full-time teaching, they bring to their full-time teaching position lessons learned from teaching contingently (Pollock, 2008).

Why is it important to reconceptualise the teacher career cycle? One reason is that professional support for teachers is usually based on how teachers’ careers are conceptualized. For example, the Ontario provincial government stated in its fifth mini discussion paper (August, 2004) prepared for the Education Partnership Table that “continuing professional development for teachers is about reinforcing all the dimensions of good teaching throughout a teachers’ career (emphasis added)” (p.1). If teachers’ careers and career cycles are conceptualized in the traditional way then only full-time teachers will receive this continuing professional development. As the survey data indicates, teachers new to the teaching profession in Ontario currently teach contingently for a number of years before they secure a full-time permanent teaching position (if they ever do). Consider for a moment one example of a contingent teacher’s career trajectory in Ontario, an individual entering the teacher workforce contingently or full-time must be a member of the Ontario College of Teachers which means they must be a certified teacher. The individual will have had to completed minimum, a three-year undergraduate degree, a one-year accredited teacher education program and a few other administrative tasks. Once they are certified they must go through an application process to be considered for an ‘eligible to hire’ list for individual boards, which essentially means they are on a substitute teacher call list. If they are lucky, they will be called and if they figure out the system, they will be called back until they either leave the profession, decide to teach contingently and not seek a full-time teaching contract or until they secure a full-time teaching position. If they do secure a full-time teaching position they are then granted access to much more professional learning opportunities. This essentially means a teacher is supported through their pre-service year, mainly ignored as they enter the teaching profession as contingent teachers (Betts, 2006; Damianos, 1998), and then re-invited into the professional learning community once they secure a full-time teaching position. This does not bode well for contingent teachers who both need and desire support for their teaching (Pollock, 2008).

Career concepts have historically been constructed with an unconscious assumption of artificial gender neutrality. Several researchers have argued that the traditional career conception, however, is socially constructed from a male perspective (Acker, 1992; Bascia & Young, 2001; Biklen, 1995). Traditionally, patterns of employment and organizational structures, predominantly practiced by men, consisted of a number of specific characteristics used to consider whether specific work can be considered a career. Huberman’s (1993) research assumes gender neutrality, even though he does report on men and women. While he did report that some
teachers do exit and re-enter the teaching profession, he did not emphasize the relevance of gender within this practice. This is also important when considering teacher career and career cycles because many teachers (men and women) do leave full-time teaching for a period of time only to re-enter again later, but they do so for different reasons. Traditionally, many of these people tend to be women as they balance family responsibilities and teaching careers. This reflects the general trend in nonstandard work. Vosko, Zukewich and Cranford (2003) cite statistics for 2002 where “42% of men compared with 25% of women worked part time because they were attending school, while 15% of women and just 1% of men cited child-care responsibilities” (p.2).

Statistics Canada 2006 census data indicated that the approximate ratio of female elementary and kindergarten teachers to male elementary and kindergarten teachers was 5:1. In this study the ratio was 9:1 with women over-representing the contingent teacher workforce. Between 2007 and 2009, the ratio of women to men entering teacher education programs in Ontario was 7:3 (Teacher Education Application Service, 2007, 2008, 2009). This statistic is not broken down for the education divisions such as primary, intermediate, junior and senior so it is not clear how many men enter the teacher education program at the primary/junior level. But this ratio can indicate in general terms that more men enter education programs than those that actually practice their profession contingently. There may be less men teaching contingently for two reasons; they either exit the profession or are hired into full-time teaching positions because of the current trend for hiring more men in the elementary division (Jamieson, 2007).

One can argue that it is important to understand how gender (or how unpaid work is delegated) can play out in terms of engaging in work because a portion of teachers working contingently do so because it is a work-balance strategy. The online survey hinted towards this when participants were asked if caring for a child or an adult influenced their decision to work contingently. While a small portion indicated that caring for an adult influenced their decision to work contingently, a larger group of teachers (approximately 61: 57 female and four male) indicated that caring for children less than 18 years of age influenced their decision to teach contingently. This reflects the previous statistics presented above. The over representation of women in the contingent teacher workforce reflects general trends within nonstandard work in Canada.

Why is it important to know the gender composition of the teachers who work contingently? Recognizing the gendered composition of the teacher contingent workforce in terms of numbers should be the first indication that this workforce may also be a feminized workforce. In this case, feminization does not refer to the numbers of women in the contingent workforce but to the fact that it is predominantly women who do the work, and that the work ends up being less autonomous, deskill in some way, provides reduced opportunity for upward mobility, lower wages, and greater pressure for rationalization (Apple, 1986). This study is not able to answer the question of whether or not contingent teachers work in a feminized workforce but it does provide the basis for moving forward in exploring the possibility. What is known from other preliminary studies is that this may be the case (Betts, 2006; Duggleby & Badali, 2007; Pollock 2006, 2007, 2008). The data in this study does indicate that two-thirds of contingent teachers teach in areas for which they are not certified to do so, mainly the intermediate division and French, a division and subject area that is more difficult to cover. Intermediate level appears to be the division most
difficult in terms of classroom management and French as a subject has been one of the most difficult areas to cover because many do not know the language.

It is also important to understand the gendered nature of the contingent teacher workforce because events such as having children or relocating can influence how women interact with the workforce. For example, in this study of the teachers who had held a permanent teaching position previously, 28% indicated that they had left for family reasons and another 28% indicated that they had left a permanent teaching position for reasons around relocation. This reflects the claim that Vosko and Clark (2009) make when they state that certain events such as the birth of a child or relocation, can increase workers’ exposure to forms of employment characterized by insecurity” (p. 26). There is no job security in contingent teaching. This phenomenon needs to be explored further.

**Conclusion**

Growth in the contingent teacher workforce has significant consequences for government, school districts and teacher unions. At the system level, policies and program will be affected. The government has begun the process of reducing the enrolment in teacher education programs. This will mean that faculties of education will receive fewer students and less revenue. School districts will continue to have the luxury of choosing from a large pool of teachers when hiring. But they will also be taxed as they attempt to provide professional learning opportunities for their large local contingent teacher workforce. Teacher unions will also see their membership composition change with more contingent teachers and less full-time permanent teachers.

The knowledge gleaned from this provincial study provides evidence that the contingent teacher workforce requires attention. This workforce will benefit from contracts that provide better working conditions for contingent teachers. A better understanding of the growing contingent teacher workforce means that teacher unions, school districts and governments can provide more targeted professional learning opportunities for this specific group of members.

Exploring Grade Six Students' Comprehension of Statistical Graphs in the Social Science Curriculum

Chen, Hsing-Me

Department of Mathematics and Information Education, National Taipei University of Education

No. 134, Sec. 2, Heping E. Rd., Da-an District, Taipei City 106, Taiwan

hsingme@yahoo.com.tw

In Taiwan Grade 1-9 Curriculum Guidelines (2003), interpreting statistical graph is suggested to teach in the social science curriculum while reading & comparing statistical graph are emphasized in the mathematics curriculum. Under this circumstance, statistical graph comprehension is partitioned into two parts to teach. This is for the idea of interdisciplinary connections. But, whether does this kind of curriculum setting help students to understand the social context conveyed by statistical graphs? How do students perform the comprehension?

To answer these questions, we designed an assessment test with 45 multiple choice items structured by two dimensions. One dimension was based on three hierarchical abilities for understanding statistical graphs—reading, comparing and interpreting. These abilities were proposed by Curcio (1987) as reading the data, between the data and beyond the data. In Taiwan, reading & comparing are emphasized in the mathematics curriculum while interpreting is suggested to teach in the social science curriculum. The second dimension was based on five types of statistical graphs found in the social science curriculum—bar graph, line graph, pie chart, complex graph & map chart. Except the map chart, the other four types of statistical graphs are also in the mathematics curriculum. All of the statistical graphs in the test were copied from the social science textbook. A total of 513 grade six students from twelve elementary schools in Taipei Area participated in this survey. The validity was constructed by several experts and the reliability was good with cronbach α=0.843.

As to three abilities for understanding statistical graphs, reading was performed best with 85.83% correct respondents, followed by comparing with 72.36% correct respondents, and then interpreting with 54.79% correct respondents. The performance of interpreting was related significantly by the performances of reading and comparing separately with determination coefficients 30% and 38%. As to five types of statistical graphs, bar graphs & line graphs were performed best with smaller variances, followed by map charts with largest variance, and pie charts & complex...
graphs were the worst. Hence, even though students’ comprehension of statistical
graphs in the social science textbook was related to their learning experiences of
statistical graphs in the mathematics curriculum and to the complication of the
statistical graphs, there were some other factors that affected the performance of
interpreting.

There was a significant interaction between three abilities and five types of
statistical graphs. Through interviews with some students, the type of the statistical
graph was not the only factor to the performance of the ability. For example,
complication of the graph and familiarity with the unit of data measuring affected the
performance of reading and vision decoding affected the performance of comparing.
For the performance of interpreting, students were convinced more easily by numbers
than by words as to inference descriptions. Some suggestions for teaching and future
work will be provided from the view of cross disciplines.

Key words: elementary school, social science curriculum, statistical graph

Abstract

The most current recession that began in December 2007 has shown that many Americans are living beyond their means and do not have a firm grasp of basic financial concepts. Studies have shown that four in ten Americans are misusing and misunderstanding credit, and high school seniors on average answered less than fifty percent of financial competency questions correctly. (Mandell, 2008; JumpStart Coalition, 2008). It appears that adults as well as many youth did not receive the adequate financial training necessary to make sound choices on how to spend, save and invest.

Multiple organizations have responded to this lack of training and developed financial curriculums to be used with high school-aged students. Forty states have responded by implementing some type of personal finance training into their high school curriculums however, only seven states require students to take a personal finance course as a high school graduation requirement (National Council on Economic Education, 2007). In addition to the response by organizations and public education, perhaps studies should examine the financial training and modeling (or lack of) occurring in the home between parent (or guardian) and the child.

Many researchers agree that financial education needs to begin at an early age and that educating children on personal finance management at a young age will have positive, lasting effects on the rest of their lives (Lai, 2010; Lunt and Livingstone, 1999; Staten, 1993; Sumarwan and Hira, 1993). A study done by Pinto, Parente, and Palmer (2001) showed that lack of parental involvement in a child’s finances can have serious implications on the amount of debt they will ultimately obtain. These researchers
examined the relationship between parental involvement in credit card acquisition and the amount of credit card debt that college students accrue. They concluded that college students whose parents were involved in the acquisition of their credit cards have lower overall credit card debt than students who had no parental involvement at all. A similar study conducted by Goldberg (2005) examined variables that affect debt accumulation and concluded that while 70 percent of parents in his study had taught their teens how to do laundry, only 34 percent of them had taught their children how to balance a checkbook. And, only 34 percent of them had taught their children how credit card fees and interest work.

For purposes of this poster presentation, a team of researchers from a university in the Pacific Northwest conducted an online survey in November 2009 of 2000 randomly selected undergraduate students (n=778). Specifically, the researchers examined if parental discussion about personal finances made a difference in the amount of credit card and student loan debt incurred by the young adult.

Preliminary analysis indicated that 45% of the respondents reported having credit card debt and 72% reported having student loan debt. Full-time, non-international, undergraduate students who discussed finances with their parents showed significant differences and had less credit card debt than those who did not (p=.0028) and less student loan debt than those who did not (p=.0245). Additional descriptive and statistical analyses will examine grade level, age, gender, part-time or full-time student, if they had a personal finance course in high school, as well as current financial habits in saving, budgeting, and overall perception of current financial situation.
Faculty Diversity in Rural Higher Education

Faculty Diversity in Rural Higher Education

While much of the current literature focuses on the benefits of ethnic diversity as described above, other types of diversity are equally important on university campuses. Anyone who differs from the able-bodied Protestant-Christian Caucasian heterosexual male norm brings a different perspective to the classroom and could assist students increase their cultural sensitivity and broaden their belief that people different from the norm can succeed. The four areas of diversity of interest in this study were ethnic, religious, disability, and sexual orientation.

The literature pertaining to ethnic, religious, disability, and sexual diversity shares common themes. In every case, there is a lack of research investigating faculty members from diverse, as identified in this study, backgrounds working in rural Appalachian institutions of higher education (IHE). The purpose of this research project is to identify common themes that emerge from faculty members’ experiences as part of minority (diverse) populations in an Application University.
Interviews were conducted with faculty members and administrators at a 4-year public Appalachian University. Faculty informants indicated the acceptance of diversity depends to some extent on the department culture and the department leadership (e.g., chair). All informants commented on the importance of the administration's commitment to diversity and that the leadership commitment needs to be clearly stated for all types of diversity, and that needs to filter down to all levels of leadership – including the department chair level. Other common themes mentioned by faculty participants were culture of the community, recruitment and retention, and areas for improvement. Analysis of administrator interview data continues. Results will be available at the conference.
Learning across contexts: How students regulate their learning in an informal context

Full Paper
Abstract

Primary school learners are often engaging in learning opportunities in both inside and outside of school contexts. To understand how these different contexts afford opportunities for metacognition and self-regulation, we follow local primary school students of elementary grades five and six. In Vygotsky’s work, metacognition appears as an awareness of one’s own thinking processes and the way they can be controlled and directed. For Vygotsky, metacognition and self-regulation are completely intertwined in which the latter takes the forms of control over one’s attention, thoughts, and actions (Fox & Riconscente, 2008). Consequently, the understanding of these important constructs supports the understanding of human behavior, learning, and development within a broader context of all human activities. To explore the learning of metacognition and self-regulation in students’ learning, we draw data from an informal context: a primary school, co-curricular activities (CCA), in bowling. Interpreting from a variety of data-collection techniques such as field observations, interviews, field notes, and video recording, the research team has been observing the bowling team’s practices at least once a week since January 2010. Although the school’s team comprises of more than thirty students, we targeted our observations to nine of these students. A further sub-section of two participants were selected and interviews were conducted to collect information on strategic planning, self-efficacy, and knowledge application. Moreover, artifacts such as written statements of the way their families assisted in their learning in an informal context were also collected. Preliminary findings indicate that learning in an informal context affords opportunities for metacognition and self-regulation in interesting and authentic ways. In addition, students point out that learning strategies can be used in both formal and informal contexts. The findings also illustrate the importance of linking students’ development of metacognitive abilities to parental mentoring in providing a fuller understanding of their learning in both formal and informal contexts.
Introduction

“Must still keep your mental calm and try to do better the next shot. And don’t keep thinking about the bad frame (Each game of bowling is made up of 10 frames. Each frame entitles the bowler up to two attempts to knock down ten pins); Just look forward to the next round”. (Mark)

I keep a notebook so you have notes and stuff, so if there is a spare (A spare indicates that all of the pins have been knocked down after the second ball of a frame), and you don’t know what line to use them, just refer to the notebook. (Jay)

The two eleven-year-old primary school boys who were quoted above are reflecting on their learning in an informal context and their strategies for gaining expertise. Their descriptions suggest that they move toward attainment of their goals with the engagement of self regulatory behavior; while Mark demonstrates regulation of one’s emotion, Jay monitors his learning through the use of a note book. These learners demonstrate that learning in an informal context requires more than compliance with prior directions (in cases whereby their school coaches would give specific bowling instruction to prepare students for their participation in various private bowling clubs due to differences in lane conditions); it also involves controlling, monitoring, and taking responsibility for one’s own learning processes. Metacognition is often described as conscious control, active monitoring, and regulation of learning processes (Flavel 1987; Baird & White, 1996; Larkin 2006). This article aims to investigate the impact of broader informal learning experiences on students’ metacognition and self-regulation as there is compelling evidence from formal classroom suggesting that students who are more metacognitive can improve their learning and while becoming more empowered learners (Baird, 1986).

Learning in formal classrooms provides students with the knowledge and skills that they need to become contributing citizen in a society. However, the importance of redirecting focus and attention upon contexts other than the classroom where students learn through participation in the communities and practices help to capture learning experiences and the understanding of different contexts and practices over time (Biesta, 2008). To shift away from class-room centric focus, the research emphasizes one particular setting, the
co-curricular activities (CCA) in bowling, and on the metacognitive learning afforded by this informal setting.

**Metacognition and Self-regulation**

The term “metacognition” is most often associated with the cognitive information-processing tradition represented by the early work of John Flavell (1979) and Ann Brown (1987). Metacognition was originally referred to as the knowledge about and regulation of one’s activities in learning processes (Veenman, Van Hout-Wolters, & Afflerbach, 2006). A review of seminal works in the field reveals that there appears to be no uniform definition of metacognition in the literature (Larkin, 2006). For instance, Kuhn, Amsel, and O’Loughlin (1988) view metacognition in terms of students’ ability to not only think with their ideas (knowledge), but about their ideas (knowledge). Gunstone (1994) considers metacognition as a combination of student knowledge, awareness, and control relevant to their learning. Moreover, White (1992) and Costa (1991) place emphasis on evaluation which represents another aspect or dimension of metacognition. Furthermore, Fox and Riconscente (2008) note that historical precursors of metacognition (along with self-regulation, and self-regulated learning) appear in the writings of James, Piaget, and Vygotsky, however, contemporary research has been heavily influenced by Flavell in the area of metacognition (Schunk, 2008). Being one of the earliest contributors to the conceptualization of metacognition, Flavell laid the contemporary foundations for metacognition. Flavell describes the conceptual definition of metacognition as “thinking about thinking (Miller, Kessel, & Flavell, 1970), he further operationalizes metacognition into four key areas: metacognitive knowledge, metacognitive experience, goals, and the activation of strategies. At a broader level, the foundation of metacognition is in the mind of the individual. Further, Baker and Brown (1984) separated metacognition into two distinct elements: knowledge about cognition (monitoring) and self-regulatory mechanism that contain monitoring as a central focus. The self-regulatory mechanism included checking the outcome, planning, monitoring effectiveness, testing, revising, and evaluating strategies (Dinsmore, Alexander, & Loughlin, 2008). Moreover, the term “self-regulation” derives from the socio-cultural
tradition founded on the work of the Russian psychologist, Lev Vygotsky (1978, 1986). In Vygotsky’s account of historically situated and culturally determined human behavior, self-regulation and metacognition are central to human development driven by language-based social interactions. For Vygotsky, self-regulation is an essential characteristic of human behavior; it takes the form of deliberate control of one’s own attention, thoughts, and actions (Fox & Riconscente, 2008). According to Dinsmore et al (2008), contemporary self-regulation research has been heavily influenced by the work of Albert Bandura. Bandura (1986) incorporated self-regulation into his social cognitive theory of human behavior. He views self-regulation as the process of influencing the external environment by engaging in the functions of self-observation, self-judgement, and self-reaction (Schunk, 2008). Schunk (1994) defines self-regulation as students’ self-generated thoughts, feelings, and actions, which are systematically oriented toward attainment of their goals. In this article, we have adopted Vygotsky’s model in which metacognition forming the cognitive parts of self-regulations, which also encompasses affective, self-efficacy, and social elements. Furthermore, both terms metacognition and self-regulation are used to identify multiple-dimensions of the two constructs which continue to be represented in the research literature. For instance, many researchers have argued that sport expertise also depends on learned cognitive processes and behaviors (Hodges & Staarkes, 1996; Paull & Glencross, 1997; Willimans & Davids, 1995). An expert tennis coach, who worked with world highly ranked players, described the advantages of metacognitive process along with motivational benefits such as attributions to strategy use (Zimmerman & Moylan, 2009). However, much less is known about the processes individuals are using during practice sessions, and what types of processes could benefit or impact the effectiveness of learners’ performance. Based on the above synthesis, in this article, we focus on one particular setting, that of CCA with primary students in bowling in order to explore the different dimensions of metacognition and self-regulation afforded by this informal context.
Methods

To explore metacognition and self-regulation in the context of bowling, the research involves the collaboration of a Singapore primary school with students from elementary five and six. The primary school bowling team consists of more than thirty students. To capture the breadth and depth of students’ experiences as they engaged in various aspects of training, this study targeted at two groups of the school team, which consisted of nine students. The teams practiced after regular class time, two hours a day, and three days a week. In addition, a further sub-section of two participants, one from elementary five and another from elementary six, were selected for regular interviews. There are two coaches for the bowling team, and they varied somewhat in their coaching experience. For example, Alex has more coaching experience than his assistant Victor, but both of them engaged in direct interaction and instruction with the learners.

The study drew on a variety of research methods including field observations, informal open-ended interviews, video-recording, field notes, and informal conversations with students, coaches, and parents during practice. Observations occurred regularly at least once a week beginning from January 2010. Students were interviewed with questions focused on individual’s learning strategies, peers’ learning approaches, and key learning experiences. Interviews were audiotaped and then transcribed. Moreover, we collected artifacts produced by students, like written statements of the ways their families assisted their learning in an informal context. The data analysis process was iterative and started early in the course of the study as we discussed observations, analyzed transcripts, and identified changes in students’ thinking and learning approaches.

After the initial weeks of observation, we identified two bowlers (both boys) that we thought represented the profiles of potential athletes as in their dedication to the sport. Both participants shared a common characteristic in which their parents (especially their fathers) played a prominent role in assisting their boys to excel in their learning. During school practice and competitions, we paid special attention to these two boys and conducted extra interviews with them during the course of this study. In short, we draw from these students’ experiences to represent aspects of metacognitive activities.
Findings

The research aimed to capture how an informal learning context such as the CCA activity, bowling, affords opportunities for students to understand the significance of their engagement in metacognition and self-regulatory activities. In this section, we present the findings from our analysis of the two groups of participants including individual interviews conducted with two selected participants. The first part, *engagement in self-regulatory processes*, focuses on the two groups of students’ experiences of metacognitive control, metacognitive monitoring, strategies selection, and help-seeking behavior. The second part, *a closer examination of metacognitive and self-regulatory processes within a case study*, presents the first case study of a primary five student who engages in goal setting strategy and knowledge application in different contexts. Finally, the third part, *the mentoring process of metacognitive and self-regulatory learning*, highlights the second case study of a primary six student who involves in the metacognitive processes with assistance from his father.

I. Engagement in metacognitive and self-regulatory processes with two groups of students

The two groups of participants from the school team that we interviewed commented on their learning approaches and experience learned from participation in school practice and competitions. Most students demonstrate some form of metacognitive control, which help them to exercise strategic judgment about ‘what works’ in the patterns of their performance. Note that in the transcript, parentheses denote explanations:

Yeah, because you know, like if you get a bad frame (*Each game of bowling is made up of 10 frames. Each frame entitles the bowler up to two attempts to knock down ten pins*), and you bowl, the next frame you feel negative but you must tell yourself positive. Then you can do it. (Jay)

Yeah, you must apply like, whatever you win or do well in a tournament, you must always remember what you did and try to do it in the next tournament. But if you do not succeed then it’s okay, because once in a while, life has ups and downs. (Mark)
Because when I bowl first game, I very concentrate, then after that, middle, I start to lose concentration…in the middle then the last game, I will put all my effort to go back. (Benjamin)

Also, students indicate metacognitive monitoring of their errors with the use of note-taking as a way to learn from their errors and avoid consequences of not knowing how to correct errors and experience failures:

I think it’ll be easier to write it down so that you won’t forget the things that you tried but failed…but I didn’t do that for two weeks. (Thomas)

Yeah, I take, I will jot in the notes then I will…and after that, I put in my bag, then I read, if I get that wrong, I read again until I get it back. (Dixon)

Taking down notes like, when the lane gets dry then you write down your strategy. (Rick)

However, not all students find that accurate records of what they have done can improve performance and provide cues for ways to improve expertise:

Not really…lazy. (Benjamin)

Students state that the experience of going through a bowling competition can be more stressful than academic examinations due to the fact that everyone in the bowling alley is watching how the bowler is performing. To overcome irritableness and nervousness, students select strategies they consider effective in helping them to perform productively during competition:

Listen to music… (During competitions, students are allowed to take a seat with earphones on while waiting for their turns to bowl). (Benjamin)

You cannot be pressured, because if you are pressured, because everybody’s pin fall, so if you’re pressured then if you like grip the ball a bit more then the ball will start doing things that you don’t want it to do, and then that’s where probably you lose out. And when you’re taking spares, you must not be…you don’t want to get over things quickly, although you strike…yeah you must be slow…slowly take the spares down. (Mark)
Finally, some students note that help-seeking from their coaches should be the last resource as experimenting through learning and fine tuning is more challenging:

Must be independent, yeah, you cannot rely so much on like somebody… (Jay)

No, you need to experiment it yourself. Or you can call coaches if you really, really, really need help. But otherwise, most of the time, we try to do it ourselves. If we cannot, then, we’ll ask coaches. (Mark)

In this section, we have highlighted the processes of informal learning and the way in which it provides opportunities for metacognitive activities. While we recognize the potential of informal learning as an opportunity for students to engage in metacognition and self-regulation, we would like to emphasize that these skills and capabilities can be learned and practiced in both informal and formal contexts or interchangeably.

II. A closer examination of metacognitive and self-regulatory processes within a case study

Research by Zimmerman & Moylan (2009) has revealed that novices attempt to self-regulate their learning in some way. In this section, we present the first case study of Dixon, a primary five student who engages in certain dimensions of metacognition and self-regulatory activities. Dixon demonstrates that he is able to apply goal setting strategy effectively and to make connection between learning in bowling and classroom as a way to improve on his formal and informal learning endeavor. Note that in the transcript, parentheses denote explanations:

Yeah, must have a goal. Example, if you want to win a tournament then you must have high score right? You want to get high score, you must strike a goal, I mean like, every each game you must get 200. If you never get 200 then try the next game. (Dixon)

So I can get more medals, for example like happy like that. So when the coach see I bowl very good right, I mean the national coach see that I’m very good, then later if you’re lucky the coach will like, the coach will see your results and the coach will pick you up for going to the national
To achieve his goals, Dixon demonstrates aspects of metacognitive controlling, monitoring, and help seeking behaviors such as simply asking the head coach for help when having difficulties in reading lane conditions:

The mindset that means like, example, alah I can actually fail...that means not to say that in your mindset, must say must achieve this, must achieve this. Must try and try and try. That your mindset must be like a good thinking. (Dixon)

No, I didn’t talk to myself, I like, the people in the, like for example like Mark, Jay encouraged me. Don’t cry lah...come on...come on...this is just the first game. And later I thought to myself that must be happy, must be happy, must be happy. Must be happy, regardless of my fever. (Dixon)

First thing, important in masters when we first throw, first throw already right, after that, example, your ball over-hooked, you must ask our coach. So our coach can help us the first important thing. For example, if your lane is very dry, very dry then you over-hooked, ask your coach, move where, move where? But if you already know that your coach teaches you, you can adjust yourself to follow the lane conditions. (Dixon)

These individual interviews with Dixon provided evidence of the different ways in which a learner was able to self-regulate his learning experiences in an informal context. Next, we analyze an aspect of self-efficacy, which is self-efficacy calibration. Calibration is a measure of metacognitive monitoring based on the disparity between one’s sense of efficacy about performing a particular task and one’s actual performance (Zimmerman & Moylan, 2009). Dixon’s is accurate in judging his capability to perform and thus learn more effectively. His self-efficacy judgement does not exceed his actual capability as over-optimism can lead to insufficient efforts to learn:
My normal average now is about 155 for the whole year. Not for the, sometimes the game, that one sometimes game. 155 and above. (Dixon)

Last year my average was about, total was 139. (Dixon)

Sure (Dixon indicates that his last year average was 139, this year average is 155, and he thinks that next year average would be 170. Dixon demonstrates accurate metacognitive monitoring of his actual capability and performance. (Dixon)

Interestingly, Dixon points out that if one is good at bowling, one must be very good at studies too, and he thinks that there is a connection between bowling and classroom study:

Example like, achievement goals like are goals, like example last year if your score is 70 something, this year you must get, this year I want to get 80 and above, get one, like that (Dixon is relating the examples of setting incremental goals from bowling to classroom study in which last year score for a subject was 70, and this year score for a subject can be 80). (Dixon)

Dixon’s efforts presented in the above example provide an indication of knowledge application from one context to another. He raises interesting examples of how learning can be related and even intertwined between different settings.

**III. The mentoring process of metacognitive and self-regulatory learning**

This section presents the second case study involving Nathan, a primary six student and his engagement in metacognitive and self-regulatory activities with assistance from his father. In the bowling practices, parental involvements are regular. Most parents almost always attended the practices and competitions in order to assist their children’s performance or cheer from the audience seats. Nathan’s father holds an academic position in a local university. Although his work and schedule put a certain pressure on his time and availability, he attended interviews with Nathan and actively participated during the meeting sessions. The excerpt below identifies the father’s role as an important mentor who assists Nathan in monitoring his learning:
Father: Okay. You feel that you must pick up your spares.
Nathan: Yeah.
Father: What else do you think you must do?
Nathan: Train hard?
Father: Train hard; Let me write down on the whiteboard, okay. So you can remember, okay. Never mind it’s alright. So the first thing you need to do is that you need to be determined…
Father: To work hard. Anything else? What about accuracy?
Nathan: Of course, accuracy. I almost forgot you have to be very consistent unlike me (Laughs).
Father: Okay, so to be consistent…
Nathan: Consistent in your shots because every shot counts.
Father: Every shot counts.
Nathan: In a competition (Laughs).
Father: Okay, don’t waste your time, okay. Any other thing that you feel that is necessary?
Nathan: Your goal.
Father: So, goal is necessary, okay.
Nathan: Wait, determination and confidence must be, especially when you are feeling down and your scores are bad.
Father: When…
Nathan: When you are going to give up.
Father: You are feeling…
Nathan: Wait, wait. No, no. Not feeling down. Going to give up. Some people when they are going to give up they don’t feel…
Father: Okay, when they are going to give up, okay. Give up, okay. Anything else? Do you think you’ll be doing all these from now till next year?
Nathan: Wait, wait, wait. Actually the atmosphere is very important.
Father: Well you can’t do anything about the atmosphere right?
Father: Okay, you got to overcome, to overcome…
Nathan: Overcome the bowling centre atmosphere…
Father: Basically yeah…
Nathan: You must actually when, when the person bowl right, the other side right, actually you must, you must actually like be, must be, this is a, this is a courteous bowling, you have to let the person go first then you go…
Father: Okay, so you must bowl by the rules.
Nathan: Yeah.

Similar to the above discussion about bowling, Nathan’s father helped Nathan with the development of understanding both informal and formal based experiences in future
learning. In the following excerpt, Nathan told his father that he did not want to discuss about bowling but he preferred to discuss about written composition. Nathan thought that the composition topic would be related to “ambitions” and he wanted to know how he could address the topic. Nathan’s father modeled to Nathan the kinds of sub-issues which can be discussed such as “designer”, “engineer” knowing that Nathan had an inclination on these topics:

Nathan: I want to be a designer-engineer.
Nathan: my ambition is to design a flying car. I excel in sport in primary school, in the arts in secondary school, and I want to do engineering in the university!
Father: You can write about the everyday things – sports, Mona Lisa, iTouch – that there is both science and art integrated.

It is clear that informal context played an important role in Nathan’s learning as his father with his multiple roles as mentor, learning broker, consultant, and as a pointer to knowledge integration is instrumental in helping Nathan to regulate his learning across different contexts.

**Conclusions**

From the analysis, it is evident that students have the potential to control, monitor, and select goal-setting strategy in an informal context and with support from parental mentoring. As pointed out by Hung, Kim, Lim, and Jamaludin (in press), “with a packed curriculum to be covered in schools, students are often not able to engage in experimentations and related 21st century skills, but such opportunities are possible in informal contexts”. Furthermore, Biesta et al (2009) indicates that in everyday lives, young people learn from opportunities for action, participation, and reflection afforded by practices and communities. In this article, we have presented the opportunities that an informal context provided for students to experience regulatory processes and learning in a social world, which is outside of their school environment. Most students in the group interviews demonstrated the application of regulatory strategies to meet the demands and challenges in bowling. To enhance their awareness of their faulty throwing techniques,
students used note-taking as a way to assist them in making strategic adjustment for future performance. The transition from school to bowling did not involve only the physical setting but also a shift from standard closed-door examinations to competitions that are open to public. Under such a different learning context, students monitored and regulated their responses differently either by listening to music to reduce stress levels; taking one’s time to spare without nervously rushing through; or approaching their coaches for helps. Students who engaged in these metacognitive and regulatory strategies can become increasingly capable of performing under different situations. The case of Dixon who approached his coaches for advice regularly indicates that a high achiever is more readily to seek helps from teachers (Puustinen, 1998; Wood & Wood, 1999). Further, the case example of Nathan reveals that the significance of mentoring is consistent with the views that “to understand fully the determinants and impact of educational setting, we need to consider their links to other aspects of an individual’s life context” (Moos, 1991). In the collected artifacts with students’ written statements of how their families supported their learning, Nathan wrote: “my father supports me by bringing me for bowling regularly and buying me balls. He also guided me and made me feel better during competition.” Similarly, these are other written statements by students, example two: “my parents support me. They bring me to bowl, they buy me new ball and they remind me to do the things that have been taught.” Example three: “my parents support me. Even if I do not do well, they will still encourage me and ask me to play my own game.” These examples document that social variable, parental mentoring, in an informal context can be an influential factor for students’ learning. Furthermore, when Nathan’s was facing difficulty in written composition, he asked his father for assistance and this help seeking adaptive behavior is an important self-regulatory strategy, which is crucial for student learning (Newman, 1994). Clearly, the understanding of ongoing social contexts in students’ learning experience highlighted the importance of mentor in demonstrating regulatory skills and supporting opportunities for learners to practice attitudes for metacognition and self-regulation on a daily basis.

Abstract
Mentoring models and types of mentoring have changed little over the last thirty years. In today’s contemporary organizations there is a need to provide mentoring that is collegial and is based on a mutual relationship. This paper explores a reconceptualisation of mentoring that is more conducive to modern organisations and workplaces in the 21st century. A layered model of mentoring is discussed and identifies within each layer the characteristics of the mentoring relationship. The mentoring relationship is examined in respect of the implications such relationships have on professional learning. In particular, a case study forms part of the methodology that explains the model in practice. The model, although explained through the lens of Academia is applicable to other organisations that are keen to move forward in developing mentoring relationships that are based on mutual respect and the ability of the relationship to offer learning opportunities for all parties involved in the mentoring process. This layered model of mentoring does not conform to any previously documented form of mentoring. It is a new way of thinking about mentoring. This model recognizes the contribution that each person brings to the relationship and is based on reciprocal benefit.

**Title: Contemporary organizations: Using a layered mentoring model to build relationships.**

**Abstract**

Mentoring models and types of mentoring have changed little over the last thirty years. In today’s contemporary organizations there is a need to provide mentoring that is collegial and is based on a mutual relationship. This paper explores a reconceptualisation of mentoring that is more conducive to modern organisations and workplaces in the 21st century. A layered model of mentoring is discussed and identifies within each layer the characteristics of the mentoring relationship. The mentoring relationship is examined in respect of the implications such relationships have on professional learning. In particular, a case study forms part of the methodology that explains the model in practice. The model, although explained through the lens of Academia is applicable to other organisations that are keen to move forward in developing mentoring relationships that are based on mutual respect and the ability of the relationship to offer learning opportunities for all parties involved in the mentoring process. This layered model of mentoring does not conform to any previously documented form of mentoring. It is a new way of thinking about mentoring. This model recognizes the contribution that each person brings to the relationship and is based on reciprocal benefit.

---

**Introduction**

Raza and Mosca (2002) in their research explore ideas of changing employee-organisation relations. They posit that the ‘new age employee’ expects to be treated in a more equitable manner than previous generations. They believe that contemporary organizations need to provide opportunities for employees to have feedback on their progress and “proper tools to assist them achieve their goals” (p.2). Organizations in an attempt to provide these opportunities are turning to mentoring as one means to provide professional learning for their employees.

Mentoring is not a new concept; it has its roots in early history. The term was used as early as 800BC, in Ancient Greek mythology, in Homer's Odyssey (Debolt, 1992; Reglin, 1998; Bond, 1999; Schiewbert, 2000). The original Mentor was given the care and guidance of Odysseus' son, Telemachus. The Mentor in this instance served as a role model, guide, facilitator, and protector. There has been a resurgent interest in mentoring occurring as indicated by Mullen, Fish, and Hutinger (2010); Gabriel and Kaufield (2008); Le Cornu (2005); Goodwin (2004); Hegstad (1999); Zey, (1991); Carruthers, (1993) and Kerka (1998). Reasons for this renewed interest are due to organisational trends such as downsizing, restructuring, collaboration and teamwork. Increasingly,
managers in organisations are seeing mentoring as an important source of professional learning for less experienced employees. Many organisations are recognising that facilitation and support of a mentoring process is an effective strategy to build the organization.

Over time there has been a plethora of definitions on mentoring and often these definitions have been defined in terms of the type or form of mentoring. Usually, mentoring has been defined in terms of either informal or formal mentoring. By defining different forms of mentoring and the attributes of each form, communication pathways and types of relationships established can be identified. Mentoring can be recognized by the type of relationship that is evident in each mentoring process. It can be a formal or an informal relationship and within these boundaries the relationship can be reciprocal or non-reciprocal. It is the construct of the development of the relationships that is the focus discussed in this paper.

**Formal mentoring**

Formal mentoring relationships are generally designed for a predetermined length of time and are usually of short duration. Many managers implement formal mentoring programs as a strategy to induct new employees into their organisation (Douglas & McCauley, 1997). Within these programs the protégé is allocated to a mentor by the management of the organisation and usually, there is little or no involvement of staff in the selection process of matching the mentor and protégé by either party. These programs are purposefully developed, monitored and evaluated by the management in terms of expectations and goal attainment. There is an inequality of status in this relationship with communication usually being one-way. The mentor directs and drives the communication down to the protégé with little opportunity for the protégé to have input or respond to the communication from the mentor. The one-way communication in formal mentoring can result in the protégé being unable to 'connect' with the mentor. (Figure 1).

![Inequality of status with communication. Communication is driven down to the protégé](image)

**Figure 1: Formal mentoring communication pathway**
Phillips-Jones (1982), Kram (1991) and Murray (1991) have argued that management personnel in organisations do not fully understand the challenges inherent within formal mentoring programs. Ragins and Cotton (1999) put this lack of understanding down to the scarcity of empirical research related to mentoring programs. Indeed, practice still continues to exceed the pace of empirical research. In formal mentoring programs mentors do not have a previous personal connection with their protégé but participate in the mentoring programs for the 'good of the organisation'. As an outcome of this lack of connection, both mentors and protégé may not always be committed to each other or to the program. The consequences of this diminished commitment can result in an underdeveloped mentoring relationship.

**Informal mentoring**

The essence of informal mentoring is the establishment of beneficial interpersonal relationships based upon effective communication (Kerka, 1998). Mentors in informal mentoring relationships provide direction, support and insights and they essentially provide "...their protégés with a sense of what they are becoming" (Debolt, 1992, p.30). Opportunities for recognition, encouragement, feedback, advice on balancing responsibilities and knowledge of the informal rules of the organisation have been cited in the literature as some of the benefits of informal mentoring (Kerka, 1998; Schwiebert, 2000).

Informal mentoring relationships are spontaneously formed through people getting to know each other in the work environment. The relationship is usually voluntary and is often based on mutual professional identity and respect. The relationship is of a more personal nature and communication flows usually from the mentor to the protégé but it takes place in a more informal manner (Figure 2). This informality is derived from the fact that the management of the organisation does not initiate the relationship but rather the relationship often forms through social contexts such as meetings 'over coffee'. The communication in this relationship is more relaxed and has little structure. The mentor's communication is usually in the form of support, guidance and advice. Within this type of informal mentoring relationship there is still a hierarchical status with communication between the mentor to the protégé. The difference in the status of the relationship between formal and informal mentoring relationships is that the communication in informal relationships is less formal as the name denotes.

Ragins and Cotton (1999), in a comprehensive study in the United States, compared formal and informal mentoring. They found that informal mentoring relationships were much more beneficial to protégés than formal relationships as the strategies used in the informal process were of a more personal nature such as coaching, counselling, role modelling and providing friendship.
There is still a hierarchy of status in this relationship but the communication is less formal

Mentor

Protégé

Figure 2: Informal mentoring communication pathway

Perna, Lenner and Yurs (1995) concluded from their research that the effectiveness between formal and informal mentoring could be due to the differences in the structure of the relationships. The pairing in an informal mentoring relationship is often the result of both the mentor and the protégé selecting personal qualities that mirror the qualities they would like to emulate. The informal mentoring relationship offers both the mentor and the protégé the opportunity to select each other, an aspect not usually present in formal mentoring programs. Ragins and Cotton (1999) also indicated that formal mentoring programs often last less than a year. On the other hand, informal mentoring relationships can last for many years allowing for a personal connection between the mentor and protégé to develop.

Evidence from the literature indicates that there are fewer limitations in informal mentoring than formal mentoring. Ragins and Cotton (1999) found in their research that the benefits of informal mentoring were many. The two major areas of difference between formal and informal mentoring were in the levels of career guidance and psychosocial support. Informal mentors provided a higher level of coaching and increased the protégés visibility in the organisation. They also provided counselling, social interaction, role modelling and friendship.

Co-mentoring

In general, modern mentors are viewed as influential and more experienced people who can assist in the attainment of work and career goals of a less experienced person in the organisation. Mentors have been defined as guides (Bey & Holmes, 1992), counsellors or coaches and role models (Crow & Mathews, 1998). These definitions viewed mentoring as one-way relationships. Jeruchim and Shapiro (1992), however, presented a different view of mentoring encompassing a mutual and beneficial relationship between the mentor and protégé.
They define mentoring as

…a complementary relationship, within an organisational or professional context, built on both the mentor's and the protégé's needs (p. 23). One of the foci of this paper is to discuss this complementary aspect of mentoring.

A reciprocated communication pathway for each of the participants in the relationship and an equal role status of the mentor and protégé constitute the mentoring relationship that is referred to here as "co-mentoring."

The co-mentoring relationship has been a development reported in the literature in the last ten years (Jipson & Paley, 2000; Mullen, 2000; Kochan & Trimble, 2000; McGuire & Reger, 2003)). Terms such as “mutual mentoring” (Fritzberg & Alemayehu, 2004), ‘reciprocal mentoring’ (Gabriel & Kaufield, 2007) and “synergistic mentoring” (Goodwin, 2004) are used interchangeably in the literature to describe the practice of co-mentoring discussed in this paper. Co-mentoring recognises the contribution that each person brings to the relationship and is based on reciprocal benefit. In this relationship the status of each person is equal and the communication pathway is one of reciprocity with each person mutually benefitting from the relationship (Figure 3).

In this relationship the status of each person is equal and the communication pathway is one of reciprocity.

![Figure 3: Co-mentoring communication pathway](image)

Mullen (2000) defined the co-mentoring relationship as synergistic. She viewed it as providing opportunities to be involved in each other's learning by sharing purpose and commitment in common projects. A number of other writers including Jipson and Paley (2000) and Kochan and Trimble (2000) documented their personal co-mentoring experiences. In their stories they discussed how these experiences were mutually beneficial. Their discussions were based on collaboration and shared decision-makings. The ability to collaborate and share was seen as providing opportunities to strengthen personal and professional skills.

Rymer (2002) discussed two essential components necessary for a successful co-mentoring relationship. The relationship should be a friendship of peers rather than a hierarchical relationship and that communication was dialogue rather than the transmission of organisational information. The co-mentoring relationship serves the individual needs of each person involved in the relationship. Within the relationship the individuals act as partners often complementing each other's knowledge and skills. The co-mentors may be different ages and have different expertise, skills and knowledge.
What is important in this type of mentoring relationship is that the relationship is of mutual benefit.

Table 1 provides examples of characteristics of each type of mentoring. Examples of characteristics of design, allocation, selection and monitoring processes, communication, status, type of relationship, commitment and connection of mentors and protégés are drawn together in this table to illustrate the differences and similarities of each of the types of mentoring (Clarke, 2004).

A further model of mentoring that involves overlapping layers of mentoring was reported in the literature by Clarke (2004). That study, revealed that mentoring experiences could involve three stages. They were

- collegial friendship
- informal mentoring and
- co-mentoring.

This model is a new conceptualization of mentoring and portrays mentoring not as phases but rather as a series of overlapping experiences. These experiences can be schematically described as a set of layers (Figure 4). The results of the study by Clarke (2004) indicated that there were not distinct phases but rather the mentoring relationship and its characteristics moved between layers and also that the layers overlapped as indicated in Figure 4. There was not a distinct break between each layer but rather the process merged one layer into the other. The results from this previous research led to the development of the "Layered Relationship-Mentoring Model".

![Figure 4: Layered relationship mentoring model](image)

In Layer 1, Collegial Friendship formed the basis of the professional relationship. The focus of this layer of the mentoring relationship is on the development of an interpersonal relationship with the mentor and the protégé. The characteristics of layer 1 are social meetings, seeking guidance and support and the identification of and involvement in project opportunities.

The second layer, the Informal Mentoring Layer has as its focus the relationship between the mentor and protégé’s interaction regarding the protégé’s professional learning and development. For the protégé the characteristics of layer 2 are developing a positive feeling and progressing their work, affirmation of their work and seeking guidance and support.

Layer 3, the Co-mentoring Layer, develops as a result of the interpersonal dynamics of the relationship. The relationship becomes equal with support and guidance being offered by each of the participants in the relationship. The focus in this layer of the relationship is
on an equal partnership and equal status of each of the participants. The characteristics of layer 3 for both of the partners are the development of a positive feeling, identification of and involvement in, project opportunities and seeking guidance and support (from each other).

The layered relationship mentoring model provides a new way of thinking about mentoring as a layered process with identifiable characteristics and outcomes evident in each layer (table 2). Much of the literature discusses mentoring as a fairly linear process but personal experiences as discussed by Clarke (2004) did not support this. The data clearly supported the view that a mentoring relationship can be layered and that the layers are not separate, but in fact overlapping. The literature also discusses the deliberate pairing of mentors and protégé with mentors and protégés’ being carefully matched. The data in the previous study did not support this formal matching of mentor and protégé. Indeed, it was the coming together through collegial friendship that supported the further mentoring layers of the relationship to develop with the mentors and protégé.

| Trust developed by the protégé with the mentor | The protégé moves towards becoming a mentor for others
| Common work interests/research developed | Collegial friendships forming with others
| Protégé exposed to new professional opportunities |

**Methodology**

This current study is research in progress. The study is based on the mentoring process occurring with two academics at a metropolitan university in Sydney, Australia.

**Participants**

One of the academics is a full-time academic and the other is a casual academic teaching in the same program at the university. Both academics are female. One is newly appointed as a casual tutor and lecturer to Academia (pseudonym “Claire”) and the other has been working in academia for twelve years (pseudonym “Kathleen”). The process began in February 2010.

**Collection of data**

The data for this research is drawn from two sources; the literature on mentoring and journal reflections by the two academics. Specifically,

1. the research literature is used to assist in an understanding of the variety of relationships that can be formed during mentoring and to give form and shape to the data and the analysis of that data.
2. journal reflections on the mentoring relationship by the two academics are being collected over a twelve month period. The reflections will be analysed in terms of the identification of the characteristics of the layered model of mentoring using the exemplars of characteristics of types of mentoring relationships indicated in table 1 and characteristics and outcomes of the layered model of mentoring indicated in table 2.

To date, only the fulltime academic’s (Kathleen) journal reflections have been analysed
Analysis and findings of data

Literature

The literature indicates that mentoring is not confined to one type or form of mentoring relationship although formal mentoring programs are usually researched and reported on in organisations. An analysis of the literature revealed that in each mentoring process some form of relationship was evident. It also gave form to the fact that mentoring relationships could be formal or informal and that the relationship could be reciprocal or non-reciprocal. Also evident from the literature were the communication pathways that were part of each type of mentoring relationship.

The Academics’ reflections

To date the journal entries of Kathleen comment on the support given to Claire. The support has been in the form of conversations around teaching and pedagogy. Emotional support has been given providing advice on working with students and academics in the teaching team. The support has been given in both a formal and informal environment. In the workplace support and advice is given in a structured work office while at other times support is given ‘over coffee’ either in the workplace or off-campus.

“Claire emailed me this morning and seemed concerned about a range of issues. I immediately rang her and asked her to meet me for coffee off-campus. Her email contained a long list of concerns ranging from not having resources to develop the lecture, student issues, staff issues …. She seemed like she just needed some guidance and a whole lot of support” (Journal entry 1 September, 2010).

They were able to discuss her concerns away from the workplace in an environment where she would feel comfortable talking. Claire commented that she felt much better after discussing her concerns and felt that she had confidence to deal with the issues detailed in her email.

Collaboration is also apparent in the journal entries providing evidence that the mentoring process is more than a one way form of communication. Collaborative tasks were undertaken such as assessment tasks development and rubrics for marking assessment. The journal entries discuss the guidance given by Kathleen to Claire in the early stage of the professional relationship.

Further analysis of Kathleen’s journal entries showed that her reflections revealed a number of supportive strategies used in the developing professional relationship. These strategies included nurturing and collaboration and development of research and writing skills such as writing academic papers. These reflective statements identified the outcomes of the mentoring relationship and described the results of this relationship as providing trust and a critical friend to Claire.
As time progresses the journal reflections will be analysed more fully in terms of characteristics and outcomes identified in the layered relationship mentoring model. To date the relationship is in the first and second layer of the layered relationship mentoring model. Layer 1, the collegial friendship layer has been the initial phase in the relationship. In this phase, interpersonal interaction developed in a social environment in and outside the workplace. Kathleen and Claire met socially over coffee with conversations centred on their families, their work, their research and their teaching. Kathleen’s relationship with her colleague Claire developed naturally because they taught in the same teaching unit. The mentoring relationship came together in an uncontrived way as Kathleen was more experienced and guided Claire in her first teaching position in a university. Claire was enthusiastic and keen to learn. These characteristics and outcomes constitute the first layer of this mentoring relationship.

Once the collegial friendship was established they began to work on common research interests. One interest was in the area of mentoring. This common interest fostered discussions about joint papers being written.

As the relationship develops the process will be further documented in the academics’ journals and a continued analysis of the journal entries in relation to the layer relationship mentoring model will be undertaken. This further analysis will form the basis of the concluding section of this paper.

Myths in the Academe – Academic Education or Pre-Enrollment Profiles as a Key to Employment and Satisfaction?

Dr. Nitza Davidovitch¹, Dr. Hadassah Littman-Ovadia², Prof. Dan Soen³
The Ariel University Center of Samaria, Israel
Kiryat Hamada 3, Ariel, Israel 40700

Abstract

Academic education is considered a key to gaining employment and satisfaction. This study attempts to explain the association between the demographic and pre-enrollment profiles of graduates of one academic institution, and their retrospectively reported satisfaction with their academic studies, and with their career. The study, based on a case study of the Ariel University Center of Samaria, Israel, integrates Holland’s classic congruence theory and Seligman’s innovative theory of positive psychology, specifically the hypothesis concerning everyday deployment of individual character strengths. Findings of the study demonstrate that deployment of character strengths was a significant predictor of graduates’ work satisfaction. The interesting finding in this exploratory study is the failure of graduates’ pre-enrollment admission profiles to distinguish among graduates based on their post-graduate employment status or job satisfaction. This finding is especially interesting in the context of the accepted myth in the academe, according to which admission profiles are key predictors of future success.

Introduction
Academic education is considered a key to gaining employment and satisfaction. This study examines the imperviousness of this myth and attempts to explain the association between the personal and scholastic pre-enrollment profiles of graduates of one academic institution, and their retrospectively reported satisfaction with their academic studies, and with their career. The study integrates Holland’s classic congruence theory (postulating congruence between occupational tendencies, the field of academic studies, field of post-graduate employment, and occupational and overall satisfaction) and Seligman’s innovative theory of positive psychology, specifically the hypothesis concerning everyday deployment of individual character strengths (which has not yet been examined empirically pertaining the studies and employment of academic graduates) in a case study of the Ariel University Center of Samaria, Israel.

Findings of the study confirm the significance of an academic education for high school graduates with college entrance profiles that do not support their admission into undergraduate programs at research universities that set extremely high admission requirements. In this study, 80% of the graduates reported satisfaction with their current job, 41% noted that they their job is ideal for their lives; 81% believe that they are successful in their current job. Deployment of character strengths and the significance attributed to character strengths were the two most significant factors predicting graduates’ satisfaction. The interesting finding in this exploratory study is the failure of graduates’ pre-enrollment admission profiles to predict graduates’ post-graduate employment status or job satisfaction. This finding is especially interesting in the context of the accepted myth in the academe, according to which admission profiles are key predictors of students’ future success.

The global revolution in higher education
Until the end of WWII, higher education reflected the existing social order [1, 2] and functioned as a hothouse for cultivating members of the elite class. Since the since half of the 20th century, higher education expanded [3] (OECD, 2003, Table A2.4) and its target audience completely transformed, which fueled debates on the topic of “higher education for the masses,” or the “massification of higher education”[4]. As higher education became viewed as a universal right and privilege [5], a BA (or equivalent) degree became the norm in developed countries, similarly to the former status of a high school diploma [6, 7, 4]. Today,
however, the debate focuses not on the target audience of higher education but on the need and the means to increase access to higher education based on the principle of social justice. The assumption is that higher education should be available to all able individuals [8], because by virtue of the prevailing principles of “human capital economics,” well-being of the individual and society, and increasingly dependence on formal education [9, 10].

The expansion of higher education has incited heated arguments on its social implications. At one extreme are advocates of the diversity approach, representing the functionalist stream, while at the opposite end are advocates of the stratification approach, representing the conflict stream. The first approach views the extension of higher education to the masses as a development that contributes to increased social equality. Its contribution is expressed in the development of a diverse range of institutions of higher education that operate alongside traditional research universities, and appeal to various and specific segments of students [11, 12]. The educational policy of expanding higher education to the masses was designed to implement the principle of a “knowledge nation” [13, p.]. A broad range of institutions of higher education developed in response to the changing attitude to higher education, both those providing an academic emphasis and those providing vocational training for graduates.

The second stream views the expansion of higher education in its current format as an optical illusion that has no effect in creating a genuine opportunity for members of marginal social classes. According to this approach, the expansion of higher education creates a hierarchy of institutions that deliver different levels of education, corresponding to the existing class order: the center remains a center while the periphery remains a periphery [14, 15]. Furthermore, inequality in higher education was perpetuated by the credential inflation produced by the expanding system of higher education [16, 17]. Individuals were now required to present academic credentials even for jobs that did not effectively demand academic qualifications, while competition ensued over more highly considered degrees from prestigious institutions [18, 19].

The higher education revolution in Israel

The number of students in Israel has increased enormously since the establishment of the State in 1948 [20], when 1,600 students attended the country’s two institutions of higher education – the Hebrew University and the Technion. At the end of the first decade of independence, there were 9,000 students in the country, and this group continued to grow
rapidly to 35,000 students in the 1970s, 56,000 students in 1980, and 76,000 students in 1990 [21]. The Association of Regional Colleges of Israel summarized this development in a publication in the late 1990s, and determined that “according to statistics of the Commission of Higher Education (CHE), the population of undergraduates students in Israel has grown forty-fold since the establishment of the State, while the country’s population increased by five fold” [22].

Up until the 1980s, over 90% of Israel’s undergraduate students attended one of the country’s six universities [23]. In the 1990s, the Law of Higher Education was amended and the Commission of Higher Education certified a long line of colleges to award academic degrees. The decision was accompanied by the explanation [24] that the higher education system would comprise two strata: the first stratum would include universities, which would engage in research and award advanced degrees, and the second stratum would include colleges, which would focus on undergraduates studies and function as a means to achieve social equality and justice through access to higher education for students in peripheral regions.

The amendment to the Higher Education Law caused a dramatic and rapid change in the map of higher education in Israel. While in 1989/90, 46,516 students attended undergraduate studies in a university, and only 8,286 studies toward an undergraduate degree at a college, in 2002/3 the number of students attending universities and colleges was 76,581 and 68,115, respectively [25]. As an additional 11,971 students attended 18 university extensions, the number of undergraduate students at colleges surpassed the number of university students. For the first time in the history of the state, over one-half of all undergraduate students in the country studied at academic colleges.

Following the reform in the 1990s and the Commission of Higher Education’s declaration of intentions, Israel’s system of higher education is now defined by some as a binary system [26, 27], while others prefer to define is as a stratified system containing two types of academic institutions that differ in their degree of prestige [23]. According to the stratified perspective, universities should engage mainly in the “autonomous function” of higher education, that is in imparting “high culture”, promoting science through research, and shaping and certifying elite groups, while colleges should engage in the “popular functions” of higher education [28], that is, exposing new population segments to high culture contents, awarding certificates necessary to gain adequate employment.
By opening the doors of higher education to students in peripheral regions and providing access to new population segments to whom such educational opportunities were not previously available, the CHE viewed the academic colleges as a tool to achieve social equality and justice [29, 30]. The number of rejected admission requests declined from 30%-34% in the 1990s to a mere 19% in 2000 [31]. The consistent increase in the percentage of high school graduates who were admitted into institutions of higher education is another important indicator that confirms that achievement of this goal. Statistics show that the proportion of students in colleges compare to the total number of students in academic institutions is steadily rising [32, 25].

We can also infer the colleges’ role as a tool for equality from the relatively high of college students who are from towns classified in the bottom SES clusters. While only 31.8% of all 2005 high school graduates in towns classified in SES clusters 1 and 2 (lowest clusters) pursued academic education within eight years, 73.6% of all high school graduates in SES clusters 9 and 10 did so. Furthermore, 38.1% of all high school graduates in cluster 1 and 2 who pursued a post-secondary education, did so at a college, compared to 27.0% who did so at a university. In the top SES clusters, the situation is different. Of all high school graduates in clusters 9 and 10, 50.3% continued to universities while only 27.4% continued to colleges [25].

The pursuit of academic studies and other variables

There is broad agreement that education in general, and higher education in particular, in modern, industrial, and post-industrial societies is a key resource in the acquisition of socio-economic status. Studies indicate a growing gap between income of college and university graduates and income of high school graduates [33]. US college and university graduates’ incomes were 48% and 100% higher than incomes of high school graduates in 1979 and 2000, respectively. Studied in Israel point to a similar trend: Wages of individuals with 16 years of education or over were 171% higher than the average national wage in 1995–1997, while wages of individuals with 8 years of education dropped to 59% of the national average wage in 1997. The academic credentials awarded by academic institutions, rather than the education per se, account for most of the difference in earnings. US Census Survey data from 2000 show that twenty of the top-earning occupations demanded an academic degree (Fenwick, 2005). Students’ decisions to pursue education after high school are a function of diverse
factors, the most important of which is high school achievements [34, 35, 36, 37, 38], but include career aspirations and cognitive abilities [39, 40], gender [41, 42, 43, 44, 45, 46, 47] and the family’s SES (parents’ education, occupation, and income) [48, 49, 50, 51, 37, 52, 53]. It is accepted that the family imparts various types of capital to its offspring, which encourage or inhibit the pursuit of higher education. Thus, families may impart economic capital, which helps students during their studies and occasionally contributes to the choice of more expensive programs of study [54]; social capital, which implies attitudes, tastes, preferences, orientations, language usage and style of speech, which also have a considerable impact on the choice of higher education [55, 56, 57, 58]. Studies show an association between the various types of family capital and the academic achievements of their offspring [59, 60].

Institutions of higher education in Western countries have conducted orderly, detailed tracking of information on their alumni for many years, and international agencies such as UNESCO and the OECD publish details findings of such alumni studies. Although the climate in many countries is amenable to alumni research, there is a dearth of information in this area in Israel. We were unable to find a single national-level study published on this topic. Several institutions conduct such in-house studies, but access to such material is difficult. A study conducted in 2006 [61] was designed to characterize the students at the Ariel University Center and its graduates, and to identify associations between students’ profiles at admission, their subsequent academic achievements, and their pursuit of graduate studies. The current study expands on this efforts, and explores the associations between alumni’s personal and academic background and a series of measures of satisfaction with previous academic studies and job and work satisfaction.

Holland’s P-E Fit Theory and Seligman’s Positive Psychology

John Holland (1985) introduced a model of occupations emphasizing the fit between the individual and the environment. In this model, which contains six categories that describe various personalities and work environments, work satisfaction, perseverance, and success are dependent on the fit between an individual’s personality and his or her work environment. The tools relevant for applications involving this typology include the Dictionary of Holland’s Occupational Codes (DHOC) [62]. Holland defined six types (RIASEC – realistic, investigative, artistic, social, enterprising, conventional). Congruence is the degree of fit
between an individual’s RIASEC profile and the RIASEC profile of his work environment. Numerous studies have focused on the association between congruence and work satisfaction, work stress, psychological adjustments, and self-image. A longitudinal study conducted at the University of Maryland in 1989, on a sample of 774 graduates, examined the association between congruence and work performance. The study found a weak yet statistically significant link between congruence and performance among graduates employed in business administration and technologies, but not among graduates employed in administrative jobs [64]. More recently, an association was found between congruence and performance of administrative and senior personnel in the military [65].

Seligman [65] introduced a model of human happiness comprised of two key elements: enjoyment and satisfaction. Enjoyment is a short-term phenomenon, involving little reasoning, has features of addiction, and therefore increasing quantities are needed over time, as its effect fades over time. Satisfaction is a more sophisticated phenomenon that includes reasoning and analysis and tends to survive over time and therefore increasing quantities are not necessarily required. Seligman also argues that enjoyment is related to the senses and emotions, while satisfaction is related to the deployment of signature character strengths and human virtues. Seligman claims that individuals currently seek more enjoyment than satisfaction, because the effect is immediate and the required effort is limited. Nonetheless, increasing enjoyment and an absence of satisfaction increases the tendency toward a sense of emptiness and depression. The remedy to depression, according to Seligman, is to identify character strengths and derive satisfaction from their deployment. In their book, “Character Strengths and virtues: A handbook and classification” [67] whose title is itself a challenge to the DSM Diagnostic and Statistical Manual of Mental Disorders, Peterson and Seligman claim that work satisfaction is not a function of wages but of the ability to use character strengths and exhibit an optimistic outlook.

**Aims of the study**

The current study focuses on the population of alumni of various programs of the Ariel University Center, and explores the congruence between graduates’ academic experience (including their satisfaction with their former studies and with their instructors’ teaching), and the deployment of character strengths at work contribute to their current work satisfaction and success.
Data collection
In 2008, three strategies were used to contact and enroll prospective participants from among the graduates of an academic institution. The first two enrollment strategies (direct mail and telephone solicitation, and distribution of an e-mail) generated a very poor response rate: Only 30 of the 600 (5%) distributed questionnaires were returned. Finally, researchers enrolled potential participants at an alumni conference, where alumni were asked whether they are currently employed and willing to complete a questionnaire pertaining to their character strengths. Of the 120 alumni conference participants, 58 agreed to participate in the study (48.3%). Three questionnaires were not completed and therefore eliminated from the study. Thus the study sample comprised a total of 85 alumni. The third strategy was more successful as graduates who attended the conference may have been more committed to the university and therefore more willing to participate in affiliated research projects.

Research instruments
Data were collected from two sources:
(a) Demographics and academic profiles: The Ariel University Center Michlol Database. This database contains demographic information on alumni background (gender, age, country of origin, marital status, religiosity, town of origin, and employment status) and their academic studies (degree, graduation year, faculty, final grades, and admission profile – composite psychometric score and Matriculation grade average). Town of residence information was used to classify participants into SES groups.

(b) Self-report questionnaires. Alumni completed a self-report questionnaire which subjectively measures the following:

(1) Character strength deployments. Participants' strengths were measured using the VIA Inventory of Strengths (VIA-IS, Peterson and Seligman. 2004). The VIA is a self-report questionnaire, assessing the endorsement of 24 character strengths. Ten items are used to evaluate each strength, resulting in a total of 240 items (e.g., "Being able to come up with new and different ideas is one of my strong points" for creativity; "I never quit a task before it is done" for persistence). Participants rated the extent to which each item describes them on a 5-point Likert scale ranging from 1 (not at all) to 5 (very much). In this study, we used a Hebrew version of the VIA. The original inventory was translated into Hebrew by two bilingual experts (psychologists with doctoral degrees) using a back-translation technique.
(also used in [68]). Scale scores were averaged across items, yielding 24 scores for each participant, reflecting their ratings of each of the 24 strengths. Scale reliability was very high (Cronbach's alpha = .94).

The questionnaire was modified for the present study to measure deployment of character strengths specifically in vocational activities. Respondents were asked to rate the extent to which their current job offers them an opportunity to deploy each of the listed 24 character strengths. Items were rated from 1 (very little) to 5 (very much).

(2) Congruence between academic field of studies and current occupation. As recommended by [69], a specific and subjective measure was used. In this study, the measure comprised the following single item: “To what degree is your current job (position) related to the field you studied at the University?” Responses were given on a 5-point Likert scale, ranging from 1 (very little) to 5 (very much).

(3) Vocational Interests. This measure was based on Holland’s RIASEC model. A version of the categories were translated into Hebrew by the authors for the purpose of this study. Students reported their interests in the following six categories: Realistic, Investigative, Artistic, Social, Enterprising, and Conventional. Graduates marked the professions that attract or interest them, of a list of 14 occupations in each category.

(4) Job Satisfaction. This criterion variable was measured by the Short-Form Minnesota Satisfaction Questionnaire (MSQ), which was developed by the Work Adjustment Project [70, 71]. The Short-Form MSQ consists of 20 of the original 100 MSQ items that best represent each of the following 20 job dimensions: Ability Utilization, Achievement, Activity, Advancement, Authority, Company Policies and Practices, Compensation, Coworkers, Creativity, Independence, Moral Values, Recognition, Responsibility, Security, Social Service, Social Status, Supervision –Human Relations, Supervision–Technical, Variety, and Working conditions. Participants rate their satisfaction with each dimension, on a 5-point Likert scale from 1 (very dissatisfied) to 5 (very satisfied). Scale reliability was very high (Cronbach's alpha = .95), and consistent with reliabilities reported in the literature.

(5) Work success. The measure comprised a single item: “How successful are you at your current job?” Responses were given on a 5-point Likert scale, ranging from 1 (very little) to 5 (very much).
(6) Career Commitment. This criterion variable was measured by The Career Commitment Scale [72, 73]. The scale comprises seven items that express commitment to a career or profession (e.g., “It is the ideal occupation for a life work.” “I like this occupation too well to give it up.”). Responses are given on a 5-point Likert scale from 1 (not true for my career) to 5 (very true for my career). The average of the seven responses served as the Career Commitment Index. Scale reliability was very high (Cronbach's alpha = .83).

(7) Personal Well-Being. This criterion variable was measured by the Mental Well-Being Scale of the Mental Health Inventory (MHI) [74]; The scale was translated into Hebrew by [76]. This scale comprises 16 items relating to the intensity or frequency of respondent’s feelings and evaluations during the past month (e.g., “How much of the time, during the past month, have you felt calm and peaceful?”). Responses are given on a 5-point Likert scale, ranging from 1 (none of the time) to 5 (all of the time). The average of the 16 responses served as the Well-Being measure. Internal consistency was highly satisfactory (.92), and consistent with the internal consistency (.94) reported both by the questionnaire’s authors and by [75].

Statistical Analysis
Statistical analysis was designed to explore the associations between enrollment profiles, vocational interests, academic achievements, deployment of character strengths, and job satisfaction, career commitment, vocational preferences, personal well-being, and the contribution of these variables to work satisfaction.

We used Chi Square tests to examine the association between the variables, t tests for independent samples to examine contrasts, and one-way ANOVA. Where significant differences were found, we used Bonferonni tests to examine the source of the differences.

Findings

Participants
Participants were 85 graduates of an Israeli university who were employed at the time of the study. Of these, 94.7% had earned a bachelor’s degree, and the remaining graduates (5.3%) were graduate students at the same institution at the time of the study. The vast majority (98.0%) had completed their degrees at the university in the decade between 1998 and 2008.
Almost one-half of the participants (43%) graduated from the Faculty of Social Sciences and Humanities, 46% graduated from the Faculty of Engineering, the Faculty of Natural Sciences or the School of Architecture. 42% of the participants were accepted to Ariel based on their psychometric score or Matriculation average. Participants’ final grade average ranged from 50 to 96.91, with an average of 84.85 (SD = 7.02).

Over one half of the participants (54%) were female, almost three quarters (74%) of the participants were married, and the average age of the participants was 32.7 (SD = 6.80). The majority of participants (87.2%) were born in Israel, while the remainder had immigrated to Israel from various countries between 1970 and 1996. Based on participant’s place of residence, 23%, 55.4%, and 21.6% of the participants were classified as belonging to low, moderate, and high socio-economic environments, respectively. Participants were classified by their current occupation as follows: engineers, and employees in hi-tech and industry (40.5%); managerial positions (16.2%); education, welfare, and healthcare (14.9%); public sector employees (23.0%); and security-related occupations (5.4%).

Career commitment: The average of this measure was 3.65 (SD = 0.87). Reliability of the measure was high (α = 0.95). 77.9% of the participants noted that they have no regrets about entering their current occupation. Only 40.7% noted that that their current job was not their ideal job.

Job success: The majority (80.7%) of participants feel that they are successful at their current job. Only 31.3% noted that they would be more successful at work had they studied at a university or a different academic institution.

Job satisfaction: The average of this measure was M = 3.68 (SD 0.74). Reliability was high (α = 0.95). Highest satisfaction was recorded for the items “I am constantly occupied in my work”, “My work offers employment stability,” “I can do things that are not against my conscience.” Lowest satisfaction was recorded for “The way the company’s policy is executed,” “My salary and the quantity of work I perform,” and “My chances for a promotion in this job.”

Professional interests: Graduates were more strongly interested in social occupations (M = 4.03) and investigative occupations (M = 3.83) and least interested in conventional (M = 2.11) and realistic occupations (M = 2.69).

Personal well-being: The average measure was 3.87 (SD = 0.56). Reliability was high (α=0.92). Items which received the highest ratings included: “My everyday life is full of interesting events,” “I am happy or satisfied with my personal life,” “I feel loved and
wanted,” and “I generally enjoy the things I do.” Items which received the lowest ratings included: “I feel refreshed and relaxed when I wake up in the morning,” “Life is a wonderful adventure for me,” and “I feel calm and free of any tension.”

To examine the associations between personal well-being, deployment of character strengths, job satisfaction, and job success, we performed four step-wise regressions. Alumni’s demographic variables (gender, age, marital status, religiosity, type of residence, and socio-economic status), academic background variables (faculty, final grade, satisfaction with studies), character strengths and occupational interests were used to explain personal well-being, deployment of character strengths. Personal well-being, deployment of character strengths and significance of character strengths were used to explain job satisfaction and work success. Findings are presented in the tables below.

Table 1
Regression coefficients in predicting personal well-being

<td>*** 25.34</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The single variable that predicted personal well-being was the deployment of character strengths (beta = 0.53, p < .001). Character strength deployment predicted 28.7% of the variance of personal well-being.

Table 2.
Regression coefficients for deployment of character strengths

<td>*** 13.68</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
These variables predict 46.5% of the variance of character strength deployment. The variable with the greatest contribution is personal well-being (beta = 0.47, p < .001). Interest in enterprising professions contributes to explained variance (beta = 0.27, p < .001) while interest in investigative professions is inversely related to deployment of character strengths.

Table 3.
Regression coefficients for job satisfaction

<tr>
<td>Career commitment</td>
<td>0.20</td>
<td>0.23</td>
<td>** 2.74</td>
</tr>
</tbody>
</table>

The above set of variables accounts for 61.2% of the variance in job satisfaction. The variable with the highest contribution to prediction is deployment of character strengths (beta = 0.68, p < .001). Career commitment also contributed to the prediction (beta = 0.23, p < .01).

Table 4
Regression coefficients for work success

<td>** 2.66</td>
</tr>
</tbody>
</table>

This set of variables accounts for 27.2% of the variance of work success. The two variables that contribute to the prediction are career commitment (beta = 0.32, p < .01) and deployment of character strengths (beta = 0.31, p < .01).

Discussion
In this study, we attempted to examine the resilience of the prevalent myth in the academe, according to which academic studies are the key to employment and work satisfaction. We examined the associations between the demographic data and academic background of alumni.
of the Ariel University Center, their satisfaction with their academic studies, current character strength deployment, and work success.

The study integrates Holland’s classic occupation theory, which has been prevalent for over 30 years, with the more recent theory of positive psychology developed by Seligman, the study of which has been limited to recent years. Specifically, the study examined Holland’s congruence theory (the congruence between occupational interests, field of academic education, current occupation, job satisfaction, and overall satisfaction) and the deployment of signature strengths (which has not yet been studied empirically in an occupational and academic setting), among alumni of one academic institution: The Ariel University Center of Samaria.

We found associations between academic studies and alumni’s satisfaction with their academic studies. The majority of the alumni (80%) were satisfied with their current occupation, 41% noted that their occupation was ideal for their lives. 81% noted that they feel success in their current job. Alumni also noted a high degree of satisfaction in terms of personal well-being. They reported a sense of satisfaction and stability from their work and from the extent to which they were free to act according to their conscience. Alumni reported strongest professional interests for investigative and socially oriented professions. The most important factor in graduates’ work satisfaction was the deployment of character strengths.

Deployment of character strengths was found to be a significant predictor of graduates’ work satisfaction. The interesting finding is the absence of significant differences between graduates’ work satisfaction and success based on their admission profiles. That is, graduates’ pre-enrollment profiles do not predict differences in work satisfaction. The role of academic studies as a key to employment and work satisfaction was found to be independent of the admission profiles of academic graduates. This finding is especially interesting in view of the myth in the academe, which views admission profiles as the primary criterion and predictor of future success. The current study highlights the role of graduates’ character strength deployment as a key to success and satisfaction. The findings of this study offer an interesting perspective to be taken into account in academic decision making on admission policies.

The current study offers a theoretical contribution in expanding Holland’s theory of interests, and as an exploratory study in the field of character strengths and their deployment (two
constructs of positive psychology) for alumni of an academic institution. The study has a practical contribution for the field of student guidance and counseling (before, during, and after academic studies), with the aim of increasing satisfaction and self-realization. One of the goals of vocational counseling is to encourage clients to consider entering a work environment that fits his or her personality profile. Work satisfaction and occupational satisfaction play an important role in productivity, perseverance, work success and overall personal well-being.

As such, findings of the current study refute the criticism which views the expansion of higher education in its current format as an optical illusion that has no effect in creating a genuine opportunity for members of marginal social classes. Findings of this exploratory study on alumni of the Ariel University Center lead to two main conclusions: (a) Admission profiles of many alumni are such that they would have no chance at higher education were it not for the Ariel University Center; (b) These relatively poor admission profiles did not detract from their ability to pursue an academic education, fulfill their requirements, and earn a degree. The study confirms that the Ariel University Center achieved its original social goal, defined by the Commission of Higher Education in its resolutions supporting increased access to higher education. On both counts, the CHE’s philosophy is justified. The Ariel University Center — and the remaining non-university institutions in Israel, it may be assumed — offer a “last chance” to populations groups who would otherwise have no chance of earning an academic degree. Findings show that the satisfaction graduates derive from their work is less related to their pre-enrollment profiles and more strongly related to the deployment of the character strengths.

The data were based on a study in a single academic institution, and should be viewed as the first step in a genuine examination of the intriguing issues relating to higher education policies and the profiles of college graduates.

On legislation, policy, and market forces in Israel’s higher education sector

Dr. Nitza Davidovitch

Introduction

In recent years, the Israeli education system has undergone a revolutionary change in recent years, which has been called a genuine metamorphosis (Gur-Zeev, 2005). The changes in this field are reflected in multiple aspects of Israel’s higher education system: a sharp rise in the number of students, the proliferation of accredited institutions, legislative changes, changes in regulatory policy, including changes in the defined goals of higher education. These drastic changes have sparked a series of pointed public debates which all touch upon a key issue: the connection between supervision of higher education and academic freedom, reflected in an unrestricted academic “market.”

Sine the 1980s, globalization has been accompanied by competition, merchandising, market forces, free markets, affecting every location it reaches. While traditionally considered the site of freedom of thought and freedom of research (Volensky, 2005), protected from society’s economic changes (Eckel, 2007), higher education is now visited by capitalist reasoning, veneration of the principle of utility, and reliance on the invisible hand as compasses for action, all of which threaten to gnaw at the quality of higher education. The knock on the academic door occurs at a different pace in different parts of the world.

In Israel, a member of the global village, these changes have proceeded since the early 1990s, and the end is nowhere in sight. We believe that the massive transformation is at least partially due to a lack of uniform or clearly-defined policy by the relevant agencies. In many cases, higher education policy is largely a directive to “sit and do nothing.”

The absence of a clear, uniform approach to higher education triggered the current study, which focuses on an issue that is at the core of the public debate on higher education: Should the central agency or government intervene and regulate higher education? This principled issue is accompanied by many related questions, such as whether existing academic supervision is appropriate, and if so, to what extent? If a liberal market policy is adopted for higher education in Israel, to what extent should market forces be allowed to act? What is the price of such a decision? Is it possible to maintain excellence without compromising access to higher education? In the current study we describe the development of higher education policy in Israel and point to policy changes which we believe are necessary if we are to achieve our dual goal of increased access and quality.

On regulation and globalization – Changing public policy

Broadly understood, regulation is a series of rules and regulations that regulate the exchanges of goods and services in society (Moran and Wood, 1993). The term...
“regulation” may be interpreted as supervision, intervention, control, or organization of a certain action. In the governmental context, regulation refers to actions that regulate operations in the government’s sphere of authority; countries differ from one another in the extent, the design, and the application of regulatory practices.

The term regulation originated in the field of economic theory (Stigler, 1971), which defines protection of the public interest as the major goal for regulation (Waters and Moore, 1990). Historically, the United States is considered the first country to adopt governmental regulation through mechanisms that supervise the free market. As early as the beginning of the 20th century, the United States, icon of the free market, recognized the need to supervise the markets in order to stabilize market forces, supervise prices, and define minimum conditions for participation in markets. These goals have changed over time, and today regulation is designed mainly to protect public health, safeguard against hazards, and prevent exploitation of society’s weaker groups (Sunstein, 1990).

Since the 1960s, the change in the subjects of regulation is closely associated to growing globalization (Arimoto, Huang, and Yokoyama, 2005), the socio-economic process that has generated an ideological and paradigmatic revolution all over the world, spreading the principle of competition, and leading to liberalization and privatization of the markets. As the status of the welfare state declined, Keynesian economics, supporting government intervention and supervision of the markets, has cleared the stage for a “weak state,” one which allows the invisible hand to dictate economic reality.

However, after many years of complete confidence in the powers of pure market forces and a society and economy navigated by the invisible hand, the “new regulatory state” has taken the stage. The new regulatory state exists in widespread geographic areas, including the United States, Great Britain, and other European states, and may exist within states that are not regulatory by definition (Moran, 2002). The regulatory state is an improved nation state, a state which waives bureaucratic policies and the principle of Welfarism in favor of public supervision based on the principle of separation in public policy. This separation drives a wedge between policy makers in various departments, and policy executors, as it structures a formal distinction between consumers (the government) and suppliers (the market), and establishes independent institutions that act as the government’s long arm in order to affect the market in the name of the public interest (King, 2007).

As a result of globalization, concepts from the field of economic capitalism have penetrated the ivory towers of universities and affected all areas of their existence. “Globalizing political economy affects the way universities are governed, discussing practices such as managerialism, accountability, and privatization which represent a shift toward business values and a market agenda” (Currie and Newson, 1988, p. 1).

These effects, transforming knowledge into a “commodity” (Marginson, 2009), increased competition and access in higher education, but also created an urgent need to ensure the quality of the system’s products, protect the status of higher education, and avoid an “inflation” in academic degrees. In the context of higher education in Israel, the question arises of whether similar regulatory mechanisms are in place, and if so what are they and how do they operate? Does Israel contain within it a regulatory
state? To answer this question, we present the history of the higher education system in Israel, with specific reference to regulatory mechanisms.

A historical look – The development of Israel’s higher education system

**Independent self-regulation**

Even before the establishment of the State of Israel, higher education was a high priority for the local Jewish community, and two of the finest institutions of higher education were established during that period: the Technion (in 1925) and the Weizmann Institute (1934). Their establishment reflected the significance of higher education for the state-to-be: “The State of Israel must represent a goal for itself: to provide elementary, high school, and higher education to the entire young generation without exception, whether their parents are affluent or poor, whether they come from Europe or from Asia and Africa – this means, giving each young boy and girl in Israel academic education…” (Ben Gurion, quoted in Michaeli, 2008).

Although most areas of life had a quasi-military nature at the time (Gal-Nur, 1985), the academic institutions conducted themselves according to an independent self-regulatory regime (Menahem, Tamir, and Shavit, 2008). While satisfactory before the establishment of the State, these arrangements gave rise to concerns in view of the political nature imposed on the academic institutions: In the State’s early years, most budgets were controlled by the government, and repeated attempts were made to ensure that academic institutions become “relevant” and to impose bureaucratic supervision (Gal-Nur, 2009).

**Supervised Self-Regulation**

Government intervention in the academe was prevented by the enactment of The Commission of Higher Education (CHE) Law in 1958, which put an end to the diverse proposals that sought to impose government supervision on higher education in Israel. The Law regulated the establishment of the Commission of Higher Education, which was declared a “government institution for the matters of higher education in the State.” Its role included accreditation, examination of curricula, and allocation of public government funds to all institutions of higher education.

The Commission comprised 25 members who had no political affiliation, 17 of which were from the academe. The Commission’s goal was to act as a buffer between the government and the self-administered institutions of higher education (Gal-Nur, 2009). From the mid-1970s, the CHE was joined by a second entity in charge of budgetary aspects of higher education: the Planning and Budgeting Committee, which acted as the Commission’s executive arm and was responsible for budget allocation, based on CHE-defined eligibility criteria.

The joint actions of the CHE and the Planning and Budgeting Committee created a public regulatory system that allowed the universities to operate independently, under supervision of state agencies. Universities benefited from self-supervision, while the CHE has supreme administrative responsibility for Israel’s higher education system, and functioned as the academe’s gatekeeper, exclusively limiting access to higher education, and affecting the structure of the market through the budgets allocated to each institution (Menahem, Tamir, and Shavit, 2008). This policy, also known as the
“uniform policy regime” continued until the reform in the higher education system in the early 1990s.

**Higher Education Reform as a Response to Change**

Economic, social, political, and demographic changes in the late 1980s led to a change in the approach to public services. The rising power of the new right and neoliberalism called to give greater reign to market forces to redesign public services in general, and education in particular (Volensky, 1994). This call also was voiced in the Israeli Knesset, which, in Israel Government Resolution 3694 (of 1994) approved the expansion programs of several accredited institutions.

At the same time, operations of non-funded academic institutions was permitted, including the establishment of local extensions of foreign universities (Bernstein, 2002). In 1995, Amendment No, 10 the Higher Education Law provided that colleges would also be permitted to award academic degrees and would constitute part of the higher education system. According to the Law, a college was defined as “a higher education institution that is not a university and is accredited to award to its graduates recognized degrees in one or more of its units, or has been granted a certificate of permit” (Commission of Higher Education Law, Amendment No. 10, 1995).

These legislative reforms created diversification, privatization, and internationalization of Israel’s higher education system (Menahem, Tamir, and Shavit, 2008). Diversification was reflected in the three-fold increase, compared to the 1980s, in the number of public non-research colleges eligible for public funding. Privatization was created by permitting private institutions (supervised but not funded by the CHE) to award academic degrees. Internationalization was reflected in the penetration and proliferation of extensions of foreign universities into the Israeli higher education system and their accreditation. Before 1998 (Amendment No. 11 to the Higher Education Law), these extensions were not subject to local supervision of any kind.

In response to the new legislation, which marked a paradigmatic change in the regulatory regime at the time, newly established (funded) public colleges and (non-funded) private colleges, as well as new extensions of foreign universities, increased in number, and the number of students increased enormously. In the late 1980s, only 8% of all 20-29-year-olds were enrolled in undergraduate programs, and the number of students at colleges, relative to those enrolled in universities rose steadily, especially in college vocationally oriented programs that had value in the job market. This trend accelerated further after the CHE approved colleges to offer research-track graduate degree programs (Zussman, Forman, Kaplan, and Romanov, 2007). As in 2009, of the 245,000 students in Israel, 64% were enrolled in colleges (CBS, 2009).

**High Education Policy – Examples from the world**

The increasing prominence of higher education on the public agenda and in the public limelight since the 1990s is not incidental. Rather, this development mirrors the trend of global massification of higher education (Kim and Lee, 2006). The enormous growth in the demand for higher education has created pressure on
governments to resolve the issue of accessibility, and at the same time, highlighted the
need to supervise the higher education system. This struggle over the future of higher
education (Gur-Zeev, 2007) is mainly an ideological one, in which one side wishes to
impose market forces on academic life, while academe wishes to preserve existing
regulatory mechanisms.

At the policy level, the State must make determinations on two main issues:
access and funding. The relationship between these two variables is relatively
complicated. Extending access increases the number of students but imposes a greater
economic burden on the State, forcing the State to open the market to private
institutions. As a result, access is increased and funding issues are resolved, yet
differences in quality among the institutions are created. This is the situation in the
United States, where private universities and public colleges exist alongside each
other: While accessibility is great, there are genuine differences in quality between
educational institutions and their products (Eckel, 2007).

A second option is to limit access through selection by fully funded
institutions. This creates a smaller system of higher education with restricted access,
yet the system, such as that in China or the FSU, is elitist and maintains high
standards (Zhong, 2006).

Most countries in the West tend to follow demands for greater access as they
open the higher education market to competition (Kelchtermans and Verboven, 2008;
Kim & Lee, 2003), and democratization and privatization develop concurrently to the
imposition of government supervision (Beerkens, 2008; Douglass, 2007).

The scope of supervision may vary: In some countries, all institutions of
higher education are subject to state supervision, while in other countries, privately
administered institutions exist alongside supervised institutions. Supervision may
include self-assessment of the institutions themselves (Brown, 2006), accreditation,
public reporting, audit committees or peer-reviews. Funding of supervision may be
public or private, and the composition of the supervisors may include university
representatives or representatives of all institutions of higher education (Bernstein,
2002).

Sources of funding may also vary. Some countries operate according to a
model in which universities are operated and funded by the government and tuition
fees are very low or non-existence. In such countries, higher education is considered a
right to which all citizens are entitled. In other countries, higher educational
institutions are public but students must pay a large portion of their tuition. A third
model is collaboration between private institutions and public institutions (Douglass,
2007).

In the United States, for example, the regulatory model operates on several
levels. Enrollment is on a national level, supervision is performed by the federal
governments and by private accreditation institutions. Private accreditation is
performed by professional and regional entities that are funded by universities and
include representatives from all institutions (Bernstein, 2002).

In Sweden, higher education, which is public, also faces a market dilemma.
Sweden evolved from a model welfare state to a country that is administered in a
global style. Higher education was planned and controlled yet has evolved into a
system with extensive freedom of operation. Universities in Sweden oppose the
further commodification that would increase their independence from the
establishment but would involve expanding the sub-contractor element in institutions
of higher education. A comprehensive survey by Tolofari (2008) found that the
consensus in the academe and among policymakers in Sweden supports the public
nature of the country’s higher education institutions. According to this study, Swedes are fearful of the repercussions of a more global education that might increase emigration.

Echoing the developments in Israel’s higher education system, higher education in South Korea has become more widespread in the last several decades. In the 1970s, only 7% of the population’s relevant age-group were enrolled in higher education institutions, yet today, over 50% of all high school graduates continue to pursue higher education (Phelps, 2003). Similarly to Israel, South Korea faces a host of economic, social, political, and educational challenges resulting from the transformation of the higher education system, although it has been argued that this growth failed to lead in an improvement in academic standards (Kim and Lee, 2006). The South Korean government elected to address the enormous rise in the demand for higher education by removing the strict regulatory mechanisms and relying broadly on the private sector. As in Israel, removing the restrictions on private institutions to award academic degrees marked the beginning of the privatization of higher education: Currently 95% of all Korean students are enrolled in private institutions.

Kim and Lee (2006) claim that the reformed system is now able to cater to over 80% of Korea’s high school graduates. The blooming of the private institutions also contributed to the development of South Korea’s economy. Such changes were accompanied by increased access, but they created a higher education system that is highly reliant on the private sector. These researchers state that this is a problematic fact in the absence of appropriate supervision on the state’s part. In order for the higher education system to benefit from market forces, the state must impose supervision and determine the most appropriate structure for the operations of the institutions, the students, and the faculties. In the researchers’ opinion, this is an essential condition in creating an academic sector that is both equitable and efficient.

A similar development occurred in China, where strict supervision of higher education institutions was traditionally imposed in an elitist system. Increasing globalization, combined with an increase in the demand for higher education led policy markers to rethink the strict supervision policy (Mok and Ngok, 2008). The state responded to globalization and market demands by allowing the establishment of private institutions and even foreign extensions into the higher education sector, increasing decentralization, and leading to increasing diversification, and proliferation in the number of institutions. Nonetheless, tension between the government and the private institutions currently creates a feeling that the government has lost its control and ability to supervise this sector. According to Mok and Ngok (2008), a development of a formal, uniform mechanism of regulation, which fits the new market reality, is urgently needed.

Therefore it seems that numerous countries all over the world are facing a new situation in which regulatory policy is proving to be inconsistent with the changing market. Countries who acted traditionally in leading a well-supervised higher education system have been forced to outline new policies in order to cope with encroaching privatization and marketization (Beerkens, 2008; Eckel, 2007; Mok and Ngok 2008; Van der Walt, Bolsmann, Johnson, and Martin, 2003). Israel’s situation is no different.

**The higher education system and quality assurance**

Quality assurance and assessment of higher education institutions one aspect of regulation. In many countries, specific agencies and models are in place to ensure
quality in higher education, although such agencies would disagree with their
definition as auditors or setters of external standards for academic institutions, and
would argue that they merely verify the standards that the community and the
institutions determine for themselves (King, 2007; King, Griffiths and Williams,
2007).

The introduction of the concept of QA into the academe in itself is a contested
issue. Some have argued that the use of the word “quality” in the context of higher
education is misleading because ostensibly, it concerns an improvement in the quality
of services. In practice, when we speak of “quality assurance,” we mean an aggressive
all-encompassing procedure of control and supervision of the entire academic job
market (Worthington & Hodgson, 2005). While such supervision leads to increased
self-discipline, managerial control, and more effective supervision, it evokes serious
opposition on part of the objects of the supervision.

Such opposition is known as “resistance through distance,” a term which
described a situation in which the objects of supervision attempt to avoid the demands
of the authorities by creating space for themselves and avoiding quality audits.
Academics typically see themselves as being whole-heartedly devoted to their
profession and generally motivated by non-economic factors. As such, external
quality assurance is not necessary because they themselves tend to analyze their own
products from a very critical point of view. As they see it, they themselves provide
careful self-regulation and quality assurance (Worthington & Hodgson, 2005).
Furthermore, academics view their freedom of research and teaching as a legal right
to which they are entitled in the academic institution. Consequently, to gain supports
of the staff in higher education institutions, implementation of quality assurance
mechanisms in the academe must be highly subtle and sensitive to the scholars’ needs,
yet at the same time, loyal to the needs of the clients-students.

In England, the national Quality Assurance Agency (QAA) was established to
supervise the quality of the products of all higher education institutions. King and
associates (2007) studied the operations of this agency as one of several aspects of
regulation in the higher education system. They believe that although research
literature showed no great interest in academic regulation, today its role in higher
education demands that the sector be studied through “a lens of regulation.” Findings
of their study showed that the the QAA serves as a mediating regulator able, as such,
to provide an external assurance of quality and mediate between the various pressures
exerted by the regulator and by the academic institutions. The researchers believe that
the system could be improved by a clearer uniform code, comprehensible to all rather
than solely to those well-versed in specific academic jargon.

Additional evidence of the power of the QA procedure is offered by a study
by Nelson (2997), who examined quality assurance in EU countries in the specific
field of pharmacology, and found that determining core QA criteria, both for private
research institutions and for academic institutions, is an essential condition for
excellence in research. Findings of this study also indicate that government regulation
and annual reporting to an independent committee reinforce the QA element and
ultimately create greater quality.

In the case of the EU, diverse methods are used to regulate research
institutions, despite the fact that all the institutions had shared goals of promoting
research and development. Despite the common goal, the two classes of institutions
did not operate in collaboration due to difference in regulation styles.

Despite the findings supporting the significance of QA in the higher education
system, opponents have argued that the cost-benefits attributed to this procedure are
no more than a myth (Blackmur, 2004). Blackmur, who studied the costs and effects of operations of the National Qualifications Framework (or NQF), the agency responsible for regulation and QA of higher education institutions in South Africa, and concluded that the NQF’s operations had a detrimental impact on the products of higher education and the job market, because of the lack of congruence between national legislation and the global pressures acting upon the education system or the complexity of QA systems.

This argument has been joined by Lieven and Graeme (2006), who studied the operations of the British university extensions in Israel. The researchers believe that although the extensions entered the higher education system on the basis of market forces and consumers’ needs, these factors were insufficient to maintain quality of the institutions. They believe that this case illustrates the inability of market forces to guarantee the quality of higher education, of the need for external entity to supervise institutional operations.

The decision to incorporate QA mechanisms is a complex decision that entails preparations on the policy and the structural levels, and the impact of a QA system on quality is only one of many issues arising in this context. For example, a decision is needed on whether concurrent self-regulation should be permitted; Should the ratings of independent QA agencies be accepted? What is the legislature’s position on the issue?; What is the nature of the future regulatory agency?; What are the funding sources of these agencies? These are only some of the factors that should be considered when developing quality assurance procedures.

Decisions are also needed on structural issues such as, for example, national and internal refereeing, the role of the QA system in design and development training, definition of the quality that is to be measured (Hodgson and Worthington, 2005), the QA standards to be applied, the relationship between QA and public funding of higher education, compatibility of costs, and other factors (Blackmur, 2007).

In his article, King (2007) reviews several possible models of higher education supervision. The most simple of these is the Command and Control model, in which regulation is performed by controlling the final product. Regulation is applied narrowly in this top-down model, supervision is conveyed linearly from the supreme authority in the state to the higher education institutions, and the final product that must meet the requirements is what matters rather than the method. Most objects of supervision are aware of what is precisely required of them. This model is in place in the higher education system of South Africa, where its faults, including resistance and an adverse effect on motivation, are evident. Other problematic aspects of this model include inflexibility and an adversarial approach to the supervised parties.

Meta-regulation is a second model, in which self-supervision is performed by an organization whose members come from the academic sector. Although this model makes a greater contribution to motivation, it has prompted extensive criticism by consumers, who argue that the model is a “conspiracy by experts against the consumer,” and as a result, this model is viewed by some as more of a problem than a solution (King, 2007).

In the responsive regulation model, sanctions are imposed on academic institutions that fail to meet the defined requirements. This model assumes that self-regulation typically works well, but when institutions fail to meet the QA rules, they should be stripped of the right of self-management and come under strict supervision.

Yet another method to assure quality is through the use of secondary regulatory factors such as the media or publications, for example, by publishing
information on the quality of the products, the media may act as a regulatory element in “naming and shaming.”

According to King (2007), “Regulation is less a single arrow than a quiver, a mosaic rather than a simple picture” (p. 423). In other words, a holistic approach should be embraced: one that is comprehensive and takes into consideration both the urgent needs and market forces and the unique fabric of the academic world. In 21st-century Israel, consensus has yet to be reached about when and how to lead the higher education system. An expression of this is evident in the current higher education policy.

**Current higher education policy in Israel**

Higher education in Israel is unstable, as reflected in the numerous public committees on this issue and strikes. A lack of clear, uniform policy on the relationship between market forces and governmental supervision creates tension between the government, the universities, and the private institutions in Israel, which concurrently seeks to endorse globalization and extend access to higher education, yet continues to discriminate among the different classes of higher education institutions. A convention of the heads of higher education institution in Israel described this situation as follows: “While the heads of universities are interested in government funding, without which they would collapse, the public colleges believe that the current crisis is an opportunity to develop a new model that is based more on self-resources. While universities are confident that the crisis will increase the demand for graduate education, colleges treat such projections with reservation…” (Greenbaum, Amsterdamsky, and Kurtz, 2009).

Expression of the desire to subscribe to a global market ideology is clearly evident in the conclusions of the Meltz Committee (2001), which called to implement the principles and the values of the global world, and especially the principle of efficiency: “The Committee has resolved that the structure and work patterns prevalent in universities do no permit efficient utilization of the physical resources available to them. The Committee recommends a significant change in the universities’ administrative and academic methods of operation (Meltz Committee Report, 2001).

In principle, the Committee’s recommendations call to apply that global economic neo-liberalism should be applied to the academe (Slaughter and Rhoades, 2004) and transform universities into corporate entities obligated to submit reports on financial deficits and academic products – a process seen as the first step toward privatization of the universities (Odin and Manicas, 2004).

Despite the Committee’s resolution, regulatory policy applies differential budgeting of different classes of institutions: 60% of the budget is designated for universities while 40% is earmarked for colleges (CBS, 2009), forcing universities, which previously benefited from the vast majority of the budget, to share limited public resources with other budgeted institutions. The distinction between universities and colleges is the result of a “divide for privatization!” policy initiated concurrently with the cuts in higher education budgets and in employment conditions of instructors and research fellows. The colleges, both public and private, allowed an increase in the number of enrolled students while reducing per-student public spending on higher education compared to universities. The inferior employment terms of college instructors also made it possible for colleges to expand their faculty while reducing
salary costs by limiting expenditures on research, among other things (Gutwain, 2008).

Privatization, originally an exclusive process of the colleges, began to filter through to the universities, which responded by adapting to the new business-oriented logic. For example, universities began to separate between budgeted programs and unbudgeted programs that imposed a higher tuition burden, and modified curricula and conditions of learning to the demands of the students-consumers.

However, not only did consumer-appeasing marketing strategies infiltrate the system, these ideas also filtered down to the field of research: high-demand areas of knowledge received larger research grants, while in other fields research grants were significantly reduced or eliminated. Teaching was also affected by privatization, as a distinction was made between senior faculty employed by the institution and adjunct faculty. This was once again results of adopting the market logic that called for the employment of less expensive instructors, which resulted in a reduced proportion of research activities being conducted in the academe. The Shohat Committee endorsed differential salary pay to instructors, and encouraged “differential remuneration” as a function of instructors’ achievements (Shohat, 2007).

At the same time, universities remained official opponents of the introduction of market principles, arguing in support of academic freedom and research excellence. Gordon (2009), for example, argued that the Meltz Committee disregarded the aspirations that constitute a key means to promote excellence, and “unfortunately, the Meltz Committee makes no reference to the association between the organizational structure it proposes and the search for truth and the aspiration for excellence… the original sin of the report lies in its authors’ ontological superficiality. They do not distinguish between excellence and success… although some members of the Meltz Committee were professors, the report it submitted is based on historical, philosophical, and political ignorance…the short-sightedness, superficiality, and paucity of the Meltz Report authors is evident in their decision to abolish the Senate.”

In his article, “The academe, the incessant improvisor, and optional meanings in a post-modern world” (2009), Gur-Zeev links the dramatic changes deep-seated transformation that has affected universities, instigated by supposedly administrative decisions of diligent neo-liberal Ministry of Finance clerks. According to Gur-Zeev, the change in status of universities reflects the change in the status of knowledge; the status of the human subject; changes in the modes of inquiry, decoding, and representation of meaning; and the horizons of human stabilization, compared to man’s re-emerging destiny.

We are witness to a paradigmatic change in Israel’s conception of education in general, and of higher education in particular. From a system that has touted the values of equality and universal access and viewed education as a means of social mobility, the system now champions individual interests, and the values of competition and capitalism. A change in consciousness is evolving toward the privatization of public education. This transformation has not yet occurred, only because diverse interests are pulling in different directions. These changes are supported by representatives of the colleges, who claim that the higher education system in Israel should also be associated with economic and social changes and should adapt to the Zeitgeist. “It is proper that the governing institutions of universities in Israel, whose principles were formed before the establishment of the State, reorganize and adapt to the needs of the contemporary and future academic world,” without adversely affecting the academic faculty who are concerned by the
“aggressive political culture in various sectors of Israeli society which might penetrate into the academic world” (Guri-Rosenblit, 2005).

Evidence shows that opening the doors of the academe to globalization implies adoption of an ideological perspective that dictates a policy paradigm and conventional regulatory approach. We believe that the problem lies in the regulator’s lack of a clear policy line, to which the diverse voices sounded on this issue attest. While his colleagues from the universities view privatization as “the end of the academe” (Gur-Zeev, 2005), Prof. Neuman, President of the College of Administration has stated that “Universities are like banks,” and the CHE should operate similarly to the Commissioner of Banks and Insurance: “It should determine the criteria that define what a university is, and any institution that meets these criteria will be called a university,” which is similar to the determination “Any company that meets the conditions of the Commissioner of Banks is called a bank.” He also stated, “The current situation in our sector is like we were only to give existing banks a license and not grant a license to any new bank to operate” (Neuman, cited in Traubman, 2007, p. 1).

Others claim that “The academe is an anti-democratic entity…like the army. There is no room for democracy where efficiency is essential…If only numbers matter, these is no room for excellence” (Pines cited in Shechter-Rochman, 2008, p. 2). Privatization opponents claim that applying economic policy to the academe is “an ongoing blow, a creeping disaster which is difficult to catch at any point in time, which is why it is so difficult to fight it. This blow is expressed in budgetary strangulation: classrooms expand, laboratories become old, positions vanish. It is not a dramatic even, it is a war of attribution” (Elgazi, cited in Shechter-Rochman, 2008,).

Governments have several strategies available to manage higher education in a global world: One option is to employ governmental control and command in the form of strict regulations, widespread supervisory mechanisms, and budgetary controls. A second option is self-regulation: By deregulation higher education, authority is delegated to the higher education institutions themselves while the government maintains remote supervision (Bernstein, 2002).

In Israel, no consistent policy has been officially adopted. Instead, what has been adopted is the policy of “holding the stick at both ends.” On one hand, we witness the privatization and commercialization of the education achieved through permitting private institutions to award academic degrees, and on the other hand, a discriminatory budgetary policy that distinguishes between universities and colleges, despite the workings of market forces (over 64% of all students are enrolled in colleges!).

At this crossroad, several scenarios are possible. The first possibility is based on inertia: We will pursue this strategy of inaction as academic research activities continue to dwindle, and the number of students enrolled in colleges continues to grow. In one or two decades, we will be faced with a system that offers universal access and low quality. This will be the result if we continue the current trend, where no policy is defined, and where supervision is neither consistent nor structured.

Another option is to view education as a means to social and economic mobility, and as an expedient long-term public expense. This view adopts both access and quality as values. This option may materialize by adopting the principle of equality and opening the market to competition, both in universities and in colleges, based on equal budgeting and the establishment of a regulatory mechanism that guarantees that all academic institutions meet high standards of quality.
Today, we cannot return to the past and reinstate higher education in its former “ivory tower”: There is no turning back. We cannot shut ourselves to the effects the privatization, but must work to rationalize the system, and adopt a market approach accompanied by built-in checks and balances in the regulatory system.

The need to adopt and apply a consistent, uniform policy on all academic institutions is now urgent. Such a policy should, at the end of the first decade of the 21st century, be consistent with a changing competitive world yet retain quality and excellence in research. Achieving both these aims is possible by opening the market to genuine competition, such that treats all institutions equally, and allows market forces to navigate the ship of higher education and lead it to research excellence through competition. These should be conducted by a regulatory and supervisory system that audits, increases efficiencies, and improves the operations of higher education institutions – universities and colleges both.

Furthermore, we must decide on the image of the graduate we wish to develop: Do we wish to send graduates into the job market in the same state as when they first enrolled? Do we wish to create differentiation between graduates of different institutions in the job market? Former Minister of Education Amnon Rubinstein’s vision of universal education has indeed materialized, but at what price? Have we embraced quantity at the expense of quality? Access on its own is insufficient because its value is diminished if not coupled with excellence. To achieve genuine equality and genuine access, we must confirm that academic institutions of all types meet a single standard of academic excellence.

The most effective way to achieve our goals is to develop and apply a quality assurance mechanism in higher education. Academic’s initial tendency to recoil when hearing the term QA is misplaced: This may be a fixation originating in the years in which academic institutions operated under “autonomy and self-regulation.” We, however, believe that quality assurance is not as elusive a concept as some would believe. Quality can be defined. Constructing identical academic foundations, defining curricular requirements, and inspecting their quality, implementing identical exams in all institutions are only several of the possible means of QA.

It is time for higher education in Israel to embrace the post-modern age, an age in which knowledge is not restricted to a few, an age of the IT revolution, an age in which knowledge is power and many seek it. In this age we have two options: to continue the current division, where we have competition at the expense of excellence and collaboration between academic institutions, and where the quality of higher education diminishes as the number of student's increases. The second option is to embrace the transformation and support academic institutions that are involved in a free, open, and competitive market, yet are required to meet high standards of quality assurance as a condition for their existence.

Academic literacy and learning: Challenges and innovation: The case of South African and Zimbabwean tertiary institutions.

Makondo Livingstone

Senior Academic Development Advisor/ Senior Instructional Designer: Academic Development Centre, North West University, South Africa

Livingstone.Makondo@nwu.ac.za

Abstract

There are various reasons as to why some students encounter difficulties in their academic studies. Historical factors due to the political considerations that prevailed at a particular era play a key role. Due to this, some students see themselves coming from and using a language that is not of ‘academic purposes’. Almost all students in African countries find themselves in a predicament in which the language of education is at variance with their home language. To add on this, after they have attained ‘success’ at a particular level of studies they only get shocked when they go for university education and they find themselves being required to ‘start all over again’. The majority of students in South African and Zimbabwean tertiary institutions encounter several challenges in adjusting to tertiary academic environments. This discussion suggests that in the formative stages of university learning many students face various challenges hence the facilitator must be in a position to realize this and decide on ways to effectively bridge the gaps. As they continue with their studies, this article posits that the challenges can be narrowed as they begin to appreciate the way things are done in their new discourse communities. As a result, a blend of approaches that are characteristically learner–based must be explored and used so that discovery and exploratory teaching-learning tactics are enhanced. This in turn increases the learners’ motivational levels and the resultant mastery of the taught concepts. When this is done, this study reckons that the learners would have become full members of the discourse communities who are ready to participate in the academic activities of this community.
Institutional Teaching Excellence Award: Challenges and the way forward: The case of the North West University, South Africa

Livingstone.Makondo@nwu.ac.za

Abstract

Theme: Academic Advising and Counseling

This article discusses the challenges characterizing the implementation of the Institutional Teaching Excellence Award (ITEA) at the Mafikeng Campus, North West University, South Africa and the proactive way forward. By way of foregrounding, the North West University is a merge of three campuses with different historical backgrounds, namely the Potchefstroom, Vaal and the Mafikeng all located in the North West province of South Africa. When appointing lecturing staff, the University policy does not insist on the candidates having a teaching professional qualification. It is within this context that the University imbibed the hands-on ITEA approach to ensure that the lecturing staff’s performance improves. This aims at the improvement of the teaching and learning environment, a move in agreement with many progressive universities across the globe. The Academic Development Centre (ADC), through its arm of Academic staff support is tasked with the responsibility of coordinating the implementation of the ITEA program within the campus. Prominent challenges ranging from the recruitment of participants, formulation and coordination of faculty assessment committees, disregard of specifications to time constrains among others are being experienced. Therefore, this article probes these issues by advocating for a unified approach towards the successful implementation of ITEA program that stands to improve the lecturing staff’s performance and student throughput.
A Content Analysis of Turkish Newspapers: Prevalence of Articles Containing Health Information Related to Physical Activity

Abstract
This study was retrospective in design and the purpose was to review health information related to physical activity in articles of Turkish newspapers. Four daily Turkish newspapers were identified as having regularly archived documents on web pages. The key words used to identify articles to analyze included “physical activity” and as a result 184 articles from four newspapers were identified and analyzed. There were 165 (89.7%) articles that presented health information messages related with physical activity. General health information (35.9%), weight management (21.2%), cardio-vascular (11.9%) effects of the physical activity were the mostly frequently given as the main content of the articles. The target population in the articles included sedentary population (27.8%), individuals having specific disease (23.9%), and overweight people (16.9%). Twenty eight of the articles (15.2%) contained information regarding the duration and frequency of the physical activity for the target population. Thirty articles (16.3%) contained information suggesting general exercises for muscle strength and flexibility. A total of 27.7% of the article was provided by health professions (doctors, physical therapists, dieticians etc.). It was found that articles in Turkish newspapers relating to and promoting physical activity in the community contained insufficient health information and inadequate suggestions for promoting physical activity.
The Evaluation of Health Behaviors, Physical Parameters and Posture Among Child Laborers 14 to 18 Years of Age

Abstract
The purpose of the study was to investigate health behaviors (smoking, physical activity), and evaluate physical parameters and posture among child laborers 14 to 18 years of age. This cross sectional study included 522 (Boys/Girls: 435/87) children laborers aged 14 to 18 years old (mean age: 16.71±1.02 years) attending apprenticeship school in Istanbul, Turkey. Data regarding socio-demographic characteristics (i.e. age, gender, social security, education level of mothers & fathers, income status of their parents etc), working conditions; working’s sector, starting age for working, daily working hours, health behaviors (smoking, alcohol, physical activity habit, type of physical activity) were collected via questionnaires during face to face interviews. Information also collected in the study included any musculoskeletal problems such as pain and the body part(s) affected from experiencing musculoskeletal pain. An evaluation of the physical capacity was conducted on the study group by doing pinch grip and hand grip strength for right and left side. Skinfold thickness was measured from three sides: 1) triceps, 2) sub-scapular and 3) calf according to AAHPERD health fitness standards. The New York Posture test was used for the postural assessments (range of score from 15-75 points). Most child laborer’s parents have a low level education and income status. The mean age for the study group to start working was 15.03±1.71 years. Their mean working
periods were 11.41±2.03 hours per day. The prevalence of reported musculoskeletal pain in the neck, lower back, lower and upper extremity was 47.7%. The prevalence of participation in regular physical activity habits were found to be 11.8% for both sexes. The ratio of current smoking and alcohol usage were 40.4% of the participants. The points of posture assessments, the results of sum skinfold thickness were higher in female participants (respectively p>0.05, p≤0.005). As a result of this study it was concluded that health promotion programs for child laborers can contribute to a gain in positive health behaviors including participating regularly in physical activities, and abstaining from tobacco and other substance usage.
The Effects of Teacher Modeling and Textual Prompting on Sixth-Grade Students’ Self-Explanation and Reading Comprehension Performance

The Effects of Teacher Modeling and Textual Prompting on Sixth-Grade Students’ Self-Explanation and Reading Comprehension Performance

Yu-Min Ku, Yu-Ting Huang
National Central University

Abstract

The aim of this proposed study is to investigate the effects of teacher modeling and textual prompting on 120 sixth-grade students’ self-explanation and reading comprehension performance after receiving the training of self-explanation. The participants will be divided into four groups—three experiment groups: Group MP (with both modeling and prompting), Group M (with modeling only), and Group P (with prompting only) and one control group: Group C. Upon these four different conditions, this study is going to analyze the types of self-explanation that students use, and compare the scores of reading comprehension tests among four groups. It’s expected that there will be two significant main effects (teacher modeling and textual prompting) but no interaction between modeling and prompting. Additionally, it is also expected that there will be a positive correlation between numbers of self-explanations in advanced level and reading comprehension performance.

Keywords: Self-explanation; Teacher modeling; Textual prompting; Reading comprehension
The Effects of Teacher Modeling and Textual Prompting on Sixth-Grade Students’ Self-Explanation and Reading Comprehension Performance

According to Programme for International Student Assessment (PISA) planned by The Organisation for Economic Co-Operation and Development (OECD), the definition of scientific literacy is “the capacity to use scientific knowledge, to identify questions and to draw evidence-based conclusions in order to understand and help make decisions about the natural world and the changes made to it through human activity” (OECD, 2003, p. 133). Moreover, PISA also indicated that there are three scientific processes of scientific literacy; the primary process is “Describing, explaining and predicting scientific phenomena” (OECD, 2003, p. 137). Therefore, in order to promote students’ scientific literacy, the first work for teachers is to guide students to describe, explain, and even predict the scientific phenomena. McNeill & Krajcik (2007) further identified that students could gain deeper understanding of the content by constructing explanations; however, it is not an easy task for students to construct an explanation correctly all by themselves. Could it be possible that teachers provide some methods or strategies to help students construct explanations in the class?

Self-explaining is a promising and effective strategy that can help learners in learning and develop deeper understanding of the content. According to Chi’s definition, self-explaining is “the activity of generating explanations to oneself, usually in the context of learning from an expository text (Chi, 2000). From the series of studies conducted by Chi, self-explaining could improve students’ learning by enabling them to make connections between learned and unlearned experiences and gain a deeper understanding of the content (Chi, 2000; Chi & Bassok, 1989; Chi, Bassok, Lewis, Reiman, & Glaser, 1989; Chi, De Leeuw, Chiu, & Lavancher, 1994). In the present study, self-explaining is not only a knowledge-building activity but also an effective strategy to promote readers’ comprehension and understanding of the expository texts. Furthermore, the term “self-explanation” refers to “a unit of utterances produced by self-explaining” (Chi, 2000). Therefore, self-explanations produced by students in the present study will be analyzed to find out the relation between the quality of self-explanation and the levels of students’ comprehension.

The early period of Chi’s researches focused on knowledge acquisition and problem-solving to develop the meaning of self-explaining and further supposed that if
students already knew the knowledge about some topic, then they could understand the examples and produce the instances (Chi & Bassok, 1989; Chi et al., 1989). Moreover, Chi applied self-explaining to different learning situations, such as scientific learning; students need to understand and explain “how” and “why” does a scientific phenomenon happen (Chi & Bassok, 1989). After that, Chi et al. (1994) viewed from a learning perspective and pointed out that learning involves integrating new information with past experiences, and self-explaining could facilitate the process of integration.

McNamara and her colleagues conducted a series of self-explanation reading training (SERT) studies, and defined self-explaining as a process of generating the explanations of the article’s meaning to oneself (McNamara, 2004; McNamara, Levinstein, & Boonthum, 2004). In the studies, students could use six reading strategies (i.e., comprehension monitoring, paraphrase, bridging inference, elaboration, using logic, and prediction) while they are generating self-explanations.

In conclusion, the definition of self-explaining is when students are reading, they are explaining to themselves, and the generated self-explanations could make them comprehend the text and learn from the content. Therefore, the content of self-explanations include the connections of prior knowledge, the examples drawn from the article’s meaning, or applications of analogy in order to show what the students really learn but not just read for memorizing. Accordingly, based on the literature review, this study summarized six types of self-explanations as follows:

1. Paraphrasing: After understanding the meaning of the sentence or paragraph, readers could paraphrase it or say it in his/ her own words. This type of self-explanations might be the easiest one, and most of the readers paraphrase to help understand the text while reading.
2. Making Connections: Readers could think about related or similar experience in his/ her life, and make connections between experiences, prior knowledge, and the text.
3. Giving Examples: Readers could integrate the information conveyed by the text, and give some other examples to explain and to help understand the text.
4. Comparing/ Contrasting: Readers could point out the similar and different concepts from the text, and show the similarities and differences between two or more concepts.
5. Making Inferences/ Analogies: Readers could identify the principles or concepts in the text, and integrate them throughout the whole article; or he/she could combine his/her learning experiences, and make inferences/analogies.

6. Explaining How & Why: After comprehending a passage or a whole article, readers could explain how and why does a scientific phenomenon happen in detail.

In short, these six types of self-explanations could be divided into two levels: basic level and advanced level. Type one to type three (paraphrasing, making connections, and giving examples) belong to basic level; the others (comparing/contrasting, making inferences/analogies, and explaining how & why) are advanced level. If readers could generate more self-explanations in advanced level, then the quality of self-explanations would be better.

Previous researches have investigated not only the quantity but the quality of self-explanations in order to study the relation between self-explanations and learning. Chi et al. (1989) found out that students who were good at problem-solving could generate a larger number of self-explanations than students who were not while learning from worked-out examples in physics. As for quality of self-explanations, better problem-solvers could generate more elaborative self-explanations and comments. In order to investigate the differences of quality and quantity of self-explanations, this study contrasted the students with different levels of problem-solving ability, just like expert and novice.

Atkinson, Renkl, & Merrill (2003) indicated that using prompts in learning environment encourage learners to be more active and might foster transfer. The study examined the effects of backward fading and example-problem pairs incorporate with the presence or absence of self-explanation prompts. The result showed that even using very simple prompting procedure—let students simply choose the item instead of requiring them elaborate—can foster understanding and transfer. Thus, this study implied that self-explanation prompts can encourage and urge students’ learning attitude from passive to active, from superficial to profound.

Chi et al. (1994) investigated 14 eighth-grade students on self-explanations while learning from expository text of the human circulatory system. The study found that the prompted group made more progress than the unprompted group on the posttest; furthermore, prompted students who generated more self-explanations could answer more complicated questions. The prompted group had to self-explain each sentence’s meaning after reading the text; there were 22 functional prompts among 101 sentences of the text. Those prompts urged students to explain the functions of certain circulatory components. The students in unprompted group read the same text twice, but with no prompts to self-explain. The study
revealed that self-explanations could help students on comprehension performance, and it also conveyed the concept of teaching methods—using prompts to facilitate students’ self-explaining.

McNamara (2004) followed the line of thinking by Chi et al. (1994) and conducted the self-explanation reading training (SERT) to investigate the effectiveness on improving self-explanation. The experimental group received SERT training, but the control group didn’t. The result suggested that experimental group’s reading comprehension scores and quality of self-explanations were better than the control group. It also implied that the possibility of using reading strategies and training to improve the effectiveness of self-explanations.

Based on the studies above, it is concluded that self-explaining is beneficial for students’ learning and comprehension. However, what kind of teaching methods could teacher use to help students on improving the effectiveness of self-explanations? Collins, Brown, & Newman (1989) proposed six significant characteristics in cognitive apprenticeship, they are: modeling, coaching, scaffolding, articulation, reflection, and exploration; these are very common teaching methods used in practical field or in research. The idea of Chi, et al. (1994) prompted and unprompted groups were based on the concept of scaffolding; SERT adapted both modeling and coaching.

McNeill, Lizotte, Krajcik, & Marx (2006) investigated 311 seventh-grade students on scientific explanations in chemistry. The students received two different types of written support: continuous and faded, respectively; these two supports belong to the concept of scaffolding. Based on these findings, McNeil & Krajcik (2007) proposed five strategies for teachers to support students on writing scientific explanations, and these strategies are: making the framework explicit, modeling and critiquing explanations, providing a rationale for creating explanations, connecting to everyday explanations, and assessing and providing feedback back to students. They also showed the concept of modeling and scaffolding. McNeil & Krajick (2008) condensed the strategies from five to four, but still preserve the idea of modeling.

In conclusion, modeling and scaffolding were two of the most common and well-known teaching methods. Therefore, this study aims to investigate the effects of teacher modeling (modeling) and textual prompting (scaffolding) on students’ reading comprehension performance and the quality of self-explanations.
Method

Participants

The participants will be 120 children from four sixth-grade classes in Taiwan. And the participants will be divided into four groups—three experiment groups: Group MP (with both modeling and prompting), Group M (with modeling only), and Group P (with prompting only) and one control group: Group C.

Design

A 2 × 2 factorial design will be used, employing the teacher modeling (with teacher modeling or without teacher modeling) and the textual prompting (with textual prompting or without textual prompting). Therefore, there will be four conditions in this experimental design: Group MP, Group M, Group P, and Group C as Table 1 presents. The dependent variables will be self-explanations produced by participants and their reading comprehension performances of pretest and posttest.

Research Materials

There are three major tools will be used in this study: Chinese Reading Comprehension Test, 4 Expository Texts, and 2 Reading Comprehension Tests. The following will describe the details of these materials for the present study:

Chinese Reading Comprehension Test. The aim of this standardized test is to measure the ability of participants’ Chinese reading comprehension. The present study will only excerpt the expository texts from the original test for the study’s pretest. There will be 4 texts and 24 multiple-choice questions in the test.

Expository Text. During three phases of experimental period, participants will need to read 4 expository texts. The 1\textsuperscript{st} expository text, entitled “The Rock Cycle,” will be used both in the pretest and in Lesson 1; the 2\textsuperscript{nd} and 3\textsuperscript{rd} expository text (“Wind” and “Why does soda fizz?”) will be used in Lesson 2 and 3 respectively. Participants will read the 4\textsuperscript{th} text, entitled “Mist,” for the posttest. All the expository texts will be developed and designed by
researchers; the principle of developing the expository texts will also take sixth-grade students’ scientific textbooks and materials into consideration, and make the texts applicable to participants.

**Reading Comprehension Tests.** The aim of these reading comprehension tests is to measure the performance of participants’ reading comprehension on pretest and posttest. Based on the expository texts, the researchers will develop the Reading Comprehension Tests of pretest and posttest respectively. For the validity of the tests, there will be three experienced sixth-grade teachers, as experts, to evaluate and give suggestions for the tests. There will be 10 multiple-choice questions, including factual questions and inferential questions, to evaluate participants’ comprehension of factual and conceptual knowledge.

**Procedure**

There will be three major phases of this experiment: pretest, teaching intervention, and posttest. Therefore, all the participants will go through three phases.

**Pretest.** In pretest, all participants will take the Chinese Reading Comprehension Test first in their regular classroom; it’ll be a 15 to 20 minutes paper written test. Then, the participants will read the 1st text—The Rock Cycle” while constructing self-explanations in computer classroom where each participant will have one computer, a pair of earphones, and a microphone. After receiving the instructions, the participants will be given a paragraph to practice, and see if there’ll be any problems for them while accomplishing the task. During the period of self-explaining activity, the whole process will be recorded by computer microphone and camera of desktop operating system. At the end of pretest, all participants will take a reading comprehension test of text 1; it will be a paper written test as well.

**Teaching Intervention.** In teaching intervention, there will be three lessons, and each lesson includes 20-minute instruction and 20-minute individual practice so there will be 120 minutes in total; however, the treatments (teacher modeling and textual prompting) will be different among four groups. The teacher will give instruction in self-explaining first, and the participants in different group will receive different treatment of teaching (with modeling vs. without modeling). Group MP and Group M will have teacher modeling so the teacher will demonstrate how to construct self-explanations, but in Group P and Group C, the teacher will just conduct the teaching activity by describing the definition and function of self-explaining without demonstration; likewise, the participants will be given different texts (with prompting vs. without prompting) to practice constructing self-explanations in class. Group MP and Group P will be given texts with prompts to practice constructing self-explanations, but
Group M and Group C won’t; they will practice without prompts. Additionally, the form of the prompts will be questions represented by significant concepts of each paragraph. For example, the main idea of the last paragraph in “The Rock Cycle” concludes that rocks would change, and the phenomenon is called “the rock cycle.” Therefore, groups use the text with prompts will have a question such as “What is the rock cycle? And how does it happen?” In addition, one of the researchers will be the instructor through the whole intervention process; another two researchers will be responsible for classroom observation and recording.

Posttest. In posttest, all participants will read the 4th text and also have a self-explaining activity first, and then they will have a 15-minute reading comprehension test of text 4 after finishing their self-explaining. The location will be in the computer room like pretest, and all the participants will have one computer, a pair of earphones, and a microphone as well.

Data analysis

There will be two parts for data analysis: First, the self-explanations produced by participants from pretest and posttest; second, the reading comprehension test scores from pretest and posttest.

Reading Comprehension Test Scores. Two-way ANCOVA will be used to analyze participants’ reading comprehension test scores of pretest and posttest. The scores of four groups from pretest will be used as covariance in order to compare the scores of posttest.

Self-Explanations Data. After transcribing the self-explanations data from verbal recording into transcripts, the researchers will code and classify the self-explanations into six types:

1. Paraphrasing
2. Making Connections
3. Giving Examples
4. Comparing/Contrasting
5. Making Inferences/ Analogies
6. Explaining How & Why

The first three types –Paraphrasing,” “Making Connections,” and “Giving Examples” belongs to basic level, and the others are advanced level. Therefore, the quality of self-explanations could be compared and investigate the relationship between types of self-explanations and reading comprehension performance. Besides, there will be three coders to complete the coding and confirm the reliability.
Expected Results

It is expected that there will be two significant main effects (teacher modeling and textual prompting) but no interaction. That is, if there is teacher modeling in teaching, the reading comprehension performance of Group MP will be better than Group P, and Group M will be better than Group C. As for textual prompting, if there is textual prompting in texts, the reading comprehension performance of Group MP will be better than Group M, and Group P will be better than Group C. In general, the reading comprehension performance of Group MP shall be the best (the reading comprehension test scores will significantly higher than other groups.)

It is also expected that Group MP will produce more self-explanations in advanced level than the other three groups. Furthermore, there will be a positive correlation between numbers of self-explanations in advanced level and reading comprehension performance.

Life Education has been developed and promoted for over 10 years in Taiwan. The most challenging issue for the curriculum is that how to measure the effect of the learning. In this case, we designed a series of Service-Learning programs in class, demanding students to get involved in situation.

This study was intended to develop the course of Life Education applied with immersing Service-Learning activities with students who attended the programs held by non-government organizations. These programs were all about native culture issues and inspired college students to empower and to concern their existence and the relationship between himself/herself and nature/society. This action research study also attempted to help students to understand the transformative process and the teaching effect of “fusion of horizons” by viewing the situation. The first research objective is to explore the possibility of immersing Service-Learning activities to the curriculum of Life Education. The second objective is to apply the “fusion of horizons” concept to the curriculum of Life Education in a university classroom. To meet these objectives in this course, the teacher transformed the concept of “fusion of horizons” into two essential concepts of “ground” and “vision” and put it into the teaching of Life Education to encourage students to apply it in their learning process.

In order to know the students learning attainments, circumstance, observation and documentation analyses were conducted in this study. By ways of engagement and service in native community, students learned to acquire deeper understandings of other lives and culture, thus opened their eyes to see through the differences between multiculturalism and resources limited, and thought through how they could transform such new understandings for their teachings after graduation as teachers and social justice themselves in reflection.

This study described 5 sequential stages for the teaching transformative process, including conception, contextualization, activation, meaningfulness and self-reflection. The results of the study found that students recognized service-learning immersed in courses. Students learning attainments after participating service-learning activities were good with changes in students’ attitude and cognition as citizen identity.

According to the findings, the following suggestions are proposed. First, the service-learning teaching method needs to be conducted deeper and much more diverse training programs both for students and teachers. Second, the concept of “fusion of horizons” can provide a good understanding of life as citizen responsibility and gain advanced personal growth.

A comparison of the eye-movement patterns of kindergarten teachers and college students toward free-playing scenes: An eye-tracking study

Takayuki Otobe¹, Keiko Matsukawa¹, Akio Nakai²
¹ Department of Early Childhood Education, Jin-ai Women’s College
² Department of Pediatrics, Faculty of Medical Sciences, University of Fukui

Introduction

Playing freely has an important role in early childhood education. Teachers must support children’s free play in terms of security, promotion of social interaction, development of emotions, and so forth (MEXT, 2008). Actually, free playing is based on teachers’ attention to the playground and the attention would be ameliorated through experiences in the field.

Eye movement is one of the scientific indices of attention, and it can be precisely measured by using eye-tracking devices. However, the eye movements of experienced teachers have rarely been examined, although they might provide useful scientific information for the improvement of early childhood education.

The purpose of the present study is to demonstrate the effects of teaching experience on eye movement patterns of teachers in playground through a comparison of experienced kindergarten teachers and college students.

Method

Participants

Participants were divided into two experimental groups: twelve kindergarten teachers with more than 5 years experience (Mean = 15.8, SD = 8.6) and fourteen college students belonging to an early childhood education course.

Materials

The Tobii T60 eye-tracking system (Tobii Technology AB, Danderyd, Sweden; Fig.1) was used for measuring eye movements.

Five 2-min video clips that showed scenes of large play equipment or of a sand pit made up of free-play scenes at kindergarten were used as stimuli (10 min in total). The order of the video clips was randomized among participants. Fig. 2 indicates the stimuli flow of the present experiment.

A brief questionnaire (including questions about years of experience, scenes in which the participant feels danger, and what consideration the participant make at playground especially) was arranged in order to eliminate the possibility of participants becoming conscious of being measured by their eye movements.

Procedure

All participants were tested individually. First, they were instructed to watch free-play videos for 10 min. Second, video stimuli were presented to them on a Tobii T60 LCD display, and their eye movements were recorded simultaneously. Finally, participants answered the questionnaire. After the experiment, the experimenter explained the purpose of the study and why the participants’ eye movements had been recorded. All of the participants agreed to use the data gained from eye tracking and questionnaire anonymously.

Fig.1 Tobii T60 eye tracker and a participant.

Fig.2 A stimuli flow of the experiment.
**Results**

Fig. 3 shows the mean number of gaze fixations in all of the video clips of the two experimental groups. The mean gaze fixation of experienced teachers were more than those of students ($t(24) = 2.575, p = 0.02$, two-tailed). Furthermore, we defined areas of interest (AOIs) on the video clip including large play equipment (AOI_1 - AOI_4, see Fig. 4(A)) and obtained the number of gaze fixations on each AOI. The result was that only at AOI_2, which contains a shadow area, were the mean number of gaze fixations of experienced teachers more than that of students ($t(24) = 3.362, p = 0.003$, two-tailed with Bonferroni correction; Fig. 4(B)).

**Discussion**

There were some differences between the eye movement patterns of experienced teachers and college students in this study. In specific, the teachers showed more eye movements in total compared to the students. In addition, the less-visible area drew more attention from the teachers. These results have some commonalities with several eye-tracking studies done on automobile drivers, which showed that experienced drivers have wider functional field of view and more flexibility to meet changing demands than novices. (Crundall and Underwood, 1998; Crundall et al., 1999). It is suggested that the attention of experienced teachers would become more frequent and more flexible to the demands in playground by experience, at least in preventing accidents.

The present study scientifically demonstrated an aspect of experience in early childhood education. This trial may contribute to the education of college students or young teachers through showing the actual eye movement patterns of experienced teachers.

**Acknowledgement**

This work was supported by Grant-in-Aid for Scientific Research (KAKENHI 22730646). We are deeply grateful to three kindergartens that allowed us to take the videos and all teachers and students participated in the experiment.

Proposal Abstract:
This presentation will address the work of the UDI Online Project at the University of Connecticut, which extends the construct of Universal Design for Instruction (UDI) into online and technology blended courses at the postsecondary level. Results of interviews and surveys with faculty and students will be presented, as will example “e-Tools” that foster the use of UDI in online and technology-blended courses.

Proposal Description and Goals:
Enrollment in online and technology-blended courses in institutions of higher education is growing at a dramatic rate across the United States. According to an
investigation of over 2,500 institutions by the Babson Survey Research Group, the College Board and the Sloan Consortium (2008), nearly 3.9 million college students were enrolled in at least one online course during the fall 2007 term. This represented a 12% increase from the prior year. Despite this rapid growth, there is limited evidence related to effective teaching practices in online and blended courses for diverse learners, particularly those with mild cognitive disabilities. The goal of the UDI Online project is to extend prior work in Universal Design for Instruction (UDI) into online and technology blended learning environments. This presentation session will present highlights of activities to date of the UDI Online project, which is one of the funded Demonstration Projects to Ensure Students with Disabilities Receive a Quality Higher Education from the US Department of Education. Highlighted activities include the results of a needs assessment of students and faculty at six postsecondary institutions in the northeast, the development of an electronic toolbox of “e-Tools”, and the development of a series of online instructional modules for postsecondary faculty. Each is described in more detail below.

Needs Assessment - Student surveys and interviews:
Students (n = 400) with and without learning disabilities and/or Attention Deficit Hyperactivity Disorder - from six institutions in the northeast are currently being surveyed using an electronic survey instrument designed by the project staff. The survey gleans information regarding student experiences in online and technology-blended courses. The students were asked to rate their perceived importance of various components of course organization, course delivery, and course evaluation (assessment). To gather additional insight into student experiences, 30 students from the same six institutions are currently being interviewed related to their experiences in online and technology-blended courses. Half of the students being interviewed have learning disabilities and/or attention deficit/hyperactivity disorder. These students are enrolled at a research 1 university, two public universities, a private college, and two community colleges. Surveys and interviews with students at several institutions have already been completed.

Needs Assessment - Faculty surveys and interviews:
Simultaneously, interviews and surveys are being conducted with faculty at these six institutions. A total of 350 faculty, representing a range of disciplines, rank, and experience teaching in an online or blended format are being surveyed, while 30 are being interviewed. Questions focus on the benefits and challenges of teaching in this format, as well as on techniques found to effective and important.

Electronic Toolbox:
The needs assessment described above serves as a guide for the development of an electronic toolbox that consists of a series of “e-Tools”. These e-Tools are digitally presented materials, instructional techniques and/or strategies that can be used or manipulated by a course instructor to proactively create a learning environment that benefits a broad range of learners. These e-Tools range from simple, readily available features of common programs (e.g., Microsoft Word Highlighting tool that
helps to scaffold student readings), to free downloads (e.g., Jing, Doodle; Skype – programs that allow increased collaboration and interaction between students and faculty), to low cost programs (e.g., Adobe Acrobat 9.0). Using a cycle of developing, piloting, and revising, the electronic toolbox focuses on “faculty as designer”.

Instructional guides have been created for faculty to locate and use the tool, without the need for support from an instructional technology department. Faculty users will also provide ratings and feedback related to the tool that future users can employ to guide their selection and use of e-Tools.

**Instructional Modules:**
The electronic toolbox also contains a series of online instructional modules related to a range of topics such as introduction to UDI, the history of UDI, the application of UDI to postsecondary education, legal issues in serving students with disabilities in postsecondary education, and learning disabilities/attention deficit hyperactivity disorder. Other modules contain model resources that faculty can use and adapt to their courses as needed, including a list of important campus resources for students, an introductory session of an online class, and resources related to developing course objectives and grading rubrics.

**Results:**
Participants will learn about the application of UDI to online and technology blended courses, and about resources that can be used and shared with campus faculty teaching in these environments.

**Topic Area:** Distance Education

**Format:** Workshop (90 minutes long)
Promotional Tools in Higher Education: the case of Private Universities in Cyprus

Ria Nicoletti Morphitou, University of Nicosia, Cyprus
Soula Louca, University of Nicosia, Cyprus
Maria Michailidis, University of Nicosia, Cyprus

Key Words: Promotion, Communication, Tertiary Education

ABSTRACT

Cyprus's higher education system is in transition and the role of the private higher education sector is under review. These internal changes are intended to market Cyprus's educational system more competitively. Our argument is presented in three stages; an initial exploration of the tertiary education market of Cyprus, then a consideration of the necessary promotional tools in educational marketing and finally the use of Facebook as a major promotional tool.

INTRODUCTION

The operationalisation of marketing in Cyprus’s private tertiary education system as ‘increasing student numbers’ is problematic from both an educationalist’s and a marketer’s perspective. Although the USA has embraced a specific professional stance as ‘enrollment management’ and the UK has taken a broader marketing orientation that clearly embraces recruitment. These different perspectives lead to differences in implementation for both domestic and international recruitment and of course it has affected the promotional tools used.

Cyprus’s private higher education sector – influenced by both of these international traditions – is facing new challenges in terms of domestic demand, the need to increase international student recruitment, pressure of EU harmonization and the realization of the potential growth due to its geo-political location. This paper uses these insights on the readiness of private higher educational institutions to exploit national and regional markets and the marketing communication used as Cyprus seeks to become a regional centre of educational excellence.

RESEARCH OBJECTIVES

Our argument is presented in three stages; an initial exploration of the promotional tools used in tertiary education of Cyprus, then a consideration of educational marketing and the use of Facebook as a major promotional tool. We will not be making the case for private versus public institutions in this paper but we follow Zumeta assessment that nonprofit higher education “is a valuable to the nation” (1992:363) when referring to the USA.

RESEARCH METHODOLOGY

A quantitative research method was used through the use of a personal survey in order to seek an understanding and develop a language of the university’s main marketing issues. Semi structured questionnaires have been used as this is a working paper. A random sample of 400 students attending the three private institutions in Cyprus has been used. One hundred and fifty questionnaires have already been completed although the results can only be considered as tentative at this stage they do shed light on the promotional tools used in the private institutions of tertiary education in Cyprus.

CONCLUSIONS

Our research so far has shown that the marketing of Cypriot higher education is still sales driven, and that the promotional tools used in order to recruit students do not reflect the students’ communication needs and the recent technological advancements. There is often an awareness of the need to apply a holistic marketing philosophy but these aspirations are restricted by short-termism encouraged by the government’s attitude to private education and the institution’s own financial goals. This is problematic, for the realizations of Cyprus as a centre of excellence is on the shoulders of the private universities. We recommend that, like other European countries, Private Universities apply a fair market mechanism to develop a strong marketing strategy. By not developing effective communication tools this will ensure failure to match its goals, increasingly waste its marketing resources and, we predict, lead to decline in the number of students attending Cypriot institutions.

Abstract
A single classroom provides a place in which individuals from different cultural backgrounds have the potential for sharing a rich place of learning in ways that embrace and celebrate individual differences, foster the development of a positive self-concept, and provide meaningful and relevant learning experiences for each student. Facilitating this kind of learning environment is the result of practicing culturally responsive pedagogy, beyond simply having an attitude of acceptance of cultural diversity. A culturally responsive teacher acts on knowledge about cultural differences, and implements, as habit, pedagogical skills that foster a meaningful and relevant education for all of her/his learners. The call for cultural responsiveness extends to all dimensions of the school experience, including physical education. Physical education presents unique needs and opportunities to practice cultural responsiveness. Where teaching and learning heavily exist in the psychomotor domain, issues such as body language, personal space, physical contact, and dress become particularly important factors to consider. Additionally, physical education provides a unique stage from which diversity can be incorporated into the curriculum, with opportunities for learning a variety of activities, contextualized in their cultural and historical roots, from around the world. An overview of culturally responsive pedagogy will be presented, with suggestions for implementation in the physical education setting.
Developing A Mechanism for Increasing Communication Skills, Critical Thinking and Reflective Practice:
The Tuning Protocol

Abstract

This project was designed to improve teaching and student learning in undergraduate classes at a major public institution of higher learning. In an effort to improve faculty instruction and student learning, the researchers began an innovative project based on the Scholarship of Teaching and Learning (SoTL) philosophy of discovery through basic research and integration and application of knowledge (Boyer, 1990). SoTL encourages and promotes improving teaching and learning through reflection and inquiry in a constructivist educational setting. Knowledge gained through this process is then made available to peers in the profession. This project was undertaken as a means to improve college students’ reflective practice, higher-level critical thinking and communication skills. It was also designed to improve peer engagement for millennial students, as well as those who are ethnically, culturally and linguistically diverse, in academic and educational environments.

The project centered around the use of a Tuning Protocol, a structured format for peers to provide constructive feedback about each other’s work in meaningful ways. It offered participants in this study a systematic approach to reflect on, assess, evaluate and discuss written assignments in peer groups. This research project introduced undergraduate teacher education students (Foundations of Education and Health Education) with the Tuning Protocol and provided participants with opportunities to become reflective practitioners, effective communicators and critical thinkers (Gerena, Glaser & Keiler, 2010; Gerena, Keiler, & Glaser, 2009). A literature search on the Tuning Protocol found that, while it has been implemented and incorporated into instruction in a variety of settings, meaningful research on its effectiveness in improving communication skills, reflective practice, or critical thinking skills is critically lacking. This project was an attempt to provide the academic community with research-based results on the effectiveness of the Tuning Protocol in these areas of student development and engagement.

This project was aligned to the General Education framework of the institution of Higher learning where it was implemented. Imperatives to shape the future of education at that institution included increasing reading, writing, and critical thinking across the curriculum and advancing other literacies, including communication skills. It was also in alignment with strategies that are necessary to engage diverse student needs. As student populations become more ethnically, culturally and linguistically diverse, professors need to restructure their teaching methodology to allow for meaningful interaction where student can be more engaged and involved in their own learning (Huber & Hutchings, 2005; Hutchings & Shulman, 1999). In 2007, more than two thirds of the undergraduate student population at this institution self identified as diverse ethnicity and almost one third self identified as second language learners. Demographic data indicated that students originated from over 120 countries with more than 86 languages represented from among the student body (York, CUNY Fact Book Highlights, 2009).

BACKGROUND
The Tuning Protocol was developed by David Allen and Joe McDonald of the Coalition of Essential Schools. The original function of the Tuning Protocol was for teachers to examine student work (McDonald & Allen, 1991; Allen & McDonald, 2003). In this study, it was used to instruct students on how to reflect on their own learning as well as that of their peers, to work collaboratively, to improve student communication and to develop higher order critical thinking skills. Participating students were afforded the opportunity to think critically about their own learning and to respond to their peers’ reflections in a supportive, non-confrontational community of learners.

Use of the Tuning Protocol at the university level also addressed the learning preferences of the millennial students...
who are characteristically team-oriented and favor group settings (Mastrodicasa, 2007). As a student centered, collaborative and interactive teaching approach, it focused on student preferences for interaction with the instructor as a facilitator of learning (Monaco & Martin, 2007). Other research studies have suggested that college students need to develop communicative and reflective skills to manage their daily lives and to explore the meaning and purpose of life’s activities (Newton, 2000). Millennial students need to increase critical thinking and decision-making skills (Monaco & Martin, 2007), and are interested in information strategies that go beyond the written word (Coomes & DeBard, 2004). Using the Tuning Protocol provided the participating students in this study with opportunities to develop these fundamental skills.

METHODOLOGY

Participants
The Tuning Protocol was implemented in two separate academic settings at the beginning of the semester. One of the settings was a Teacher Education Foundation level class. One of the goals of introducing the Tuning Protocol in this context was to provide pre service teachers with an effective teaching strategy. Another goal was to help potential educators become familiar with a strategy that will useful to them as a teaching and assessment tool with their future students. There were fifteen pre-service teaching students in this class, and twelve agreed to participate in the study.

The Tuning Protocol was also used in a mid-level Health Education elective course. A main behavioral objective of the Health Education course was to help students improve their written and spoken communication skills. The Tuning Protocol was used to improve both written and oral communication skills. Participants were given ample opportunities to practice their communication skills using the Tuning Protocol as a novel strategy. This strategy was presented as useful and effective tool to use when planning workshops to bolster communication and health behaviors in community settings.

Study Design
This was a pilot study that used both qualitative and quantitative methods to collect and analyze data. It included a pre and post survey to measure participants’ attitudes towards engaging with peers to improve communication skills, reflective practice, and critical thinking skills. The study was conducted over a four-month period, from February to May 2010. The instruments used to collect data at six points in time included the pre and post attitudes surveys, group member reflection response logs, and students’ post Tuning Protocol written reflection worksheets. Data collection point one (T1) was during the third week of the semester and collection point six (T6) was during the final week of the semester. All data collection instruments were designed specifically for this project and were original in design and development.

Instruments
Since there was no existing instrument to measure participants’ attitudes towards engaging with peers to improve communication skills, reflective practice, engagement and critical thinking skills, an original survey was developed (Appendix A). There were 15 Likert style statements with responses ranging from strongly agree to strongly disagree. Participants were instructed to indicate if they agreed or disagreed with each statement. The scale values were as follows: 1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree, 5 = strongly agree. For example, the first item on the measure was, “I think getting feedback from my peers will help me improve my work.” Participants were instructed to select a response ranging from 1 to 5 with the higher numbers indicating greater levels of agreement and the lower numbers indicating lower levels of agreement.

For analysis purposes, the 15 statements were divided into three sub groups representing the three major dependent variables of the study: communication skills, thinking skills, and reflective practice skills. There were five statements that addressed communications skills (#1, 2, 3, 5, 9), seven items that addressed thinking skills (6, 7, 10, 11, 12, 13, 14) and two items that addressed reflective skills (#4, 8). There was a final question asking students to rate their knowledge of the tuning Protocol overall (#15). The statements are included here for reader ease. The full survey, as indicated above, can be found in Appendix A.

1. I think getting feedback from my peers will help me improve my work.
2. I am comfortable giving feedback to my peers.
3. I am comfortable receiving feedback from my peers.
4. Engaging in self and peer assessment can facilitate the process of learning.
5. Working in a group setting will help me improve my spoken communication skills.
6. Working in a group setting will help me develop higher order critical thinking skills.
7. Working in a group setting will help me develop analytical thinking skills.
8. Working in a group setting will help me improve my reflection skills.
9. Working in a group setting will help me learn to express an opinion or clarify information.
10. Working in a group setting will help me think about and critique my own personal work.
11. Working in a group setting will help me think about and critique the work of a peer.
12. Working in a group setting will help me develop questioning skills.
13. Working in a group setting will help me develop the ability to expand logical thought patterns.
14. Working in a group setting will help me learn to synthesize information.
15. I understand what a Tuning Protocol is and how it helps to improve communication, thinking and reflective skills.

Data Collection
This was a mixed measures/repeat measures study. Data was collected at six points in time using the Tuning Protocol pre/post survey and the Tuning Protocol process logs and reflection worksheets. The initial attitudes pre survey was collected at point 1. This occurred approximately three weeks into the semester. Over the course of the semester, the Tuning Protocol (Appendix B) was used four separate times (T2-T5), usually at two-week intervals. After each experience with the Tuning Protocol, all participants, presenter and group members, were asked to reflect on the process of using the Tuning Protocol by completing the “Presenter and Group Member Reflection Response Logs” (Appendix C). Participants were also asked to reflect on their personal learning and communication, critical thinking and reflective skills by completing the “Post-Tuning Protocol Reflection Worksheet” (Appendix D). In each class, assignments were specifically designed for students to use with the Tuning Protocol. Samples of these assignments that were used in the teacher education and in the health education are included in Appendix E. The post attitude survey was administered the last week of the semester (T6). Table 1 illustrates the administration points of each of these data collection instruments.

DATA ANALYSIS

Quantitative: Pre-Post Survey Results
The first step that was taken was to code the 15 statements on the survey. The five statements that addressed communication skills were coded as “C”, the seven statements for critical thinking skills were coded as “T” and the two statements that addressed reflective practice were coded as “R”. The final question was coded as “KTP” or Knowledge of the Tuning Protocol. This allowed the researchers to cluster the questions into sub groups in order to run data analysis on particular group of questions or variables.

In all, there were 34 participants in this study (N = 34), twelve from the Teacher Education (n = 12) class and 22 participants (n = 22) from the Health Education class. Participants were also coded as Teacher Education (T) or Health Education (H). All responses to the pre-participation survey were coded with the letter “A” (“Q1A, Q2A, etc) and for the post-participation survey all responses were coded with a B (i.e. Q1B, Q2B, etc).

FINDINGS

Quantitative: Pre-Post Survey Reliability
Since the attitude survey was an original survey, the first statistical analysis was to establish the reliability of the
instrument. To accomplish this, a Cronbach Alpha reliability coefficient was determined using SPSS statistical analysis software. The Cronbach Alpha reliability coefficient for the pre survey was .88 and for the post survey it was .92. These results indicated that both surveys were reliable for the purposes of this study. The reliability results are shown in Tables 2 and 3 below.

<td>Cronbach's Alpha</td>
</tr>
<tr>
<td>Cronbach's Alpha Based on Standardized Items</td>
</tr>
<tr>
<td>N of Items</td>
</tr>
<tr>
<td>15</td>
</tr>
</tbody>
</table>

**Descriptive Results**

After the reliabilities of the instruments were established, an Inter-Item correlation matrix analysis was conducted to verify that each item on the survey was independently strong and that all items were asking different questions. No two items were correlated above .8. This result indicated that each survey question was independent of all other questions and that redundancy was not an internal flaw of the instrument. The inter-item correlation results are shown below in Table 4:

**Table 4**

</table>

Descriptive analysis continued with an analysis of the main variables of the pre and post surveys. Means for all items in the pre attitude survey were above 4.00. The range of means for the pre attitude survey was 4.09- 4.35 as indicated in Table 5:

In all, the findings indicated that there were positive changes in attitudes in this survey. When the means were visually compared, positive increases to the mean scores for ten questions were noted: #1(C), 3(C), 5(C), 6 (T), 8 (R), 11(T), 12 (T), 13 (T), 14 (T), 15(KTP).

However, the means of two items decreased slightly:
• #7 (T) “Working in a group setting will help me develop analytical thinking skills”
• #11(T) “Working in a group will help me think about and critique the work of a peer”

Additionally there was no change of attitude for Q# 4 (R), #9 (C), and #10 (T).
• #4 “Engaging in self and peer assessment can facilitate the process of learning.”
• #9 “Working in a group setting will help me learn to express an opinion or clarify information.”
• #10 “Working in a group setting will help me think about and critique my own personal work.”

T-Test Analysis
A majority of the attitudes demonstrated positive increases while two attitudes decreased between the pre and the post attitude surveys. In order to ascertain if the two decreases and the ten increases in mean scores were statistically significant, a paired sample T-Test was conducted. The results indicated that one item registered a statistically significant positive change in attitude: Q#3 “I am comfortable receiving feedback from my peers”. The T-Test results are shown below in Table 7.

DISCUSSION

Implications and Future Research
This study illustrated that the Tuning Protocol can be used across disciplines to provide student-centered instruction and foster experiential learning. Both the Teacher Education and the Health Education students appeared to benefit from participating in this study. A logical progression for future research would be to explore if there are differences between the Teacher Education and Health Education students. Also, it is hoped that an analysis of the reflection response logs and the reflection worksheets will shed some light on the reasons why some of the attitudes decreased or showed no increases or improvements. Detailed analysis of the qualitative data that was gathered in the presenter and group member reflection response logs and the post Tuning Protocol reflection worksheets will provide more insights into students’ responses and personal reflective thoughts. This written feedback will be studied for themes and core beliefs following established qualitative research methodology, as recommended by Krueger & Casey (2009), Yin (2009) and Cohen (2000). This project will be repeated in the upcoming semester to attempt to replicate the findings and gain further insights into how students can improve their communication, critical thinking and reflective practice skills by participating in peer assessment using the Tuning Protocol.
An analysis of the post attitude survey will also be conducted to decide if the language of the survey could be clarified. Specifically, the researchers wonder whether or not constructing the questions in the post survey using the past tense would have yielded different responses from the participants. Also, a redistribution of the attitudes may be considered. Specifically, there were only two attitude statements on reflective practice, while there were five for communication skills and seven for critical thinking skills. However, if the survey is altered, a new reliability coefficient will need to be determined. In addition, a revised survey may affect the researchers’ ability to compare the results with future studies, which could pose a considerable conundrum.

Conclusions
This study explored whether using a Tuning Protocol can improve student reflection, higher order thinking skills, communication skills, engagement, and active participation in higher education contexts. Preliminary findings indicated that the Tuning Protocol could be an effective strategy or tool to improve reflection, critical thinking skills and communication skills. The area of communication skills registered the greatest gains, along with the significant gain in students feeling comfortable receiving feedback from their peers. The Tuning Protocol can be used in a variety of settings and across curricula areas and can be effective in a range of academic contexts. More research is needed to determine how peer engagement using a Tuning Protocol may help to enhance reflective practice skills, communication skills and critical thinking skills.

Appendix B

Tuning Protocol Instructions

1. You are in groups of 3-4. Each person in the group will have a chance to present his/her assignment.

2. As each student presents his/her assignment, the other members of the group listen without responding or questioning. They should take notes to refer to later on (8-10 minutes).

3. Immediately after the presentation, group members may ask the presenter clarifying questions (5 minutes).

4. Members of the group think about "warm" and "cool" comments (warm is positive, cool is critical, not cruel feedback) and questions to ask. Presenter is writing a personal reflection. (5 minutes).

5. Group members offer the presenter “warm” feedback. The presenter takes notes and does not respond (5 minutes).

6. Group members offer the presenter “cool” feedback. The presenter takes notes and does not respond (5 minutes).

7. The presenter discusses what he/she has heard from the group members and responds to cool and warm comments. The presenter may also offer warm and cool comments to the group. Presenter and group engage in conversation (5 minutes).

Each “Protocol” should take approximately 20 to 40 minutes
Appendix C:

Post Tuning Protocol Reflection Worksheet

Name: _____________________________    Date: ________________

**Directions:** Type your responses into the following worksheet. Handwritten assignments will not be accepted.

1. Do you think the Tuning Protocol experience improved your written communication skills? Why? How?

2. Do you think the Tuning Protocol experience improved your oral communication skills? Why? How?

3. Do you think the Tuning Protocol experience improved your critical thinking skills such as analyzing complex issues, evaluating ideas, and synthesizing information? Why? How?

4. What were the cool/warm comments about your paper?

5. How did you react to the warm and cool comments?

6. What changes did you make to your draft paper as a result of the Tuning Protocol experience?

7. What did you learn about your writing and oral communication that you can apply to future assignments?

*This reflection will be evaluated as follows:*

3 = Superior demonstration of skill; Responded to all prompts, gave in-depth and thoughtful answers with examples
2 = Acceptable demonstration of skill; Responded to all prompts superficially, did not provide thoughtful answers and/or examples
1 = Unacceptable demonstration; Skill did not respond to all prompts, worksheet is incomplete
0 = Did not demonstrate skill; Did not submit reflection
Appendix E

Sample Assignment for use with Tuning Protocol

Guidelines for Writing a Good Thought Paper

- Approximately 1-page, typed, single-spaced, name and course on top.
- Draft papers are due at the beginning of Tuning Protocol participation class.
- Only hard copies of the draft will be accepted for Tuning Protocol experience.
- Email or Black Board Final versions (text documents in Word) on or before the final due date.
- Proofread your work! Spelling, grammar, and format are important.

No hand written or late papers will be accepted

- Discuss your thoughts in writing in relation to the topic covered.
- You are graded for your thoughts --do not just write a complete summary of the medium (e.g., article, film, or exercise). Spend 2-3 sentences categorizing the topic at the beginning.
- You will not be graded for your opinion-any opinion is acceptable-but you must explain why you have that opinion. Do not simply state an opinion. Back it up with examples.
- Keep in mind class discussions, other readings on the topic—you may want to discuss the topic in relation to other areas we have covered. Please do not regurgitate some else’s opinion. Remember, I want to know that you are thinking about issues and challenging major ideas related to family and social health.
- Take time to really reflect on the topic (e.g., challenge yourself to think in completely opposite terms, consider what assumptions you hold, ponder what you don’t believe to be true) before sitting down at your computer to write a response.

Thought Papers will be graded out of 20 points.

Assignment # 1

Draft Due: March 2nd

Final Paper Due: March 9th (With draft & notes from the Tuning Protocol attached.)

Health Education
For this assignment, find an advertisement depicting a family or a family health related topic in some way. You can explore magazines, newspapers, websites, or other material (i.e., television and radio ads) to find several different examples of diverse representations of families in advertisements (e.g., interracial, gay/lesbian, single parent etc.). If the ad is in print, photocopy or print out a copy of the ad to submit as part of your assignment. Briefly describe what you found. How do you think these representations of families influence societal expectations? How have the societal expectations of families created by the media influenced the mental or physical health of individuals within families?

(HELPFUL HINT FOR YOUR SCRAPBOOK: You may like to think about looking at and collecting some advertisements of families for your scrapbook. If you are interested in history, you can find vintage ads online and in the library too.)

Teacher Education (Childhood Education)

The Role of Family and Culture in Education:
For this assignment, select one of the scholarly reading articles that have been provided for this assignment or find one from a scholarly journal (not a magazine or newspaper article. Be sure to get it approved first). After reading the article, write a summary/reflection paper. First, summarize the article and give a brief synopsis of what the author is saying. Then, reflect on how the role of the family and culture affect child and adolescent development. Based on the article that you read, discuss how one of more of these factors affect childhood and adolescent development: ethnic, cultural, linguistic, social, economic and political factors.

Abstract

Research Objectives

English Language Learners (ELLs) are the fastest growing demographic population in US schools (Hoffman & Sable, 2006), and according to the census data in 2004-2005 approximately 5.1 million or 10.5 percent of the U.S. student population are English Language Learners, or ELLs (Short & Fitzsimmons, 2007; Boyson & Short, 2003; Kindler, 2002). According to a study published in 2009 by the American Institutes for Research (AIR) and WestEd, during the 2004-05 school year, there were over 5 million ELLs in our nation’s schools, an increase of 65% from the 1993–94 school year (Parrish et al., 2006). Spanish was the most common primary language spoken by ELLs, and about 70% percent of ELLs were native Spanish speakers (Capps et al., 2005). The New York City (NYC) Department of Education has reported the following statistics on the number of ELLs in NYC public schools (Office of English Language Learners, 2008, 2009; Acompore, 2008).

- In 2008, both ELL and former ELLs accounted for 26% (n=1,190,186) of the student population in New York City public schools.
- In the 2007-2008 there were 129,004 General Education ELLs along with 19,397 special education ELLs. These students accounted for 14.1% of the total student population.
- During this time period 41,061 ELLs were enrolled in grades 9-12 (28%).
- Long-Term ELLs (LTEs) accounted for 14% of all ELLs. LTEs are those students who have completed at least six years of ELL services in NYC schools. The majority of LTEs (56%) are enrolled in grades 9-12. Most LTEs speak Spanish (83%). ELL Students with Interrupted Formal Education (SIFE) accounted for 10.5% of all ELLs. Of the new SIFE students, the highest number and percentage (1320 or 38%) entered in grades 9 and 10 with a majority speaking Spanish (56.6). Half of all Spanish dominant SIFE ELLs are from the Dominican Republic.

These statistics demonstrate the prevalence of ELLs in US schools, particularly in urban centers. However, high school graduation rates and college entrance lag significantly for most ELLs (Cadiero-Kaplan, 2004, Callahan & Gándara, 2004). In New York City, ELL graduation rates were 31.6% in 2003 and 30.8% in 2007 (Office of English Language Learners, 2009). Low level academic literacy is revealed in annual scores from the National Assessment for Educational Progress (NAEP). In 2005, only 4% of eighth-grade ELLs and 20% of students classified as ‘formerly ELL’ scored at the proficient or advanced levels on the reading portion (Perie, Grigg, & Donahue, 2005). In 2008, 42% of NYC 8th grade ELLs passed their state Math exam. Of this 42%, the lowest percentage of pass rate by language spoken was that of Spanish speakers at 33% (Office of English Language Learners, 2009, p 18). However, when the data is disaggregated for special needs or SIFE, the overall pass rate on the 8th grade state math exam for general education ELL students was 53% (Office of English Language Learners, 2009, p 19). Either way, ELLs are entering high school with significantly lower academic performance levels than are their native English counterparts. As a result, to help ELLs process the complex, academically challenging materials of secondary school, cognitive and metacognitive strategies must be explicitly taught in the content classroom. In order to meet these demonstrated needs, the NYC Office of English Language Learners has developed a range of recommendations for
high schools serving ELLs including professional development for content teachers, small group work during content classes, and imbedding literacy strategies into content courses, particularly focusing on vocabulary development (Office of English Language Learners, 2008).

The research objectives of this study are to explore ways to help ELLs process the complex, academically challenging materials of secondary school, using cognitive and metacognitive strategies in the content classroom. This study is being conducted within a larger project that fundamentally alters the traditional, teacher-centered learning environment prevalent in urban classroom across the nation. The central learning experience in participating classrooms consists of small group learning experiences led by peer instructors. Growing out of a pilot study in the spring of 2009, the current study examines this program’s potential to maximize ELL content learning. The research questions are:

- What must peer instructors know in order to be successful at helping other students learn?
- How can peer instructors effectively support the learning of ELL students?

Background

Funded through a Mathematics and Science Partnership grant from the National Science Foundation, science and education faculty, teachers and high school students in New York City have collaborated to develop a highly successful instructional model for mathematics and science classrooms serving at risk students. In the Peer Enabled Restructured Classroom (PERC) students work in groups lead by a Teaching Assistant Scholar (TA Scholar) who guides the group activity, scaffolds learning of new concepts, and assesses student understanding. The TA Scholars must have passed the course and the state Regents exam in the relevant subject area, but do not need to have achieved an advanced score or be eligible for honors classes. The model initially was developed in a summer school for students who had not passed their state Regents exam during the academic year. Both test scores and qualitative studies of student and TA Scholar affective responses to the program suggest a highly successful model (Gerena & Keiler, 2009a; Gerena & Keiler, 2009b; Keiler, 2010). The extremely high pass rates for this program, two to twelve time standard city summer school pass rates, led to the adoption of the model for the academic year. In 2008-2009, participating classes had exam pass rates 20 percentage points higher than control classrooms. While these results have showed great promise for extending the model to additional schools and classrooms, the research team continues to explore ways to improve its application and explore ways teachers and peer instructors need to be supported during its implementation.

This study grew out of pilot work and preliminary observations during the summer of 2008 and the 2008-2009 academic year. Transitioning the PERC model from a summer revision program to a school year initial experience offered many challenges and opportunities during this period. These included the requirement of using high school students as TA Scholars, rather than college students. This decision was made in order ensure daily support in the classrooms, which was not feasible for college students’ schedules. The model of using high school students as the TA Scholars allowed for creation of a separate course to facilitate their experience. During the summer of 2008, three Living Environment (LE = biology) teachers worked together to develop this course for the peer instructors, creating a set of lesson plans for the year. The course introduced some pedagogical skills in the first segment, but quickly moved away from this focus to enriching the students’ understanding of biological content. The TA Scholars were earning a science credit for the course, making it seem important to spend the majority of the students’
time learning new content. However, observations of this 2008-2009 inaugural peer instructor course suggested that most class time was spent on immediate preparation for the next PERC lesson, which was confirmed in teacher interviews. When asked about the differences between the high school TA Scholars during the school year and the college students who staffed the summer programs, teachers immediately spoke of the difference in content knowledge expertise and confidence. This perception led teachers to estimate that they spent 60-90% of their TA Scholars class on reviewing and preparing the content for the PERC class. This was far from the original plan of the TA Scholars course and left the teachers wishing that they could achieve a broader range of pedagogical objectives with their peer instructors.

Previous studies of the PERC program have documented the lack of awareness of which students in the program were ELL or Former ELL (F-ELL) students (Gerena & Keiler, 2009a; Gerena & Keiler; Keiler, 2010) let alone what kinds of supports were required by these students. During interviews and surveys, teachers expressed a desire to provide their peer instructors with more targeted pedagogical tools to support the PERC students, particularly ELLs. During a feedback session, TA Scholars reported that one of their most significant frustrations involved working with ELL students who did not speak the TA Scholar’s native language. In response, Dr. Gerena began teaching research-based literacy interventions to a group of TA Scholars with one LE teacher during spring of 2009. This teacher reported that the TA Scholars and PERC students were successful using vocabulary-based tools and reading comprehension strategies during the PERC classes. During a TA Scholars class observation by Dr. Keiler, she noticed a negotiation between the teacher and TA Scholars resulting in an effective modification of one vocabulary tool based upon TA Scholars’ observations from the previous day. The conversation appeared to deepen the TA Scholars’ understanding of the concept being studied, provide feedback about student understanding to the teacher, and prepare both teacher and TA Scholars for the up-coming lesson, achieving many goals of the TA Scholars class. Dr. Gerena, in questioning the TA Scholars during their collaborative class with the teacher, found that the graphic organizer strategy that had been implemented the previous two weeks was generally considered by the TA Scholars to be an effective learning tool, especially with the ELL students. TA Scholars stated that the PERC students learned the vocabulary better, and that it was not time consuming to use the graphic organizer. Statements from TA Scholars included: “They (vocabulary maps) help explain the words they (the PERC students) have to learn” and “It is helpful for them to see words and meanings.” On the time issue it was stated that, “It only took a few minutes once they (the PERC students) understood what to do.” However, the teacher reported that not all TA Scholars used the tools regularly with their students, raising the questions of who should be making such implementation decisions. What was learned from this pilot study and research about other aspects of the program (Gerena & Keiler, 2009a; Gerena & Keiler, 2009b; Keiler, 2010) shaped the current exploration of peer instructors and ELL students.

**Literature Review**

Second language acquisition is a complex process that encompasses social or conversational language (Basic Interpersonal Communication Skills, or BICS) and academic language proficiency (Cognitive Academic Language Proficiency, or CALP) (Cummins, 1994, 1981). ELLs initially develop social language through daily interactions with English speakers. While ELL adolescents may use conversational language fluently, even incorporating idiomatic expressions effectively, social language is easier to master and is acquired through interaction with peers and adults, both in and out of school. It is developed using face-to-face interaction and
concrete contextualization in social settings. However, social language is not sufficient to process challenging content in an academic setting.

The language of academic proficiency is developed over many years of academically challenging grade level content instruction and is difficult to master. It is the language of school and usually tied to abstract concepts, de-contextualized thought processes, and abstract language skills. In the classic literature of social language versus cognitive academic language proficiency, experts in the field of second language acquisition argue that social language is simply the language of everyday conversations supported with contextual clues while academic language is the language of school and is usually developed through literacy (Balderrama & Diaz-Rico, 2006; Chamot, 2009; Chamot, & O'Malley, 1994; Cummins, 1981, 1994; Curtin, 2009; Echevarria, Short, & Vogt, 2008; Faltis & Coulter, 2008; Genesee, Lindholm-Leary, Saunders, & Christian, 2006; Reiss, 2008; Thomas & Collier, 2002). Development of academic language for ELL/F-ELLs in challenging content takes considerably longer than social language to fully develop and is dependent on a student’s previous schooling and literacy development (Cummins, 1994, 1981).

Both aspects of language are necessary for social and academic success but without the development of cognitive academic language, success in school will be limited. Students who have mastered social but not academic language may seem fluent but will have difficulty with dense subject matter. Many times LT-ELLs and newly reclassified F-ELLs may appear to be fluent in English because of their well-developed social language, and are mistakenly thought of as having mastered the complex language of cognitive thought. However, they may still struggle with complex academic material since they do not have grade appropriate academic language. This struggle is often misunderstood as a lack of interest or ability. Lack of academic language skills can lead to course failure, poor performance on exams, and acts as a de facto barrier to academic success and high school graduation. Academic language is not usually developed outside of the educational context and so it is imperative that students who have mastered social language are not left unsupported when trying to negotiate the language of learning.

Learning from peers

While the in-class peer instructor model is a novel approach to classroom instruction, research on the experiences of more traditional tutoring relationships is relevant to the current study. For example, research has shown that both tutors and tutees in experimental groups exhibit higher critical thinking (Shamir, Zion, & Ornit-Spector, 2008). It also reveals that learning from “near-peers” (Lockspeiser, O’Sullivan, Teherani & Muller, 2008) is valuable since the tutors have recently studied the material and have struggled with it themselves. Roscoe and Chi (2008) report that peer tutoring has found that students sometimes benefit academically from tutoring other students. Additionally, peer tutoring programs in math have demonstrated that peer tutoring can be effective for African American, other minority students and White students who participate as tutors, as tutees, or both (Robinson, Schofield & Steers-Wentzell, 2005). Stoddart, Pinal, Latzke, and Canaday (2002) go further to state that: “The integration of authentic hands-on inquiry with linguistic and metacognitive analysis serves to promote the development of higher order thinking skills.”

Literacy Strategies

A review of the literature and a review of research findings have shown that ELLs need to develop specific literacy skills in order to be successful in content area learning. Out of this
grows the conceptual framework that ELLs must be given explicit training and teaching in cognitive and metacognitive strategies to help them process complex, academically challenging materials while they are acquiring a second language (Balderrama, & Diaz-Rico, 2006; Carlo, August, McLaughlin, Snow, Dressler, Lippman, Lively, & White, 2004; Chamot, 2009; Cummins, 1994, 1981; Curtin, 2009; Echevarria, Vogt & Short, 2004; Faltis, & Coulter, 2008; Fradd & Lee, 1999; Genesee, Lindholm-Leary, Saunders, &, Christian, 2006; Hart & Okhee, 2003; Reiss, 2008; Thomas, & Collier, 2002.) In fact, Meltzer and Hamann (2005) state that “If, as student outcome data suggest, traditional approaches to content-area teaching and learning are not meeting the needs of many students, serious changes are in order” (p.61). Francis, Rivera, Lesaux, Kieffer and Rivera (2006) continue to make a clear case for the need to develop academic language in ELLs:

Unfortunately, ELLs often lack the academic language necessary for success in school. This lack of proficiency in academic language affects ELLs’ ability to comprehend and analyze texts in middle and high school, limits their ability to write and express themselves effectively, and can hinder their acquisition of academic content in all academic areas, including mathematics.

It is important to distinguish academic from conversational language skills, as many ELLs who struggle academically have well-developed conversational English skills. To be successful academically, students need to develop the specialized language of academic discourse that is distinct from conversational language (p. 7).

Torgesen, Houston, Rissman, Decker, Roberts, Vaughn, Wexler, Francis, Rivera and Lesaux (2007), Metzer and Hammon (2005), and The National Reading Panel (August & Shanahan, 2006) state that literacy strategies are key to ELLs’ access to content area knowledge. ELLs need “direct and explicit” instruction (Torgesen., et al. p 97) to develop academic language, word learning skills (use of cognates, word roots, base words), vocabulary, comprehension, thinking skills. They need expressly to be taught strategies and approaches to process text and sophisticated higher order thinking skills, such as questioning, clarifying, predicting, and summarizing. Even students who come to the content class with well developed literacy skills in their first language will need direct and purposeful instruction to access these skills. Those who come with low levels of first language literacy will struggle even more. Approaches are needed that will allow students to process both language and content, develop comprehension skills and provide systematic opportunities for peer interaction.

Content teacher pedagogy must include using specific cognitive, metacognitive and social interactive strategies to help second language learners become more scientifically and mathematically literate and to develop and expand the specific skills needed to be successful in the math and science classrooms. The development of cognitive skills can help the learner develop an active role in organizing the information to be learned, including note taking, visualizing, drawing, illustrating, predicting, guessing, rereading or re-listening. Metacognitive strategies help the learner take steps towards self-monitoring or self-assessing, by planning strategies, such as previewing materials, thinking while reading or speaking, reflecting and maintaining journals or logs. Social affective strategies help learners practice communication and social skills in conjunction with others who are also learning the material (Chamot, 2009; Corder, 2007; Curtain, 2009; Echeverria, Short & Vogt, 2008; Peregoy & Boyle, 2008).
ELLs and struggling F-ELLs in the content classroom must have a full linguistic portfolio to be able to access the academically challenging content and language of the subject matter. These skills are expressly acquired through literacy and literacy related skills. They are developed through reading comprehension and writing, and they promote the development of higher level thinking skills. To help ELLs and struggling F-ELLs process the complex, academically challenging materials of secondary school, cognitive and metacognitive strategies must be explicitly taught in the content classroom. In order to meet these demonstrated needs, the NYC Office of English Language Learners has developed a range of recommendations for high schools serving ELLs including professional development for content teachers, small group work during content classes, and embedding literacy strategies into content courses, particularly focusing on vocabulary development (NYC DOE Office of English Language Learners, 2008). However, although these recommendations have been made and there have been a central office calls for organizational support, there is no consistent evidence that these strategies are being implemented in the classroom. ELLs are still falling behind.

Also it is not sufficient to simply use literacy interventions and strategies that have proven useful to or successful with native English speakers. Strategies must be targeted and tailored to the specific needs of the ELL and struggling F-ELL students to maximize their effectiveness. The need to develop vocabulary, oral language, and background schema are more pronounced in ELLs than native English speakers (Short & Fitzsimmons, 2007). August and Shanahan (2006) report in the Executive Summary of the National Literacy Panel that the experts agree that:

Instructional approaches found to be successful with native English speakers do not have as positive a learning impact on language-minority students. It is not enough to teach language-minority students reading skills alone. Extensive oral English development must be incorporated into successful literacy instruction. The most promising instructional practices for language-minority students bear out this point: Literacy programs that provide instructional support of oral language development in English, aligned with high-quality literacy instruction are the most successful (p 4).

Highly developed literacy strategies in an academically challenging subject such as biology are critical to student success. We have seen how Cognitive Academic Language Proficiency (CALP) skills are requisite for students to be able to read and process information (Cummins, 1981, 1994). Student literacy levels must be developed in the content area to assure access to the conceptual and analytical skills required to achieve at a high level in the content classroom. Unfortunately ELL students lag far behind native English speakers in their development of literacy skills and the gap between ELLs and non-ELLs has been a consistent cause for concern (Koelsch, 2006, Ruiz-de-Velasco & Fix, 2000; Snow, 2002; Snow & Biancarosa, 2003). While this may be cause for concern for all ELLs, the Hispanic ELLs are the least prepared in literacy and have the lowest high school graduation rates of all ELLs (Ruiz-de-Velasco & Fix, 2000). As researchers seek information on the causes of and remedies to these dismal statistics, several areas of intervention have been recommended. Content area teachers must infuse literacy skills into the content curriculum by tapping into students’ prior knowledge, modeling and demonstrating how to make inferences, and develop text level literacy skills, and integrate metacognitive skills and cognitive skills to develop both vocabulary and expository text awareness (Lesaux et al., 2006). It is believed that providing ELLs with rich literacy skills and strategies will improve educational outcomes, and increase high school graduation rates (Lesaux
& Geva, 2006). In fact, more successful high schools have been identified as those where teachers work collaboratively, meet regularly and engage their students in high level literacy activities. Teachers in these schools appreciate the importance of professional development and search for connections across curriculum lines (Langer 2009). In a report prepared by the national High School Center (2009) it was revealed “high schools that emphasized literacy across the curriculum areas were identified as having higher achievement levels and ‘better-than-average performance among ELLs.’” (p5).

The ability to impact student learning must come from a better prepared educational community. Teachers must infuse these literacy skills in their content classrooms and to do so successfully they must receive quality ongoing professional development to improve literacy skills in their ELL student population (Walqui, 2001; Walqui, van Lier, & Koelsch, forthcoming). Heller and Greenleaf (2007) state it succinctly and unconditionally: “Perhaps the greatest challenge of all has to do with the scarcity of ongoing high quality professional development for teachers. In spite of the many workshops and textbooks dedicated to literacy across the curriculum, and in spite of the single pre-service course required in most states, few of the nations secondary school teachers have had meaningful opportunities to learn about the reading and writing practices that go on in their own content areas” (p18).

Strategy development to improve literacy among adolescent ELLS has been identified as a critical area of need and a precursor to improved educational outcomes. In grades 6-12 students must be able to read, discuss and write in the subject area they are studying. High school teachers must therefore become literacy teachers; in effect they must provide their student with strategies to negotiate the content reading material. This may be a new role for high school teachers who traditionally see themselves as experts in the content and not in reading. As a result, teachers need to be retrained to understand the value of literacy strategies and to provide students with opportunities to use strategies in the content classroom. Content areas teachers must take on the role of literacy teachers because increasing literacy skills will improve ELLs academic success (Koelsch, 2006; Leasaux, & Geva, 2006; Walqui, 2001, 2000).

What then should high school biology teachers and tutors focus on to provide ELLs with literacy skills? Short and Fitzsimmons (2007) describe the challenges and solutions of providing literacy skills to adolescent ELLs. They report on a successful high school that incorporated a variety of literacy strategies such as anticipatory activities, shared reading or read-aloud activities, structured note-taking, graphic organizers, vocabulary instruction, writing to learn prompts, and reciprocal teaching addition to questioning techniques as part of the overall classroom structure to help improve ELL literacy skills.

Approaches to improve literacy in ELLs includes explicitly teaching reading comprehension strategies, such as making inferences, predicting, summarizing,previewing, reviewing, comparing contrasting, analyzing, note taking, clarifying, interpreting, understanding relationships, identifying main idea, connecting themes, ideas and concepts, and linking to previous knowledge (Denti & Guerin, 2004; Garcia & Godina, 2004; Bernhardt, 2005). If students are literate in their home language, these strategies may not have to be explicitly re-taught as it is widely held that comprehension and literacy skills may be transferred from the first language to English reading with guidance from a skilled literacy teacher (August, 2002; Riches & Genesee, 2006). But if students are not fluent readers in their home language, these strategies will have to be explicitly taught in the second language and applied consistently.

Another area that needs to be explicitly developed in ELLS is vocabulary. In order for high school students to access the high level content they must have approximately a vocabulary
of 50,000 words (Graves, 2006). ELLs are under increasing pressure to acquire this vocabulary knowledge in a relatively short amount of time. Strategies to increase vocabulary include a wide variety of graphic organizers, use of visuals and demonstrations, use of cognates, use of affixes and prefixes for word identification and meaning, use of context clues, understanding words with multiple meanings, idiomatic and metaphorical expressions, and specific content related words. This vocabulary growth must be expressly and explicitly taught to ELLs in the content area classroom as well as the English classroom (August, 2003; Echevarria, Vogt, & Short, 2004; Graves, 2006).

**Methodology:**

This study examines the process and impacts of an intervention to improve content learning by ELL students through enhanced literacy skills. A university faculty member who is an expert in Living Environment curriculum (Dr. Keiler) is working with and supporting the teacher and the TA Scholars in the academic content. A university faculty member who is an expert in English Language Learner (ELL) development (Dr. Gerena) is a co-investigator in the project to assure that ELL pedagogy and linguistic needs are met. Workshops, seminars and weekly visits from the university faculty members are providing pedagogical, linguistic, instructional and academic support to the teachers and the TA Scholars. Both researchers focus on delivering the strategies and learning tools to help TA Scholars be successful at helping other students learn and effectively support the learning of ELL students in addition to their role as researchers in the project.

**Pilot Study**

During the pilot study phase (spring 2009) of the project the researchers worked with the teacher and the TA Scholars in the PERC classroom and offered assistance in planning lessons for at risk students in the class, both mainstream and ELL, with the focus on instructing tutors in content and pedagogy. The teacher could not assume that the TA Scholars had the knowledge, skills and dispositions to teach high level, complex content. The TA Scholars, who were high school students themselves, needed to be carefully monitored to assure that the learning environment remained focused and in control, on task, pedagogically sound and content accurate. Teacher not only pretaught and pre-assessed the content that the TA Scholars would be covering in class, but they also trained the TA Scholars in effective teaching pedagogy, strategies and ways of learning. This was especially true for at risk English Language Learner.

The various data sets, including interviews, focus groups, classroom observations, were analyzed and interpreted to develop findings, themes, and suggestions, following Kruger and Casey (2009) and Yin (2009). Thorough reiterative readings, patterns emerged from the data sets that provided insights about the processes occurring the classroom (Huberman & Miles, 1994).

During the pilot study, the teacher and TA Scholars focused on developing targeted pedagogical tools to support their students, particularly with ELL students. As a result, Dr. Gerena began to teach research-based literacy interventions to a group of peer instructors with one LE teacher. Strategies included concept definition maps, vocabulary graphic organizers and a text deconstruction strategy known as Questions Answer Response (QAR).

**Continuing Research**

During the 2009-2010 academic year, the researchers worked with a Living Environment teacher in a science-themed urban high school serving struggling, at risk students, both
mainstream and ELLs. The teacher has two PERC classes and one TA Scholars class, plus other classes not related to the program.

A preliminary survey was developed and implemented at the first teacher and TA Scholars meeting in order to determine both the teachers’ and TA Scholars’ experience and expertise in working with ELL students and literacy strategies, as well as their own language backgrounds, (see Appendix A). Data was collected from all the teachers and TA Scholars participating in the PERC program during the 2009-2010 academic year in order to contextualize the data from the study participants. Schools not participating in this literacy intervention will be used as controls throughout the study.

Each week we met with the teacher and his TA Scholars during their class to provide professional development concerning using literacy strategies to enhance content learning, particularly by ELL students. Each month a different area of literacy was the focus of the professional development. The eight strategy areas are: 1) vocabulary building/concept definition mapping, 2) pre-viewing/reviewing text, 3) summarizing, 4) comprehension/inferring/analyzing, 5) main idea/predicting/visualizing, 6) reciprocal teaching, 7) learning logs and self assessments, and 8) graphic organizers. During planning periods, the teacher was introduced to multiple specific strategies within each area so that he could develop a complete literacy ‘tool kit’ to implement throughout his career. In collaboration with Dr. Keiler, the teacher evaluated the literacy strategies for appropriate matches with the content being taught each month. Dr. Gerena and the teacher then trained the TA Scholars in using the selected strategies, with particular attention to how to use the strategies with ELL students. Based upon feedback from the pilot study teacher about minimizing the number of specific strategies in order to enable the TA Scholars to master implementation, new strategies were introduced when the TA Scholars are proficient in using the previous strategy.

During PERC classes each week, data was collected through classroom observations and collection of students work samples. Additionally, the teacher and TA Scholars, as well as their students, were interviewed to ascertain their perceptions of the success of the literacy strategy implementation program. Ultimately, the impact of the program was measured based upon the performance of the ELLs and other students in their coursework and state Regents exam. All participants were assigned pseudonyms.

Findings:

Experience with literacy strategies prior to the study

Integral to this project is the introduction and teaching of cognitive and metacognitive learning strategies to Teaching Assistant Scholars and PERC students, and by extension, the participating teachers. During the pilot, literacy strategies were incorporated into the content teaching. These strategies were introduced, modeled, demonstrated, monitored and observed by both investigators. Observational and qualitative data was collected during the pilot study through field observations and weekly meetings with teacher and TA Scholars. Quantitative data was collected through surveys of the teacher, TA Scholars and students, as well as test scores and grades. Preliminary findings suggest potential for the literacy interventions to have a positive impact on student content learning as well as raising questions for further exploration. Use of the concept definition map and the QAR literacy strategy were in the beginning stages when the pilot study was terminated at the end of the academic semester. The teacher and the TA Scholars reported that these strategies were beginning to show effective student outcomes, such as greater ability to read questions and the ability to organize high-level content material.
Ten of the 12 Living Environment TA Scholars who completed the survey indicated that they grew up speaking a language other than English, with seven claiming oral and written literacy skills in that other language. Eight TA Scholars indicated Spanish as their primary language, one Albanian, and one Urdu.

On this preliminary survey, the TA Scholars were asked about their experiences, beliefs and comfort levels concerning learning math and science with literacy pedagogies and ELL students. All but two of the TA Scholars indicated some experience using reading skills to learn math and science themselves, and all claimed to believe that reading would help their students learn content. However, only four of these respondents indicated that at this point they were comfortable using literacy to teach math and science, the lowest level of agreement for all the statements. While all but one TA Scholar believed that they were capable of working with ELL students, four did not believe that their students would be successful passing the state exam. This data suggests that the TA Scholars, based upon their experiences and attitudes, need to and are prepared to learn literacy-based pedagogy to help their ELL students to master science content.

On the preliminary survey, the TA Scholars reported widely varying experience with the different areas of literacy strategies. Most or all TA Scholars reported that they have used previewing, summarizing, inferring, and predicting. Approximately half the TA Scholars reported having used reciprocal teaching and graphic organizers, while only one third had used mapping techniques or learning logs. This data about the TA Scholar’s experiences will help shape the professional development for the tutors.

**ELL Student and TA Scholar perspectives on literacy strategies**

**Responses to literacy strategies**

When asked about the most important thing she had taught her students this year, TA Scholar Susan answered, “Probably GIST, things like strategies...because it helps them
minimize the question or a paragraph into something they will understand better.” Susan claimed that her students had a range of responses to the strategies such as GIST. For example when asked if students used strategies on their own, she explained, “Francesca, she hate uses GIST, which is why I like to use GIST so she’ll get accustomed to it. That’s why she was sarcastic today. Yeah, they use it and then they put it into smaller words.” This TA Scholar perceived that some students were able to appreciate the importance of the literacy strategies while others had to be encouraged to persist with the tasks.

Literacy and test-taking

Both ELL students and their TA Scholars claimed that the literacy strategies helped students with high stakes tests. David and Jose, ELL students in the PERC class, claimed that their TA Scholar helped them to approach test questions effectively. Danny started describing what they were taught, “Every time your going to do an outline, or a question, or multiple choice, read the question. Read the questions before any passages; try to break it down in different ways so you can understand it.” Jose added, “To like really read the question over. Sometimes you may slip up.” And David concluded, “So you can get the point of the question.” These students suggested that the strategies helped them make sense of test passages and questions, leading to success in answering these literacy-based science questions.

The TA Scholars talked about the ways in which literacy strategies helped the students persist with difficulty questions. For example, Nadia described her students’ approach to test questions that require reading a passage before and after literacy intervention:

I think a lot of the test-taking strategies, like mostly when they, when they’re presented with a test they just read through it and if they don’t understand they just keep moving through it. But now they’ve more learned a dissecting a question and seeing what parts they understand and how they can infer what the answer is. Before, “oh, I don’t understand; let me just skip it.”…

When asked for a specific example, she continued,

Like with Michael, before if he didn’t understand something he would just like let it go, and he would just leave the paper there, and now, we were going over a paper, we were going over a test, and he showed me that he was underlining what the question was asking him. Maybe not for all questions, but he tried for some of the questions and it was a big improvement from just throwing the question away.

This persistence is vital if the ELL students are going to succeed on high stakes exams, which are required for graduation and important in college admission.

Transfer of literacy strategies

The ELL students discussed the ways that they used what they learned in Living Environment class to help them succeed with literacy-based tasks in other classes. Anna explained that her TA Scholar had taught her to “take apart a text,” which she used in other classes. In response to a question about using these literacy strategies in other classes, Hugo explained that he used them in, “English or even by my own self. If I’m doing something at home, homework or something…. usually when I don’t understand something, I probably highlight it. That way, the next day, I make sure I ask the teacher what I’m having problems with. And, I get to learn the topic to the full extent.” Maria described an experience with a reading during the evolution unit,
The TAs had to teach us a certain way that you could read it without the information all getting, like thrown at you. So we would summarize the whole first paragraph and then move on to the next one. So now in English that makes it so much more easy than you just reading it and being like, “Oh, what did I just read?”

Maria’s description suggests that the literacy strategies helped her take ownership of reading assignments in multiple classes. David claimed that he used the approach to breaking down questions that his TA Scholar taught him in his other classes, asserting that this raised his grades, resulting in an upward spiral of performance: “you get a better grade, then you start getting things more, you start doing your homework. It’s going to be easier.” David believed that the literacy strategies he was learning in Living Environment improved his learning, performance and attitudes across subject areas.

The TA Scholars also believed that students could and did transfer the literacy strategies they learned in Living Environment class to other courses that did not have TA Scholars. Susan argued that having TA Scholars in Living Environment helped students in other classes because they could transfer literacy skills that the TA Scholars taught to classes such as English and Global History. Matthew claimed that the literacy skills the students developed in Living Environment was important for all classes, providing an example, 

Some students have read books in their English classes and some don’t understand what’s going on in the story. So, sometimes they read one page and on another paper they just write what that page talks about and it just helps them remember things. And, they always ask themselves a question, “What is this passage saying?” in their head, without even writing it down. So, it’s pretty helpful.

Ivonne shared, “I heard one of my students said that they used GIST for English, to review. I guess it was an essay or something like that. And it really helped them.” Amy summarized her discussion of ABC Brainstorming, GIST, and tiered vocabulary by proposing that: “The literacy strategies, they can recycle.”

The literacy strategies also benefitted the TA Scholars in their other classes. Both Susan and Denise claimed that they themselves used the literacy strategies that they were teaching their students in their own classes. Denise explained, “When I have to do my AP US outline, because they’re really long and tedious, so I have to use GIST to write a sentence for each paragraph.” She then shared her wish that she had used the strategy on her SAT exam, believing that it would have improved her English score. Ivonne argued that being TA Scholars helped them be better students because they used study guides, GIST, and concept maps as TA Scholars, which they could then use in other classes. The TA Scholars spontaneously transferred these skills to their own learning experiences, as neither the teacher nor the researchers suggested that they do so.

**Modifying literacy strategies**

While the TA Scholars appreciated many of the strategies, they emphasized the need to prioritize the students when making instructional decisions. Nadia recommended, “I think adapt the strategies to the kids. Not adapt the kids to the strategies, but the strategies to the kids.” When asked to expand on this she explained, 

a lot of the strategies is with an ideal type of student in mind. It’d be better if we saw a group of students that learn the same and see how, what they do that helps them. And then modify it and create a strategy rather than get a strategy and see how it works on your kids. It should be from them up, not from like the other way around.

This approach to strategy develop holds promise for future research.
Educational or Scientific Importance of the Study

Literacy skills and learning strategies must be developed if ELLs are to be successful in the secondary science classroom. While there is general agreement that ELLs share many characteristics with struggling native English readers (Short & Fitzsimmons, 2007; Ruiz-de-Velasco & Fix, 2000), there are language specific areas that impact ELLs in the literacy process. Multiple meanings of academic vocabulary and terminology, lack of culturally acquired prior knowledge, low levels of oral language proficiency which impacts comprehension of the written text, all affect ELLs in the content classroom. Content-area literacy, which includes vocabulary development, activating background knowledge, specific literacy comprehension skills (main idea, prediction, inference, etc), and text awareness (text organization, key concepts, expository text structure, etc) are essential for adolescent ELLs who lack reading strategies in their native language (Short & Fitzsimmons, 2007; Meltzer & Hamann, 2005). This study explores ways that content area teachers can provide language in context, modeling, critical thinking and reasoning activities, exposure to scientific text structures, and active student involvement in processing text. Along with these strategies, active participation and interactive collaborative learning are indispensable if ELLs are to be provided with an equitable and comprehensible education in the secondary content classroom (Jamestown Reading Navigator, 2007; Meltzer & Hamann, 2005, 2004; Peregoy & Boyle, 2008, 2000). Stoddart, Pinal, Latzke, and Canaday (2002, p 683) go further to state that “The integration of authentic hands-on inquiry with linguistic and metacognitive analysis serves to promote the development of higher order thinking skills.” These types of learning experiences are imbedded in the structure of the PERC classroom, and this study demonstrates ways that a focus on literacy can be integrated into such active learning experiences.

Thank you!!!
Teacher Assistant Scholars Survey- October 3rd

My Teacher’s Name:         My School:

Subject Area: Math  or  Science

Did you grow up speaking a language other than English?  Yes  No
   If you answered Yes, which language? ___________________________
   Do you read and/or write this language? ___________________________

Were you ever in a school ELL or ESL program?  Yes  No
   If Yes, how many years? __________
   Which years in schools? (e.g. 2nd & 3rd grade) __________

Circle the answer that best shows your level of agreement with each statement.

6. I have experience using reading skills to learn math and science.
   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

7. Reading skills will help the students in my group learn math and science.
   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

8. I am comfortable teaching reading skills to my English Language Learners in my content area teaching.
   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

9. I am comfortable in my ability to teach science and math to English Language Learners.
   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

10. My English Language Learner students can pass the Regents Exam at the minimum score of 65.
   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

11. Check each of the following reading skills that you have used or would like to use.

Purpose

With the economic globalization and the rapid innovation of telecommunication technology, the means of communication have evolved from face-to-face meetings, text-based communication, either synchronous or asynchronous, to long-distance videoconferencing. While many researchers and educators encourage cross-cultural videoconferencing communication in foreign language instruction (e.g., Coverdale-Jones, 2000; Glisaan, et al., 1998; Morand, & Ocker, 2003; Shi, 2005), few empirical studies have been conducted specifically to investigate the learning process itself, particularly, the use of politeness strategies (Brown & Levinson, 1987), which has previously been found not only to create a comfort zone for discussion but also to interfere with students’ negotiation of meaning in asynchronous computer-mediated discussions (Yang, et al., 2006). This pilot study was designed to continue this line of research and investigate how politeness strategies were used in a Cross-Cultural Distance Learning Project, in which university students in Taiwan communicate with students in Japan on regular bases in one semester.

Theoretical Framework

Recently, due to the development of technology and Internet services, video-conferencing starts to receive much attention from language educators and researchers. Glisaan, Dudy, and Howe (1998) explored the use of distance learning on secondary school students who were learning Spanish and found that video-conferencing improved their listening comprehension skills. Meanwhile, investigating students’ perceptions between students learning German and native German speakers, Coverdale-Jones (2000) reported that videoconferencing communication provide more and better opportunities for the communication and interactions between people across different countries than other modes of online communication. In Shi’s (2005) study, her students reported that communicating with students from other countries, even with those non-native English speakers, via videoconferencing was beneficial and more authentic than text-based communication. Nevertheless, most previous results were mainly based on students’ perceptions, but few analyzed the actual process of the communication. This study intended to explore further on this issue in terms of what strategies, namely politeness strategies, used in the videoconferencing communication and how these strategies may affect the process of the negotiation of meaning.

Politeness in discourse was first introduced by Lakoff (1973) and further defined by Brown and Levinson (1987). They proposed that when individuals try to address their ideas towards certain issues, they tend to express their thoughts in an appropriate manner, taking their listeners’ feeling into consideration. In Brown and Levinson’s view, the core of politeness strategies is the concept of
saving-face, in another word, how to “communicate politely to maintain each other’s face” (Carlo & Yoo, 2007, p. 198). Three types of politeness strategies were proposed: a) positive politeness, with which the speaker presents his/her gratitude in the way that his/her hearers would like to hear, tending to save the speaker’s face by “minimize[ing] social distance with the hearer” (Carlo & Yoo, 2007, p. 199); b) negative politeness, with which the speaker tends to decrease any obligation or threat that he/she wants his/her hearers to consider or follow, trying to save the hearers’ face by “increase[ing] social distance and not impose[ing] upon the hearer” (Carlo & Yoo, 2007, p. 199); and c) off-record, with which the user attempts to make a statement that is open to his/her hearers to decide it is obligatory to them. Briefly speaking, positive politeness strategies address saving hearers or readers’ face, whereas negative politeness strategies address saving the speakers or writers’ face by presenting social “distance and impersonality” (Vinagre, 2008, p. 1025).

In recent years, several researchers explore politeness strategies in computer-mediated or computer-supported educational environments. Vinagre (2008) examined how students from two countries, Spain and U.S., employed politeness strategies to reduce face threatening in collaborative email exchanges and found that students at both sides used both positive and negative politeness strategies; however, Spanish students used more positive politeness strategies (218, about 57%) than U.S. students (165, about 43%). The positive politeness strategies mostly used in this email exchanges were “claiming common ground,” “assuming or asserting reciprocity,” and “conveying cooperation.”

Through literacy activities in asynchronous online discussions, Yang et al. (2006) emphasized the importance of taking politeness into consideration by stating that “a concern with politeness in discourse is more than simply an additional veneer added to make one’s words ‘nicer’ but instead, seems to be at the core of reflecting how words enact or reflect the relationship between interlocutors in any discourse event” (p.342). In the asynchronous online collaborative learning, the 32 graduate students seemed to apply positive politeness strategies almost two times more than negative politeness strategies because the students were equally competent, and tried to negotiate meaning and learn the constructs in scholarly papers. In addition, using positive politeness strategies in their comments seemed to reduce negative feelings, like feeling isolated, and further increase their learning and participation, or refining their words and thoughts. However, being too polite to each other due to fulfilling the needs of the interlocutors hindered their willingness to negotiate more deeply for learning the new constructs.

This study intended to extend the exploration on politeness strategies to the communication in videoconferencing environment, focusing on students’ use of politeness strategies in a cross-cultural communication project, where students at universities in Taiwan and Japan discuss online via video-conferencing in small groups, with only two to four students from each university in one discussion group. The purposes of this study were to find out what politeness strategies students in both universities used in videoconferencing communication and uncovered what kind of strategies, positive or negative strategies, were most frequently used. Moreover, this study explored the role of politeness strategies in the communication process.
Method

Though the participants were 43 university students (25 from Taiwan, 18 from Japan), the main focus in this study was on the Taiwanese students. The course at the university in Taiwan was elective for EFL majors, but was a free and open course for any majors at the Japanese university. The students were divided into small groups, with two to three students from each school. There were four topics for this course, two weeks for each topic, from 1) Introduction, 2) Advertising, 3) Front Page, and 4) Country Images. Within each topic, the students have one class with the classmates in their own university, and one joint class with the other university students. There were tasks assigned in each topic in the textbook, such as creating a catchy phrase or advertisement slogan for an international cellphone company, for the students to complete via the videoconferencing communication with those from the other university. Due to the constraint of the technical issues, for each online discussion, three groups were chosen to be recorded and later transcribed verbatim. The reflection papers that the students were required to turn in for each topic were also collected as part of the data.

Transcripts of the discussions were analyzed through discourse analysis based on Brown and Levinson’s (1987) definition of the politeness strategies. We first carefully established a coding scheme for each strategy based on the theory and then coded the transcripts accordingly to identify the politeness strategies used in the cross-cultural video-conferencing discussion. Each complete idea, usually a complete sentence, was given one code, if a politeness strategy was revealed; however, we did not double code each unit. Peer-debriefing was conducted and the differences of interpretation were resolved by discussions. Content analysis and qualitative coding procedures (Lincoln & Guba, 1985) were applied to analyze the reflection papers to determine how politeness strategies facilitate or hinder students’ negotiation of meanings.

Results

In the following, we presented the major results found in this study and related discussions. They are politeness strategy use, including positive and negative strategies, and the role of politeness strategies in the communication.

Politeness Strategy Use

Table 1 and 2 present the 15 positive politeness strategies and 10 negative strategies respectively, with a brief definition of each strategy modified from Brown and Levinson’s (1987), the total number of times that we observed the strategy in the transcripts, and at least one typical example for each strategy. Among the strategies, Positive Strategy #1, “notice and attend to H” needs further explanation. Although each response to the group members may be considered as giving notice or attention to the hearer, only the utterance that was explicitly stating the matter was coded. Moreover, because the students were communicating using a foreign language, i.e., English, and their language proficiency was not high, some of the strategies that may require higher language proficiency to express, such as Positive Strategy #9, “assert or presuppose S’s knowledge of and concern for H’s wants,” Positive Strategy #14 “assume or assert reciprocity,” Negative

Go on record as incurring a debt, or as not indebting H
Disclaim the indebtedness of H
0

Total 525

Strategy #3 “Be pessimistic,” Negative Strategy #9 “nominalize,” and Negative Strategy #10 “Go on record as incurring a debt, or as not indebting H,” were not found in the results.

The results showed that the students used positive strategies more frequently (659) than negative strategies (525). As positive strategies are used to fulfill one’s desire to be liked and admired to others (Brown & Levinson, 1987), it seems that in this intercultural exchange, the students made efforts consciously or unconsciously to give face to the interlocutors so that the conversation could go smoothly. One Taiwanese student, Wendy reflected a similar concern in the paper and stated that

We should learn to respect the person who is talking, and try to understand their thinking then reply in right way….It is important to know that taking seriously when others are talking.

There are something we should notice. I think be polite is the necessary.

Another student, Ben also described how Japanese students behaved in his reflection as he wrote, “Japanese students do carefully listen to what others are saying, and answer the questions earnestly.” These reflections may explain students’ frequent use of positive strategies.

The most often used positive strategies were Positive Strategy #2 “exaggerate” (152), #12 “Include both S and H in the activity” (191), and #15 “give gifts” (158). Because the students were divided into small groups of four or five students, it seems to be understandable that they would use the term “we” or “let’s” to include and invite everyone into the discussion. Also, they tended to exaggerate their responses by using phrases such as “Oh, wow!” “I really like it” to show their involvement and interests in what the speakers were saying in the conversation. In fact, we only coded the expressions that revealed strong exaggeration in the discussion; otherwise, the number of the codings for this strategy may be even higher. Moreover, as Japanese and Taiwanese people are often taught in their cultures constantly to show the appreciation, to be understanding to people, and to give compliments, which are considered “good manner,” the students in this study quite often used the expressions, such as “Thank you,” “It’s OK,” and “This is a great idea.”

As for the negative strategies, #2 “Question, hedge” (341) was the one that the students used most, followed by #7 “impersonalize S and H” (75), #6 “apologize” (49), and #1 “be conventionally indirect” (41). Because this is an intercultural communication, and the students were not as familiar with the students from the other country as they do with students in the same country, they seem to be very conscious when sharing their opinions. Whenever they wanted to express their ideas, they
tended to add “I think,” or “maybe” in the expression so as not to show too much imposition on others, and in the meantime, save their own face. James, a Taiwanese student, reported his concerns in the reflection paper and stated:

In our preparation class, every one is from the same university, and every one is Taiwanese so we can speak out loud and don’t need to worry about making a mistake. However, in Live On discussion, there may be some cultural difference and language barrier between us. We need to be conscious that our careless behavior may insult those foreigners.

Meanwhile, because these discussions occurred between two countries, and many tasks require the students at both sides to share knowledge about their own culture and information in their country, these Taiwanese students tended to consider themselves representing their country, and often responded using “we” instead of “I,” to save their own face, even when the idea may come from the speaker himself or herself. For example, in Table 2 Strategy #N7, Cindy was trying to talk about her belief that Japanese are very creative, but she stated that “in Taiwan we think Japanese are very creative.” In addition, the students tended to say “sorry” very often. It seems to be common for two people to initiate an utterance at almost the same time because these were group discussions with more than two people. The students were aware of and alert to this situation, and when it happened, they often immediately expressed their apology, and gave the chance for the other person. When they did not understand what others were saying, they also apologized before they asked for clarification.

The Role of Politeness Strategies in the Communication

In the following, we illustrated how politeness strategies were used in the communication with a small excerpt. We present the excerpts in its original content, and there may be grammar mistakes, misspelling, and even incomplete sentences because students were communicate in the foreign language, English. In this first set of excerpts, the group members were trying to complete the task asking them to create an international front page for readers of both of the countries. The facilitator of the day, Beniko, a Japanese student, was asking about the proportion of the text and images in the front page. Before this excerpt, other group member Mutsuo had proposed the percentage to be half and half. Tim, their Taiwanese group member, however, preferred to have more images because it would be easier for the readers to understand.

Beniko: So… Yeah. So Tim thought more images. Hm… Ok. Thank you. How about Bella?
Bella: I think fifty fifty.
Beniko: So why?
Bella: Because if use too more images, it can’t be really tell people what you want to say, I think.
Beniko: Hum.
Bella: Yeah, but too [much] text is not good also because I dare [not] to read. So if we half and half is better.

Here, we observed that the facilitator, Beniko, usually summarized the main point of the previous speaker and then use Positive Strategy 15 “give gifts” to show her appreciation to the group.
members’ contribution. On the other hand, the group members were very careful when expressing their ideas and constantly hedging their opinions by adding “I think” in the statement, Negative Strategy #2 “hedge, question,” so that their opinions would not sound too strong.

Beniko: Ok. Thank you. So how about Olivia?
Olivia: I think…. I prefer text… more little [a little more].
Beniko: A little more text? Oh, ok.
Olivia: A little.
Beniko: Yeah?
Mutsuo: Huh hum.
Olivia: Because….I think image is necessary, but words can tell people what’s happened. More detail about the news. Yes.
Beniko: Yeah. Hum…Yeah, you think… you mean that text is… it will tell detail or information.

Olivia: Hum. Yes, but I think…image is very important.

However, another Taiwanese group member, Olivia had a different opinion. She wanted to have more text in the front page, but she did not want to impose the ideas to the others, so she used the expression, “a little more” to minimize the imposition, Negative Strategy # 4. For one moment, Olivia did not receive a positive response from the group members, so she, using Positive Strategy #6 “avoid disagreement,” partially agreed with Mutsuo and Bella to gave them face before expressing her real opinion, “images is[are] necessary, but words can people what happened.” Interestingly, when Beniko repeated Olivia’s idea, but did not give any positive response to fulfill Olivia’s face want, Olivia responded with a rather confusing statement, “Yes, but I think…image is very important,” which seemed to be confounded her original idea. In this case, the use of politeness strategies may mislead the clarity of ideas, and thus hinder the communication.

In the next excerpt, the group members were trying to create a catchy phrase for their cell phone advertisement. Before this excerpt, the group had agreed that the ideal cell phones should look beautiful but cost little. The catchy phrase proposed had been changed from “make it fashion,” to “give self-confidence by low price.”

Olivia: So, Tim, do you have any kind phrase about appearance and price?
Tim: You can… have it many color… of appearance…It is many color you can choice in the appearance.
Olivia: You mean…Difference colors of cell phone appearance.
Tim: Yes. We can have yellow, black, and you can choice what kind of color. You can work and suit of your dressing.
Olivia: Huh… So what is your catching phrase?

[Tim was typing his idea, and everyone is waiting for Tim’s response.]
Olivia: A little long.
Bella: It’s a good idea too.
Olivia: Yes. Maybe we can….We can consider it. And how about Beniko? Do you have one?

Tim, who had never had opportunity to talk to people from other countries before, was not
confident in speaking English and expressing his ideas. Being called by the facilitator, Olivia, Tim hesitatingly said and wrote his thoughts using Positive Strategy #12 “Include S and H in the activity,” by saying “we can” do something. The group member did not like his idea, but they did not want to make him lose face. Therefore, Olivia used Negative Strategy #4, and used the phrase “a little” to minimize the imposition. Bella even tried to support Tim’s positive face by giving a white lie, Positive Strategy #6, and said “It’s a good idea, too.” Olivia then concluded with a hedge, Negative Strategy #2, and said “maybe we can consider it.” These politeness strategies used seemed to help Tim to be comfortable in the group, and also facilitated the communication.

As presented above, many students were consciously aware that the discussions were in a cross-cultural context, so they were very careful in terms of how to express their ideas without hurting the other group members’ face, and thus used more positive strategies in the conversation. These acts, such as giving attention, exaggerating responses, giving compliments and supports, seemed to result in positive emotions and experience for students in the communication. Wendy reflected her experience in the reflection paper and said, “I felt extremely happy with my LiveOn experience because whenever I proposed some ideas, the other persons agreed with me and responded with support.” Another Taiwanese student Cathy also stated, “At first, I was afraid of making mistakes, so I dared not to say much. However, when I did make some mistakes later, I realized that it did not matter that much.” The support and understanding given by other group members not only satisfied her desire to be accepted and understood, her positive face, but also provided her comfort and relief from her negative emotions.

On the other hand, the students also reported that the topics were switched or discussions were limited due to the concern of saving face. For example, Flora, a Taiwanese student, reported that they chose to discuss more about Japan rather than Taiwan because they did not want to make the Japanese students felt uncomfortable in the discussion.

Japanese students do not know Taiwan a lot….Taiwanese students like to use Japanese issue for the reason we can continue the discussion or if they have no idea of other issue that will be silent, so we choose Japanese one.

The use of politeness strategies and the concern of face, in this case, can affect the communication process. It can, on the one hand, promote the communication and increase the involvement of the group members, but too much concern about saving both of their faces can become a problem and impede the real exchange and knowledge sharing that are both expected in the communication.

Discussions

The results of this study revealed similar results to previous findings that positive strategies are used more in online discussions than negative strategies (e.g. Vinagre, 2008; Yang et al., 2006). As Brown and Levinson (1987) referred that negative politeness behaviors are more elaborate and explicit in western cultures, it seems that for Asian cultures, positive politeness behaviors may be more explicit. Moreover, in this study, politeness strategies were found to be important to continue the conversation and make group members comfortable when participating in the discussion. This result echoed Yang et. al (2006) and further confirmed the importance of instructing students how to
use and respond with politeness strategies when communicating with people from different cultures. Nevertheless, this study also suggested a caution that too much concern about face and overuse of politeness strategies may perplex the communication and even cause misunderstanding between group members, whether in a graduate course in the western world (e.g. Yang et al., 2006) or a cross-cultural distance course in the eastern world, like this study. Although in this study, the Taiwanese students did not learn a wrong concept, as reported in Yang et. al (2006), they did make their own opinion unclear and even gave in the chance to share information about their own country, which should be one of the major goals for the intercultural communication.

One limitation of this pilot study is that only the data produced by Taiwanese students were collected. Future researchers may explore the positive and negative politeness strategies that the students of both universities use in qualitative and quantitative comparisons. It may also be worthy investigating how the students at one side interpret the politeness strategies that the students at the other side employ.

TITLE OF SUBMISSION: Assessing the Extent of Communicative Language Teaching (CLT) Approach Implementation in English 1/101 at St. Paul University Dumaguete Towards a Faculty In-service Program.

NAME OF THE AUTHOR: Professor Tichie Ann Saycon-Econg
Master of Arts in English (Teaching English to Speakers of Other Languages at Silliman University, Philippines
Doctor of Philosophy in English (Language) – candidate
University of San Jose Recoletos, Cebu City, Philippines

AFFILIATION OF THE AUTHOR: College Professor --St. Paul University Dumaguete
Dumaguete City, Philippines.

ADDRESS OF THE AUTHOR: St. Paul University Dumaguete, L. Rovira Road, Bantayan, Dumaguete City, Negros Oriental, Philippines

E-MAIL ADDRESS OF THE AUTHOR: teacher486@gmail.com or ann021081@gmail.com
ABSTRACT

This study (inspired by Gloria, 2007) assesses the extent of implementation of the Communicative Language Teaching (CLT) approach in English 1/101 at St. Paul University Dumaguete (SPUD), toward the design of an in-service training program. Assessment is done on the following areas: syllabus design, teacher student interaction, lesson content, materials used, activities conducted, lesson presentation, and assessment types and procedures. The respondents include selected teachers and students of English 1/101 at SPUD. Employing both quantitative and qualitative research methodology, the study uses a structured interview guide, classroom observations, and focus group discussions (FGD) to gather data. Classroom observation data analysis focuses on student-teacher interaction; analysis is done using the Communicative Orientation to Language Teaching (COLT) Scheme and the Sinclair and Coulthard Codes and Functions. Findings show that CLT is implemented; however, the teachers practice the weak form of CLT, which emphasizes structure and grammar skills still. The findings support the proposed in-service training program on CLT for the English language teachers at SPUD.
Perfectionism and Intrinsic/Extrinsic Motivation of Taiwanese EFL Undergraduate Students

ABSTRACT

The concept of perfectionism and motivation represent two important individual difference variables that have received considerable attention. This session presents the results of two questionnaires that asked 400 Taiwanese EFL undergraduate students to identify their perfectionism types and academic motivation. The two instruments used in this study were: (1) the Multidimensional Perfectionism Scale designed by Hewitt and Flett (1991); and (2) the Work Preference Inventory (Students version) created by Amabile (1994). The purpose of this study was to propose and test the role of perfectionism and academic motivation in EFL undergraduate students in Taiwan. Hewitt and Flett (1991) claimed that the type of motivation is associated with multidimensional perfectionism. Therefore, the relationship between perfectionism and English learning motivation were also investigated.

The statistical analyses of the questionnaires indicated that most Taiwanese undergraduate students are self-perfectionism or socially prescribed perfectionism type, and a few are identified as other-oriented perfectionism. In addition, these students tend to have intrinsic motivation toward EFL learning. This shows that most of them learn English due to internal reasons such as setting own goals, enjoying their learning, etc. Furthermore, self-oriented perfectionism was found significantly positively related to extrinsic motivation. Socially prescribed perfectionism has associated positively with extrinsic motivation. However, other-oriented perfectionism is neither related to intrinsic motivation nor extrinsic motivation. Further, the theoretical importance of the findings and the implications for EFL learning were also discussed.

Key words: Perfectionism, Intrinsic / Extrinsic motivation, EFL university students, Taiwan

Learning communities are classes that are linked or clustered during an academic term, often around an interdisciplinary theme, and enroll a common cohort of students. It also includes a variety of learning experiences to build community between students and their teachers, and among faculty members and disciplines. Learning communities may adopt themes or be applied to multiple disciplines.

Findings from a study by Chun-Mei Zhao and George D. Kuh (2003) indicate that participation in a learning community is positively linked to engagement as well as student self-reported outcomes and overall satisfaction with college. Students’ participation in learning communities may lead to: (1) increased opportunity for academic success; (2) increased likelihood to matriculate; (3) formation of collaborations with peers and professors outside of class settings; (4) enhanced interpersonal dialogue; (5) improved experiential learning; and (6) heightened intellectual development.

The implementation of learning communities at Albany State University is part of the 2006-2011 Strategic Plan, Goal 1: Strengthening the Historic Mission, Strategy 4: Implement an effective enrollment management and marketing program to recruit, retain, and graduate students of diverse backgrounds. The strategy to attain this goal is to institutionalize and expand the first and second year experience, and to develop learning communities.

The purpose and benefits of learning communities align well with the mission and goals of teacher training programs in the College of Education at Albany State University. The Teacher Education Department has established learning communities to address the needs and issues of two distinct cohorts of students: those who are declared education majors and those who have progressed to teacher candidate status.

First, declared education majors are invited to become a part of the Adult Non-Traditional (ANTS) Learning Community. The National Center for Education Statistics (NCES) defines a "nontraditional student" as a student with at least one of these seven characteristics:

1. Does not enter college immediately after high school.
2. Attends part time rather than full time.
3. Works 35 hours a week or more.
4. Is financially independent as defined by financial aid criteria.
5. Has dependents other than a spouse.
6. Is a single parent.
7. Lacks a high school diploma but may have a GED or other high school equivalency (NCES, 2005 as cited by Croix, 2007).
The mission of the “ANTS” (Adult Non-Traditional Students) is to encourage and coordinate support, education, and advocacy for the declared education majors/adult non-traditional students. The ANTS Learning Community promotes academic success, collaborations, and interactive activities designed specifically for the adult non-traditional student. Researchers report cohort grouping, such as those for professional seminars, is beneficial; students who socialize more and cooperate to learn have better outcomes (Drucker, 2000; Frieswick, 2000; Moore, 2000, as cited by Wray, 2007). The “ANTS” Learning Community activities support all facets of participants’ lives that may impede academic success. Special emphasis is placed on producing culturally-responsive practitioners, reflective educators, and technology-competent practitioners.

Second, early childhood and special education majors who have progressed to teacher candidate status are targeted for the Integrated Literacy Approach Learning Community. Research indicates a need for an innovative marriage between early childhood educators and special education. Over eighty percent (80%) of children in special education programs are placed simply because they have not learned how to read (Blanton & Pugach, 2007). Also, few children placed in special education close the achievement gap to a point where they can read and learn like their peers (President’s Commission of Excellence in Special Education Report, 2002). To address these findings at Albany State University, classes in the Early Childhood Education Program and the Special Education Program are linked to create a learning community.

The Early Childhood Education & Special Education: An Integrated Literacy Approach Learning Community focuses on collaborative efforts to design and establish co-teaching modules of reading instruction for diverse populations. The Integrated Literacy Approach Learning Community yields culturally-responsive teacher candidates who gain advances in objectivity for assessing, planning and implementing instructional strategies for diverse readers.

The conference presentation will be a panel discussion of the design and implementation of the ANTS Learning Community and the Integrated Literacy Approach Learning Community. Discussions will include the strengths and weaknesses of the two learning communities, the struggles and gains for the students, and the evaluative components used for improvement and continuation. Additionally, a demonstration of best practices will be provided through a video presentation of a simulated lesson plan. The presentation will conclude with a question/answer session.

Hawaii International Conference on Education----Issues in Teaching
Learning Communities in Higher Education

Abstract

The implementation of learning communities at Albany State University (ASU) is one part of the 2006-2011 Strategic Plan to recruit, retain, and graduate students of diverse backgrounds. The purpose and benefits of learning communities align well with the mission and goals of teacher training programs in the College of Education at Albany State University. The Teacher Education Department has established learning communities to address the needs and issues of two distinct cohorts of students: those who are declared education majors and those who have progressed to teacher candidate status.

First, declared education majors are invited to become a part of the Adult Non-Traditional (ANTS) Learning Community. The ANTS Learning Community promotes academic success, collaborations, and interactive activities designed specifically for the adult non-traditional student. All activities support every facet of participants’ lives that may impede academic success with special emphasis on producing culturally-responsive practitioners, reflective educators, and technology-competent.

Second, early childhood and special education majors who have progressed to teacher candidate status are targeted for the Integrated Literacy Approach Learning Community. To address response to intervention research and its implications for program modifications, selected courses in the Early Childhood Education Program and the Special Education Program are linked to create a learning community. The Early Childhood Education & Special Education: An Integrated Literacy Approach Learning Community focuses on collaborative efforts to design and establish co-teaching modules of reading instruction for diverse populations. The Integrated Literacy Approach Learning Community yields culturally-responsive teacher candidates who gain advances in objectivity for assessing, planning and implementing instructional strategies for diverse readers.

Utilizing a Panel Session format, discussions will include the strengths and weaknesses of the two learning communities, the struggles and gains for the students, and the evaluative components used for improvement and continuation. The presentation will conclude with a question/answer session.
BEYOND THE CLASSROOM WALLS

Pros and Cons of Cyberlearning: How Does it Affect Graduate Students, The University and Professors?

La Vonne Fedynich Ed. D.
Texas A&M University-Kingsville

Abstract

This article discusses some of the advantages and disadvantages of online learning as it pertains to graduate students, universities and professors. Although much has been written about the growing presence of online learning, this author's position is that consideration must be given to the rewards and drawbacks of cyber learning as it pertains to graduate programs serving graduate students in remote parts of the country, universities and faculty. Reviews of both sides of the issues via in-depth literature reviews, conversations with graduate students experienced in distance learning along with studies from universities guided the discussion of the article. The general consensus pertaining to online learning was viewed as beneficial overall, despite some major drawbacks.

Keywords: online learning, advantages and disadvantages of distance learning, graduate student perceptions of online learning, instructor perceptions of online learning
Beyond the Classroom

“The next big killer application for the Internet is going to be education. Education over the Internet is going to be so big it is going to make e-mail usage look like a rounding error.”

John Chambers, CEO Cisco

Online education is growing exponentially in popularity among graduate programs of education throughout the country. This phenomenon called online learning has been revered as an extraordinary change to the delivery platform of education. However, there are some that seem to believe this is not the panacea it is venerated to be, as it has sacrificed academic growth and the imagination of students (Monk, 2010). How has this format of learning affected the universities, faculty and most importantly, the students in graduate programs located in remote parts of the country? What is being said about the pros and cons of online learning?

Traditional Classrooms to Online Classrooms

Distance education, what exactly is it? According to Lewis, Whitaker, and Julian (1995), it is “the delivery of the educational process to receivers who are not in proximity to the person or persons managing or conducting the process” (as quoted in Bitter and Legacy 2006, p. 130). Distance education has "brought new life and possibilities...No longer is learning away from a traditional classroom the exception, but rather it is becoming a learner-centered standard many educational models strive to replicate" (Bitter & Legacy, 2006, p.131). With the increasing popularity of the Internet within the past thirty years, new dimensions of learning have surfaced as alternative forms of education that has brought traditional learning platforms offered in higher education out of the four walls of the classroom into the realm of cyberspace.

The Advantages of Online Learning

Convenience is cited as the foremost advantage of online learning. According to graduate students, the convenience of time and distance was a huge advantage over the brick and mortar classrooms. Morrison, Ross, and Kemp (2007) postulated that distance education has "additional
strengths beyond the traditional classroom lecture and self-paced instruction for both training and education environments...Students can ‘attend a class’ without going to campus. Very large audiences situated miles apart can potentially be served” (Morrison et al., 2007, p. 21). This is especially important to graduate students living in remote areas of the country. Such was the case with a south Texas graduate student, "For me personally online work has been a big time saver for me. I live about... three hours from [campus].... it would have taken a lot longer to finish." (personal conversation, May 7, 2010). Another student adds, "If you use your time wisely, the extra time saved allows students to spend that time producing better quality work or doing better research" (personal conversation, May 12, 2010). There is more flexibility, as the course is as close as the computer and an Internet connection. The student decides when and where study is to take place. The student sets the pace of assignment completion, study and research time.

Distance learning allows students expeditious access to instructors, peers and information. When, Leia, a graduate student attending Phoenix University, was asked what she liked most about online classes, she replied, “I like having the entire Internet at my fingertips to do all of my research, although there are some situations that call for a book, but they are few and far between… [and] the freedom of creating my own schedule. Posting when and how I can. I also don’t have to worry if I have enough gasoline to make it to class.” Leia also received her Bachelor degree from Phoenix University, thereby giving her five years of experience in the online learning environment (personal conversation, February 1, 2010).

Participation

Ease of participation is an appealing feature of the cyber classroom. One of the many versatile elements of cyber learning is the ability for students to participate either asynchronous, synchronous or in a blended learning format. Teaching online “offered via the Internet can take
many forms, ranging from Web pages to mailing lists to course management systems such as Blackboard. Students can interact in real time in chat rooms or asynchronously by posting to bulletin board or forums” (Morrison, et al., 2007, 218). Provided with all of these communication formats, students are afforded an easier route of communication with the instructor or other students in the class.

The playing field for communication and participation purposes is leveled, because everyone in class can contribute. According to professors at Central Florida, "Introverts, who are quiet in the face-to-face class, really participate [online]," (Garnham and Kaleta, 2002, p.3). Kupczynski, Stallone Brown and Davis' study (2008), found student participation increased in the asynchronous environment, as there is time to "post messages, read and respond to messages, reflect on responses, revise interpretations, and modify original assumptions and perceptions..." but in a face-to-face class this would not be the case (p. 6). A south Texas graduate student admits, "I am basically a shy person. I don't share a lot of my opinions and thoughts in a whole class situation. The online class has given me the freedom to "take a chance" and share my thoughts and opinions with others. I also like time to think about my response so taking this online class is great in that area as well (Discussion Board Conversation, May 11, 2010).

Hybrid Courses

The hybrid or blended course, as it is sometimes referred to, is another advantage of distance education. “As the name implies, there are a blend of various forms of learning activities. These may include classroom, learning experiences, and e-learning or various forms of e-learning or some combination of all three” (Steen, 2008, p. 528). This type of offering meets the needs of those students who prefer a face-to-face format as well as those students who prefer an online format. Garnham and Kaleta (2002) explain “The goal of hybrid courses is to join the best
features of in-class teaching with the best features of online learning to promote active
independent learning and reduce class seat time" (p. 1). Students' positive perceptions of blended
learning are the "reduced logistic demands, convenience, increased learning flexibility, and
technology enhanced learning" thereby promoting a more enjoyable and successful academic
experience (Dziuban, Hartman, Moskal, 2005, slide 19). A graduate student participating in an
online Educational Administration class states, "Overall I think that the online course work is
good but, I do think the combination of face to face courses and online is better than all online"
(Discussion Board Conversation, May 7, 2010).

What about the faculty teaching the mixed class format? Faculty teaching hybrid courses at
the University of Central Florida noted more flexibility, interaction and communication with
their students. Garnham and Kaleta (2002) found that “The amount of student to faculty contact
is going to increase in the hybrid format. Students are more engaged in learning activities
therefore will seek out more assistance” (p. 2). For example, a professor of archaeology can
create lectures on artifact classification for online activities. Class time could be devoted to the
actual handling and experiencing of the artifacts, thereby making seat time a more enriching
experience (Garnham and Kaleta, 2002). The academic attainment for students in hybrid courses
was significantly improved in hybrid classes. Instructors believed their students performed better
on exams, produced better papers and came prepared to have more meaningful discussions while
in the classroom (Morrison et al., 2007).

Student Retention

Student retention was also an advantage of online classes. Students participating in online
courses tended to complete their programs more often than not. Graduate students discussing the
aspects of completing their degrees online stated, "Online classes are allowing me to get a degree
I would otherwise have to put off later in life or not at all." Another student added, "I love my on-line classes and would not be able to finish without them!!!!!!" (Discussion Board Conversation, May 10, 2010). According to data attained from a study on Web-enhanced courses at the University of Central Florida (2005), "Web-enhanced courses have higher success rates (percentage of students obtaining an A, B, or C) and lower withdrawal rates than their comparable face-to-face courses" (University of Florida, 2005. p. 3).

**University Benefits**

Universities also realize advantages to hosting online classes. More students tend to register and take the online classes, as this reduces the opportunity costs of an education for the student and the university (Dziuban, et al., 2005, slide 19). In combination with increased student population and lower withdrawal rates of online students, universities have found online learning to be very cost effective and efficient via many avenues never thought possible before online learning came into existence (Steen, p. 527).

As more students enroll in online classes, classroom allocation is an area that can be streamlined. The demand for classrooms tends to drop, because the space is not needed as often, thereby cutting the cost of utilities and up keep. “Online programs have little or no cost for instructional facilities, transportation and related staff” (Cavanaugh, 2009, ¶ 6). In these days of budget cuts, reductions in force in both the private and public sectors coupled with declining enrollment for some universities, this is good news for the university bottom line.

**Disadvantages of Online Learning**

So far, online learning appears to have many advantages for all concerned. Even though there is a positive spin being endowed on cyber learning, there are negative aspects that need to be
brought to light. If not properly understood, anticipated and prepared for, these disadvantages can prove to be formidable obstacles.

**Computer Literacy**

An aspect that is often times overlooked is that individuals participating in online courses are computer literate. Students and faculty have to be computer literate. It’s a plain and simple fact. As hard as it is to imagine these days, there are individuals that are less than adequately prepared for a technology-rich learning environment (Ratliff, 2009). Without this ability, the cyber classroom is a moot point. According to Dutton et al., 2002; Halsen & Gratta, 2002, numerous studies have indicated that the Internet can prove to be an effective learning instrument, but the studies also point out that the students participating in an online course necessitates a particular level of computer literacy also (as cited in Wojciechowski, Bierlein Palmer, 2005). According to Peach 2001, when an online student is not computer literate, this leaves the faculty member charged with teaching the online course to bear the responsibility of teaching content of the course, as well as remediating the student in the use of technology (as cited in Ratliff, 2009).

**Online Access**

Although computer literacy is a requirement of online learning, so is online access. The lack of access either due to logistics or economic reasons, will exclude participants from the cyber class. Quality transmission is another issue of the telecommunications system and other resources required to successfully transmit. Although there may be two-way communication capabilities available, if the quality is poor, distractions and frustrations can ensue making it "difficult to follow aurally and visually, students may lose interest in the instruction" (Morrison, et. al., 2007, p. 218). Morrison also brings out the point that hardware requirements for online learning may be too expensive for some institutions and students (p. 219). In essence, the
institution hosting the eLearning courses as well as the participants need to acquire reliable access before considering the online learning endeavor.

**Course Design**

Design and implementation can be a disadvantage to online learning. Designing the cyber course to effectively meet students' needs can be a sizeable responsibility for the educator, as "there is no one-size-fits all approach to the design of eLearning, because each course is unique..." (Steen, 2008, p. 531). Data from the University of Central Florida's study (2005) on the learning impact of online courses found 77% of faculty believed preparation time for online courses to be significantly higher as opposed to preparing for comparable face-to-face sections (slide 6).

Individuals charged with the implementation of courses online not only have to be knowledgeable of the subject area they are teaching, but also "acquire new teaching skills, such as learning to facilitate online interactions and assess student online learning..." (Garnham and Kaleta, 2002, p. 4). Online teaching is has many different requirements than the brick and morar classroom. Dr. Steve Bain, professor of counseling education at Texas A&M University-Kingsville proposes that "Online learning is two dimensional. You can think it and write it, but you can't feel it. In other words, there is the physical and the cognitive" (personal communication, February 2, 2010). For those educators that have taught only face-to-face classes now have to be retrained to think in different dimensions as Dr. Bain has alluded to.

**Face-To-Face Time**

Lack of instructor face time is another issue that is seen as a downside to cyber learning, especially for students of particular learning modalities. For example, students that learn via the tactile/kinesthetic modality do best when moving, doing, and touching to facilitate their learning.
experience. Learning online for these students is not the ideal environment for them, as they perceive their educational experience to be "through abstract symbols, decontextualized and cast on a two-dimensional screen making it intangible to them " (Monk, p. 326 - 327). Graduate students in an online south Texas Educational Administration Discussion Board class conversation (May, 2010) lament this issue, "The hardest obstacle for me is the lack of face to face social interaction-I do like to talk and visit on a personal level-just not share in class discussions. I really like getting to know people and listen to their stories. I like to share stories about my family. I think you can network, problem solve and collaborate easier in person as well." Another student from that same conversation states,

Society still calls for a personal face-to-face connection, especially in education. Although online learning has many benefits, this phase of learning is severely needed. Each student needs to be individually challenged through a “class” setting. I know I personally answer questions differently online versus a face-to-face setting. Whether because of the time frame of assignments or the comfort of the home computer, I feel the student, especially at the Master’s level, needs the pressure of oral question and answer feedback.

Attending classes online is out of the physical realm of the campus thus requiring students to work at their own pace. Students requiring a "pacing mechanism, such as a weekly lecture..." may not be successful in the cyber classroom, as they may fall behind (Morrison et al., 2007, p. 219). "On the average, fully online courses have slightly lower success rates...than either their face-to-face or Web-enhanced counterparts" (University of Central Florida, 2005). There is little support and guidelines provided for students in an online course, as they are expected to seek their own resources for assignment and examination completion. This can be a daunting experience for some students as is evidenced in this graduate student's Discussion Board lament on the downside of online learning,

It definitely takes more of a commitment and a higher level of responsibility and maturity to take these types of courses. For the very same reasons I discussed on why these classes are
such a benefit, can be the same reasons why it could be detrimental to ones education. Some people need a structured and organized course framework. Some people need to be challenged and stimulated by a professor (in person on a regular basis). It's kind of like a coach pushing you to reach your potential. Could you do it without that person helping you and pushing you? Also, it's very easy to let time get away from you. If you don't have the discipline to make sure you are doing all your work on a regular basis, it can get away from you and you're playing "catch up" all year. Student GPA's have suffered from taking online courses. In my opinion they are a tougher course to take, compared to traditional courses or research type courses. One would think, as graduate students you should have reached this level of maturity and responsibility to deal with this. I'm not convinced it's as easy as what it seems on the surface. It can slowly creep up on you, without you even realizing how far you are behind. You need to have good study habits, and a keep to your structured schedule of providing time each week towards your studies. It's all on your shoulders, without a professor meeting with you two or three times a week.

**Parting Thoughts**

With the increase of e-Learning, consideration needs to be given to some of the advantages and disadvantages of online learning and how it affects all the individuals involved. As technological advances have become entrenched in the information world, individuals have become more exacting and better informed as to what choices exist for their education. Of these new advances, Berge (1998) hypothesizes collectively the demographic trends, political forces, economic factors, the need for lifelong learning, and the changing emphases in teaching and learning, there is a resurgence of interest in distance education both at traditional institutions of higher education and in organizations whose sole mission is distance education as with any situation, there are two sides to consider. (p. 1)

The two sides Berge refers to are the advantages and disadvantages of such an educational delivery system. As online education grows exponentially in popularity among programs of education, the deliberation of the strengths compared to the weaknesses is vitally important so as to be better prepared to cope with the challenges of working and/or learning in this environment.
After looking at these two sides Berge refers to, what is to be gleaned from this comparison? How has it really affected the entities involved in this evaluation? Since graduate students are affected the most in the end with the attainment of their Masters Degree or not, why not let them sum it up? The following are actual responses from a Discussion Board conversation (May 2010) between graduate students taking online classes to attain their Masters Degree in Educational Leadership at a south Texas university: "This has been a very positive experience." "It has been a great experience for me." "For me personally, when you weigh the good versus the bad, it's a far more benefit to having the opportunity to take online courses than not." "Online learning is the best thing that ever happen to help students finish their education."

6. Abstract: The purpose of this interpretive qualitative study was to explore, understand, and describe the past and present experiences of heritage learners (HLs) of Mexican descent who have been educated in the United States and were studying or had recently studied advanced Spanish at the university level. The researcher sought to understand their experiences and gain insight into the motivations and factors that lead these students to study advanced Spanish. This study is important because many HL students are entering and are expected to continue entering and will continue to enter educational institutions in the United States.

7. Bio: Alicia Gignoux teaches Spanish at The University of Montana in Missoula, Montana. She was born in the Philippines and is of Mexican American descent. She earned her Ed.D. in Curriculum and Instruction in 2009. She has a BA and an MA in Spanish, a minor in Asian studies, and a K-12 teaching certificate. Her areas of research have included Afro-Hispanic literature in Venezuela and heritage learners
of Mexican descent. She has also filmed a collection of oral histories in Guadalajara, Mexico.
Tennessee’s Statewide K-6 and Higher Education Mathematics Academies

Ryan Andrew Nivens

George Poole

East Tennessee State University

Johnson City, TN USA

Tennessee has been awarded a grant from the U.S. Department of Education in the first phase of the Race to the Top competition. Only two states were selected in the first phase, and Tennessee’s award was $500 million. Arne Duncan, Secretary of the Dept. of Education, said, "Both states have statewide buy-in for comprehensive plans to reform their schools. They have written new laws to support their policies. And they have demonstrated the courage, capacity, and commitment to turn their ideas into practices that can improve outcomes for students." While the funds are for educational reform in general, this paper describes a two-fold idea on how Tennessee plans to improve mathematics education in the state.

Initially, we began working on this idea in anticipation of our state receiving the Race to the Top (RttT) funds. As early as February 2010 we began brainstorming on ways to improve mathematics education in Tennessee. By May 2010, we developed a two-fold idea that might change the paradigm of mathematics education in Tennessee. This is the subject of this paper.

Soon after Tennessee learned of its RttF award, it began allocating the monies to improve education. However, we were surprised to find out that no portion of the RttT funds were earmarked for statewide professional development. Part of the rationale for this lack of designation is that districts throughout the state were slated to receive half of the funds to spend as they deemed appropriate. The remaining balance of funds were disbursed according to the discretion of the Tennessee Higher Education Commission. For the first fiscal year of the grant, this is how they distributed approximately $20 million.

List of Projects from Race to the Top Managed by THEC: $20,369,136

1. Integrating Common Core Standards into Pre-Service: $1,350,000
   a. THEC will contract with an external source to provide training for college faculty. Training will be provided for faculty at no cost to the institution.
2. Integrating TVAAS into Pre-Service: $1,350,000
   a. RFP issued for development of module (geared toward SAS or Battelle).
b. RFP issued for higher education institutions to receive funds to implement the module as well as contract with SAS for additional studies related to graduate performance as measured by TVAAS.

3. School Leaders Supply and Demand Study: $172,800
   a. This will be a direct contract with UTK's Center for Business and Economic Research.

4. UTeach Program Replication: $4,104,000
   a. These will be direct contracts with the University of Memphis and the University of Tennessee, Chattanooga to implement the UTeach programs proposed through the RFP issued in March 2009.

5. Teacher Preparation Program Effectiveness Report Card: $432,000
   a. THEC will be working with teacher preparation programs to design a more effective report card. This will include the state-wide report card as well as institutional feedback reports related to graduates.

7. STEM Professional Development: $6,480,000
   a. RFPs will be issued for STEM Centers to provide professional development to K-12 teachers in STEM disciplines.

8. Tennessee Consortium on Research, Evaluation, and Development (TNCRED) (This will flow through to Vanderbilt University's National Center for Performance Incentives.): $3,240,000

An interesting observation from the disbursement schedule above is that $6.48 million has been set aside for professional development for K-12 STEM education. While this is a substantial amount of money for professional development, this amount will be divided among six regional hubs to distribute. Although we see this as a forward step in supporting professional development efforts, it still leaves Tennessee a little less unified and a bit more fragmented relative to its statewide effort.

The state spent a great deal of effort to write mathematics standards for statewide implementation in complying with the Common Core State Standards, a requirement in the RttT funding. But relative to how monies are spent on professional development, regions and school districts are left to their own discretion. Teachers and their students will certainly benefit from this investment of money. However, the state of Tennessee will continue to develop its teachers in a way that keeps them disconnected from one another.

Knowing that we have to work within the current structure, we plan to modify our ideas to fit a regional model, in the hopes that it will become exemplary for statewide implementation in the coming years. We developed a theoretical framework to base these ideas on as shown in Figure 1. In the following sections, we provide details to explain and describe the framework.
K-12 Education – In-service Teachers

The in-service teachers located in the public schools maintain involvement with the university in two ways: 1) taking courses for personal and/or professional growth and 2) cooperating in undergraduate education through field placements and student teaching. Their role as supervisors of undergraduates who are either in a field-placement observation role or the more intense student teaching role has placed them in a position of being a teacher educator.

In-service teachers often enroll in university-based courses with the intention of improving their pedagogy or content knowledge. This interaction between in-service teachers and the higher education teacher educators is often the extent to which these two groups interact. In this case, it is solely for the benefit of the in-service teacher’s professional growth. To our knowledge, these courses have no direct impact on the pre-service teachers that may be placed in the K-12 classroom throughout the school year.

Higher Education – Teacher Educators

One role of the teacher educators in institutions of higher education are teaching courses and they are typically located in one of two areas: 1) Colleges of Education and 2) Colleges of Arts and Sciences. The Colleges of Education house departments such as Curriculum and Instruction and Early Childhood Education. Primarily through the department of Curriculum and Instruction, pre-service teachers take a range of courses designed to teach them about the elements of effective teaching. With the exception of a single course that serves as a liaison between the university and the field placement, all of the other courses are taught within the university with no contact with the K-12 environment. For example, at East Tennessee State University, our students enroll in courses that require a field placement component, but the instructor of that course has no contact whatsoever with any part of the K-12 setting. A typical semester will have one field placement, approximately one credit hour, which is required as a co-requisite. The instructors of the courses operate independent of this K-12 component.
The College of Arts and Sciences is involved primarily with the content preparation for secondary education majors (grades 7-12, ages 13-18), as well as the content preparation for elementary teachers (grades K-6, ages 5-12). Preparation for secondary licensure includes a major in mathematics while preparation for elementary licensure includes three well-defined courses: Number Concepts and Algebraic Structures, Logic, Geometry and Problem Solving, and Probability and Statistics. A few of these university teacher educators are also uninvolved in the K-12 field placement component of the pre-service teacher’s education.

The other role of the university teacher educator is that of K-12 liaison. This important role is assigned to only a few individuals within the university. They spend most of their work time traveling to various K-12 sites where they monitor and observe the in-service teachers who are completing their field placement hours.

**University – Pre-service Teachers**

The lives pre-service teachers lead is unusual, but interesting. On one hand, they are placed in K-12 settings where they do not know the teachers, administrators, or staff. Their only connection to the school may be the higher education liaison who is not frequently present. They are on their own to negotiate a relationship with K-12 teachers who may or may not have any initial contact with the university liaison. Pre-service teachers often have a variety of tasks to complete within the field placement setting, and the K-12 teachers may be reluctant to allow them the freedom necessary to complete these tasks.

On the other hand, pre-service teachers are enrolled in many courses, as previously described, in the Colleges of Education and Arts and Sciences. Frequently, the coursework they take is not only disjoint from the K-12 setting in which they will eventually be placed, but their content and pedagogy courses are also bifurcated.

**A Plan for Tightening the Framework**

In this paper, we outline the two-fold idea to tighten the framework of mathematics education in Tennessee through the implementation of dual Academies. These two academies will target a separate group, both of whom are strategic in reforming and improving mathematics education in Tennessee.

1) Professors in institutions of higher education responsible for preparing future K-6 teachers, and

2) Teachers of mathematics in grades K-6.

The third component of the “new” framework, namely the cadre of pre-service teachers, is completely dependent upon the two groups identified above. Moreover, an implied, but natural outgrowth from this new framework is one that strengthens the influence of university teacher educators upon in-service teachers.
Tennessee Elementary Teacher Educators for Mathematics (TETEM)

TETEM is a group of two-year college and university professors that formed from a National Science Foundation (NSF) project to develop stronger, more common mathematics and science courses for elementary teachers. From 2005 through 2010, an NSF grant supported over 15 meetings held on several different campuses in Tennessee, and provided a forum for teacher educators to discuss content and pedagogy in mathematics and science for elementary teachers. The membership of the participating faculty and schools grew to include nearly all institutions of higher education within the state.

What emerged from this NSF program is a closely knit, network-connected, well-focused community of elementary teacher educators whose heart-felt mission is to better prepare in-service elementary teachers in the areas of science and mathematics. At these NSF sponsored meetings, ideas on content, pedagogy, teaching strategies, and technology were shared and discussed among two-year and four-year faculty who have earned mutual trust and respect for each other. During the meetings, the atmosphere was always warm, respectful, encouraging, and optimistic.

Because of faculty obligations, these meetings have ranged from 1 to 3 days. Although topics discussed were good and informative, we believe a week-long retreat just for those responsible for preparing elementary teachers in mathematics content and pedagogy would accomplish much more than the shorter meetings. About 60-70 faculty members from the institutions of higher education would participate in this retreat. The retreat includes two summer, one-week retreats, along with two mid-year, two-day retreats. Initial plans are to include sessions on approximately 25 topics that directly impact the curriculum that occurs in the elementary grades K-6.

A basic theme throughout the week-long presentations is one that promotes a broader, deeper view of K-6 mathematics, and one that encourages these aspiring elementary teachers and their future students to

- Acquire a Butterfly-view of K-6 mathematics, not a Caterpillar-view
- Understand that K-6 Mathematics is Challenging, but accessible
- Trust their own thinking skills, not the thinking skills of others
- Embrace Piaget’s powerful, far-reaching Conservation of Number precept
- Think flexibly with respect to problem solving and computations
- Believe in multiple-way (not one-way) strategies, both in problem solving and computations
- Make sense out of problem solving and computational strategies
- Accept Piaget’s Notion of Disequilibrium: Learning can be hard and confusing at first, but this is an acceptable phase before “Aha moments” arrive.
- Realize that they control mathematics, mathematics does not control them
A few examples of these mathematical topics are early counting concepts, algebraic thinking, and fractions as well as pedagogical topics such as literacy and art, technology, and best teaching practices.

**Tennessee Elementary Teacher Educators for Teachers (TETET)**

TETET is the name of the reform effort for teachers in grades K-6.

*Initial Leadership*

We plan to begin our search for Master Teachers, defined as teachers of record with at least 3 years experience in the classroom and significant professional development activity, early in the spring of 2011. Depending on how many regions we designate, between 30 and 36 Master Teachers will be recruited through an application process to undergo an intense training process, preferably in the summer of 2011, after which they will model future Academies to occur in the next 5 summers.

*Year 0 (begins spring 2011)*

Training of the Master Teachers by selected higher education faculty who were involved in the TETEM project. This should occur at a central location in the state for all of the Master Teachers. One goal is to create camaraderie among this group as well as a statewide professional network for these individuals. At least four Higher Education Faculty per region will do the training of these Master Teachers, for a total of at least 12. About half of these higher education faculty should be mathematicians who are favorable towards K-6 education, and about half should be mathematics educators.

*Participants (In-service Teachers):*

In-service teachers will be recruited, in pairs, from districts in all parts of the state with a two year commitment of Academy participation. Part of their two-year commitment will be a requirement to host student teachers and/or field placement teachers in their classrooms throughout the school year. Approximately 60 teachers per region will be accepted each year. In the summer of 2012, their would be 60 teachers. In the summer of 2013, there would be another group of 60 teachers plus the first group of 60 teachers in their second year, for a total of 120 teachers.

A leadership development component is available after the first two years as described below.

*In-service teachers becoming Leaders*

To extend the leverage of the Academies, a leadership component will be offered to keep a steady flow of leaders. If we identify 10% of the Participants each year to participate in a leadership development effort, we would be able to expand the
potential of the program at a nominal cost. For example, in a group of 60 participants, six could be recruited to meet three or four times in the coming school year to prepare for the following summer. The full process would take 4 summers. Table 1 shows the transition through a four-summer process.

</tbody>
</table>

To illustrate the impact of those seeking a leadership role consider two participants, X who started in the first summer and Y who did not start until the second summer. Table 2 illustrates their transition through the years, using five summers to illustrate the cycles.

</tbody>
</table>

By the fifth summer, we have the potential of having 12 teacher Leaders per region, assuming group sizes of 60 and 10% participation in the leadership function. Having many people trained as leaders is beneficial since not all of them may be able to participate each summer. With enough trained, they may not all be necessary for the current year Program, allowing for people to take leaves of absence, or other personal reasons for not filling the leadership role.

Regional Site Structures:

Each university will be required to have an undergraduate mathematics education group, preferably designated as an affiliate of the National Council of Teachers of Mathematics (NCTM) and Tennessee Mathematics Teacher Association (TMTA). Funds will be allocated to start groups where no current group exists. These funds will assist in the start-up of groups, including money for teambuilding events, travel for the student leaders to state, regional, and national conferences. The purpose of this is to ensure that our future teachers are involved in the professional growth and development of mathematics teaching on many levels.

Each institution of higher education will be required to have two faculty members as sponsors for these undergraduate groups: one from a mathematics department and one from an education department.
In-service Teachers who are participating in the TETET project will be used as guest speakers at meetings of the undergraduate groups.

**Regional Group Structures:**

The state will be split into 3 parts: west, middle, and east. Each region will host groups of in-service teachers for training. Training will take place at either the university, a state park, or other suitable site.

The two Academies set forth in this paper are intended to help Tennessee prepare to meet benchmarks set out by the U.S. Department of Education as part of the Race to the Top funding. By focusing on those in higher education who prepare K-6 pre-service teachers, as well as in-service K-6 elementary teachers, we hope to radically change the culture of teaching throughout Tennessee. Through this new framework, our goal is to improve both attitude and achievement in mathematics. Ultimately, we want students to reach their highest potential in mathematics and fulfill their vocational dreams.
Facilitating Students Attendance via An Online Attendance System

Abstract

Many studies have revealed that attendance is strongly associated with student achievements, and have proposed different strategies to improving students' attendance. However, there are few studies investigating how to take students' attendance -- the key component to improve students' attendance. Taking attendance manually is inefficient since it will consume part of the limited class time. This paper describes the design of a simple online attendance system. The implementation of the system is currently undergoing at both West Virginia University and California University of Pennsylvania.

Introduction

The importance of attendance to students' performance is well understood. Regular attendance has been linked to higher achievement. Many studies have revealed that attendance is strongly associated with student achievements (Ali et al. 2009; Buckalew & Daly, 1986; Johnson, 2000; Jones, 1984; Ledman, 2010; Park & Kerr, 1990; Romer, 1993; Street, 1975), since the most invaluable time for students' achievement is the time spent in the classroom, compared to other time such as the time spent in discussion sections or the time spent studying outside of class preparing for the class session itself (Schmidt, 1983).

Consequently, strategies to improving students' attendance have been proposed (Reeves, 2008). However, there are few studies investigating how to take students' attendance, which is the key component to improve students' attendance. Manually taking attendance is a time-consuming process, especially for big classes in which the instructor may not recognize every student. In a 50-minute class, it may take 5 minutes to take students' attendance, which is very inefficient, considering that the most valuable and important time commitment in a course was the time actually spent in the classroom.
In this paper, we describe a simple online attendance system that can be used in classrooms to efficiently take students’ attendance. The online attendance system allows students to take their attendance from the computer they are using with a simple click. Although paid online education systems such as Blackboard, E-College or Desire2Learn are currently used at WVU or CalU, none of them has the function for students to take attendance.

The implementation of the system is undergoing at both West Virginia University (WVU) and California University of Pennsylvania (CalU). Once it is completed, the system will be used in computer-equipped classrooms at CalU. Codes of the system will be shared on the Internet.

**Design**

In this section we describe the requirements of an online automatic attendance system, based on which we will present the modules of the system.

**System Requirements**

Normally, in a classroom equipped with computers, each student will use a separate computer. Considering such a scenario, we define the following attendance policies.

- An attendance can only be taken during the class time. Students should not be able to take attendance before or after the class.
- Each student can take at most one attendance in one class.
- Attendances can only be taken within the classroom. In other words, only the computers physically located in the classroom can be used to take attendance.

The main purpose of this online attendance system is to save the instructor's time so that the instructor can efficiently spend the whole class time in teaching. It also needs to facilitate the instructor's managing students' attendance in some special situations, for example, students’ absence due to
sickness; students forgot to take attendance but realize it immediately after the class is over; some computers are broken and two students need to share a single computer. When these situations happen, the instructor may also want to manage the attendance records.

System Model

The requirements mentioned in the previous subsection will be achieved by the attendance models described in this subsection. This attendance system consists of three major components (Figure 1). Attendance webpage is the webpage students will use to take their attendances. Every student's name is listed on the webpage and at most one student can be selected. After a student selects his/her own name and submits the attendance, the information is sent to the second component, a common gateway interface (CGI) program. The CGI program running on the web server checks whether an attendance is valid based on the attendance policies described previously. If the attendance is valid, the CGI updates the attendance records; otherwise, it sends an error message back to the student's web browser. The third component is the management component. Basically, this component allows the instructor to modify students' attendance in the special scenarios described above and displays statistics data of the attendance.

Nontraditional Student Transition to Higher Education

Abstract

This study is intended to explore the experiences of nontraditional students as they transition to community college. The target population is students who returned to school after being separated from any type of formal education for 5 or more years who are underemployed or dislocated workers and finished at least one year. Community Colleges that have initiated programs to facilitate nontraditional students’ transitions are the focus. An understanding of the students’ personal motivations and the opinions of faculty and administrators about transition obstacles or innovations are explored using qualitative research methodology. Preliminary results show that once transitional challenges are alleviated with supportive services provided by the college, nontraditional students in community colleges are highly capable of completing an associate degree, obtaining a certificate or transferring to a 4-year institution. The greatest institutional resource is having one center where students have access to services that provide academic and personal support. Other important services include targeted mandatory orientations, advisory check-ins throughout the year, and supplemental instructors who are in the classroom and who are also available for tutoring outside of class.

The Current Study’s Relevance

A study of the transition pathways for nontraditional students\(^1\) is especially relevant because of the current economic climate in the US where massive job layoffs have resulted in large populations of unemployed and displaced workers who need further education to obtain gainful employment (Carnevale, 2009). Community college programs that focus on accelerated remediation and incorporate college ready skill development are showing promise in helping more students, especially nontraditional students, transition to community college. Theories on student motivation underpin the rationale of these programs. Research on the experiences of

\(^1\) The characteristics of nontraditional undergraduates include any or all of the following: delaying enrollment (i.e., not entering postsecondary education in the same calendar year as finishing high school); attending part time for at least part of the academic year; working full time while enrolled; being financially independent from one’s parents; having dependents; or being a single parent; does not have a high school diploma (National Center for Educational Statistics, 2002). For the purposes of this study, nontraditional students are 25 years or older, unemployed due to involuntary separation from employment and may have completed high school.
nontraditional students attending community colleges shows there is a need for institutional change involving both organizational and pedagogical adjustments (Kilgore & Rice, 2003; Achieving the Dream, 2005; Bailey, Calcagno, Jenkins, Kienzl & Leinbach, 2005; Pusser, et al., 2007; Bailey, 2008; Bailey, 2010; Jobs for the Future, 2010).

Examining the progress of programs that are designed to facilitate nontraditional students” transition is a timely inquiry. In light of President Obama’s unprecedented commitment to spend twelve billion dollars over ten years to increase community college completion rates – “which represents the first serious consideration by the federal government to invest in broad community college improvement” (Bailey, 2010). With “54 million adults who lack a college degree,” the ultimate goal is to bolster their skills so that the United States has a well-trained workforce that is employable in the jobs of the 21st century (Pusser, et al., 2007). Thus, it is important for college administrators and policy makers to know if the efforts to remediate adult students who are entering or re-entering college are effective and if students are responsive to the programs. Students who were employed in fields that have become obsolete and do not have any postsecondary education are in need of some form of higher education to compete for the types of jobs that are available today. For those who decide a college degree is the path to pursue, they will likely undergo a life-altering transition process.

**Literature Review**

Bailey (2008) acknowledges that most of the transition research is focused on remediation initiatives. Researchers have attempted to show causation between remediation and successful college-going, but their results have not provided any concrete evidence that there is a positive relationship. Bailey, et al. (2005) created an empirical model for measuring institutional effects on community college graduation rates using data from the National Education Longitudinal
Study (NELS) and the Integrated Postsecondary Education Data System (IPEDS). Unobserved factors like leadership, faculty relations, the local political environment, and the number of institutions a student attended were included in the production function to test whether they had any bearing on student outcomes. Bailey et al. (2005) found that graduation rates go down as school size increases; institutions with higher part-time faculty have lower graduation rates; where there are high concentrations of minority students, there are lower graduation rates; and financial factors did not have strong effects for community college students. Bailey et al.’s (2005) institutional characteristics study showed implications for greater student services. Students who face multiple barriers need more counseling and guidance. It was pointed out that other variables related to “pedagogical, faculty culture and organizational structure” were not analyzed and could be more influential than the NELS and IPED data measured by this study. Bailey et al. referred to these variables as “unobservable characteristics” and stated they are missing from a number of studies on suggest they be included in further research.

Other authors recognize the need for special institutional services for older students who must juggle multiple priorities in addition to attending school. Kilgore and Rice (2003) advocate for a special approach to program planning for adult education, whereby, the organization of academic, social and administrative functions take place in “a web of interrelated people.” Rice (2003) identified specific areas in institutions where changes are needed to accommodate nontraditional students. She said, for example, “many student services offices meet the needs of adult students by offering alternative office hours” (p. 54). She also mentioned that offering a “unique orientation program” provides a forum for nontraditional students to get information tailored to their needs and situations. Kilgore (2003) discusses a “holistic approach” to the higher education planning process which is flexible enough “to meet the diverse motivations and needs
of adult students…” (p. 87). Kilgore and Rice offer valuable information for understanding the transition factors in the context of curriculum and program planning for adult students. Their advice echoes earlier work related to adult learners’ motivation and ability to persist through college beyond the traditional college-going stage of life.

There is much literature about how the decision to attend college for older students is a life-altering (Hardin, 2008), mentally challenging (Conley, 2008) expression of self-efficacy and economic survival (Bandura, Barbaranelli, Caprara and Pastonelli, 1996; Zajacova, Lynch & Espanshade, 2005). One example is Courtney’s (1992) work that explored the question the question “Why Adults Learn?” Courtney’s offered a “theory of participation in adult education.” He discussed the evolution of adult education in community colleges and cited historical research related to the sociology of participation, the psychology of motivation, decision-making models, theory of action, and participation in voluntary institutions. Courtney asserted several thought-provoking questions in his conclusion, such as the futility of continuing research on why more adults are not participating or why they drop out. He goes on to propose that perhaps less attention is needed researching motivation and the “underlying personality characteristics of disadvantaged adults” and more attention to “whether the institutions are really designed for those who need education the most” (Courtney, pp.145-146).

Several other scholars of Courtney’s time came to a similar realization, such as Bean and Metzner’s study that focused solely on the experiences of nontraditional student. Bean and Metzner (1985) found several poignant factors that affect persistence among nontraditional undergraduate students. Bean and Metzner’s described these factors as “environmental variables” and included student characteristics such as seeking economic advancement, commuting to school as opposed to living on campus, older age (beyond 24 years), and the need
to balance family, work and school responsibilities simultaneously. Bean and Metzner (1985) assert that “environmental support compensates for weak academic support, but academic support will not compensate for weak environmental support,” (p. 492). They found that the environmental variables, which often relate to family responsibilities, took precedence over academic variables, such as grades. This means that the more environmental support a nontraditional student can maintain, such as child care, the better he or she will be able to sustain themselves academically. Thus, environmental variables are often of greater significance and impact nontraditional student transition and persistence more than cognitive ability and identity development factors as Tinto’s theories suggest.

Tinto’s (1987) original model of student departure explores undergraduate student transition in the cognitive and social integration domains. His later theory of student departure has influenced many college administrators and is widely used by education scholars to examine “the adequacy of past theory and the effectiveness of existing programs to enhance student retention on campus” (Tinto, 1993 p. ix). However, his theories have also been greatly debated and criticized as lacking relevance for graduate, nontraditional and minority students, and for excluding factors from outside the college environment that affect a student’s persistence. Even though Tinto (1993) extends his model to include a theory of graduate persistence, which includes nontraditional students, the basic premise is rooted in the undergraduate attrition rationale and also does not take into account institutional inhibitors that are beyond the individual student’s ability to become fully socially integrated.

A conclusion from the Bean and Metzner study as well as Courtney’s book is that nontraditional students have many competing factors that affect their college-going and persistence, many of which require intuitional support through special services. Despite the
efforts of scholars to shed light on the needs of nontraditional students over the past three decades, most community colleges continue to operate pretty much in the same way. Bailey et al.’s (2005) institutional characteristic study showed that several aspects of the way community colleges are currently operating result in lower graduation rates. It also showed implications for greater student services. So what are community colleges doing today to address the special needs of nontraditional students?

Theoretical Framework

Community college programs that focus on accelerated remediation and incorporate college ready skill development are showing promise in helping more students, especially nontraditional students, transition to community college. Theories on student motivation underpin the rationale of these programs. The learning strategies are based on pedagogical methodology research which has proven to be most effective for teaching adult students. Many scholars believe that the motivation to start or return to college is a function of a person’s self-efficacy (Zajacova, Lynch & Espanshade, 2005) and nontraditional students often undergo a particularly agonizing mental and psychological adjustment (Bandura, Barbaranelli, Caprara and Pastonelli, 1996; Conley, 2008; Hardin, 2008). Although there has not been a lot of research on the specific experiences of nontraditional students attending community colleges, research has shown there is a need for institutional change involving organizational and pedagogical adjustments (Bean and Metzner, 1985; Terenzini, 1992; Kilgore and Rice, 2003; Bailey, 2008). Achieving the Dream (ATD) was created to address the institutional processes that impede the success of student populations who are most at-risk and “have faced the most significant barriers to success” (Achieving the Dream, 2005).
The work of Bailey et al. (2005), Bandura, Barbaranelli, Caprara & Pastorelli (1996) and Terenzini (1992) and has greatly influenced the current research. Bailey et al.’s work identifies the characteristics of institutions and their effects on student success. Bandura et al.’s work on self-efficacy theory provides insight into the psychology of motivation, especially for understanding why older students’ return to school, particularly during periods of financial difficulty. And Terenzini’s work illuminates the impetus for community college administrators to implement pedagogical and institutional changes to better accommodate nontraditional students’ needs. The Achieving the Dream initiative is of interest because it is a nationally recognized program designed to “improve student progression” through comprehensive institutional improvement (Achieving the Dream, 2009).

Missing from the current literature are studies on how programs, such as Achieving the Dream, are progressing and whether they are impacting students’ orientation to learning enabling them to persist and eventually finish with an associate degree or vocational certificate. Evidence of ATD’s national effectiveness is forthcoming, as the current cohorts matriculate through the programs and states continue to develop data-collecting systems for tracking student performance. There is positive evidence that schools that have implemented the ATD strategies are showing better retention rates since 2004 (Jaschik, 2010), but this data represents all of the ATD participants. What are the outcomes of the nontraditional student population? At present, the ATD program is aimed at helping traditional-aged students. How many community colleges are using it to help nontraditional students and are they realizing any progress in terms of persistence and retention? These are relevant questions since the majority of nontraditional students enroll in community college as the entry point to higher education (Bailey et al., 2005).
The purpose of this study is to examine the experiences of nontraditional students attending community colleges that have implemented institutional changes in order to facilitate nontraditional students’ transition; and to examine colleges using the strategies prescribed by the ATD program. The research questions are: Why do nontraditional students have trouble transitioning and persisting through their first year of community college? What are the institutional characteristics that have facilitated nontraditional students’ transition?

Methodology

Data Collection

The majority of nontraditional students enroll in community college as the entry point to higher education (Bailey et al., 2005), thus, the target population is students who returned to school after being separated from any type of formal education for 5 or more years. They are also underemployed or dislocated workers and have finished at least one year at the institution. A qualitative multi-case study approach seems to be the most appropriate for the study because of the replication logic in the case study process (Yin, 2006) and the use of phenomenologically based interviewing, which produces in-depth life stories of the participants (Seidman, 2006). The first part of the research is an exploration of personal characteristics affecting motivation among students. An understanding of the students’ personal motivations and elements of their transition process was gained through 45 minute, tape-recorded, face-to-face interviews. The second part relates opinions about students’ transitions and developmental education innovations from faculty and administrators, also through 45 minute, tape-recorded, face-to-face interviews. The interview questions for students were designed to probe their feelings about going to college and how they expected it would impact their future. The questions for the faculty and administrators were related to the ATD academic goals that include: successful completion of remedial
instruction; successful completion of “gatekeeper” courses in math and English; achieving a grade of “C” or better; persistence through multiple terms; and earning an associate degree or certificate (Achieving the Dream 2009). The interview questions also inquired about the ATD targeted areas of institutional improvement that include: leadership committed to “achieving equity in student outcomes across racial, ethnic and income groups” (p. 8); establishing a data collecting process for tracking student outcomes; engaging all departments across the college as well as community stakeholders; developing planning processes using the data on students outcomes (Achieving the Dream 2009).

The main college chosen for the current study (Case A) has participated in the ATD program since 2007. Two additional schools were included because they were in varying stages of implementing the ATD program. Case B has developed the ATD strategy framework and will be rolling out the implementation in the fall of 2010. Case C recently adopted the ATD initiative and is in the strategic planning stage. The researcher felt that by looking at schools in varying stages of implementation, a more comprehensive view of the ATD initiative could be obtained.

The interview participants were recruited on site once permission was granted by the appropriate administrator. For Case A, three students who were visiting a resource center were asked to participate. The interviews were conducted in a private office. For Case C, the participant was randomly recruited at a campus café. Permission was not granted for access to students at Case B. The 45 minute interview format provided ample time for the participants to give thoughtful responses to the questions. Each participant was given a $10 restaurant card.

Limitations

This study was the first phase of research on community colleges utilizing ATD to facilitate nontraditional students’ transition to college. A limitation of the study was the number
of institutions that could be examined during the limited research period of 6 weeks. Another limitation was the availability student participants from Cases B & C because of the institutions’ status in implementing the ATD program. Although the number of participants for Case A is small, the researcher found the in-depth information that she was seeking through the interviews of students, faculty and administrators. The continuation of this study will include returning to Case B and C as well as adding other institutions that are further along in the implementation of ATD. A future goal is to compare the students’ interview responses with those of the faculty and administrators to identify distinct patterns of student and institutional characteristics across multiple cases.

The next phase of research will include on-site observations, data on the college setting, student-administration interaction, student-faculty interaction, and student engagement inside and outside of the classroom. To supplement the interviews and the observations, the researcher will also review the school’s history and public records to establish a more informed perspective of the state-of-the-environment at each site related to nontraditional student transitions.

Data Analysis

The tape-recorded interviews were transcribed and uploaded for analysis in QSR NVivo8. The responses were coded manually to include certain categories which were not specifically named in the interview responses, such as “transition process” and “adjustment.” Other codes were created automatically from the frequency of certain text or phrases, such as “use of technology” and “intimidation.” As additional sources become available, the researcher intends to query combinations of categories to explore any special connections among them. Because there were so few sources from which to draw at this phase of the study, the associations were not considered statistically meaningful at this time. However, the data from the
interviews do provide valuable information about the experiences of students and institutional characteristics from Case A. At this stage of the study, the answers to the research questions were derived directly from the interview responses.

**Current Findings**

For Case A, three students were interviewed. All of the participants are over age 40, had successfully completed their first-year and were enrolled for the upcoming semester. Two administrators were interviewed, a dean and a director, and one full-time faculty member. There were no students for Case B and one interview with a dean. There was one student for Case C who is 35 years old and was continuously enrolled for two years, but did not complete the degree, transfer or receive a certificate. One administrator was interviewed for Case C, a director of student services. The answers to the research questions were derived from participants’ responses as described in the following paragraphs.

**Mental and Psychological Adjustments**

*Why do nontraditional students have trouble transitioning and persisting through their first year of community college?* The students reported a lack of confidence, a fear of change, and never being challenged in the way college challenges them. This response is consistent with Conley’s (2008) findings about the need for students to be mentally prepared. Many students become lost and disengaged in the process because of a lack of information about what it requires to be “college ready. They also report difficulties in navigating the college systems, such as registration, financial aid, advocating for themselves and seeking assistance. One of the administrators for Case A mentioned:

They have a sense of being kind of outside of the education experience. Because you are already taking them out of the context of life, new contacts, new people and new stuff to
navigate. The other challenge that I hear is the work after school. With a job you go home and with school you go home and do homework.

The faculty member and the students echoed a similar sentiment. Successful completion of a degree requires learning a new set of behaviors, such as cognitive strategies, content knowledge, academic preparation and contextual skills (Conley, 2008). A student who is college ready is familiar with college culture and academic expectation which enables him or her to relate to professors, classmates and family members differently than he or she did in high school. For nontraditional students, who initially chose not to pursue education beyond high school, these skills are never cultivated. The director of the student service center described a transition problem in the context of learning how to use the computer.

They didn’t know how to use the mouse, didn’t know how to use Word, didn’t know what that little cursor thing was, didn’t know how to set margins. This can send them right over the edge. Not only were they stressed with losing a job, not having a job or training for a new job or having a lot of responsibilities, not having computer skills was the last straw.

The director’s comment illustrates how one difficulty can be compounded into a feeling of total defeat, which explains why many older students start at community college completely terrified and unsure how they will do it. They often start and stop-out, then return. Hardin (2008) describes adjusting to the challenges and rigors of going to college as “creating a new identity.” There are many characteristics of nontraditional students that “put them at risk for being unsuccessful” (p. 50), they include: part time enrollment, full time jobs, financially responsible for dependents and being academically unprepared. Hardin (2008) classifies these characteristics as stemming from “institutional barriers,” “situational barriers,” and “educational barriers.” The most challenging to overcome are the “psychological barriers,” which include “inadequate coping skills due to lack of confidence, peer-self image and school created anxieties based on negative prior experiences or expectations about outcomes” (p. 53). It is sometimes difficult for
older adult students to start over in a new discipline, especially if they once had a successful career. This causes feeling of “vulnerability” as he or she adjusts to the beginner role in an academic program. For some it causes a mid-life identity crisis. A male student mentioned that not only were there mental challenges, but he faced physical ones as well.

Um, it is really a challenge basically when you’ve really been out of the workforce for so long ago that you readjust, you know, to how they conduct things [in school]. You are used not used to sitting down in a room with computers and stuff like that and you’re used to being in a factory, a factory, where you stand for 3-4 hours, so you try to learn how to do that.

Overcoming transition challenges involve a range of changes that differs from person to person. As Conley and Hardin suggests, if the readiness skills were taught throughout secondary schooling or included in meaningful orientation programs, more students would be prepared for success and the transition to higher education would be less difficult. Adequate psychological preparation would reduce the stressors of multiple mental adjustments involved in developing a college disposition (Hardin, 2008).

The researcher observed a change in the students’ disposition when they talked about their adjustment period. As students talked about “the dark days,” as one student referred to it, their voices became barely audible. And when they started talking about how things are going for them now, the volume went way up, their body position shifted and the tone of their voices was more cheerful. The students explained that going to college made them feel proud and confident. They also exhibit diligence, curiosity and a sense of commitment.

I am ambitious now. I must make sure I get good grades. You have to keep pushing yourself. And another exclaimed “You start finding out you can do things that you didn’t really think you could do. But it does take sacrifice. I think I feel better about myself.

The students’ attitudes support Zajacova et al.’s (2005) study on self efficacy and stress. This research posits that self-efficacy beliefs affect college outcomes by increasing student motivation
and persistence to master challenging academic tasks and by fostering the efficient use of acquired knowledge and skills. It also suggests the extent to which a person perceives a situation as a threat versus a challenge affects a person’s ability to manage external demands and manifests his or her level of self-efficacy. On the other hand, “people confronted with high stress and anxiety on a regular basis could show lower levels of self-efficacy in their decision-making” (p. 680). The students expressed a similar emotional tug-of-war as they learned to process their transition as a challenge rather than a personal threat against everything they already knew.

The faculty and administrators also notice the change in students who struggled initially, but managed to persevere. A dean commented, “But by gosh they persist and they do pretty well in their classes!” The dean also talked about the overall performance of nontraditional students.

What I”m getting at is that the older student does persist higher than average and their cumulative grade point average is 3.13 overall. The overall GPA for this school is like 2.0. So they are doing better and they are persisting better.” She further explained “You can see them as students and when we give them a clear direction, goals and support they use all that. They parlay the resources, use all of them and they follow the advice. The success of the nontraditional students at this institution is attributed to the efforts of the faculty and administrations that have used the ATD tools to create strategies aimed specifically at the nontraditional student segment. The specific institutional elements that have made a significant difference in facilitating student success are discussed in the next section.

While listening to the students’ stories, the researcher wondered if their longevity could be a factor in overcoming seemingly insurmountable obstacles. The students in this study were all age 35 or over and had worked at previous jobs for many years. Does age affect a person’s resilience? Gecas (1989) offers a view of older students in his assessment of self-efficacy “over the life course,” which adds another dimension to understanding nontraditional students” transition that has been largely understudied. From his perspective, self-efficacy in later years is
more related to consequences of life rather than a specific age. If events occur more “untypically” than one would expect in comparison to the experiences of peers (i.e. returning to school), then there are possible negative associations with “off-time” events. Events that increase “role strain, economic or social disruption” [such as losing a job] can have a negative impact on self-efficacy (p. 307). The resulting effects are the “psychological barriers,” as Hardin (2008) describes, which causes challenges for older students attempting to adapt to the college environment. Conversely, Gecas believes this type of adversity is less likely to affect the self-efficacy of older students because they have developed the adaptive capacity to deal with crises over the course of their lives. This idea supports a more positive view of the capacity of older students to adapt to the rigors of going to college. The students of the current study certainly exhibited great resilience, a sense of pride and optimism toward using their newly acquired knowledge. All of the students recognize that going to college has not been easy, but they have embraced it and are eager to continue.

I made mistakes when I was younger as a former drug addict. Honestly, it’s a struggle, but I feel good about me going through this struggle. I think I’ve learned how to help myself and how to get resources and how to search for resources.

For another student, there have been certain epiphanies, such as “Honestly, one of the things that I learned is that, if you are struggling, you need to ask for help.”

Perhaps the transition to college for older nontraditional students is less about creating a totally new identity but more about expanding their life-long identities with a new level of academic efficacy.

**College Services**

What are the institutional characteristics that have facilitated nontraditional students’ transition? The greatest resource in Case A is having one place where students can access multiple services such as tutoring, counseling services, computers, printers, and other students.
As Kilgore and Rice (2003) stated, nontraditional students require a special approach to program planning, whereby, the organization of academic, social and administrative functions take place in “a web of interrelated people.” A faculty member commented on the student service center: “They are not going to show up at the tutor center unless they know somebody who says, yes this is a cool place” And a student gave an example how she used the center.

I like their counseling because I went to their counseling for a while, which is paid for in the tuition. When I started to feel stressed with home and balancing, I was able to sit down with a social worker and make a plan. The center, I highly recommend it especially when you are just getting back. They have staff that will help you sit down and teach you how to learn to study again and use the computer and utilize your time.

This student has successfully completed all of the prerequisites and is moving into the nursing program in the fall. She credits her success to the people in the student center who helped her through the initial difficulties.

Other important services are targeted orientations that are mandatory, advisory check-ins throughout the year, and supplemental instructors who are in the classroom and who are also available for tutoring outside of class. Rice (2003) mentioned that offering a “unique orientation program” provides a forum for nontraditional students to get information tailored to their needs and situations. All of the administrators in this study concur with this recommendation.

They need their own orientation because nontraditional students need to tell you their life and have that attention. And they have a different set of questions than younger other students who are coming in, so we try to keep that in mind… It’s a different conversation.

Kilgore (2003) discusses a “holistic approach” to the higher education planning process which is flexible enough “to meet the diverse motivations and needs of adult students…” (p. 87). One of the deans remarked that “nontraditional students thrive in a guided environment, whether it is the cohort based or the learning community models, they perform better when they are familiar with their surroundings.” A faculty member from Case A expressed that “the adjustment [to college] for learning community students is easier than students who are not in a guided environment.”
The program director from Case C echoed a similar sentiment by saying “Certainly, they feel stronger in school in the cohort-based community.”

Case A exemplifies the holistic approach to meeting the needs of the students through the creation of a student center that caters to nontraditional students’ unique circumstances. The administrators explained how their institution rose to meet the challenge:

We have the same services for everybody, but we have beefed up the services for nontraditional students. We are the support services arm of the college. We provide peer tutoring, paraprofessional tutoring (those are tutors that have already received their associate degree), and adjunct instructors who are teaching something here at the college. Most are tutoring in writing, some a little bit of math and the others are tutoring whatever the college needs.

For nontraditional students we have advisors that are particularly assigned for nontraditional students. They take a little longer in the advising session and they do a more thorough discussion, I think, of what the students are going through and what skills they come from. Generally, especially a displaced worker will not see the skills they have, like this was my job, but they don’t translate, they have trouble translating skills into something else. So they help with that. And we have social workers that help them talk through the emotional things they are going through. The advisors and social workers are connected in the community and are familiar with the resources they can offer if you are having trouble making this bill or finding this class.

The efforts to accommodate nontraditional students are showing positive results for Case A. The dean shared some of the data from the most recent semesters. She was able to extract specific information about the No Worker Left Behind participants who are all nontraditional students.

We had just looked at our No Worker Left Behind population and the result we have for that, kind of typically, from semester to semester like from fall to winter, our persistence rate hangs around 70 -72%. Here’s the numbers for the traditional versus nontraditional students in the SI [supplemental instruction] and non-SI for the math class. With the SI situation, 67 % success compared to what...15% higher than the traditional age. Success in this class is 2.0 or higher.

The collecting of group-specific information is an outcome of implementing the ATD strategy.

The only student from Case C told an interesting story about her experience. She explained that upon entry to college, her intent was to complete the program in two years.
Unfortunately, institutional limitations coupled with changes in the spouse’s employment (forces beyond the students’ control), the student’s progress toward completion has been suspended. As with all of the student participants, inescapable life situations had a direct impact on their transition and ability to persist in college. When these circumstances are compounded or if there are insufficient institutional resources to alleviate transitional difficulties, such as inflexible class scheduling, the primary barriers are institutional as well as environmental. As previously mentioned, Bean and Metzner’s (1985) study showed nontraditional students’ persistence is closely connected to environmental variables. Thus, as in the student of Case C, institutional barriers coupled with environmental variables had a greater impact on her persistence than cognitive ability and identity development factors.

**Conclusion**

Case A is an example of an institution where the implementation of Achieving the Dream for nontraditional students is showing success. It was reported that many nontraditional students are out-performing the traditional age students because of the focused support available to them. Learning communities provide a guided environment where the students are less intimidated by more advanced students and get critical assistance in navigating college systems. The dean from Case A reported that nontraditional students in Michigan’s No Worker Left Behind program (they are also enrolled as ATD participants) are persisting at an average of 70%. In the fall semesters, the persistence average rose to 86% in 2008 and 87% in 2009, which is higher than the rest of the college’s population. The average grade point average for the No Worker Left Behind student is 3.13 while the average for the total student population is around 2.0. Another important strategy is the use of supplemental instructors for developmental math classes. The nontraditional students’ success rate is 67% compared to traditional students whose success rate
is 15% (success is achieving a grade of 2.0 or better). At present, the faculty is in the process of developing supplemental instruction for other subjects, such as reading and writing.

The progress of the nontraditional students in Case A is attributed to the institution’s attention to the “environmental factors” that previously impeded their transition. As Bean and Metzner’s (1985) study found, environmental variables are of greater significance and impact nontraditional student transition and persistence more than cognitive ability and identity development factors, as Tinto’s (1993) theories suggest. The literature also recommends special orientations to address nontraditional students’ specific questions and concerns (Terenzini, 1992; Kilgore & Rice, 2003; Bailey et al., 2005). For students that have persisted beyond the first year, their motivations (as an expression of self-efficacy beliefs) are quite different than the motivations of traditional students especially during periods of financial difficulty (Gecas, 1989; Bandura et al. 1996).

It is hoped that information from this study informs college administrators of the special academic and psychological needs of nontraditional students. The preliminary results suggest that when transitional challenges are alleviated with supportive services provided by the college, nontraditional students are highly capable of completing an associate degree, obtaining a certificate or transferring to a 4-year institution for a baccalaureate degree.

**Abstract**

With the current estimations of autism spectrum disorder (ASD) prevalence at 1 in 110 and the increasing number of culturally linguistically diverse (CLD) students attending early childhood programs and preschools, educational professionals, speech language pathologists, and other related service providers are presented with an opportunity to develop a more culturally responsive approach to the treatment of students with ASD and how they interact with the student’s family. The purpose of this review of literature is to gather information in regard to current best practice in meeting the child and his/her families’ needs through culturally appropriate practices. Utilizing a combination of three practice components, educational professionals, speech language pathologists, and other related service providers can improve their knowledge and skills to a new level that will be more responsive to diverse populations. The practice components discussed are cultural competence, family centered involvement and child centered development of activities and methods.
In search for participation and transparency
- Evaluating organization for reform of national course syllabi in compulsory school

Laila Niklasson

Mälardalen University

Abstract

The article present and discuss how a national reform initiative was created and carried out during 2009 and 2010 in Sweden aiming at change of national curriculum and course syllabi for compulsory school. The research objective is to study how the organization for the revision was constructed and how the work process was carried out. The vision the National Agency for Education had was to increase transparency and participation during the process, compared with earlier revisions of curricula and syllabi. As a part of the transparency the work with the revision was also evaluated. It is part of the evaluation that is referred to in this study. As a way of evaluating the work participants in the revision were asked to comment. The participant group comprise those who worked with the first version of the course syllabi such as workgroups, reference groups with experts and schools all over the country, researchers, teachers and the staff at the National Agency for Education who wrote the last version. The method used for data collection comprises text analysis, observations, interviews and questionnaires. A conclusion that can be made from the design of the reform process is that transparency and participation can be discussed both from a political and a practical perspective. The different actors found the model for the organization suitable, but gave a lot of suggestions for improving the work process in general.

A Review of Transition of International Education and Educational Co-operation in Developed Countries and Developing Countries

SAKAGUCHI Chie

Abstract

This study reviewed the transition of international education and educational co-operation as the approach of global society in terms of education in developed countries and developing countries. While developed countries recognized the significance of education for understanding the world imbalance from their aspects such as Development Education and World Studies, developing countries put the expansion of insufficient basic education before everything else. The review should be able to reveal and present the diversion of education from point of views of developed countries and developing countries which were less seen in preceding studies. Therefore, how international education and educational co-operation have transited would be deeply focused on and described in the review. And, it extended upon the article on Sakaguchi (2010) in the bulletin of Graduate School of Social Sciences and Humanities, Chiba University at the history of international education and educational co-operation.

The rise of international education in developed countries and construction of basic education in developing countries were characteristic of 1960s. A small number of developed countries occupied the great majority of the world until World War II ended. Colonized countries gained independence after 1945, although obvious differences between developed countries which were placed generally in the Northern parts of the world and developing countries which were mainly in the Southern parts of the world were there. Hence, the world economy was polarized rapidly and the situation was recognized as North-South problem. Actually, the United Kingdom and other European nations have started to notice North-South problem from the beginning of 1960s. Consequently, the promotion of Development Education which is the study of understanding the structure of North-South problem, and considering the way of resolving it was directly related with attention of North-South problem (Osler, 1994).

At the same time, construction of basic education system became one of the urgent issues in developing countries (Kuroda, Yokozeki, 2005). The literacy rate in developing countries was terrible low in 1960s. UNESCO held on the regional international conferences for educational development at Karachi in 1960, at Addis Ababa in 1961, and at Santiago in 1962. In these conferences, the goal of the implementation of basic education till 1980 (and till 1970 in Latin America) was resolved.

Thereafter, establishment of several international education standards in developed countries and
stagnation of expansion of basic education in developing countries were appeared from 1970s to 1980s. In the United States, Global Education was introduced in 1970s (Yoshida, Ito, Ishimori, 2009). In 1970s, the United States was in the Vietnam War and people were disgusted by that linger war. So, the educational activities were based on reflection against Americanism such as the war, and recognition of multicultural country the United States was (Tanaka, 1994). And it was taken over as World Studies in the United Kingdom. The idea of World Studies is to learn the world wide issues, and to acquire knowledge and attitude to live in the multi-cultures and people (Otsu, Mizoue, 2000). Almost the same time, the Labour Party government established Development Education Fund in the Overseas Development Administration in 1977 in the United Kingdom. Development Education has been expanded that scale gradually.

Then, UNESCO suggested “recommendation concerning education for international understanding, co-operation and peace and education relating to human rights and fundamental freedoms” in 1974. This recommendation has been useful substantial conception in terms of education for the world issues even it was adopted more than a quarter of a century ago (Otsu, Mizoue, 2000).

Whereas, the generalization of basic education was incomplete in developing countries. In fact, primary education was expanded immediately after the regional international conferences. However, population growth in developing countries was much rapidly (FASID, 2010). And then economic crisis was happened to many parts of developing countries in 1980s. It obliged educational budget to cut, and development of social sectors was standstill.

Then, educational co-operation for basic education has been progressed after 1990s. The World Conference on Education for All was held under the auspices of World Bank, UNESCO, UNICEF and UNDP in Jomtien, Thailand in 1990. The biggest purpose was nation and global society should have responsibility on the assurance of basic education. This international conference influenced educational policy in developing countries and educational co-operation directly. Education for All (EFA) became the key word of educational development hereafter.

Ten years later, World Education Forum was held on Dakar, Senegal in 2000 as the follow up conference. Dakar Framework for Action was established to achieve goals for EFA which was still unreachd since 1990.

In the same year, United Nation Millennium Summit in New York. Millennium Development Goals (MDGs) was put together with eight goals and eighteen concrete precepts (MOFA, 2009). It included two educational goals of the spread of basic education and gender equality in terms of education as well as Dakar Framework for Action.

The history showed that international conferences and international educational co-operation make a point of educational development for social cohesion (Kuroda, Yokozeki, 2005). The educational stream of the world has been working on the achievement of MDGs at present.

Last but not least, this research was supported in part by a grant from Chiba University. I wish to
express my gratitude to the university.

DEDICATION

To the students of The Kayne ERAS Center:

Thank you for your participation in this study and for all I’ve learned from you.
ACKNOWLEDGEMENTS

The completion of this project would not have been possible without the assistance and support of many individuals. I would like to thank my thesis committee members: Dr. Menzies, Dr. Symon, and Dr. Garcia. I am particularly grateful to Dr. Menzies for chairing the project and for her guidance, support, and unending patience throughout this endeavor. I am especially thankful to her for taking the time to read my drafts and provide me with her invaluable feedback and insights. The amount I learned from her is immeasurable and I would not have been able to accomplish a project of this magnitude without her. I am grateful to Dr. Symon and Dr. Garcia for agreeing to be on my committee and providing me with their astute guidance and expertise.

I am grateful to the staff at The Kayne ERAS Center for their participation in this project, in particular to Ms. Francziska Steagall, Ms. Karen Sangl, and Ms. Jolonda Dabney for their assistance and support. I am especially indebted to Mr. Dwight Counsel and Ms. Mishele Ross for allowing the project to occur at the school. I am also indebted to Mr. Counsel for his constant support and dedication throughout the project. I am grateful to the students of The Kayne ERAS Center for their participation in the project. They showed enthusiasm and cooperation and what I learned from them is immeasurable. Lastly, I’d like to thank my family and friends for their support, particularly my husband Allen. His patience and support throughout this project enabled me to complete it. I would also like to thank my mother, Patricia Sangl, whose support throughout my life enabled me to reach such a goal as this.
ABSTRACT

Bullying at a Non-Public School:

An Intervention Plan

By

Jean Pellerin

Bullying is a serious problem for schools. It is difficult to address as it often goes unnoticed by teachers. Victims of bullying experience stress, low self-esteem, and depression. This study examines bullying at a non-public school that includes elementary, middle, and high school students. A School Wide Positive Behavior Support Plan was introduced to reduce bullying behaviors. The plan’s implementation consisted of training, defining expectations, precorrection, reinforcement, and suggestions for alternate behaviors. Student perceptions of bullying and the program’s effectiveness were measured using self-report questionnaires. Results indicated a significant decrease in student reports of bullying.

CHAPTER 1

Introduction

Statement of the Problem

Around the world, reported instances of bullying have reached alarming numbers and involve many students (Bjorkqvist, Lagerspetz, & Kaukiainen, 1992; Olweus, 1993, 1997, 2001; Rigby & Slee, 1991; Stephenson & Smith, 1989; Swearer & Espelage, 2004; Wong & Lo, 2002). In the United States, 24% of students report being bullied once a week (Dinkes, Cataldi, & Lin-Kelly, 2007). Smith and Brain (2000) define bullying as an aggressive behavior intended to cause emotional, social, or physical harm to others of lesser power. Bullying is neither random nor limited to physical aggression. Bullying behaviors include verbal abuse, harassment, threats, intimidation (Patton, Glover, Bond, Butler, Godfrey, & DiPietro, 1998), name-calling, teasing, inappropriate gestures, social exclusion (Olweus, 1991) gossiping, suggesting the shunning another person, spreading rumors, and befriending someone out of revenge (Bjorkqvist et al., 1992). Olweus (1993) defined open attacks on a victim as direct bullying and social exclusion as indirect bullying. In all of its forms, bullying is an unacceptable behavior that has been shown to have negative effects on students (Boulton, Trueman, & Flemington, 2002).

Bullying can affect a student’s academic and psychosocial well-being and self esteem (Crick & Bigbee, 1998; Hawker & Boulton, 2000; Hodges & Perry, 1999; Olweus, 1994a, 2001) and can have negative effects for all involved. Students with learning disabilities who are bullied are especially prone to low self esteem, feelings of
inferiority (Forness & Kavale, 1996), loneliness, depression, anxiety, (Hawker & Boulton, 2000; Nabuzoka & Smith, 1993; Olweus, 1994b, 2001; Rigby, 2002) and can have psychosocial problems that prevail into their adulthood (Hellendoorn & Ruijssenaars, 2000). Bullies are more likely to drop out of school, use alcohol and drugs (Gottfredson, Gottfredson, & Hybl, 1993), engage in domestic violence (Rigby, Whish, & Black, 1994), and have criminal convictions (Olweus, 1994a). Peer bystanders can prolong bullying by providing reinforcing attention (Craig & Pepler, 1995), and they, too, may end up feeling sad, depressed, angry, guilty, confused, disgusted, or fearful that they may become the next victim (Lodge & Frydenberg, 2005). Interventions to address bullying are considered a matter of high priority by educators and school administrators (Lodge & Frydenberg, 2005).

*Bullying at The Kayne Educational Resource and Service (ERAS) Center*

The Kayne Educational Resource and Service (ERAS) Center is a Non-Public School that serves K-12 students with special needs including those with emotional disturbance (ED), autism (AUT), mental retardation (MR), specific learning disabilities (SLD), and other health impairment (OHI). The school is in Culver City and the students are transported by bus from varying neighborhoods. Some of the inappropriate behaviors exhibited by the students are stealing, tagging (gang related graffiti), foul language, lying, and bullying. These behaviors seem to occur at a higher rate in the hallways, bathrooms, and in the cafeteria.
At the Kayne ERAS Center, bullying appears in all of the previously mentioned forms. It appears to be more prevalent among middle school and high school students than among elementary students, though it also occurs between them as well. Students often target a student whom they consider to be weaker or of lesser social status. Peers are encouraged to join in the harassment. Students that do most of the bullying are popular among the other students in the school, which is consistent with research findings (Rose, Swenson, & Waller, 2004). There does not appear to be a significant difference between the genders in number of occurrences; however, boys tend to bully physically, or bump into students while passing them in the halls. Girls tend to bully in more indirect ways: threatening to withdraw friendships, social manipulation, social exclusion, gossiping, starting rumors, and whispering about someone loud enough that they can be overheard, which is also consistent with previous research (Craig, Pepler, Connolly, & Henderson, 2001). Both types of bullying can potentially escalate to physical altercations. Bullying has been observed during unstructured time and in classes where the teacher may have poor behavior management skills, but it seems most prevalent during transition to classes, transition to and from the buses (particularly in the afternoon), on the buses, and in the cafeteria.

The Kayne ERAS Center offers a Diploma Track (DT) and a Certificate Track (CT) program. DT students are working toward a diploma, while CT students may not be able to achieve that, so instead they earn a certificate of completion. Bullying seems to be an issue all over the school, but it appears to be more prevalent between the DT students
and the CT students. DT students are more often in the role of the bully, while CT students are more often in the role of the victim. In a preliminary study at Kayne ERAS, students answered questionnaires about bullying and why they thought they were bullied. Students who were bullied reported that they were bullied due to their track or disability. The DT students may think of themselves as better than CT students, even though many of them will also receive a certificate of completion rather than a diploma. They may also get bullied at home about being in a special education school and possibly displace their anger by bullying those they perceive of as less powerful. Leff, Power, and Goldstein (2004) found that bullies often demonstrate academic difficulties. Copius research demonstrates links between being bullied and learning disabilities (Nabuzoka & Smith, 1993; Farrell, 1997; Norwich & Kelly, 2004). In a study by Norwich and Kelly (2004) 49% of the students who were bullied had learning disabilities, and related being bullied to their learning disabilities. In another study, 83% of students with dyslexia reported being bullied regularly (Singer, 2005). These findings are consistent with the behaviors exhibited at the Kayne ERAS Center, where 70% of the students attributed being bullied to their disabilities.

Review of the Literature

Positive Behavior Support

Over the past eight years, more than 5,000 schools in 39 states have successfully implemented Positive Behavior Support (PBS) programs at every grade level (Frey, Lingo, & Nelson, 2008) to modify behavior and promote academic success (Bohanon-
PBS programs have been administered at individual schools (Lane & Menzies, 2003) as well as at the school district level (Sadler, 2000) and state level (Freeman et al., 2005).

PBS uses functional behavior analysis (FBA) to assess the function, or purpose, of the behavior. FBA specifically describes the behavior, identifies the events preceding it, and the contexts in which the behavior is likely to occur. Then, reinforcers or consequences that support the behavior are identified. FBA hypotheses may be derived from a variety of sources including (a) direct observation, (b) student records, (c) office referrals, (d) team consensus, or (e) data from assessment scales (Killu, 2008). These assessment findings may be used to establish PBS programs that can reduce a student’s need to use inappropriate behaviors (Sugai et al., 2000). PBS programs should teach appropriate, alternative, pro-social behaviors to students and support the students’ use of these behaviors (Johnson-Gros, Lyons, & Griffin, 2008). The key features of PBS include the following: They are prevention-based and implement proactive approaches to teaching and improving social behaviors. They clearly state expected behaviors and subsequently reinforce the demonstration of those behaviors. Finally, they use data to monitor an intervention’s effectiveness and to implement changes as needed to ensure success (Sugai et al., 2000). A PBS plan specifies the observable outcomes and how to assess whether the plan is effective (Sugai & Horner, 2002). The goal of PBS is to
increase appropriate behaviors in students and reduce the need to use inappropriate
behaviors. This allows for productive academic time, increased engagement (Sugai &
Horner, 2002), and a better overall school environment, which may lead to a better
quality of life.

School-Wide Positive Behavior Support

School-wide Positive Behavior Support (SWPBS) programs can use a 3-tiered
system of intervention that includes the following levels: primary (school wide plan),
secondary (classroom or small group intervention), and tertiary (individual intervention;
Sugai & Horner, 2002). Primary interventions in PBS target the increase of appropriate
behavior in all students in the school setting and typically demonstrate success with 80% of
them (Sugai & Horner, 2002). SWPBS programs are effective only if the environment,
or school, is effective in making the necessary changes needed to support the behavioral
changes; thus, SWPBS plans are directed toward the environment (Sugai, 2008): What
changes will the staff make? What changes need to be made in the school or classroom?
What changes need to be made in teaching strategies?

SWPBS programs typically include providing positive reinforcement for desired
behavior, teaching appropriate behaviors, prompting or pre-correcting to assist in the
students’ use of these appropriate behaviors, and creating learning environments that
discourage inappropriate behaviors (Colvin, Kame'enui, & Sugai, 1993; Johnson-Gros, et
al., 2008; Lewis & Sugai, 1999). These plans include a description of what will change
in the school to help students reduce their need to use problem behaviors and improve
their social skills (Sugai et al., 2000). The school environment should support the students’ changes in behavior. Since SWPBS is directed at changes that should occur in the environment, including school and staff, it should also provide staff training. It is imperative that there be consistency in the implementation of the plan, as without it the plan may not be as effective (Warren et al., 2006). Also, it is imperative to facilitate staff consensus as to the problem to be addressed, as well as their support of the plan (Sugai, 2008). It may be important for staff to understand that if students can develop more appropriate social skills at school, they may be able to generalize those skills to other areas of life (Carr et al., 2002).

Primary interventions view the school as a unit. Schools may consider a SWPBS when they encounter students engaging in problem behavior and existing intervention plans or strategies have been ineffective. SWPBS plans typically include (a) a visible leadership team, (b) description of problem behavior, (c) a review of existing data, (d) definition of expected outcomes, (e) the measurement to be used to analyze implementation and outcome, (f) use of an evidence-based plan, and (g) supports for students who engage in appropriate behaviors.

Secondary interventions incorporate the same guidelines and conceptual components as primary interventions, but on a more intense level. Sugai (2008) describes secondary interventions as those that are designed to support a smaller group of students who are at-risk for problem behavior of a more serious nature. These students require more support to be successful in making behavioral changes. It is beneficial to first
understand the function of the behavior in order to design the most effective plan, and then regularly assess data to monitor the success of the plan. Secondary interventions typically target the approximately 15% of students who don’t respond to the primary level of intervention. Recommendations for secondary level intervention may come from teams that assess office discipline referral data, review the student’s attendance, grades, and achievements, or use screening tools such as the *Systematic Screening for Behavioral Disorders* (Walker, & Severson, 1992). They may also include teacher and parent referrals.

McCurdy, Kunsch, and Reibstein (2007) implemented a secondary level PBS in an urban elementary school to reduce disruptive behaviors with eight students. Students checked in with the facilitator at the beginning of the school day where they were given a behavior check sheet and a reminder to adhere to the school rules. Results were mixed with 50% of the students achieving significant results in increasing their ability to adhere to the rules.

Tertiary interventions focus on the approximately 5% of individuals who do not respond to primary or secondary level interventions. These students are at high risk for problem behaviors of a more severe nature. As with the secondary level of intervention, the tertiary level begins with a FBA: What does the behavior look like? When and where does it occur? What supports the student using the behavior? What consequences follow the behavior? What is the student trying to get or avoid? After a FBA has been conducted, a Functional Behavior Plan (FBP) is implemented. The student is taught
alternative behaviors that are supported through making behavioral changes and monitored using measurable instruments to ensure the success of the plan (Sugai, 2008). Sometimes physical changes to the environment are necessary as well: seating arrangement, signaled transitions, etc. As with secondary intervention plans, tertiary intervention is best executed by a collaborative support team that may include teachers, special education teachers, behaviorists, and other school staff that are experienced in the area of behavior support (Medley, Little, & Akin-Little, 2008).

Lane, Rogers et al. (2007) implemented a tertiary level intervention plan that included FBA and FBP with two students, a first and an eighth grader, at an inclusive rural school. Unresponsiveness to primary and secondary interventions was defined academically by low GPA ($\leq 2.7$) or one or more failing grades, and behaviorally by having one or more office referrals in the first four months of school or scoring moderate to high-risk using the Student Risk Screening Scale (SRSS; Drummond, 1994). The SRSS is a screening tool used to identify students with antisocial behavior patterns. Student and teacher interviews, the SRSS, observations, and a six-celled function matrix (Umbreit, Ferro, Liaupsin, & Lane, 2007) were used to determine the function of the behavior (to get or avoid attention, tangibles, or sensory stimulation), thus insuring implementation of the appropriate intervention. FBP included manipulation of antecedents and reinforcers to increase the likelihood of appropriate behaviors and directives for extinguishing the inappropriate behaviors. The study indicated successful outcomes for both students.
Review of Positive Behavior Support Plan Implementations

A variety of SWPBS interventions have been studied. These studies have looked at (a) FBA of inappropriate behaviors (Frey et al., 2008), (b) the importance of staff support and participation (Warren et al., 2006), (c) clearly defined expectations that were discussed, taught, and posted (Benedict, Horner, & Squires, 2007), (d) precorrection (Johnson-Gros et al., 2008), (e) reinforcement of appropriate behaviors (Frey et al., 2008; Lane, Wehby et al., 2007; Warren et al., 2006) and (f) measurable, data-based assessment (Frey et al., 2008; Warren et al., 2006).

Functional Behavior Analysis. FBA is typically applied to tertiary and secondary levels of intervention. Analyses focus on the relationship between the student’s behavior, the context of the behavior, and the need that the student is trying to meet (Scott & Caron, 2005). Scott and Caron suggest that at the primary level a FBA should consider the school as a single unit. The predictions, functions, and prevention strategies of problem behaviors are examined according to the locations in which they happen.

Lane, Rogers et al. (2007) determined the function of behavior to be one of six objectives: to get or avoid attention, tangibles, or sensory stimulation. Frey et al. (2008) highlighted the importance of FBA of elementary students when developing a SWPBS plan to reduce bullying. They suggested that the bullying behavior was due to a lack of empathy for the victims. They also stated the importance of reinforcing appropriate behaviors and minimizing the reinforcement of inappropriate behaviors. Their study was guided by three critical elements: (a) finding a clear link between behavioral and
academic success, (b) using SWPBS due to the success of past studies, and (c) using data to drive their decision making. Faculty and staff were committed to the planning process as well as the implementation of the plan. The results were decreased office referrals, suspensions, detentions, and a 61% increase in instructional time gained, thus showing a link between behavioral success and academic success.

Participation. As suggested in the Frey et al. (2008) study, it is imperative to have staff cooperation, support, and participation when developing a SWPBS. Warren et al. (2006) ran a three-year study of SWPBS in an urban middle school. Their study targeted three main components of SWPBS: training staff, explicitly teaching expectations to students, and reinforcing appropriate behaviors. They devoted their first year to training faculty and building a rapport between research staff and faculty to ensure their support of the program. The administrators and teachers developed a “Steps to Success” program for the students that included being respectful, responsible, cooperative, ready to learn, and safe. Warren et al. found significant decreases in most of the disciplinary outcomes during year two. Unfortunately, the decreases did not continue through year three. They attributed this to a lack of staff support of the original intervention plan that included punitive additions to the SWPBS, decreases in positive reinforcement, and the addition of other behaviors to the list of targets.

Benedict et al. (2007) found that as teachers’ use of universal features of the SWPBS increased, children’s appropriate behavior increased, thus making a case for staff support as well as the use of SWPBS in pre-schools. The teachers affirmed their
satisfaction with the SWPBS and their desire to recommend it to other professionals. In a two-year study by Lane, Wehby et al. (2007) the entire first year consisted mainly of training staff to devise, execute, and assess a SWPBS plan. The staff created a list of five behavioral expectations for students and four teaching expectations for teachers: post the mission statement and expected behaviors in common areas, give reminders during school announcements (pre-correction), have monthly assemblies, and model expected behavior. Johnson-Gros et al. (2008) had success with a one-time, 30-minute, after-school training session. Faculty and staff were trained in active supervision, which included arriving to the designated area on time, staying in the area and scanning for students congregating, gesturing or physically prompting students to go to class, and interacting with students during the entire transition period. Faculty was given daily feedback on their abilities in active supervision. The study showed a significant decrease in student tardiness.

Codding, Feinberg, Dunn, and Pace (2005) indicated that performance feedback to teachers increased the likelihood that PBS intervention would be implemented as intended. Teachers were trained in PBS and FBA and implemented a PBS program using behavior support plans (BSP) that were already in progress in the school. Data were collected on the accuracy with which teachers delivered antecedents and consequences according to feedback they received.

*Defining expectations.* It is important that behavioral expectations are clearly defined, taught, and posted to ensure a successful SWPBS. Typically a list of 3-5
expectations stated in clear, positive, observable terms is often developed with input from students, teachers, and staff. These expectations may also serve as replacement behaviors.

Warren, et al. (2000) implemented a SWPBS program that included explicit instruction of expected behaviors. Five behavioral expectations were taught to all students using direct modeling and practicing. For five weeks of intervention, one expectation was taught per week. Expectations were integrated into the classroom rules and included during school-wide morning announcements. Results indicated significant decreases in problem behaviors.

Benedict et al. (2007) ran a successful SWPBS in 15 preschools: 6 Head Start programs, 6 community preschools, and 3 special education classrooms. They used the Preschool-wide Evaluation Tool (Pre-SET; Horner, Benedict, & Todd, 2005) to monitor the schools’ progress. They assessed the schools implementation of the plan according to 15 features of the SWPBS including (a) defined expectations, (b) expectations taught, (c) acknowledgement of appropriate behavior (reinforcement), and (d) the organization and predictability of the setting. Both teachers’ use of these elements of the SWPBS as well as the children’s response to them was assessed. Teachers were measured on the degree of implementation of some universal SWPBS practices: Was there a poster with clearly stated rules? Was a classroom schedule posted? Did the teachers use a transition signal? As the teachers adhered to the implementations of these practices, the success of the outcome increased.

*Precorrection.* Another important facet in developing a successful SWPBS plan is
the use of pre-correction strategies. Precorrection is an antecedent intervention that can reduce predictable problem behaviors before they occur (Colvin, Sugai, Good, & Lee, 1997). For example, a teacher might say “Remember to walk in a line down the hallway” before the children leave the classroom, thus reminding them, or precorrecting them, to walk appropriately down the hall (Benedict et al., 2007). Precorrection may also include gestural cues, modeling, tangibles, such as “Gotcha” tickets for students who are engaging in appropriate behaviors (Oswald, Safran, & Johanson, 2005), or reminders of reinforcers available for use of appropriate behaviors (DePry & Sugai, 2002).

Johnson-Gros et al. (2008) implemented SWPBS in a high school to assess the effectiveness of the plan in regard to tardiness. They modeled it after the DePry and Sugai (2002) study, which paired the components of active supervision with precorrection, and suggested significant results in decreasing problem behavior in students. Stormont, Smith, and Lewis (2007) implemented a PBS program in a Head Start Preschool that measured the effects of precorrection and praise statements. Teachers precorrected students before they had an opportunity to behave incorrectly. Precorrection was paired with verbal praise for appropriate behaviors. Results were a reduction in overall problem behaviors among students.

*Positive reinforcement.* Positive reinforcement of appropriate behaviors is crucial to an effective SWPBS plan. Positive reinforcement of desired behaviors is powerful when attempting to change behavior. Skinner (1938) developed a reinforcement and punishment method of successfully modifying behavior. Through operant conditioning he
could increase or decrease behaviors by giving or taking a reinforcer or aversive condition (Skinner, 1958). According to Skinner (1938), positive meant giving something and negative meant taking something away. Reinforcement meant the behavior increased and punishment meant that the behavior decreased. It is important to remember that positive and negative, in this instance, are mathematical rather than positive meaning something pleasant and negative meaning something unpleasant (Malott, Malott, & Trojan, 2000). Examples of these techniques are as follows: Positive Reinforcement is getting a reinforcer, such as computer time, to increase a behavior, such as finishing work in a specified amount of time. Negative Reinforcement is the removal of an aversive condition, such as doing homework, to increase behavior, such as following the classroom rules. Positive Punishment is getting an aversive condition, such as detention, to decrease behavior, such as using foul language in class. Negative Punishment is the removal of a reinforcer, such as a class trip, to decrease behavior, such as verbally disrupting class (Skinner, 1938). It seems that the most powerful and long lasting of these is positive reinforcement of desired behaviors (Leaf & McEachin, 1999; Skinner, 1958; Sugai & Horner, 2002).

Frey et al. (2008) had significant success reinforcing appropriate behaviors and minimizing the reinforcement of inappropriate behaviors. In successful studies by Warren et al. (2006) and Lane, Wehby et al. (2007), reinforcement was in the form of tickets that went into a drawing for prizes; however, every student that received tickets did not win a
prize. The impact of random reinforcement (prize drawing) may be difficult to assess as students who work hard, but don’t win anything may become discouraged.

When trying to increase desirable behavior it is imperative that reinforcers are reinforcing. Teachers often think that what they like will be a reinforcer, when in fact it may not be a reinforcer to the student at all (Lane, Wehby et al., 2007; Leaf & McEachin, 1999).

Assessment. Data-based assessment should drive the SWPBS program as well as measure its success. Lane, Wehby et al. (2007) implemented SWPBS in two high schools, with students in 10th through 12th grades, with the purpose of addressing the following questions: How did different types of high school students respond to SWPBS? How accurate was the teachers’ assessment of the students? Did students have equal access to reinforcement? Was the SWPBS implemented accurately? Students were categorized behaviorally as externalizing, internalizing, co-morbid, typical, and high-incidence (specific learning disabilities, other health impairment, or speech and language impairment). Dependent variables included the students’ (a) grade point average (GPA); (b) attendance (including unexcused tardiness); (c) discipline referrals and suspensions; and (d) referrals to an alternative learning center (ALC), Students Taking a Right Stand (STARS), General Education Intervention Team (GEIT), or special education eligibility determination (SPED). The study showed that there were subtle differences in how different students responded to the SWPBS plan: students with internalizing behaviors were most responsive in the areas of GPA and attendance, typical students were most
responsive in the area of disciplinary referrals, and students with comorbid and high-incidence behaviors were the least responsive in all categories.

In a three-year study by Warren et al. (2006) staff training and its efficacy on subsequent implementation of the SWPBS plan was the primary focus. During year one, staff was trained with no implementation of the plan. The plan was implemented in year two with continued staff training, and in year three the staff implemented the plan without training or assistance from the researchers. Year one, staff chose target behaviors for the students, which were subsequently incorporated into the posted classroom rules during year two. Student adherence to these rules was measured. Data consisted of the number of (a) office referrals, (b) conferences, (c) time-outs, and (d) in-school and out-of-school suspensions, and was collected at the beginning and end of years two and three. Staff adherence to altering the environment, increasing choices, adapting curriculum, teaching replacement behaviors, and administering reinforcement were observationally assessed. Training was added as needed in these areas. Results suggested a decrease in disciplinary outcomes during year two, which were not sustained during year three.

Numerous studies indicate that SWPBS is an effective way to increase appropriate student behavior and that a successful SWPBS plan needs to include staff support and participation, clearly defined expectations, precorrection, reinforcement of appropriate behaviors, and measurable, data-based assessment.
Social Skills

An effective SWPBS program should also include social skills instruction. Expected behaviors should be explicitly described, taught, and supported (Lewis, 2008). Social skill lessons may be taught using a variety of techniques including direct instruction, role-playing, and modeling.

Social skills are an important aspect of a child’s development as well as later success in adult life. Developmental theorists such as Erickson (1963) and Bandura (1969) found that there was a connection between socially well-adjusted children and their successful progression into adulthood. Bandura’s (1969) social learning theory stressed that children learn through modeling, observation, and imitation. He suggested that there is continuous interaction between the environment, cognition, and behavior; thus, social skills are acquired through interaction with one’s environment, including parents and peers. It is evident that the ability to effectively socially interact with peers and others is an important aspect of childhood and throughout life.

Children with learning disabilities are at high risk for social inadequacies (Bryan, 2005). Kavale and Forness (1995) found that about 75% of students with learning disabilities had deficits in social skills in contrast to their peers. In fact deficits in social skills are often a distinguishing characteristic of students with learning disabilities (Canney & Byrne, 2006). Social skills deficits are also predictive of challenges in employment (Elksnin & Elksnin, 1998). For these reasons social skills teaching should be a high priority for teachers of students with high incidence disabilities.
Social skill deficits manifest themselves in various ways and researchers have defined them differently: lack of ability to initiate and sustain relationships (Gresham, 1997), disruptive and non-cooperative behaviors (Pearl, Donahue, & Bryan, 1985), attention seeking behaviors (Perlmutter, 1983), depression, anxiety, and self-imposed isolation (Miller, Lane, & Wehby, 2005). Kavale and Mostert (2004) list examples of social skills: starting a conversation, introducing yourself, negotiating, dealing with frustration, responding to failure, apologizing, controlling anger, and listening. Rustin and Kuhr (1989) categorize social skills into four subjects areas: foundational skills (including eye contact and understanding non-verbal communication), interaction skills (including initiating conversation and turn taking), affective skills (recognizing your and others’ feelings and trust), and cognitive skills (problem solving, negotiating, and self-monitoring). Gresham (2002) groups social deficits into four categories: skill deficits (referring to what a student doesn’t know socially), performance deficits (referring to a student’s choice to perform the known social skill), fluency deficits (referring to the student’s inability to generalize the skill or perform it in a natural way), and competing problem behaviors. Gresham’s (2002) breakdown is functional, targeting the purpose of social deficits, and therefore may make it easier to target specific areas for change.

Students’ proficiencies in social skills predict positive outcomes such as friendships, acceptance, and academic success (Lane, Menzies, Barton-Arwood, Doukas, & Munton, 2005). Students with deficits in social skills often experience negative outcomes such as teacher and peer rejection and bullying (Farrell, 1997; Nabuzoka &
Smith, 1993; Norwich & Kelly, 2004). Positive affect is also a vital aspect of social development. Positive affects are subjective good feelings, emotions, and moods that can increase attention and desirable behavior (Fredrickson & Branigan, 2005). Children with positive affects perform significantly better in math and reading (Bryan, 2005).

**Social skills teaching.** Social skills instruction can be an important component of a SWPBS plan. Research supports the necessity of social skills teaching (Lane et al., 2005; Lewis, Sugai, & Colvin, 1998). It should not be expected that students already possess the expected behaviors; they need to be taught the behaviors. The best social skills teaching is consistent (Lewis et al., 1998), is systematically administered (Colvin & Sugai, 1988), and is based on specific needs (Lane et al., 2005). Research also supports that an intervention plan needs to: incorporate students, staff, and parents; use a positive support plan (reinforcement); and be consistently administered.

Gresham (2001) recommended that social behaviors be examined in context. What might be appropriate in one setting may not be in another. Behavior should be assessed in regard to where it occurs: what are the stimulus (antecedent) and the consequence (including reinforcers and punishers) to the behavior? He also stated that the best intervention in social skills includes manipulation of antecedents and consequences. The effects of using well thought out reinforcement practices can be very powerful (Skinner, 1958).

Lane et al. (2005) achieved significant results in an increase of improved social interactions, a decrease in disruptive behaviors, and an increase in engaged time in the
classroom using Elliott and Gresham’s (1991) *Social Skills Intervention Guide: Practical Strategies for Social Skills*. The intervention included five phases: tell, show, do, follow through, and generalization. These phases included instruction with questions and answers, role-play, written work, and integrating the new social skills into situations beyond the classroom. Success was supported by well constructed lesson plans, integrity, clear expectations, positive reinforcement, and lessons that were conducted in a natural setting (Lane et al., 2005). Unfortunately, the generalization phase is often neglected and the skills fail to sustain over time (Lane & Beebe-Frankenberger, 2004).

An effective social skills intervention plan requires appropriate staff instruction (Barton-Arwood, Morrow, Lane, & Jolivette, 2005), good training tools and lesson plans (Lane et al., 2005). In addition, direct instruction techniques for modeling and role-play (Gresham, 2001) are critical and the plan must be in place for a prolonged period of time (Gresham, Van, & Cook, 2006). Students need to be motivated through consistent positive reinforcement (Skinner, 1958).

In a study by Canney and Byrne (2006), social skills training was taught during circle time. The results were inconsistent due to the variable of teacher input indicating the importance of consistency in which the training is delivered. Kavale and Mostert (2004) also had modest effects with their intervention plan, which was based on structured training for students with learning disabilities. They attributed the disappointing results to the intervention tool, the intensity of training (their plan for three hours per week for ten weeks), and problems with the concept of what appropriate social
behavior is which would indicate the importance of explicitly defined expectations. Miller et al. (2005) studied the effects of using a social skills curriculum with a group of seven students in a self-contained classroom. Only one student maintained appropriate social skills post-intervention. Disappointing outcomes were attributed to brevity of intervention, variability in students’ academic levels, and limitations due to a self-contained classroom. Lastly, Gresham et al. (2006) found that most interventions only ran for an average of 30 hours. He took this limitation into account and studied the effects of social skills training with homogenous groups for 60 hours. Students who received the social skills instruction showed decreases in problem behaviors, validated by pre/post tests at two-month follow-up.

A social skills intervention plan should include social skills instruction for students and staff, explicit behavioral expectations, opportunities for students to practice new social skills, and positive reinforcement for exhibiting those skills (Barton-Arwood et al., 2005). Without effective reinforcement, it is unlikely that students will incorporate the new skills into their repertoire and generalize them into other settings (Miller et al., 2005). It seems too, that if generalization is where the effects start to fade (Lane & Beebe-Frankenberger, 2004) that this area of instruction needs to be targeted as well. It is also important when dealing with inappropriate behaviors to use Applied Behavioral Analysis (ABA) to assess what the function of the behavior is, to properly intervene with successful outcomes (Barton-Arwood et al., 2005).
In conclusion, some of the issues faced in regard to social skills instruction are that social skills deficits are not part of the definition of learning disabilities, so instruction is recognized as necessary (Bryan, Burstein, & Ergul, 2004). Also, social skills instruction typically addresses more disruptive behaviors that influence instruction rather than peer interaction skills (Bryan, 2005). It is understood that teacher and school personnel have many responsibilities, and to add social skill instruction on top of that would be difficult and time consuming (Lane et al., 2005). Yet, it is important to help students acquire the social skills needed to maximize academic achievement and social competence (Bryan, 2005), as well as the skills necessary to negotiate interactions with adults (Miller et al., 2005). Social skill deficits have negative effects on students with learning disabilities. They draw negative attention from their peers (Kavale & Forness, 1995), elicit bullying, (Norwich et al., 2004), negatively impact academics (Bryan, 2005), and affect adult life including employment (Elksnin & Elksnin, 1998). It is important to address this issue.

*Intervention Plans to Address Bullying Behaviors*

SWPBS plans may be used to address various social skills and behaviors including bullying. Bullying is of primary concern in schools. Several studies have been conducted on the implementation of anti-bullying intervention programs (Beale & Scott, 2001; Frey et al., 2005; Salmivalli, Kaukiainen, & Voeten, 2005; Olweus, 1997). Similar to the SWPBS plans mentioned here, these intervention plans included (a) staff training; (b) staff, student, and parental involvement; and (c) social skills instruction.
**Staff Training.** Studies indicate that staff training is an essential aspect of SWPBS and bully intervention plans. Salmivalli et al. (2005) used a three-tiered program that included tertiary, secondary, and primary levels of intervention. The program was implemented in 16 schools and included 48 classrooms with students in grades four, five, and six. It began with extensive teacher training that spanned a year. There were four meetings total, two in the fall semester and two in the spring semester. Three of the meetings were all day (eight hours) and one meeting was three hours. Teachers were trained on facts, research, methods of intervention in bullying instances, and curriculum. The intervention plan showed an increase in efficacy beliefs, a decrease in bullying, and a decrease in victimization. The study had some limitations: Fidelity of training and implementation were not reported. It was difficult to measure the consistency among staff in 16 different schools in the implementation of the plan. Frey et al. (2005) implemented a successful plan that ran for 12 weeks and included weekly staff training. The “Steps to Respect” manual was used to train teachers, administrators, and counselors in how to respond to and advise students who were bullied. Researchers noted a decline in bullying behaviors and an increase in pro-social interactions.

**Staff, student, and parental involvement.** Studies also indicate the necessity of staff and student involvement in SWPBS and intervention plans. Olweus (1997) implemented a bully intervention plan that incorporated students, staff, and parents. The goal of the program was to increase awareness of bullying problems, involve parents and teachers, create rules about bullying, and provide protection and support for victims. The
program began with a study of what characterized bullies and victims. This study included interviews with the students’ parents as well as the teachers to raise their awareness and involvement. Questionnaires for the students were used to monitor the plan’s success. The plan incorporated a three level approach: primary, secondary, and tertiary. It included conferences, class rules, PTA meetings, and individual talks on a serious level. The plan was implemented in 42 schools over a two-year period and resulted in a 50-70% decrease in bullying behaviors.

Frey et al. (2005) also included teachers, parents, and students in their anti-bullying program. Parental involvement included initial information about the program, letters sent home about the progress of the program, and activities to support the program at home. Beale and Scott (2001) involved parents through school newsletters that included activities they could do at home to help address bullying. The students also reenacted their plays about bullying for the members of the PTA. Although parental involvement was a component in these successful studies, it was very difficult to measure actual levels of parent participation (e.g. some parents may not take the time to read the information sent home or implement the at home activities). As a result, it is unclear to what degree parent involvement contributed to the program’s success.

*Social skills instruction.* As with SWPBS, social skills instruction is a common component of bully intervention plans. Beale and Scott (2001) employed drama to reduce bullying. Sixth grade students acted in plays that represented realistic bullying situations. The plays were followed by discussions that encouraged students to examine ways to
deal with bullying. Teachers were encouraged to create classroom rules with students’ help to target bullying behavior. Students were asked to discuss what they were learning about bullying prevention as well as sign a pledge against bullying. The pledge included an agreement not to bully, to watch for bullying, and to report any bullying. The program was successful with a 20% reduction in instances of bullying over the course of a year.

Beale and Scott’s program had some limitations. Victims of bullying may have low self-esteem issues and may not want to participate in a play in front of other people. In fact, many students would probably be afraid to perform in a play in front of others.

Frey et al. (2005) used a school wide “Steps to Respect” program that included literature-based and scripted-skill lessons, and lessons for students grades two through six that focused on peer relationships (being part of a group), being an effective reporter of bullying (tattling vs. reporting), and recognizing and refusing to be bullied. The effects of the intervention plan showed an increase in positive social interactions and a decrease in instances of bullying behavior. Frey et al. (2005) targeted multiple levels of context and social skills; however, the social skills training was mainly to counter bullying rather than to forge a general increase in friendships. An increase in friendships may have more significant long-term effects on instances of bullying.

The Salmivalli et al. (2005) curriculum included discussions about bullying, role-play, literature, class rules, and bystander behavior. The curriculum included three levels of focus: raised awareness, self-reflection, and commitment to stop bullying (Salmivalli et al., 2005). The intervention plan showed an increase in efficacy beliefs, a decrease in
bullying, and a decrease in victimization. The effects varied over the grades. The intervention plan had a more significant effect on fourth graders than on fifth and sixth graders.

These intervention plans had a significant impact on bullying behavior. All of them included training staff and teaching students. Two of them also included parents. An effective bully intervention plan should include all concerned people, use a three-tiered approach, and target multiple levels of the behavior.

Assessment

In the area of bullying, researchers have relied primarily on student self-report questionnaires that are completed anonymously. Salmivalli, Karhunen, and Lagerspetz, (1996) found self-reports to be unreliable when asking the students if they bullied. They concluded that students may not consider their behavior to be bullying. Olweus (1991) asserted that self-reports were the best vehicle for measuring instances of bullying and that more accurate results could be attained by asking students if they participated in specific bullying behaviors, such as teasing and threatening, rather than general bullying. Cole, Cornell, Dewey, and Sheras (2006) compared self-reports and peer reports in regard to bullying. They concluded that peer reports were more reliable and markedly different from self-reports.

Furlong (1995) used a comprehensive school safety questionnaire to determine the demographic differences between multi-victim and non-victim students. The questionnaire included 21 questions about specific violent behaviors ranging from verbal
harassment to threats with weapons. It also included questions about students’ feelings of safety, belonging, peer relationships and teacher connections. Questions about unlikely situations were included in the questionnaires to check for validity. They found that multi-victim and non-victim students differed in a variety of variables including perceived safety, peer relationships, and course grades.

Conclusions

Research on school wide positive behavior support plans, social skills teaching, positive reinforcement, and bully intervention plans indicate that an effective intervention plan to address bullying in schools can be developed. It appears that the most powerful tools are (a) SWPBS, (b) positive reinforcement of appropriate behaviors, (c) pre-correction, and (d) social skills teaching. The literature studied here on the effects of social skills teaching, especially in generalization over time, was the least conclusive. An effective plan would need to incorporate students, faculty, and parents. Additionally, raising general awareness about bullying may be an effective component. The plan to address bullying at the Kayne ERAS Center will incorporate these elements.

Statement of Purpose

There is a “Policy for Bullying Prevention” already in place at the Kayne ERAS Center. At the beginning of each academic year the students must read and sign the policy and it is placed into their file. The policy includes the Center’s belief that all students have a right to a safe, healthy, and respectful school environment. It lists various behaviors that the Center believes are acts of bullying. It includes environments such as
the classroom, the lunchroom, other on and off campus areas, including off site school-based activities, where bullying is most likely to occur. It includes a list of consequences to deter bullying such as a report to the principal, staff intervention, and possible expulsion. It is a reactive, punishment based plan. The policy doesn’t seem to be effective. This may be because the policy and the school wide behavior plan are not consistently adhered to and the students are aware of that.

Lack of consistency in administering the policy and the implied behavior plan is only one aspect of why bullying may be so prevalent at the Kayne ERAS Center. Other reasons may be that students take great pains to hide their bullying. Indirect bullying is often whispered and occurrences of bullying are underestimated by school staff (Bradshaw, Sawyer, & O’Brennan, 2007). While social support is helpful in ameliorating the impact bullying has on a victim (Demaray & Malecki, 2003), its impact varies according to age and gender (Davidson & Demaray, 2007).

This study looked at the outcomes of a School-Wide Positive Behavior Support plan implemented at a non-public school to decrease instances of bullying between students who are primarily from inner-city neighborhoods and have special needs that include ED, AUT, MR, SLD, and OHI. Students filled out pre, mid, and post questionnaires to (a) define target behaviors and determine how prevalent occurrences of those behaviors in school were, (b) assess which bullying behaviors occur most often, (c) determine the primary locations of bullying events, and (d) assess the effects of a SWPBS
plan on instances of bullying. Another goal was to determine whether there were increased rates of pro-social behavior.
CHAPTER 2

Method

Goals and Design Type

The goals of this study were to determine student perceptions of (a) how prevalent bullying was in the school, (b) which bullying behaviors occurred most often, (c) the location of bullying events, and (d) the effects of a school wide positive behavior support plan (SWPBS) plan on instances of bullying. Another goal was to determine whether there were increased rates of pro-social behavior due to implementation of the plan.

The research design employed use of a survey to measure student perceptions of bullying behaviors. Rates of pro-social behavior were estimated through student eligibility and attendance at the weekly reward celebrations, which were dances, movies, or picnics.

Participants

Students

Of the 216 students at the Kayne ERAS Center, 155 participated in the study. Although all 216 students participated in the intervention program as it was a school activity, data were collected from only the 155 students who returned verification of parental permission (see Table 1 for participant characteristics).

Many of the participants lived in foster homes (27%) and/or received free lunch (74%). All of the participants had Individual Education Plans (IEPs). Eligibility
categories included specific learning disability, emotional disturbance, autism, other health impairment, and mental retardation.

*Student participation.* Student participation decreased over the eight weeks in regard to number of questionnaires collected at four and eight weeks. Initial student participation was 155, dropping to 131 in the fourth week and 126 in the eighth week. Reduction in student participation was due to absences and decisions not to participate.

Note. AFA = African-American; CAU = Caucasian; HSP = Hispanic; ASN = Asian; OTH = Other.

*Ethical provisions.* Research procedures were reviewed by the California State University, Los Angeles Institutional Review Board for the Protection of Human Subjects in Research. All students in the school participated in the SWPBS plan; however, data
was only collected from participants who had signed consent forms. Consent forms (see Appendix B) and letters explaining the research project (see Appendix A) were sent home to parents/guardians prior to the onset of the intervention. Consent forms included the procedure for the study, confidentiality safeguards, and a statement that no risks, discomforts, or inconveniences to the students were expected. Consent forms were collected and stored in a confidential file. Access to the files was limited solely to the researcher.

Participants were volunteers and were not paid for their participation in this study. They were treated in accordance with ethical standards of the APA in the *Ethical Principals of Psychologists and Code of Contact* (American Psychological Association, 2002).

*Researcher*

The researcher was a Caucasian female pursuing her M. A. in Mild/Moderate Special Education. She also held a B. A. in Behavioral Science. She had three years experience as a Special Education Teacher and eight years experience as a Behaviorist in the field of Autism in both home and school settings.

*Staff*

Staff members included 129 school personnel and 16 bus drivers that assisted in the implementation of the plan as well as the observation of bullying instances. The school staff included 25 teachers, 25 teacher’s aides, 49 one-on-one aides, 5 speech therapists, 13 counselors (4 licensed and 9 interns), 7 in-house staff (staff to assist in students’
severe behavior episodes), 3 assistant principals (one for each, elementary, middle school, and high school), 1 principal of high school, and 1 director of programs (above all of the school staff). The director of programs insisted on full participation by staff. Staff participation was assessed through discussion and observation and prompted through weekly delivery of supplies.

School site

The school is located in a large urban area in Southern California. It was a non-public school (NPS) where all students have IEPs and received all of their eligible services on campus. It was a highly restrictive environment. Students were required to have an escort when in the halls or the bathroom. There were four hallways (wings): (a) one for elementary and middle school Certificate Track (CT), (b) one for middle school Diploma Track (DT) and high school CT, (c) one for high school DT with one CT classroom, and (d) one that connected them all and included the assistant principal’s, principal’s, and director of programs’ offices and the computer lab. There was also a drama classroom and an art classroom on the high school wing. The CT classroom on the high school wing included four students who are working toward their diploma despite being in CT. There was one small cafeteria that accommodated about 50 people at the tables. Students used the cafeteria in shifts according to grade or program. There were bathrooms and In-House (time out) rooms in each of the classroom hallways. There was one Isolation Room for extreme behavioral circumstances.
The number of students per class was small: 12 or less. Some students had one-to-one aides if their behavior warranted a more intense approach. Elementary and middle school students were in self-contained classrooms while high school students transitioned to their various classes: six 50-minute periods throughout the day and lunch.

Measures

Two types of assessment tools were used in this study: questionnaires that were developed by this researcher and head-count attendance at highest-level reinforcer events. Participants (students) were given questionnaires to fill out; they filled out the first one at an initial Bully-Free meeting and the second two in their classrooms. The first questionnaire (see Appendix C1) consisted of 14 questions that included demographic information such as gender, ethnicity, grade level, track assignment, gang affiliation, and parental gang affiliation. Three questions about student perception of bullying were measured using a 5-point Likert scale: (a) bullying behaviors observed in the school, (b) how often they bullied others, and (c) how often they were bullied. Three open ended questions requested their opinion about (a) bullying behaviors not mentioned on the questionnaire, (b) why they bullied, and/or (c) why they thought they were bullied. Two questions asked where bullying occurred. The second two questionnaires (see Appendix C2) consisted of 11 questions; the questions that pertained to gang affiliation and what is considered bullying behavior were omitted.

Questionnaires were distributed, filled out, and collected three times during the study: before the program was implemented, four weeks into the intervention, and at the
end of the program. The intervention ran for eight weeks. The first questionnaire was given at the initial Bully-Free assembly and training for the students. The assembly took place on the Friday prior to the start of the intervention in the multi-purpose room and was attended by students according to grade level: one meeting each for elementary, middle, and high school students. After the presentation of the new intervention plan, the researcher distributed questionnaires and pencils to students. The researcher read each question aloud to the students from the stage using a microphone. School staff assisted them at their seats if students asked for assistance. Questionnaires were collected and students returned to their classrooms. The intervention began the following Monday. The second and third questionnaires were distributed by the researcher to the students in their homerooms on the mornings of the bully-free assemblies at the end of the fourth and eighth weeks. Students filled out the questionnaires with their teachers in the classroom. Questionnaires were picked up by the researcher by first period and tallied before the assemblies. Progress of the intervention was reported to the students at the assemblies.

Head count attendance was taken by the researcher and an assistant at each of the dances, the park picnics, and the movies: five high school, six middle school, and two elementary school dances; two elementary school movies; and two elementary and one high school picnic in a local park. Attendance at each grade level was tallied and recorded on paper.
Intervention Plan and Procedure

The SWPBS plan ran for eight weeks. It included school staff, bus staff, students, and parents. Students were able to earn tickets to a weekly dance, an in-school movie with popcorn, or a picnic in a local park, as well as homework free passes and positive phone calls home for having BFs (Bully Free; indicated that the student had not bullied) on their check sheets. Students already carried behavior check sheets on which they earned points for various behaviors. Staff used these same check sheets and added a BF in green ink after every period (50 minutes), lunch (30 minutes), or homeroom (10 minutes) that the student was bully-free and a - BF if the student bullied. At the end of the day, if the student had earned at least nine BFs (they had the opportunity to earn 10), they received a ticket from their homeroom teacher. The BFs and tickets worked both as positive reinforcers for pro-social behavior and as a precorrection not to engage in bullying behaviors during transition to the next period of intervention. The tickets earned from the morning bus also served as reinforcement for behavior on the bus and precorrection to proceed to class without exhibiting bullying behavior.

Homeroom teachers kept the students’ tickets in individual envelopes in their desks out of students’ reach. The students also earned a ticket a day from their bus drivers if they were bully-free on the ride home and the ride back to school. They received their tickets in the morning as they exited the bus and gave them to their homeroom teacher, who put the tickets in the same envelopes. At the end of the week, if the student had earned at least eight tickets (they had the opportunity to earn 10) they were able to go to
the dance, picnic, or movie. The dances/picnics/movies were held three times a month and bully free meetings were held once a month. Tickets were not required to attend the bully free meetings; however, during these meetings the tickets they had earned were entered into a raffle drawing for prizes. Differential reinforcement included a ‘Homework Free Pass’ for at least seven tickets earned and a positive phone call home regarding their progress and improvement for at least six tickets earned. Consequences for bullying included lack of access to the above reinforcers, differential phone calls home, student and/or parent conferences with the principal, detentions, in-school suspension, and/or suspension.

The plan also included suggestions for replacement behaviors that were provided and discussed at the bully-free meetings. Posters of the targeted bullying behaviors, reinforcers, and consequences were also hung in classrooms and in hallways. Students had opportunities to (a) discuss bullying issues in their counseling sessions, (b) report bullying anonymously by putting notes in a ‘bully-box’, and/or (c) join buddy support groups, which were to be made up of students who signed up and met in a group with one of the counselors. None of the students participated in the last option.

The intervention plan was first presented to the school leadership team, then to the Parent Teacher Organization (PTO), and finally to the staff at one of two all-staff meetings. The first staff presentation was given after school for 1 hour. The second presentation was given during the school day, also for 1 hour, and was for staff that could not be at the first meeting. Both presentations for the staff were the same. The
presentations were designed to forge staff awareness of bullying behaviors in the school as well as elicit their participation and buy in to the plan. The information given at the presentations specified (a) the definition of bullying with an explanation of its damaging effects, (b) the instances of bullying found at the Kayne ERAS Center in a preliminary study, and (c) the success of previous intervention plans to decrease the instances of bullying at other school sites. Expectations of staff and students were solicited. The staff was presented with the bullying behavior, reinforcement, consequence, and replacement behavior lists. Letters to the parents that explained the SWPBS plan and parental consent forms were given to all of the teachers to send home the next day and have returned within the next few days (before the presentation to the students).

The researcher distributed tickets and supplies, including green pens, envelopes, and flyers with reinforcements and alternative behaviors, on Friday afternoons. Procedure check and discussion of plan progress was discussed at this time as well.

The intervention plan was then introduced to each bus driver individually. The procedure for bus tickets was explained in detail and an opportunity for questions was given. Bus drivers received the first set of tickets at this time. This researcher provided a procedure check every day for the first week and bi-weekly thereafter. New tickets were given weekly on Friday afternoon for the upcoming week.

Lastly, the intervention plan was presented to the students by grade level (i.e., elementary, middle school, and high school). The plan (which included a list of bullying behaviors, defined expectations, reinforcers, consequences, and suggestions for
replacement behaviors) was explained in detail to the students. Students were also presented with the option to use their counseling time to work through bullying situations. The following concepts were discussed: (a) people often decide that they don’t like someone without even knowing who they are, (b) it is okay to not like someone, and (c) you can dislike someone without being cruel to him/her. The concept that these bullying behaviors will not be tolerated in school was discussed as well. The students were told about the ‘bully-boxes’ that were placed in each of the in-house rooms where they could report bullying anonymously. They were given the opportunity to sign up for the buddy support groups that were available by grade level.

Data collection began with the distribution of the questionnaires to the students at the end of the presentation. The students were told that no names were to be on the questionnaires and that they would be kept anonymous and confidential. The questionnaires were passed out and the questions were read aloud one by one to the entire group by the researcher. Students were given time to answer the questions. They had the opportunity to get assistance from their teachers if needed to fill out the questionnaires. When the questionnaires were completed, they were collected by the researcher. The results of the questionnaires were tallied according to accounts of being bullied, bullying, ethnicity, grade level, and gender.

At the end of four weeks and eight weeks (the end of the plan), there were bully-free meetings by grade level. Students were given the questionnaires to fill out in their morning homeroom. Data from the questionnaires was tallied for presentation at the
meetings, which occurred in the afternoon. All students were invited to attend the meetings that consisted of a presentation of data results and a discussion of the progress of the plan. Students were given the opportunity to ask questions about the plan and to share how it was going. They put their tickets in for a drawing for prizes. At the first meeting 30% of the students won a prize, but at the last meeting every student won a prize. Names were drawn from raffle tickets and students chose from the displayed prizes. Students could win one prize each.

Guidelines and Contingencies

On the questionnaires students reported bullying behaviors to be the following: (a) physical aggression, (b) verbal abuse, (c) threats, (d) intimidation, (e) name-calling, (f) teasing, (g) inappropriate gestures, (h) social exclusion, (i) gossiping, and (j) spreading rumors.

Reinforcers included one-hour dances on Fridays, three times per month, for middle school and high school students with the exception of one picnic in the local park for high school students. Elementary students rotated reinforcers: picnic in the park, in-school movie with popcorn, and a one-hour dance. There were also once a month meetings by grade level where students could win prizes, homework free passes, and positive phone calls home. Teachers and bus drivers each gave one ticket per day for students who refrained from bullying.
Consequences (punishers) included lack of access to the above reinforcers, phone calls home reporting misbehavior, silent lunch, student and/or parent conferences with the principal, detentions, in-school suspension, and/or suspension.

Replacement behaviors included the following alternatives: (a) find someone in the room that they like and talk to them about something else, (b) find staff and discuss it with them, (c) carry a small stress relieving activity in their pocket, such as lanyard key chains or beaded jewelry, (d) participate in sports such as football or basketball to facilitate team membership and tolerance of others’ differences, or (e) join a support group to facilitate more socialization and friendships.

Effective replacement behaviors are individual, so the students could brainstorm with their counselors as to what their replacement behaviors would be. Also, if the students agreed to it, the bully and the victim could have some counseling time together. All of the students in the school received an hour of counseling per week, so this was easily arranged.

All surveys were collected and stored in a locked cabinet in the researcher’s office. The instances of bullying were tallied for presentation at the two bully-free meetings. Data was entered and calculated in accordance to gender, grade level, have bullied, and been bullied after the program had concluded.
CHAPTER 3

Results

Prevalence of Bullying Prior to Intervention

The first question addressed was students’ perceptions about the prevalence of bullying prior to the intervention. Data from the pre intervention survey indicated that a total of 48.15% (n=64) of students reported bullying others while 47.1% (n=64) reported being bullied. Of those who were bullied, 20% (n=32) reported bullying and 23% (n=37) reported being bullied a lot or always. The five most prevalent bullying behaviors were (a) name calling (57.75%), (b) teasing (54.25%), (c) threats (51.3%), (d) intimidation (48.2%), and (e) gossiping (48%). The two least reported bullying behaviors were spreading rumors (41.1%) and social exclusion (40.5%). Although rumors and social exclusion were reported the least, over 40% of the students reported experiencing this type of bullying (see Figure 1).

Figure 1. Prevalence of bullying by type prior to intervention.

![Graph showing prevalence of bullying behaviors](image-url)
The five most prevalent bullying behaviors among males were (a) name calling (62.8%), (b) threats (57.55%), (c) teasing (57.35%), (d) verbal abuse (56.9%), and (e) physical aggression (52.8%). The two least reported bullying behaviors were spreading rumors (43.9%) and social exclusion (43.5%). The five most prevalent bullying behaviors among females were (a) name calling (46.8%), (b) teasing (46.8%), (c) gossiping (43.05%), (d) intimidation (40.5%), and (e) verbal abuse (39.45%). The least two reported bullying behaviors among females were spreading rumors (33.9%) and social exclusion (32.85%). Both male and female students indicated on their questionnaires that the most prevalent bullying behaviors prior to intervention were name calling, teasing, and verbal abuse. Both also indicated that the least prevalent bullying behaviors were spreading rumors and social exclusion. Males reported bullying 15.47% more than females (see Figure 2) and being bullied 11.89% more than females (see Figure 3).

*Figure 2.* Prevalence of bullying prior to intervention according to gender.
Figure 3. Prevalence of been bullied prior to intervention according to gender.

The prevalence of bullying (see Figure 4) and been bullied (see Figure 5) according to grade level is indicated below: elementary (49.79% have bullied, 41.03% been bullied), middle school (53.83% have bullied, 56.8% been bullied), and high school (44.95% have bullied, 41.27% been bullied). Although data indicates that bullying was prevalent across genders and grade levels, it was most prevalent in middle school and least prevalent in high school. The three bullying behaviors that occurred most in elementary, middle, and high school were (a) name calling, (b) teasing, and (c) verbal abuse. The fourth most prevalent bullying behavior in elementary and high school was threats while in middle school it was physical aggression. Physical aggression was fifth for high school. All three grade levels indicated social exclusion and spreading rumors as the least occurring bullying behavior.
Figure 4. Prevalence of bullying prior to intervention according to grade level.

![Figure 4](image)

Figure 5. Prevalence of been bullied prior to intervention according to grade level.

![Figure 5](image)

Location of Bullying Events

The third question examined the prevalence of bullying in specific locations: school, home, community. 92.9% of students indicated that bullying occurred in school (see Figure 6). Of the students who reported bullying or being bullied in school, 92.2% indicated bullying occurred in the classroom, 89.1% indicated the bus, and 76.6%
indicated the hallway. Other areas indicated as places where bullying occurred were the cafeteria (57.8%) and the bathroom (39.1%; see figure 7).

*Figure 6.* Where bullying occurred.

![Graph showing the distribution of bullying incidents across different locations: Home, School, Community, Cafeteria, Hallway, Bathroom, Bus.]

*Figure 7.* Where bullying occurred in school.

![Graph showing the distribution of bullying incidents within the school: Cafeteria, Hallway, Bathroom, Bus.]

*Efficacy of Intervention Plan*

The final question examined students’ perceptions of the effectiveness of the school-wide anti-bullying intervention in reducing bullying behaviors. A one-way analysis of variance (ANOVA) was conducted to determine whether there were
significant differences in students’ perceptions before and after program implementation (see Table 2). Using an alpha level of .05, results revealed significant effects of the program on the students who have bullied in (a) physical aggression, $F(1, 256) = 10.67$, $p<.001$, (b) verbal abuse, $F(1, 254) = 8.54$, $p = .004$, (c) threats, $F(1, 256) = 11.23$, $p<.001$, (d) intimidation, $F(1, 252) = 11.13$, $p<.001$, (e) inappropriate gestures, $F(1, 251) = 7.71$, $p = .006$, (f) social exclusion, $F(1, 251) = 4.82$, $p = .029$, (g) gossiping, $F(1, 252) = 10.91$, $p<.001$, and (h) spreading rumors, $F(1, 250) = 4.62$, $p = .033$. Students’ perceptions of bullying decreased in these areas from pre to post intervention. Results were not statistically significant for name calling, $F(1, 255) = 1.98$, $p = .16$, and teasing, $F(1, 255) = 3.23$, $p = .07$ (see Table 2). Effects were not significant for students who were bullied, however, all behaviors decreased (see Figure 8).

*Figure 8.* Decreases in bullying among students who reported being bullied.

Another goal of this study was to determine whether there were increased rates of pro-social behavior among the students. Rates of pro-social behavior were estimated through student eligibility and attendance at the six weekly reward celebrations which were dances, movies with popcorn, or picnics. Bully-free meetings were held at the end
of the fourth and eighth weeks of the intervention. All students were invited to those, so that attendance data at that event is not included here. Results showed an increase of attendance at all of the reward celebrations by all grade levels although the lowest rate of growth was demonstrated at the elementary level (see Figure 9).

*Figure 9.* Attendance at weekly reward celebrations according to grade level.

![Graph showing attendance at weekly reward celebrations by grade level]

*Notes:* Total participants varied according to grade level: 25 for elementary, 56 for middle school, and 74 for high school. R=reward celebration.
CHAPTER 4

Discussion

Research Questions

This study examined the outcomes of a School-Wide Positive Behavior Support plan implemented at a non-public school to decrease instances of bullying among students who were primarily from inner-city neighborhoods and had special needs that included emotional disturbance, autism, mental retardation, specific learning disability, and other health impairment. Results indicated a significant decrease in bullying from students who reported bullying others in all behaviors except two: teasing and name-calling. Results also indicated a decrease in being bullied from students who reported being bullied, however, those results were not statistically significant.

This study also assessed (a) how prevalent bullying behaviors in school were prior to the intervention, (b) which bullying behaviors occurred most often, and (c) the primary locations of bullying occurrences. Increased pro-social behaviors were also measured using head count attendance at weekly reinforcement opportunities. Results showed increased attendance at all grade levels: elementary, middle, and high school.

Prevalence of bullying behaviors prior to intervention. The examination of student’s perceptions of bullying prior to intervention via self-report questionnaires indicated that nearly half of the students were either being bullied or engaged in bullying, which are alarming numbers that exceed other findings (Olweus, 1993, 1997, 2001; Rigby & Slee, 1991; Swearer & Espelage, 2004; Wong & Lo, 2002), but may not
surprising for a non-public school. There is considerable congruence between reports of being bullied and engaging in bullying, which would indicate similar perceptions between the groups. In addition, bullying was most prevalent amongst the middle school students, followed by elementary, and lastly high school.

The most prevalent bullying behaviors across grade levels and genders were teasing, name-calling, threats, and verbal abuse. Previous studies have also indicated that these verbal bullying behaviors are the most common among students (Hazier, Hoover, & Oliver, 1991). The least reported behaviors among the groups were spreading rumors and social exclusion, but even those were reported by 40% of the students.

Locations of bullying in the school. Students also indicated on their questionnaires that bullying occurred (from most prevalent to least prevalent) in the (a) classroom, (b) bus, (c) hallway, (d) cafeteria, and (e) bathroom. It is surprising that student reports indicated the classroom as the area where bullying most occurred as it should be the most restrictive and monitored of the five locations. This may be due some students’ deficits in pro-social behaviors; teasing and verbal abuse may be their primary way of interacting. Other studies have indicated that bullying more often occurs in the least restrictive areas (Olweus, 2001), particularly the playground, which was not an option on these questionnaires. This study was done at a non-public school, which was a highly restrictive environment and outdoor recess was only permitted at the elementary level where staff to student ratio was approximately 1:4.
Elements of the intervention. The intervention consisted of a SWPBS plan that included (a) taught expectations with suggestions for alternate behaviors, (b) used precorrection, (c) offered positive reinforcement, and (d) provided staff training and participation. This combination of elements was used for the following reasons. First, several studies have shown the importance of ensuring that students understand what is expected of them (Benedict et al., 2007; Horner et al., 2005). In this study, students were presented with bullying behaviors, information about the effects of bullying, the plan including reinforcers and consequences, and alternative behaviors at a power point presentation by grade level. The students responded well, exhibiting appropriate behavior in the meetings as well as asking appropriate questions about various aspects of the plan.

Second, precorrection was used as it is also an effective tool in behavior support. Teachers and researchers have had tremendous success with precorrecting (DePry & Sugai, 2002; Johnson-Gros et al., 2008), particularly when it was paired with reinforcement (Stormont et al., 2007). In this study precorrection came in the form of posted reinforcers and consequences around the school, song request sheets for the dances, positive marks on the students check sheets, and tickets, one from their teacher at the end of the school day and one from their bus drivers in the morning. As bullying often occurred in the hallway, carrying the tickets from the bus to the classroom was a precorrection not to bully on the way to class. In addition, the green bully-free (BF) marks on their check sheets acted as precorrection not to bully on their way to the next class, or even in the next class. The song request sheets served as a reminder of the
coming reinforcer. The students demonstrated excitement about the marks and tickets and it became necessary to use color-coded tickets to keep them from trading or selling them.

Third, reinforcement was used. Reinforcement, when used correctly, is very powerful in changing behavior (Frey et al., 2008; Skinner, 1958; Sugai & Horner, 2002). Warren et al. (2006) had significant success when reinforcing appropriate behaviors and minimizing the reinforcement of inappropriate behaviors. It is particularly important that reinforcers are actually reinforcing (Lane, Wehby et al., 2007; Leaf & McEachin, 1999). Reinforcers for this study included six weekly reward celebrations: dances, movies with popcorn, or picnics. Reinforcers were selected according to observation. Students enjoyed socializing in the classrooms, halls, and cafeteria. High social status was attained through some forms of bullying; if the students hoped to achieve social status by bullying, maybe they could achieve the same goal in a more appropriate way with more satisfying results. Also, as this was a highly restrictive environment, most students held social events in high regard. The students were enthusiastic about the weekly reinforcers and often discussed them with staff and students. At the dances the students and staff seemed to enjoy music played by a D. J., particularly if their requested song was played. Some of the male students even dressed in suits for the events. Students who earned the dances, but weren’t particularly interested going, played video games in one of the classrooms.

Lastly, as suggested by Frey et al. (2008) it is imperative to have staff cooperation, support, and participation. Benedict et al. (2007) found that as the teacher and staff
participation increased, the children’s appropriate behavior increased. Johnson-Gros et al. (2008) gave faculty daily feedback on their abilities in active supervision and achieved a significant decrease in student tardiness. During this study staff received supplies weekly at which time they could ask questions, receive feedback, or comment on how it was going. Codding et al. (2005) indicated that performance feedback to teachers increased the likelihood that a PBS intervention would be implemented as intended. Most staff participated enthusiastically. Staff and bus drivers commented weekly about the changes in the students since the onset of the intervention plan. They often stated that they saw drastic decreases in bullying both on the bus and in school, and that the students were enjoying the program.

In conclusion, the combination of these four elements should render significant results. It is notable that raised awareness about bullying seemed to have a positive effect on both staff and students.

Effects of the intervention. According to student self-report questionnaires, students who reported bullying others showed a significant decrease from pre to post intervention for (a) physical abuse, (b) verbal abuse, (c) threats, (d) intimidation, (e) inappropriate gestures, (f) social exclusion, (g) gossiping, and (h) spreading rumors. This indicates the intervention’s success. Although the two most prevalent behaviors, teasing and name-calling, decreased, the results were not statistically significant. Several reasons may explain this: First, these types of bullying behaviors are often hidden by students and escape the attention of school staff (Bradshaw, Sawyer, & O’Brennan, 2007). Second,
these types of behaviors often gain the reinforcement of laughter from the other students, hence elevating the bully’s social status (Craig & Pepler, 1995). It may be that the reinforcement from teasing was greater than the reinforcement that the program provided.

Among the students who reported being bullied, or victimized, data showed a decrease in the instances of all ten bullying behaviors; however, those results were not significant. Reasons for this may be that these victims experience ongoing feelings of low self-esteem, inferiority (Forness & Kavale, 1996), loneliness, depression, or anxiety (Hawker & Boulton, 2000; Nabuzoka & Smith, 1993; Olweus, 1994b, 2001; Rigby, 2002) long after a bullying incident (Hellendoorn & Ruijssenaars, 2000) and may have reported being bullied to a greater extent then they were after implementation of the intervention. In addition, even if these students were not being bullied to the extent they were before, they were probably still being bullied to some degree and the degree to which one feels bullied is difficult to measure.

According to head count measures, attendance at the weekly reinforcer events was greater every week at every grade level indicating that students had demonstrated an increase in pro-social behaviors. This also suggests that the celebrations were reinforcing. Attendance at the first high school reinforcer (dance) was quite low compared to the number of students who earned it. This was probably due to two variables: a few classes were on a field trip and other students indicated they were unsure whether the dances were going to be “cool.”
Strengths and Limitations

The present study adds to the literature in several important ways. First, as it attained significant results in reducing bullying behavior it supports the previous literature that SWPBS is a powerful tool when trying to modify behavior and promote success (Bohanon-Edmonson et al., 2004; Eber, Sugai, & Smith, 2002; Lane & Menzies, 2003; Lane, Wehby et al., 2007; Sugai & Horner, 2002; Warren et al., 2006).

Second, it is unique in participant characteristics. All participants received special education in a highly restrictive school. Most of the participants were inner city students of low socio-economic status (SES). Students were from grades K-12 and included those from diverse ethnicities with varying and sometimes multiple disabilities including emotional disturbance.

Third, it is unique in researcher characteristics. The researcher primarily ran a SWPBS plan to decrease the instances of bullying without external support. This speaks to the efficacy of practitioner led interventions. Also, the plan was implemented for a short period of time (eight weeks) and still achieved some significant results. Often SWPBS plans are implemented for as much as one to three years to achieve significant results (Lane, Wehby et al., 2007; Salmivalli et al., 2005; Warren et al., 2006).

Limitations to the study included (a) staff inconsistencies, (b) selections for reinforcers, (c) reliability of student self report, (d) follow through and generalization, and (e) head count attendance data. Lack of focused social skills teaching was a limitation as well; however, it will be discussed as a focus for future research.
Staff inconsistencies came in two forms: one high school teacher did not participate and some bus drivers needed weekly prompting to ensure that their students received their tickets. The teacher who did not participate blamed the students for not carrying their check sheets to receive their green BF s and subsequently their tickets for the dances or other reinforcers. Unfortunately, none of her homeroom students were present at the dances or the picnic though they expressed their desire to attend. Also, due to inconsistencies with some of the bus drivers’ participation, the researcher needed to be out by the buses on a weekly basis to ensure that deserving students received all of their tickets.

During the intervention, some of the students chose to play video games in a classroom instead of going to the dances. Some students approached the researcher with suggestions for other reinforcers. This would indicate that there needed to be more choices for reinforcers. What one student finds reinforcing may not be reinforcing to another student. Also, students’ desires may change over time and reinforcers need to be reevaluated (Leaf & McEachin, 1999).

Student self-report questionnaires can sometimes be unreliable. Students may not consider their behavior to be bullying (Salmivalli et al., 1996). Cole et al. (2006) concluded that peer reports were more reliable and markedly different from self-reports. During this study there were the additional variables of students who could not read and were embarrassed to ask for assistance and students who were “too cool” to fill out the questionnaire properly.
Unfortunately, the generalization phase is often neglected and the skills fail to sustain over time (Lane & Beebe-Frankenberger, 2004). Due to time constraints and the structure of this study, generalization was not measured.

Although head count data showed an increase in attendance at the weekly reinforcers, more information may have been gained with sign-in sheet data. The documentation of students’ names would have provided insight as to who was attending the reinforcers every week: bullies or non-bullies.

**Future Research**

Because social skills teaching was minimally addressed in this study, it may be an aspect of future research when paired with this existing program. Although some of the literature studied here on the effects of social skills teaching, especially in generalization over time, was inconclusive (Canney & Byrne, 2006; Kavale & Mostert, 2004; Miller et al., 2005), some did indicate its success in increasing desirable behaviors (Elliott & Gresham, 1991; Lane et al., 2005; Lewis et al., 1998), particularly when paired with positive reinforcement (Barton-Arwood et al., 2005).

When developing social skills instruction it is important to remember that expected behaviors should be explicitly described, taught, practiced, and supported (Lewis, 2008). Instruction should be provided for staff as well as students. Students must have opportunities to practice their newly acquired social skills and should receive reinforcement for exhibiting the new skills (Barton-Arwood et al., 2005). This study only addressed raised awareness, expectation descriptions, suggestions for alternative
behaviors, and reinforcement. A social skills curriculum might also include self-
reflection, discussions about expected behaviors including bystander behavior, lesson
plans, role-play, and commitment. Additionally, it could be beneficial to incorporate the
expected behaviors into the class rules (Lane et al., 2005; Lewis et al., 1998; Salmivalli et
al., 2005).

Because children with learning disabilities are at high risk for social inadequacies
(Bryan, 2005; Kavale & Forness, 1995), social skills teaching may be particularly
important. Deficits in social skills are often a distinguishing characteristic of students
with learning disabilities (Canney & Byrne, 2006) and manifest themselves in various
ways, including lack of ability to initiate and sustain relationships (Gresham, 1997),
disruptive and non-cooperative behaviors (Pearl, Donahue, & Bryan, 1985), and attention
seeking behaviors (Perlmutter, 1983). Moreover, students with deficits in social skills
often experience negative outcomes such as teacher and peer rejection, and bullying
(Farrell, 1997; Nabuzoka & Smith, 1993; Norwich & Kelly, 2004); therefore, future
studies might address social skills instruction and practice in conjunction with an anti-
bullying program.

Letter to the Parents

Bully Intervention Plan

A School Wide Bully Intervention Plan, has been developed by Jean Pellerin, a graduate student at California State University, Los Angeles and High School Teacher at The Kayne ERAS Center. The plan will be put into effect for 8 weeks: April 7-May 30. All of the students will be participating in the positive support plan. Please find the lists of bullying behaviors, the reinforcement list, and the consequence list below. Students will be earning tickets for being bully-free in school and on the bus. The tickets will be used for the reinforcers listed below. As part of the intervention, the students will be filling out questionnaires to help assess the plan’s effectiveness. Ms. Pellerin would also like to use the questionnaire data for her graduate thesis. The attached Parental Consent form is asking your permission to use the information from the questionnaires as part of her thesis report. The questionnaires are anonymous, unless your child needs assistance in filling them out, and then they will be kept confidential.

Thank you for your cooperation in this effort, Jean Pellerin

Bullying behaviors include the following:
- Physical aggression
- Verbal abuse
- Threats
- Intimidation
- Name-calling
- Teasing
- Inappropriate gestures
- Social exclusion
- Gossiping
- Suggested shunting
- Spreading rumors

Reinforcers:
- 1-hour dances on Fridays
- (Need 8 tickets to get in (checks for elem.))
- Once a month meetings. Tickets will go in for a drawing on the Fridays that we have the meetings.
- ‘Homework Free’ passes
- (Need at least 7 tickets (checks for elem.))
- Phone calls home (Need at least 6 tickets (checks for elem.))
- Teachers and bus drivers will give 1 ticket per day for students who refrain from bullying.

Consequences:
- Lack of access to the above reinforcers.
- Phone calls home.
- Silent Lunch
- Student and/or parent conferences with the principal.
- Detentions.
- In-school suspension.
- Suspensio
Appendix A2

Plan de Intervención acerca de intimidación agresiva (Bullying)

Este es un plan amplio de una intervención acerca de intimidación agresiva (bullying), desarrollado por Jean Pellerin, una estudiante de maestría de la Universidad Estatal de California, de Los Ángeles y maestra de (High School) secundaria en el centro de Kayne ERAS. El plan estrenará efecto por 8 semanas: 12 de abril – 20 de junio. Todos los estudiantes participarán en este plan positivo. Por favor de considerar la lista abajo de comportamientos de intimidación agresiva (bullying), reforzamiento, y consecuencia. Los estudiantes ganarán boletos cada vez que no intimiden o son agresivos (bully) en la escuela y en el autobús. Los boletos serán utilizados para reforzar la lista abajo. Como parte del programa, los estudiantes llenarán los cuestionarios para ayudarnos en evaluar la eficacia del plan. Ms Pellerin también quisiera utilizar los datos del cuestionario para su tesis de graduación. La forma asociada de consentimiento parental le está pidiendo su permiso de utilizar la información de los cuestionarios como parte de su informe del tesis. Los cuestionarios son anónimos, a menos que su niño necesite ayuda en completarlos, y entonces serán mantenidos confidenciales. Gracias por su cooperación, Jean Pellerin

Los comportamientos bullying incluyen lo siguiente:

• Agresión física
• Abuso verbal
• Amenazas
• Intimidación
• Llamar a otros por sobre nombres
• Irritar
• Comportamiento inapropiado
• Exclusión social
• Chismes
• Sugerir a ortos (el no juntarse con otros estudiantes)
• Hacer rumores

Reforzamiento:

• Una hora cada viernes de danzas
• Se necesitan 8 boletos (Cheques para la Elementaria.)
• Tendremos juntas una vez al mes. Los boletos se rifaran cada viernes que tendremos las juntas.
• Pases gratis de tarea
• (Se necesitan por lo menos 7 boletos (Cheques para la Elementaria.)
• Llamadas telefónicas a casa (Se necesitan por lo menos
• 6 boletos (Cheques para la Elementaria.)
• (necesidad por lo menos 6 boletos (comprobaciones para Elementaria.)
• Los profesores y los conductores del autobús darán 1 boleto por día para los estudiantes que se refrenan de bullying.

Consecuencias:

• La lista previa de privilegios no estarán disponibles.
• Llamar al hogar.
• Almuerzo en silencio
• Conferencia con el estudiante, padre y principal.
• Detención.
• Suspensión en la escuela.
• Suspensión
Appendix B1

Parental Consent Form

Your child is invited to be in a research study conducted by Jean Pellerin, a graduate student at California State University, Los Angeles, who is also a High School Teacher at The Kayne ERAS Center. Kayne ERAS is implementing a new, positive intervention plan to reduce the instances of bullying. This is a school-wide plan and intervention and all students will be participating. The purpose of this intervention, which will run for 8 weeks, is to uncover bullying behavior at Kayne ERAS and the effects of a new anti-bullying plan. It is also designed to explore bullying or being bullied.

Students will be earning Bully-Free (BF) marks on their check sheets. They will earn one ticket per day that they are bully-free in school. They will earn one ticket per day from their bus drivers as well. At the end of the week there will be things they can earn with their tickets: Entrance into a 1 hour dance, raffle prizes, picnics in the local park, etc. We will send home separate permission slips for any events that will occur off-campus.

During this time, your child will also be asked to complete three 14-answer questionnaires: one before the plan is implemented and two after the plan is implemented. Your child will be asked to rate to what degree s/he is bullying or being bullied. Each questionnaire will take approximately 15 minutes to complete. Questionnaires will be filled out and collected anonymously, but if your child requires assistance from his/her teacher with filling it out, the information will be kept confidential.

For my study, I would like to use the questionnaire information collected from your child during the 8 weeks of the intervention in my graduate thesis report. We ask that you read this form and ask any questions you may have before agreeing to allow me to use your child’s questionnaire information in this report. No names will be used in the published report.

There is minimal risk involved, including the possibility that students may be uncomfortable in answering some of the questions, and the possibility of a breach of anonymity/confidentiality. Your child may choose not to answer any question that makes him/her uncomfortable. The records of this study will be kept private. Questionnaires will ask only for gender and age and no names will be on the questionnaires. I will not be assisting the students and will have no way of connecting any questionnaire responses with a particular student. Consent forms, questionnaires, and data will be kept securely in separate locations for 3 years after completion of this study.

Your decision whether or not to allow your child’s questionnaire information to be used is entirely voluntary. If you decide not to allow your child’s questionnaire information to be used, it will not affect your child’s grades or their relationship with The Kayne ERAS Center. You may ask any questions you have now or later. You may contact me at 310-737-9393 ext. 306 (Jean Pellerin) or my adviser, Dr. Holly Menzies, at 323-343-6346.

Appendix B2

Formularios de Consentimiento de los Padres

Su hijo/hija está invitado a participar en estudio de búsqueda conducido por Jean Pellerin, estudiante de maestría en La universidad estatal de California, en Los Angeles, que también es profesora de secundaria en el centro de Kayne ERAS. Kayne ERAS está ejecutando un plan nuevo, positivo de intervención para reducir las instancias de bravatas o amenazas (mal trato sobre los estudiantes que parecen débiles). Todos participarán en este programa escolar, cual será realizado en seis semanas. El propósito de este estudio es para detectar los varios comportamientos de bravatas o amenazas en Kayne ERAS y para anotar los efectos de un plan nuevo de anti-bravatas.

Todos los estudiantes recibirán puntos de anti-bravatas (AB) en sus hojas de cuenta. Ellos ganaran un boleto cada día que mantengan el estatua de anti-bravatas. También ganaran un boleto por el conductor del autobús. Al final de la semana podrán ganar cosas diferentes con sus boletos, como: una entrada a un baile de una hora, precios de rifa, partidas de campo, etc. Mandaremos hojas de permiso separadas para los eventos que se tomaran fuera de la escuela.

Durante este tiempo, les vamos a pedir que completen un cuestionario de catorce preguntas, uno antes de implementar el plan y dos después que plan se implemente. Le preguntaremos a su hijo/hija hasta que degrado han sido sometidos a bravatas/amenazas. Cada cuestionario se tomará aproximadamente 15 minutos en completar. Los cuestionarios serán llenados y colectados anónimamente, pero si su hijo/hija requiere ayuda de su maestra/maestro, en llenar el papel, la información será confidencial. Los nombres no apareceran en el reporte publicado.

Para mi estudio, Me gustaría usar la información colectiva de su hijo/hija durante las ocho semanas de intervención en mi reporte de el tesis de graduación. Les pedimos que lean este papel y que hagan preguntas que tengan antes de consentir darme permiso de usar la información del cuestionario de su hijo/hija en este reporte. No usaremos los nombres de sus hijos/hijas en el reporte publicado.

Hay mínimo riesgo involucrado, incluyendo la posibilidad de que los estudiantes se sentirán incómodos contestando algunas de las preguntas, y la posibilidad de una infracción de anonimato/confidencialidad. Su hijo/hija puede escoger no contestar cualquier pregunta que lo haga sentir incomodo. Los documentos de este reporte serán mantenidos privados. Los cuestionarios preguntarán solo el genero y edad y los cuestionarios no tendrán nombres. Yo no asistiré a los estudiantes y no tendré manera de conectar ninguna respuesta de los cuestionarios con algún estudiante en particular. Los formularios de Consentimiento, cuestionarios, y datos se guardarán con seguridad en localidades separadas por tres años después de completar este estudio.

Su decisión de dejar o no dejar usar la información del cuestionario de su hijo/hija es completamente voluntaria. Si usted decide no dejar usar la información de su hijo/hija, no afectara las calificaciones de
su hijo/hija o la relación con el centro Kayne ERAS. Usted puede preguntar cualquier duda que tenga ahora o más adelante. Puede comunicarse conmigo al (310) 737-9393 ext. 306 (Jean Pellerin) o con mi consejera, Dra. Holly Menzies, al (323) 343-6346.

List of Bullying Behaviors, Reinforcers, and Consequences

Bully Intervention Plan

A School Wide Bully Intervention Plan will be put into effect for 8 weeks: April 7-May 30. All of the students will be participating. Please find the lists of targeted bullying behaviors, the reinforcement list, and the consequence list. Jean Pellerin

Bullying behaviors include the following:

- Physical aggression
- Verbal abuse
- Threats
- Intimidation
- Name-calling
- Teasing
- Inappropriate gestures
- Social exclusion
- Gossiping
- Suggested shunning

Reinforcers:

- 1-hour dances on Fridays
- (Need 8 tickets to get in (checks for elem.))
- Once a month meetings. Tickets will go in for a drawing on the Fridays that we have the meetings.
- ‘Homework Free’ passes
- (Need at least 7 tickets (checks for elem.))
- Phone calls home (Need at least 6 tickets (checks for elem.))
- Teachers and bus drivers will give 1 ticket per day for students who refrain from bullying.

Consequences:

- Lack of access to the above reinforcers.
- Phone calls home.
- Silent Lunch
- Student and/or parent conferences with the principal.
- Detentions.
- In-school suspension.
- Suspension
Appendix E

List of Replacement Behaviors

Replacement Behavior List

• When you feel the desire to verbally bully someone, you can instead find someone in the room that you like and talk to them about something else.

• When you feel the desire to bully someone, you can find staff and discuss it with them.

• You can carry a small stress relieving activity in your pocket, such as lanyard key chains or beaded jewelry, and create something instead of bullying.

• You can participate in sports, such as football or basketball to facilitate team membership and acceptance of others’ differences.
University Alcohol Consumption: A Comparison between Athletes and Non-Athletes

Abstract  
The purpose of this study was to compare alcohol consumption of student athletes to non-athletes at a midsized university in the Southern part of the United States. The eCHECKUP TO GO program is personalized evidence-based, online prevention interventions for alcohol developed by counselors and psychologist at San Diego State University. It is an interactive assessment tool that allows students to anonymously enter information about their drinking pattern and receive feedback on their alcohol use. The basic alcohol survey takes approximately 20 to 30 minutes to complete. The program is entirely self-guided, and requires no face-to-face contact time with an administrator or counselor. The eCHECKUP TO GO program is currently in use on over 550 universities and colleges across in 49 states, in Canada, Australia and Ireland. The eCHECKUP TO GO program is designed to motivate individuals to reduce their consumption using personalized information about their own drinking and risk factors and encourage students to ‘check-up’ on their use of alcohol, akin to checking their blood pressure or cholesterol levels from time-to-time.
Gardner versus Sternberg: Analyzing Theories of Multifaceted Intelligences and Applying Them to Fourth Grade Gifted Students

Deborah A. Stiles and Joy A. Berry
School of Education
Webster University

Author Notes:
Correspondence should be addressed to Deborah Stiles, Ph.D., School of Education, Webster University, 470 East Lockwood Ave., St. Louis, MO, USA, 63119. E-mail address: stilesda@webster.edu, phone number: 314-963-1042, fax number: 314-968-7118

The authors wish to thank Michelle Oder for sharing with us her ideas on gifted education and the Multiple Intelligences Worksheets and Profiles. We also thank Dr. Marlene Birkman for evaluating the children’s poetry and Jeremy Day for proofreading the manuscript.
Abstract

To better serve our gifted students, we as educators need to realize our own intellectual strengths so that we can guide our students to recognize their special abilities and potentials. Our study compares and contrasts two theories of multifaceted intelligences and applies them to ourselves and to fourth grade gifted students in a midwestern elementary school. Based on the theories of Gardner and Sternberg, we used self-reflections, surveys, work samples, observations, and discussions to gather information about 16 fourth grade gifted students and ourselves. Results suggest that each person involved (whether a child or an adult) was intrigued by these two theories and also interested in recognizing how the theories could be applied to him or herself. Through the study of these theories we discovered that each person is a distinct individual with his or her own intellectual strengths. Both Gardner’s and Sternberg’s theories proved to be valuable for adult educators who can use awareness of multifaceted intelligences to understand and appreciate their students, differentiate instruction, and provide a balanced curriculum. Both theories were useful in helping gifted students become aware of their personal traits, but the elementary gifted students in this exploratory study preferred Gardner’s ideas to Sternberg’s because the descriptions of the eight intelligences provided concrete and rich examples of abilities the children could recognize in themselves.
Gardner versus Sternberg: Analyzing Theories of Multifaceted Intelligences and Applying Them to Fourth Grade Gifted Students

Deborah A. Stiles and Joy A. Berry

The two major views of intelligence are as follows: (a) general factor, single trait, theories of intelligence and (b) pluralistic or multifaceted theories (Gardner, 1983, 2006; Sternberg, 1985, 1997). Psychologists Howard Gardner and Robert Sternberg believe in the second view of intelligence, described as “multifaceted conceptions of intelligence, which emphasize the importance of multiple and distinctive aspects of intelligence” (Sternberg, Jarvin, and Grigorenko, 2009, p. 4). Both psychologists view intellectual abilities as multifaceted, recommend that individuals identify their own pattern of intellectual strengths, and encourage schools to use their theories to guide and educate students (Gardner, 2006; Sternberg et al., 2009). In many ways their beliefs about human intelligence are similar, but in other ways Gardner’s and Sternberg’s theories are competing theories.

Gardner has proposed eight intelligences: logical-mathematical, linguistic, musical, bodily-kinesthetic, spatial, interpersonal, intrapersonal, and naturalist (Gardner, 2005, 2006). To be human is to possess all of the multiple intelligences. Each person has strengths – that is intelligences that are more developed. “No two individuals – not even identical twins – have exactly the same intellectual profile because, even when the genetic material is identical,
individuals have different experiences” (Gardner, 2006, p. 23). Gardner advocates using his theory to assess children and teach accordingly.

Sternberg has proposed a triarchic theory of intelligence: analytic, creative, and practical (Sternberg, 2006; Sternberg et al., 2009). Analytic skills are critical thinking and evaluation skills; creative skills include brainstorming, “problem-finding”, and the use of the imagination; practical skills involve real-world applications of knowledge. Sternberg et al. (2009, p.6) advocate the following: “Create a supportive learning environment in which students find their own pattern of abilities, understand how uniqueness allows each individual to make a particular contribution to the learning community and value diversity.… Balance the types of activities you offer your students so as to broaden the range of abilities addressed.”

The purpose of this exploratory study was to apply the theories of Gardner and Sternberg to understanding the intellectual abilities of 16 fourth grade academically gifted students. To accomplish this purpose the theories of Gardner and Sternberg were examined, multifaceted intellectual strengths of eighteen individuals were identified, both theories were applied to the classroom setting, and then the two theories were compared and contrasted.

Method

Participants

The main participants in this exploratory study were 16 elementary school students including 8 girls and 8 boys who were 9 or 10 years old. The elementary school is located in St. Louis County, Missouri. The state of Missouri labels the
demographics of the school district in the following ways: Asian 10.9%, Black 16.7%, Hispanic 2.2%, Indian .1%, and White 70%. Students from low-income families were identified on the basis of meeting the criteria for eligibility for free and reduced lunch; 17% met eligibility requirements.

In this school district, educational giftedness is as defined by “working at or above the 96th percentile in the areas of achievement, reasoning/problem-solving, and general mental ability” (unpublished document). On the WISC IV the 96th percentile is associated with an IQ of 126 or 127.

Also participating in the investigation of multifaceted intelligences were two adults, a gifted education teacher (adult Q) who interviewed the children and provided work samples and a university professor (adult R) who served mainly as a consultant.

Materials

Both the gifted education teacher and the university professor read books and articles by Gardner and Sternberg and both viewed and discussed two videos, Multiple intelligences: Developing intelligences for greater achievement and Intelligence, creativity, and thinking styles. Sixteen children completed the Multiple Intelligences Worksheet (based on Gardner’s theory; ALPS Publishing, 1999). Adults collected and evaluated poems from 10 children and work samples from 16 children. Applications of multifaceted intelligences were illustrated by two photographs of the gifted education classroom (Figure 1).

Procedure
In August 2009 intensive study of theories of multiple intelligences commenced. In September the gifted education teacher shared information with her fourth grade students about the lives of Gardner and Sternberg and each of their theories. She provided several examples of Gardner’s “eight ways of being smart” and Sternberg’s triarchic theory (book smart, street smart, and creative).

Each of the 16 gifted education students completed the Multiple Intelligences Worksheet (based on Gardner's theory; ALPS Publishing, 1999). Later the teacher prepared an associated Multiple Intelligences Profile for each student and discussed the results with each student individually. This profile identified strengths based on Gardner’s eight intelligences: verbal/linguistic, logical/mathematical, visual/spatial, bodily/kinesthetic, musical/rhythmic, interpersonal, intrapersonal, and naturalist.

A different process was used for identifying each child’s strengths according to Sternberg’s triarchic theory. Due to difficulties in finding an age-appropriate instrument for fourth graders comparable to the Multiple Intelligences Worksheet, “triarchic” strengths were identified mainly through students’ work samples, teacher’s observations, and students’ self-reflections. Sternberg’s triarchic theory includes analytic, creative, and practical abilities. By definition all of the gifted children in this study have strong analytic abilities because they each scored at the 96th percentile or above on tests of reasoning/problem-solving and general mental ability. Creativity and practical intelligence were mainly assessed through teacher observations. An additional professor who is an expert on children’s poetry independently assessed the poems of 10 of the 16 students.
The criteria for evaluation were similar to what Sternberg has used for adolescents and adults (novelty, quality, sophistication). Responses were rated on a scale ranging from 1 (very low) to 5 (very high). In addition to earning points for novelty, quality, and sophistication, students earned double points for overall creativity. Each poem could receive a minimum of 5 points and a maximum of 25 points.

In September and October, using information from work samples, observations, self-reflections, discussions, and the Multiple Intelligences Worksheet; the teacher and the professor prepared Table 1. This table identifies the intellectual strengths of the 16 children and two adults.

In October the teacher made observations of and reflections on teaching the gifted students; these were recorded in three written emails. (See Table 2).

Results

All of the participants in this study were fascinated by the theories of multifaceted intelligences and enjoyed applying the theories to themselves. Presented here is Table 1 that describes the intellectual strengths of each of the 16 fourth grade students and the 2 adults according to the theories of Gardner and Sternberg. The 16 children are labeled A through P and the two adults are Q and R.

My strengths have always served me well in running a family business, as a salesperson, and as a teacher. Working with gifted students, I rely on my strengths to create unique and challenging lessons geared to their strengths and specific learning styles. (Q is most similar to children J, L, N).

My strengths have been obvious since I was a young child. In kindergarten my teacher described me as “artistic and dreamy.” I taught myself to swim at four years. Today my life includes psychology, art, research, and triathlons. (R is most similar to the child F.)

Figure 1 shows gifted education teacher (adult Q) and includes two photographs of her elementary school gifted education classroom. The two photographs illustrate pluralistic views of intelligence incorporated into the design and decoration of a classroom for gifted children.

Figure 1. The gifted classroom

Table 2 contains excerpts of emails documenting observations of and reflections on incorporating the theories of Gardner and Sternberg while teaching gifted students.
Teacher and student are similar to each other

As I think about the students with whom I share similar intellectual profiles, I realize that I relate really well with the students who are most like me. When selecting activities I know exactly what will appeal to these students. I also know how to differentiate instruction to fit their needs. Student J was the one who wasn't happy with finding the facts about Christopher Columbus. I asked her a few questions, counted on her creativity, and suggested writing a song. She happily composed one and immediately sang it to the assistant principal who was observing in my classroom.

Teacher and student are different from each other

As I think about the students whose intellectual profiles are different from mine, I realize that my lesson planning has changed. Now I spend more time researching ideas and ways to reach the students [who are least like me]. Since they are all very strong mathematically, I usually have an additional critical thinking problem for them to work on while others are still completing the first problem. Many times, I have them working on different problems than the whole group. These students would rather work on their own; however, I want them to be able to work with others and select activities where it is logical and worthwhile for them to do so. If the activity allows for independent work, I let these students do so.

Overall benefits of knowing about the intellectual strengths of students

My teaching is improving along with my growing awareness of the theories of multifaceted intelligences. The uniqueness of my students has become very apparent to me. It has become clear that I need to make sure that I am teaching to everyone’s strengths. Last night I had to plan my activities for the Gateway Field trips that we are taking this week. I think I took into account their multiple intelligences… We are going to take the information and create various projects. The students will be able to select how they will present their ‘discoveries’.

Discussion

One might reasonably expect the class of 16 gifted fourth grade students to be quite similar intellectually. After all, these children are all of the same age (9 or 10); they are all strong in academic achievement and general mental ability; and they had all qualified for the gifted education program based on test scores at or above the 96th percentile.

Distinct intellectual abilities
On the contrary, each child in this study proved to be a distinct individual with his or her own intellectual profile; the individual strengths of each child are shown in Table 1.

All eight of Gardner’s intelligences are represented in Table 1, as are all three of Sternberg’s intelligences. No two individuals are exactly alike. The gifted education teacher (adult Q) is most like children J, L, and N; the professor is most like child F.

Table 1 shows that some students (such as A and D) are similar to each other, but no two students are the same. As a result of applying the theories of Gardner and Sternberg, it became apparent, for instance, that students N and F do not have the same intellectual strengths. N has a passion for words and language and is linguistic, spatial, interpersonal, analytic, and practical; whereas F loves nature and enjoys learning about living things and is a naturalist, logical-mathematical, intrapersonal, creative, and analytic. Therefore, students N and F are inspired and challenged by different kinds of activities.

As a result of applying multifaceted theories of intelligence, the educators discovered different intellectual abilities in students who initially appeared to be very much alike. For example, both A and D are athletes and exceptionally good students who enjoy critical thinking activities. Applying Gardner’s theory revealed that A is stronger in intrapersonal intelligence and prefers to work alone; he wrote a self-reflective poem that was rated high in creativity. D is stronger in interpersonal intelligence and interacting with others. D assists other students, speaks out, and expresses himself confidently.
The gifted education classroom

Two photographs show a classroom environment conducive to using multifaceted intelligences. The photograph on the left illustrates how much creativity is encouraged in this class. "Poetry is everywhere!" and examples of poetry from both students and published poets are displayed. Above the poems are several examples of students’ artwork. The photograph on the right illustrates a colorful and comfortable space designed by the gifted education teacher. In this cozy environment children can read and think quietly or they can participate in small group discussions. A student who is giving a presentation to the group is invited to sit in the special multicolored chair that resembles a hand. On the wall is a teacher-made blinking facsimile of the St. Louis arch and photographs of several St. Louis communities and neighborhoods. The gifted education teacher (adult Q) is strong in creative, practical, interpersonal, verbal/linguistic and visual-spatial abilities. Each of these abilities is prominent in the visually inspiring and thoughtfully arranged gifted education classroom.

Applications to instruction

Some results on Table 1 are surprising. Logical-mathematical and linguistic intelligence are the traditional scholastic intelligences; “most tests of intelligence focus on logical and linguistic intelligence” (Gardner, 2005, p. 1). The 16 students qualified for the gifted education program because they all scored at or above the 96th percentile on traditional tests. And yet, on their profiles, none of the 16 gifted students was strongest in both of Gardner’s scholastic intelligences. Sternberg’s analytic intelligence is another example of the “traditional scholastic”
intelligence. None of the gifted students was exclusively strong in Sternberg’s analytic intelligence and only eight students were strongest in analytic reasoning. With this new knowledge of the abilities of her students, the gifted education teacher can differentiate instruction and broaden the curriculum. She can follow the suggestions of Sternberg, Ferrari, Clinkenbeard, and Grigorenko (1996) and broaden her instruction and assessment procedures to include multifaceted abilities.

The profile of the gifted education teacher is most similar to those of children J, L, and N and most different from A, F, I, and K. In Table 2 the teacher reflects on the value of studying and applying the theories of Gardner and Sternberg. She discovered what Sternberg and others wrote (2009, p.14), “Your students can have both preferences and profiles of success that can be very different from yours.” She now revises lesson plans to reflect what she has learned about her students. It has become clear to her that she needs to make sure that she is teaching to everyone's strengths.

Gardner Versus Sternberg

Gardner (2007) asserts that the theories of multifaceted intelligences hold out “hope that more students can be reached more effectively, if their favored ways of knowing are taken into account in the curriculum, instruction, and assessment.” Gardner encourages educators to discover applications of his theories. According to Gardner (2006, p. 73), “Sternberg reveals he is much more of a psychologist and psychometrician than I am. This may explain why his work has been of great interest to psychologists, whereas mine has captured the
In contrast to believing multifaceted theories “hold out hope”, Sternberg tests out his theories with scientific research studies. He designed and conducted several research studies to evaluate the application of his theory of successful intelligence to educational settings. He describes a series of research studies on instruction and triarchic intelligences; Sternberg and his colleagues (2006, p. 94) found that students “placed in instructional conditions that better matched their pattern of abilities outperformed students who were mismatched. In other words, when students are taught in a way that fits how they think, they do better in school…. [Combining analytic, creative, and practical learning has greater benefits than just emphasizing memory or critical thinking. In several studies] students in the analytical, creative, practical condition outperformed the other students.”

Prior to this investigation Teacher Q had not extensively studied the theories of Gardner and Sternberg. As a result of this study she realized that both theories were helpful in terms of understanding and teaching her students. She discovered that she liked both of the theories, but enjoyed Gardner’s theory slightly more because his theory inspired her “creative and practical” self to think of ways to teach to students who are “naturalists” or strong in “logical-mathematical” thinking.

The professor (adult R) is a psychologist and as a psychologist agrees with Sternberg’s (2007, p. 31) recent criticism of Gardner’s book Five minds for the future that he provides “no real empirical evidence” to support his ideas. She
prefers Sternberg’s theories, but the professor thinks that Gardner’s theories are, in fact, more intriguing and delightful than Sternberg’s are.

The nine and ten year old gifted students in this exploratory study liked Gardner’s ideas more than Sternberg’s. They were very interested in the Multiple Intelligences Profiles. They often recognized themselves on the profile, and in some cases began reflecting more deeply about their strengths. For example student I was surprised and interested in his strength in musical intelligence and student M was surprised that naturalist was “first place” for her. The athletes enjoyed discovering that they possess high bodily-kinesthetic intelligence.

Sternberg’s triarchic intelligences are abstractions, but Gardner’s descriptions of the eight intelligences provided concrete and rich examples of abilities that the children could recognize. After one girl was complemented on her contribution to a class discussion, she exclaimed, “Well I am, after all, a naturalist.”

In conclusion, although only 16 gifted fourth grade students were involved in this exploratory study, much was learned. We encourage other researchers to study the application of multifaceted theories of intelligence to the education of gifted students. Educators will want to consider the theories of Gardner and Sternberg when they assess and instruct their gifted students. As a result of understanding their own strengths and the strengths of their individual students, educators can successfully teach and guide gifted students to realize their potential abilities.

**The Integration of Children with Down Syndrome into the Normal Classroom**

An ongoing debate about the inclusion of children with Down Syndrome into the normal classroom has raged among educators and parents since the early 1970s when the idea was first introduced. In 1975, the Education for All Handicapped Children Act gave all children the right to free public education regardless of handicap severity (Rynders, 2005). But after 35 years of research and experimentation, the question still remains: Is it better for the child to be integrated into the normal classroom, or to be educated in a special education setting? There are pros and cons to both sides, and the question is made more complex by the numerous factors that can vary from situation to situation, from the presence or absence of paraeducators to the modification of materials. All these years of experimentation have led to the current model, which offers a limited type of mainstreaming to some individuals, usually with significant support. Many improvements still need to be made to this model. I propose two new educational models, each of which may be able to preserve the advantages of the current mainstreaming practice and address many of its limitations. By incorporating aspects of these programs into existing programs, we will be able to make more progress toward optimal education for all students, especially those with Down Syndrome.

What are the goals and hopes that, when met, would mean that the integration of the child with Down Syndrome has been successful? First, both the disabled and nondisabled children should benefit academically from the experience. To ensure that all children excel, they should be taught with academic materials that are appropriate for their level and that will help them learn to the fullest extent of their ability. Second, all students should also benefit socially. This means that they have sufficient time and opportunity to interact with each other, that they have appropriate peer models to learn from, and that there will be extra support available for the children’s safety and learning if certain skills are
lacking. Finally, for the ideal program to be workable, it must also be financially feasible. When all of these requirements are met, both children with learning disabilities and normally developing children will have the optimal chance to prepare to be happy and successful adults.

The special education classes that are now in place in many school districts have some great advantages. Some more practical lessons are taught to the children there, such as personal care and vocational skills. Children with Down Syndrome particularly benefit from group speech and occupational therapy conducted by visiting therapists (Ehlen, personal interview, 2010). The learning sessions are more closely guided than other classes, helping the disabled children better understand what their task is. These classes also allow for more individualized instruction at the child’s understanding level. Perhaps most importantly from an administrator’s point of view, special education classes are much cheaper than having individual aids and therapists for every child, as might be required if they were to be in a normal classroom setting.

Nevertheless, research has clearly shown that even though special education classes have their advantages, integration has a much greater benefit for everyone, and most especially for children with Down Syndrome (Rynders, 2005 and Wolpert, 2001). Completely unlike children with autism, for example, children with Down Syndrome are usually outgoing, sensitive to others’ emotions, interested in communicating, responsive to praise and approval, and very attuned to the behavior of others. They generally exhibit the ability to learn and recognize what is correct socially. By being included with children who inherently understand social norms, they learn what is appropriate and what is not. Rynders (2005) says that if the goal is to help the children become independent, the disabled child must be able to successfully interact with others. Every successful interaction at school is in preparation for when they must interact without any guidance from teachers or parents (p.6). Emily Ehlen, my sister, is a 14-year-old girl with Down Syndrome who has been in normal classrooms her whole life. Her nerve
endings above the upper lip never fully developed and she does not sense anything there. Her nose would often be runny, but she never understood why she should wipe it when it did not bother her. However, when all her classmates told her how gross it was, she quickly learned how much it bothered others and changed her habits. This is what Myers (2010, p.682) calls, “normative social influence.” We are all sensitive to social norms because we want to be accepted by others around us, and so we will change those habits that make people want to avoid us. Integration can have a strong, positive influence on a child with Down Syndrome.

While there are benefits to integration, there are also some legitimate concerns presented by parents, teachers, and other school administrators. Parents of non-disabled children ask how the integration will affect their child’s development (whether it will hold them back from their own potential) and are concerned about their child’s personal safety as well (Bricker, 2000). Parents with a disabled child may be worried about how he or she will be treated by their peers and whether they can keep up with everyone else. Teachers do not always know how to deal with the children when they misbehave and have received little or no training to deal with the situation. They also want to challenge the non-disabled children, also worry whether the disabled child keep up with the pace. Administrators have strong concerns about the cost of integration. A full-time aid and multiple inclusion and behavioral specialists who visit the classroom once a week to observe and report progress, are generally required for each fully-included disabled student. (This cost also influences administrators when making decisions about grade placement, such as whether to allow children with Down Syndrome to be held back a year if too little progress has been made.) Eric and Vicki Ehlen discovered that it was an “unwritten rule” that if a parent with a non-disabled child wished to hold them back a year, it was no problem, but if a parent with a disabled child wanted the same thing, it was out of the question (Ehlen, personal interview, 2010).
Are the concerns of the parents of normally-developing students legitimate? Would inclusion be a
detriment to their non-disabled child? Quite the opposite is true. After 12 years of research, Rynders
(2005) found that the children involved in the program had grown in self-confidence because of their
involvement with children with disabilities. They also had higher regard for people with disabilities and
greater appreciation of their own self worth. When a disabled child is extremely aggressive and may be
a threat to others, safety comes first, of course. Inclusion may need to start in small doses (i.e. an hour a
day) until the children grow accustomed to the change, and then longer periods of time can be spent in
the classroom (Rynders, 2005, p.8). Aksoy and Yildrim (2008) also found that those personally familiar
with someone with a disability are more accepting of others with similar problems (p.776). This would
be valuable a any child to be able to understand.

Despite all of the great benefits that be had thanks to the two different programs already in place in
most of the country, there are serious drawbacks to each of them.

For the parents of the disabled child, the unknowns may be frightening. One of the largest concerns
is the child being taken advantage of sexually. Rynders (2005) says that while it is good for peers to help
the child learn, they should never help or teach them to brush teeth, change undergarments, apply
deodorant, and other similar tasks. If that principle is followed, the risk is greatly reduced. It would also
help if children were made more aware of the difficulties the disabled children face so that they can have
more sympathy towards them. Close observation by the trained teacher is required so that possible
problems are noticed and dealt with before they develop. Another pressing concern of the parents of
the disabled children is that without the more individualized instruction of the special education
classrooms, their children will fall hopelessly behind their peers academically. In the early years of
education, the gap may not be very wide, but it continues to grow until there is no possibility for the
child to catch up. This very legitimate concern is not addressed by the current inclusion model, and is
very often the reason that full inclusion is abandoned by the time students with Down Syndrome reach the high school level. We need to make some changes to fix this.

Finances are always a concern in school districts where budgets are limited. If there is leftover money in a certain department, it can be used for something else, which makes the administration far less willing to spend it on one child. One set of parents said that every administrator was completely against their daughter’s inclusion, despite state and district policies that recommended the “least restrictive environment”—ie, inclusion if at all possible. They were quick to point out how wonderful the special education teachers were, how large the regular classrooms were, etc., but the defining problem was actually how expensive it would be to fully support a child in a regular classroom that was several grades higher both academically and emotionally than her current developmental level. They were told by school board members that they would “rather fund programs than individuals” (Ehlen, Personal Interview, 2010.) There is no good remedy for this problem with the programs that are now in place.

Although special education classrooms are clearly more cost effective than mainstreaming, there are many reasons they may not give the optimal education to individual students. First, these classrooms are for all children with disabilities. In one class, you may have someone with muscular dystrophy, a child with Autism, a child with Down Syndrome, and a child who is deaf These are four very different disabilities, with unique challenges associated with each one. If it is hard for a teacher to deal with one child with challenges in a normal classroom, it is that much harder to teach 8 to 20 children, all with very different problems and disabilities. Another great disadvantage of the special education setting is the lack of social skills present in that environment. If they have been isolated from normal children since age 4, then virtually none of children know how to behave normally. Furthermore, all of the children in a special education classroom are challenged academically. They have poor study skills, poor organizational skills, and limited ability to participate in an academic discussion or oral presentation.
If there are no correct examples to follow, how can anyone form proper social or academic habits? We need a new solution.

We may be able to discover some new ideas by looking at an innovative program in the Torrance, California area called LAUNCH Preschool. Specially trained teachers and therapists are put in charge of each class, which is for children with disabilities, including those with Down Syndrome. The key is that only a portion of the students are disabled. Normally developing children are invited to attend the school to be models for the disabled students. The peers are very carefully selected so as to insure that they are good examples in every way for the disabled children to learn from. All children range from age 3 to 5 and work closely together to learn new skills. Class sizes are small and allow all the children to interact with one another. So, does this make a difference? Diane Bricker, one of leading experts in the field of Inclusion, referred to her early research of integration with normal functioning children: “We observed that including children without disabilities offered the children with disabilities relevant and appropriate models for learning new skills and information” (2000, p.15). This LAUNCH program demonstrates exactly what Bricker says. All the disabled children learn many new and valuable skills, and are well prepared to enter normal schooling. Not only is that idea important, but another focus in the school introduces novelty and teamwork into the classroom. The children are given new tasks, challenges, and projects which keeps them thinking creatively. This idea that novelty encourages learning is also supported by Rietveld (1988, p.8). And, importantly, the normally developing children have the benefit of an incredible program, designed to stimulate thinking, physical coordination, and cooperation, all supervised by extraordinary teachers and therapists.

It would be wonderful if all children with Down Syndrome had positive experiences when integrated, but sadly, that is not always the case. Because of all the above mentioned problems, some fully mainstreamed students find themselves virtually friendless in a class of students that are so much more
mature... ignored by teachers who have no idea how to include them in a conversation (Ehlen, Personal Interview, 2010). All researchers agree that it is best for the child to be integrated, but Gawne and Brothers Keith (1995) remind us that circumstances change and the only way for integration to be successful is by constantly evaluating and making changes to fit the needs of the individual (p.5).

Every year all of the children with disabilities take an array of tests to measure how much progress has been made in the last year. Reading, oral language, math proficiency, Piaget’s psychology test (Rietveld, 1988), and many tests are administered. With all the information that is gathered from the examinations and by comparing the scores with normal children, the administrators can say that someone is at a 5.1 year old level in reading, and yet their math comprehension is that of a 7.2 year old. If someone is in the normal classes and their scores are low in one area, the paraeducator may try to help them, but that child is still expected to normally advance to the next grade despite possibly having fallen behind in one or more subjects. Now imagine for a moment that you have a son in third grade, but then the teachers think he should advance to the seventh grade level of English. Despite having a paraeducator, their maturity and understanding are not yet at that age level, and no amount of help will change that fact.

Here is a new and different approach: We should not hold back the children, but rather place them in the grades where they place on their tests. If their age is that of a 6th grader and they keep up in reading and social studies, but math in only at a 3rd grade level, they should be allowed to attend the 3rd grade math class so that they will learn something. Evaluations will need to be done constantly to ensure that everything is going according to plan, but this would mean that the child with Down Syndrome would be able to keep up in comprehending and completing the activities. There will still be a difference in expectations, as was so in the case study by Gawne and Brothers Keith (2008). There was a young girl with Down Syndrome, who was placed into a normal school and graduated with full honors as
a very capable adult. The committee which met to discuss her progress on a regular basis realized that the priorities were different for her and set unique goals that they felt were obtainable and would push her to still learn.

Another important aspect to this plan is that there will be no need to have a full time aid present. If the child can understand as readily as their slightly younger peers, then there will be no reason for someone to explain every task to them again and keep them from getting bored when they cannot follow a class discussion. This would save lots of money in the long run. There would still be some other specialists, but the number of people involved with each child would be significantly less, therefore saving time and money for the schools.

Of course, there would have to be limitations to how far this plan is taken. An 18-year-old individual would probably not be placed with second grade children if that was the entire extent of the math that they were capable of doing. It might still be necessary to have some special classes for unique cases. This new regimen should at least be tested to determine if it is a real solution. Through IEP meetings and observation of the child's development, we can determine if such a plan would be appropriate for the child of interest.

Even if this new theory does not work, there are many aspects in the current education systems that need to be modified in order to make the integration easier for everyone. In one study, Wolpert (2001) found that 55 percent of the 230 teachers who had a Down Syndrome child in the class had never received any training or preparation from the school district on how to make inclusion successful and only 63 percent of them had ever received any special education training. It is no wonder that so many attempts at integration are not successful! One way we can change this low statistic is to introduce new classes at universities required for all students with a teaching major. Classes and seminars also need to be organized for all the teachers currently working with students so that they can receive advice and give
input on current technique effectiveness. Rietveld (1988) wholeheartedly supports this idea (p.7) and also suggests that the student’s peers are educated about the child’s condition so that they can better understand why the child is different. In her studies she observed that many problems arose because the children did not know how to properly respond to babbling or incoherent noises, which were actually attempts to communicate. Children could solve that issue by responding with verbal statements instead of ignoring or making fun of them (p.8). Also organizing a committee (IEP, if there is not already one) involving the parents, teachers, and other faculty would greatly help to identify what the priorities for the child should be.

Despite the many advantages with the current educational programs, by implementing and testing the new program, the Inclusion of children with Down Syndrome would be very beneficial to everyone. Both children, with and without disabilities, would benefit from the experiences: disabled children would learn social skills and excel in the learning environment, being able to keep up with their peers and giving input in class discussions. Financial costs would be greatly reduced and all other goals for successful inclusion can be obtained. The new measures that would apply no matter what ensure that the experiences with integration will be much more positive than before and may also inspire others with other ideas of how to best integrate the children with Down Syndrome. Helen Keller once said, “Life is full of suffering, but it is full also of the overcoming of it.” Let us give these children a chance to overcome their challenges and maybe we will overcome some of our own.

Ehlen, Eric and Vicki, Personal Interview, 2010

Education is one of the fundamental factors of economic development. According to Ilhan Ozturk (2001), “No country can achieve sustainable economic development without substantial investment in human capital.” All countries must realize that better education leads not only to higher individual income but is also a precondition for long-term economic growth (International Institute for Applied Systems, 2008). According to Dr. Jose Enrique Vallarta Rodriguez (2007), the people of Mexico believe that their educational system is expensive, dysfunctional and corrupt. However, the faith in the value of education remains strong in Mexico.

Research indicates that Mexico lags behind what many other countries have already achieved in education. Instituto Nacional para la Evaluacion (INEE), (2003) revealed that sixth graders in urban primary schools achieved 45 percent satisfactory or above in reading and 15 percent satisfactory or above in mathematics. Results in rural and indigenous primary schools were even lower (RAND Corporation, 2005).

While Mexican President Felipe Calderon has proposed ambitious reforms in the educational system of Mexico and many of those concerned about education believe that things are changing for the better, the problems created when education intersects with bureaucracy, politics and organized unions are complex and multifaceted (Wall, 2008). According to the RAND Corporation documented briefing series (2005), some of the key issues in Mexican education at
the national and state levels that must be addressed include teacher training and a lack of research and evaluation that can inform school improvements efforts.

Teachers in Mexico are being trained to teach according to the frontal model, to prioritize information and memorize facts (Schmelkes, 2008). The structure of the frontal model or transmission model is rigid and hinders the creativity of the teacher. There is very little room for the teacher to improvise because this method follows a step-by-step procedure. Students do not actively participate in the learning process, they simply sit and listen. Students do not work in teams and they are not taught to think, to solve, to explore or to do research (Schmelkes, 2008).

Based on current research of best practices, students need to learn by observing, imitating, exploring, reading and doing research, talking to others, experimenting, discovering, working together, discussing, reflecting, solving problems and helping others.

According to Schmelkes (2008), the transmission model of teaching utilized throughout Mexico must be discarded. The object of education can no longer be the transmission of knowledge. It should be replaced by “a model that prioritizes the development of competencies” (Schmelkes, 2008, p. 108). The transformation of the teacher’s view of teaching and learning is without a doubt the most important factor for insuring quality education for the future.

**Mexico Teacher Project**

The *Mexico Teacher Research Project*, a collaborative research partnership between the University of the Incarnate Word’s Dreeben School of Education and a private school, the Instituto Migul Angel do Occidente in Mexico, was designed to create and disseminate new and promising teaching strategies to K-6 grade teachers in Mexico.

Mr. Alejandro Junco, funder for the Mexico Teacher Research Project, is the publisher of several newspapers in Mexico. Two of the most prestigious papers are *Reforma* in Mexico City.
and *El Norte* in Monterrey. His interest in having educational research conducted in Mexico stems from his view that Mexico is being destroyed by drug cartels. He believes that by improving the economic and social situation, the country will be in a better position to get rid of the cartels. His focus has been on improving the country's educational and judicial system.

The project’s vision is to contribute to the transformation of the educational system of Mexico by training a new generation of teachers to increase the academic achievement of students. The research initiative was designed to provide data that contributes to the literature on Mexico’s educational system. The research goals of the project are: (1) To design a research project that would lead to a transformation of how teachers in Mexico view the teaching and learning of literacy and apply the new skills to the classroom, (2) To conduct a needs assessment with school personnel, teachers, parents and students, (3) To collect baseline data for the project and (4) To design a training program. The execution initiatives are designed to increase the academic achievement of students in Mexico in literacy through teacher training in teaching methodology and literacy content. The execution goals are: (1) To develop a series of literacy workshops designed to improve the teaching skills of teachers in Mexico, (2) To increase the number of teachers who utilize a variety of teaching models, (3) To develop and implement a model of training for teacher leaders, (4) To develop a transferable model and duplicate the activities of the project in a second school; and (5) To disseminate project information through the project web page and established process of scholarship to contribute to the literature on Mexico’s educational system.

While this international project began in the summer of 2009, the Dreeben School of Education at the University of the Incarnate Word has worked with the teachers at the Instituto
Migul Angel do Occidente in Mexico since 2007. A strong, collaborative relationship and rapport was developed between the partners prior to initiating the project.

As an initial step in the research project, a meeting between the dean of the Dreeben School of Education, the coordinator of funding for the project and the principal and coordinators of the Instituto Migul Angel do Occidente was held in Guadalajara. The three year research project was discussed, designed, revised and finalized. A formal partnership agreement was signed in July, 2009.

It was determined that the paper based, English version of the Scholastic Reading Inventory would be used as the instrument for assessing the improvement of student’s reading skills in grades kindergarten through grade six at the Instituto Migul Angel do Occidente. This inventory was administered to approximately 633 students during the first semester of the project.

**Literacy Workshops in Mexico**

Faculty in the Dreeben School of Education in conjunction with the coordinators from the Instituto Migul Angel do Occidente developed a series of literacy workshops. These workshops were tailored to meet the needs of the school. Topics for these workshops included reading strategies, running records, performance-based assessments, task-based instruction, learning centers, writing process, classroom management, Inductive Thinking Teaching Model, Picture-Word Induction Model, Think-Pair-Share, Jigsaw II Cooperative Learning Model and the Concept Attainment Model. In August, 2009 and 2010, faculty from the Dreeben School of Education conducted two day literacy workshops (10 hours a day) at the school in Mexico for twenty three teachers. In January, 2010 faculty traveled to Guadalajara to conduct additional two day literacy workshops.

**Follow-up and Feedback**
About two months after the workshops, faculty traveled once again to Guadalajara to do observations in the teachers’ classrooms to ensure that the pedagogy taught in the workshops was being implemented. After the observations, faculty provided performance feedback individually to the teachers. Based on the individual observations, additional strategies for implementing the new approaches to teaching were shared with the teachers.

**Mexico Teachers at University of the Incarnate Word**

The twenty three teachers from Instituto Migul Angel do Occidente in Guadalajara traveled to the University of the Incarnate Word for a week in April to visit the schools in the San Antonio area and to attend workshops conducted by faculty at UIW. The teachers’ schedule for the visit included four days of visiting classrooms in the morning and attending literacy workshops in the afternoon.

**Future Plans for the Mexico Teacher Research Project**

Unfortunately about a year after the education project began, Mr. Junco, who funded the project, decided he wanted to further focus on the judicial system of Mexico and how it was impacting ordinary Mexicans. So he decided to concentrate his resources in that area. Since the Mexico Teacher Research Project was completely funded by Mr. Junco, funds were not available to continue the project.

When Sor Gloria Eugenia Orez Villalon, principal of Instituto Migul Angel do Occidente, was told that the project could not continue, she was very disappointed. She is convinced that the project and the training of the teachers are making a difference in the student achievement in the school. Because of the school’s commitment to the project, Sor Gloria offered to provide funding for the project for an additional year. The Mexico Teacher Research Project will
continue in an abbreviated form for the second year. However, the future of the project is uncertain.

Implementation of the mathematics curriculum in Taiwan: A case study of one elementary school teacher

Wei-Min Hsu
National Pingtung University of Education, Taiwan
ben8535@mail.npue.edu.tw

Douglas A. Grouws
University of Missouri-Columbia, USA
grouwsd@missouri.edu

In Taiwan, elementary mathematics curriculum reform has been a continuous process for the last 20 years and it has primarily focused on restructuring the written curriculum. But we know very little about how Taiwan teachers implement the reformed curriculum in their classrooms. In the past, most curriculum research has focused on textbook content analysis and comparisons of Taiwan textbooks with textbooks from other countries. Because of these research focuses, this study was conducted to develop an understanding of the mathematics curriculum implementation of an experienced elementary school teacher in her classroom, and to explore factors which influenced her curriculum implementation. Case study methodology was used to study a sixth-grade teacher with more than 10 years teaching experience. The study gave specific attention to how the teacher chose tasks to present to students and how these tasks were enacted in the classroom. The primary data sources were classroom observations, teacher interviews and problem solving records of students, all collected during the second semester of the 2008-09 school year. Analyses of study data indicated that 54% of the mathematics tasks the teacher used were from the textbook, the others were teacher-designed or extended from the textbook. Sixty-eight percent of tasks she used were classified as high cognitive demand tasks that emphasized the meaningful connections among different content representations. The main structure associated with task implementation (78% of tasks) was small group oriented and consisted of the following activities: problem posing, problem solving, presentation and explanation, and discussion. In implementing high cognitive demand tasks she regularly employed multiple representations as part of exploring the tasks, and she provided many opportunities for students to discuss and explain their thinking as they worked on and completed the tasks. Most of time, she used open-ended questions when interacting with students.

The driving force behind the teacher’s curriculum implementation and the associated decision making process was composed of the following interrelated factors: beliefs about mathematics teaching and learning, support and reflection from the professional teaching group she attended, and students’ reactions in classroom. In the beginning, the teacher often doubted whether her implementation could really improve students’ learning performance. She also initially expressed concern that if she
allowed time for students to communicate and to share their solving processes and results, then she
would not have enough time to finish teaching other required topics. But with strong support from
her professional teaching group and self-reflection about her mathematics teaching and her students’
good performance in the classroom, she confidently continued during remainder of the school year to
employ small group discussion, present high cognitive demand tasks, provide opportunities for students
to communicate their thinking and their problem solving processes, and focus on meaning connections
among representations. The teacher was a special case and her curriculum implementation may not
represent all other teachers in Taiwan, but it does demonstrate that with a support group and
opportunities for self reflection, teachers can change their instructional practices in ways that reflect
recommended teaching methods in recent curriculum reform documents.

Businesses and Business Schools – Bed fellows or Estranged Partners?

Introduction

Although showing a soaring increase in student enrolment numbers, business schools face relentless criticism (Pfeffer and Fong 2002; Quinn Trank and Rynes 2003). In the middle of last century business schools were criticized for being too similar to vocational trade schools and offering lowly programs. This censure resulted in an influx of academically bent faculty and the embracement of a scientific model to mimic other established disciplines such as the sciences and economics. However towards the end of the last millennium, several authors began to criticise business schools again: this time as being too academic, focused solely on research and a business education less and less relevant to practitioners (Armstrong 1995; Bennis and O'Toole 2005; Clinebell and Clinebell 2008). Pundits advocate striking the right balance in curriculum design and delivery (Friga, Bettis et al. 2003; Quinn Trank and Rynes 2003; Bennis and O'Toole 2005) which Clinebell and Clinebell (2008) liken it to “walking a tightrope between the academic side of business and the practitioner side”. Indeed this is a salient and pressing issue as for example the Australian Learning and Teaching Council (ALTC) investigates the equilibrium between professional and liberal education ideals in the business realms of tourism and hospitality management (Australian Learning & Teaching Council 2009).

Research shows a low correlation between an MBA degree or lofty academic grades earned in businesses courses and career success (Pfeffer and Fong 2002; Raskin 2002). This low correlation bucks the premise of academic credentials being the raison d’etre for business education. Furthermore business schools’ chequered past in relation to its philosophical and pedagogic modus operandi does not bode well for their future. Even management guru Drucker predicted extinction of academic institutions in the field of business school education in the near future (Lenzner and Johnson 1997). 13 years later, however, that prediction might have been somewhat off base because business schools still continue to flourish and are omnipresent. The once much lauded MBA is commonplace, and indeed disparagingly banal albeit beneficial to those successfully undertaken them by increasing managerial skills, self-confidence and career development (Baruch and Lemming 2001) and remuneration (Connoly 2003). Nonetheless, the value of the formerly prestigious MBA has been tarnished (Raskin 2002).

Some authors question the claimed strong link between business schools and businesses in general because discussing models and theories in training differs from the application of skills in the workplace. Businesses prefer an applied shortcut to success to engaging in an abstract academic discussion about generalizable models with a penchant for prescriptive solutions. Thus, possible interactions between both might have to be limited to mere consultancy services.
(Fowler 2005). This highlights the dichotomy between theory and practice and stresses the need to revisit the relationship between the two in the context of business education.

The remainder of this paper discusses requirements of a business school education in the 21st century and proposes a model for a revised curriculum that embraces a holistic and balanced perspective to reconcile the interdependent yet tenuously independent relationship between business schools and their audiences.

**Literature Review**

Students enrol into a business school course with different backgrounds and for various reasons. Depending on the expected outcome of higher degree studies, a degree program should have the right mixture of academic rigour and applied skills but also cater for different learning preferences.

Whereas most doctoral degree students aim to learn research skills for academia, a bachelor student has less interest in academic rigor and more interest in professionalism and employability (Star and Hammer 2008). This is reflected in educational frameworks such as the Australian Qualifications Framework (AQF) requiring schools to map their programs against the expected degree outcome. The AQF describes a PhD degree having a strong theoretical focus, Master and Bachelor degrees have a lower theoretical but higher applied focus (Australian Qualifications Framework Advisory Board 2007). For example at the undergraduate hospitality management level, Ogle and Berwick (2010) found that practitioners’ recommendation to educators for improving curricula was to address practical knowledge and competency training while not neglecting theories.

Another consideration is students’ learning preferences (Lashley 1999). For example, hospitality management students have a low inclination towards theorising or reflection (Lashley 1999) thereby validating the argument that business education should be more didactic and applied to suit the expectations of industry. The modern manager is a reflective practitioner: a professional who thinks carefully about his/her actions while he/she does it (Schön 1987). Tribe (2002) extends this premise further by introducing the concept of the philosophic practitioner. This concept relates to the curriculum necessary to produce graduates who deliver efficient and effective services while simultaneously providing stewardship for the business progression of enterprise (Tribe 2002). The integration and fine balance between discreet curricular forces is illustrated in the following diagram.
Generic, specific and research skills

To cater for different learning preferences and degree outcomes a modular approach of generic and specific skills, and academic rigor should drive modern business education (Friga, Bettis et al. 2003). Having a focus on employability, bachelor degree students should learn skills to be successful in the workplace. However a graduate’s workplace and its influencing environmental factors have changed significantly within the last years. A global, interdependent economy results in a higher complexity and uncertainty in today’s marketplace compared to last century’s trade schools providing a “good enough education” for local marketplaces. Factors such as having to take demands of different cultures into account, an increased pace of economy through modern ICT technology and volatile business environments require different skills (Friga, Bettis et al. 2003).

To improve employability and professionalism in a knowledge society and globalised world, a modern curriculum should discuss multidisciplinary, practical and ethical questions. Students must learn generic skills such as communication, problem-solving, critical thinking, teamwork, and technology and information literacy. Furthermore intercultural competency and understanding the need of continuous learning are important (Barrie 2005; Bennis and O’Toole 2005; Star and Hammer 2008). These generic skills can be applied to a variety of industries.

For students already aiming to enter certain industries, a curriculum could include specific skills. This tailored curriculum might be a business schools’ competitive advantage. Yet to sustain organisational efficiency, a school should focus on global industries of significant economic importance such as hospitality and tourism (World Tourism Organization 2010) or at least industries of local dominance.
Furthermore depending on research interests and requirements of a later career in academia or market research, building on generic problem-solving skills more sophisticated research skills build a third module in a revised business curriculum.

**Staffing**

Similar to disciplines such as medicine and law disciplines, business schools arguably must adopt a more professional instead of a pure scientific model to avoid extinction and survive (Bennis and O'Toole 2005). One way could be hiring executive professors, business professionals with academic ambitions such as executives planning to pursue an academic career (Clinebell and Clinebell 2008). Whereas these “hybrid” professors might be perfect to build a bridge between academia and business reality at first, hybrid solutions have downsides. Executive professors might lack necessary pedagogical and teaching skills (Clinebell and Clinebell 2008), thereby limiting learning effectiveness. Furthermore after a certain time in academia, the strong business link might weaken as their former business networks evolve and hence there is a strong possibility of getting unconnected which undermines the rationale of poaching industry practitioners. A mix of executives bringing industry views inside the classroom and faculty focusing on academic rigor and teaching support might be a viable model.

**The Right Mix of all Elements - A Model for a Future Curriculum**

A viable curriculum should follow the proposed modular approach of teaching generic, industry specific applied and research skills whilst catering for different student demands. Figure 2 shows a model for two Bachelor degrees – a generic ‘Bachelor of Business’ and a more applied ‘Bachelor of Business in Hotel Management’.
Core units are common in both programs, major units provide an industry flavour or advanced knowledge in a subject. Feedback from industry and students showed that both courses need the discussed mix of operational concepts in which to put the theoretical framework into context but also flexibility. Electives allow students to follow individual interests and both Bachelor degrees offer students flexibility to change between courses due to the communality of the curriculum. For students who have identified vocational opportunities, there are two exit points – Diploma and Associate Degree – after the first and second year of the Bachelor course program.

Internships follow the argument of applying knowledge and employability. Two double-weighted Internships in semester six give students the opportunity to apply knowledge and skills gained in the classroom and get industry experience. An Internship coordinator assures critical reflection of student’s workplace experience.

Both courses have adopted the same structure, and have been developed along the lines of a traditional undergraduate business degree - with students taking four units of study in each semester over three years fulltime.

Conclusion

Both degrees, Bachelor of Business and Bachelor of Business in Hotel Management, have been designed to offer students an industry relevant higher education qualification. It is a qualification that will provide them with practical and theoretical skills to become highly respected
professionals in their discipline. Whereas this should be the right combination having a focus on employability and industry relevance, a Master degree and especially a doctorate degree need a higher degree of theoretical but generalisable knowledge and academic research skills. As a veteran hospitality educator aptly puts it, "the recipe for a successful career in this industry is a dash of inspiration, a healthy measure of aptitude, a large dose of positive attitude, a dollop of passion and a sprinkle of sweat" (Capriano 2010), thereby infusing a highly technical area of expertise with the requisite soft skills highly vaulted in industry.

The Accidental Profession: Career Paths of Academic Library Development Officers

MICHAEL LORENZEN
Western Washington University

ABSTRACT. Libraries in higher education are increasingly seeking to expand their fund raising efforts to address declining financial support from their institutions of higher education. Development officers who specialize in raising money for academic libraries have proven to be an important aspect for success in library fund raising. This paper examines how individuals in academic library development positions find themselves in these positions in the first place. The results of a qualitative study are presented which demonstrates that most academic library development officers do not set out to seek their current jobs and instead they arrive in the positions by happenstance and accident. The paper also looks at implications of this finding and offer suggestions for better recruitment and training of academic library development officers.

KEYWORDS library development officers, fund raising, academic libraries, career paths, philanthropy, higher education

Introduction

Higher education is an important but expensive endeavor. The costs to attend and operate colleges and universities continue to rise at the same time that governmental support for these institutions has waned (Gladieux & King, 1999). Clark and Brandon (2006) argued that the majority of the states (43 of 50) deserved F’s in college affordability because they have chosen as a matter of public policy to place much of the financial burden for a college education on families through higher tuition and other expenses thus making degrees less affordable. As a result of the decline in public support and increasing costs, many institutions of higher education are seeking increased private funding. Turning to private money to supplement other sources of income is a reasonable strategy for higher education as state governments cannot be relied upon to fund at the same levels they did in the past. Evidence indicates that there is private funding to be found. According to Summers (2006), "By several measures, well over $100-trillion will exchange hands in the next decades as baby-boomer wealth passes to the next generation" (p. 22). Thus, institutions of higher education in the
United States of America are seeking supplementary new sources of revenue from private donors just as one of the largest transfers of wealth is about to occur between generations.

This need to fund raise has not gone unnoticed by librarians. Clearly, "academic libraries have become active players in the fund-raising game" (Hoffman, Smith, & DiBona, 2002, p. 540). Latour (2003) found that while 96% of academic libraries were involved in fund raising efforts, only 61.3% of them were successful. The literature suggests that raising funds for a library is closely tied to marketing a library. Donors are unlikely to give to a library if they are unaware of it or if they do not think highly of it. Past experience strongly suggests that it is not enough for potential donors to simply “like” libraries. A general knowledge and appreciation of libraries often does not make libraries a high priority for donors. How can donors be made aware that a library is a worthwhile beneficiary of a gift? Part of the problem is simple competition. Weingand (1998) noted, "The library's present and potential customers have increasing numbers of choices and competitors for their time and support. Simple 'goodness' will no longer suffice" (p. 132). In the last two decades, higher education has lost substantial public funding as both state and federal governments have had to struggle with budget deficits (Legon, 2005). This has caused library administrators to look for ways to raise funds to support the library including new approaches such as targeting alumni of distance education programs (Casey & Lorenzen, 2010).

This need for fund raising for the academic library has required that libraries employ development officers. Surprisingly, very little research has been conducted on this group. This paucity of literature relating to library development efforts makes it difficult to know much about library development officers (Wedgeworth, 2000). This study helps fill in a need in learning how academic library development officers enter this career. This should help in the better recruitment and training of academic library development officers in the future.

Library Development Officers

Although the literature calls upon library leaders to personally learn fund raising skills (Browar & Streit, 2003; Dewey 2006), because of the demands upon leaders’ time it is likely that this solution to the problem will not prove particularly successful. An alternative response to the problem of having a lack of fund raising know how is to employ development officers in the library. Development officers in higher education work to raise funds for an institution. Most major academic units in a large university will have their own development officers who work to raise funds for a particular area of campus as well as the larger institution. Several authors (Dewey 2006; Miller 2002; Ruggerio & Zimmerman 2004) have called for academic
libraries to hire development officers. Many academic libraries have employed a development officer with experience in fund raising. Other libraries have chosen to train library staff in development skills (Eaton, 1971). There is a belief that it is easier to train library staff in development skills than it is to teach development staff library skills (Welch, 1985).

Some library development officers have been successful in helping to lead academic libraries in productive fund raising endeavors. This includes key development functions such as cultivating donors and encouraging them to give (Greenfield, 1999), collaborating with both internal and external teams (Miller, 2002), working with library staff to identify potential donors (Lerud & Dunn, 2001), and highlighting the success rather than needs of a library (Lowenstein, 2001). Library development officers have also been successful in connecting library fund raising to college athletics. Neal (1997) found, "affiliation with a central academic agency like the campus library can help to restore credibility and to legitimize the heavy investments in sports programs" (p. 59).

A variety of administrative structures exists for library development officers (Martin, 2000). The development officer may report to the library director (decentralized) or to the campus development office (centralized) or may work in some hybrid of these two systems. Martin warned that the centralized approach could be dangerous to libraries. “Development officers tend to focus on the sexier academic programs unless the university administration has made the library a specific high priority - a rather unusual circumstance" (p. 5). Nevertheless, Martin believed that the relationship of a library with the development office on campus was central to its success and that a library not supported by the development office would be hampered in fund raising efforts.

Downes (1984) argued that an organizational approach between centralized and decentralized was best. He believed that a library development officer should report directly to the library director and also be a part of the library administration. However, he also felt the library development officer should have an adjunct appointment in the central campus development office to represent the needs of the library to the larger development unit.

Regardless of the reporting relationship between library development officer and library director, fund raising is still ultimately the responsibility of the library director and the library management team. Mulhare (1991) stated, "It is the library's key leaders who raise funds by working in cooperation with the development officer...Asking for money is only one stage in a far more complex process involving prospect research, cultivation, solicitation, and recognition" (p. 117). The role of the library director remains central in the fund raising process regardless of
where the development officer reports in the campus hierarchy. It would seem then that the relationship that a library director has with the library development officer is equally important to the success of the process.

Not all academic libraries can afford to hire a full-time development officer. Some alternatives to this include giving development duties to a public relations officer or hiring an outside consultant to create a development plan and then having library staff implement it (Clark, 1986). Part-time development officers are also an option for libraries (Welch, 1985). Another staffing consideration involves assigning a library development officer a clerical assistant to help keep track of donors (Eaton, 1971). Regardless of how a library staffs a library development office, those libraries which have a larger development unit are more successful than those with fewer staff (Brittingham & Pezzullo, 1990). However, those libraries with larger development staffs also tend to be bigger and have more prestigious reputations which may account for some of the success.

**Methodology**

This qualitative study used a phenomenological approach based upon interviews with library development officers from academic institutions. Participants were identified by using the list of Association of Research Libraries (ARL) members. ARL is an association of 123 of the largest research libraries in the United States and Canada. Participants were identified via an e-mail sent to all ARL library development officers in academic libraries asking them to suggest the best development programs within ARL. Out of 123 ARL libraries, 80 were selected to receive the e-mail. The remaining 43 were not included as they were not academic libraries (being special or public libraries) or because it was impossible from their websites to determine who their development officer was at all or even if they had a development office. In addition, several institutions had vacancies in the development position resulting in their exclusion from the study.

A small number of programs frequently selected by ARL library development officers had their library development officer invited to participate in this study. Selected participants were contacted by e-mail with consent forms faxed to them in advance of interview dates. Nine were selected to participate. One individual declined due to a family emergency. Eight agreed to participate and they returned the signed forms via fax. The participants were interviewed over the phone. Conversations were recorded and notes maintained during the interview.
Later, the data from the interviews was transcribed into Microsoft Word files. These files were then entered into NVIVO 7, a qualitative research software, for analysis.

Participants were scheduled for one hour interviews. Creswell (1998) noted that after a period of time, participants will begin to repeat themselves. Thus, a small workable number of participants and a reasonable number of questions can still provide meaningful data for analysis.

Purposeful sampling is an overall sampling strategy that can be used in a qualitative study. In it, individuals are selected that provide the information needed to address the purpose of the study (Patton, 1990). LeCompte, Priessle, and Tesch (1993) argued that the overall sampling strategy used in qualitative research was criterion based selection because inclusion criteria to select individuals are developed by the researcher. Purposeful samples study people, organizations, communities, cultures, and events that are information-rich (Johnson & Christensen, 2004). The participants included in this study of academic library development officers were selected from a purposeful sample of information rich individuals who provided the information needed to address the research questions of this study. The researcher was able to determine what experiences these individuals have had as they provided in-depth descriptions of their perceptions of these experiences as is what is important in phenomenological research.

An individual, over the phone, in-depth interview was the main mode of data collection for this study. Lincoln and Guba (1985) suggested that the researcher is the best instrument "because it would be virtually impossible to devise a priori a nonhuman instrument with sufficient adaptability to encompass and adjust to the variety of realities that will be encountered" (p. 39).

Data Collection Procedures

Each participant was called at a mutually agreed upon time. The participants were reminded that participation was voluntary, that there were no adverse consequences for refusing to participate, and that his/her identity would remain confidential. The researcher requested permission to tape record the interview to ensure the participants' responses were accurately recorded for later analysis. A speaker phone was used to better facilitate the recording of the interviews.

A semi-structured interview protocol guided the conversation. It is important to recognize in the interview process not to constrain the participant's responses to
predetermined framework (Lancy, 1993). As such, participants in the study were allowed to stray from guiding questions although they were also asked all questions on the list. Patton (1992) wrote that truly open ended questions allow participants to respond on their own terms as the questions do "not presuppose which dimensions of feeling or thought will be salient for the interviewee" (p. 354). The questions for the interviews were all open ended and allowed the participants to answer in whatever manner they wished.

The study participants were asked a total of eleven questions relating to their perceptions of fund raising for academic libraries. Most of these did not deal with their prior training or their career paths. The responses to those questions are not considered in this paper but can be found in Lorenzen (2009). One relevant question was, “Describe for me your career path on your way to your current position.” Several probes relating to this were, “Have you always worked in higher education?,” “Did you specifically aspire to this position?,” and “What positions did you have that prepared you for this current position?” Participants were also asked what training they had had in the context of defining their roles as library development officers.

In addition to tape recording the interviews, the researcher kept field notes during the interview process. By necessity, this was selective as not everything could be written down. Schwandt (1997) wrote about inscription as "a particular kind of practice whereby data are generated, undertaken in the midst of other activity" (pp. 71-72). The written notes were used to record key points made by the participants in the study and used later to help in the transcription process.

Data Analysis

Data analysis is a process that transforms interview and document data into the interpretation of the findings. The analysis of the data collected began as the researcher recorded insights during the interviews. In addition, key points were marked and summarized immediately after each interview was concluded. An assistant was hired to transcribe the interviews and place the data in Microsoft Word documents. After each transcript was finished, the researcher checked for accuracy by listening to the tapes while reading the transcript (Patton, 2002). Transcripts were sent back to each participant for a member check to make sure that the transcripts were accurate as well.
After the transcription process was completed, the transcripts were uploaded into the NVIVO7 qualitative data program for coding and analysis which also allowed for easy organization and access to the data. On computer-assisted data analysis, Scwandt (1997) wrote:

Software tools are used for recording, storing, indexing, cross-indexing, coding, sorting and so on. They facilitate the management of large volumes of data and enable the analyst to locate, label (categorize or code), cross-reference, and compile various combinations of segments of textual data. (pp. 17-18)

Reading the transcripts, the researcher looked for recurring statements and coded them in the smallest interpretable units that relate to the research questions being studied (Lincoln & Guba, 1985; Merriam, 1998; Patton, 2002). As a result, the data were coded in sentences or paragraphs, with some sections being coded multiple times. As the initial themes emerged, they were compared and contrasted in the same interview and across different interviews (Merriam, 1998). This allowed for the process of horizontalization where the data were laid out, clustered in themes, and had irrelevant data removed leaving only the "horizons...of the phenomenon" (Moustakas, 1994, p. 97). A phenomenological reduction of the data was allowed for using the horizontalization method as the researcher was involved in reflecting on the data to understand "how the experience of the phenomenon came to be what it was" (Moustakas, p. 98).

The researcher looked for internal homogeneity to confirm that “the data that belong in a certain category hold together . . . in a meaningful way” (Patton, 2002, p. 465). In addition, the researcher was also was concerned about external heterogeneity to make sure that the “differences among categories . . . were clear” (Patton, 2002, p. 465). The data was also worked with "to affirm the meaningfulness and accuracy of the themes until the interview data were analyzed exhaustedly" (Chen, 2006, p. 62).

The coding and grouping were created by inductive inferences (Schwandt, 1997). Inductive coding is used when codes are developed from the text of interviews rather than in advance. Inductive inference is a process of exploring and identifying themes based on the raw data. Deductive inference involves testing and confirming the appropriateness and inclusiveness of the coding system (Patton, 2002). Deductive inferences were used after the coding was developed from an inductive process. The themes that developed to represent the data allowed for broader conceptual dimensions which then allowed for them to be incorporated into multiple themes. In the end, this allowed the researcher to make some meaningful conclusions.
The researcher sought to enter the contextual world of the participants in the study to better understand the phenomenon of academic library development officers’ perceptions of fund raising. To not allow personal biases to interfere, the coding schema was not developed until after all the interviews had been completed. The researcher read the transcripts and developed a coding schema based on the responses of the study participants.

Findings

It became quickly apparent that for the majority of participants in this study that becoming a library development officer was an accidental career decision. While many had training in development, only one participant had any training in library work. For a number of differing reasons, and from a variety of backgrounds, the study participants found themselves raising money for an academic library.

This lack of training was noted even when the preliminary e-mail survey results were examined. Many of the survey takers reported that they were new to library fund raising and were not sure how to successfully fund raise yet. A total of seven of the 25 respondents to the e-mail survey made notes in their responses that they were new to the field. It is probable that many of the ARL library development officers who did not participate in the e-mail survey may have felt the same way prompting them to decline the opportunity to respond.

Of the eight participants who were interviewed, only one had training as a librarian and had worked in libraries before taking up library fund raising. The other study participants had worked as a teacher, a community educator, a buyer for a retail chain, a small business owner, and in development work. Further, participant responses indicated that most of them had not planned to work in fund raising for academic libraries.

As one participant noted:

So no library experience and all fundraising experience. I also got an MBA, so I did an executive MBA while I was at one of my jobs. But I was not at all aspiring honestly. To do it in libraries, it just happened to be that way.

Another participant described in detail how she got into development work in a library:

There are several executive search firms here that focus on non-for-profits, and I was recruited by them to come talk to the library. And to be real honest with you, I didn’t
know why these people were calling me. They called several times over several months and I said I wouldn’t know how to raise money for a library. I don’t know anything about a library. I know about the university because I grew up on the south side of the city but I wasn’t really excited. Then I finally said okay I’ll go meet with the university librarian. Then the information he gave me about the library, I got so jazzed within twenty minutes I thought this is something I should probably pursue.

Although many of the study participants had experience in development work, many of them had not. For four of the eight study participants, their job in the library was their first job in fund raising. One participant, when asked if she had planned on working in higher education, retorted “never.” Other participants claimed they had been clueless about fund raising before getting their current position.

As one study participant related:

I said that I was new in town, that I was available part time or temporary and they hired me to be a reference librarian. It was just around the time that the dean of the library, wanted to raise money for the library. So he asked me if I was interested in the position. I didn’t know anything about fund raising, but he really wanted a librarian to do the fund raising for the library. He hired me and I started doing library development there.

Another participant noted:

I had no training in working in a library or raising money. I really learned on the job. I found my colleagues to be invaluable in learning what I needed to do. I also have learned a lot by going to conferences. I just figured this job out as I went.

In addition, not a single participant in this survey had aspired to work in library development. Several participants had goals to work in development and one had been a librarian prior to moving into library development work. Yet, not a single participant had anticipated or sought a job in library development. Working in library development was not a calculated career move but instead an accident of opportunity. One of the study participants even questioned the wisdom of the library when she interviewed for the library development position as she assumed she had no transferable skills.

Finally, even after getting a job in library development, formal training in development work was not always forthcoming. Five of the eight participants who were interviewed had little to no formal training in development work. Several of the participants said their only training
was done “on the job.” Even the participant who had worked fifteen years in library development stated he had no formal training and that he learned the job by doing it.

As noted by several authors (Martin, 1998; Winston & Dunkley, 2002), fund raising skills are not taught in library schools. Hence, it is not a surprise that librarians lacked the education and skills needed to successfully perform development work. However, it does seem surprising that many of the study participants lacked experience and education in both development and libraries. If libraries were seeking outsiders to manage the development process for them, why were they hiring individuals for these positions who have no better development background than members of the library staff? At least if a library insider was hired for the job, he would understand libraries. This seems puzzling. However, because the role is constructed with the emphasis on development, rather than libraries, it is probably more critical to have the people skills for relationships and fund raising. These skills likely develop better in a business school than a library.

Despite often not having a library background, the library development officers in the study did see mentoring library staff as part of their role. This was particularly true of the library director. Many of the study participants felt they needed to train library staff in development work if they themselves were going to be successful. The library staff did not appear to have sufficient skills in development of their own.

Two authors (Eaton, 1971; Welch, 1985) wrote articles arguing for the training of library staff in development practices and many of the study participants were actively engaged in it. Several of the study participants noted their role as a team captain for the library staff in fund raising and that library staff were often very good at it. However, it was also noted by participants that some library staff were suspicious of fund raising efforts.

Closely related to a lack of library staff development training was a concern about turnovers among the library staff that library development had to deal with. Many librarians were retiring and some of the participants felt this was starting to hinder their fund raising ability. One participant said, “You know a lot of our key librarians have been in place for 30 years, boards and our big donors have really developed a strong relationship. They really have not groomed any really strong people to follow them It’ll be a stranger coming in and that scares me.” Efforts are going to need to be made to train and educate library staff on fund raising to replace the knowledge being lost by retirements in the library.
The library development officers who participated in this study appeared to be successful in exercising leadership skills and in maintaining good donor relationships. However, the lack of training of themselves and library staff is still evident from their background stories and from their descriptions of many of the realities of their positions. Better training for both library development officers and for library staff could well make both more effective and allow for academic libraries to raise even larger sums of money. However, it may be difficult to identify who is best suited to doing this training.

Implications for Practice

There are several areas where the evidence from this study suggests implications for practice for academic library development officers. One of the stated purposes of this study was to help those working in the library development field find ways to be more successful in fund raising. All of the recommendations in this section are intended to accomplish this goal.

Library development officers would benefit greatly from increased professional development. The participants in this study as a whole had little experience in development work before starting in their current positions. They had even less experience in libraries. Professional development or training in both areas would help. It is a question to who should provide this training. While learning on the job is inevitable, this learning would probably be smoother if new library development officers were given frequent and early exposure to professional development training in development practices. Further, as knowledge of many principles of library science (especially collection development) are important for success, library development officers should be given more exposure to the relevant aspects of running a library as soon as they start in their positions. In addition, professional development training in both areas should continue throughout the career of the library development officer to keep individuals in these positions up-to-date on new trends in both fields.

Further, potential library directors looking to go into these positions in higher education should be carefully vetted for a knowledge of and interest in fund raising. If this is important to an institution, it should be a major criterion for evaluating candidates for library director positions. Library development officers need an interested and knowledgeable fund raiser in the library director’s position to be successful long term. Library director candidates lacking substantial knowledge in this area, but who are otherwise qualified, should only be hired if they
are willing to commit to professional development training in development work early in their tenure at an institution.

Also, library staff need better training in development practices as well. These individuals are the front line when donors visit a library and their knowledge is often key in getting donors committed to a project. Yet, they often lack even basic knowledge of good development practices. Not all library staff should be targeted for this. It makes no sense to train most catalogers or circulation clerks for example. However, librarians engaged in management or collection development should be trained in the basics on how to deal with and cultivate a potential donor who comes unexpectedly through the door. They should also be comfortable long-term in helping the library development officer to close deals if it impacts areas they work with directly.

One possible training solution would be to provide future librarians a course on fund raising in library school. If this became a mandated part of the curriculum for graduate schools of library and information science, eventually all library directors and a large number of library staff members would have exposure and basic training in fund raising skills. The American Library Association (ALA) is the accrediting body for library and information science programs in the United State and Canada. If ALA became convinced that this form of education was necessary, this could become a valuable part of the education of new librarians.

Conclusion

Libraries in higher education are increasingly seeking to expand their fund raising efforts to address declining financial support from their institutions of higher education. This will not be changing any time in the foreseeable future. The need for development officers who specialize in raising money for academic libraries will continue. The results of a qualitative study demonstrate that most academic library development officers do not set out to seek their current jobs and instead they arrive in the positions by happenstance and accident. This should be a cause for concern for those in library administration. Why are we not better preparing those in the fields of librarianship or fund raising to work in development work for academic libraries? In addition, since it is clear that most library staff (in addition to academic library development officers) are also lacking needed fund raising skills, remedial instruction in these areas should be implemented when it is possible in order to allow for increased fund raising success.

Abstract

The status of English as the fastest growing language in the world is uncontested. In today’s global economy English is used widely and almost exclusively as the language of international trade, economy and politics (Edwards, 2004). Non-English speaking countries which have not had a previous anglo affiliation (e.g., Brazil, Japan, Egypt, Italy) are now facing the growing hegemony of the English language. In response to this global phenomenon, countries have a difficult choice: try to preserve their own language, culture and history and not participate in the growing impact of English or become involved in the spread of English as the lingua franca of the economic world. 25% of the world’s population uses English for some purposes (Kachru & Smith, 2008) and this percentage is increasing. English has gained the status of the language of ‘global communication’ (de Swann, 2001) and the ‘language of the world market’ or ‘commercial lingua franca’ (Brutt-Griffler, 2002). This paper examines the growing impact of English in one of these countries i.e., Italy and the Italian education system. The analysis focuses on issues of educational policy and practice and addresses discrepancies that exist across these areas with regards to English proficiency and use. The first part of the paper examines the education system in Italy and foreign language policy initiatives that impact language policy and practice in Italy. The second part of the paper reports on findings of a survey completed by twenty nine high school teachers and professors of English on their perceptions on the role of English in the Italian
education system and the society at large. While this study focuses on the situation in Italy, there are overlapping themes and complexities with other non English-speaking countries that will be discussed.

The role of the European inspections in the European educational space—echoes from Portugal regarding the assessment of schools

Ana Márcia Pires¹
Estela Costa²

ABSTRACT

This paper is an approach to the construction of a European educational space (Nóvoa & Lawn, 2002), which is due to new modes of regulation in education, that is, different government perspectives that support the development of educational policies in the European Union (EU). The policy under consideration is the external evaluation of public schools (both basic and secondary schools) carried out since 2005 by the Portuguese General Inspectorate of Education (IGE) - a branch of the Ministry of Education. Our aim is to explore, more specifically, how concepts and policies get ‘contaminated’ by the European models (Barroso, 2003c, 2006a, 2006b). We are also interested in understanding how the regulation is outlined by the Inspectorate of Education in some European countries, including Ireland, England, Wales, Scotland, France, the Netherlands and Belgium, referenced as a sample. This paper owes to the phenomena associated to “travelling policies” (Alexiadou & Jones, 2001), to “policy transfer” (Dolowitz, Hulme, Nellis & O’Neill, 2000; Stone, 2001), and to “policy borrowing” (Halpin & Troyna, 1995; Whitty & Edwards, 1998; Walford, 2001; Phillips & Ochs, 2003, 2004; Steiner-Khamsi, 2004).

We must stress that our perspective on the flows and the influences of the international movement of policies is free from simplistic and deterministic logics (see Lingard & Rizvi, 2000). From our point of view, the internationalization of ideas comes along with national reflections on how these ideas are materialized (see Popkewitz, 1996: 47). At the local and regional levels, the regulation of educational systems can be characterized as a growing "multi-regulation" - that comes from a growing number of sources, an increasing variety of tools and resources (such as assessment, monitoring and sharing best practices) - which mingle with modes that exist in a more traditional, bureaucratic regulation (see Afonso & Costa, 2010, in press). Thus, each country has its own overview about the structures and effects of globalization, which do not occur simultaneously, nor in the same way in different 'nation states' (see Lingard & Rizvi, 2000: 210).

1. The importance of evaluation in the context of the European Union

Since the last decades of the twentieth century assessment has become, globally, an institutional obligation in most developed countries. The Anglo-Saxon countries were the first to apply instruments for measuring the efficiency and quality, and were rapidly followed by large international organizations. Nowadays, the State is questioned about its traditional role, since the emergence of the Anglo-Saxon accountability, whose benchmarking and best practices permanently transform the concepts related to educational administration and increasingly influence management and governance.

On the 1\textsuperscript{st} Conference on the Quality of Public Administrations in the EU, held during the Portuguese Presidency, in Lisbon, in 2000, a set of proposals were presented for the action program known as the "Lisbon Strategy". At that time, the European Council had the objective that the education and training system of the EU would become a global reference by 2010. The Lisbon Summit (2000) has characterized the Open Method of Coordination (OMC) as a means of disseminating best practices and of acquiring a greater convergence. Opposite to the classic process of European decision, the OMC consists in the establishment of guidelines for the EU Member States. It is based on a decentralized process of political construction among national governments, municipalities and civil society. It undertakes to set short-term objectives. The established policy is evaluated based on indicators and compared among the Member States. The process leads, in theory, to an emulation among Member States and it aims to develop good governance practices.

The modernization and improvement in public services has been an issue expressed at different institutional levels and the object of recommendations emanated from the Parliament and the European Council. The objective is to modify and streamline public management systems, so that the quality of services is reflected socially in the form of a society oriented to a knowledge-based economy and, accordingly, demanding a larger commitment from educational systems and subsystems. We have entered the field of principles of quality improvement, prospecting education and training as priorities for the competitiveness of economies. At the summit in 2001 were issued recommendations that strengthen the fact that the "quality of school education must be assured at all levels an in all areas of education, regardless of any differences in educational objectives, methods and needs, and regardless of school excellence and rankings where they exist" (n\textsuperscript{e} 2 e 3). It’s emphasized the need:

"to develop external evaluation in order to provide methodological support for school self-evaluation and to provide an outside view of the school encouraging a process of continuous improvement and taking care that this is not restricted to purely administrative checks" (1.f.) and "encouraging and supporting, where appropriate, the involvement of school stakeholders, including teachers, pupils, management, parents and experts, in the process of external and self-evaluation in schools in order to promote shared responsibility for the improvement of schools" (European Parliament and Council, 2001).
These supranational procedures require forms of integration, incorporation and adaptation, focused “on the mediating actors who move between centre and locality” (Nóvoa & Lawn, 2002: 4), stressing the existence of several levels of regulation in what educational politics are concerned. Those levels are supranational, national and local and involve different institutions, actors and sources of regulation (Barroso, 2003, 2005, 2006b, 2009).

The governance of Europe can be “conceptualized as a multilevel system of governance” (Nóvoa & Lawn, 2002: 5), stimulating European cooperation and the exchange of transnational experiences to identify and disseminate effective methods of quality assessment (n.° 10). In most European countries, educational policies have focused on the problem of change in education, either global, institutional reforms, or according to a logic of promotion of innovation by identifying and disseminating best practices. With the phenomenon of globalization (and Europeanization), the production of global frameworks for interpreting the world tends to escape the national State, the borders and constraints of governments. We may call it "transnational regulation", while the national regulation will be a 'low intensity globalization' (Barroso, 2003). João Barroso (2003, 2005) refers to hybrid modes of institutional regulation and the crisis of the "State - educator", passed over by the State - market. This is clear in the proliferation of devices for evaluation and in the transfer of a control based on standards/rules for monitoring based on the results. The crisis of the State - Welfare is revealed and it is replaced by a State - evaluator, which expresses itself in particular in promoting a competitive ethos through external evaluation (see Afonso, 2001).

2. Repercussions in the Portuguese context

The influence of the EU on the orientation and the legitimization of specific policy measures in the Member States allows us to capture a set of modifications, transnational influences and interdependencies and, ultimately, contributes to the progressive structuring of a common European area of education.

In Portugal, the pressure of the external evaluation is propagated indirectly and subtly, through this new soft way of governance of the EU. This is visible in the restoration of national exams for secondary school conclusion and the creation of national benchmarking tests in the last year of each cycle of basic education (4th, 6th and 9th grades). However, since the academic year of 2004/2005, for the 9th grade, aferition tests were replaced by national tests for Portuguese Language and Mathematics. This focus on the evaluation of school performance led to the creation of the Educational Evaluation Office (GAVE), a central bureau of the Ministry of Education with functions of planning, coordination, preparation and control instruments for external assessment of learning as well as supervision of the accurateness of the tests. We also highlight a device for social control of the school, since it has been assumed as a resource increasingly used for the preparation and publishing of ordered lists of schools, based on the results obtained by their students in national exams - the rankings. Moreover, the pressure of the external evaluation is also expressed through international programs of assessment of student performance, such as the Program for International Student Achievement (PISA), conducted by the Organization for Economic Co-operation and Development (OCDE). The disclosure of the results into a logic of hierarchy of the participating countries feeds a media
debate about “quality education”, usually developed in a logic of “common sense” and not related to the education professionals’ “know how”, or even with expressed disdain for such “know how” (see Afonso & Costa, 2007; Costa & Afonso, 2009, Afonso & Costa, 2009 and Carvalho, Afonso & Costa, 2009).

3. The policy of external evaluation of schools in Portugal: the normative framework

From the normative point of view, this new paradigm is reflected in the Law 31/2002, article 3rd, which aims:

“the improvement of the quality of the educational system, its organization and its levels of efficiency and effectiveness, to support the formulation and development of policies for education and training and ensure the availability of that management information system that (paragraph a), article 3rd, Decree-Law 31/2002).

Through self-evaluation processes and external evaluation procedures, the external evaluation is seen as “a central instrument of policy education” (art. 3rd), and the relation among the micro, meso and macro levels of the educational systems is underlined. Article 9th presents the first indicators for the evaluation of the parameters of schools to take into account. In Articles 14th and 15th general and specific objectives of the evaluation are set, as weel as the dissemination of its results (Article 16th).

The logic that rules is that of for monitoring and steering. Its focus is on the production of relevant information about the quality of performances (see Afonso, 1999). According to Ball (2004: 1116), this makes “the monitoring role of the state” easier, because it governs in a distant way – ‘governing without government […] and the work with the educational institutions’ knowledge (knowledge-work) becomes ‘results’, ‘performance levels’, ‘quality forms’”.

4. The external assessment of schools in Portugal: European influences

“Post-bureaucratic” instruments, such as the assessment of schools, increasingly focus on self-evaluation and autonomy for best practices to be adopted, while rule compliance instruments tend to lose their traditional prominence as key elements in policy making. This is built up through scientific knowledge, selected mainly from school effectiveness and school improvement literature, as well as from the inspectors’, principals’ and teachers’ professional know-how. There is the option for exterior knowledge, of an international nature (OECD, European Education Inspections, the Permanent International Conference of General and National Inspections of Education, etc). It is clear, in this process, the selection of certain kinds of products that insist on ‘quality’, ‘accountability’, ‘benchmarking’ and ‘good practices’ and its common reference to the new conceptions of the public administration (new public management), “educational modernization”. The references and sources of inspiration are clearly outlined with reference to models used in the Education Inspections of European countries.
IGE’s participation in SICI, and the models used in European countries (e.g. Scotland and Northern Ireland), as well as the investigation coming from different countries, are quite relevant. We come to examine those contributions.

4.1 Contributions from European inspections

It is not strange in Europe the change of the modes of regulation of public policies regarding education. Due to social, political and economic modernization, in the last two decades, the States felt the need to create and/or strengthen inspection systems that would enable them to monitor the practices of the units that comprise them. Mainly from the nineties onward, there was an increase of the inspecting action in several European countries in what the public sector is concerned.

The investigation that has been developed within the public policies at the level of the Inspectorate of Education allows us to recognize, on the one hand, that the international debate on evaluation of schools has become central; and, on the other hand, either due to managing reasons, or to increase autonomy and decentralization, many EU countries seek to implement a system of self-evaluation of schools. This has to do with the accountability, with the consequent restructuring of the external inspection (see Meuret & Morlaix, 2003; Devos & Verhoeven, 2003; McNamara & O’Hara, 2006; Perryman, 2006; Plowright, 2007; Wolf & Janssens, 2007).

There seems to be a growing consensus: some forms of assessment can play a significant role in the efforts made to improve schools, as well as providing a reasonable level of public accountability, that prevails in democratic societies. Questions remain about how the balance can be achieved between these objectives. The framework provided by several authors illustrates convergent ideas, doubts and questions more or less common, based on the experience that the implementation of new policies has been offering. McNamara e O’Hara (2006) state that Ireland has been trying to develop an assessment of schools; this has been done by balancing internal autonomy and accountability with external monitoring and inspection. The investigators refer to the progress that two evaluation projects provided, as well as their outcomes and consequences. The first, entitled Whole School Evaluation (WSE) was put into practice in the late nineties in 35 schools and it was completed in 1999. In 2003, comes the publication of a new framework for assessing schools, based on the WSE, and a second project called Looking at Our School (LAOS). The first evaluation of schools within this framework took place in 2004 and it highlights the emergence of an evaluative framework in a complex educational environment, in which teachers are highly resistant to what they consider to be interference to their professional autonomy.

The evolution from the WSE to LAOS shows, however, a clear progression from an external monitoring to a self-evaluation (McNamara & O’Hara, 2006: 569). The school managers who participated in the projects stated that any form of external assessment was, by its nature, superficial and that it underestimated the achievements of schools in non-academic aspects. This raised many concerns among teachers who, by contrast, considered self-
evaluation without external monitoring a great success⁴ (see McNamara & O’Hara, 2006: 570). However, the authors point out drawbacks of this process: many aspects are not taken into account by the school, because the project does not provide guidelines regarding the criteria and research methods, and schools aren't used to collecting and analyzing data in order to gather evidence on which to base their opinions; the concept of self-evaluation wasn't assimilated yet and there is no development plan for the school based on the results. Among the schools surveyed, there is also a profound skepticism regarding the intervention by the Department of Education and Science (DES) in cases where the assessment has indicated problems.

Thus, on the one hand, it would be useful that self-evaluation would be accompanied by more guidelines; on the other hand, it will take some time for a new structure to be assimilated. Finally, there are tools to be developed to improve the practices of schools whose self-assessment is not good. Plowright (2007) also wonders about the process of self-assessment of schools. The self-management of schools led to a greater pressure to take more responsibility for their development, progress, monitoring and review of educational provision. Aware of this fact in England, he questions the development of a school culture. One of his central questions is whether the school is developing an organizational culture of learning when it gets prepared for an external inspection through self-evaluation. Other questions that concern the author have to do with the inspection process, i.e., whether it contributes positively to school improvement, something also shared by Wolf and Janssens (2007). He also reflects on whether inspections can actually help schools to improve their ability to carry out self-evaluation; whether schools have the capacity to get involved in identifying their own problems honestly and rigorously. This last question meets Perryman (2006). Using the metaphor of the "panoptic gaze" to characterize the role of the Inspectorate in England and Wales, he launches a new question: the assessment the inspection makes is based on the self-assessment of schools, so, are the changes really assimilated by the school? (Perryman, 2007: 159).

Ehren and Visscher (2006) focus on a theory of school improvement, through the Inspectorate, in the Netherlands. They describe two types of inspections according to two different scenarios. Schools with a weak innovation capacity and few external impulses should be helped by a more directive approach in which the inspector clearly points out the strengths and weaknesses of the school, the causes of this underperformance and potential ways of improvement, pressuring it in order to commit formally to develop an improvement plan. Instead, a school with high innovation capacity and strong external impulses should have a more reserved approach and inspectors would only stress their strengths and weaknesses.

Wolf and Janssens (2007) say that, in the Netherlands, new forms of accountability to improve school performance were introduced. These reforms were accompanied with discussions on the advantages and disadvantages of different mechanisms of external control in education, as well as an attempt to balance the different systems (379).

Meuret and Morlaix (2003) state that schools in France are encouraged to develop an "evaluation culture". Although schools are given indicators that assist them in this process, these tools are used by only about 5% of schools. Teachers say this happens because they

---

⁴ The replacement of the term "assessment criteria" for "topics for self-evaluation" made the process more acceptable in schools. The experience was rated as very positive, increasing cohesion among teachers, and the work of inspection teams was ranked favorably.
lack the time and expertise to develop any kind of evaluation. Self-assessment is not popular, although there is a greater receptivity to this process than the external assessment itself. Although the investigators consider that there isn’t evidence enough that self-evaluation can increase efficiency and improve the school, it seems to be useful. However, it is more praised by politicians than effectively used (54).

Devos e Verhoeven (2003) report that, in Belgium, policy makers feared that a greater autonomy would lead to a deterioration of the quality of schools, hence the need for the verification of compliance with the objectives outlined. Inspectors seek to convince the school that the quality is not only reached by an external monitoring, but also through self-evaluation, and try to promote a culture of self-evaluation that the authors compare to that of the Ofsted (id.: 403).

The need to follow European trends is common to the Member States in general and to Portugal in particular. Indeed, the schools’ self-assessment has come to occupy the political agenda in different countries. There’s the belief that it may contribute to a significant improvement in schools’ provision, assuming more responsibility in the identification and resolution of their issues. Investigation indicates that this is an ongoing process and there are positive and negative indicators. Equally striking is some resistance of the schools, in implementing self-assessment, in spite of, as we have seen, in the cases of Ireland and France, useful tools for the schools to monitor in this process having been provided. This resistance appears to be associated with the reluctance to change itself, although self-assessment has been better received than the external assessment alone. For some investigators, it is clearer that self-evaluation can help to improve the performance of schools, but doubts remain about the role of the Inspectorate in this process.

4.2. Regarding the main sources and references: The Scottish and Irish influences

In 2006, in Portugal, the 17th Government launched a new experimental external assessment of schools Programme, coordinated by a School Evaluation Working Group, created under the Bureau of the Ministry of Education. The “School evaluation working group” (GTAE) was created within the Ministries of Finances and Public Administration and the Ministry of Education, for a year work. The main objective was to launch a national evaluation programme of non-higher education teaching establishments, with the aim to improve the quality of education and to create conditions to intensify schools autonomy. The work of this group, which was concluded in December 2006, conducted to the ministerial decision to proceed with the External Evaluation of Schools and to hand over the responsibility for its accomplishment to the IGE (see Barroso et al., 2007, December).

Several different sources of information inspired the Portuguese policy of external evaluation. There are two models worth mentioning that are used in the UK. The Scottish model is a special case of transfer of explicit knowledge among the various member states, including Portugal:
“because of the enormous popularity it enjoys in Europe and the educative dynamic that has promoted by giving schools the responsibility and the tools to question their own quality” (idem, ib: 9).

The handbook of self-assessment of the Scottish Inspection - “How good is our school” (2002, 2005) – is essential due to the clarity of the concepts and the formative nature of the model and the description of the evaluation criteria. “Exploring Excellence” is a more elaborate document and it introduces elements that were adapted to the Portuguese context, by making easier the internal benchmarking and by bringing a larger demand in the processes of comparability.

Secondly, we also stress the Northern Ireland evaluation model, whose self-evaluation model is noteworthy because it is part:

“of a national strategy to improve education, which includes the evaluation of schools, assessment and improvement of the curriculum and educational services at the different educational levels, improvement of the quality of initial and continuous teacher training and an overhaul of the inspection methods so as to help guarantee quality.”(idem, ib.)

Finally, we underline the project ESSE (Effective School Self-Evaluation) created by SICI, which aimed to evaluate the consistency of self-assessment of schools and was also adopted in Portugal.

4.2.1 IGE’s participation in SICI

IGE’s participation in the activities of the Standing International Conference of Inspectorates of Education (SICI) is an example of institutional and international cooperation. This organisation was established in 1995 and brings together inspection services from a large number of European countries, and its activities are focused on the exchange of experiences, development of partnership projects and the organisation of scientific and professional events for the discussion of inspection methodologies and the continuous training of inspectors. The importance of this institutional relationship is reinforced by the General-Inspector in the introduction to the Activities Plan for 2007, emphasising the International Conference of Lisbon to be held in November, in the context of the Portuguese Presidency of the European Union, as well as the organisation of the workshop “Inspecting for Equality in Early Childhood Services” promoted by OFSTED. The aims of this activity were based on their importance in terms of knowledge circulation: to participate in the activities of SICI as a way of exchanging information, models and perspectives that may benefit the configuration and performance of IGE; to gather information that will contribute towards the improvement of the profile of the inspectors, in relation to the new challenges they face (Barroso, Carvalho, Fontoura, Afonso, & Costa, 2007).

As a corollary of perspectives provided by SICI members, we stress the following items that influenced the Portuguese context: the revision of the inspecting mission; the redefinition of the role of inspectors; the monitoring and methodological support for self-assessment of schools and the increasing of schools autonomy (see Lume, 2004: 61).
SICI has contributed to the debate of education in Europe and the awareness that education is evolving rapidly, leading to new demands and expectations regarding the evaluation of its quality. There have been developments in educational systems, namely the trend to emphasize self-assessment of schools crossed with external evaluation, arising out of the propensity, at the European level, to increase school autonomy, leaving up to them the decision of their own modus operandi. There is also the need to take into account the individual characteristics and ambitions of the school organization and the learning that takes place outside the formal curriculum. Students, politicians and the public need assurance regarding the quality and the performance of schools. Technology is also changing the world quite rapidly, including the ways people learn, communicate and share information. Therefore there should be an effort to modernize the tools of inspection, because the traditional fail to achieve the new goals. In its technical and scientific discourse, SICI also stresses that, in the European context, members of the EU set ambitious goals for their economies, societies and education systems to improve the quality and efficiency of education and facilitate access for all to lifelong learning, opening up education systems worldwide.

In short, despite the differences that separate education systems in Europe, it seems there is a trend towards convergence in European education policies emerging in the last twenty years, resulting in a growing autonomy of schools, even if controlled by several methods such as assessment and monitoring practices; a trend towards decentralization of educational systems; the growth of the external evaluation at the level of education authorities and intermediate level schools through external evaluation and self-evaluation; and legitimization and promotion at different stages of a larger school choice by parents. These changes in modes of regulation seem to be due to political and economic factors, such as changing economic contexts that conduct the school system to a raise of the level of skills, to be more efficient and to adapt education to the needs of the labor market; the policy demands for spending on education are more effective and efficient, with a reduction of financial resources in some countries, cultural change in favor of a greater individualization of education; and finally, globalization and international comparison of school systems have a greater influence on national and local policies through the dissemination of 'governance models', as well as management or educational models.

Conclusion

The transnational policies emanated from European institutions are 'itinerant policies', or 'vernacular for globalisation' (van Zanten, 2000). Local understanding of possible educational futures (Vongalis & Seddon, 2001: 1), influence policy and national and local educational practices, creating an environment of 'performativity' in school assessment (see Lyotard, 1984, p.xxiv and Ball, 2004). Along with accountability, that assumes a central role rooted in the culture and practices of the public sector. Thus, we refer to a 'performance culture' related to the economic power, which is associated with the development of the comparisons of results, construction of standards and quality indicators.

In terms of schools assessment, the change in the new modes of regulation of education is caused by progressive focusing on audit programs and external evaluation rather than on
devices of a compulsory nature. Here, it must be stressed the importance of the integration of IGE in SICI, and the redefinition of its mission in the late '90s, both in the organization's structure and its programs and projects (see Lume, 2004: 61). The institution that conducts external assessment in Portugal - IGE - has followed the evolution of new modes of regulation. Policies of external assessment also come from a recycling process of the inspection itself. Moreover, there was a key role played by a former General-Inspector, who had the knowledge about school assessment and came to influence indirectly the model of external assessment in Portugal.

As stated, in the European education area there is a clear trend of an evolution of "hard" modes of regulation for a 'soft', more persuasive regulation. In Portugal, the political-educational setting, in what the evaluation of non-higher education institutions is concerned, is based on the weakening of logical rules of inquisition and bets on the voluntary membership of actors, their involvement and collaborative work. Legal traditional penalties of the classical instruments (hard regulation) give rise to indirect modes of regulation, based on social sanctions and the socialization processes that are used as powerful mechanisms of compliance. It is a transnational nature of regulation that contributes to the gradual framing of a European educational space, which is under construction and that is based on instruments that seek ideational power (see Marcussen, 2004).

The External Assessment of Schools in the framework of the evolution of the types of regulation of educational politics in Portugal

Ana Márcia Pires

ABSTRACT

Part of this paper was presented as a report at the end of a training year in the Portuguese General Inspectorate of Education - Inspecção-Geral da Educação (IGE). Our objective is to provide an overview of how IGE’s activity “External Assessment of Schools” (EAS) is structured, and the relevance that this educational inspection activity has in the framework of the evolution of the regulation forms in this public institution.

Our initial process is to design a theoretical framework in which we discuss the importance of regulation and modes of regulation in public policies. Then we explain what aims IGE’s programmes and activities have. Afterwards, we bring out the assessment of schools: a diachronic perspective, the framework of EAS and how it is developed. Finally, we give a critical perspective on how this activity is structured.

We believe this work may offer a contribution for a deeper reflection on the EAS, as well as of the evolution of IGE’s mission.

1 Inspector of the Portuguese Inspectorate of Education and PhD student in Educational Administration and Politics, Education Institute, University of Lisbon, Portugal.
1. Theoretical framework

“There can be little human activity that is not regulated in some way, by laws, norms, or simply by the action of others. (...) changes in modes of regulation are taking place at the same time as a paradigm shift in the social sciences themselves” (AA.VV, Orientation 3: specifications, 2007: 1).

In this first instance, our purpose is to discuss, in the theoretical field of public policy analysis, relevant concepts both for the construction of this report, and also to the study of the relationship between knowledge, policy making and public action in education, mirrored in IGE’s activity, External Assessment of Schools.

1.1 Public policies – the emergence of new concepts

In a game in which science influences social events and they influence science, enabling transformations, the dynamics of phenomena opens up new horizons over reality, so that the perspective modifies itself, evolves and therefore allows us to look at through with a different lens. So, we look at public policies (intervention of an authority over a sector of society) from a different angle, emphasizing new concepts in the translation of reality. By giving visibility to local (public and private) actors, in a complex interdependence of different levels, and not restricting public policy to the State, the linear and hierarchical vision breaks up, and is transformed into a horizontal and circular one.

The concept “public action” reflects the complexity of this process\(^2\). Lascoumes and Le Galès (2007: 13) propose a pentagonal observation of public policies where actors, referentials, institutions, processes and outcomes are included and, through this analysis we watch a rupture with the State and a shift from a political to a social regulation. The actor, individually or collectively, takes part in decision making, covering up two dimensions: one that has to do with the actor’s contribution in the political process; and another related to the impact the contribution has over the outcome (Grossman, 2004: 23). Actors confront themselves according to their interests, mobilizing their own representations and therefore emerging another concept – the referential.

States need to change their regulation processes, so that their policies become more effective. On the one hand, they have to develop new competences and, on the other hand, they search for ways of legitimation of their action.

In this process, knowledge - understood as scientific knowledge - has a central role (Pons e Van Zanten, 2007). The educational research has demonstrated that knowledge has become a key resource for States, since it allows a better regulation.

\(^2\) “The approaches all seek to avoid limiting public policy to merely the moment when the decision is taken or to the State (...). In order to reflect the complexities involved, one branch of French-speaking literature has coined the term public action, thus indicating a break with the traditional public policy approaches” (Delvaux, 2007: 60).
1.2 The concept of regulation in the process of reconfiguration of the State

The study and analysis of public policies has pointed out the relevance of the concept of regulation in the processes of redefining the role of the State and, consequently, in changing their ways of intervening in government, which implies changes in the forms of guidance, coordination and monitoring of educational systems (Dutercq e Van Zanten, 2001: 5; Mangez, 2001: 81; Vandenberghe, 2001: 111; Barroso, 2006a: 11; Maroy, 2006). This happens because, on the one hand, the State tries to hold a central role in the definition, management and implementation of public policies and, on the other hand, the State knows that role has to be shared with other agencies and actors (Barroso, 2006a: 11). Thus, we have been witnessing a replacement of the idea of an omniscient State3, that is able of enforcing a legitimate global order, for a more complex conception of public action, in which one understands the existence of limits on the role of the State over the multitude of actors and agencies (Muller, 2000).

In this context, regulation means, not only the production of rules of guidance and conduction of actors, but also the ownership of those rules and their transformation by the actors themselves (Maroy and Dupriez 2000; Muller, 2000; Reynaud, 1993 and 2003). In the first case, it is a normative, institutional and control regulation; while in the second case, it’s a situational, active and independent regulation (Barroso, 2006a: 12-13; Dutercq and Van Zanten, 2001: 6).

In this process of recomposition of the role of the State, school-based management is accompanied by assessment and/or external regulation, through which the State develops tools for remote control, sometimes based on the results achieved by schools and students (Vandenberghe, 2001: 113). The creation of contracts between the State and the schools at the level of school based management, and the development of evaluation through results, is therefore a possible alternative to regulation in the classical hierarchical sense.

From what we've seen, regulation is always an expression of power, through which an actor seeks to structure other actors' behavior. The resistence to regulation may be collective and organized, coming from associations, trade unions and lobbies, conducting to negotiation in different stages of the political process, involving changes in politics’ content, in the regulation instruments and in their ways of implementation, as well as results.

Opposed to a top-down, vertical regulation model, the evolution of modes of regulation suggests a bottom-up, horizontal perspective, in which policies encroach contexts where they mingle with previous policies, structures, traditions and habits, and consequently, lead to several forms of hybridization. Hence policies can create different practices in different national and local contexts.

Rather than the application of knowledge, we believe that regulation has to do with the processing and production of knowledge, consisting of a process in which perception and practices of both the regulator and the regulated are developed through negotiation and

---

3 "Tout au long du XXe siècle, le mode de régulation scolaire le plus répandu a été celui alliant, sur le plan formel, financement et production par l'État sur le modèle hiérarchique ou bureaucratique (…). Sur le plan plus informel, ce mode de régulation était en outre largement soutenu par (…) un principe d'autorité, soit un principe d'obéissance dans un cadre hiérarchisé dont chacun – celui qui ordonne et celui qui obéit – reconnait a priori la justice et la légitimité" (Vandenberghe, 2001: 112).
confrontation which can produce unexpected results, because it is linked to different contexts and systems of action. Thus, new interfaces between the processes of social construction of knowledge and policies are being created, emerging a kaleidoscopic, hybrid regulation according to the principles, actors, functions and procedures that it aggregates.

A reason for this mutation seems to be globalization, that, in a sense, limits the ability of the States (Dutercq e Van Zanten, 2001: 7); because they do not define their choices independently (Giddens, 1999).

1.3 Modes of regulation

The reflection on the vital role of globalization brings us to the different modes of regulation: transnational, national and microregulation.

As it suggests, transnational regulation involves the alliance of the national overview with an international one. Barroso (2006) defines it as “the set of rules, discourses and instruments (...) that are produced and circulate in the forums of international consultation and decision, in education, which are taken by politicians, officials and national experts as ‘obligation’ or ‘legitimacy’ to propose or adopt decisions for the functioning of the education system” (45).

Thus, reliance on foreign policy seems to have the function, on the one hand, to justify and legitimize political decisions internal to a country; on the other hand, such loans may lead to policy measures intended to change modes of regulation of public education, serving as criteria for modernization, bureaucracy and a way of fighting the inefficiency of the State.

Barroso (2006) defines national regulation, comparing the concept to the institutional regulation: “how public authorities (...) carry on coordination, control and influence over the education system, directing, through rules, injunctions and constraints the context of the action of different actors and their results” (50). However, through political and social changes, the emergence of a transnational regulation, and new modes of regulation, led to a shift in the modes of State regulation.

The local microregulation "refers to a complex set of strategies, negotiations and actions of various actors, whereby the rules, injunctions and constraints of national regulation are (re)adjusted locally, often unintentionally" and they can be specified as the process of coordinating the actions of actors on the basis that results from the confrontation, interaction, negotiation or compromise of different interests, logics, rationales and strategies" (Barroso, 2006: 56-57).

Metaregulation is a coordination of coordinations that the State can continue to ensure, not being the only holder of the legitimacy of political justification. Thus the concept of regulation arises, a space, context or territory where they meet and illustrate the various modes of regulation, which also includes several actors of mediation, crossing several regulatory streams, a sort of "knots of the network".

So stated, the concepts discussed appear to be central in the analysis on the IGE's activity External Assessment of Schools we intend to discuss.
2. IGE’s programmes, activities and their aims

IGE is a public inspectorate organization that belongs to the Ministry of Education and that controls the preschool, basic and secondary education in Portugal. It works to ensure quality, equity and justice in education. Inspectors monitor, control, evaluate and audit public and private schools, in order to guarantee social reliance on education, and to inform policy makers as well as the public opinion. IGE develops different programmes and activities, with distinct aims:

<table>
<thead>
<tr>
<th>Program</th>
<th>Activities</th>
<th>Aims</th>

3. Schools' assessment. Concepts, functions and references

“All assessment is a perpetual work in progress.”
Linda Suske

In the last two decades, due to social, political and economic reasons, the States felt the need to create and/or strengthen their inspection systems, so that they could monitor the public sector. There seems to be a growing consensus: some forms of assessment may have a significant role in what schools’ improvement is concerned and may provide a fair level of accountability as well. Scientific investigation has assigned relevance to school inspection, assessment, quality and self evaluation, essential in the current educational decisions.

The school assessment refers to a process of determining the merit and value of a school through collecting and analyzing information and so it’s a monitoring mechanism of actions to check the levels of quality of schools.

Law No 31/2002, 20th December, Article 4th, No 1, calls for an evaluation design that aims, from a diagnostic analysis, to provide the creation of terms of reference for higher levels of requirement; and to identify best organizational practices, which are examples of recognition, appreciation, encouragement and promotion of education.

Thus, through accountability, external assessment provides information to policy makers and the public about the state of the art of the educational system, as well as on the quality of schools and education that they offer. On the other hand, governments and inspections see external assessment as a contribution to the improvement of schools, particularly through the assessment reports that provide information about the strenghts and weaknesses of schools and how the development of their self-evaluation is promoted.

3.1 Schools’ assessment in Portugal: a diachronic perspective

As there is a need for improvement of education and of the quality of schools, the importance of adequate evaluation mechanisms is also recognized.

National experience in terms of school assessment is already substantial and it has been conducted, over the past sixteen years, through projects led by the Ministry of Education, or to which schools have joined willingly. Among the projects of schools evaluated under IGE’s responsibility, which brought gains to the system, are included the Assessment of Global Functioniong of Schools (1993-1995); Pedagogical Auditing (1997); Secondary Schools Assessment (1998-1999); Integrated Assessment of Schools (1999-2002); and Benchmarking of Self-Evaluation Effectiveness (2004-2006).

Such projects, inserted into the mission of control and support to the development of quality education, triggered the implementation of new guidelines on the development of the inspection activity, coming from a re-estabilishment of the educational politics. They were also a device for measuring the performance of school organizations, whose aims were focused on an
assessment of the quality of service of education and in the development of schools, a culture of self-assessment and reflection on teaching practices.

3.2 Legal framework of the activity

Law No 31/2002, 2th of December, approves the assessment system of schools and defines the general guidance for self-evaluation and for external assessment of schools. On article No 3, the assessment system is seen as a central instrument for definition of the educative policies. The aims are also expressed, based on the promotion of the improvement of the quality of the education system, its organization and its levels of efficiency and effectiveness; the relevance of a framework on the functioning of the educational system; the stimulus for the processes of quality improvement, schools’ organization and results; the awareness of various community members to participate actively in the educational process and the enhancement of their role, ensuring the credibility of the performance of educational establishments and education. All these actions aim to ensure the educational success, by promoting a culture of quality and responsibility in schools.

Article No 5 of the same Law establishes the assessment framework, which integrates self-evaluation and external evaluation. Article No 8, No 1, points out that external evaluation is based on (...) the measurement of compliance of normative conformity in teaching and administration and management, as well as their efficiency and effectiveness. It also assigns IGE this checking.

The XVII Programme of the Government chapter II, item I, “More and Better Education”, underlines the relevance of an accountability culture, performance and results evaluation (43), which comes related with a bigger responsibility and schools’ autonomy (44). It is also clear its purpose is to launch a national assessment programme of basic and secondary schools.

The Regulamentar Decree No 81-B/2007, 31st of July, (IGE’s Organic Law), establishes as IGE’s competence the participation in schools’ assessment and the support in activities related to the organization.

EAS regulation, including its aims and procedures is, therefore, clearly established.

4. External Assessment of Schools’s framework (2006-2010)

Designed to assess the quality of education in our country, i.e., to identify the strengths and weaknesses of schools, suggesting improvement areas, the ultimate objective of the EAS process is to improve the provision of school and the students’ achievements. EAS objectives clearly stress the need for improvement: (1) the systematization of indicators on schools’ quality, leading to the development of an action plan; (2) the need of developing self-evaluation and autonomy; (3) the construction of a “picture” of the schools in the country, getting to know examples of good practices and subsequently spread them to the different education actors.
EAS’s more detailed aims:
1. To encourage a systematic questioning within schools about their own achievements and the quality of their practices
2. To relate the external assessment feedback with the schools’ self-evaluation culture and procedures
3. To strengthen the schools’ ability to develop their own autonomy
4. To contribute to the regulation of the educational system
5. To contribute to a better knowledge of the public education service, promoting a deeper social participation in the schools’ daily life

The report of each EAS is structured according to 5 established domains. Each one of them has several key factors of evaluation:

<table>
<thead>
<tr>
<th>1. Results:</th>
<th>4. Leadership:</th>
</tr>
</thead>
<tbody>
<tr>
<td>‣ Academic success</td>
<td>‣ Management of material and financial resources</td>

</tr>
</tbody>
</table>

The assessment team is formed by two IGE’s inspectors and an external evaluator, who can be a university professor, a researcher or even a retired professor. The school visit is developed in two days in Secondary schools, and in three days in clusters of schools. It starts with IGE’s presentation of this activity; followed by a school introduction by the school Director (Headteacher); and then a visit around the school. The methodology also includes group interviews, preceded by some document analysis. The output is a report that is sent afterwards
to the school, which may contradict it. Schools’ report stresses their strengths and weaknesses, as well as opportunities for development and constraints. All the reports and schools’ contradictories are published on IGE’s website. The aim is to feed thinking and use it as a tool for further discussion, encouraging schools to develop their own self-evaluation processes. All the public schools are evaluated in a four-year cycle.

We will focus now on the structure of EAS procedures.

4.1 Step 1 – Preparation

First of all, we have to mention two aspects that contribute for a better reception of this activity in schools. The first one has to do with the participation of external evaluators in the teams. This avoids the expression “inspection team”, that might be seen negatively. This represents increased resources, but, more importantly, we must stress the diversity of experiences that enrich the work. The second aspect has to do with the fact that there is a great amount of information available in IGE’s site which is extremely useful for schools in the preparation of this activity.

In the first stage of this activity, the members of the assessment team analyse the “School’s profile”, a document made by IGE based on the data given by MISI (a department of the Ministry of Education), the school autonomy documents (Educative Project, Curricular Project, Annual Activity Plan, Internal Regulation and Self-Evaluation Reports) and also the “School Presentation Document”. These documents are sent by the school’s board and they are relevant because they reflect the image the school has of itself, enabling the assessment team to prepare for the field work.

The text with the school’s characterization may be written according to the structure suggested in IGE’s site (“Topics for the school’s presentation). This may also function as a tool for the improvement of self-evaluation processes of schools.

A meeting takes place with the team members and the documents are discussed, information is selected and the data that needs validation is identified. The school is asked to point out the different actors for the panel interviews. At this time, the team contacts the school in order to avoid the presence of the participants in more than a panel, and to be sure there is representativity.

During the preparation, the team may elaborate a summary of the students’ results. This procedure is relevant for (1) a comparison of the profile’s data and the information given by the school’s board; (2) the preparation of the interviews, bearing in mind that information. For what has been said, this step is important for it prepares the work developed during the intervention.

4.2. Step 2 – Intervention

The methodology of this Activity includes (1) the documental analysis previously illustrated, (2) the intervention, which includes the presentation of the activity by the assessment team,
the presentation of the school by the board, (4) the visit to the school, (5) the interviews with the different actors; (6) the elaboration of the report with the possibility of a contradictory and, at last, (7) the national report.

4.2.1 The visit’s agenda

The intervention begins with a presentation meeting in which the community is invited to attend. First, IGE’s activity is presented. Though the PowerPoint document, the activity’s aims, the domains and factors evaluated, the evaluation rate and the methodology are explained. This method is fruitful because it allows: (1) to do a first approach of the activity, clarifying the memorandum previously sent by the Regional Delegation and exploring the tasks the assessment team will develop; the documents that are analyzed and the explanation of the report that will be sent by IGE after the intervention; (2) to answer eventual doubts, that may be asked the team after the presentation; (3) to create an interpersonal atmosphere of trust, that will have benefits on the work that follows.

Then, the school’s board presents the school, normally using also a PowerPoint presentation. This allows the gathering of information and the registration of evidences that complement the documents previously sent by the school’s board. This is also effective because it creates a solid basis for the preparation of the interviews.

The schools’ visit, in the first and second day of intervention, includes the direct observation of the different buildings, classrooms. The team pays attention to the quality and diversity of equipments, the facilities’s preservation, the functioning of the several services, which contributes to a larger vision of realities and a better grounding of the judgements about the different domains and factors.

Then, during the next two/three days, there are panel interviews.

4.2.2 Panel interviews

The data gathered through the documental analysis and direct observation is complemented by the informations gained through interviews to a large number of actors internal and external to the school, where all the structures are represented. This methodology allows a gathering of information about the school organization and leadership according to multiple perspectives, and to understand the participation of the different actors in the school activities.

The field work that we did in this activity led us to the conclusion that panel interviews are a hard task, in which we have to pay attention to a varied amount of aspects apparently obvious but that have a significant bearing. This is a complex process in which there is a constant encoding and decoding of questions and answers by the interviewer(s) and respondent(s), given the objectives, assumptions and knowledge of both. Thus, the interview panels are, in our opinion, a key aspect of the activity. This allows all education stakeholders to have a voice, (1) provide a more varied collection of data, and triangulating the information gathered by analyzing
documents allows the reasoning behind their judgments about the different areas; (2) those are moments not only for questioning, but also of reflection by all participants, which has contributed to a self-evaluation of their teaching practices and for the possible need for change. We underline the importance of conducting the interviews by asking intentional questions about the subjects where there are less effective practices, in order to induce the development of measures to improve. The atmosphere of trust contributes to the fact that the interviewEAS point out both positive and negative aspects in their practices.

4.3 Step 3 – Report

As the product of the intervention, the report is a valuable feedback not only to the school, but for the whole community. It must be seen as a powerful instrument that is the most visible image of IGE’s work. Therefore, the team members have a personal and institutional responsibility.

Based on the experience we have been provided, we believe that the report will have as much quality as: (1) it respects the model of the EEA framework; (2) it focus on the specific reality of school; (3) does not speculate; (4) it bans advice and recommendations, but induce improvement. The style of the report should be based on clear language, economic, with short sentences and direct, coherent, non-redundant, and language appropriate to different recipients, ie, diluting adjectives, acronyms without decoding, inaccurate descriptions and value judgments. In positive evaluations, assertions should come first, followed by evidence to justify them; in less positive ratings the evidence should appear first, and then the conclusions derived from it, for the preparation of the readers to the conclusions.

The external assessment reports should also be crucial in their return to school, and this is one way of enhancing the effectiveness of the work: is a catalyst for the efforts of professionals and a management tool that serves to motivate, guide and define the work and give a sense of responsibility. In the school organization, this feedback would be relayed in terms of processes, ie, as the work unfolds, and in terms of results.

We believe that the EAS reports are well organized, being sent to schools with the possibility of being presented a contradictory. This procedure, coupled with the fact that these documents are disseminated by publishing them on IGE’s website on the Internet, makes the process transparent, while allowing the preparation of schools for the activity.

The national report of EAS, published annually, is a source of information and conclusions about the whole process are priceless.

5. External Assessment of Schools – critical perspective

The assessment model adopted and the ongoing process that embodies it result of the working group established by the Joint Order of the Ministries of Finance and Public Administration and Education No 370/2006, 3rd of May. This group organized the frame of
reference for external assessment, conducted a pilot trial and released in 2007, the second evaluation phase, already under the responsibility of IGE, which has been conducting this work.

At this point, we want to reflect on some practices, choosing to examine critically the model to operationalize the process and its results.

5.1. Structure and methodology

One of the objectives of this activity is to identify strengths and weaknesses, so that schools can improve the quality of education they provide, and increase the educational standards achieved by pupils. In this process feedback and reports referring to the strategy of planning and improvement through a rigorous external assessment, by identifying key points for action is critical. The analysis of the reports produced during the years 2006/2009 on different regional delegations by different assessment teams, suggest that the production process of writing is one of the more complex tasks of EAS. This is a job that consumes a lot of time and energy, generating questions about its relevance to each school.

4.51.2 External Assessment of Schools’ framework

A system that combines external and internal assessment in a coherent and systematic way hasn’t yet been implemented. We wonder if our schools are developing the ability to perform a reflective and reliable self-evaluation. Not all of them are at the same level of development, so they may be unable to do so due to lack of a culture or knowledge. Ideally, in the future, the schools will be able to sign an accountability system that allows them to develop a rigorous self-evaluation, in this being included a greater autonomy. So that the school truly improves, it should be (1) flexible, in that it accepts that there is no single way to achieve the objectives and adapts to the context that has, by managing the difficulties that present themselves as challenges that will have to be overcomed; (2) the commitment and effort should be constant and persistent; (3) should be empowered to deal with the unpredictable; and (4) should be a joint construction envisaging the development of a culture that mobilizes all actors who can contribute to that improvement. In this vein, EAS should consider that, for the improvement of school quality can not be inhibiting innovation, promoting a culture of diversity and not uniformity.

5.2. Challenges

EAS is a picture of a school at a certain point in time and not a detailed long term study from which solid conclusions could be drawn and recommendations sustained. This way, schools are being labeled through the ratings that are assigned, as obtaining answers to their problems or failing in identifying them.

To supply the school with a simple external diagnosis of their problems does not seem to exploit the potential of this evaluation. The element of sustainability of this process towards
improvement seems to be the belief in the feasibility of process and personal and professional advantages of all these actors participative in their investment. The need for monitoring and ongoing support to schools in terms of self-assessment and response to external assessment became evident. For schools evaluated less positively, IGE has developed a work-based rehabilitation activity. So, in order to monitorize the process of improving the quality of school, a new activity was created in 2010: Self-Evaluation of Schools (SES). Through monitoring activities, articulated and intentionally scheduled with EAS, IGE will provide technical support preceding the visit of EAS, encouraging the professionals' reflection, and therefore leading to an improvement of skills and performance.

6. Conclusion

IGE's EAS has a gigantic dimension not only as an activity, but also and above all, in national and international panorama. It is therefore an activity which, besides having to be carried out with a huge responsibility, in our opinion, has to bear a deep reflection, analysis and systematic comparison of the reports, accessible to all actors who are more or less directly involved in education. This leads to the production of basic knowledge in various spheres because at a local and regional level, the regulation of school systems is a growing multiregulation, i.e., a regulation which comes from a large number of sources and a variety of tools and resources such as assessment, monitoring and sharing best practices, along with more traditional-bureaucratic instruments. Pressured to follow European trends, wrapped in a growing transnational regulation, the political agenda has thus been occupied by internal and external assessment of schools, believing that these mechanisms may contribute to a significant improvement in the provision of educational services, assuming more responsibilities in identifying and addressing their needs. In this process, there are items to be worked out: (1) schools have no practice of collecting and analyzing data to build knowledge on which to construct their choices; (2) it hasn't been assimilated the concept of self-assessment, with some notable resistance from schools in this implementation, although they have been given useful tools in monitoring this process, a reluctance associated, in our view, to change itself.

LEARNING OF ALGORITHMS ON MOBILE DEVICES
THROUGH BLUETOOTH, SMS AND MMS TECHNOLOGY

Abstract: Teaching Institutions are up against challenges of an advanced technology of learning with the objective of improving the efficiency of the teaching-learning process. Joining the students’ learning style to the technologies is important to improve the educational process. This work presents the advantages of using mobile devices, associated with the students’ learning styles. The learning which is carried out with the use of mobile devices makes it possible for users to learn at anytime and anywhere.

Keywords: algorithms, mobile devices, mobile education

1. Introduction

The use of ICTs in the teaching of algorithms was made possible through the supervision of the teaching-learning process of this subject at Instituto Federal Fluminense, in Campos dos Goytacazes, when it was able to verify the huge difficulty experienced by the students. The creation of environments which support this learning is of great interest, since the knowledge construction process necessary to the production of algorithms for programming constitutes an arduous task to the student, as BERCHT (2005) emphasizes.

There is consensus, among the teachers of the area, that it is not enough to present an algorithm in an explanatory way on the board in order to be able for the student to comprehend it completely, and to create similar or derived algorithms from that, neither to become capable of resolving problems with these instruments (BARCELOS, 2009). This work presents the use of mobile devices to the teaching-learning process of algorithms.

The use of mobile devices as an educational resource is not trivial because the features of the pieces of equipment differ substantially from the ones which are normally used at home and in labs at schools, chiefly by the size of the presentation area of the visual pieces of information. Another factor to consider is the process of transference of the educational content in a thrifter way, because the cost of access to the Internet, via cell phone network, is still very high in Brazil. In this work, it is related an experience in
which it was explored another way to transfer learning material to students’ mobile
device, using the wireless technology called Bluetooth and SMS.

Caudill (2007) states that *mlearning* can be defined as learning through the use of
devices and the wireless technology. According to Boyinbode (2008), this learning
through mobile devices (*Mobile learning*) is observed due to the fact it is without the
permanent physical presence within the educational process.

To make explicit mobile learning is to define the use and possibilities about the way
how the mobile technologies will be inserted into the educational process. Valentim
(2009) points to the potential that these technologies enable in terms of learning
strategies such as constructivism, interaction, curiosity, complexity, collaboration,
challenge.

In a learning context for *mobile learning*, even if the mobility is one of the pillars,
various other factors must be considered like: i) learning along the time; ii) the
informality and iii) the appropriation of knowledge by the student.

The use of mobile devices within the learning process has been performed as a support
to the presentational learning, though, the purpose of this work is to make observed the
formal learning of the school environment, that is, the students have got the possibility
to “download” the learning objects onto mobile devices for, from then on, these to be
accessed for learning at the moment when the users consider it to be more appropriate.

This work investigated the use of the *Bluetooth* connection that is faster, of easy access
for the student to share data among the various mobile devices, like: from cell phones to
cell phones, *laptop* to PDAs, *laptop* to cell phones, *laptop* to smartphones. The SMS
technology was also used, which is the transmission of text messages – maximum of
160 characters for the sending of solution of problems, incentive messages, notices of
tasks already performed. The MMS technology makes it possible the sending of
educational objects with formats besides texts and videos.

According to Sharples (2007), the future educational applications and services will need
resources to make it easier its use, like: to download materials in different types of
format, text, voice and video, to “run” without the use of adaptations, as well as to make
feasible the reduction of the cost of access to the Internet because the characteristics of
the functionality of the devices differ from manufacturers.
Figure 1 - The convergence Technology and Education

Figure 1 shows the investigations of this work, which embody the programming subjects, in particular in the learning of algorithm, the learning styles, in particular the students’ ways of learning, as well as the mobile devices technology, besides the insertion of the mobile technologies for the learning refinement. The intersection of these areas is investigated in the teaching of algorithm and corresponds to the way how the students learn by using technologies.

The learning of algorithm has been presenting at IFF one of the largest indexes of failing. A survey carried out by the author, at IFF-Campos-RJ, in the technical course and higher education courses, points out the presented results in Graphic 1, encompassing the four late semesters between the first semester of 2008-1 and the second semester of 2009-2.

Graphic 1 - Failed ones in Algorithms

Graphic 1 shows, in the semesters 2008-1 to 2009-2, the percentages of failing in the Computer Science Technical Course, from 2008-1 to 2009-2, the average of 34% of the failing of algorithm students. This has become a motivation for an investigation work aiming at the improvement in students’ learning. This work investigated the use of new
technologies in groups of this universe for the improvement of the teaching-learning process.

The reasons for this high level of lack of success are not specific ones of the area. In general, Barcelos (2009) and Jenkins (2002) observe that the students do not present self-assurance in the organization of reasoning, elaboration of strategies for solving problems, attention, concentration, stimulus to the process of mental calculation. Thereby, the skills involved in this process, such as trying, observing, conjecturing, deducing, and that constitute what we call logical reasoning, not being appropriately developed, they interfere in the learning of practically all cognitive areas, but, especially, they affect this area of knowledge.

On the other hand, the students show a unique self-assurance concerning the use of technological resources. To nullify this difficulty, taking advantage of the students’ motivation and vocation for the use of technology, new strategies have been investigated regarding the use of computer science resources in education, in order to enhance skills which aim at the development of the reasoning, according to (GRABE, 2001).

2. Objective

The objective of this work is to make it available, through the Bluetooth technology, the pedagogic materials of algorithms to the mobile devices. In parallel, the students are registered by their cell phone number so that they receive short texts and messages through the SMS. Texts are sent to absent students from presential classes, informing them about the topics taught in presential lesson and assignments to be developed. Also it was used the sending of educational objects by MMS.

The use of this learning way is considered, in this work, as being a support to the classroom lesson. According to Azubel (2002), this resource is indicated to the improvement of learning in two moments essentially different: (1) right after the initial learning, when part of the forgetting of the content can occur, in order to consolidate the content learned in a more efficient way and, also, to originate the learning of gradations and subtle implications, not learned in the first presentation; (2) after a certain time, when a considerable forgetting can occur, making it possible for the student an opportunity to take advantage of (to avoid posterior presentations) his/her own
awareness of negative factors (such as ambiguity or confusion with similar ideas) responsible for the possible forgetting.

Various peculiarities are important in the learning process of algorithms as it follows: i) coherence with the fundamental objectives of algorithms and that the teacher must build in the operationalization of this learning for the students: i.1) to express in an objective way the ideas, the concepts and the techniques to the students because if the teacher presents the algorithms in a confusing way (confusing ones) in the presentational class or by using transparencies, the students do not understand the resolution of problems involving this learning and the expected results of the proposed algorithms are not clear in students’ responses; i.2) to highlight the importance of the theoretical results and show formal rigor in the situations, even in the simpler ones; and i.3) to valorize the use of techniques in the resolution of problems; ii) to highlight the critical thinking, a care to be observed, because the students own little experience in the resolution of problems involving mathematics and tend to believe any demonstration. This kind of behavior must not be stimulated. It is essential that the students have critical thinking on any resolution of problems and are stimulated to obtain new solutions for the same problem. It will be from healthful doubts and of a new resolution and perception that the importance of the theoretical work will be presented. Still in that sense, a valuable resource is the set of exercises which make it possible for the students to identify argumentation failures, errors in algorithms or algorithms that would be made better; iii) the theory put into practice. The experience shows that the students, in general, do not feel themselves motivated as they consider the learning of algorithms to be extremely abstract, then, it is believed that it is important to use real examples as a didactic resource.

That group of factors is the one that makes it possible the improvement or the lack of success of the learning. First of all, it is essential to comprehend what an algorithm is. Its definition becomes, thus, important to have a perfect comprehension of these peculiarities, because the algorithm is a sequence of instructions in order, without ambiguities, presented in a logical way for the resolution of a determined task or problem. The algorithm is a mathematics formulation, a piece of code, and finds itself located between the input and output to transform the first into the second. It is the way for the solution of a problem and, in general, through these ways several solutions can be obtained.
3. Characterizing the target public

Initially, it was investigated the students’ age of two Computer Science Technical Course class groups Level 1 – Morning and Level 2 – Afternoon at Instituto Federal Fluminense. The students’ age, according to Graphic 2, presents four eighteen-year-old students, six students of the 16-17 age group and three of the 28-29 age group. In this case, there is a heterogeneity with regard to the group of students, because whereas the 15-19 age group can be regarded as being digital natives, the 45-50 age group, according to Prensky (2001), is characterized as digital immigrants.

![Algorithm students’ age Level 1 Daytime](image1)

**Graphic 2 - Algorithm students’ age Level 1 Daytime**

In Graphic 3, with the Level 2 students, this discrepancy of age does not take place, because all students can be characterized as digital natives since the age is between sixteen and eighteen years old.

![Algorithm students’ age Level 2 Daytime](image2)

**Graphic 3 - Algorithm students’ age Level 2 Daytime**

4. Methodology

Using MLE, Bluetooth and SMS – In stage 1, the construction of a quiz (questions) about algorithms with images and sounds using the MLE (Mobile Learning Engine) was
the solution presented in this work. This system is *open source* (code free font); free of charge and with capacity of personalization, and the access to MLE by cell phone is done through *Bluetooth* technology. The MLE is available in two languages, German and English and offers various tools, as it is shown by following the items: i) Didactic Material: It constitutes of a set of pages, ending with a question with answer alternatives. ii) *Quiz*: It is a multiple choice test, true or false, and questions of short answers. Each attempt is automatically checked and the teacher can choose by which way the interaction with the student will occur, i.e. the answers will be sent, or to present the right responses to the immediate student’s correction.

Through the MLE, a special learning object is constructed called *Mobile Learning Objects* (MLOs) that can be stored into the cell phone and subsequently used, without any connection to the Internet. This way is considered as *off-line*. The learning through the MLOs implements all the MLE functionalities, including: interactivity among instantaneous questions with automatic correction, answer to *quizzes*, simple and multiple choice questionnaires.

Learning objects – shaped like videos – were sent and made available to the students with the following topics and time duration: i) introduction, time – a minute and six seconds; ii) types of data, time – two minutes and thirty-six seconds; iii) sequence, time – two minutes and fifty seconds; iv) repetition, time – two minutes and sixteen seconds; v) decision or selection, time – three minutes and six seconds; vi) refinement, time – two minutes.

The use of SMS technology in this project was used in various categories. Three categories of themes to send SMS messages by cell phone were selected.

1. Administrative Messages: They are content messages specifically about the operational and administrative part of the course. For instance, messages informing the availability of the contents, activity hand-in deadline, and the contents taught at the presental lesson etc. Example of messages sent: i) Two days left to hand in the assignment about If…Then…Otherwise; ii) The content of the August 04th presental activity was the construction If…Then…Otherwise; iii) Today, August 11th, we are starting the If…Then…Otherwise.
2. Pedagogic Messages: Content messages related to the subject of the course. For example, tip about sites with related content, reading suggestions etc. Example of messages: i) Send a message to a classmate about which questions of the assignment you have already done; ii) Ask another classmate which questions of the assignment he/she has done; iii) Do you have any difficulty about the problems to be solved?

3. Motivational Messages: They are messages that enable the motivation for the learning and the resolution of proposed problems and the individual objectives: i) messages which rouse students’ interest in the learning of algorithm. ii) messages that are usually out of the context of the course like, for instance, “have a good holiday” or “U had a good performance in the activities grade 8,5” iii) Are you going to solve problems this holiday?; iv) When you are to solve problem 5, try If…Then; i) Have a good weekend!; Enjoy the holiday!.

The work had as a return text messages sent by SMS, by phone-call or by e-mail. Example of messages of replies sent by students: i) Thanks for the Information; ii) Nice holiday! 4U2.

The learning object constructed to be used on mobile devices demanded a series of observations like: size of characters, colors, sounds, among others. The sequence of Figures 2, 3, 4, 5 presents the contents on the mobile device.

![Figure 2 - Representation of data types](image-url)
Besides this technique of videos with contents of algorithms, demonstrative videos of functioning were produced using one of the techniques called Table Test, presented by Szwarcfiter (1994) and Medeiros et al. (2002), that consists of following instructions of the algorithm in a sequential and accurate way, storing the possible values of the variables to verify the procedures used in the designing of the algorithm.
Figures 5 and 6 show the construction sequence of the table test. This test makes it possible to compare the results to the objective of the algorithm and the possible errors during the execution. The teachers also use them in learning environments through the web. It is a technique which prioritizes the visual perception.

5. Difficulties and Discussion

As soon as the students were informed about the cell phone use as an educational device, the reaction was very reticent because they do not “believe” and also do not understand how the cellular could be used in educational activities. In so far as they acquired knowledge about the methodology to be used, it was observed that the learning with the use of technological resources and the attitude changed.

The results appeared from individual interviews with the students, taking into consideration punctual questions like the use of the student’s cell phone (access, didactic-pedagogical perspectives, interface, cooperation, synchronous and asynchronous tools, adequacy and usability. It was observed that only one of the
students did not have a cell phone with the Bluetooth function. Initially, the students were apprehensive with regard to learning by using the mobile devices for the learning and also how the pieces of information about this content, that is, how to learn using these devices, not only with theory, but also to resolve problems. Miscellaneous students’ accounts were important in this work: Student F1: “I did not have a hard time using my cellular, but how are we going to learn?”. Student M1: “The activity was very interesting, because the classes are always the same”. Student M2: “I was convicted of not having a flowchart of algorithm in the cell phone”.

The results obtained showed that students own a developed technological view, and the relations of them with the videos were the best ones because they manifested the desire to access and watch the video related to the content to be taught in the presentational lesson of the day.

We can state that the students identified themselves with the format of the objects, mainly when they had entire knowledge of their learning styles. Thus, they requested the materials that would better provide them with learning; however they also accessed other format of objects.

Under the aspect of the used technology, the students presented difficulty in the transmission of videos notebook/cell phone. In this methodology, they pointed out the delay to “download” the files into the devices. In the execution of the system, problems appeared due to the low memory of the cell phones regarding the size of the file to be sent.

Some of the difficulties in the construction of the educational objects are related as it follows: i) the diversity of cell phone models. In relation to the materials to be consulted by the students, there was the necessity of installing the software Java in two cell phones – program required for the mobile devices, as they did not contain the necessary “plugins” to run the materials, that is, the devices which do not ‘run’ files with .doc, .pdf. format. The solution found was to convert the files with .txt extension (in text format), though, in a short way, because in this format they do not contain the illustrations of the original material, serving just as fast consultation about the concepts over specific subject.
Another difficulty reported by students was the cost, in the case of the sending of SMS to other students and teachers, impairing the interactivity. Concerning the educational difficulties, the students “would like to have more consultation material during the learning out of the classroom”, more didactic material, i.e. videos with other contents of algorithms.

In a general way, the students understood that the use of this technology for the learning was of great importance and they expect that its use converts itself into positive results in their performances in the learning. The fifteen students answered the questions on a Saturday and Sunday and on their way work/school and, mainly, when they did not have access to the computer.

6. Results

With regard to the male students’ learning styles, only one with visual and kinesthetic learning style as well as male student with preference to the auditory learning style did not obtain approval.

Concerning the female students’ learning styles, only one with visual and kinesthetic learning style as well as male student with preference to the auditory learning style did not obtain any approval.

The failed students were interviewed and reported that the experience regarding the knowledge of their own learning styles was beneficial to the learning and attributed the weak performance to extra-class problems, because they missed the examination. Though, they even reported that would like to keep on in the process and be re-evaluated based on the support with educational objects.

Graphic 7 shows the result in the subject of Algorithms of the students of the Computer Science Course in the year 2010-1 that the performance was satisfactory, because in the year 2009-2 the index of failing was of (29%) and in the year 2010-1 this index was of 13%.
Through accounts, the students attributed to the satisfactory performance in this subject several factors, as it follows: i) the use of mobile devices making it available the access to the course content, what enhances the motivation and learning opportunity, as the performance shows. Practically by just one click, contents are found which permits students to learn wherever they are, despite the limitations of the home responsibilities, work hours, trips etc. Besides, since the students achieved the success and progress through exercises, they state that they have being motivated to learn more by the use of pieces of technology; ii) Another factor was the strategy of learning of algorithms in an individual way made possible by the convergence of information and communication technology with the strategy used; iii) the learning of algorithms through the opportunity of interaction among the students. The availability of the learning objects must include the opportunity for the students to interact with other students and with the teacher in order to report the difficulties and the solutions found in the resolution of the proposed problems. The students understand that the mobile devices are becoming integral part of the teaching.

7. Conclusion

The use of mobile learning in the teaching of algorithms led to a significant improvement on the students’ performance, because it made possible the collaboration, giving a good opportunity for the support of multimedia such as videos, graphics. The learning through the mobile devices in consonance with the students’ learning styles, as well as their motivation with the insertion of this technology made the teaching of algorithms more attractive and, consequently, made it possible to improve the learning.
Regarding the fifteen level 1 students, fourteen students participated actively of the assignments and thirteen obtained approval without need of a third exam to be retaken. It can be, therefore, stated that the experience contributed to the development of the logical thinking and made it easier the supervision of the academic trajectory. It was verified in these students the improvement of the abstraction, of the logical reasoning and of their learning performance, confirming a differential with regard to the ones who did not take part into the project, even though, evidently, other factors can also have interfered into the learning.
