In recent years, our University has implemented changes with respect to content, teaching methodology, and assessments in entry-level calculus courses. However, though both the Engineering and Non-Engineering sections of Calculus I feed into a common, coordinated Calculus II course, there are two coordinators for Calculus I. Table 2 shows DFW rates for students enrolled in each version of Calculus I. Rates are given for two groups, former early entry students and all students enrolled in the fall offering of each 4-credit course.

Table 2

### *DFW Rates for Students in Calculus I*

---

Semester	DFW rate early entry students engineering	DFW rate all students engineering	DFW rate early entry students non- engineering	DFW rate all students non-engineering
F12	81% = (17/21)	54%	36% = (10/28)	35%

---

Table 3 shows DFW rates for students enrolled in the first semester, year-long Calculus I course at our institution. Rates are given for two groups, former early entry students and all students enrolled in the fall offering of the 4-credit course. There are approximately 400 students enrolled in the first semester on-campus, year-long course each year.

Table 3

*DFW Rates for Students in First Semester Year-Long Calculus I*

---

Semester	DFW rate early entry students	DFW rate all students
F12	11.4% = (4/35)	41%

---

Table 4 shows DFW rates for students enrolled in Calculus I in Fall 2012 who took College Algebra and Trigonometry in the fall and spring semesters the previous year. Rates are given for two groups, former early entry students and on-campus students for each version of the 4-credit Calculus I course.

Table 4

*DFW Rates for Students in Calculus I with Early Entry and On-campus Pre-requisites*

---

Semester	DFW rate early entry students engineering	DFW rate on-campus students engineering	DFW rate early entry students non-engineering	DFW rate on-campus students non-engineering
F12	81% = (17/21)	90% = (44/49)	36% = (10/28)	45% = (17/37)

---

## Discussion

The research question explored in this study is: What are student indicators that lead to successful completion of calculus (grade of "A", "B", or "C") for students enrolled in an early enrollment sequence of algebra and trigonometry courses? The motivation for this study is trend data indicating that early enrollment students might be experiencing higher-than-normal difficulties in their first on-campus Calculus I course. Students in the early enrollment project must have at least a 3.0 overall high school GPA and a C or better in Algebra I, Algebra II and Geometry at the time of enrollment. Thus, students in the project have relatively good grades. The students succeed in College Algebra and College Trigonometry courses, and while these courses are not among the traditional AP course offerings, they are considered advanced high school mathematics courses. Burton (1989) found that students who passed an algebra-trigonometry pretest with minimal or poor prior calculus experiences still had disappointing performances in calculus. Therefore, prior calculus experience should be investigated more closely.

An analysis of the data suggests that although there is a trend of higher DFW rates in Calculus I for the early enrollment students, the difficulty seems to be occurring in the engineering version of the course. The goal of any dual credit course should be that students who successfully complete it are at least as well prepared for the next course as those who have taken it at the college from which the credit is given (Bressoud, 2007). Early entry students' success in Calculus I was compared with the success of students entering Calculus I via the on-campus College Algebra and College Trigonometry courses. When compared with on-campus students taking the same pre-requisite courses, the early enrollment students were found to have lower

DFW rates in both versions of Calculus I. An additional observation is that there are fewer on-campus students moving through the sequence of courses, algebra to trigonometry to calculus, than expected. Our University had not offered a pre-calculus course in several years. Upon investigation, it was found that 160 on-campus students took College Algebra and College Trigonometry in the same semester in Fall 2012. Those students, mostly engineering majors, were then able to move directly into Calculus I in the Spring 2013 semester. As a result of this finding, in the Fall 2013 semester, our University will once again offer Pre-Calculus and students will no longer be able to enroll in algebra and trigonometry concurrently. This will again change placement criteria for courses before calculus.

A prior study (Pyzdrowski et al., 2013) suggested the possibility that a change in the placement test and scores used to enter into Calculus I created a "success gap" between students placed via a test and those placed using prerequisite courses. Early enrollment students who have successfully completed both algebra and trigonometry are able to enroll directly into Calculus I in their first semester, but due to the difficulties emerging in recent years, students have been advised to consider the year-long Calculus I course. Students taking that option are doing well as compared to their on-campus peers; but, only one-half of the surveyed students knew about that option.

The literature leads us to believe that prior experience with calculus concepts is a factor that could influence student success in entry level calculus. Seven of the students responding to the survey indicated that having calculus before enrolling into Calculus I would have helped them to do better; but, six of those students had no prior calculus experience. The Non-Engineering Coordinator has said that as long as the students have a good grasp of pre-requisites

knowledge, it should make no difference if they have had prior calculus experience. So, is the problem related to the perception of being at a disadvantage, or are students really at a disadvantage if they have no prior experience in calculus? In fact, of the three students who indicated that prior calculus experience was not necessary for success, two students indicated that they had poor instruction of calculus while in high school resulting in difficulties in the course.

Of the 49 students invited to participate in the survey, only 14 responded giving a return rate of 29%. Though this return rate is better than that in the previous study, 19%, it is a disappointing rate. Of the nine students who self-identified as being unsuccessful in Calculus I in their first attempt, it can be seen that in general they felt a lack in content knowledge (no-prior calculus experience), were confident about their mathematical ability, saw mathematics as relevant, enjoyed learning calculus, and did not like how the course was organized. They also did not have outside issues causing a lack of success in the course.

One survey question asked students if they felt that the instructor or the student has more impact on the successful completion of Calculus I. In a previous study (Pyzdrowski et al., 2012) four of seven students surveyed felt that the instructor had more impact on the successful completion of Calculus I. Students making this selection were dissatisfied if an instructor "got behind" in a coordinated course, could not be understood (had a language barrier), or did not seem to care. It was not clear whether students were not taking the responsibility for their learning, or whether there were instructor issues that need to be addressed. In this study, when asked who has more impact on the successful completion of Calculus I, 11 chose the teacher and 3 chose the student. Most interesting were the justifications for the choice. The student

reflections were for the most part very mature and indicate that perhaps there are instructional issues that need to be addressed such as teacher preparedness and pedagogical knowledge and implementation.

### **Conclusion**

It is the intent that findings in this study be used to improve student performance in Calculus I either directly or indirectly. Students surveyed said that having prior experience in calculus was important to the success in the first semester Calculus I course. The literature suggests that given the trend that so many students are now taking calculus as a high school course, it is recommended for universities to rethink the structure of their Calculus I and Calculus II courses (Bressoud, Carlson, Mesa, & Rasmussen, 2013). Should there be different Calculus I experiences for students depending on their prior experiences in calculus? Is it possible that the year-long version of Calculus I is a better course for all students entering based on prerequisite course work. We will explore how many students in our Calculus I courses have had previous exposure to calculus concepts and the impact of that experience on their success in the course. Have placement changes created a "success gap" between the students placed via a test and those placed using prerequisite courses. When early enrollment students in Calculus I are compared with students entering Calculus I via the on-campus College Algebra and Trigonometry courses, they are doing well according to success rates. However, both groups are doing poorly in the Engineering version of Calculus I. Adjustments may need to be made in all College Algebra and Trigonometry sections, both on- and off-campus in order to help students be better prepared for the course. In particular, because only one-half of the early entry students

knew about the year-long calculus course, efforts will be made to better communicate and advise.

## **ABSTRACT**

In 2004, in Japan, “information studies” was established as the core subject area in the field of informatics education at the upper secondary school level. However, few teachers have sufficient pedagogical content knowledge (PCK) in this field, and the method of instruction has yet to be studied extensively. By way of progress in this field, Hirabayashi and Matsuda (2011) proposed an instructional method that integrates 13 items of “informatic and systematic thinking,” which Matsuda (2003) had earlier proposed for the effective use of information and communication technology (ICT), along with Tamada and Matsuda’s (2004) method of cyber ethics education, which was based on three types of knowledge. Moreover, based on their method, my team developed both e-learning game materials and a design framework; we also verified the effects through trial lessons. However, in order to persuade teachers to employ this method, it is important to explain why it is useful, especially because most teachers have insufficient PCK. Therefore, I consider a student model for informatics education in order to discuss how learners acquire domain-specific knowledge and how they utilize views, ways of thinking, and problem-solving strategies. Based on the model, I improve the previous design framework for e-learning game materials in information studies. Concurrently, I revise one of our e-learning materials.

## **INTRODUCTION**

### ***The Need for Establishing New Subject Pedagogies or Information Studies***

In recent years, educational reform has been progressing rapidly in many countries, aimed at cultivating students’ twenty-first century skills (Partnership for 21st Century Skills 2009). These efforts have highlighted the need for informatics education because, today, people are required to solve everyday problems more efficiently using information and communication technology (ICT) and maintain safety from cyber threats. As proposed by UNESCO (2002), there are many types of informatics and other related curricula: curricula conducted by independent subject area, latent curricula conducted in each existing subject area, vocational education on ICT, and so on. Each country adopts one or more types of curricula depending on the purposes and

conditions of the educational system in that country.

In Japan, informatics education is imparted through the compulsory technology subject area of Industrial Arts and Home Economics, in particular, through the topics of Information Technology in lower secondary school and Information Studies in upper secondary school. However, the time allocated for the subject Industrial Arts and Home Economics is 175 hours, of which only 25 hours are allotted to the topic of Information Technology, and the time allocated for Information Studies is only 70 hours. According to the National Course of Studies (NCoS), students are expected to learn how to utilize ICT for problem solving in other subject areas by applying their learning in these subjects to the field of informatics education. Toward this end, the Ministry of Education, Culture, Sports, Science and Technology (MEXT 2000) categorized the objectives of informatics education as follows: (1) ability to utilize ICT for problem solving, (2) scientific understanding of ICT, and (3) students' attitudes as members of the information age. Objective (1) is expected to be included in the lessons plans for each subject area, and objectives (2) and (3) are expected to be achieved through the specific topics included in informatics education.

However, there exists a gap between the current situation of informatics education in schools and the expectations of MEXT. Since the topic of Information Studies is a newly established subject area (started in 2004), the teachers teaching it are merely migrants from other subject areas such as mathematics, science, and vocational subjects; further, the method of instruction for this topic has not yet been thoroughly studied. Currently, teachers emphasize aspects such as computer/software operation, multimedia design, making presentations, holding discussions after online research, or other activities like memorizing the latest technical knowledge and judgment rules for cyber safety and ethics. Consequently, the Central Council of Education (2008) has pointed out that the existing instructional method for Information Studies does not cultivate the students' problem-solving ability.

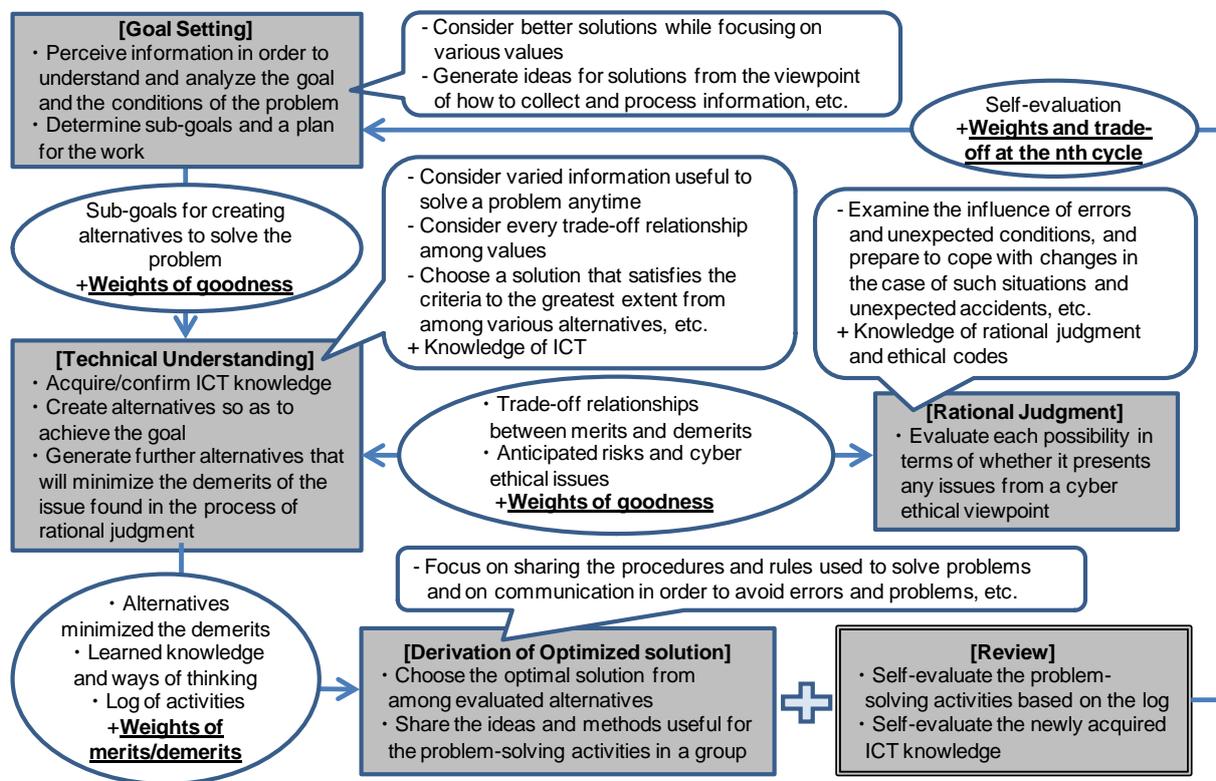

In addition, the Japanese teacher promotion program to become secondary school teachers emphasizes content knowledge (Stern & Matsuda 2010). Therefore, teachers tend to think that the lesson's objectives are sufficiently met if they instill the requisite knowledge or offer activities that simulate the daily context. The objectives of education have changed from providing knowledge to developing intellectual skills, but teachers lack the pedagogical training to help students effectively meet this goal. Their approach should consider the model of cognitive process, as well as the relationship between this process and the knowledge, rules, procedures, values, ethical codes, etc., that students are expected to learn.

### ***Our Research on a Design Framework of Gaming Materials for Information Studies***

To improve the current situation of information studies instruction in schools, my team has researched the construction of a design framework of gaming materials (Figure 1), while simultaneously developing some games and confirming their effects (Hirabayashi et al. 2011, Hirabayashi & Matsuda 2011, Matsuda et al. 2012). Our framework has the following features:

- It was constructed to integrate Tamada and Matsuda's (2004) method for cyber ethics education with Matsuda's (2003) method for informatics education. The former teaches cyber ethics judgment based on a combination of three types of knowledge, proposed by Murai (1987), for general moral education, while the latter teaches 13 items of informatic and systematic thinking when using ICT in problem solving.
- It consists of four sub-processes for problem solving and one for reflection, as shown by the rectangles (Figure 1): goal setting, technical understanding, rational judgment, derivation of optimized solution, and review. The first four sub-processes correspond to those of the design process students are required to learn, as per the technological literacy standards (International Technology Education Association: ITEA 2007).

- It clearly shows students where each of the 13 items of informatic and systematic thinking and the three types of knowledge should be utilized in the task of problem solving (balloons in Figure 1).
- It renders the entire process into a cycle in order to offer students the opportunity to solve similar problems under various conditions. It also introduces the challenge of flexibility, whereby students can apply their skills to changing circumstances.
- It assesses the manner in which students demonstrate sufficient knowledge of ICT, how they harness informatic and systematic thinking, and their consideration of the range of merits/demerits involved in the problem-solving process, as well as the weights and trade-off relations among merits/demerits when evaluating various possible plans. For this purpose, the game remains as the underlined elements in Figure 1 to the variables, and these elements are examined to ascertain whether the weights are consistent with the students' evaluation of each idea in the review process.

**Figure 1**

*Hirabayashi and Matsuda's (2011) design framework of the e-learning game materials for information studies.*

On the other hand, Matsuda (2013) is currently developing a student model of a virtual lesson game for technology education. This model will be used to generate learners' responses to a teacher's decision in a game. However, if we were to consider that the design framework suggests the ideal model of learning outcomes, we will notice some common features between the student model and the design framework. I consider the usefulness of revising our design framework based on the student model in order to clarify the kind of cognitive activities required to prompt learners in gaming materials, as well as the reasons for this.

## PURPOSE

In this paper, I discuss a student model for information studies in order to discuss how learners acquire domain-specific knowledge and how they utilize views, ways of thinking, and problem-solving strategies. Based on the model, I improve Hirabayashi and Matsuda's (2011) design framework of e-learning game materials for information studies. Concurrently, I revise one of their e-learning materials.

## **CONSIDERATION OF A STUDENT MODEL BASED ON THE DESIGN FRAMEWORK**

Bruer (1993) introduced Perkins and Salomon's (1989) theory of intelligence and claimed that domain-specific knowledge, meta-cognitive skills, and general strategies are all elements of human intelligence and expert performance. On the other hand, Matsuda's (2013) student model consists of domain-specific knowledge, views and ways of thinking, and knowledge of problem-solving scripts. Views and ways of thinking help students control the direction of problem-solving activities and self-learning, which are then associated with meta-cognitive skills, although these remain distinct from one another. Bruer (1993) illustrated a variety of different general strategies ranging from study skills to means-end analysis (Newell & Simon 1972). On the other hand, Matsuda adopted Hirabayashi and Matsuda's problem-solving processes of the design framework as a problem-solving script. The reasons for and details of the student model are discussed in this chapter.

### ***Script Knowledge of Problem Solving: As General Strategies***

Although many may consider general strategies too broad to teach explicitly, Bruer noted that they cannot be transferred easily without "informed" instruction. Here, it is important to consider whether informed instruction should be imparted inductively or deductively. For this reason, I adopted scripts (Schank & Abelson 1977) as general strategies. Scripts are sets of procedural knowledge that represent appropriate behaviors for situations or places, such as in a restaurant. Acquiring this type of knowledge depends upon situations; however, when learning in a new situation, some individuals gradually generalize, while others acquire knowledge based on each situation. Therefore, it is necessary to consider the trade-off between experiential learning and explicit instruction.

I consider Hirabayashi and Matsuda's problem-solving process to be necessarily acquired as script knowledge in information studies. This process corresponds to the design process described in the ITEA (2007); then, it follows that this process might be applicable to science, technology, engineering, and mathematics (STEM) education, in general. However, Katto and Matsuda stated that in order to conduct collaborative problem-solving activities, the process of consensus building should sometimes be added after the process of derivation of the optimized solution. Matsuda (2013) also pointed out that there are many different problem-solving processes. Therefore, I propose to understand that the script knowledge of problem solving has a hierarchical structure. Then, we can introduce a mechanism by which to integrate two different scripts into one or to generalize one script from many situation-oriented ones. Moreover, this allows a script to execute recursively, for example to understand the task collecting information in a goal setting process as a sub-problem and execute this task recursively, using the script knowledge of problem solving. On the other hand, it is possible to define many different scripts that can control how we can use lower level scripts corresponding to the script knowledge of each sub-process. In this case, upper level script knowledge plays the role of meta-cognitive skills controlling the execution of lower level scripts.

### ***Informatic and Systematic Views and Ways of Thinking: As Meta-Cognitive Skills***

Meta-cognition consists of meta-cognitive knowledge and meta-cognitive activities (Sannomiya 1996). The

former refers to knowledge of one's good/poor problem-solving methods and the appropriate application of a method to each situation. Meta-cognitive activities consist of monitoring and control. Monitoring involves evaluating present states, perspectives, and problem-solving results, while control involves conducting goal setting, planning, and improvement of activities. This explanation calls to mind the fact that upper level script knowledge plays the role of meta-cognitive skills controlling the execution of lower level scripts, as previously mentioned. Moreover, the informatic and systematic views and ways of thinking that are explicitly embedded in each process of script knowledge also control the tasks in each process. Therefore, I consider there to be different types of meta-cognitive skills.

Matsuda (2003) pointed out that informatic and systematic views and ways of thinking are deeply associated with 12 "recurring concepts," as identified in the Computing Curricula 1991 of ACM/IEEE-CS Joint Curriculum Task Force (1991); these concepts frequently emerge in discussions on a computer science curriculum. The 12 recurring concepts contained many items that are similar to the core concepts required to be taught at the ITEA (2007). In this study, I emphasize views and ways of thinking for the following reasons.

First, views and ways of thinking are procedural and suitable for explicit instruction. For example, to date, I have not met any student teacher who reported learning "recurring concepts" in a computer science class. Second, views and ways of thinking are easy to clearly show where they should be explicitly utilized in each process, as Hirabayashi and Matsuda's framework showed. Third, since mathematical views and ways of thinking are typical examples—because they correspond to the operations used to transform the representation of a problem sequentially and prospectively—they provide a framework by which to solve a problem from different perspectives. Based on these three reasons, I argue the necessity for informed instruction on the utilization of views and ways of thinking in connection with tasks in the script knowledge of problem solving.

What remains of importance is the relationship between views and ways of thinking and the domain-specific knowledge required to utilize them. For example, people need to have knowledge of the good points of results and the methods of problem solving in order to utilize one aspect of informatic and systematic views and ways of thinking, that is, "consider many good points."

### ***Domain-Specific Knowledge***

Domain-specific knowledge is modeled by means of the semantic network (Collins & Quillian 1969). Since long-term memory is not lost but only temporarily unavailable, the student model has to be able to explain how this knowledge can be activated and utilized.

Toward this end, first, Matsuda's model emphasized the chunking of knowledge like frame (Barr & Feigenbaum 1981). The model also assumed that if students recognize the importance of chunking, they might learn a mechanism by which to acquire all related knowledge by themselves, maybe by using views and ways of thinking as study skills.

Second, the reconstruction of acquired knowledge for changing the direction of connection—both among different types of knowledge and between knowledge and situation—is very important. In general, domain-specific knowledge is taught using a buildup approach. However, in real situations, people do not use knowledge in this order. Therefore, students need to have the opportunity to reconstruct knowledge in a manner analogous to real life situations, or they have to learn knowledge in a real situation.

Third, the strength of knowledge connections is important. Matsuda's model applied Keller's (1987) ARCS (attention, relevance, confidence, satisfaction) model of motivation to explain the strength of connections. For example, relevance is heightened by emphasizing reasons and situations that require the activation of specific types of knowledge; further, experience of the appropriate uses of knowledge to achieve the goal should heighten confidence.

## REVISION OF THE DESIGN FRAMEWORK AND E-LEARNING MATERIAL

Based on the discussion so far, I improve Hirabayashi and Matsuda's design framework as well as an e-learning game material. Hirabayashi and Matsuda developed three games corresponding to the first three of four units in "Information Study for Participating Community." For the purpose of this study, I use the "Designing an Effective Presentation" game, developed for Unit 1. Many teachers have conducted ineffective lessons in this unit, and Matsuda and Tamada (2012) consequently used this unit as an example of a virtual lesson game.

### *Goal Setting Process*

In the previous design framework, the purposes were to understand and analyze the goal and the conditions of the problem, and to determine sub-goals and a plan for the work. Therefore, informatic and systematic views and ways of thinking such as "consider better solutions while focusing on various values" and "generate ideas for solutions from the viewpoint of how to collect and process information" were expected to be utilized. The design process of the ITEA (2007) and the problem-solving process defined in the NCoS guidebook have corresponding sub-processes. In addition, in a mathematical problem-solving process, this process corresponds to the sub-process of generating mathematical representation of the problem in the real world.

Therefore, in this process, a mission is provided as an input in the form of an ambiguous expression; learners are required to define the good points of solutions and alternatives and constraints as outputs, such as available information and time restrictions. In order to generate outputs from inputs, learners need to perform a series of tasks while focusing on the appropriate and efficient use of ICT. However, to do this, it is very important to choose an appropriate problem setting in order to focus learner's activity on achieving the learning objectives of informatics studies.

For example, in the case of designing presentation slides, whether students can determine the theme, content, and materials freely or whether they can only arrange some of them according to specific purposes and constraints will affect the necessary tasks they are required to perform not only in this process but in other processes as well. The original game material adopted the latter condition—of arranging according to purposes and constraints—and the scenario was to allow students to make presentation slides by summarizing the report they wrote themselves. Finally, they had to make a presentation in front of all the school students. This scenario has an additional condition; the presentation slides will later be published on the web site. These conditions are closely connected to the objectives of this unit. Students learn the differences in property between materials and information; for example, information is easier to duplicate and convert than materials, but it is necessary to consider the protection of copyrights and confirmation of credibility. Therefore, students should learn methods to increase the efficiency of problem solving by reusing and converting information appropriately. If students have to consider the content in the slides, it will take them too much time to repeat the problem-solving cycle. Moreover, although students may pay attention to content design because they consider it to be important when evaluating each other's presentations, this point is not very closely associated with the utilization of ICT.

Related to the above issue is the fact that the domain-specific knowledge studied in this unit is limited to differences in properties between materials and information, features of digital information, digitization of numerical-values/characters/images/sounds, input devices of varieties of information, process of problem solving, and multimedia design. Devising expressions of language, images, or sounds, and mastering presentation skills do not form part of the content in this subject area, but these skills should be learned in other subject areas. However, many teachers inadequately emphasize the importance of these skills in their lessons, especially in the exercises contained in this unit.

Therefore, in the new design framework, after listing down all the possible tasks, it is necessary to discriminate between tasks that are appropriate and inappropriate for information studies. This helps to eliminate lessons that are inappropriate for this subject area. Similarly, it is important to distinguish between the domain-specific knowledge necessary to be learned in information studies and the knowledge that depends on a specific mission, which can then be forgotten after the mission is achieved.

In addition, teachers can instruct students on problem-solving techniques—such as brainstorming and the Kawakita Jiro (KJ) method—to be used as general strategies and the domain-specific knowledge concerned with examining reliability of information and cultivating media literacy. However, although the former is useful for this unit, the latter is more useful after studying the properties of communication and network technology, which comprises the subsequent unit.

As main tasks in this process, students gather information to clarify the problem, that is, they utilize information to reduce the ambiguity of the problem, and they formulize objectives and constraints of the problem based on the information gathered. Students utilize methods for divergent thinking in order to imagine expected objectives and constraints, as well as information to confirm those expectations. On the other hand, students also utilize a method for convergent thinking in order to arrange gathered information. All these tasks require students to consider the practical use of ICT. Required information and its collection methods are the sub-problems that need to be solved recursively by means of the same problem-solving cycle. This enables the cyclic repetition of a game material on a small scale.

Finally, because the outputs of this process are not alternatives but good points and constraints—instead of informatic and systematic views and ways of thinking, as in the previous framework—the following views and ways of thinking are necessary for used in this process: “considering various good points,” “considering the trade-off relationship among various good points,” and “understanding problems from systematical perspectives.” Moreover, in order to clarify these, it is necessary to use the option of “considering varied information useful to solve a problem anytime.”

### ***Technical Understanding Process***

In the previous design framework, the aims of the Technical Understanding process were to acquire or confirm ICT knowledge, create alternatives by which to achieve the goal, and generate further alternatives that will minimize the demerits of the issue found in the Rational Judgment process. The design process of the ITEA (2007) and the problem-solving process defined in the NCoS guidebook have corresponding sub-process. Therefore, it is necessary to use informatic and systematic views and ways of thinking such as (1) “consider varied information useful to solve a problem anytime,” (2) “consider every trade-off relationship among values,” and (3) “choose a solution that satisfies the criteria to the greatest extent from among various alternatives.”

Since the output of the previous process turns into the input for this process, students need to generate two or more alternatives that will fulfill the constraints of the problem and achieve the objectives satisfactorily. However, in this process, students are not required to pay attention to constraints but need to focus on achieving objectives better by using divergent thinking, mainly because the constraints are examined in the Rational Judgment process.

In the Technical Understanding process, instead of only using pre-acquired knowledge, students are expected to investigate new technology in order to conceive a solution. At this time, they need to use option (4)—“considering varied information useful to solve a problem anytime.” If students try to gather information in order to use new technology, the same problem-solving cycle can be performed recursively as a sub-process, as in the Goal Setting process. However, when there are time restrictions, students need to determine whether to use new methods or conceive alternatives from known methods by examining the trade-off relationship between pursuing goodness of results and avoiding the risk of time running out. Although many Japanese teachers allow

students to perform practice sessions without any time restrictions and compliment their efforts, this tendency may result in problems like overworking in the workplace. It is important for a company to improve productivity, and ICT is usually employed to meet this goal. One possible reason that the educational use of ICT has not advanced in Japanese schools is teachers' misconceptions about ICT.

Because the purposes of the Technical Understanding process are to conceive alternatives —instead of informatic and systematic views and ways of thinking (1), (2), and (3) in the previous framework—following views and ways of thinking will be useful; “generate ideas for solutions from the viewpoint of how to collect and process information”; and “recognize that there are always two or more alternatives such as using or not using ICT.” Furthermore, when an improvement to an alternative is required after examining in the Rational Judgment process, “considering new ways to solve problems with utilizing ICT in the situations and fields that people consider to be difficult to solve” should be utilized.

With regard to the “designing an effective presentation” game, the previous game asked students to choose one of following choices for each slide: (a) use only text data in the report; (b) use newly collected or created data, including and other than text; and (c) use the functionalities of PowerPoint, such as word art, auto shape, animation, table, graph, macro. If students tried to use a new functionality, they were assessed on whether or not they had understood the usage of that functionality. If they did not understand it correctly, they would fail the game.

In the new game, I retained the above basic policy; however, the previous game does not assume to utilize report data with conversion. As already mentioned, the objective of this unit is to convert and reuse information by focusing on its merit. Therefore, I suppose that there are various types of data in the report, and then I raise the level of difficulty by increasing the choice of data and alternative methods of its conversion according to the repetition of the cycle. Moreover, to increase the difficulty level, my revised game requires students to consider problems associated with copyright protection and cyber ethics.

The tasks included in this process are closely related to the tasks in the Rational Judgment process. However, in the previous game, the tasks in these two processes were not at all connected. In addition, although the design framework included a task that had to be performed after returning from the Rational Judgment process, the previous game did not include this task because of the independence of these two processes. Therefore, I needed to add a task, for example, because there is a possibility of copyright infringement if students use the image data in the report and publish it on the web site. Therefore, they need to consider how to improve this alternative by maybe switching to other image data or texts, obtaining consent for use of the image data, and so on.

### ***Rational Judgment Process***

In the previous design framework, the purpose of the Rational Judgment process was to evaluate each possibility in terms of whether it raised any cyber ethical issues. Therefore, it was necessary to use informatic and systematic views and ways of thinking such as “examining the influence of errors and unexpected conditions and preparing to cope with changes in the case of such situations and unexpected accidents,” and “knowledge of rational judgment.” Although the design process of the ITEA (2007) has corresponding sub-processes, the problem-solving process defined in the NCoS guidebook does not have any sub-process.

The Rational Judgment process was set to integrate the method of “three types of knowledge” for cyber ethics education into the method for informatics education, which emphasizes the utilization of informatic and systematic views and ways of thinking for problem solving. Therefore, in this process, it is important for students to consider how to utilize ICT effectively, while simultaneously avoiding the negative influences of ICT use. As mentioned previously, the task for improving the alternatives is performed in the Technical Understanding process. However, sub-goals for improving each alternative should be considered in the Rational

Judgment process because these sub-goals focus on why the alternatives should be improved. To meet these ends, students need to follow informatic and systematic views and ways of thinking that are additional to those utilized in the previous framework: “considering the trade-off relationship among various good points”; “considering good points should be changed according to situations and decision-makers”; and “considering the clarification of a procedure and sharing of a rule in decision making to avoid problem.”

As mentioned in the previous section, this process asks students to critically examine “a good alternative” that was generated in the Technical Understanding process. However, in the previous game, these two processes had no association, and the problems that occurred in the Rational Judgment process were completely unrelated to the alternatives conceived in the Technical Understanding process. Therefore, in the new game, I put forth a problem related to copyright infringement, as mentioned in the previous section. I also added yet another problem: when faced with time restrictions, how do students evaluate trade-off relations between giving up and not designing better slides, and taking the risk of time running out and not finishing the work but designing better slides.

### ***Derivation of Optimized Solution Process***

In the previous design framework, the purpose of the Derivation of Optimized Solution process was to choose the optimal solution from among various evaluated alternatives and share the ideas and methods useful for problem-solving activities in a group. The following informatic and systematic views and ways of thinking are expected to be utilized: (1) “focusing on sharing the procedures and rules used to solve problems and communication in order to avoid errors and problems”; (2) “choosing a solution based on evaluating the good points”; and (3) “making a decision by being aware of one’s own responsibility for the results and its influences on other people.” Although the design process of the ITEA (2007) has corresponding sub-processes, the problem-solving process defined in the NCoS guidebook does not have any sub-process.

In the framework for the previous game, students were required to perform few tasks in this process, and they were provided with feedback messages for their choices in each process. This was because the alternatives were listed as choices in the Technical Understanding process, and students were asked to select one alternative in that process.

In the new design framework, to avoid this contradiction, all alternatives that satisfy constraints in the Technical Understanding process become the inputs for the Derivation of Optimized Solution process. Moreover, I define the task of this process as choosing the best alternative as the solution, while using views and ways of thinking such as “considering trade-off relationship among various good points,” as well as (2) and (3) from the previous framework. The solution and reasons for its choice become the outputs of this process. In addition, to evaluate consistency, students are asked why they did not choose other competitive alternatives. Furthermore, in the new design framework, sharing of useful ideas and methods is moved to the Reflection process.

### ***Consensus Building Process***

This process constitutes a new addition to the game, but it is not always required. Neither the design process of the ITEA (2007) nor the problem-solving process in the NCoS guidebook mentions a corresponding process. The purposes of this process are to explain the solution that a student judges to be optimal toward decision-makers and to ask for a decision when the student is not the only decision-maker.

It should be mentioned that the aim of this process is not to insist on one’s own proposal. First, in the Goal Setting process, it is important that students investigate which good points other decision makers consider important. Second, in the Rational Judgment process, students should try to modify alternatives by paying attention to various good points other than the ones they consider important. Third, in the Derivation of Optimal

Solution process, the students' reasons for choosing the solution should be rational. Finally, in the Consensus Building process, if another student comes up with a better proposal, then students should agree to that solution. For example, even if students try to gather information in the Goal Setting process, there is a possibility that the decision makers would not have determined the weights of the good points; then, there is a high possibility that a person's proposal will not be adopted. Moreover, in such case, if two or more persons propose alternatives, it might be better to choose a unique solution instead of those proposed in the Derivation of Optimal Solution process.

### Review Process

Although the problem-solving process in the NCoS guidebook contains the "Evaluation of the Result" process, the design process of the ITEA (2007) does not have a corresponding process. This process is very important in the simulation and gaming method as well as in Hirabayashi and Matsuda's design framework, because learning is not expected to be undertaken during the game plays but during the Review (debriefing) process. Therefore, it is important for learners to repeat the cycle twice or more within a short period.

In this process, students should be prompted to self-evaluate their activities in order to improve the utilization of views and ways of thinking based on the logs; students should also reconstruct domain-specific knowledge by choosing useful information that should be memorized. The previous design framework did not take into account the reconstruction of domain-specific knowledge; however, according to the student model, it is very important to promote the activation of knowledge in appropriate situations.

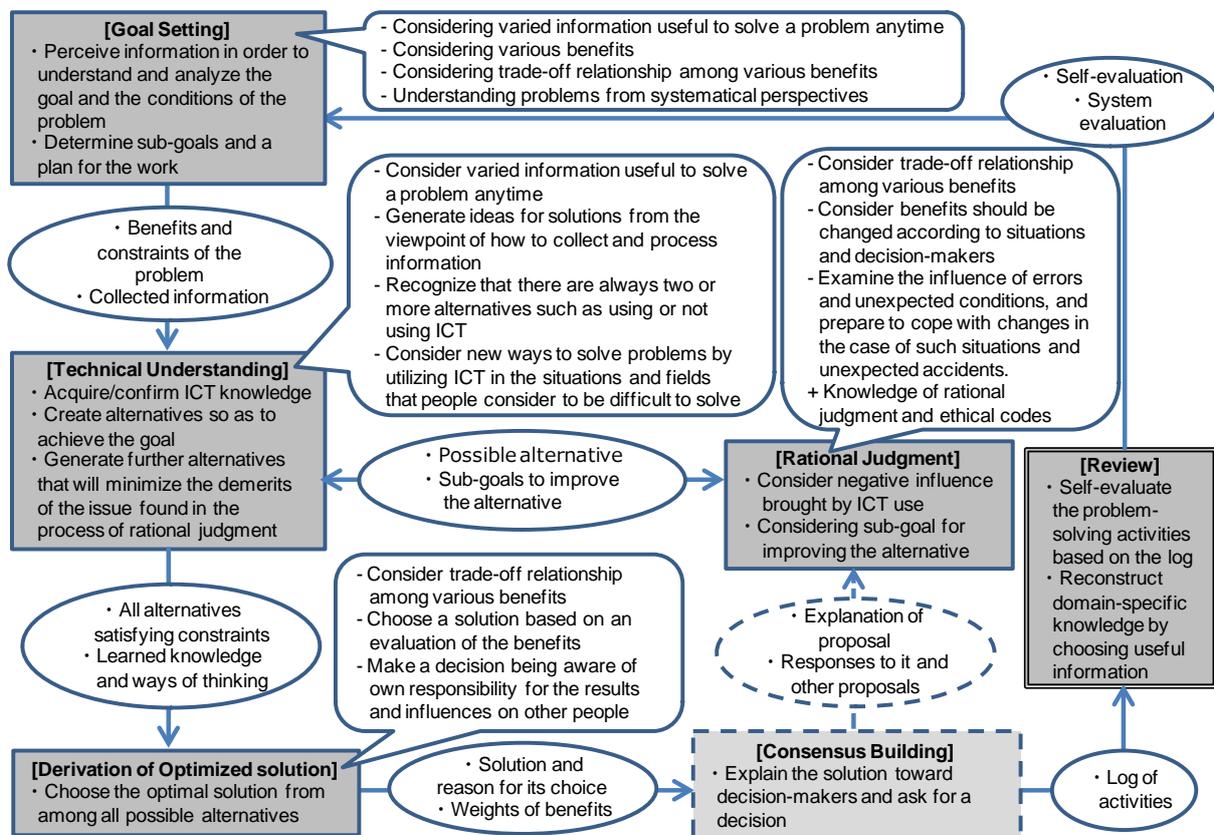

Figure 2

Revised design framework of the e-learning game materials for information studies.

## FUTURE PERSPECTIVES

In this paper, I discuss a student model for informatics education in order to examine how learners acquire domain-specific knowledge and how they utilize views, ways of thinking, and problem-solving strategies. Based on the model, I improve Hirabayashi and Matsuda's design framework of e-learning game materials for information studies. Concurrently, I revise their "Designing an Effective Presentation" game.

By way of future research, I aim to conduct experiments using the revised game to determine the effects of this revision. Moreover, I will analyze the logs of students' activities to examine the validity of the student model and make suggestions for its improvement and refinement. Furthermore, I will use this game to explain the student model in a teacher education course in order to confirm the game's effects in facilitating improvement in teachers' lessons.

## ACKNOWLEDGEMENTS

This research was supported by JSPS KAKENHI Grant Numbers 23501137 and 24501208 and the foundation for the Fusion of Science and Technology (FOST).

## **Abstract**

*Cancer medicine compared to the national education in DR Congo from primary school to university. This work Attempts to find the root of the cancer, to give the deep causes and ways to remedy this, a survey of the struggle against the anti-values Conducted by the Ministry of Higher Education, University and Scientific Research (ESURS) allowed us to Participate Whose recommendations are discussed and Proposed. Criteria: such as: overall score, education and research, industry revenues and the international visibility to less and less Decreases come to disappear for DR Congo Without any worry. The DR Congo MIN.ESURS of UNESCO, the World Bank, All which continued to fight against anti-thesis gains should Regulate the payments and interest of teachers encourage students to excellence in scholarship, publish the moral values of Each teacher and educate students, teachers and administrative staff.*

**Keywords:** higher education, DR Congo, ant value, decline.

## **1. Introduction**

Anti-values that grow by proliferation and kill the leadership of social integrity. In schools and universities institutions, they have made a strong decrease of civil society and incompetence in professional life. It's possible to find the source, the causes of this so-called cancer poisoning harm and propose means of combating it.

This survey tries to give a modest contribution to the broadening of reflections on anti-values in higher and university education as a good university is an appropriate framework for education in democratic values. "We cannot change the world without turning men." So the nation ales and international conferences, journals and annual reports on anti-values in higher education in DR Congo and Africa have allowed us to have this story. Despite this, the entities and the international visibility of higher education and university disappear less for sub-Saharan Africa.

In a first point, we try to present and briefly describe and gradually the root of this cancer (anti-value), which is an obstacle to development. Problems that are caused by this cancer from the viewpoint education, politics, society, etc... in the national and international environment will be related in the second point. The third point is mainly focused on the technical and remedies to fight against these scourges (cancer virus) in higher and university education.

An educational reform is always the goal and proof of social transformation. This study describes: the root of the cancer, the root causes and strategies to fight finally have a positive 2020 for the emerging nation.

## **2. Methodology**

Cancer, comparing it to that of National Education of the Democratic Republic of Congo is defined as beginning anti-value lowest (family, kindergarten and elementary school) and develops in the mind of the person.

This cancer is a malignant tumor that lies in the core of education. "A fish begins to rot at the head and not the tail"<sup>1</sup> "so this root comes only from the family (parents), institutions (schools and universities) and policy makers (the country's authorities, academia, the instructors). In DR Congo, cheating starts with the head. From independence to date, no stability of institutions is only possible conflicts and wars that influence cancer.

- This cancer is produced by:
- Interethnic conflicts
- The lack of a patriotic spirit
- Tribalism in higher and university education.

The majority practitioners of anti-values are better organized and plan a more education that research.

Currently in DR Congo, democracy is not applied, the non-compliance handbook (university constitutions), human rights either, this is just a slogan.

Congolese universities (Université Nationale du Zaïre time now University of Kinshasa, ISC, ISTA...) who were counted among the great universities of the world through its diplomas come with more features, but these degrees are now challenged even in other countries in Africa. This decrease does not bother anyone.

Many sources are in corruption among teachers, school authorities and students. Cheating, sexual violations in schools, sexual harassment practiced between teacher and student finally ensure the success of the student who lack money: are current practices (Sexually Transmitted points). Recommendations from colleagues, but they are used as an act of placing or place themselves under the protection of someone said "I have a Nganga"<sup>2</sup>. Boys may umbrellas if they have money, about the girls, they do leave for lack of means. But it is more deplorable is that the Congolese institutions is that the people who practice it are well known by students and colleagues their own service (teachers, academic or administrative authorities) but they are not punished. Students who are not excluded and not punished, instead they are the ones who practice it more successful and become wizards. Those who force themselves to work on their own intelligence are excluded or NAF (not allowed in the faculty).

The student does not have the ability to acknowledge a teacher in practice; such an accusation is not considered and pursued by the authorities. As we have said, "a fish only begins to rot from the head ...". So this phenomenon originated from the authorities. Some authorities to maintain this, many committee members are changed if they are in line to fight against these anti-values.

Students (pupils) are harassed by teachers, since in doing so, they will be provided in class. For a position, begins corrupting the summit.

Some questions we ask:

- This practice isn't rape made the woman?
- Associations of women do not want them on this?
- Human Rights and those of women ill-treat cannot take solution?
- Teachers in practice they may not to worry?

The answers to these questions will study several researches finally fight against cancer.

---

<sup>1</sup> Natural Observation by housewife

<sup>2</sup> Username language Lingala (Congo DRC) who means clustering magician or sorcerer

An assumption of the professionalization of higher and university education in the Democratic Republic of Congo is characterized by different ways in which the roots of this can turn into cancer: the proliferation of tomorrow's world with the term "bribe";

### *2.1. How to straighten weak level development of our higher institutions?*

Indeed, knowledge is a set of scientific and technical data that is acquired through research and experience<sup>3</sup>.

Tertiary institutions in the Democratic Republic of Congo suffer from inadequate equipment in table 1 below explains.

*Table 1: Capacity and actual enrollment in public institutions in Kinshasa 1989-2000<sup>4</sup>.*

	Capacity (Assize places)		Students effective				
	Initial 70/71	Real in 99/2000	89/90	90/91	98/99	99/00	Utilization
<b>UNIKIN</b>	5000	10150	10452	12525	31387	34526	240
<b>ISTA</b>	3591	13000	5169	5815	10449	14460	11
<b>INBTP / ISAU</b>	1616	1134	2488	3093	2481	2210	94
<b>ISTM</b>	1532	*	2515	2728	4726	5409	253
<b>ISC-KIN</b>	1572	5194	6303	11112	15980	15919	206
<b>IFASIC</b>	115	*	361	380	1038	1119	87
<b>ISAM</b>	115	325	115	192	770	863	165
<b>INA</b>	149	*	149	223	476	791	43
<b>IST-ABA</b>	269	100	481	499	736	854	754
<b>UPN</b>	3544	8456	5811		10312	11065	31
<b>ISP / GOMBE</b>	453	965	859	848	1084	1603	66
<b>ISPT / KIN</b>	50	314	50	366	328	399	27
<b>Total</b>	<b>18006</b>	<b>39638</b>	<b>34753</b>	<b>37781</b>	<b>79767</b>	<b>89218</b>	<b>111</b>

*Table 2: Level of training between public and private institutions*

Establishment	% Of students in the DRC	% Of teachers in schools	Level of training (theory and practice)
<b>Public institutions (ISTA, ISC, ISP ...)</b>	25%	40% of teacher, 60% of CT and Assistants	Average (55% theory, 30% practice)
<b>Private institutes (ISIPA ...)</b>	10%	10% prof, 90% of CT and Assistants	Low (45% theory, 40% practice)
<b>Public universities (UNIKIN, UNILU, UNIKIS ...)</b>	50%	70% of teacher, 30% of CT and Assistants	High (60% theory, 20% practice)
<b>Private universities (USK, ULK ...)</b>	15%	15% of teacher, 85% of CT and Assistants	Average (55% theory, 40% practice)

As regards the level of training, we present the theory, practice and the rest percentage is for personal research students.

One constant is that in public institutions, we note that the personal search for each student is 15% on the 55% theory and 30% practical. As institutions private institutions, there is a balance between theory and practice for the 45% and 40%, having 15% of personal research.

For public universities, with its high training among institutions in the country has 60% theory, 20% practice and keeps 20% of personal research. And as for private universities,

<sup>3</sup> La professionnalisation de l'enseignement supérieur et universitaire au Zaïre ; option des utilisateurs du secteur de l'enseignement secondaire. p12

<sup>4</sup> Le système éducatif de la république démocratique du Congo, priorités et alternatives, p123

in part, they retain 55% of theory, 40% practice and 15% for individual research of each student.

These ideas are not exhaustive because:

Institutes and public universities, academic costs are lower, the democratization of scientific body, which is why we find more teachers (those who can maintain the integrity of education), and Assistants or Head Works.

While in private institutions, scientific bodies are motivated, academic fees are higher than public schools.

Table3: Balance of public and private institutions.

Public Institution	Private property
<b>Academic fees is least expensive</b>	Academic fees costs isn't least expensive
<b>Teachers are not motivate</b>	Teachers' motivations
<b>Difficulty of exchange of the teachers</b>	Easiness of exchange of the teachers
<b>Over theories than practices</b>	Under theories than practices
<b>Dispense a strong and distinct education regardless of income</b>	Exemption low education taking into account income
<b>More professors (Ph.D) that wizards and Heads of work</b>	Low professors (Ph.D) that wizards and Heads of work

## 2.2. Subsidy funding and the Education

The composition of public education expenditures (including expenditures central and local government and foreign aid), shows that investment in higher education is very low in the order of 2%

Table 4: The evolution of public expenditure (World Bank)

	2005	2006	2007	2008	2009	2010	2015
<b>Total public expenditure (millions of CF)</b>	<b>190044</b>	<b>232828</b>	<b>244296</b>	<b>277809</b>	<b>315514</b>	<b>303284</b>	<b>509158</b>
<b>Total public expenditure (\$ million)</b>	<b>514</b>	<b>629</b>	<b>660</b>	<b>751</b>	<b>853</b>	<b>820</b>	<b>1376</b>
<b>Composition of public expenditure dies (%)</b>							
<b>Common</b>	33%	37%	49%	55%	63%	73%	71%
<b>Staff</b>	22%	21%	25%	24%	24%	28%	30%
<b>Non-staff</b>	11%	16%	24%	31%	39%	45%	41%
<b>Investment</b>	67%	63%	51%	45%	37%	27%	29%
<b>Dice current public expenditure (\$ million)</b>	<b>95</b>	<b>150</b>	<b>219</b>	<b>301</b>	<b>413</b>	<b>450</b>	<b>686</b>
<b>Re partition sub-sector (in %)</b>							
<b>Pre school</b>	0%	0%	0%	0%	0%	0%	0%
<b>Primary</b>	51%	56%	60%	64%	69%	71%	72%
<b>Secondary</b>	33%	31%	28%	25%	21%	19%	20%
<b>Higher mirthful</b>	16%	13%	11%	11%	10%	9%	7%
<b>De think government investment (million \$)</b>	<b>191</b>	<b>260</b>	<b>229</b>	<b>247</b>	<b>243</b>	<b>162</b>	<b>284</b>
<b>Re partition sub-sector (in %)</b>							
<b>Pre school</b>	0%	0%	0%	0%	0%	0%	0%
<b>Primary</b>	85%	87%	86%	87%	94%	94%	52%
<b>Secondary</b>	13%	11%	12%	11%	6%	6%	48%
<b>Higher mirthful</b>	2%	2%	2%	2%	0%	0%	0%

The Congolese government is unconscious for some countries preschool basic support children kindergarten through elementary school. A subsidy is to consider the government of national unity in 2014.

### 2.3. Low intelligence students<sup>5</sup>

This weakness is characterized by the five forms of cheating and two for corruption. For those of cheating, the document states: copy and paste (plagiarism), verification, collaboration or cooperation, missiles or insurance (which could become bombs) and copyright.

Copy and paste: the act of plagiarizing a literary work slavishly for personal purposes. Verification or cooperation refers to the fact for students to communicate the answers during the examination (interrogation, examination or tests). As for missiles, these are pieces of crumpled papers that students are getting quietly during the tests in order to communicate the answers, It become bombs if they are intercepted by the supervisor.

Copyright (not to be confused with the rights granted to the author of a literary, scientific or artistic work fully use revenue from its work of mind) is a form of conditioning students for success in a course upon purchase of syllabus (course), TP or other leaflets summarizing the subjects taught

Regarding corruption in the upper and academic institutions, we are two: the connection or enlisting and hallway (the *suivilogie*<sup>6</sup> or monitoring).

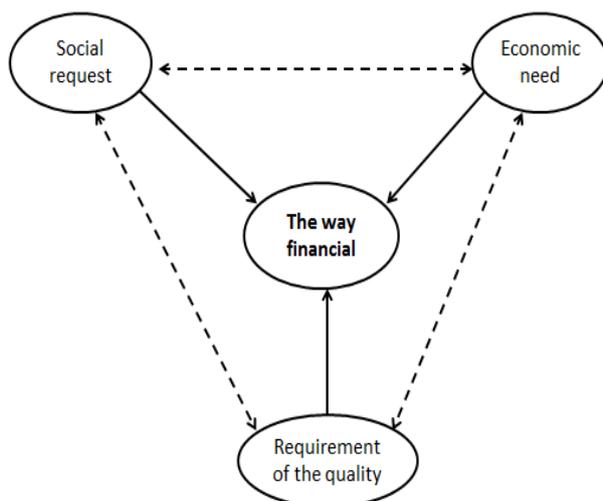

The connection is a practice that is to set up each time after an examination or test question, a list of students seeking points with the teacher of the course holder or his representative, together with a full wrap banknote. The corridor, monitoring or *suivilogie* is a practice of conducting approaches in order to obtain the change in odds poor payment of a sum of money. The existence of an anti-value necessarily involves two people: one who does the action and one that is acted upon. Moral and legal level, both are punishable.

To believe the leaflet Ministry, cheating as corruption has consequences both in terms of its author and of the entire community.

Whoever cheats and corrupts gets a big distinction. While he's an empty shell... This is the case that we find a state-certified unable to write his name or two short sentences properly. But at the community level, corruption and cheating throw discredit on the quality of the training provided in the upper and academic institutions.

### 3. Resultants

#### Structure of a good higher education

The principle simulation of the keys for a better growth of higher and university education for social development element. The first circle is to open access to higher education broadly and as fair as possible. The second is to provide quality educational services both in the field of education than in research. The third tag assumes that the system meets the actual demands, both in quantity and quality, the society and the labor market. The fourth is that the developed structural strategy is fiscally sustainable given the available national resources, external resources that could be mobilized and public cross-offs. Although the demand for quality is difficult to

But if the nation fails to make this concrete

structure, we obtain negative causes such as:

<sup>5</sup> Brochure Ministry of higher university education and scientific research. February 2013, p. 1-2.

<sup>6</sup> Term used by students at the university for to pursue the teacher at last for aid them the points at the course

- The production of several diplomas, but few calcified, because those who practice anti-values remain only empty shells. It's the case that we remark that a baccalaureate unable to write his name correctly é or two short sentences.
- The questioning of our diplomas in Western, same in the resident country. During that they produce Engineers civilians, technicians, builders, architects such as Town planner, but we invite others to come, to fit and modernize the city then that they product each Grad also qualified.
- The difficulty to the market of employment and all that falls on the government. It the case that they remark a Lawyer is unable to make his job, a Management or Marketer unable to create a job.

This is proving the *decay* of higher education and university.

As this is the man that is the basis of all these evils, the only man who can stop, but at or these roots came, we would meet and perform certain rules. We include some *remedies*.

Professor MPEYE Nyango proposes to examine the strengths that the university owns or rather should have to contribute effectively to the promotion of peace in DR Congo<sup>7</sup> and in other countries:

Peace - Democratic - Development = a Dynamic.

A Dynamic = Identifier - Resolving Conflict - Critical analysis solutions.

= University Centre of knowledge production, of thought.

Peace within borders: organization and lived social relations between citizens.

Peace out = border.

= University Partner of the Government and society.

After finding peace in all national borders, we finally propose some technicalities to fight against these anti-values:

### ***3.1. The technicality to uproot this cancer***

This work is not only a responsibility of government; we must all hand in paw. This is a responsibility of everyone: *parents, academic authorities, teachers and administrative staff, students, and the environment.*

#### ***3.1.1. Charge parents***

To protect their child in school is essential. They must be existing bodies function, especially for Parents Committees play a role in monitoring and warning of dangerous behavior manifested in an institution. They should be especially supportive and fight together. Control is often more difficult. Many parents are illiterate, sometimes complex with their children "high" school. Often they are not even concerned about what is happening in their children's schools. Also, parents should as much as possible contact with the institutions to ascertain the behavior of their children.

Parents and academic leaders must be models to be credible. What may be the credibility of a director, a teacher who sexually harasses her students? Who practice favoritism: children watching? And this is not because they tell us nothing they think less.

#### ***3.1.2. Academic authorities***

There is currently a problem in the management of institutions, often reported by the authorities. It is the lack of training on the management of academic institutions; they must manage the pedagogical issues (educational support for students and teachers), financial issues. Often, we find that even the administrative practice of handing back when a change is not made responsible. The lack of

---

<sup>7</sup> L'université de l'an 2000 et la vision de la paix en République Démocratique du Congo, p86

monitoring control of students and teachers, through ignorance, consciously or laziness is a multiplication factor of negative behaviors in schools. These officers should receive regular information updates and reminders of their duties.

The knowledge of the rules and conventions, a student community cannot be managed without payment and without compliance. Accustom students to respect the law and regulations; it is still necessary that they are aware of these rules. It is also essential to explain the serious consequences of certain behaviors. Example: the dangers of corruption and cheating in the future life, drugs, alcohol... A child who behaves correctly should be rewarded, the offender shall be punished, and especially it must also know why it is sanctioned.

### **3.1.3. Teachers<sup>8</sup>**

Teachers, given the serious mistakes that some of guilty, we can conclude that there is a lack of training and preparation for business, especially with regard to professional ethics. There is also another, a situation deplorable, consecutive unemployed young graduates.

These pending "having a job" will teach. We thus find agronomists teaching mathematics, citizenship... in college, so they never learned to teach. Teach is to implement a set of practices, techniques that learn to impart knowledge and know-how / be is to respect a number of ethical rules related to trade.

It does not do anything in a class or with students. Individual responsibility of teachers is to take account of course for serious misconduct which some are guilty, but the way they are prepared to exercise their profession is also questionable. A reform of the training of teachers at all levels of education is essential if we want to correct the situation in schools.

### **3.1.4. Students**

Students also are not excluded. Case of students who take the initiative to bribe teachers or academic authorities, sometimes with the complicity of parents. We must also recognize that the way they are trained gives them little openness. Many of their behaviors identified above prove that they take risks for short-sighted interests. Cheat or get pregnant can demolish all his training.

### **3.1.5. The environment**

The student environment is somewhere responsible for indiscipline in schools situations, due to the indifference of the surrounding populations. Indeed, the tenants of pubs nearby establishments hide students who drink pimps, "sell" to young female students, the sales networks of narcotics. We really cannot believe that all these crimes are not seen, recognized by neighbors, relatives ... Is this-the police and the administration does not know?

An impunity environment is a major obstacle in the process of raising a child. *"Impunity is the number one enemy of change"*, because the beneficiaries of impunity does not accept so easily lose its benefits. Impunity gives a pleasant feeling of power and tranquility. Guilt eventually disappears. Fault eventually losing quality fault, the thief finally boast of his exploits thief...

### **3.1.6. The government**

#### **3.1.6.1. Fight against cultural separation from the other cultures has earning**

- Awareness of students and academic staff;
- Respect Vade Mecum (the constitution academic) and its application.
- To put the authorities who have a valid ethical as a member of the committee management and the canal's authority.
- Publish each year the moral values of every teacher and institution.
- Courses and seminary knowledge of the country and the problems of development.

---

<sup>8</sup> Ndayisaba Joseph, Negative and antivalues school behavior: the case of Burundi, p12

- Language learning: it is important that at the end of his studies university, each qualified must understand at the least the French and English. Which it musts a revision content and methods of education.
- The initiation other cultures by conference-debate, debate contradictory and democratic, seminary, emissions (medias). And find solutions to conflicts
- Encourage e the students establish organizations of democratic, transparent and actively participate.

### **3.1.6.2. Against the bulkhead regional and ethnic by the mobility**

We find:

- A difficulty of materials essentially of economic order: moving expensive.
- A difficulty é political (ethnic conflict): *geopolitics* ' of turning to the decade 80-90 up to date is accompanied by a sharp rejection of the other removal of *non-nationals*.
- A difficulty security: unrest, wars and rebellions in regions and in the capital.

The State should consider promoting

- The mobility teachings and students by appropriate politic.
- The encouragement to the registration of non-originating;
- Scholarships, excellence's price and travel, etc...
- Consisting of a salary to teachers, personal academic, etc..

### **Conclusion**

Changing habits and practices, especially the poor, is always difficult. In sub-Saharan Africa, are developing a teacher receives a salary unsatisfactory, it can be a major source of this root. Even where the teacher is better paid, corruption is not lacking. The noble profession of a teacher universities, teacher or researcher does not depend on money or result salary, but the passion of the character, because "happiness is not in the goods that we has, but rather in the satisfaction of the portion that is allocated." DR Congo, corruption and anti-values are planned, organized better than teaching and research. Even the authorities recognize.

We see that clearly identified the culprits escape punishment because of support and protection they receive from high persons in the administrative hierarchy, judicial or police. We must accept that we need to change, denounce evil, set goals, milestones, and can provide the effort it takes to achieve them.

**Abstract**

*This paper examines the mathematical knowledge of Grades 3-5 elementary teachers during a week-long professional development experience focusing on geometry, measurement, and fraction concepts as described in the Standards for Mathematical Content articulated in the Common Core State Standards of Mathematics (CCSSM). The data were gathered during a one-week professional development project conducted in large school district in the southwest United States, and address the specific sub-goal of increasing teacher content knowledge in geometry and measurement concepts in the Common Core State Standards for Mathematics.*

**Introduction and Related Research**

The professional development project reported on in this paper engaged participants in classroom discourse, effective instructional strategies, and hands-on learning activities to increase their content knowledge of specific Common Core State Standards for Mathematics (CCSSM) content and practice standards (National Governors Association Center for Best Practices, Council of Chief State School Officers [CCSSM], 2010) as part of a long-term effort to increase student achievement. Classroom mathematical discourse

was chosen because of the central role it plays in shaping students' mathematical capacity and disposition (Ball, Lubienski, & Mewborn 2001; Schulman & Schulman, 2004; Stein, 2001). The focus of our research revolved around the following question: What impact does professional development focused on classroom practice related to specific Common Core content and practice mathematics standards affect elementary teachers' content knowledge across those Common Core content domains?

According to Carpenter, Franke, and Levi (2003) the very nature of mathematics presuppose that students must engage in discussion in order to learn mathematics. Lamberg (2013) supports the inclusion of professional development for teachers related to their understanding of, and strategies for encouraging communication of their students as she states, "By focusing on how students can communicate mathematical concepts, both the Common Core State Standards and the NCTM standards naturally support a whole class discussion approach to teaching math." (p.3). An emphasis on communicating mathematically provides students with the opportunity to demonstrate understandings and at the same time alerts teachers and students to possible misconceptions. According to Lamberg (2013), the goal of improving teachers' ability to use communication strategies in classrooms is such that, "Teachers need to understand how classroom discourse will help increase student learning and improve test scores," (p. xiii).

Cave and Brown (2010) emphasize that through communication and discussion students can be given opportunities to examine mathematics through various forms including manipulatives, words, diagrams, symbols, graphs, tables (see, Boaler, 2008). Students can have conversations where they act like teachers by asking questions, rephrasing problems and questions, justifying the reasoning used in their solution strategies, and providing formal or informal justifications to support the validity of their reasoning. Students use higher-order thinking skills when they uncover or discover mathematical principles, concepts, and relationships. To actively facilitate classroom discourse, teachers must have content knowledge in order to know the range of mathematical ideas students may need to work on in a given mathematical problem. Teachers who are aware of multiple paths that lead to appropriate solutions of problems, and know and use strategic questions to guide students down any one of those paths,

assist students in their quest to learn more mathematics and in more depth.

The National Research Council (2001) has characterized elementary mathematics teaching and learning in the United States as too often limited rote experiences that do not boost mathematics thinking. D'Ambrosio, Boone, & Harkness (2004) point out that teachers may have limited content knowledge which may translate into a dislike for more in-depth explorations of mathematics content, such as proposed by the CCSSM, especially that some content was moved to earlier grades in CCSSM compared to prior curriculum arrangements. Weaver and Dick (2009), studying the results of a mathematics leadership institute project, found that after three years of summer institutes, teachers showed significant overall improvements in their content knowledge and “The degree to which the professional development utilized well-defined professional learning tasks and protocols developed by the project staff and modeled during the Summer Institutes,” (p. 70) were traits of an implementation scale that were correlated to student achievement.

The professional development was also designed to focus on understanding the progression of the CCSSM standards and effective research-based instructional strategies including classroom discourse, hands-on instruction and engagement strategies that promote achievement in mathematics for elementary students. The project specifically addressed the following CCSSM standards: Grade 3 Measurement and Data Standards 1–2 and 5 – 8, Grade 4 Measurement and Data 1-3 and 5 – 7, Grade 5 Numbers and Operations – Fractions 3– 7 and Grade 5 Geometry 1– 4. These were chosen because of the district students' historically poor performance on Criterion Reference Tests in these domains.

### **Methods and Findings**

Sixty-nine elementary teachers participated in the professional development: 23 third-grade, 21 fourth-grade, and 25 fifth-grade. The selection of teachers was made through an application process that gathered input from building principals to ensure participants had the capacity to develop best practices to support the sustainable implementation of mathematics content including working with others outside the classroom. As such, after the professional development (PD) teachers were expected to share information at their respective schools concerning what they learned as a result of the professional development particularly with regard to learning progressions, Standards for

Mathematical Practice, and effective instructional practices for enhancing student achievement.

Participants engaged in a one-week PD to understand the content, depth, and rigor of CCSSM mathematics content and practices. Participants engaged in hands-on instruction that discussed various solution strategies, alternative student conceptions, effective questioning techniques, and justifying solutions by reasoning as they extended their own understanding of mathematical content knowledge appropriate to the grade levels in which they teach.

To assess content knowledge of teachers, an assessment was created for each of the grade levels. Of the items on each test, 14 were common to all grade levels 3-5 and oriented towards assessing teachers' pedagogical and mathematical knowledge for teaching. Because the remaining items per grade level were developed to address content specific to the particular grade level of the participants, only the results on the 14 common items are reported here. While the focus of the professional development was on specific measurement, data, fractions, and geometry CCSSM standards from Grades 3 – 5, the research reported here largely relates to geometry and measurement concepts in all grade levels. Specifically, the geometry and measurement items common to all grade levels in the assessment are related to topics such as classification of geometric figures, geometric properties, area and perimeter relationships and include items that look at structure, examine arguments, and look for patterns of regularity in reasoning. Table 1 presents descriptive statistics for both the pretest and posttest for each grade level.

The mean scores increased for the teachers at each grade level, with increases of 1.61, 2.28, and 2.24, for grades 3, 4, and 5, respectively. That there was not a larger gain is not surprising due to the limited time of the project as changes in conceptual knowledge take time to develop. The mean value of both the pretest and posttest were smallest for Grade 3 and largest for Grade 5. The results on the posttests ranged from less than 50% for Grade 3 to just over 57% for Grade 5, indicating there is room for more growth. Two-tailed paired t-tests were used to explore the differences on the pretests and posttests for each grade level. The values, 0.00059, 0.000062, and 0.000019, respectively for grades 3, 4, and 5, indicate significantly higher posttest scores for each grade level.

Table 1

*Descriptive statistics on correct responses on pretests and posttests per grade level*

	Pre			Post		
	Gr 3	Gr 4	Gr 5	Gr 3	Gr 4	Gr 5
N	23	21	25	23	21	25
Total	14	14	14	14	14	14
Mean	4.87	5.29	5.92	6.48	7.57	8.16
Min	1	2	2	3	4	2
Q1	3.5	3	4	5.5	7	7
Median	5	6	5	6	7	8
Q3	6	7	8	7.5	8	11
Max	9	9	11	11	11	13
SD	1.87	2.19	2.27	1.97	2.13	3.10

Pretest, posttest, and change between pretest and posttest on correct answers per questions are given in Tables 2, 3, 4, respectively. The data in Table 2 show that for only Questions 1 and 14, 65% or more of the teachers answered correctly at each grade level, although Grade 5 correctly answered 68% on Question 4. Less than 25% of the teachers answered Questions 3 and 12 correctly at each grade level.

Table 2

*Percent of correct answers per question per grade level on pretests*

Question	Grade 3 N = 23	Grade 4 N = 21	Grade 5 N = 24
1	0.74	0.67	0.92

9	0.17	0.19	0.52
10	0.13	0.29	0.32
11	0.43	0.67	0.60
12	0.52	0.48	0.52
13	0.78	0.86	0.84
14	0.65	0.86	0.88

Table 4

*Percent gain of correct answers per question per grade level from pretest to posttest*

Question	Grade 3 N = 23	Grade 4 N = 21	Grade 5 N = 25
1	-0.17	-0.05	-0.16
2	0.13	0.19	0.40
3	0.48	0.57	0.52
4	0.43	0.10	0.08
5	0.09	0.05	0.24
6	0.00	0.14	0.08
7	0.35	0.14	0.00
8	-0.04	0.19	0.08
9	-0.13	0.05	0.36
10	-0.09	0.05	-0.04
11	-0.09	0.19	0.08
12	0.43	0.33	0.32
13	0.26	0.33	0.08
14	-0.04	0.00	0.20

With regard to the posttest data in Table 3, more than 64% of the teachers at each grade level answered Questions 3, 4, 13, and 14 correctly. However, less than 45% of the teachers per grade level answered Questions 5, 6, 8, and 10 correctly. Additionally, only 17% of Grade 3 teachers, and 19% of Grade 4 teachers answered Question 9 correctly.

When examining the gains in Table 4, a drop is evident for Question 1 at all grades, even though it was a questions answered correctly at a fairly high level on the pretest. Question 3 had gains of 48% or more at each grade and Question 12 had gains of 32% or more at each grade. Grade 3 had 6 questions on which the percent correct on the posttest was less than the percent correct on the pretest. However, there was only one question for Grade 4 and two for Grade 5 where the posttest score was less than the pretest score.

In particular, the gains in Questions 3 and 12 potentially represent teachers' developing understandings of attributes of quadrilaterals. Specifically, Question 3 relates to identifying a square as a specific case of a rhombus; Question 12 relates to understanding constant ratios among the attributes of quadrilaterals, specifically with regard to squares and the distance "across" compared to the distance "around." In each case, specific attention was given to concepts that underlie these problems during the PD. In particular, in discussing in discussing the Grade 3 standards, concepts such as area (and the associated attributes of figures) were discussed that could have led to teachers gaining better understandings related to attributes of quadrilaterals. Furthermore, in Grade 4, discussions related to the measurement and data strand (specifically 4.MD.3) could have led to teachers being more sensitive to area and perimeter concepts related to attributes of quadrilaterals. Finally, teachers in Grade 5 were engaged in conversations around geometry standards, specifically 5.G.3, in which they discussed attributes specific to quadrilaterals (and even more specifically, rectangular shapes). Consequently, although there is no causal evidence, correlational curiosities abound related to the gains in correct answers for Questions 3 and 12.

Alternatively, the decrease in correct answers on other questions could be due to the fact that because these questions try to get to the heart of what teachers know and understand, teachers may have some confusion about what they know. That is, if teachers have fragile content knowledge they might waver in their responses to questions that are geared to assess their pedagogical content knowledge. To examine the changes in pre and posttest responses further, we examined two other pieces of data. In Table 5 these two pieces of data are presented, namely, the number of questions answered incorrectly on the pretest but answered correctly on the posttest (denoted W-->R); and those answered correctly on the pretest and incorrectly on the post-test (denoted R-->W). Examining

these gives not only a measure of how many more (or fewer) questions an individual answered correct on the posttest, but gives a partial measure of confidence in their correct pretest solutions. That is, ideally there should be no R-->W for a participant.

Table 5

*The number of answers changed: wrong to right (W-->R), and right to wrong (R-->W) per participant per grade level*

Grade 3 N = 23		Grade 4 N = 21		Grade 5 N = 25	
W-->R	R-->W	W-->R	R-->W	W-->R	R-->W
3	1	2	0	1	2
4	3	3	1	2	0
4	0	4	3	0	3
6	2	4	1	4	0
4	1	4	2	5	1
3	1	3	2	3	0
2	2	2	1	6	1
1	1	4	2	4	2
3	2	1	1	4	1
3	0	5	0	3	3
1	2	5	1	3	1
3	0	5	0	5	1
3	1	2	1	2	0
2	1	0	3	2	1
4	4	2	1	4	0
4	3	4	1	3	1
5	4	3	1	4	0
3	1	5	1	3	2
6	1	4	2	5	1
3	2	7	0	5	3
3	6	4	1	6	0
5	0			2	0
2	2			5	1
				1	1
				1	2

In Table 5, of the 69 participants, 16 (23%) did not change an answer from R-->W, 29 (42%) changed one answer from R-->W, and 24 (35%) changed two or more answers from R-->W. This is an indication of fragile knowledge for over a third of the

participants. Furthermore, in Table 6 data related to changing answers for each question per grade level is presented.

Table 6

*Number of answers changed: wrong to right (W-->R), and right to wrong (R-->W) per question per grade level*

Question	Grade 3 N=23		Grade 4 N=21		Grade 5 N=25		Totals N=69	
	W-->R	R-->W	W-->R	R-->W	W-->R	R-->W	W-->R	R-->W
1	2	6	3	4	0	4	5	14
2	6	3	6	2	11	1	23	6
3	11	0	13	1	14	1	38	2
4	11	1	3	1	4	2	18	4
5	4	2	5	4	7	1	16	7
6	3	3	4	1	6	4	13	8
7	10	2	5	2	5	5	20	9
8	5	6	6	2	4	2	15	10
9	2	5	4	3	9	0	15	8
10	1	3	2	1	3	4	6	8
11	2	4	6	2	3	1	11	7
12	11	1	8	1	8	0	27	2
13	6	0	7	0	3	1	16	1
14	3	4	1	1	6	1	10	6

We can see that Questions 1 and 10 had more R-->W changes than W-->R changes and that over 10% of the teachers changed Questions 5, 6, 7, 8, 9, 10, and 11 in a R-->W manner. On Question 3 almost half of the participants changed from W-->R, while only two changed from R-->W. The same was seen on Question 12, where 27 changed from W-->R and only 2 changed from R-->W; and Question 13 where only 1 changed from R-->W. Again, such changes are reflected by the coverage of the standards discussed earlier. In particular, Question 13, although not related specifically to perimeter, area, or quadrilaterals, is related to rigid motions of a plane and symmetries that was prevalent in discussions related to the inclusion of transformational geometry within the CCSSM (e.g., CCSSM, p. 74) throughout the week long PD.

### **Discussion**

This paper illustrates that a five-day professional development focused on CCSSM standards for mathematical content and standards resulted in teachers increasing their

content knowledge in general, and on several questions in particular. Specifically, content on the pre and posttests that were relatively aligned to the underlying concepts in specific CCSSM standards addressed by the PD saw gains in the number of teachers answering correctly. However, concerns still exist related to teachers' propensities to change their correct pretest answer to an incorrect posttest answer.

Specifically, we argue that such changes in answers from "right to wrong" speaks to an underlying fragility within teachers' confidence of their mathematical knowledge. Perhaps such changes were further affected by teachers' engagement in more robust problem situations that they had experienced prior to the PD. In other words, in presenting problems throughout the PD that were identified by the PD developers as potentially fostering conversations regarding the standards for mathematical practice, the participating teachers may have questioned their prior knowledge through an "incorrect versus correct" paradigm rather than a "how else can this mathematics be represented" paradigm. That is, engaging in PD with a mathematical lens of "incorrect versus correct" could have led the teachers to believe their original mathematical thinking was "not correct" rather than "correct, but could be better informed conceptually." As such, a potential area of future study could well focus on the epistemological views of teachers regarding what it means to "know" mathematics as they engage in PD, along with the way in which they respond to pre and post pedagogical and mathematical content knowledge assessments for the PD.

## **Abstract**

Research on ego-resiliency has reported substantially over the past decade in South Korea. Some of the studies revealed inconsistent results regarding ego-resiliency. The evaluation of research on ego-resiliency requires reliable and valid measures to illustrate more clearly. The purpose of this study is to review scales of ego-resiliency of school-aged children in South Korea through literature. To achieve the aims, we reviewed articles published recently focusing on three research questions as follows: 1. What is the most used scale? 2. How is the reliability of scales? 3. What types of validity is conducted?

For analyzing the scales, fifty three articles, (which were published between 2002 and 2012), were selected from four academic library databases including RISS, KISS, NDSL, & DBpia, focusing on indexed in the KCI(Korea Citation Index). The KCI is the most influential and useful resource in Korea. The subject in this review was limited to elementary school students. The scales were divided into self-reported and parent-reported form. Two of the scales were developed by Korean authors, the rest of the scales were used as translated version. Frequency and content analysis were used.

Total of eleven scales on ego-resiliency were used. All of the articles presented an

internal consistency on their scales. The most used scale was Ego Resiliency scale used in Park(1996)'s study, which was a modified scale from the scales of O'Connell-Higgins(1983) and Block & Kremen(1996). This scale used in Park's study had a range of Cronbach's alpha from .77 to .90. The next most used scale was Block and Kremen(1996)'s Ego Resilience Scale(ER89) translated into Korean with Cronbach's alpha from .69 to .94. Except for two scales presented above, the rest of the scales were used for under three times. Ju and Lee(2007)'s Resilience Scale for Children(RSC) had relatively low application frequency(used in only three studies) but had the highest average Cronbach's alpha .94. All of the analyzed scales, the lowest average Cronbach's alpha was .76 with scale extracted from the ego-resiliency related items from Block & Block(1980)'s California Child Q-Set(CCQ).

Two of fifty three articles presented both a construct validity by factor analysis with Principal Component Analysis(PCA). One was a article utilized Ego Resiliency scale used in Park(1996)'s study, the other was a articles used Block and Kremen(1996)'s Ego Resilience Scale(ER89) translated into Korean. Particularly, Block and Kremen(1996)'s Ego Resilience Scale(ER89) was developed for young adults(18 and 23) so the scale was revised for school-aged children. After the factor analysis, this scale was reported as three factors unlike four factors in original scale.

In Korea, there seem to have mainly two preferable scales for measuring ego-resiliency in school-aged children. One of the scales was developed for children, but the other one was developed for young adults. The reliabilities for the scales could be evaluated acceptable; however, the validity regarding application of ego-resiliency for young adults need to replicate more. With regard to these findings, further studies on the validity and reliability and differentiation between clinical and non clinical subjects on the study of ego-resiliency are need to applying the appropriate scale according subjects.

This paper examines retention and degree completion of students registered in a first year course entitled EDUC 104 Introduction to Academic Pedagogy: An Aboriginal Approach. The proposed course, conceptualized by a Faculty of Education in conjunction with the Aboriginal Programs and Services is based on the nationally recognized University 101 program developed by the University of Southern Carolina (Barefoot, 1993; Gardner, 1980; 1981). However, in keeping with culturally relevant pedagogy, the authors explore the pedagogical impact of using the Wheel of Medicine in an introduction to university course. Imbedded in this approach is a self study of teacher education practices (S-STEP) which aim to create and foster positive learning environments by harmonizing the intellectual, emotional, physical and spiritual self according to community and context. Participants will be invited to discuss issues, strategies and challenges faced when using alternate approaches teaching underrepresented and marginalized youth.

## **Introduction**

The intent of this paper is to explore how the Medicine Wheel can be used as a conceptual framework in higher education. This paper will focus on understanding and acknowledging one of many First Nations' philosophical approaches to teaching and learning. By focusing on the Medicine Wheel, an examination of basic principles that support successful transition to academic programs can be identified. In particular, the newly created course for Access students, *Introduction to Academic Pedagogy* at a Western Canadian university campus will serve as an important example of how higher education can embrace non-traditional pedagogies.

### **A First Nations World View of Education**

*“Indigenous knowledge is an adaptable, dynamic system based on skills, abilities, and problem-solving techniques that change over time depending on environmental conditions”* (Battiste, 2002, p.11).

It is to be noted that the University of British Columbia's Okanagan campus sits on unceded Okanagan territory. While respecting the diversity of First Nations approaches to teaching and learning, the focus of the instructional design resides in Okanagan epistemology. In the preface to Armstrong's (2005) essay on Okanagan education, the Aboriginal principle of “nested systems” (p. 80), where “each living system forms a whole itself, while at the same time... is part of a series of larger systems” (p.80) describes a comprehensive perspective of education that is very different from the typical Eurocentric worldview. As First Nations scholar, Marie Battiste (2002) writes, the “holistic nature of Indigenous knowledge” (p.10), is “fundamental” (p.10) to Aboriginal worldviews and must always be taken into account when considering Indigenous education. This viewpoint is also highlighted within the First Nations Education Steering Committee's *First Peoples' Principles of Learning* (FNESC, 2013) which states that: “Learning is holistic, reflexive, reflective, experiential, and relational (focused on connectedness, on reciprocal relationships, and a sense of place)” (see Addendum A). This idea of interconnectivity reflects the nature of the nested system, where all facets of learning link with many other systems on emotional, spiritual, mental, and physical levels.

Battiste (2002) also writes that from an Indigenous perspective: “Knowledge is ... inherent in and connected to all of nature, to its creatures, and to human existence” (p.14), where no one part is perceived as more important or separate unto itself. In the Aboriginal worldview, we are all seen as interconnected with the natural systems surrounding us, rather than separate, as is often found in Western conceptions and understandings. Also, changes to any one aspect of life are recognized as affecting everything else. Battiste’s (2002) statement that: “Indigenous knowledge thus embodies a web of relationships within a specific ecological context” (p.14) describes the strong connections to the natural world surrounding each of us that is inherent in this worldview. The term “ecoliteracy” used by Armstrong (2005, p.83) and others to summarize First Nations’ thinking about education, affirms this idea. When discussing Aboriginal epistemology, Anuik and Gillies (2012) also recognize this philosophical outlook. They write: “Everything is/has Spirit/Energy. We need to be mindful of our feelings, thoughts, words, and actions. What we put out there affects everybody and everything else” (p.68).

In relationship to education, teaching from this holistic perspective offers a very different outlook from conventional Western school structure, where school subjects are divided into individual disciplines and students are required to learn in a more linear fashion (Armstrong, 2005, p.81; Claypool & Preston, 2011, p.2). This way of thinking tends to clash with Aboriginal worldviews and have a negative impact on Aboriginal students because it lacks the holistic perspective of Indigenous epistemology (Claypool & Preston, 2011, p.3). In order to rebalance this issue, Battiste (2002) writes of the need to “end the fragmentation Eurocentric educational systems imposed on First Nations students and facilitate the goal of wholeness to which Indigenous knowledge aspires” (p.30).

### **The Importance of Bridging Programs for Aboriginal Students**

*“healing involves honouring and practising Indigenous teachings that stimulate the heart as well as the brain to collaborate in post-secondary education. However the challenges are formidable, especially because the objectives set for learners and teachers were established long before either party entered post-secondary institutions” (Anuik & Gillies, 2012, p.66)*

This disconnect between Indigenous worldviews and the traditional Canadian school model is beginning to gain much more notice within the academic community due to low graduation rates for Aboriginal students in both secondary and post-secondary institutions. According to a *Canadian Policy Research Networks Report* (Sharpe and Arsenault, 2009), Aboriginal students have significantly lower than average graduation rates from high schools and are not entering universities or other higher level education institutions at anywhere near the rates of their other Canadian counterparts. The report states that: “Aboriginal Canadians aged 15 and over have a much lower educational attainment than their non-Aboriginal counterparts, with 43.7 percent not holding any certificate, diploma or degree in 2006, compared to 23.1 percent for other Canadians” (p.8).

Having a better understanding of why this is and how we, as educators, may be able to help Aboriginal students have more success within the educational system is becoming a growing concern, particularly given the fact that the Aboriginal population is currently one of the fastest rising populations in Canada (Canadian Council on Social Development, 2012). Over the next few years, First Nations, Métis, and Inuit (FNMI) students will become key players within the Canadian educational and economic system (Sharpe & Arsenault, 2009), so consideration of Aboriginal worldviews is going to become an imperative part of maintaining strong discourse and fostering academic success for this important community of learners (Claypool & Preston, 2011, p.1).

Many scholars have identified the fact that the sole use of Eurocentric pedagogy has not worked for First Nations students and recommend that traditional Aboriginal philosophies of education be incorporated into institutional programming (Battiste, 2002; Anuik & Gillies, 2012; Stang & Vedan, 2012; Claypool & Preston, 2011). Battiste (2002) writes that “Indigenous knowledge is now seen as an educational remedy that will empower Aboriginal students if applications of their Indigenous knowledge, heritage, and language are integrated into the Canadian educational system” (p.9). However, she also points out that “Despite this realization, few universities across Canada have made Aboriginal education a mission or priority” (p.9; Battiste & Henderson, 2009, p.16). This problem is confirmed by Stang and Vedan (2012) who write that though there is assistance in place to support Aboriginal admissions into most universities, many do not provide

the necessary access or bridging programs to foster First Nations student success once they have entered an institution (p.7).

As Stuhldreier and Ford (2009) write, upon entering the university environment, these students may face considerable challenges because of vast differences between Indigenous worldviews and Eurocentric schooling. They state that “post-secondary education culture does not reflect Aboriginal perspectives, traditions, values, nor the diversity of Aboriginal communities” (slide 2). They, like Battiste (2002) and others, assert that “Aboriginal traditions and culture need to be incorporated into curriculum” (slide 3) and that “culturally suitable curriculum must incorporate Aboriginal perspectives and world views into the planning, design and delivery of instruction” (slide 3).

As far as post-secondary education is concerned, incorporating Indigenous knowledge (IK) into the curriculum offers a means to address some of the discrepancies found missing between Western and Aboriginal pedagogy. As Battiste and Henderson (2009) write: “In a quest to heal their nations and communities, Indigenous scholars and professionals have turned to IK [Indigenous knowledge] and Elders to restore control over Indigenous development and capacity enhancement” (p.6). The University of British Columbia, Okanagan Campus, has recognized the need to better support the transition of students into academic life, and thus have created a bridging course for Aboriginal and non-Aboriginal students called *Introduction to Academic Pedagogy* (Ragoonaden, 2013). This course will use elements of Indigenous pedagogy, in particular the Medicine Wheel, as its foundation in order to teach students how to gain “the essential skills needed for academic success” (Ragoonaden, 2013, p.3) in a university setting.

### **The Medicine Wheel**

*“Holistic teaching from the Medicine Wheel begins with the individual and expands therefrom to include an Aboriginal view of human development: mental, spiritual, emotional, and physical”*  
(Saskatchewan Education, 2002)

The Medicine Wheel, a holistic teaching instrument used by almost all First Nations communities in both North and South America for millennia (Bopp, Bopp, Brown, & Lane, 2004, p.9), is a profound example of Indigenous knowledge that has proven to be very useful for incorporating Aboriginal principles directly into educational curriculum. The Aboriginal Wheel of Medicine or “sacred hoop” (Neihardt, 1979, p.155), which is read as both a circle and a spiral, is used to symbolize the interconnectivity of the Aboriginal world view, and offers a very practical way to instruct from this perspective. In its simplest form, it is represented by a circle divided into four parts, with each part representing one aspect of human nature: physical, mental, spiritual, and emotional, with volition or self determination at the point of convergence in the centre (Bopp, et al., 2004, p.36).

The Medicine Wheel is described by Loiselle and McKenzie (2006) as providing a “framework that presents a complete picture of a ‘person-in-environment’ and provides a map or plan for problem solving, for enhancing one’s awareness and understanding of self and for restoring healthy relationships and general well-being” (p.11). The framework of the Medicine Wheel, which on the surface appears very simple, is actually capable of portraying many complex layers intrinsic to the ever-changing and dynamic epistemology it represents. This powerful tool is used in Aboriginal settings as a guide to teach individuals or groups about self understanding (Claypool & Preston, 2011, p.3) as well as how to navigate the ever-changing conditions of their lives. It can also help people make decisions that reflect the integrative and holistic principles inherent in this worldview.

The philosophical outlook behind the Medicine Wheel suggests that each of its four aspects must be in equilibrium or equally developed in order for an individual, decision, or action to be healthy and well-balanced (Bopp, et al., 2004, p. 38). As Loiselle & McKenzie (2006) write,

“the world in which we live is composed of four cardinal directions existing in harmony, balance, complementarity and unity: east, south, west, and north. Each of these directions corresponds to one component of a person’s being as identified in the Medicine Wheel: the

physical/material, the emotional/relational, the mental/intellectual and the spiritual/cultural” (p.9).

The Medicine Wheel, then, acts as a holistic representation of both the interconnectivity of the self and the connection of the self with the rest of the world. One can think of it as a metaphorical compass that can lead individuals in a positive direction towards self-knowledge and understanding of their place in the world. Because the Medicine Wheel is in the form of a circle or spiral, the relationships between these systems, an integral aspect of examining the world through Aboriginal perspectives (Battiste, 2002, p.10), are inherently taken into consideration. Loiselle and McKenzie (2006) write that by viewing whole systems as interconnected circles or spirals, “No single element at any level or of any kind can thus be treated in isolation” (p.8). Finally, as Cargo, Peterson, Levesque, and Macaulay (2007) write, within this simple design, “balance, interdependence, and wholistic health are captured in the symbolism of the Medicine Wheel” (p. 88).

### **Variations in the Medicine Wheel**

There are many different variations on the theme of the Medicine Wheel. As Bopp, et al. (2004) write, “Because many tribes and peoples have used the Medicine Wheel to look at themselves, there are many different ways of explaining those universal truths that human beings share in common” (p.35). However, though the Medicine Wheel may look slightly different from one community to another, for example which colours represent which elements or directions, the same universal principles can be applied with each version of it. As Bopp, et al. (2004) write: “Even though some tribes will assign different qualities to each of the points on the circle, ...the teachings telling which qualities make up the total picture of a complete human being are nevertheless universal” (p.36). In this paper, for ease of communication, I will use Bopp, et al.’s rendering, bearing in mind that many other, equally valid, manifestations of this teaching tool exist and are used by different Aboriginal groups.

### **Parts of the Medicine Wheel**

Each quadrant of the Medicine Wheel represents one aspect of the human disposition and in most Aboriginal belief systems, only when all of these aspects are equally present can a person

or an action, be deemed as whole. “To be a whole person is to be alive in a physical, emotional, mental, and spiritual way” (Bopp, et al., 2004, p.56), therefore, each aspect of the Medicine Wheel must be taken into consideration when learning new ideas or working towards goals. The holistic, circular, and spiralling nature of the Medicine Wheel, similarly reflected in the circular nature of the seasons and other patterns, teaches us that each of the quadrants must be revisited over and over again throughout one’s life (p.43), a fact that can easily be seen when one begins to apply its teachings to decision-making and goal setting.

According to Bopp, et al. (2004), the Eastern quadrant represents the spiritual component, “illumination” (p.43) or ideas, and is coloured red. It symbolizes new beginnings and the season, spring. The East represents the gaining of new insights and is thought to be a good place for starting new projects and to begin learning about the power of one’s own determination or resolve (pp.42-47). The Eastern quadrant speaks of the interconnectivity of all things and marks the beginning of the journey, but not the end. As Bopp, et.al. write: “The East is the place of all beginnings. The human being must return many times to the East ... [where] each time there will be new things to learn on a new level of understanding” (p.42).

The Southern quadrant represents the emotional part of one’s life, innocence and “the place of the heart” (p.43). In Bopp, et al.’s rendition, it is coloured yellow. It is symbolized by summer and teaches about using discipline and “determination (an aspect of volition, i.e. the will) to fulfill our purposes and achieve our goals” (p.49). Part of the teachings of the South relate to the act of training oneself on emotional levels in order to be able to meet one’s future aspirations (pp.48-52). According to Bopp, et al., when working with the Southern quadrant, one can learn about controlling the emotions and developing the senses to best serve your own and others’ interests.

The Western quadrant is generally coloured black and is representative of the physical component of the self. It is symbolized by autumn or fall and speaks of introspection. The West “is the place of testing, where the will is stretched to its outer limits so that the gift of perseverance may be won” (p.53). The West therefore, represents the physical determination needed to complete our goals, as well as the vision required to “see clearly with our inner eye

what we could become, or what the people could become together, if we should undertake the necessary journey” (p.61). The journey to the West then, helps one see what *could be* and to “develop...[oneself] to the fullest possible extent” (p.60).

The Northern quadrant represents the mental component and represents wisdom and “detachment” (p.66). It is generally coloured white and is symbolized by winter. In the North, the task is to find the “certitude (sure knowledge) that the goal is near and can indeed be won” (p.65) and it teaches about “completion and fulfillment” (p.65) of projects started. The journey to the North, then, is about training the mind how to intellectually detach, and to be able to see objectively “all things as they really are” (p.71) in connection to everything else around us. As Bopp, et al. put it: “Here the powers of volition reach their zenith as we learn to complete what began as a far away vision” (p.65).

The very centre of the Medicine Wheel can represent the self or the self-determination of an individual or a group. As summarized from *The Sacred Tree*, Cargo, et al. (2007) write: “The centre of the Medicine Wheel, the point of convergence of the four aspects of self, is referred to as the point of self-determination. This point is said to reflect the will of a person or group to influence the course of their lives” (p.90). Looking at one’s life through this centre point teaches us how we “fit together with everything else” (p.67) and also helps us to direct our lives in alignment with each of the four elements of the Medicine Wheel. Finally, as Bopp, et al. write: “Since volition is a primary force in developing all of our human potentialities, it is placed at the centre of the Medicine Wheel” (p.14) in order to lead us toward the vision of what our potential could be.

### **Using the Medicine Wheel in Education**

*“Education for First Nations students can and should help them get more in touch with their Indigenous consciousness and the traditions that inform and animate their intimate and spiritual selves”* (Battiste, 2002, p.29).

The way to read the Medicine Wheel is as a mirror through which to examine one’s life or intended goals from each element: the physical, mental, spiritual, and emotional. If a person is in

balance, then the elements from each of these perspectives will be in balance. Bopp, et al. (2004) state that: “Our journey around the wheel is a symbolic one. What we are really doing is using the patterns found in nature... to understand our own selves” (p.41). Loisel and McKenzie (2006) see the first layer of the Medicine Wheel as a tool for self-assessment. They write: “By looking into the mirror, which is the first wheel, the person can see that his construct of the reality of his current life may not be complete or accurate. He will then be able to identify his strengths and weaknesses and plan adjustments accordingly” (p.13). As Mazzola (2004) writes, the original goal of the Medicine Wheel was to help one in:

developing a balanced personality that included the highest possible combination of Wisdom, Innocence, Introspection, and Illumination. Education consisted of the progressive development of each individual’s potentials, until the powers of the North, South, East, and West were integrated in an authentic manner, appropriate to the calling, sex, and station of the individual (p.66).

In examining the teachings of the Medicine Wheel, one can thus see that they offer a very comprehensive way of understanding the self and the world around us. Loisel and McKenzie (2006) write that examining one’s life in this way can be “an eye-opener as to what attitudes and behaviours one may need to develop in order to live a balanced, harmonious, responsible, and accountable life” (p.15) and as Bopp, et al. (2004) write: “Just like a mirror can be used to see things not normally visible, ... the Medicine Wheel can be used to help us see or understand things we can’t quite see or understand because they are ideas and not physical objects” (p.9).

The holistic perspective of Medicine Wheel describes a very different perspective from Western pedagogy in that it allows students to focus on areas of life not normally addressed in standard education. As Battiste (2002) writes: “Much Indigenous education can be called *endogenous* as it revolves around a transformational process of learning that animates students’ inherent talents and capacities” (p.30). Unlike in conventional Western pedagogy, where the focus is mainly on the mental and occasionally physical aspects of education (Anuik & Gillies, 2012, p.74), Indigenous teachings seek to incorporate the spiritual and the emotional elements as well, in the belief that all elements are essential to the whole picture of a human being as well as their learning processes. As Bopp, et al. (2004) write: “It cannot be said that a person has totally

learned in a whole and balanced manner unless all four dimensions ...have been involved in the process” (p.29).

### **Indigenous Knowledge and Student Engagement**

In the desire to understand how Aboriginal students can be more effectively supported, Indigenous educational philosophy and epistemology are lately becoming much better understood and researched in contemporary educational discourse. For example, Claypool and Preston (2011) have identified the need for changes to support Aboriginal students in the educational system by suggesting that “student learning and assessment techniques need to parallel Aboriginal worldviews and ways of knowing” (p.85). This movement towards “naturalizing” Indigenous knowledge such as the Medicine Wheel into mainstream instruction (Battiste and Henderson, 2009, p.6) is one that is rapidly gaining ground within academic circles (Battiste, 2002; Claypool & Preston, 2011; Battiste & Henderson, 2009; Saskatchewan Education, 2002) and offers the justification for incorporating the teachings of the Medicine Wheel in bridging programs such as *Introduction to Academic Pedagogy* (Ragoonaden, 2013) at the University of British Columbia’s Okanagan Campus.

Battiste and Henderson (2009) state that, “naturalizing IK creates potential for Aboriginal and non-Aboriginal learners in trans-systemic ways that EK alone cannot do” (p.13), highlighting both the fact that Indigenous knowledge not only has the potential to assist Aboriginal students, but also those of non-Aboriginal backgrounds as well, and also indicating that IK can help students because it is “trans-systemic” meaning that it lies beyond conventional educational structures. In their article, Anuik and Gillies (2012) discuss the success they have had in incorporating IK into their teaching practices in post-secondary settings, concluding: “It is clear that IK can strengthen teachers’ pedagogies regardless of the cultural or racial identities of the teachers or students” (p.75). The Saskatchewan Education’s (2002) guide to Indigenous pedagogy makes a similar assertion, stating: “The teachings of the Medicine Wheel offer a model of inclusion for all students” (p.1).

Unlike conventional Western education, where only the mental, and occasionally physical processes are highly cultivated (Anuik & Gillies, 2012; Saskatchewan Education, 2002),

Indigenous pedagogy, the Medicine Wheel in particular, seeks to engage the emotional, and spiritual as well, thereby creating highly engaging learning environments for students. Anuik and Gillies state: “As teachers and lifelong learners, we believe emotional and spiritual growth is a requisite for learning. However, that point is often not recognized in the educational system” (p.65). As Battiste (2002) writes: “the learner’s affective state is often not considered in the domain of educational philosophy” (p.16). Rather, she states, “Western or modern education focuses on a cultural construction of knowledge built on Eurocentric origins and concrete science” (p.16). However, as Battiste and Henderson (2009) write: “when IK is naturalized in educational programs, the learning spirit is nurtured and animated” (p.13).

Though the tradition of solely focusing on the mind in Western education has much value, it can also result in alienation that creates disengagement and disconnection from the learning process for many students, particularly for those whose cultural worldview integrates the whole self: physical, mental, spiritual, and emotional,. Anuik and Gillies (2012) suggest that incorporating all four elements of the Medicine Wheel in education is such an important part of supporting students because it offers a more holistic approach to learning that permits for the “collaboration of the heart and the mind” (p.64), a point they say is essential to engaging and nourishing the learning process. They write that incorporating the teachings of the Medicine Wheel and other Indigenous knowledge into educational practices allows educators to link the passions of the heart with the intellect of the brain to better engage and connect students to their own understandings of knowledge, not only on a personal, but on a community level as well.

For example, these educators discovered that, when working with controversial topics such as those found in anti-racism education, Western style pedagogy on its own created limitations to understanding by generating “learning blocks” (Anuik and Gillies, 2012, p.72) that disengaged students from the processes needed to address controversial or emotion-laden issues. They write, “most contemporary teachers and teacher candidates have been trained in western education and, therefore, want to practise anti-racism education through mental capacities only. ... In anti-racism education, however, learning cannot happen if emotions are left out of the process” (p.74). Each of these educators found success however, by exploring, rather than avoiding, emotions in their teaching practices, and found that it was a means of better engaging the learning process for their

students. Battiste and Henderson (2009) summarize this success stating that: “by communicating the emotional journey that such explorations will generate, teachers and learners can create positive spaces where they can both learn and grow” (p.14).

### **The Medicine Wheel and Teacher Education**

*“educators need to make a conscious decision to nurture Indigenous knowledge, dignity, identity, and integrity by making a direct change in school philosophy, pedagogy, and practice”* (Battiste, 2002, p.30).

Despite much research suggesting that the inclusion of Indigenous knowledge and philosophy fosters success for both Aboriginal and non-Aboriginal students, there are still many factors blocking Indigenous educational reform. A large problem is that it is simply not being taught. In their findings, Higgins, Madden, and Korteweg (2013) state that even when adequate Indigenous curriculum is available, many teachers are highly resistant to teaching using Indigenous knowledge (p.10), which suggests that simply adding Indigenous teachings to an otherwise Western educational structure is not enough.

Battiste (2002) also alludes to this issue when she states: “Much literature in the last decade has focused on the importance of diverse cultural or multicultural methodologies to...address the needs of Aboriginal students. The studies however, do not examine the culture of the schools themselves” (p.16). This insight suggests that issues surrounding institutional Eurocentrism in schools are also an important factor to consider when examining student success. As Anuik and Gillies write: “Too often, the focus of Aboriginal education is on integration of Aboriginal content rather than decolonizing pedagogy and practice” (p.74). This issue reveals the importance of bridging programs, but also calls into question why Eurocentrism continues to persist within school culture.

In their study, Higgins, et al. (2013) found that many teachers were reluctant or even resistant to teaching from other cultural perspectives. These researchers identified the fact that “white teacher participants saw themselves as ‘cultureless’ and, as a result, did not have a clear understanding of culture” (p.10), thereby limiting their ability or perceived ability to teach from

another worldview. It was also identified that this perspective allowed teachers to avoid addressing questions of “white privilege” (p.4), permitting them to continue teaching from what Battiste (2002) describes as “the silent curriculum of Eurocentrism” (p.30).

Many of the teachers interviewed in this study felt they needed a better understanding of their own cultures before they could teach about other cultures. As an example, Higgins, et al. (2013) found that one teacher had “minimal knowledge of her personal ethnicity and ancestry... [but felt that] if she did possess such ‘cultural’ knowledge she would be better positioned to engage with and teach about cultures that differed from her own” (p.8). This lack of cultural understanding was found by the researchers to be a rather large one, stating that it “acts as a significant barrier to white teacher’s engagement in Indigenous education reform” (Higgins, et al., 2013, p.2). In regards to incorporating Indigenous knowledge into classrooms, for example through bridging courses, Battiste and Henderson (2009) write: “The heart and soul of these programs is a healing process of genuine caring about and sensitivity to the students, their heritage, and the knowledge that they come with and that they need to continue to learn” (p.16). However, without the needed cultural understanding of teachers towards Indigenous knowledge and worldviews, Higgins, et al. (2013) see their strength and empowering features as being easily lost (p.5).

According to these researchers this calls for the need to address not only the structure of the curriculum, but also teacher education (19-20). Just as written in the *First Peoples Principles of Learning* that “Learning requires exploration of one’s identity” (FNESC, 2013), Higgins, et al. see the need for teacher education programs that can “sustain white teachers’ processes of coming-to-know themselves as cultural beings...so that they are better positioned to attend to the relationship building and honouring of Indigenous knowledges and peoples” (p.20-21).

Interestingly enough, the teachings of the Medicine Wheel have the potential to also help with this process. Because they are largely about self-knowledge and self understanding (Claypool & Preston, 2011, p.3), incorporating the teachings of the Medicine Wheel directly into teacher education would not only support students by allowing for much-needed alternative perspectives that have the potential to create “positive empowerment” (Battiste & Henderson, 2009, p.14), but

would also help teachers come to a better understanding of themselves and their own cultures in order to potentially disrupt the problems and issues surrounding Eurocentrism in classrooms.

As Battiste (2002) writes: “By animating the voices and experiences of the cognitive ‘other’ and integrating them into the educational process, it creates a new, balanced centre and a fresh vantage point from which to analyze Eurocentric education and its pedagogies” (p.5). As educators gain a more thorough understanding and awareness of their own culture, they would thereby have more insight and understanding of other cultures, and thus be better equipped to support their diverse students.

## **Conclusion**

Rapidly changing demographics of Canadian society call for new approaches to education that are more inclusive and more holistic in nature. Despite the fact that Aboriginal youth are one of the fastest-growing populations in Canada, graduation rates from secondary and post-secondary institutions continue to be consistently lower than the national average. Incorporating Indigenous knowledge into standard curriculum in order to rebalance this discrepancy is one way that policy-makers, Elders, scholars, and educators have identified to address this pressing issue.

Unfortunately, despite the known effectiveness of Aboriginal pedagogy for students, Indigenous educational reform has been slow to occur. Researchers have identified Eurocentric school culture, as well as resistance and lack of understanding of white educators towards Indigenous knowledge, as key areas of concern. Changes in teacher education and standard curriculum that incorporate a process of learning about the self and one’s own culture in order to help shift the Eurocentric attitudes and practices that exist in conventional institutions have also been recommended by scholars.

The Medicine Wheel, an ancient Indigenous teaching tool that integrates not only the mental and physical elements into educational practice, but also the emotional and spiritual, provides an important means of addressing these issues. This holistic way of approaching education has been found to combat the chronic lack of engagement with conventional academic instruction that many Aboriginal students face, while also nurturing the learning spirits and self-

understanding of students from many diverse backgrounds. The teachings of the Medicine Wheel also have the potential to benefit not only students, but teachers as well, by offering a means for educators to better understand themselves through a holistic pedagogy that integrates the heart, body, mind, and spirit into educational practice.

## **Addendum A**

### *First Peoples' Principles of Learning:*

- Learning ultimately supports the well-being of the self, the family, the community, the land, the spirits, and the ancestors.
- Learning is holistic, reflexive, reflective, experiential, and relational (focused on connectedness, on reciprocal relationships, and a sense of place).
- Learning involves recognizing the consequences of one's actions.
- Learning involves generational roles and responsibilities.
- Learning recognizes the role of indigenous knowledge.
- Learning is embedded in memory, history, and story.
- Learning involves patience and time.
- Learning requires exploration of one's identity.
- Learning involves recognizing that some knowledge is sacred and only shared with permission and/or in certain situations.

# **Event-structure metaphor in American English and Saudi Arabic--- -Implications for translation**

**Dr. Saad Nasser Aldwayan  
Salman bin Abdulaziz University  
Dean of library affairs  
Saudi Arabia**

I would like to thank Salman bin Abdulaziz University for providing entailed financial assistance to finish this paper. I also extended my gratitude to the Scientific Research Deanship at Salman bin Abdulaziz University for their support. My thanks go as well to anonymous reviewers for their valuable suggestions which resulted in a qualitative improvement of this article.

## **Keywords:**

**Metaphor, Event, Translation, Universal, Cognitive**

## **Abstract**

States, changes, actions, causes, difficulties, and purposes are events common among all human beings. Since these events are abstract, it has been argued (Lakoff and Johnson, 1980, 1999; Aldokhayel, 2009) that they are conceptualized metaphorically. They show little variations as to the conceptual domains used to conceptualize them. Such events can be mapped into physical domains of space, motion, and force (Lakoff, 1993). Against this background of universalism, this paper adduces evidences from the “Cognitive Translation Hypothesis” (Mandelblit, 1995) and "Cultural Variation" (Hiraga, 1991; Kövecses, 2005) to prove that in spite of the similarity in conceptualizing events in terms of space, motion, and force space, there is still a room for differences between languages and cultures exemplified in this paper through examples from English and Saudi Arabic. This research particularly addresses differences at the level of focus of languages and cultures on a particular member of a “duality of patterning.” For instance, English conceptualizes states as containers (I am in trouble) and/or possessions (I have a lot of trouble understanding something). Differences are also detected at the “Cognitive Translation Hypothesis” level (Mandelblit, 1995), which offers two scenarios: (i) a “similar mapping condition” (SMC) and (ii) a “different mapping condition” (DMC). The SMC is displayed if no conceptual shift occurs between the metaphors from English and Saudi Arabic; the DMC, however, is detected when a conceptual shift replaces the metaphors of the two languages. Both scenarios serve as a measure of similarity or difference in conceptualizing events in English and Saudi Arabic. However, Hiraga’s (1991) more explicit scenarios for “comparative cultures” isolates real differences between languages and cultures in terms of (i) similar metaphorical concepts and similar metaphorical expressions, (ii) similar metaphorical concepts but different metaphorical expressions, (iii) different metaphorical concepts but similar metaphorical expressions, and (iv) different metaphorical concepts and different metaphorical expressions. This paper concludes by showing the implications of the findings to translation from English into Arabic and vice versa.

## **Introduction**

Cognitive semantics, as represented by the cognitive theory of metaphor (CTM), deals with events through studying the cross-domain mappings that they create and the inferential systems that are created by these mappings. The study of the event-structure system has focused, therefore, on the event-structure metaphor (ESM), based on which “states, changes, processes, actions, causes, purposes, and means, are characterized cognitively via metaphor in terms of space, motion, and force” (Lakoff, 1993: 220). The event-structure concepts are abstract events that are “understood metaphorically in terms of space, motion, and force” (Lakoff, 1990: 57). The experiential motivation for this event-structure system comes from our familiarity with motion in space, motion, and force, whereby these metaphors “emerge from everyday bodily experience” (Lakoff and Johnson, 1999: 171).

In western tradition, pronouncements about cross-cultural phenomena originate in the writings of the E. Sapir and B. Whorf, who championed the Sapir-Whorf Hypothesis (Whorf, 1956). The essence of their hypothesis, in its strong version, claims that the language we speak shapes the way we think (known as linguistic determinism). The hypothesis went through some ups and downs but with the advent of cognitive science in the 1970s, comparing cultures has assumed an inter-cultural interest rather than a cross-cultural perspective owing to cognitive science's interest in the workings of the human mind. Basic to this approach, cultures are not anymore seen in conflict with each other but seen as offering different views of the world to be investigated, documented, and understood in order to gain insight into the human mind at both universal and non-universal dimensions (i.e., cultural).

This paper investigates the event structure metaphor in Saudi Arabic (SA) in contrast to American English (AE). The core point here is that although they belong to two different families of languages and cultures, SA and AE show striking similarities at the conceptual level and vary at the linguistic level and at the level of duality of patterning of events. This paper is structured with two sections: a section that offers an overview of the Saudi culture; and a section that represents the bulk of the article and addresses events in SA, and focusing on conceptual and linguistic levels of these events. The last section focuses on some implications of the cognitive view of events on translating.

## 1. Overview of the Saudi culture<sup>1</sup>

The Saudi society is a curious blend of two extreme worlds: the Saudi individual who is a rudimentary humble bedouin and a modern and flamboyant city person. This dual identity is, in effect, the outcome of a sudden social transformation brought about by the advent of wealth in Saudi Arabia.

### 1.1. Bigness as a cultural value

In Saudi Arabia, the idea of *large-size* family has its roots in the religious teachings of Islam as well as in the nature of the Saudi social structure itself. Both religion and the tribal system encourage and support this idea. From both perspectives, a *large family* means a reserve of fighting power to intimidate the potential enemy of Islam or the rival tribe. In the *Holy Quran*, for instance, the notion of fighting power is phrased as: “and make ready against them all you

---

<sup>1</sup> The ideas in this overview of the Saudi culture are drawn from Hassan Souissi's Ph.D. dissertation (2007), *Visual metaphor as indirect claim: An interactive approach to persuasion, imagination and culture in contemporary TV advertising*, pp. 31-34.

can of power to threaten the enemy of Allah and your enemy” (Surah Al Anfal, Verse 60). Encouragement to have children is clearly expressed in this Quran quotation: “Wealth and children are the adornment of the life of this world” (Surah Al Kahf, Verse 46). Basic to this perspective, the notion *big* is generally an operative criterion in the lives of Saudis. This is obvious from the big-size automobiles they drive, the spacious villas/apartments they dwell in ,and from many other numerous facilities. Undoubtedly, the favorable Saudi economic situation enhances the notion *big*, but it should not be considered a necessary condition for its sustainability for the simple reason that large Arabian mud houses had existed long before the discovery of oil and the advent of wealth in general (Abdallah, Al Shakkar & Mortel, 1979).

In an exceptionally wealthy society (as is the case in Saudi Arabia), the criteria for judgment may vary widely and certain concepts such as *comfort* and *luxury* may not find their standard definitions. What is ordinarily considered luxurious may be seen as being simply comfortable by higher-class standards, this entails a blurring of concepts in certain cases. Regarding the purchase of automobiles, Saudis in general tend to opt for high quality makes that are loaded with Super Extra Luxury (SEL) features. A walk or a ride around the busy streets of Riyadh city would reveal that SEL vehicles are by no means a scarce commodity. For a large segment of the Saudi society, luxury is not a privilege as much as it is a way of life.

### *1.2. Uniformity of attire*

The uniformity of the dress code in Saudi Arabia is a highly sensitive social regulation that is strictly observed and abided by. Wearing anything other than the designated attire, for women as well as for men, is considered a rebellious and disgraceful act of deviance that entails a legal punishment. Potentially, this strict adherence to dress code can have significant repercussions on the individual’s behavior. The uniformity of attire leaves no room for showing off distinction. The natural urge to demonstrate personal notoriety and excellence cannot be held back, and must, therefore, find another means of expression. Here, the private automobile seems to be a popular outlet. Given the fact that there are no restrictions imposed on car appearances, Saudis generally are fond of the looks of their cars. They compete in buying the most expensive and luxurious cars. Sometimes, when touches of embellishment (such as curtains, pillows...) are needed, Saudis do not hesitate to add them. They also tend to change cars every now and then to keep in style or just like getting rid of one’s old garments to replace them by more stylish ones.

### *1.3. The environment and being a Bedouin*

Despite the harsh living conditions of the desert, Saudis love outdoor life. This is about the only original characteristic of the Saudi way of living that has survived the sweeping changes brought about by modern civilization. Deep in the heart, the Saudi individual is a desert person whereas desert stands for his/her real home. The daily excursions a number of Saudis make into the desert on daily basis are an obvious expression of that genuine feeling of nostalgia to desert. The above remarks on the identity of the Saudi individual are but illustrations of a panorama of complex and hidden factors that have helped shape the Saudi culture and made it what it is today.

## **2. Duality of patterning**

Lakoff and Turner (1989: 113) argue that there are four semantically autonomous categories in the world, namely spaces, objects, substances, and containers, which are used by non-autonomous abstract concepts to make them less abstract or concrete. This is known as the CTM, according to which “states, changes, processes, actions, causes, purposes, and means, are characterized cognitively via metaphor in terms of space, motion, and force” (Lakoff, 1993: 220). Lakoff and Johnson (1999: 178-79) argue that our understanding of event-structure metaphor (ESM) is governed by two basic event-structure metaphors, which make use of the primary metaphors causes are forces and changes are movements:

The location event-structure metaphor (henceforth, LESM)

States are locations (interiors of bounded regions in space)

Changes are movements (into or out of bounded regions)

Causes are forces

Causation is forced movement (from one location to another)

Actions are self-propelled movements

Purposes are destinations

Means are paths (to destinations)

Difficulties are impediments to motion

Freedom of action is the lack of impediments to motion

External events are large, moving objects (that exert force)

Long-term, purposeful activities are journeys (p. 179)

The object event-structure metaphor (henceforth, OESM)

Attributes are possessions

Changes are movements of possessions (acquisitions or losses)

Causation is transfer of possessions (giving or taking)

Purposes are desired objects

Achieving a purpose is acquiring a desired object

Achieving a purpose is getting something to eat

    Trying to achieve a purpose is hunting

    Trying to achieve a purpose is fishing

    Trying to achieve a purpose is agriculture (p. 198)

The two components of the ESM differ in the sense that one conceptualizes events as locations, the other as objects. This should remind us of the bi-dimensional nature or duality of time as represented by the time-as-an-object-in-space and the time-as-a-substance metaphor (Lakoff and Johnson, 1999: 145). The Location Event-Structure Metaphor (LESM) has three variants that enrich the LESM with other primary metaphors (Lakoff and Johnson, 1999: 203), namely, the moving activity metaphor, the action location metaphor, and the existence as location metaphor. The three variants of the LESM are illustrated below:

(1)

(a) The project has *slowed to a crawl*.

(b) She *came near* to resigning.

(c) I *removed* all the errors in the manuscript.

In (1a), the activity predicated of the project is slow motion as suggested by the choice of “crawl.” In (1b), resigning is described as a location in space to which the Experiencer was

moving. The location of the experiencer vis-à-vis the resignation is signaled through the adverb “near.” In (1c), the Experiencer is described as making errors disappear from existence by removing them from the manuscript. So, what these variants add to the initial LESM is change of motion, motion towards a location, and force exercised to reach a location.

The LESM should not be understood as precluding motion. Indeed, the variations on the LESM in (1a-c) are solid evidence for dynamism, where location is reinforced by motion as in slowed, came, and removed. Further, apart from the states are locations metaphor of the LESM, which does not involve movement, all of its other constituents do show movement to or from a given location or to a destination in space. To anticipate, the same holds for the OESM, whose most important components involve spatial motion. The duality between the LESM and the OESM can be accounted for in terms of figure-ground reversal, where the values of figure and ground change across the two poles as demonstrated in the following examples:

(2)

- (a) Harry is in trouble.
- (b) Harry has trouble.

In the LESM reading as in (2a), Harry is the figure while in the OESM reading in (2b), Harry is the ground, with trouble as a figure. These two poles have been dubbed by Lakoff and Johnson (1999: 194) “duality of patterning.”

The ESM, in particular the LESM of it, has been held to be essentially image-schematic (Peña Cervel, 2004). As two important examples of events governed by image schemas, states (states are locations) and purposes (purposes are destinations) can be mentioned. The universal, embodied nature of containers has been attested by Lakoff and Johnson (1980: 29) as follows: “we are physical beings, bounded and set off from the rest of the world by the surface of our skins, and we experience the rest of the world as outside us. Each of us is a container, with a bounding surface and an in-out orientation.” Equally important for the LESM is the path concept, which is defined by Johnson (1987: 113) as including “(1) a source, or starting point; (2) a goal, or end-point; and (3) a sequence of contiguous locations connecting the source with the goal.” Johnson (1987) qualifies the universal, embodied nature of paths. He argues that “our lives are filled with paths that connect up our spatial world” (113). Both containers and paths are spatial, and are mapped in the ESM onto non-spatial concepts.

### **3. The event-structure metaphor in AE and SA**

#### *3.1. States in AE and SA*

##### **3.1.1. States in AE**

States may include *depression, danger, coma, love, poverty, peace, harmony, debt*, etc. as per the duality of patterning (DP), states can come as containers (i.e. *being* in a state) and as possessed objects (i.e. *having/possessing* a state). The logical inference from containers and possessions is that the cognizer is either caught in a state or possesses the state as one possesses an object:

(3)

- (a) He is *in a depression*.  
 (b) He *has* a depression.

In (3a), depression is conceptualized as a location, i.e., a bounded region in space, which suggests the conceptual metaphor, states are locations/containers. The topology of a bounded region includes an interior, an exterior, and a boundary, which inferentially provide and, indeed, can not only predict other possible linguistic metaphors like *out of depression*, *in a deep depression*, etc., but also preclude the existence of certain expressions that do not conform to the image-schematic structure of containment such as \*to be on a depression, \*to be under a depression, or \*to be beside/next a depression, etc. which do not exist in English. However, in (3b) trouble is conceptualized as a possessed object as can be shown in attributes are possessions. The states-as-possession mapping predicts or entails the possibility of doing to states what one does to possessions such as getting rid of one's depression, giving someone a depression, etc.

### 3.1.2. States in SA

States in AE and SA come as LESM and OESM, which means that, in spite of AE and SA belonging to different families of languages and cultures, they adopt containers and objects as shared concepts to conceptualize states. However, AE and SA differ in terms of which states come as containers, which states come as objects, and which ones come as containers and objects simultaneously as will transpire in the following tables.

**Table 1: Examples of states in AE according the DP**

Conceptual metaphor	State
States are locations	<i>Danger</i> <i>Coma</i> <i>Love</i> <i>Peace</i> <i>Harmony</i>
States are possessions	<i>Problem</i> <i>Flu</i> <i>Disease</i> <i>Blood pressure</i>
States are locations- possessions	<i>Depression</i> <i>Poverty</i> <i>Debt</i> <i>Trouble</i>

**Table 2: Examples of states in SA according the DP**

Conceptual metaphor	State
States are locations	-khatar- خطر (danger) - gayboba- غيبوبة (coma)

	- alhub- الحب (love) - wardhah- ورطة (trouble) - saadah- سعادة (happiness)
States are possessions	- mushkilah- مشكلة (problem) - bard- برد (flu) - maradh- مرض (disease) - dhagat- ضغط (blood pressure) - dayn- دين (debt) - anhyar asabi- انهيار عصبي (depression)
States are locations- possessions	- faqer- فقر (poverty) - amen- أمن (peace)

There is a general tendency in SA for states to be possessions, which implies that fewer states come as both locations and possessions. This tendency may have the consequence of offering the users of SA less possibility for construal of some states. Such skewing of states between AE and SA may require extra effort on the part of translators to determine the right option for translating states either into AE or SA.

### 3.2. Changes in AE and SA

#### 3.2.1. Changes in AE

Changes are actually alterations that occur to states. Since states are either locations in space or possessions, changes combine location and possession with motion, which yields either a cognizer leaving a state, or a state moving in space as illustrated below:

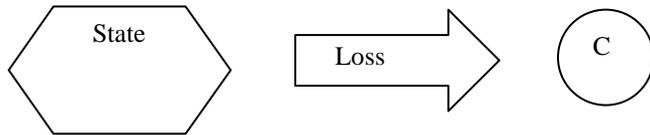

- (4)
- (a) I came out of my depression.
  - (b) My depression went away.
  - (c) His new business brought him a lot of money.

In (4a), the change is actually motion between states as presupposed by the preposition *out*. The cognizer was inside the state of depression, but left it. The in/out image schema governing the change is responsible for motion from being in a depression to being out of it, which evokes the changes are movements metaphor as in the following diagram.

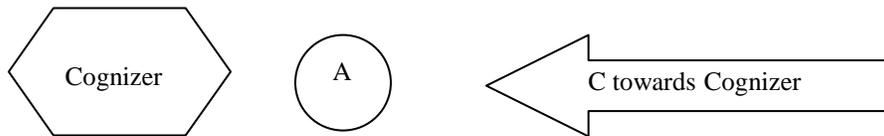

**Figure 1: Changes as movement diagram**

In (4b), however, depression is a possession, as signaled by the possessive adjective “my,” moving in space, describing the conceptual metaphor changes are movements of possessions. The difference between states and changes is that states are static but changes are dynamic, a difference that explains the use of verbs such as “to be” with the prepositions *in*, *out*, *on*, etc., and “to have” with states, and the use of motion verbs such as *come*, *go*, *fall*, *enter*, etc., with changes. The following figure shows the state mutating into a change (C), thus leaving the state as diagrammed below:

**Figure 2: Changes as movements of possession diagram (Loss)**

As per the logic of objects and possessions, since changes are movements of possessions, this movement can be characterized either by loss of one’s possessions (as in 4b above) or an acquisition of a new possession (as in 4c above), whereby instead of losing, the cognizer gains something as a change of state as diagrammed below:

**Figure 3: Changes as movements of possessions diagram (acquisition)**

Note the direction of the arrow pointing to the direction of the cognizer, who witnesses the movement of an acquisition (A) towards the self.

### 3.2. Changes in Arabic

In the previous sub-section, it has been noted that Saudi Arabic has a preference for conceptualizing states as possessions. For this reason, changes in SA are more of like movements of possessions than movements of changes:

**Table 3: Examples of changes in SA**

Conceptual metaphor	Linguistic metaphor
Changes are movements	- rah mini alkawf- راح مني الخوف (Fear left me)
Changes are movements of possessions	- mihnati mishit- محنتي مشيت (My trouble went away) - ashabi karagoni min wardati- أصحابي خرجوني من ورطتي (My friends helped me leave my trouble) - ahli talaoni min mushkilti- أهلي طلعونني من مشكلتي

	(My relatives helped me leave my problem)
--	---

### 3.3. Causes in AE and SA

#### 3.3.1. Causes in AE

Since causes are external to the cognizer, they do not exist as possessions. In the LESM reading, causes combine location with force as a form of causation, yielding the conceptual metaphor, causes are forces. However, in OESM reading, causes combine objects with force, yielding the conceptual metaphor, causation is a transfer of possessions as it is exemplified in the following examples:

- (5)
- (a) The news *propelled* the stock market to record heights.
  - (b) The noise *gave* me a headache.

In (5a), the trajector (the news) is exerting force on the landmark (stock market), which causes the stock market shares to soar to record levels. It should be noted that *propelled* can be traced back to an up/down image schema, which can be paraphrased as “caused the stock market to go up,” presupposing that the shares were at a lower location on the stock market indices. Some of the verbs associated with causation include *bring, throw, drive, pull, push, move, propel, thrust*, etc. In (5b), however, causation has to do with causes as objects, which triggers a set of entailments in line with what can be done with objects in our experience such as *having, getting, taking, giving, losing*, etc. them.

Explaining the motivation for force as an image schema for talking about events, Johnson (1987: 42) argues that right from our very early age, we experience reality as “one massive series of forceful causal sequences.” Johnson (1987: 43-45) has proposed that the force we experience in our socio-physical environment has a certain number of characteristics encapsulated under “*a gestalt structure of force*,” i.e., a “unified whole within our experience and understanding that manifests a repeatable pattern or structure.” It is experienced through “interaction,” and it has “directionality,” “a path of motion,” “origins or sources,” “degrees of power or intensity,” and “a structure or sequence of causality.”

Johnson (1987: 45-48) has isolated seven common force structures that are pre-linguistically present in our environment, namely,

(i) *Compulsion*

“Everyone knows the experience of being moved by external forces, such as wind, water, physical objects, and other people.”

(ii) *Blockage*

“In our attempts to interact forcefully with objects and persons in our environment, we often encounter obstacles that block or resist our force.”

(ii) *Counterforce*

“Here two equally strong, nasty, and determined force centers collide face-to-face, with the result that neither can go anywhere.”

(iv) *Diversion*

“A variation on the previous gestalt is one in which a force vector is diverted as the result of the causal interaction of two or more vectors.”

(v) *Removal of restraint*

“The removal of a barrier or the absence of some potential restraint is a structure of experience that we encounter daily.”

(vi) *Enablement*

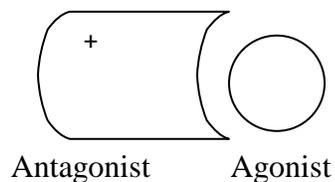

“If you choose to focus on your acts of manipulation and movement, you can become aware of a felt sense of power (or lack of power) to perform some action.”

(vii) *Attraction*

“The force is not gravitational, in the standard sense, but it is a kind of gravitation toward an object.”

It goes without saying, as Johnson points out, that these are not the only force structures present in our environment.

To borrow Talmy’s (2000: 415) terminology, causation “involves an Agonist with an intrinsic tendency toward rest that is being opposed from outside by a stronger Antagonist, which thus overcomes its resistance and forces it to move.” This can be diagrammed for the instances of causation as follows:

**Figure 4: Causation as Antagonist acting on Agonist**

Causation can be conceived as a force exerted on Agonist by an unhindered Antagonist. The + in the Antagonist (Ant) signals the force exerted by the Ant on the Agonist (Ago). The Ant is the causal force, and the Ago can be either the cognizer or a concept (e.g. a country). In conceptual metaphor terms, this is causation is force or causes are forces.

### 3.3.2 Causes in SA

As spelled out earlier on, AE uses verbs such as *bring, throw, drive, pull, push, move, propel, thrust*, etc. to conceptualize causation in its duality of forces and transfer of forces. SA uses verbs of causation, where force is embedded into the verb (e.g. make and force) as in English or can be expressed through the emphatic form as in (jannatni) جئننتني , which doubles the consonant (ن) “n” in the verb.

**Table 4: Examples of causation in SA**

Conceptual metaphor	Linguistic metaphor
Causes are forces	خالاني أغانر الشغل Khalani akader alshogil (He made me leave the job) غصبني

	kasabni (He forced me) جنتني jannani (She made me mad )
Causation is a transfer of possessions	ما جابلي إلا وجع الراس Ma jab li ala wajaa alraas (He only brought me headaches)  السيول أخذت كل أغراضي Alsyol akadat kul akradi (The floods took all my belongings)

### 3.4. Actions in AE and SA

#### 3.4.1. Actions in AE

Since actions have to do with motion in space, they are captured in the primary conceptual metaphor, actions are self-propelled movements, which yields the following sub-metaphors in AE (Lakoff, 1993: 220-22; Lakoff and Johnson, 1999: 188):

**Table 5: Actions are self-propelled movements in AE**

Conceptual metaphor	Linguistic metaphor
Aids to action are aids to movement	Getting the grant gave us just the boost the project needed.
Manner of action is manner of motion	She is falling all over herself.
Careful action is careful motion	I'm walking on eggshells.
Speed of action is speed of movement	He flew through his work.
Freedom of action is the lack of impediment to movement	I don't want anything to tie me down.
Suspension of action is the stopping of movement	They halted the project.

As is clear from their name, actions are par excellence conceptualized as movements in space, which explains why actions do not have a version of the OESM.

#### 3.4.2 Actions in SA

Since actions have to do with motion in space everywhere, they are also captured in the primary conceptual metaphor, actions are self-propelled movements in SA as shown in the table below:

**Table 6: Actions are self-propelled movements in SA**

Conceptual metaphor	Linguistic metaphor
Aids to action are aids to movement	ضبطلي - سحب علي - عززلي - كو علي
Manner of action is manner of motion	ماشي على البيض - ماشي بالشويش - جاب العيد - ماشي حبة حبة
Careful action is careful motion	المشروع ماشي حبة حبة - ماشي على البيض
Speed of action is speed of movement	طار للشغل - معشق خامس
Freedom of action is the lack of impediment to movement	رئيسي رابطني - نشبلي - حجرلي
Suspension of action is the stopping of movement	قفل - كنسل - وقفنا العمل - سكرنا

It is interesting to note that SA uses some culture-specific linguistic metaphors in the conceptualization of actions such as رابطني (tying me down), which is reminiscent of how Arabs tie down animals with a rope in the ground; معشق خامس (shifting to fifth gear), which is reminiscent of the extent to which cars count in Saudis' lives as to conceptualize actions with the movement of cars; حبة حبة (grain by grain), which adopts the size of a grain of wheat to conceptualize actions as performed slowly and carefully.

### 3.5. Difficulties in AE and SA

#### 3.5.1. Difficulties in AE

Difficulties are so much linked with actions. Since actions are movements, difficulties encountered in acting are impediments to our movements as captured by the conceptual metaphor, difficulties are impediments to movements as illustrated in the following examples:

**Table 7: Difficulties are impediments to movement in AE**

Conceptual metaphor	Linguistic metaphor
Difficulties are blockages to action	She's trying to get around the regulations.
Difficulties are due to the features of the terrain	We've been hacking our way through a jungle of regulations.
Difficulties are burdens	She's weighed down by a lot of assignments.
Difficulties are counterforces	He's holding her back.
Difficulties are due to the lack of an energy source	We're running out of steam.

In AE, a difficulty may be conceptualized as a blockage to motion but it can be gotten around by the cognizer. This is inherited from the physical domain, whereby the impediment takes a lot of energy for the cognizer in order not to be confronted by it. A different way of conceptualizing difficulty arises from our experience with physical impediments to real motion, where the cognizer has to cope with the morphological features of the terrain as suggested by hacking and jungle. A difficulty may also be conceptualized as a burden on the cognizer, who has to spend extra effort to cope with it. A difficulty may be seen as a counterforce exerted by the cognizer against the force of motion. A difficulty may arise from lack of an energy source to sustain it.

### 3.5.2. Difficulties in SA

Compared to difficulties in AE, difficulties in SA use the same sub-metaphors of difficulties are impediments to movement except for one: difficulties are due to the features of the terrain. Such a conceptual metaphor may not have arisen in SA because the terrain of Saudi Arabia is so spacious and open that accidents do not count for Saudis because they do not seem to have a problem with space.

**Table 8: Difficulties are impediments to movement in SA**

Conceptual metaphor	Linguistic metaphor
Difficulties are blockages to action	ناشب في الزحمة - نشبلي - استعدلي
Difficulties are due to the features of the terrain	
Difficulties are burdens	شاييل هم الإمتحان
Difficulties are counterforces	نشبلي - استعدلي
Difficulties are due to the lack of an energy source	انهد حيلي - طفيت

### 3.6. Purposes in AE and SA

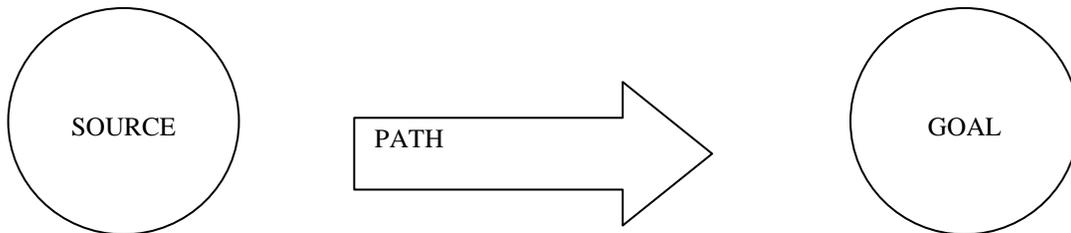

#### 3.6.1. Purposes in AE

Purposes involve a dual structure in English as in the following examples:

- (6)
- (a) We've reached the end (LESM).
  - (b) She is pursuing an impossible dream (OESM).

In (6a), purposes are destinations while in (6b) purposes are desired objects.

In the LESM version, purposes are destinations, which are governed by the source-path-goal schema as in the following figure:

**Figure 5: Source-path-goal schema governing purposes are destinations**

In the LESM reading, i.e. source-path-goal schema, purposes show the following sub-metaphors of purposes are destinations:

**Table 9: Purposes are destinations in AE**

Conceptual metaphors	Linguistic expressions
----------------------	------------------------

Achieving a purpose is reaching a destination	The goal is a long way off.
Lack of purpose is lack of direction	He is just floating around.
Means are paths	She did it the other way.
Starting a purposeful action is starting out on a path	We have taken the first step.
Making progress is forward movement	We made lots of forward movement.
Amount of progress is distance moved	We've covered lots of ground.
Undoing progress is backward movement	It is time to turn around and retrace our steps.
Expected progress is a travel schedule	We're behind schedule on the project.
Lack of progress is lack of movement	We are going nowhere with this.

It should be noted that the linguistic expressions realizing the conceptual metaphors governed by purposes are destinations come to fill in one of the members of the source-path-goal schema. For instance, although the linguistic metaphor realizing achieving a purpose is reaching a destination in Table (9) seems to target the goal, it actually situates the purpose to be attained as very far from the goal and closer to the source. On the other hand, the linguistic metaphor realizing amount of progress is distance moved in table (9) situates progress in the purpose closer to the goal.

However, in the OESM of purposes are desired objects, purposes offer the following conceptual metaphors (Lakoff and Johnson, 1999: 197):

**Table 10: Purposes are desired objects in AE**

<b>Conceptual metaphors</b>	<b>Linguistic expressions</b>
Achieving a purpose is getting something to eat	This is a mouth-watering opportunity.
Trying to achieve a purpose is hunting	I'm shooting for a promotion.
Trying to achieve a purpose is fishing	I've got a line out on a good used car.
Trying to achieve a purpose is agriculture	The contract is ripe for the picking.

In terms of construal (what?!), it should be noted that AE uses more options in line with destinations than with desired objects, which safely enables us to argue for the importance of the source-path-goal schema in the life of Americans as spelled out in the variety of conceptual metaphors governed by purposes are destinations in Table 9 above.

### 3.6.2. Purposes in SA

in terms of construal?, it should be noted that sa uses more options in line with destinations than with desired objects, which safely enables us to argue that the source-path-goal schema is even more important in the life of Saudis as spelled out in the same variety of conceptual metaphors attested in AE and governing by purposes are destinations in Table 11 below.

**Table 11: Purposes are destinations in SA**

Conceptual metaphors	Linguistic expressions
Achieving a purpose is reaching a destination	وصل - وصل إلى القمة - وصل للي بيبه - حققت مرادي - وصلنا لغايتنا - على وشك Wasal-wasal ala alkimah- wasal lili yabih-haqaqt muradi- wasalna ligaitna- ala washak
Lack of purpose is lack of direction	ضايح ما يدري وين يروح - شاطح Dayaa- mayadri wayn yrooh- shatih
Means are paths	كل واحد وطريقه - أنت من طريق وأنا من طريق Kul wahed wa tariqah- ant min tariq wana min tariq
Starting a purposeful action is starting out on a path	أنا في أول الطريق - في النصف - على وشك - شرف على نهاية الطريق
Making progress is forward movement	ماشي - في تقدم
Amount of progress is distance moved	ما بقى اللي ما هان - أزحف - هدفي بعيد - هدفي قريب - مرامي أبعد من حلمك - خطوة جيدة - قطعنا شوط
Undoing progress is backward movement	نمشي خطوة ونرجع عشرة
Expected progress is a travel schedule	متأخرين
Lack of progress is lack of movement	على حطة يدريك

However, the OESM of purposes in SA offers the following conceptual metaphors (Lakoff and Johnson, 1999: 197):

**Table 12: Purposes are desired objects in SA**

Purposes are desired objects	
Conceptual metaphors	
Achieving a purpose is getting something to eat	
Trying to achieve a purpose is hunting	صيدة
Trying to achieve a purpose is fishing	
Trying to achieve a purpose is agriculture	حصد أرباح المشروع

Clearly, SA favors destination in conceptualizing purposes. Such a preference may be motivated by the importance of the concept of journey in the life of Saudis owing to the vastness of the country and the importance of trade.

### 3. Implications for translation

The implications of the event-structure metaphor for translation are evidential in two paths. First, events such as states, changes, causes, and purposes take a dual conceptual metaphor in line with the mega conceptual metaphors: the location event-structure metaphor and the object event-structure metaphor. In other words, states are conceptualized as containers and possessions; changes as movement and movement of objects; causes as forced movements and transfer of possessions; and purposes as destinations and desired objects across languages and cultures (Lakoff and Johnson, 1999: 195).

But why do Arabs and Americans have these dualities of patterning? Space is universal - all human beings live and move in space. Objects that we can possess are also universal. The universality of space and objects is what makes the Arab and American cultures sound similar in using the location-object duality. Can we, for instance, talk about a one-to-one relationship between states in the two cultures? yes and no. Yes, because with some states in the Arab and American cultures totally overlap in terms of the kind of state and the fact that the state takes the location-object duality. Such examples include the states of poverty and trouble, etc. (to be in poverty and trouble and to have poverty and trouble in both languages and cultures). No, because some states in the Arab and American cultures do overlap in terms of the kind of state but the state in question does not take the location-object duality, i.e. they exist either as location or object only. Such examples include the states of

When translators know that the mind functions by using spaces and objects as two important categories in life, this knowledge may facilitate their job in translating states by giving them the power to predict that in many languages and cultures states are spaces and objects. However, they should also know that since different languages and cultures may focus either on spaces or objects, they might have to translate a state-as-space in one culture into a state-as-possession in another. For instance, the state “problem” is profiled in English as “I have a serious problem” (a state is a possession) while in Saudi Arabic it is profiled as أنا في مشكلة (I am in a problem), i.e. a state is a container.

It is interesting to note that SA signals changes exclusively through deictic/motion verbs such as (مشت) and (خرجوني) while English uses more prepositions than verbs to conceptualize change. Since the location-possession duality is a universal of human experience, and since English uses prepositions while Arabic verbs, translators would know how to translate a change if they know about the related state in Arabic or English. For instance, if they know a state to be conceptualized as a container using the preposition IN, it is most likely that the change would involve the preposition out. If, however, a state in Arabic uses (في), it is most likely that the change would translate using either (مشى) or (خرج).

Causes and actions are far easier to translate than many other events because they mostly use causative and action verbs in Arabic and English. So what the translator needs to know is get to which verbs are causative and dynamic in Arabic and English.

When translators know that the mind functions by using objects as an important category in life, this knowledge may facilitate their job in translating difficulties by giving them the power to predict that in many languages and cultures difficulties are objects. However, they should also know that since different languages belong in different cultures, they might translate difficulties in one culture in different language although the same conceptual metaphor is adopted in two different cultures. For instance, AE and SA share the conceptual metaphor difficulties are counterforce, yet AE uses *He's holding her back*, which involves some action mixed with force while SA conceptualizes this as استقعدلي , which does not involve action and force as much as standing on the way as a blockage to action.

When translators know that the mind functions by using destinations and objects as important categories in life, this knowledge may facilitate their job in translating purposes by giving them the power to predict that in many languages and cultures difficulties are destinations and objects. However, they should also know that since different languages belong in different cultures, they might translate purposes in one culture in different language (i.e. wordings) although the same conceptual metaphor is adopted in the two cultures. For instance, AE and SA share the conceptual metaphor lack of purpose is lack of direction, yet AE uses "He is just floating around," which is the way Americans conceptualize aimlessness as buoyancy on water while SA conceptualizes this as ضايح ما يدري وين يروح or شاطئ, which express aimlessness as loss in space, which suggests going right and left without any aim in mind. Therefore, the translator should be careful not to translate these into the two languages literally.

## Conclusion

The event-structure systems of English and SA show wide similarities at the conceptual level, whereby the two systems actually function within the same mapping of events onto space, which derives from the abstract nature of event concepts and the availability of experience with space in many, if not all, cultures. Thus, the event-structure system in SA is an extension of the physical space, inheriting its characteristic features of motion, impediment to motion, change of location, etc., and turning events as objects manipulated in this physical space. Thus, the two systems conform to Mandelblit's (1995) "similar mapping condition" (SMC) scenario.

However, one of the areas of difference between English and SA has to do with the concept of duality. Even though there are cases of "similar metaphorical concepts and similar metaphorical expressions," the data in SA conforms more to Hiraga's (1991) "similar metaphorical concepts but different metaphorical expressions" scenario. English seems to offer a wide-ranging duality for event-structure concepts, which enables its users to conceptualize experience in alternative construal. For instance, English conceptualizes states alternately as locations or objects, in that its users can show different degrees of involvement with states as locations or possessions. Consistent with the topology of the image schema of containment, the location metaphor restricts the freedom of action of the users, thus at least partly reducing their degree of moral responsibility vis-à-vis the state, while the state-as-a-possession metaphor gives them more freedom of action in dealing with it and more responsibility as is clear from the various entailments of possessions.

Another area of difference between the two cultures has to do with cultural details. For instance, SA does not seem to offer the same alternatives to its users as far as states are concerned. Or, rather its users do not like to offer themselves the same alternatives for a good reason. As has been explained earlier on and in spite of the existence of states as possessions, a state is a container in SA. Logically, if one is in a state, and if one holds being in states to be bad, why should one desire to conceptualize states as belongings when one is trying hard to come out of or leave these states?

In terms of causation, it seems that SA differs from English based on the basic-level categories used to talk about causation. While English uses verbs such as bring, throw, drive, pull, push, propel, move, etc., SA uses verbs such as xalla (cause/make to do), xarraj (cause to pull out), daxxal (cause to bring in), Talla3 (cause to lift up/go up), mašša (cause to walk along), etc., which, despite their important overlap with the English verbs for causation, describe two

important systems of schematic causation governed by the conflation of the causal sub-event with the vertical or horizontal schema, which are not found in English.

**Title:** Zen Jesus: Teaching Religion with Meaning and Purpose

**Description:** This report is to highlight an innovating teaching model “Culturally Responsive Teaching” (CRT) and how it can help with the teaching of religion. It will also take a look at how this model can help with the Quebec’s unique Ethics and Religious Culture program. The principles Culturally Relevant Teaching provides an opportunity for educators to examine their approach to religion and show how this model can further promote open and diverse classroom settings.

**Author:** Sabrina Jafralie, M.A. in Theological Studies

**Affiliation and University:** Department of Integrated Studies – McGill University

**Email:** [sabrina.jafralie@mail.mcgill.ca](mailto:sabrina.jafralie@mail.mcgill.ca)

## **Zen Jesus: Teaching Religion with Meaning and Purpose**

### **Abstract**

This research report introduces the innovating teaching model “Culturally Relevant Teaching,” and how the model can be used to effectively teach religious education in both private and public schools. In this panel session, a secondary school teacher will highlight the educational benefits of the Culturally Relevant Teaching model as well bring to the attention of the participants some of the current approaches to religious education. Currently, the scholarly literature indicates that teachers value the teaching of moral and religious education, however, continue to struggle with the successful delivery of its content and complexities.

In this panel session, Professor Jafralie will present the model, Culturally Relevant Teaching and outline what it entails. Also, participants will be exposed to the challenges surrounding the existence of religious education, and different arguments from a number of countries. The research report will focus on the contentions in religious education, the unique path taken by Quebec, the role and impact that religions has on evolving and pluralistic societies and most importantly the role education plays in the teaching of religious education in an intellectual and culturally sensitive manner .

BUILDING CAPACITY FOR TEACHING WRITING WITH RIGOR: TEACHERS'  
PERSPECTIVES ON WHERE TO START

Dr. Sherry Dismuke

Boise State University

1910 University Drive  
Boise, Idaho 83725-1745

## **Abstract**

### *Building Capacity for Teaching Writing with Rigor: Teachers' Perspectives on Where to Start*

## **Research Objectives**

The purpose of this mixed-methods study was to employ multiple measures to examine the influences of intensive professional development, delivered through a university course devoted exclusively to writing, on teacher's dispositions, understandings, and daily practices. Furthermore, this study sought to understand teachers' perceptions of factors in their context such as educational policy, accountability, and district resources that influenced their ability to teach writing. This study has implications for administrators and policy makers, school improvement teams, and teacher educators interested in engaging in or implementing writing professional development aligned with current, more rigorous writing standards; such as in the Common Core State Standards (CCSS) in the United States.

Guiding questions for this inquiry include:

1. What shared perceptions of writing contexts and their effects on writing practices exist between practicing teachers, grades 1-6.
2. How do these perceptions of writing contexts and practices differ between teachers who have taken a university graduate course devoted exclusively to K-8 writing and those who have not?
3. How do these similarities and differences in teachers' perceptions of their writing context and practices link to their actual classroom practice and the university course in writing?

## **Introduction**

Lack of progress in students writing achievement has been linked to variability in teachers' knowledge, skills, and dispositions regarding writing (Troia, Lin Cohen, & Monroe, 2011). Many teachers feel that they lack the knowledge, skills, and strategies they need to facilitate children's emerging competencies as writers (Troia & Graham, 2003; Troia & Maddox, 2004). However, few resources have been allocated to alleviate teacher's concerns about their own lack of competency in the area of writing instruction. Levels of writing proficiency required to successfully participate in today's digital work place now require levels of writing that are so ambitious, ignoring these concerns will be impossible (Calkins, Ehrenworth, & Lehman, 2010).

## **Theoretical Framework**

The complexities of integrating the cognitive, social, and emotional aspects of the writing processes are an obstacle to both writers and those who teach it (Hayes, 1996; Vygotsky, 1978; Bruning & Horn, 2000; Bereiter & Scardamalia, 1987; Bahktin, 1981). However, the literature on teacher professional development indicates that teachers' self-efficacy improves when they see strategies and skills modeled, decompose strategies, and then have opportunities to apply and approximate these new practices in everyday practice (Hawley & Valli, 1999; Grossman, 2005). While engaging professional development experiences practicing teachers need time to reconstruct their practice through action research, reflection, and discussion of their own lessons and student work (Garet, Porter, Desimone, & Birman, 2001; Lieberman & Miller, 2008; Quick, Holtzman, & Chaney, 2009). Last, student achievement improves when teachers develop deep content knowledge of the subjects they teach as well as the pedagogy specific to the content (Hill, 2007; Carpenter, Fennema, Peterson, Chiang, & loef, 1989; Shulman, 1987; Sykes, 1999).

## **Methods**

### ***Context***

Participants in this study included twelve teachers, grades 1-6, from five different school districts, within the same northwestern state. All participants had a Masters Degree, Reading Endorsement, or equivalent units. Six of the teachers participated in a university graduate level writing methods course. This course engaged students in learning opportunities which modeled research-supported writing strategies and facilitated the joint construction of content knowledge and dispositions pertaining to writing. The control group teachers had not experienced any significant professional development in writing.

Participants who had the intensive professional development all took the same university course sometime over the preceding five years. This 3 credit, semester-long course focused exclusively on writing instruction and was taught by the same instructor, with experience and research in writing.

A triangulation mixed-methods design (Creswell & Plano, 2007) was purposefully selected for its ability to not only triangulate the results from the different data sources, but also to elaborate on and clarify the results from one method, with the results from the other method (Greene, Caracelli, & Graham, 1989).

### ***Data Sources***

Teachers participated in a response-guided interview and four classroom observations over the 2011-2012 school year. Data was collected using The Writing Observational Framework (WOF), (Henk, Marinak, Moore, & Mallette, 2004) as well as observational field notes and follow up interviews. To further strengthen links between teacher practice and the methods

course four observations were conducted while the course was in session and course documents were surveyed.

### ***Data Analysis***

Quantitative data and qualitative data were analyzed separately and then transformed, consolidated, and compared to establish their points of convergence and disagreements (Onwuegbuzie & Teddlie, 2003; Creswell & Plano, 2007; Greene, 2007). The WOF data was analyzed with independent sample t-tests on SPSS. Observational notes were coded using a deductive coding scheme developed a priori (Troia, Lin, Cohen, & Monroe, 2011). Analytic inductive coding was applied to the interview data. Frequency counts, data displays, and individual narrative summaries were created (Miles & Huberman, 1994) for all qualitative data. Throughout coding, similar responses were grouped and regrouped through constant comparison (Glaser & Strauss, 1967) and descriptive and analytic memos (Miles & Huberman, 1994) provided further analysis. Chi Square analysis was performed on relevant interview data to provide qualitative and quantitative linkages (Miles & Huberman, 1994). Data analysis included consensus conversations, member checks, peer debriefings, as well as 27% interrater checks on observational data and 25% inter-coding checks on interview data.

### ***Outcomes***

Teacher practice, and subsequent student learning experiences, were shaped and influenced by many factors outside the teacher's immediate control. Three elements in teachers' contexts emerged as influential: (1) their preservice and inservice preparation to become teachers of writing, (2) resources provided by their district for teaching writing including professional development opportunities, and (3) accountability for writing instruction by their state, district, school, and university.

### ***Perceptions of Preparation to Teach Writing***

Significant differences existed between teachers who experienced the writing professional development (PD) and teachers who had not (NPD) regarding their perceptions of their preparation to teach writing. Teachers had strong opinions about their university preservice and inservice preparation. All six PD teachers felt they had acquired the necessary content knowledge and confidence to teach writing. Unfortunately, this was true for only two teachers who had not taken the course,  $X^2(1) = 6.00, p = .02$ . Conversely, all six NPD teachers had a desire for more writing professional development while only one PD teacher felt this was necessary,  $X^2(1) = 8.57, p = .003$ .

### ***Perceptions of Resources Dedicated to Teaching Writing***

Ten of the 12 teachers stated that there was no specific writing curriculum provided to them by their districts except supplementary sections of their Basal reading programs. Amy said, "It doesn't seem like there's a defined writing curriculum. I've heard some different things from

different people, but since I've been here we haven't really had any professional development for writing instruction." Like Amy, seven of the 12 teachers reported they had little to no professional development in writing instruction and the rest had only received compacted teacher inservice workshops, which have little effect in changing teacher practice.

### ***Teacher's Perceptions of State, District, and School Accountability***

Teachers in both groups felt there was a lack of accountability to teach writing. Although there has been stringent accountability for student performance on standardized tests in reading, language arts, and math, accountability for writing performance in the United States has been nearly non-existent (Calkins, et.al., 2010). Ninety-six percent of all teachers in this study reported that the writing performance of their students was not tested or monitored by their state or district. One participant explained, "I mean we're in a situation now economically and everything else and we're looking at end results and writing is not one of them." Another teacher shared the result this has had on her practice, "It is just the unfortunate nature of not being tested on writing; it is one of the things that gets side lined."

### ***Teacher's Perceptions of University and Teacher Certification Accountability***

Few universities require a writing methods course for teacher certification (National Writing Project, 2006). Not surprisingly then, this study found that only 1 NPD teacher felt writing instruction was valued by her university compared to 5 out of 6 PD teachers,  $\chi^2(1) = 5.33$ ,  $p=.02$ . This difference in viewpoint is significant and followed through to a significant difference in the value teachers placed on writing instruction. Three NPD teachers made statements that suggested they did not place writing on an equal footing with other subjects. This viewpoint was never expressed by PD teachers,  $\chi^2(1) = 4.00$ ,  $p=.05$ . On the contrary, five of the six PD teachers made statements that suggested they valued and made time for writing.

### ***Conclusions***

In this study, differences in teachers' preparation to teach writing played a significant role in shaping teachers' perceptions and understandings about writing. These factors influenced their daily practice and most importantly their students' learning opportunities. Students of teachers who were confident in their abilities to teach writing taught writing more often; demonstrated and enacted more research supported instructional practices, and provided their students with more effective learning opportunities to become successful writers.

While all teachers in this study agreed that there was little accountability, resources, or professional development provided by their districts or state for writing instruction, it was teachers who took the course, who overcame these obstacles and were committed to teaching writing well.

### *Implications for Educational Leadership and Policy*

The findings of this study call for policy makers, departments of education, and school districts to not only increase accountability for student writing performance, but to partner that pressure with targeted resources, curriculum alignments, and professional development. Professional development needs to provide teachers with experiences that build positive teacher dispositions, deep subject matter knowledge, and knowledge of effective practices in writing instruction.

As well, universities and their accrediting bodies should pool their collective expertise to develop and require powerful learning experiences for developing teachers of writing. In this study, unequal learning opportunities for teachers resulted in inequities in student learning opportunities. Universities could fill the existing gap between what teachers are prepared to teach and what students are being asked to do by requiring dedicated writing methods courses for both preservice certification and graduate work in literacy (National Commission on Writing, 2003). Additionally, tests that measure teacher competencies should hold candidates accountable for demonstrating knowledge of writing subject matter knowledge and pedagogical practices unique to writing with the same rigor required for reading.

Aiding teachers in improving their capacity to teach writing will require strong leadership and a commitment to resources from those in roles of influence and leadership. Teachers will need partners who can set in place policies and provisions that provide for the development of their dispositions, knowledge, and skills.

## Purpose

Lack of development in children's interpersonal skills has been attributed as a background factor to issues related to maladjustment including refusal to attend school and bullying. In recent years, social skills training (hereinafter, "SST") has been implemented actively in order to improve children's interpersonal skills. SST programs that have been conducted in Japan targeting toward elementary and middle school students so far have the following skills as common target skills of the training: "how to invite your friends", "how to use kind words", "how to ask for favors politely", "how to decline politely", and "how to control one's feelings and emotions." Most training methods use procedures such as instruction, modeling, rehearsal, and feedback in order to make the target skill entrenched (Emura & Okayasu,2003; Fujieda & Aikawa,2001; Honda, Ohshima, & Arai,2009; Ishikawa, Iwanaga, Yamashita, Sato, & Sato,2010).

On the other hand, Honda (2007) and Honda, Ueyama & Suzumura (2010) positions social skills to be a procedure to express empathy, morality, and pro-social behavior. They stipulate that in order to be able to engage in pro-social behavior, not only does one need to possess social skills, but empathy needs to have been developed within one's internal side; they state that this is crucial as a prerequisite. Honda (2007) proposed that the following factors are important in the development of empathy: a) for emotions to have been sufficiently differentiated; b) being able to understand one's own emotions; c) being able to understand others' emotions; and d) being able to understand what the others would like one to do with such emotions.

In particular, students who suffer from LD, ADHD, and Asperger's syndrome may have several difficulties due to the characteristics of their disabilities. They might have difficulties in understanding the slight difference in nuances, controlling their own emotions, and in reading other people's feelings, emotions, and intentions. Such

difficulties can often become a cause of interpersonal issues and conflicts.

For example, even if students learn the skills for “asking for favors politely” or “declining politely”, if they are unable to understand at a specific point whether they are sad, irritated, or nervous, they may not know what they themselves would like to do. Therefore, they may be unable to use the skills and turn them into action. Furthermore, learning only how to control one’s feelings and emotions will not result in the student being able to control their feelings and emotions well if they cannot accurately perceive their feelings and emotions at the time to begin with. Emotional intelligence (EI) is a concept related to emotions in such interpersonal relationships. EI is intelligence and skills for perceiving, expressing, and understanding one’s own and others’ emotions. EI is believed to come into use mainly during interpersonal communication settings (Komatsu & Hakoda,2011). Mayer & Slovey (1997) postulated that emotional intelligence consists of the four factors of : I .perception, appraisal and expression of emotion; II .emotional facilitation of thinking; III .understanding and analyzing emotions; employing emotional knowledge; and IV.reflective regulation of emotions to promote emotional and intellectual growth. In the past, the importance of emotional intelligence within interpersonal relationships has been raised in Japan. However, there are virtually no programs for children that aim to develop skills and knowledge that correspond to emotional intelligence.

Therefore, this study aims to develop a new psycho-educational program (hereinafter, “E-pro”) those objective is to deepen the self-awareness of own emotions as part of social skills training for middle school students.

## Method

### *The development of the program*

**The aim of the program:** The goals and sub-goals of E-pro are listed in Table 1. E-pro is a program for middle school students developed with the aim of deepening self-awareness of one’s own emotions. As elements for deepening self-awareness, We supposed that the 4-factor model of: Factor I :Perception appraisal and expression of emotion and Factor III:Understanding and analyzing emotions; Employing emotional knowledge are significant.

In order to achieve its goal, the following eight sub-goals have been set for E-pro: ① to become able to perceive one’s own emotions; ② to become able to perceive one’s emotions by differentiating them; ③ to attain a wide variety of terms to express one’s emotions; ④ to become able to put a name to the emotions one is feeling; ⑤ to become able to notice the true emotions behind the emotion that is being felt superficially or is being said; ⑥ to become able to express various emotions behind the emotion that is being felt superficially or is being said by verbalizing such background emotions; ⑦ to understand the mechanism in which emotions are generated; and ⑧ to understand that emotions are not determined by events, but different emotions are generated depending on how such events are perceived. Sub-goals ① to ④ correspond to Factor I , while sub-goals ⑤ to ⑧ correspond to Factor III.

**The content of the program:** Table 2 examines the specific activities and their methods to achieve the goals, turning them into a program.

**Table 1** The goals of the program

Goal : Deeping self-awareness of one's own emotions	
Sub-goals	Correspondence with 4-factor model of Mayer & Salovey(1997)
①To become able to perceive one's own emotions	Factor I : Perception appraisal and expression of emotion
②To become able to perceive one's emotions by differentiating them	
③To attain a wide variety of terms to express one's emotions	
④To become able to put a name to the emotions one is feeling	
⑤To become able to notice the true emotions behind the emotion that is being felt superficially or is being said	FactorIII: Understanding and analyzing emotions: Employing emotional knowledge
⑥To become able to express various emotions behind the emotion that is being felt superficially or is being said by verbalizing such background emotions	
⑦To understand the mechanism in which emotions are generated	
⑧To understand that emotions are not determined by events, but different emotions are generated depending on how such events are perceive	

**Table 2** Program content

	Program name	Program content	Sub-goals
1	Emotion Map	An activity that utilizes the emotion map that the authors developed. An emotion map sample (Figure 1) is shown to participants. After its content is briefly explained, the participants are asked to create two axes of “pleasant – unpleasant” and “excited – calm” on the floor using ropes. Next, the instructor will give different topics, using phrases such as “when....” (for example, “when the dinner that is served when you get back home is your favorite dish” or “when you make a mistake in front of many people”.) The participants then have to contemplate how they will feel and what kind of feelings and emotions they will experience in such situations. They walk on the two-dimensional plane until they reach a point which best fits their response. The instructor then will ask each participant one by one, “How would you express this feeling/emotion in words?”	① ②

2	Creating “My” Emotion Map	Prepare an A4 sheet of paper that has the two-dimensions of “pleasant-unpleasant” and “excited – calm” and thirty seven strips of paper that have emotions (i.e., ‘sadness’, ‘anger’, ‘boredom’, and ‘happiness’) written on them. The participants have to first think at which position of the two-dimensional space does each word of emotion fit the best for them before mapping the emotions. The participants create their own My Emotion Map by coloring or drawing pictures that match the image of emotions that were laid out.	② ③
3	Taking a Journey of Emotion	This is an activity where participants engage in self-reflection in a manner that seems like they are going on a trip to find the true nature of one’s own emotions using the “My Emotion Map” created in the second session. This is a practice which involves naming the emotion one feels using highly-abstract materials, such as photos, music, and drinks. The participants discuss in a group the feelings and emotions they are experiencing at that time as they look at the presented photos, listen to music, and drink juice. With a participant that cannot describe his/her feelings and emotions well with words, the instructor helps the participant find an emotion that fits the best by traveling on the map together while asking questions such as, “Is the present feeling/emotion pleasant or unpleasant? Calm or excited? And to what degree?”	④
4	The Iceberg In the Mind (1)	This is an activity that uses the “The Iceberg in the Mind Worksheet ver.1” that the authors have created. When Japanese youths express negative feelings and emotions, they frequently use terms such as “I’m annoyed”, “this bugs me”, and “this sucks” in an ambiguous manner. Therefore, at first, each participant is asked to give one specific setting where they feel something is “annoying”, “bugs them”, or “sucks” (for example, being insulted by someone you don’t like, or when a friend decides on the future course path first). Next, the instructor poses a question by saying, “if the tip of the iceberg is a feeling and emotion like, ‘annoyed’, ‘bugging’, and ‘sucks’, perhaps there are many feelings and emotions under the iceberg that cannot be seen, being hidden away by the ocean.” Each participant writes down on his/her worksheet the various feelings and emotions that lie deep in the mind using My Emotion Map.	⑤ ⑥

5	The Iceberg In the Mind (2)	This is an activity that uses “The Iceberg in the Mind Worksheet Ver.2” that the authors have created. The worksheet has a section where one writes down situations where one experiences uncomfortable feelings and emotions, and a section where one writes down the cognition→ emotions →and behaviors, in order from the bottom of the iceberg. Firstly, the participant is asked to write down a setting where s/he experiences bad feelings and emotions. Each participant is then asked to write down what kind of emotions they are experienced at that point, and what kind of action is taken. Furthermore, the participants are also asked to write down what kind of thoughts they have at that time (how they perceive the event). Next, the participants contemplate to which emotion these thoughts are linked, and in turn, to which actions such emotions are linked by connecting them using arrows.	⑦ ⑧
---	-----------------------------	--	--------

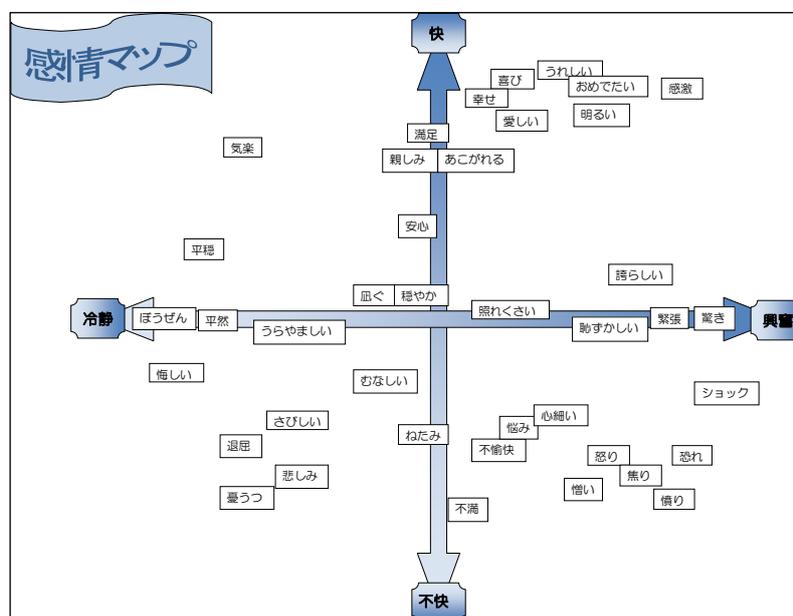

Figure 1 Sample of an emotion map

**Practice method of the program**

**Program format:** E-pro was conducted as part of an SST program for middle school students. The instructors were the three authors and a student majoring in psychology, a total of four people. The SST program has been constructed to be conducted for a total of ten sessions at a rate of once a month, with each session being 2.5 hours. E-pro was conducted in the first half of the program from sessions 1 to 5. The first program session consisted of a warm-up (approx. 45 min), the main activity (approx. 75 min), and cooling down and reflection (approx. 30 min). E-pro was conducted during the main activity

time. During the warm-up segment, self-introduction, a one-minute speech, and facial stretching using facial expressions were conducted. For the “reflection” segment, the group as a whole looks back on the day’s activity during a free conversation after each participant has written down on the self-reflection sheet provided. The items in the self-reflection sheet include current feelings/emotions, why the participant came to experience such feelings/emotions, new things they noticed through the activity, and future goals.

**Subjects:** this program’s subjects were 10 middle school students (5 males, 5 females) who applied for the SST program since they experienced difficulties in interpersonal relationships. Among these 10 students, there were students who had been diagnosed with Asperger’s syndrome and ADHD by professional bodies. Intake interviews were conducted with all participants and their guardians prior to the program. The programs were conducted by separating the students by gender.

### ***Measuring effectiveness***

**Emotional intelligence scale for middle school students:** in order to measure the program’s effectiveness, the participants were asked to give answers about the emotional intelligence scale for middle school students before the start of the program (May) and after completing the program (September). The emotional intelligence scale for middle school students was developed by Toyota and Sakurai (2007), and comprises the two scales of J-WLEIS (Japanese Version of Wong and Law EI Scale) for middle school students and J-ESCQ (Japanese Version of Emotional Skills & Competence Questionnaire) for middle school students. J-WLEIS for middle school students consists of four factors and sixteen items of “evaluating and perceiving others’ emotions” (4 items), “using emotions” (4 items), “adjusting one’s own emotions” (4 items), and “evaluating and expressing one’s own emotions” (4 items). J-ESCQ for middle school students consist of “expressing and naming emotions” (6 items), “perceiving and understanding emotions” (8 items), and “controlling and adjusting emotions” (7 items). The participants were asked to respond to all items using a 4-point scale (1. Strongly disagree; 2. Slightly disagree; 3. Slightly agree; and 4. Strongly agree).

**Self-reflection sheet:** A self-reflection sheet was prepared for each session in order to evaluate the effectiveness of the program from unrestricted reactions of the participants. Before the start of each program, participants select from stickers depicting various emotions drawn one that best describes their current feelings. Then the participant wrote down freely why they feel this particular feeling. Similarly, the participants selected a sticker after the end of the program and wrote down freely the reason for their choice. Furthermore, at the end of the activity, the participants were also asked to freely write down something new they noticed and their goals for interpersonal relationships.

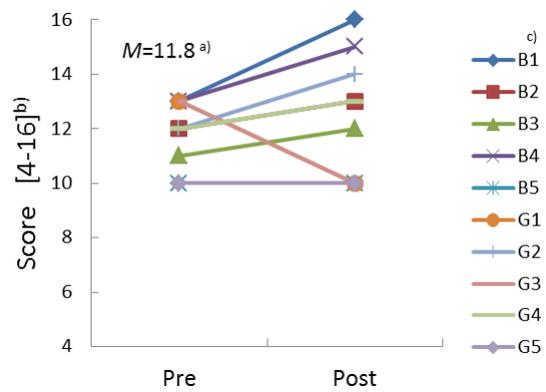

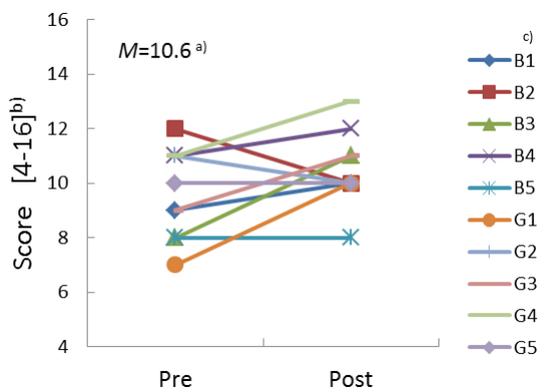

## **Result and Discussion**

### ***Emotional intelligence scale for middle school students***

In order to examine the effect of the program, a *t*-test that corresponded to the seven scales of emotional intelligence scale was conducted. The results showed that there were no statistically significant differences in any scales, and the average scores after the program weren’t changed compared to before the program. Although no

statistically significant differences were seen, in light of the fact that sample size for this study was small ( $n=10$ ), the changes in scores of the 10 participants before and after the program for seven scales were rendered into graphs as a reference. The changes in scores were verified using the graphs. The results showed that in “adjusting one’s own emotions” and “evaluation and expression of one’s emotions” in J-WLEIS for middle school students, 6 out of 10 participants had higher scores after the program compared to before the program (Figure 3,4). And with 2 showing no change, and 2 having lower scores after the program. Those two participants had a pre-program score that was higher than the average score for middle school students. In particular, in “adjusting one’s own emotions” the participants that had low pre-program score saw a significant rise in points.

“Evaluating and expressing one’s emotions” deals with understanding the various feelings and emotions within oneself well. It is a scale that is directly related to the sub-goals of E-pro, which was developed for this study. The results showed that E-pro developed for this study, has a certain effect toward goals set in advance, which was fostering skills of self-awareness of one’s emotions.

**Figure 3** The change in “adjusting one’s own emotions” before and after the program

**Figure 4** The change in “evaluating and expressing one’s own emotions” before and after the program

a) The average of 682 7<sup>th</sup> to 8<sup>th</sup> grade students.

The author calculated the score using Toyota and Sakurai (2007) as a reference.

b) The range of scores is presented within the brackets [      ].

c) B1 to B5 represent males, while G1 to G5 represents females

“Adjusting one’s own emotions” signifies controlling one’s emotions and regaining composure through controlling one’s anger and other emotions. It is a scale related to Factor IV: Reflective regulation of emotions to promote emotional and intellectual Growth, of Mayer & Salovey (1997). Factor IV did not have a content that was presumed in advance as the goal of E-pro conducted for this study. Despite this, the reason why a difference in scores was seen in this study is because being able to organize one’s emotions through deepening one’s understanding of one’s emotions, becoming able to verbalize one’s emotions, and understanding the mechanism of how one’s emotions are

formed, indirectly increased the effectiveness toward adjustment of emotions. These results showed that adjustment of emotions was not only effective as a skill training to teach how to control one's emotions, but also to promote self-awareness of emotions as a prerequisite. Furthermore, the results suggested the necessity of an approach such as E-pro.

### ***Self-reflection sheet***

Next, the effects of programs were reviewed from the free writing participants did on the self-reflection sheet. After "Create My Emotion Map", the second session, participants wrote comments such as, "I realized that I didn't have many emotions toward the direction of calmness", "I realized that each person perceives the same word differently", "I realized that being nervous for me also entails a slight excitement", and "I realized that happiness for me isn't about being excited, but being moved". This shows that self-awareness was further deepened through comparing My Emotion Map with others as participants introduced the completed My Emotion Map to one another.

The comments written after "Taking a Journey of Emotion", the third session, included "(Although in the past I wasn't good at thinking about emotions) I realized that I was surprisingly able to think about emotions", "I realized that I am optimistic compared to other participants", "I felt that I was glad that I came here. I felt I found peace inside me." These comments show that engaging in an activity of giving names to the emotions one is feeling using My Emotion Map one made gives a sense of effectiveness to participants who had difficulties in understanding emotions where they can feel that they can understand their own emotions. Furthermore, this shows that there are participants that experience peaceful feelings by having their feelings and emotions organized by giving names to vague emotions.

The comments written after "The Iceberg in the Mind(1)", the fourth session, included, "I realized that although I have deep emotions, I usually express them with light emotions", "I realized that the feeling of 'this bugs me' contained remorse and anger", "I want to convey my emotions even if it is indirectly". These comments show that the sub-goal of E-pro, "⑤ to become able to notice the true emotions behind the emotion that is being felt superficially or is being said" had been mostly achieved. Furthermore, the comments show that there was a participant who noticed his/her true emotions, which led to the motivation of conveying those emotions to people in his/her surroundings and making them understand such emotions. This shows that being able to understand one's own emotions has led to the motivation for interpersonal communication. This result suggests the importance of self-awareness of emotions as a prerequisite for social skill training.

The comments written after "The Iceberg in the Mind(2)", the fifth session, included, "I became able to express my emotions well", "I strove to confront myself", "Although it was difficult, I feel that I came to understand myself", "I felt refreshed, being able to organize my emotions and feeling", and "I felt calm". These comments show that by completing difficult tasks in small steps, an attitude of striving to confront one's own feelings and emotions has started to grow. Furthermore, descriptions such as, 'I felt refreshed and 'I felt calm', suggest that activities that mentally understand the mechanism in which one's emotions are generated and actually organizing such

emotions not only deepens self-awareness of one's emotions, but also leads to emotional self-control.

### ***Future tasks***

In this study, a new psycho-educational program targeting middle school students with the aim of deepening the self-awareness of one's emotions was developed. The result of conducting the developed programs for ten middle school students suggested the following possibilities of the E-pro: a) E-pro has an effect of deepening self-awareness through comparison with others when it is conducted for a group; b) by taking a step-by-step approach to completing tasks, participants can develop a sense of being able to effectively understand their own emotions; c) being able to understand one's emotions leads to controlling one's own emotions; d) understanding one's own emotions leads to motivation toward interpersonal communication; e) the self-understanding skills of emotions that E-pro aims to achieve are significant as prerequisites for SST.

However, since the sample size for this study was small, the interpretation of results needs to be conducted with caution. In future, we would like to examine the effect of E-pro and improve the program by accumulating practical implementation of E-pro using a similar group of five to ten participants. It is also necessary to run the program at grade-level basis and individually, and examine the effects through comparing E-pro practice according to the implementation format of the program. Furthermore, there were participants in this study who saw relatively significant effects and those who did not. The Aptitude Treatment Interaction (ATI) effects between the various aptitudes of the participants and the program also need to be examined by comparing the effects of E-pro in each individual case example. Furthermore, in order to link the skills learned with E-pro to interpersonal settings, we should also examine with which SST program we should co-ordinate E pro.

## **Hawaii International Conference on Education**

**Title:** A Case for Active Engagement: Balancing teacher and student centeredness in the classroom

**Presenter:** Dr Damian Rentoule, Middle School Principal, Le Jardin Academy Oahu/Chair, Hawaii Association of International Baccalaureate World Schools (HAIBWS), [damian.rentoule@gmail.com](mailto:damian.rentoule@gmail.com)

**Area:** Curriculum, Research and Development

**Presentation type:** Workshop

**Description:** Teachers and students share roles in classroom discourse. A healthy balance of these roles is required if classroom practice is to reflect the promises made in curriculum documents, which increasingly outline pedagogy as well as content. What do these patterns look like, and what can a school do to develop more effective patterns?

### **Workshop Abstract**

Teachers and students share roles in classroom discourse. A healthy balance of these roles is required if classroom practice is to reflect the promises made in curriculum documents, which increasingly outline pedagogy as well as content. What do these patterns look like, and what can a teacher do to develop more effective patterns? These questions are investigated through a series of workshop activities designed to critically evaluate the role of students and teachers in the classroom practice of the participants. The workshop is based on the results of a recent PhD study at the University of Queensland, which examined the nature of student discourse in classrooms. The alignment between the written curriculum and the competing classroom discourse experiences of students was investigated and from the results, a series of teaching strategies that support specific types of discourse roles, both student and teacher centred were identified. The workshop is aimed at helping teachers identify types of discourse that they would like to promote in their own practice and provide concrete strategies to support this pedagogical shift, moving towards greater levels of active engagement in the classroom.

**Focus Research:** Locating Competing Student Discourses in International Baccalaureate Classrooms: A Focus on Active Engagement as a Pedagogical Priority

**Researcher:** Damian Rentoule, The University of Queensland, 2013

### **Abstract**

This study examined the nature of student discourse in classrooms with an International Baccalaureate (IB) Middle Years Programme and Diploma Programme to investigate alignment between the written curriculum and the competing classroom discourse experiences of students. Patterns of classroom discourse were revealed in one case study site and data analysed using critical discourse analysis. The form and the function of classroom discourse were investigated, providing a unique contribution to the field because, typically, the focus is either form or function, but not both. Video recordings of 100 classroom episodes, from Year 6 to Year 12, across a range of subject areas, were collected and observed, and data were analysed to determine the nature of the competing discourses in which students were engaged. The purpose of the study was to determine the extent to which classroom discourse in this school aligned with the written curriculum guidelines of the IB.

The research was designed to investigate the following research questions:

1. What competing student discourses exist in an IB Middle Years Programme and an IB Diploma Programme in one school setting?
2. To what extent does the function of student discourse align with the IB vision and philosophy?
3. What inferences can be drawn about teacher pedagogy and student discourse?

Results were analysed within a taxonomic organisation based on the forms and functions of classroom discourse. Results suggested that a wide range of intricately interconnected and interdependent discourses existed within the classrooms, competing in terms of both form and function. It was also found that student engagement in classroom discourse only partially aligned with IB vision and philosophy, and pedagogical change would be required to create closer alignment. The teacher was found to be the major determinant of the nature of student discourse.

This study contributes to existing knowledge in the field of critical discourse analysis through the identification of the relationship between form and function of discourse and provides educational leaders with a framework for planning pedagogical interventions.

**Keywords:** International Baccalaureate, discourse analysis, pedagogical change, international education

## LESSONS ON ANGLES IN AMERICAN AND KOREAN ELEMENTARY MATHEMATICS CURRICULUM PROGRAMS

Ok-Kyeong Kim  
Western Michigan University  
[ok-kyeong.kim@wmich.edu](mailto:ok-kyeong.kim@wmich.edu)

Jee Hyon Lee  
Seoul Women's University  
[jh802@swu.ac.kr](mailto:jh802@swu.ac.kr)

*This study compares lessons on angles in two elementary mathematics curriculum programs: Mathematics (Korea) and Math Trailblazers (U.S.). In both programs, right angles are introduced in grade 3 and the concept of angle is extensively explored in grade 4. These programs include similar key content, such as right, acute, and obtuse angles, and using protractors to measure and draw angles. The two programs, however, exhibit distinct approaches to teaching and learning angle. Mathematics (Korea) uses a static meaning of angle and operates on angles as objects from the beginning, using protractors early on and finding the sum of and differences in angle measures. In contrast, Math Trailblazers (U.S.) emphasizes a dynamic notion of angle and promotes various processes of creating, showing, and estimating angles.*

This study compares lessons on angles in two elementary mathematics curriculum programs: *Mathematics* (Korea) and *Math Trailblazers* (U.S.). In this study, curriculum programs refer to written curriculum materials for day-to-day teaching and learning. *Math Trailblazers* is one of the reform curriculum programs developed with funding by the National Science Foundation in the U. S. *Mathematics* is based on the National Curriculum of Korea, where students have outperformed those in other countries in a number of international studies in mathematics (Mullis, Martin, Gonzalez, & Chrostowski, 2004; Schmidt, Blömeke, & Tatto, 2011).

Geometry is an important mathematics strand in that it provides useful tools to explain our daily lives and it helps students develop reasoning skills. Geometric representations and spatial reasoning help solve problems in other areas of mathematics as well as in real-world situations (National Council of Teachers of Mathematics [NCTM], 2000). Among the various topics in geometry, we focus on the concept of angle in the two programs because it is crucial in learning geometry not only at the elementary level, but also in advanced level of mathematics such as differential geometry. The comparison examines the characteristics used in each program to represent and develop this important concept in a series of lessons. A set of questions guided this comparison: What are similarities and differences in the two programs in terms of key mathematical ideas and their development and organization in the lessons? What characteristics (including strengths and weaknesses) does each program exhibit in those lessons? What can the two different programs learn from each other?

## Theoretical Foundations

Teaching is regarded as a cultural activity (Givvin, 2004). In the same sense, curriculum programs are the products of culture. Cultural insiders are accustomed to their own curriculum, which makes it hard for them to view their curriculum objectively (Geertz, 1984). Comparing curricula from different countries is meaningful not only for finding alternatives, but also for acknowledging potential in one's own curriculum. Specifically, to pursue globalized education in the 21<sup>st</sup> century, we need to uncover local characteristics (Daly, 2007) of curriculum in various countries, such as strong and weak aspects. Such an examination can promote global perspectives on curriculum and ultimately help curriculum developers to envision and design a better curriculum in each country. In this respect, cross-national analyses of curriculum programs should be considered an opportunity to improve one's own curriculum based on the local characteristics identified as well as global perspectives that surface.

Given the significance of international comparisons of curricula, we examined the two curriculum programs with respect to the concept of angle. Researchers argue that the concept of angle is critical to the learning and understanding of geometry (Clements & Burns, 2000; Mitchelmore, 1998). The concept builds the foundation to explore 2- and 3-dimensional shapes from elementary to advanced levels. Angles are defined in two different ways, which may affect students' understanding as well as misconceptions. A static definition of angle is "a part of the plane included between two rays meeting at their endpoints" (Clements & Burns, 2000, p. 31); a dynamic definition is the amount of turn/rotation from one of the rays to the other within the plane. In fact, according to the dual nature (i.e., process and object) of mathematical concepts (Sfard & Linchevski, 1994), students should learn angles as a process (turn/rotation) and reify them as objects (the part between two rays sharing the same endpoint). This means that students need to be able to see angles as processes as well as objects to fully understand the concept of angle. A common misconception students have is that an angle is the distance between the two rays, which comes from experiencing angles in only static ways. In contrast, students who see angles only as processes will have difficulty later when angles operate as objects. To summarize, earlier studies point out that how the concept of angle is represented and developed is crucial to students' learning of angles in particular and perhaps to their future learning of geometry.

## Methods

We analyzed fourth-grade lessons on angles in two curriculum programs in Korea and the U.S. The Korean program, *Mathematics*, based on the national curriculum, is the only one available for elementary students; *Math Trailblazers* is one of various elementary mathematics curriculum programs in the U.S. (see Table 1).

*Mathematics* (grades 1-6), the Korean mathematics curriculum program analyzed, is based on the 2007 National Curriculum, which was developed by the Ministry of Education, Science, and Technology. *Mathematics* aims not only to improve the ability to solve day-by-day problems rationally, but also to recognize mathematical values and promote positive attitudes toward mathematics. In doing so, *Mathematics* emphasizes

understanding basic concepts, principles, and rules; thinking and communicating mathematically; and observing daily phenomena mathematically.

Table 1. Two Curriculum Programs

	Mathematics (Korea)	Math Trailblazers (U.S.)
Edition	2007 revision	3 <sup>rd</sup> Edition
Developer	National team using the 2007 National Curriculum	University project funded by NSF, based on reform movement
Publisher	Ministry of Education, Science, and Technology	Kendall/Hunt Publishing Company
Materials analyzed	Teacher guide, student textbook, student workbook	Teacher guide, student guide, Discovery Assignment Book
Lessons analyzed	8 lessons/sessions in one unit on angles in grade 4	3 lessons (7 sessions) in two geometry units in grade 4

*Math Trailblazers (Trailblazers)* is an elementary (K-5) mathematics curriculum developed by the Teaching Integrated Mathematics and Science Project (TIMS) at the University of Illinois at Chicago, with funding from NSF. *Trailblazers* is aligned with reform recommendations, particularly those known as NCTM Standards, and also integrates mathematics with other disciplines, especially science and language arts. This curriculum introduces advanced mathematics in early grades (e.g., exponents in grade 3) for in-depth inquiry of mathematics, while focusing on computational and problem-solving skills on a daily basis throughout the year.

In both curricula, angles are introduced and explored in-depth in the fourth grade. (In both programs, right angles are introduced in grade 3 in the context of exploring polygons (e.g., triangles), and angles are further explored in polygons in grade 5.) For the analysis, we utilized curriculum materials/resources for both teachers and students that were needed for day-to-day teaching and learning, such as teacher guides and student books. These materials provided the details of the mathematical content and context for each lesson and organizations of the lessons. While the number of lessons in the two programs was different, they had a similar number of sessions, which made the lessons in the two programs comparable. The lessons in *Mathematics* were organized by session, whereas *Trailblazers* had longer lessons that required more than one session.

In the analysis, each lesson was described in terms of the main concepts, representations used, and student activities. The flow of each lesson was examined, and then the sequence and emphases of the entire lessons in each program were studied in terms of the key content and its development through the lessons. Common features and differences in various aspects and approaches to teaching the concept of angle were compared between the two curriculum programs.

## Results

Angles are introduced and extensively explored in the lessons for grade 4 in both curriculum programs. The key content covered in those lessons is nearly the same. Common key content in the angle lessons from the two curriculum programs includes:

- Identifying right, acute, and obtuse angles
- Representing angle measures in degrees
- Using protractors to measure and draw angles
- Identifying components of angles (e.g., a vertex, and two rays or sides)
- Estimating angle measures

Even though the two programs contain similar key content in their angle lessons, they exhibit different approaches to teaching such content and distinct organization of the lessons (see Tables 2 and 3).

Table 2. Angles Represented in the Two Curriculum Programs

	Mathematics (Korea)	Math Trailblazers (U.S.)
Definition of angle	No explicit definition discussed or used in grade 4; “a shape composed of two lines” in grade 3	The amount of turning; the amount of opening
Introducing angle measures (degrees)	One right angle is $90^\circ$ and $1/90$ of one right angle is $1^\circ$ .	One complete turn around a circle (clock face) is $360^\circ$ . Halfway around a circle is $180^\circ$ ; a third of the way around is $120^\circ$ ; a quarter of the way around is $90^\circ$ .
Notations	Angle 가 or Angle 나가다 (using Korean alphabets)	Angle A, $\angle A$ or $\angle BAC$ $\angle A = 90^\circ$
Representations of angles (in order of appearance in the lessons)	Folding fans, clock face, protractors, examples of angles in real life	Clock face (curved arrows representing angles), two rulers or two pencils, angle circles, scissors, examples of angles in the classroom, pattern blocks, and protractors
Contexts representing angles	Folding and opening fans in different degrees, angles in parts of a bicycle frame	A complete turn in ballet, airplanes taking off at different angles, different shapes of sandboxes, angles in pattern blocks, angles in polygons

Table 2 summarizes how the concept of angle is introduced and represented in the lessons in each program. *Mathematics* introduces angles using real-life examples (e.g., two folding fans opened in differing degrees) and asks students to compare sizes of angles intuitively and then by using transparent paper. Such activities lead to the use of a tool (protractor) to measure angles precisely. *Mathematics* uses the static meaning of angles and operates on angles as objects from the beginning, using protractors early on and finding the sum of and difference in angle measures. In contrast, *Trailblazers* introduces angle as the amount of

turning and asks students to do motions to represent angles, such as making a complete turn. In the last lesson, angles are described as the amount of opening as well as the amount of turning. In fact, *Trailblazers* promotes dynamic as well as static meanings of angle, with much emphasis on dynamic interpretation of angle throughout the lessons.

The contexts and representations used in the two programs share some similar forms, such as clock faces and examples of angles in the classroom and real life. *Mathematics* uses physical and concrete representations at the beginning and moves quickly to symbolic notations with diagrams of angles to discuss and precisely measure sizes of angles. *Trailblazers* focuses the notion of turning throughout the representations. In general, *Trailblazers* provides more diverse representations and contexts to illustrate the concept of angle in a dynamic (rather than static) way.

The ways in which each of the two programs introduces angle measures and degrees are distinct. *Mathematics* introduces a right angle as  $90^\circ$  and then defines  $1^\circ$  by using  $1/90$  of one right angle. This curriculum also introduces protractors very early in the lessons. *Trailblazers* defines one complete turn as  $360^\circ$  and then introduces half turn, quarter turn, and a third of a complete turn. *Trailblazers* does not use  $1^\circ$  until the last lesson, in which students start to use protractors to measure angles. In the meantime, *Trailblazers* uses expressions like “a little more than  $90^\circ$ ” and “a little less than  $180^\circ$ ” to show or estimate angles.

Table 3 summarizes the organization of the lessons on angles in the two curriculum programs. Just as they exhibit different approaches to representing angles, their activities and organization of lessons reveal distinct characteristics. The activities in *Mathematics* are organized very carefully from beginning to higher levels and move by small steps toward the advanced level. For example, in the lesson on drawing angles, *Mathematics* has several specified activities to draw angles, ranging from drawing angles intuitively, to drawing angles with one side and the vertex given and with the side given and no vertex, to drawing angles from scratch. In contrast, *Trailblazers* has a somewhat looser organization. Unlike *Mathematics*, *Trailblazers* does not contain all the lessons on angles within one unit. The three lessons on angles are in two separate units, one early in the school year and the other much later. Consequently, the last lesson includes frequent reviews of some concepts taught in the previous lessons to remind students.

*Mathematics* has a typical format in its lessons: facing perturbation, reasoning intuitively, sharing of possible solutions, exploring the main activity with teacher’s guidance, and final checking (closure) and practice. These main steps are listed in the student book as well, which may help students see the flow of their exploration. In contrast, *Trailblazers* does not have a common format throughout the lessons, except that *Trailblazers* has an extensive student exploration segment. One potential reason for this difference in lesson flow is the length of individual lessons. *Mathematics* has lessons organized by sessions (i.e., one lesson is one session), whereas *Trailblazers* has longer lessons with multiple activities or activities requiring more than one session to complete. This means that *Mathematics* has lessons segmented by session, yet they build on the previous ones and

move toward the goals of the entire lessons, i.e., the unit. *Trailblazers'* lessons are less hierarchical, even though they build on previous learning.

Table 3. Organization of Lessons on Angles in the Two Curriculum Programs

	Mathematics (Korea)	Math Trailblazers (U.S.)
Main activities in sequence	<ul style="list-style-type: none"> <li>• Compare the various sizes of angles using transparent paper/sample</li> <li>• Use protractors to measure the sizes of angles</li> <li>• Draw given angles with/without protractors (find various ways to draw angles without a protractor using intuition; draw angles with given base line with/without vertex; draw precise angles without any given)</li> <li>• Estimate the size of angles and then measure the actual size</li> <li>• Find the sum of and difference in angle measures</li> <li>• Find the sum of all the internal angles of a triangle; Cut out the three angles and put them together to see their sum; Find the size of one missing angle or the sum of two missing angles in a triangle</li> <li>• Find the sum of all the internal angles of a quadrilateral; Cut out the four angles and put them together to see their sum; Explore the relationship between the sum of the internal angles of a triangle and the sum of the internal angles of a quadrilateral; Find the size of a missing angle in a quadrilateral</li> <li>• Extension - Explore the sum of the other two angles and external angles of a triangle; Explore the sum of internal angles of other polygons</li> </ul>	<ul style="list-style-type: none"> <li>• Compare pairs of shaded angles pictured on clock faces (which has more turning)</li> <li>• Create angle circles using two same-sized, different-colored circles (green and white); Use them to show and compare different-sized angles</li> <li>• Use angle circles to show angles larger or smaller than the given ones; Draw angles larger or smaller than the given ones and label them</li> <li>• Explore right, acute, and obtuse angles</li> <li>• Estimate angles by using <math>45^\circ</math>, <math>90^\circ</math>, and <math>180^\circ</math> as benchmarks; Use angle circles to make angles in various sizes (e.g., a little less than <math>180^\circ</math>)</li> <li>• Explore angles in pattern blocks (equilateral triangles, trapezoids, hexagons, rhombi, squares) – angle measures of those shapes using the relationships among them</li> <li>• Use protractors to measure angles and practice</li> <li>• Measure three overlapping angles and see that the sum of the two smaller angles are the measure of the larger angle</li> <li>• Construct a sandbox (polygon) with a specific angle (e.g., <math>50^\circ</math>)</li> <li>• Explore internal angles of polygons (quadrilaterals)</li> </ul>
Emphasis	Static approach, angles as objects; Use protractor precisely to measure and draw angles; Think intuitively; Manipulate angles (e.g., cut out angles and place them together); Practice skills	Motion (dynamic approach), angles as processes; The size of an angle is determined by the amount of turning/opening, not by the lengths of the sides.

Precision and approximation are appropriate words to describe overall characteristics of *Mathematics* and *Trailblazers*, respectively. *Mathematics* emphasizes and promotes accuracy and exactness throughout the lessons. Estimating, thinking intuitively and manipulating angles are often required in order to emphasize the necessity of using

protractors. *Trailblazers* uses approximation extensively throughout the lessons. Using benchmarks, such as  $90^\circ$ , to estimate, show and sketch angles is a core activity in the lessons. Also, expressions such as “little more/less than  $90^\circ$ ” are commonly used to describe angles.

### Significance

Understanding mathematics curricula in other countries helps us examine and improve our own practice. It provides new insights and different approaches to looking at phenomena familiar to us, which may not be available otherwise. Comparing the lessons on angles in the two Korean and U.S. elementary mathematics curriculum programs revealed stark differences as well as common features between them. This effort is significant not only to help enhance the quality of the curriculum in each country, but also to promote international perspectives and discussions on curriculum, which can help establish a common ground to investigate issues related to curriculum.

## Preschool Educational Professionals' Perspectives about Collaboration in an Inclusive Preschool Classroom

### Abstract

Meeting the needs for all preschoolers in inclusive settings is the ultimate goal of effective collaboration. In this study the author explored and reported the preschool educators' perspectives towards the role of successful collaboration to address and meet preschoolers' needs. Eight educators who were related to an inclusive preschool classroom participated in this case study. The author interviewed educators and observed the actual collaborative meetings. The data were analyzed into three major themes: understanding the concept of collaborative practices, practices that were utilized among educators, and the impact of collaboration on an inclusive preschool classroom. The results indicated that all the themes were addressing that establishing effective collaboration among educational professionals is an essential factor in promoting the educational and behavioral outcomes of all preschoolers in inclusive classrooms.

### Research Questions

The research question for this study was: What are the preschool educational professionals' perspectives about collaboration in an inclusive preschool classroom? The question had three sub-questions, which are the following: 1) How do educators understand the concept of collaboration? 2) What models and/or practices do educators utilize in their inclusive preschool classroom? 3) What is the impact of collaboration on the inclusive preschool classroom?

### Participants and Setting

Eight early childhood educators who were associated with an inclusive preschool classroom in a school that is located in the Rocky Mountain Region participated in the study. All collaborative team members who supported the preschool teacher were targeted to be participants.

### Data Collection

Triangulation methods were utilized, which included:

- 1- Observation of the participants' collaboration meetings one time per week for approximately one hour, for three weeks. An observational protocol was utilized to observe where, when, who, why, and how they collaborated and worked together.
- 2- Participants were interviewed using semi-structured interview questions that were developed based on the extant literature review of models and strategies for collaboration.

### Data Analysis

The transcribed interviews that describe participants' perspectives of the collaborative practices and its impact on the inclusive preschool classroom were analyzed by following Merriam's (2009) technique of thematic analysis. Observations of collaborative practices described and utilized support participants' statements.

### **Findings**

Three major themes emerged. The first one was educators' understanding of the concept of collaboration. The participants demonstrated various levels of understanding of the concept of collaboration. The second theme was collaborative practices that the educators implemented for the inclusive preschool classroom. Educators reflected on the effectiveness of these practices. The third theme was the impact of collaborative practices on preschoolers' achievement, which had two sub themes: 1) describing successful collaboration that produced positive outcomes for young children and 2) the challenges of collaboration. Overall, the results indicated that all the themes were addressing that establishing effective collaboration among educational professionals is an essential factor in promoting the educational and behavioral outcomes of all preschoolers in inclusive classrooms.

**1. Title of the submission:** Innovations in Teacher Education: Preparing Teachers of Deaf/Hard of Hearing Students

**2. Name of the author:** Dr. Charlotte Enns

**3. Affiliation of the author:** University of Manitoba

**4. Address of the author:** Dr. Charlotte Enns  
Faculty of Education  
University of Manitoba  
Winnipeg, MB R3T 2N2  
CANADA

**5. Email address of the author:** [charlotte.enns@umanitoba.ca](mailto:charlotte.enns@umanitoba.ca)

**6. Abstract:**

Approximately 10% of the Canadian population has some degree of hearing loss. This means that many students in our schools have a hearing loss that impacts their learning. Educational programming for these students is greatly enhanced when a Teacher of the Deaf/Hard of Hearing (DHH) is on the educational team. Currently, there is a significant shortage of teachers of the DHH in Manitoba and across Canada. These teachers work with students of all ages and in a variety of different work capacities including, resource/special education, regular classrooms, itinerant/consultant, or special schools/programs for DHH students.

This presentation discusses a newly developed program designed for current teachers who are interested in taking the Deaf/Hard of Hearing. The program is structured within a University of Manitoba Post Baccalaureate Diploma in Education (PBDE) hour (10 three credit hour courses) professional development program for teachers. Students are also required to complete 400 hours of practicum over a 10-week period as part of the program, which is divided over two years to ensure that students receive experiences in a variety of educational settings. The courses include flexible course delivery options (evening, weekends, online, etc.) so that teachers who are working full time and live throughout Manitoba can participate. This includes employing a combination of face-to-face and distance modes of instruction. Students move through the series of courses as a part-time cohort group and, upon admission, are expected to make a commitment to complete the entire program within the two-year timeframe.

The first group of teachers were admitted into the program in May 2012, and began taking their first courses in July 2012. The group included a total of 18 teachers, of whom eleven did not reside in Winnipeg (Winnipeg is the major urban centre in Manitoba and the location of the University of Manitoba). For this reason, it was decided to offer face-to-face courses during the summer months, and blended courses (primarily online with one face-to-face session on a Saturday) during the regular Fall and Winter terms. The decisions regarding which courses to offer in a

blended format were challenging, as practical coursework is typically best offered within interactive settings. Specifically, in the area of Deaf Education, there are numerous technological devices and assessment practices that require hands-on learning. The following table outlines the courses that were part of the Teacher of the Deaf/HH PBDE Program and how and when they were offered.

### **Proposed Course Schedule:**

#### **Year 1**

##### **Summer (July) 2012**

1. Language, Learning & Literacy (6 credit hours) – face-to-face classes in an intense two-week format

##### **Fall 2012**

2. Communication Approaches in Educational Settings (3 credit hours) – online and one Saturday face-to-face class

##### **Winter 2013**

3. Educational Audiology 1 (3) – online and one Saturday face-to-face class

##### **Winter/Summer (January – August) 2013**

Practicum (5 weeks)

#### **Year 2**

##### **Summer (July) 2013**

4. Deaf Studies (3) – face-to-face classes in an intense one-week format
5. Educational Audiology 2 (3) – face-to-face classes in an intense one-week format

##### **Fall 2013/Winter 2014**

6. Curriculum Development for Deaf/Hard of Hearing Learners (6) – online and one Saturday face-to-face class each term

##### **Summer (July) 2014**

7. Speaking and Listening with Deaf/Hard of Hearing Learners (3) – face-to-face classes in an intense one-week format
8. Literacy Development with Deaf/Hard of Hearing Learners (3) – face-to-face classes in an intense one-week format

##### **Winter/Summer (January – August) 2013**

Practicum (5 weeks)

#### **Practicum (10 weeks or 400 hours):**

The practicum was administered by the University of Manitoba in partnership with the professional organization of CAEDHH-MB (Canadian Association of Educators of the Deaf/Hard of Hearing – Manitoba chapter). The goal was to place students in a variety of educational settings for a minimum of 4 weeks in each setting to complete a total of 10 weeks of direct experience working with children under the

supervision of a CAEDHH certified teacher of the DHH. The current programming for DHH students in Manitoba is to include them in their home schools and within regular classes. For this reason, it was challenging to find suitable practicum placements for our teacher of the DHH candidates. Most teachers of DHH students work as itinerant teachers, supporting a variety of students in regular classrooms in different schools. We did arrange for placements with itinerant teachers of the DHH, as well as placements in cluster programs and the specialized school for DHH students. We also developed Spring Break and Summer Educational Camps for DHH students to provide opportunities for our teacher of the DHH candidates to work with groups of DHH children in classroom settings. All students were required to keep an accurate log of their hours and activities, and supervisors were required to complete evaluation reports.

The first group of teachers is currently beginning the second year of the program and this presentation outlined the insights and challenges encountered through program implementation to this point. In particular, a further discussion of the criteria and strategies for decisions regarding online course delivery and practicum placements was included.

Name: Jennifer Leauga

Department: Head of Māori Department

Organization: Lynfield College, Auckland, New Zealand.

Email: [jleauga@lynfield.school.nz](mailto:jleauga@lynfield.school.nz)

Submission ID: 1405

Submission Title: Topic two: 'Using a *Range* of Strategies to Teach a *Range* of Students, **Practical** Tools, **Visible** Results'

Topic Area: Secondary Education

Presentation Format: Workshop

Overview: This workshop allows attendants to see different methodologies used in the classroom at various ages, for a mixture of student types. Teachers and Parents can adapt tasks/activities to suit their own subject/school, to make teaching and learning more fun, improving engagement and most importantly achieving results!

## HAWAII INTERNATIONAL CONFERENCE ON EDUCATION

12<sup>th</sup> Annual Conference

January 5-8, 2014

1. **Title:** *The Art of Mass Media in Ancient Times: the Greeks and the Romans.*
2. **Name of the author:** Joaquín Montero, Ph.D.
3. **Affiliation of the author:** Associate Professor; Departments of Languages and Literature, Global Studies and Humanities. Benedictine University, Lisle, IL.
4. **Address of the author:** 1012 Kimberly Way, Lisle, IL 60532 (USA).
5. **E-mail address of the author:** [jmontero@ben.edu](mailto:jmontero@ben.edu) / [monterojk@sbcglobal.net](mailto:monterojk@sbcglobal.net)
6. **Topic area:** Cross-disciplinary areas of Arts and Humanities/History

**Presentation format:** Paper Session

**Description:** This paper shows a newly, unique and updated approach to the history and theory of mass communications: it sustains for the first time the thesis that ancient numismatics are the first and earliest medium of mass media communication in history. Provides a great number of examples from the ancient Greek and Roman worlds. This interdisciplinary topic covers areas from history, politics, art and communications.

### 6. 1. Abstract:

#### *Introduction*

This presentation is based on a finished and completed research paper ready to be published. This work shows a new and unique approach to the history and theory of mass communications, with an introduction to the definition of mass communication in history, when and how it appears for the first time. It debates the importance of numismatics in history as vehicles to carry messages widely, and gives strong evidence that, for the first time, ancient currency is the first and earliest medium of mass media communication in history. The coin will start to be a mass medium from the very beginning since it was produced in mass quantities, and circulated continually throughout and beyond some ancient empires.

The new theory will be proved and illustrated with the accurate evidence provided by images of ancient coins classified by time periods and themes related to the specific communication purposes: from some Greek city-states, where the coin was a global tool to unify politically different economic areas, to the Hellenistic rulers and the Roman Empire, when the power of image and political propaganda were used in an extensive and intensive manner.

## ***Methodology***

The presentation contains two parts:

1. A brief introduction to the theory of mass media communication in history to explain and support this thesis.

2. The numismatic evidence and the practical examples that illustrate the different methods and topics of mass communication through coins in the ancient times, with an extensive part dedicated to the Romans, truly masters of propaganda in their coinage.

The methodology that will be used on this part is based on the division of the themes. The contents of the presentation are divided in the following parts:

2.1. Precedents. History of coinage. Coins of the first empires: local use vs. global circulation.

2.2. First global use of coinage: Alexander the Great and the Hellenistic rulers.

2.3. The Romans, masters of communication through money. The coin as a tool to carry a message. Portraits and the power of image. A great variety of reverses for each emperor's *headlines*.

Images classified by topics:

- Religious types and rulers as gods.
- Military achievements: victories and trophies.
- The reverses of Trajan and Hadrian.
- Other propaganda issues.

## ***Sources***

The research and literary sources are very numerous and they would take so much space in the abstract to be mentioned, so we will provide just a few basic references here, but an extensive bibliography will be included in the paper of the presentation.

## **6. 2: Full paper:**

### **The Art of Mass Media in Ancient Times: the Greeks and the Romans**

*Joaquín Montero, Ph. D.*

In our contemporary society, media and communications are readily visible and affect our lives on a daily basis. Due to the evolution of technology, the amount of information we process every day is astounding and sometimes overwhelming. Although not all this information we receive is propaganda, we see how publicity and commercials, -brothers and sisters of the propaganda family-, attempt to influence people all over the world.

Today, the transmission of ideas, images or messages is fairly easy with the boom of technology in communications. Information is available to anyone anywhere at any moment, and in real time. We have the Internet to get extraordinary amounts of data of any kind and e-mails to be in touch with other people. Not to mention *Facebook*, *Twitter* and other networks, as well as *iPads* and *iPhones* or other devices to connect with any person, see their faces while we chat, or sending notes wherever we are by text messages. The impact of communications today is so great that even those actions are becoming new words of our vocabulary in English and other languages. The last couple of decades have seen the explosion of social connections, even if this does not mean that people are closer than ever to each other, at least they have more options to keep in touch or to have the feeling of staying connected. Nobody dares to walk out of his or her home every morning without a cell phone, and if we forget it, we may have a feeling of anxiety or insecurity, like walking naked down the street. The technological availability of communication in the present day makes possible and more present the influence of media and mass communications.

In ancient societies, where the transmission of ideas or messages was limited by the level of technology and the equation of time and space, they discovered and started to use the first mass media tool in all history: the coin. Coinage easily meets the criteria utilized to define mass media. Coins were reproducible in mass quantities; light enough to be easily transported through space; and also destined to an anonymous mass audience (unlike, for example a letter, that is specifically addressed to a particular person). So, it is not difficult to see how this medium of communication was the first one transmitting messages from the power. This power (kings, emperors, or other types of rulers) controlled the production of the coinage and thus decided on the message the carried<sup>[1]</sup>. It is obvious then that ancient coinage was the birth of political propaganda on a massive scale.

### **“Global” Circulation**

The concept of “global” or “globalization” that we can apply for the Ancient World is different from the contemporary term. Considering the geographical limitations of the Ancients and the knowledge of their own world compared to ours, “global” in those days can be referred to a certain extension of territory with some common characteristics overall (like sharing an official language, living under one ruler or power, and the use of the same coinage); but, at the same time, those territories could have their own artistic and cultural expressions, languages, coinages, or even governments, but only used locally.

The extensive production or mint of coins, and the global circulation of a coinage is different from an extended circulation or acceptance of a coin. For example, during the Golden Age of Athens (V Century B.C.), the popular Athenian tetradrachms with Athena and the owl was used in trade from mainland Greece to Egypt, as well as accepted and

imitated by many other cultures, but the importance of this coinage was limited if we compare it to latter and more global examples. There is no doubt that the acceptance of a coin further from its original territory shows evidence of economic strength, but it still far from the stronger expression of power of being the official coinage of different lands and civilizations, united by the power of a common coinage.

The first example of global circulation and production of a coinage, in the extensive meaning of what we understand by “global”; also made under one common ruler, and with a wide expansion not only geographical, but also in the length of time, is the coinage of Alexander the Great. With the Macedonian king -later Egyptian pharaoh and Persian emperor-, the opening of new trading routes from Greece and Europe to Asia Minor, the Middle East, North of Africa, and all the way to India, the call for an extensive use of coins was a real need. A common coinage will be the most decisive step into a political unification of the many countries full of diversity that he conquered. At the same time, after Alexander’s lifetime, coins will also became a political instrument for regulating the economy, controlling territories, and carrying a message from the power in charge. And since then, coins will be the most important tool of political propaganda in global empires, where their circulation and reach was global too. The next global empire found in history after Alexander’s is the Roman Empire, which will last longer –almost exactly 500 years-, and will expand for three continents, and minting millions and millions of different coins.

### **The First Steps: Propaganda on Greek Coinage**

Not all Greek coinage illustrates propaganda issues mainly for religious reasons. Propaganda typically took the form of endorsing current leadership and in later times, included portraits of rulers. Initially, however, no human being could be represented on a metal. The reason why portraits of human beings did not appear on coins may have been due in part to some religious taboo, which made the coins rightful property of the gods, as was everything else that came from nature. It was considered sacrilegious to represent humans on coins. This portraiture was viewed like an elevation of humans to the level of the gods. Therefore, the first portraits on coins were gods, goddesses, heroes and mythological creatures. As the religious viewpoint evolved, portraits began appearing on coins at the time of Alexander the Great and his successors, the pioneers in the use of image as propaganda coming from power, and the first examples of a deified ruler.

For a man, king or ruler, to be represented in the metal of a coin, he must be first recognized as a god. The first king that we have on the history of numismatics is Alexander the Great, not only on his posthumous portraits minted in the different coinage by his successors, but also during his lifetime. According to Martin Price “only certain portraits of Alexander on lifetime coins are those of the bronze issue of Memphis (3960) and the figure on the five-shekel (dekadrachm).”<sup>1</sup> *See Fig. 1*

---

<sup>1</sup> GOLDSBOROUGH, Reid. *The Celator*. Vol. 16, No. 9, September 2002. p. 4, 37-38.

Fig. 1. Reverse of the Porus dekadrachm, showing the image of Alexander holding a thunderbolt, symbol of Zeus, on his right hand. This would be the only image of Alexander to survive from his lifetime.

This remarkable piece is known as the dekadrachm of Poros and was minted after Alexander's victorious campaign in India, probably in the imperial mint of Babylon. Even if the most important question of who issued these coins remains, there is general agreement<sup>2</sup> that the warrior represented on both, obverse and reverse, can be none other than Alexander. The action on the obverse depicts a horseman on a prancing horse attacking two riders on an elephant retreating to the right. He wears a plumed Phrygian helmet, cuirass, and *chlamys*, and with his right hand he thrusts a long spear toward the elephant. The reverse shows Alexander standing to the left, being crowned by a small Nike flying toward him from the left. He wears a plumed, crested Phrygian helmet and a cuirass with a belt and fringes. A scabbard hangs from a strap over his right shoulder, and *chlamys* floats on his back. In his right hand he holds a thunderbolt horizontally, and he rests his left on a long spear. The most astonishing feature of this scene is the

---

<sup>2</sup> ARNOLD-BIUCCHI, Carmen. *Alexander's Coins and Alexander's Image*. Harvard University, 2006. p. 74-75.

thunderbolt<sup>2</sup>, the divine attribute of Zeus, in the right hand of Alexander. The importance of this coin is that “never before in the Greek world, and certainly never on a coin, had a mortal been portrayed with divine attributes.” After Alexander’s visit to the oasis of Siwa in Egypt in 331 B.C., Alexander was recognized as a son of Zeus by the priests and, as a pharaoh. He may use this relationship with the divine as propaganda between his eastern subjects, who would not understand a king or a ruler not divine or deified. Since then, Alexander was a living god for the Eastern cultures, and also, since then, his portrait could be represented in coins, as he is not a mortal anymore. According to Otto Morkholm<sup>3</sup>, “if Alexander were responsible, however, the reverse type of the decadrachms would be a document of crucial importance for the discussion of Alexander’s claim to deification, a claim for which we have written evidence from the last years of Alexander’s reign.”

### **Hellenistic portraits as propaganda**

After the death of Alexander the Great, some of his generals kept minting the same imperial coinage under his name in order to keep a fictitious unity of Alexander’s empire, but others started minting their own coinage using the image of the Macedonian king as reference for propaganda purposes. This is the case of Lysimachos in Thrace and Ptolemy in Egypt.

Alexander portrait coinage was so extensive in the Lysimachos’ tetradrachms that the face of Alexander has endured through time. We can say that Lysimachos’ propaganda was too successful, and his aim was to associate his own name with the legend and aura of Alexander, and this association can never be wiped away<sup>4</sup>. But as Mark Rakicic wonders in his article about propaganda in the coins of Lysimachos, we can ask ourselves the same questions: “Did the horned head of Alexander, with all its divine glory, really reflect Lysimachos’ respect and veneration towards his late master, or are we to view it as a particularly clever piece of propaganda solely designed to add security and legitimacy to his reign?” Maybe for the ancients this coinage showed a mark of respect towards a man who had changed their world, whether or not Lysimachos have established more credibility or gained some favor through his coinage. *Fig. 2.*

<sup>4</sup> RAKICIC, Mark. *Ancient Literary Sources Offer Glimpses into the Character of Lysimachos*. *The Celator*. Vol. 6, No. 4. April 1992. p. 10.

Fig. 2. Lysimachos' tetradrachm with the deified portrait of Alexander the Great wearing the horns of Zeus-Ammon. *Authors' collection.*

Ptolemy, while he was satrap of Egypt, minted tetradrachms with the portrait of Alexander as well. He soon introduced a new and significant obverse type on his silver tetradrachms: the head of the deified Alexander wearing an elephant's scalp with trunk and tusks. Beneath the elephant headdress the ram's horn of Zeus Ammon (the same one represented in the Lysimachos' coins) is visible, and the royal diadem appears above the forehead. The king also wears the *aegis* of Zeus tied around the neck by two snakes. This coin is full of symbolism relating Alexander to his divinity. Indeed the relationship between the conqueror of the world and his close friend and general, Ptolemy, to legitimize his own power and rule in Egypt.

Fig. 3. Ptolemy's I tetradrachm. Diademed head of deified Alexander the Great, wearing an elephant skin headdress as conqueror of India, with the horns of Zeus-Ammon underneath and the aegis over his shoulders tied with two snakes.

Demetrius Poliorcetes started using the Alexander-type coinage, replacing later the name of Alexander for his own one and adding soon a royal title to it. After 300 B.C., Demetrius made a significant change in his coinage. The new silver tetradrachms now showed on the obverse a winged figure of Nike carrying a trumpet in one hand and a signal mast in the other, alighting on the forecastle of a defeated galley, the prow ornament (*stolos*) of which has been broken off. This type has the intention to remind the world of his great sea victory of 306. "Cases of conscious propaganda in Greek coin types are rare, but this, together with the Porus issues of Alexander, presents perhaps the most obvious example<sup>5</sup>."

---

<sup>5</sup> MORKHOLM, Otto. *Early Hellenistic Coinage*. Cambridge University Press, 1991. p. 78.

Fig. 4. Obverse of a Demetrius Poliorcetes' tetradrachm. Nike standing left, holding trumpet on prow left.

In the new types of tetradrachms that Demetrius Poliorcetes will introduce later, the reverse shows the same striding Poseidon with trident, while the obverse gives place to the earliest portrait of a Hellenistic king with the royal diadem and bull's horns. The bull is the sacred animal of his patron deity Poseidon. These are excellent examples of Hellenistic portraiture, showing a lifelike representation of marked individuality. The bull's horns indicate that Demetrius claimed divine honors for himself, this one being the first certain numismatic example of deification of a living ruler<sup>6</sup>.

Fig. 5. Tetradrachm of Demetrius Poliorcetes. Diademed head of Demetrius right, with bull's horn on obverse. Poseidon standing left, right foot on rock, resting right arm on thigh and holding trident with left hand on reverse. *Author's collection.*

### **Roman Imperial Coinage: the many faces of propaganda and messages on the reverse types.**

Even if the Greeks started using the portraits of the rulers as image of power and political propaganda, “this was especially sophisticated in the Roman period, when ruling elite chose to impress a message on their intended audience through a web of literature, monumental architecture, mosaics, wall paintings, sculpture, and other media. The cheapest, quickest, and most widespread way of disseminating a message to the mass population of the Empire was through coinage, which could represent the portrait of a new political leader or emperor, commemorate the conquest of a new territory, or legitimize the accession of a chosen heir, and so on. This was born in the power politics of the late Republican period, but was seemingly killed off as a concept in Late Antiquity<sup>7</sup>.”

The Romans were the authentic masters of numismatic propaganda, but even if we can find some very valid examples of propaganda in the Roman Republican coinage, the adoption of the coin as a real and extensive tool of propaganda in history began in a massive way with the Roman emperors. In a time when there were not other mass means of communication, like today's newspapers, magazines, television and Internet, the coins became the mass media instruments delivering to everyone several different messages. From the governor of the province to each peasant, coinage reached everyone's hands<sup>8</sup>.

<sup>7</sup> MERRONY, Mark. *Propaganda On Roman & Early Byzantine Coins*. Minerva. Vol. 18. No. 2. March/April 2007. p. 54.

<sup>8</sup> David R. Sear agrees with this theory on his article *The Reverse Types of the Imperial Coinage*: “There can be little doubt that the emperors of Rome were fully aware of the value of the Imperial coinage as a tool of propaganda, it being one of the most effective means of mass communication available to them. (...) The

For the various types of themes in the propaganda or messages that are found in the Roman Imperial coinage, we just have to observe the reverses of the coins, and even if a large proportion of those reverses are not to be included under the term “propaganda”, the majority of the reverses could be included in particular groups according with specific topics of communication. There are so many examples of propaganda types that it is not possible to include them or to do justice to the topic in an article of this length. This is just a little taste of some examples to introduce and illustrate the concept and theory of the ancient coinage as vehicle of mass media communications.

According to David L. Vagi<sup>9</sup>: “The reverse of the Roman coins is undoubtedly the most variable, because it was arranged in so many different ways. Like the obverse, it typically consists of a design surrounded by an inscription in the periphery (...). In a most practical sense, all Roman coins were vehicles of propaganda. The obverse reminded the people on a daily basis who was in command, whereas the reverse would deliver a wide array of messages that promoted the interests of the government and the ruler.”

The topics on the reverses can be classified attending to their representations in many different groups<sup>10</sup> as:

1. *Personification of concepts*, (such as patience, prudence, friendship, justice, virtue, good fortune, etc.), *deities and gods*.
2. *Geographical types*. This extensive group includes the personification of provinces, cities and rivers. This topic and the next one share a deep connection, since some provinces visited by some emperors were represented personified.
3. *Travels of the emperor*: including places regions visited (this group would also include the sub-category of geographical types above of personification of provinces and cities. This could be particularly applied to the journeys of Hadrian), means of transportation (generally ships), the emperor saluting cities and provinces or helping them to rise<sup>11</sup>. The popular reverses with nautical types representing ships could be included here when they are related to the trips of the emperor.
4. *Restitution or reparation types*. They commonly show the emperor offering a hand to raise the personification of a province or a region who appears kneeling in front of him.
5. *The emperor and his family* or dynasty.
6. *Empresses*. Types struck for women with deities and personifications associated with womanly duties.

---

government of the day was thus able to present itself and its achievements in surprising detail to almost all of the inhabitants of the vast Empire.” “*Roman Coins and Their Values*”. The Millennium Edition, Volume I, Spink, London 2000. p. 56.

<sup>9</sup> VAGI, David L.: *Introduction to the Reverse in Coinage and History of the Roman Empire. Volume Two: Coinage*. Coin World. Sidney, Ohio. 1999. p. 53.

<sup>10</sup> This classification has been made combining the criteria of David R. Sear and David L. Vagi. with some additions.

<sup>11</sup> This particular and propagandistic topic needs its own category because if sometimes it is related to military campaigns, there are several examples when the restoration or reparation of some provinces or territories are the consequence of a civil reform or the process of a project.

7. *Consecration types*. They show deified relatives or predecessors of the current emperor.
8. *Divine associations*. They represent the imperial godliness. Many emperors related themselves with certain deities, adopting symbols, objects or animals associated to supernatural beings, like Commodus wearing the lion head and skin as Roman Hercules or representing himself as Janus.
9. *Commemorations, anniversaries and festivals*. This is a very wide classification, including the interesting group of buildings and other constructions. It also includes the iconography of foundation of new cities.
10. *Military accomplishments*. Reverses with victories, trophies and conquests of new regions are very extended, common and one of the most important uses of propaganda in the Roman coinage. The legionary types would be included under this category, but with their own military identity.
11. *Inscriptions*. Reverses with no figures and mainly just lettering.
12. *Heavenly bodies*. Representations of stars, crescent moons and comets.
13. *Mythological types*. They include popular legends and myths.
14. *Symbolic types and objects*. They usually have some religious association (sacrificial tools, tripods, emblems, etc.) with some exceptions, like tables with prices on them in some Roman provincial coins.
15. *Animals and other creatures*. Most of them representing symbols of regions, emperors, concepts or deities.
16. *Architecture*. Related to the category of commemorations since most of the structures shown were represented on coinage to commemorate its construction. This classification includes a wide variety: buildings such as amphitheaters (like the Colosseum), temples, statues, altars, columns, triumphal arches, forums, military camps gates and towers, bridges, ports, roads, etc.
17. *Fiscal and financial*. Coins related to money, taxes and financial issues. Important for the historians as well as the numismatists.
18. *Restorations and posthumous*. Series of earlier types issued by some emperors for an anniversary or with a commemorative purpose.

Some of the categories above are not related to any aspects of propaganda, but many others are in one way or another, as we can see in the illustrations below. These are just some examples to illustrate the relationship between coinage and propaganda, or numismatics and mass media communications in ancient Rome<sup>12</sup>.

### 1. Personification of concepts, deities and gods.

Some of the female personifications on the reverse types were allegories of the virtues and qualities of the rulers depicted on the obverse of the coin, so the common people could associate those values to the current emperor or his reign. This is one of the most interesting and extensive themes in the Roman Imperial coinage, carrying small pieces of personal propaganda. *Clementia* personifies clemency and mercy; *Concordia*

---

<sup>12</sup> The photographs and some of the comments have been found in the catalogs of these main numismatic sellers: Mail Bid Sales and Triton, from Classical Numismatic Group –CNG Coins-; Gemini Auctions, from Harlan J. Berk and Freeman & Sear; and Stack’s Coins auctions.

and Patientia are concord and harmony, patience and endurance; Constantia symbolizes courage and perseverance; Felicitas is happiness associated with prosperity and success, that is why one of the symbols she holds is the cornucopia; Fides is good faith and loyalty; Fortuna good fortune and prosperity; Hilaritas and Laetitia personify rejoicing, gladness and happiness; Indulgentia is gentleness; Justitia and Aequitas are justice; Liberalitas is liberality; Libertas is liberty or the restoration of freedom; Virtus personifies valor, courage and bravery; etc.

Fig. 6. Trajan (98-117 AD). Denarius. 115-116 AD. Felicitas standing left, holding short caduceus and cornucopia. *Author's collection.*

Fig. 7. Trajan. Denarius. 115-116 AD. Virtus standing right, left foot on helmet, holding spear and parazonium. *Author's collection.*

Fig. 8. Hadrian (117-138 AD). Denarius. 128-129 AD. Aequitas standing left, holding scales and cornucopia. *Author's collection.*

Fig. 9. Trajan. Denarius. 116 AD. Radiate, draped bust of Sol right. Sol, the sun god, represents the East, where Trajan was campaigning at the time of this issue. This portrait

of Sol has the attributes of other portraits of Alexander the Great as Helios or Sol. Alexander was the conqueror of the East, and it is possible that the Roman emperors wanted to associate themselves with Alexander's conquests and became another Alexander by minting this suggestive Alexandrine portrait on the reverses. *Author's collection.*

## 2. Geographical types

Some of the types included here under geographical types could also be included in the category of travels. One of the most important series was produced by Hadrian to illustrate all his trips around the Roman Empire.

Fig. 10. Trajan. Denarius. Danube reclining left, head right, cloak billowing over head, right hand on ship's prow.

Fig. 11. Hadrian. Denarius. 132 AD. Nilus reclining right, holding reed and cornucopia, hippopotamus before him, crocodile in waves below. This type commemorates Hadrian's visit to Egypt in 130 AD, during which his young companion Antinous drowned in the river Nile.

Fig. 12. Trajan. Denarius. 112 AD. Arabia standing right, head left, holding branch and pointed bundle of rods, camel at her feet. Commemorates the annexation of this province. *Author's collection.*

Fig. 13. Hadrian. Denarius. 132 AD. Egypt reclining left, holding sistrum and resting elbow on basket of grain, ibis at her feet. *Author's collection.*

Fig. 14. Hadrian. Denarius. 132 AD. Africa reclining left, wearing elephant skin headdress and holding scorpion and cornucopia, basket of fruits at her feet. *Author's collection.*

Fig. 15. Hadrian. Denarius. 132 AD. Alexandria standing left, holding sistrum and snake in basket. *Author's collection.*

Fig. 16. Hadrian. Denarius. 132 AD. Asia standing left, setting foot on prow and holding hook and rudder. *Author's collection.*

Fig. 17. Hadrian. Denarius. Hispania reclining left, holding branch, rabbit at her feet.  
*Author's collection.*

Fig. 18. Hadrian. Denarius. 132 AD. Italia standing left, holding scepter and cornucopia.

### 3. Travels of the emperor

Hadrian series are the most popular ones on this category.

Fig. 19. Hadrian. Denarius. 131 AD. Galley left with Hadrian under roof at stern, four rowers, and small sail on slanted mast at prow.

Fig. 20. Hadrian. Denarius. 132 AD. Roma wearing Amazonian garb and holding spear, clasps hands with Hadrian, who is togate and holds roll. This reverse celebrates Hadrian's return to Rome on 131 AD, after his second great tour of the empire.

#### 4. Restitution or reparation types

The ruler or emperor shows himself as a savior or someone bringing good to the different provinces of the empire. These types have a high content of propaganda.

Fig. 21. Hadrian. Denarius. 132 AD. Hadrian on right, standing left, raising kneeling Africa, who wears elephant skin headdress and holds wheat ears, two wheat stalks between them.

Fig. 22. Hadrian. Denarius. 132 AD. Hadrian on left, standing right, raising kneeling Gallia; Hadrian's right foot is forward and his body is seen from the back. *Author's col.*

Fig. 23. Hadrian. Denarius. 132 AD. Hadrian on right, standing left, raising kneeling Hispania, rabbit at Hispania's feet. *Author's collection.*

Fig. 24. Hadrian (117-138 AD). Sestertius. Struck 120-122 AD. Laureate bust of Hadrian left, on obverse. Reverse: Emperor standing left, raising kneeling Orbis Terrarum (Empire) who holds globe. *Author's collection.*

5. The emperor and his family

Fig. 25. Hadrian (117-138 AD). Dupondius. 117 AD. Radiated portrait of Hadrian on obverse. Trajan standing left and Hadrian standing right, looking at each other and holding the globe between them, on reverse.

Fig. 26. Hadrian. Denarius. 117 AD. Hadrian and Trajan, both laureate and togate, supporting a globe between them and holding rolls. This is one of the earliest issues of

Hadrian at Rome, giving him the victory and honorary titles of Trajan. This reverse type implies that his adoption by Trajan and succession was legitimate, not fabricated after Trajan's death, as some people speculated.

#### 6. Divine associations

The emperors used the coins to show their divine ascendance to the common people in regular basis. In some other cases, they will portrait themselves and high priests, offering sacrifices to the Gods and identifying their personas with mythological heroes, gods or cults.

Fig. 27. Elagabalus. Denarius. 218-222 AD. Portrait of the emperor on the obverse. Eagle standing on thunderbolt before the stone –probably a meteorite– of Emesa, holding wreath in beak, five stars above.

Fig. 28. Elagabalus. Aureus. Struck 220-221 AD. Laureate and cuirassed bust right of emperor on obverse. On reverse: slow quadriga left drawing the Stone of Emesa surmounted by an eagle, star above. This coin and the previous one commemorate the inheriting of the office of high priest of the sun-god by Elagabalus at Emesa, Syria, when he was fourteen. The cult was represented by a sacred stone, and in 219 AD, when he moved from Emesa to Rome, he took the stone with him. This event is what the coin has recorded.

#### 7. Commemorations, anniversaries and festivals

Fig. 29. Trajan. Sestertius. 115 AD. Jupiter, nude except for cloak hanging behind his shoulders, standing left, holding out thunderbolt and the edge of his cloak in right hand over small figure of Trajan, and holding scepter in left hand; Trajan is togate, standing left and holds branch and short scepter. The legend of this reverse is a dedication to Jupiter as “the preserver of the Father of his Country”. The coin commemorates Trajan’s miraculous escape from an earthquake at Antioch in 115 and thanks the god for his divine intervention.

Fig. 30. Titus (79-81 AD). Sestertius. Struck 80/1 AD. The Flavian Amphitheater (The Colosseum), on obverse. Titus seated left on curule chair, holding branch; a pile of arms around him. This coin commemorates the completion of the Colosseum by Titus in 80 AD. Its construction began in 71 AD, under Vespasian, but finished by Titus and recorded as that in metal.

Fig. 31. Gaius (Caligula). 37-41AD. As. Minted in Caesaraugusta, Spain. Laureate head of emperor left on obverse. Reverse: pontiff veiled in toga driving yoke of oxen right, plowing pomerium.

## 8. Military accomplishments

These types were very popular and extensive. Scenes of the emperor in military actions and combat, addressing the troops, or setting up a trophy, were important and powerful images for propaganda. We also find many types of victories and trophies to indicate successful military campaigns.

Fig. 32. Vespasian (69-79 AD). Sestertertius. Struck 72 AD. Laureate head of Vespasian right on obverse. Reverse: Titus on horseback right, spearing enemy. In 71, Titus received the title of imperator and was elevated to the rank of co-ruler with Vespasian. The reverse celebrates Titus' victories in the Jewish War.

Fig. 33. Trajan. Denarius. 112 AD. Victory standing right, left foot on helmet, inscribing DA / CI / CA on shield set on palm tree. This issue celebrates Trajan's victories in Dacia.

Fig. 34. Trajan. Sestertius 116-117 AD. Trajan standing left, head right, holding spear and parazonium; at his feet Armenia seated left wearing tiara, flanked by the river gods Tigris and Euphrates, each holding reed and reclining on urn from which water flows. This coin commemorates Trajan's capture of Armenia and Mesopotamia, the moment of

the Roman Empire's greatest territorial expansion. It also bears one of the longest legends (like text messages in today's cell phones, but permanent) ever placed on an ancient coin with 54 letters on the obverse and 44 on the reverse.

Fig. 35. Trajan. Sestertius. Struck 115-116 AD. Laureate and draped bust right, on obverse. Trajan seated right on platform, accompanied by two officers, addressing soldiers.

Fig. 36. Trajan. Denarius. Reverse: Victory, right, crowning emperor, left, in military dress with cuirass and spear on his right hand.

Fig. 37. Trajan. Denarius. 107-111 AD. Trophy of Dacian arms, round shield and two crossed oblong shields above, two further shields, two spears, and two curved swords at base. *Author's collection.*

Fig. 38. Hadrian. Denarius. 131-138 AD. Victory-Nemesis advancing right, drawing out fold of dress from breast and holding branch. *Author's collection.*

Fig. 39. Hadrian. Denarius. 128-129 AD. Victory naked to waist, standing right, raising hand to head and holding palm with left.

Fig. 40. Marcus Aurelius (161-180 AD). Medallion. Emperor holding spear crowing trophy while Victory places shield on the left. Two German captives, man and woman, at base. Commemorates his victories in Germania.

Fig. 41. Lucius Verus (161-169 AD). Sestertius. Laureate bust of emperor right. Reverse: Victory holding trophy with Armenia seated right at her feet.

#### 9. Heavenly bodies

Fig. 42. Augustus (27 BC-14 AD). Denarius. Struck 17 BC. Head left wearing oak wreath on obverse. Comet with eight rays and tail with the inscription: DIVVS IVLIVS on reverse. A comet that appeared in summer 44 BC was held to signal Julius Caesar's ascension to the heavens. The memory of Caesar's deification was revived in Augustus' Saecular Games of 17 BC. This coin commemorates this event and the divinity of Julius Caesar, and in fact, Augustus own divinity for being a family member of Julius and his successor.

## 10. Mythological types

Fig. 43. Augustus. Denarius. Struck 19 BC. Bare head of Augustus right, on obverse. Reverse: Tarpeia standing facing, hands raised, buried to the waist in a pile of shields. The message on this coin is associated with the story and the legend that portraits. Tarpeia was a Vestal Virgin who betrayed the city of Rome to the Sabines when they attempted to rescue their wives from the Romans. She asked the Sabines for what the soldiers wore on their arms, meaning the gold bracelets, in payment for her betrayal. The Sabines were offended by her greed and treason and gave her the price literally, crushing her under the weight of their shields. The message that indirectly carries is that all the traitors to Rome pay with their lives. Since then, all the traitors were executed and punished in the Tarpeian Rock, the very same place where Tarpeia died.

## 11. Architecture

Fig. 44. Augustus (27 BC-14 AD). Cistophoric tetradrachm. Pergamum, 19-18 BC. Triumphal arch inscribed, decorated with legionary eagles left and right and surmounted by emperor in quadriga right.

Fig. 45. Claudius. Denarius. 41-54 AD. Portrait of emperor on obverse. Triumphal arch or reverse with equestrian statue of emperor on top of the structure, flanked by trophies on both sides. This coin not only depicts the monument, but also commemorates Claudius' victories in Britain.

Fig. 46. Nero. Sestertius. 54-68 AD. Aerial perspective of the port of Ostia. Originally was a military port to protect the mouth of the Tiber and its access to Rome. In 42 AD the emperor Claudius started the construction of a major port for Rome's grain supply. This project was not completed until the reign of Nero, who issued this coin to commemorate this event. It shows with detail several ships at anchor within the circular breakwater. The entrance, at the top, was marked by a lighthouse and a statue of Neptune. At the bottom, the river god Tiber reclines where the river flows into the harbor. This port will be extended by Trajan later.

Fig. 47. Trajan. Denarius. 112-115 AD. Statue of Trajan on horseback, holding spear and Victory. This reverse shows the famous equestrian statue of Trajan in his Forum that got lost in time.

Fig. 48. Trajan. Denarius. 112-115 AD. Column of Trajan, surmounted by his statue and resting on a two-tiered base, flanked by eagles. The spirals and dots indicate the famous relief on the monument that narrates, on an ascending spiral, the events of Trajan's two Dacian wars, still in place today. The statue of Trajan on top of the column is extending

his right hand and holds a spear in his left. The base has a door in the center flanked by reliefs showing Victories on the left and right.

Fig. 49. Trajan. Denarius. 112-115 AD. Via Traiana reclining left, head right, holding wheel and branch. This reverse commemorates Trajan's construction at his own expense of the road between Beneventum and Brundisium. If no one knows what you do, you do not get any credit for it. The emperors made sure that would not happen.

Fig. 50. Trajan. Sestertius. 103-111 AD. Trajan's Danube bridge, depicted as a single arching span between entrance and exit towers topped by statues; a boat in the river below.

The main purpose of this brief introduction to the numismatics related to the mass media communication is to reveal some of the many messages that ancient coins transmit, and also to show the infinite possibilities that these many themes can offer to the historians, numismatists, and scholars with one common thought in mind: the mass media started centuries before most people could think, and the coin was the perfect and durable vehicle, a witness of history and time that still survives and will last longer than our own lives.

**Women in Administration: Understanding the Relationship between Occupational Stress  
and Health Risk**

**Presenter:** Renique Kersh

**Topic Area:** Educational Administration/Higher Education

**Format:** Poster Session

**Description:**

The increasing demands for women in administrative positions in higher education may lead to increased stress and a detailed examination of the relationship between occupational stress and health risk, as well as examining effective coping strategies will be explored.

**Presenter:**

Renique Kersh  
University of Illinois/Department of Kinesiology and Community Health  
rtkersh@illinois.edu

Abstract

Studies have shown that working women's physiological response to stress has increasingly led to an increase in health risk (Ganster and Rosen, 2013). Therefore, employing effective stress management strategies is key to short-circuiting the potential long-term physiological and psychological damage that may occur (Lazarus, 1966; Frankenhaeuser, 1991). The increasing demands for women in administrative positions in higher education may lead to increased stress and a detailed examination of the relationship between occupational stress and health risk, as well as examining effective coping strategies will be explored.

## **Description**

1. To provide national data on health issues that are increasingly concerning for women
2. To provide survey data on the relationship between occupational stress and health risk for women in administrative roles in higher education
3. To provide survey data on coping strategies most employed by women who participated in the research study
4. To promote the further exploration of occupational stress in higher education environments and the role colleges and university can play in ensuring the health of employees

## **Program Description**

This poster presentation will cover the literature around occupational stress and health risks for women, working women and women in higher education. Further, the poster will provide information from the literature around coping strategies. The researcher will be conducting a mixed methods study on the relationship between occupational stress, strain and coping for women in administrative roles in higher education. As part of the study, the occupational stress inventory-revised will be used in order to determine the stress and coping scores for a convenience sample of 85 to 130 participants. Additionally, the health status questionnaire-12 will be incorporated to determine both physical and mental health risk. Correlation analysis, multiple regression and ANOVA will be used to study both surveys, along with demographic and institutional data. Further, a number of open-ended questions will also be analyzed using NVIVO software and independent review. The results of this study will be presented as part of the poster presentation along with recommendations for next steps.

## **Conceptual Framework Used**

A number of researchers have sought to understand and define stress (Lazarus, 1966; McEwen, 2002; Selye, 1983). In general, experiences or perceptions often lead to increased load. The amount of load and an individual's personal resources determine how the body will respond in order to achieve a sense of balance (homeostasis). Often, individuals with increased stress levels develop habits like sleep deprivation, overeating, feelings of anxiety, perfectionism or lack of exercise (McEwen, 2002; Buckley, 2002). These habits are considered maladaptive and are counterproductive to the body's ability to create homeostasis (McEwen, 2002; Selye, 1983). Others exhibit more adaptive habits like engaging in recreational activities, psychological thriving or reframing stressors in order to achieve balance, self-care and engaging in social interactions with others (Fusilier, et. al, 1986; Epel, McEwen and Ikovics, 1998; Osipow, Doty and Spokane, 1985). How individuals cope with increased stress impacts their physical and psychological well-being and may influence their long-term and short-term risk of illness.

Occupational stress has been linked to a number of chronic illnesses like cardiovascular disease and high blood pressure (Din-Dzietham, Nembhard, Collins and Davis, 2004; Ganster and Rosen, 2013; Smith, Johal and Wadsworth, 2000). Further, studies have shown increases in absenteeism, psychological distress and the development of burnout among workers with increased stress levels (Westerlund, et. al, 2010; Ganster and Schaubroeck, 1991; Layne, Hohenshil and Singh, 2004; Ganster and Rosen, 2013; Demerouti, et. al, 2001).

There are a number of models that have been developed in order to better understand occupational stress (Spokane and Osipow, 1983; NIOSH, 1999). Those who are constantly challenged by stressful work conditions, without effective moderation by individual and/or situational factors are more likely to have a higher risk of injury and illness (NIOSH, 1999). Osipow (1991) suggests that the perceptions of the work environment that cause stress may be mediated by how individuals cope with this stress and what

personal factors exist. A number of other researchers have validated this notion asserting that coping strategies have the potential to effectively moderate occupational stress outcomes (Jackson, 2004; Layne, Hohenshil and Sign, 2004; Osipow and Davis, 1988; Lazarus, 1966; Selye, 1983; McEwen, 2002; Osipow, 1991). For the purpose of this study Spokane and Osipow's (1983) model of occupational stress which explores the relationship between stress, strain and coping resources, will be used as a theoretical framework.

**Additional Documents:** A one-page document will be provided for individuals who visit the poster. If appropriate technology is available, the presenter will also provide a brief presentation alongside the poster. Individuals are free to discuss and engage the researcher in a dialogue.

## **Financial Inputs and Educational Outputs of IEPs That Really Work for Students**

### **Introduction**

Generating and implementing an individualized education program (IEP) is a major investment not only of school funds but also of professional time. This raises questions about cost effectiveness that remain unanswered. An IEP is expected to generate enhanced student performance, but does it? This article will examine the IEP process against its costs to determine if spending is justified.

In 1977, the individualized education program (IEP) process was placed into law for two reasons: to give students with disabilities adequate educational opportunities, and to give parents of special needs students a voice in their child's education. Today, all levels of public education are affected by the IEP process including: district administrators, teachers, parents, educational advocates, and students. However, little attention has been given to how cost-effective the individualized education program process is. In 2004, the Center for Special Education Finance reported that \$77.3 billion was spent to meet the needs of IEPs. In 2007, Winters & Greene reported that 13.7% of publicly educated students had an IEP. In 2012, the President's Commission on Excellence informs us that 21.4% of the nation's \$360.6 billion education budget is spent implementing individualized education programs. With so much invested in the IEP process, what does it produce? This article attempts to determine if the IEP process adequately meets the needs of disabled students, gives their parents a voice, and accomplishes this in a cost effective manner.

**Examining the individualized education program process and its efficacy**

As both a process and a document, the IEP was meant to carry out the law's intent for the appropriate education of the disabled (Smith, 1990). To understand special education's current state, it is necessary to have an understanding of its past. The individualized education program process was the main element of Part B of the Education for All Handicapped Children Act of 1975. As a result of this act, every public school in the United States incurred the mandated costs of the individualized education program process, and IDEA became an obligated part of every U.S. public school's annual budget.

IDEA was passed to ensure that all schools would meet the needs of every student classified as disabled. Schools were expected to appropriate their annual budgets into creating new environments for these children, environments with as few obstacles to the child's success as possible. Cost was not to be a factor in the creation of these new environments. The IEP process consumes 40% of the money spent on all students in the United States (Center for Special Education Finance, 2012; Menlove et al., 2001) yet we do not know what the result of this spending is. Though IDEA mandated cost not be a factor, cost became a major issue.

Special education costs have significantly increased. In the past ten years, the number of learning support students has risen by 30% (The Center for Special Education Finance, 2012). In 2012, the special education population was six million children nationwide (National Education Association, 2012). The Center for Special Education Finance (2012) also reports that nearly every general education classroom in this country has learning support students entitled to special services.

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

Twelve years after the adoption of IDEA, we learned that early intervention could defer IEP spending. Will (1986) found there was a positive correlation between the age at which intervention occurs and the level of success that can be expected as a result of the intervention. In other words, if we intervene early, fewer children will need individualized education plans later. Will suggested that a systematic intervention might best prepare children for the more formal and demanding structure of later grades. According to Will, the IEP process would be most effective if children were identified as early as possible, but this did not happen. Early identification of special education students did not decrease the funds needed for future services, and thereby decrease the overall special education budget. Instead, from its genesis in 1974 to the year 1990, the clear intent of the IEP document, to implement special education law, became mired and confusing (Smith, 1990). Legally, the importance of an IEP could not be ignored, yet that importance was becoming increasingly unclear.

Will (1986) also found that to make the learning support process effective, reform must be done at the building level. His findings were ignored in favor of the class-by-class modifications that are made today. Will further demonstrated that building level administrators must be empowered to assemble appropriate professionals, and other resources, for delivering effective, coordinated, comprehensive services for all students based on individual educational needs rather than eligibility for special programs. In other words, Will found that special education was most effective on an issue-by-issue basis rather than the overall labeling process that has found acceptance.

Originally, the IEP was intended to be a blueprint for special education services and how they were to be implemented on a child-by-child basis. Every section of the IEP was meant to relate to a specific element of a student's education including: needs, goals, objectives,

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

placements, evaluation criteria, present levels of performance, duration of programs and modifications (Dragsgow, Yell, & Robinson, 2001; H.Res. 5, 1997). IEPs were also to regulate meeting dates, parental consents, and student accountability, as well as responsibilities of education agencies (Huefner, 2000).

We know what IEPs are meant to do, but how do we know if they are doing it? How is the effectiveness of an IEP determined? Kayale & Forness asked this question 13 years ago and found that practically from its genesis, special education has been given the task of evaluating its own effectiveness to determine whether it is working on a cost-benefit basis (Kayale & Forness 1999); but how special education was to do this had not been determined. In 2013, a method to evaluate the effectiveness of the IEP process still does not exist. While trying to measure its own effectiveness the field of special education has developed into an amalgamation of different modified instructional techniques and methods. Without a clear intent of this collaborative team approach, the true purpose of the IEP process cannot be fulfilled (Schrag, 1996; Smith, 1990).

In addition, a disproportionately large amount of special education funding is spent before special education services begin. According to the Center for Special Education Finance (2012) previous studies tell us that a substantial portion of special education funds are spent on determining the eligibility of the students. This money is not being spent on the IEP, it is being spent determining if the IEP is necessary. These services include: pre-referral activities, referral activities, initial screenings, ongoing assessments, evaluations, and reviews. Occasionally, funds are spent preparing IEPs for students who will later be determined ineligible for special education. None of these prerequisite services directly modify the students' educations. Funds pay the salaries of assessment staff members including: psychologists, counselors, social

Running Head: IEPS THAT REALLY WORK FOR STUDENTS

workers, and consulting teachers. Now that we have examined the individualized education process, we turn our attention to examining its cost.

### **Investment in the individualized education program process**

Special education costs can be difficult to decipher. Currently, special education finance studies are conducted about once every decade by the Office of Special Education Programs OSEP (President's Commission on Excellence, 2012). In this section, we will attempt to simplify the financial investment in the individualized education program process, identify trends, and project future expenditures.

The Center for Special Education Finance was created to determine the cost of special education spending in the United States. They arrived at their figures by seeking answers to a series of questions. These questions were:

- What are we spending on special education services for students with disabilities in the U.S.?
- How does special education spending vary across types of public school districts?
- What are we spending on due process for students with disabilities?
- What are we spending on transportation services for students with disabilities?
- How does education spending vary for students by disability?
- What factors explain the differences in spending?
- What role do functional abilities play in explaining spending variations for students with disabilities?
- What are we spending on preschool programs for students with disabilities?
- Who are the teachers and related service providers who serve students with disabilities?

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

- How are special education teaching assistants used to serve students with disabilities?
- What are we spending on special education services in different types of schools?
- How does special education spending vary across states classified by funding formula, student poverty, special education enrollment levels, and income levels?

In 2004, the Center for Special Education Finance reported that for the 1999-2000 school year \$77.3 billion was spent to meet students' individualized education programs. This equates to spending an annual average of \$12,474 to meet the needs of one IEP for one student. Another one billion dollars was spent educating students placed in other special needs programs (e.g., Title I, English language learners, or gifted and talented students), bringing the per student average to \$12,639.

Since additional time and school staff becomes necessary to educate the learning disabled student, public schools, on average, spend two to three times as much on a student eligible for special education services as they do on a student without disabilities. Annually, it costs about \$6,555 to educate a student without an IEP. Compare this to \$12,639 for the student with an IEP. The difference is \$6,084 (Center for Special Education Finance, 2004).

The percentage of the United States' education budget spent implementing IEPs continues to increase. In the 1977-1978 school year, the total portion of the United States education budget for special education services was 16.6%. This increased to 21.4% in the 1999-2000 school year. These percentages do not include monies spent on school facilities. The President's Commission on Excellence (2012) informs us:

Total spending to educate students with disabilities including regular education, special education and other special needs programs combined represents 21.4% of the \$360.6 billion total spending on elementary and secondary education in the United States.

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

Special education costs have demonstrated that they will continue to rise. Consider that in the 1985-1986 school year the average cost of educating a student with an IEP was \$9,858. By the 1999-2000 school year this cost had risen to \$12,474. This yields an annualized growth rate of 1.7%. In that time period, the growth rate itself increased to 2.0% (President's Commission on Excellence, 2012). By using this 2.0% annualized growth rate we can estimate the current annual cost to educate an IEP student at \$15,468. However, \$15,468 is most likely an underestimation as trends suggest the growth rate will continuously increase at a faster relative rate.

Not only are the costs of special education increasing, but the number of students qualifying for an individualized education program is sharply increasing. In 1977, 8.3% of all students qualified; in 2004 13.7% qualified (Winters & Greene, 2007; Center for Special Education Finance, 2004). This equates to a 0.2% increase each year. Using this as a basis, we can estimate the special education population for the year 2013 at approximately 15.3% of the total student population.

To conclude, national expenditures for special education total an estimated \$50 billion, an additional \$27.3 billion is spent on regular education services for learning support students, with another \$1 billion spent on other federally funded special needs programs (e.g., Title I, English language learners or Gifted and Talented Education) (President's Commission on Excellence, 2012). We now have an understanding of how much the individualized education program process costs. We also have an understanding of the IEP process itself. Let us now turn to the results, the outcomes for the child and his/her family.

**Assessing the outcomes for the child and family**

Special education has been thoroughly studied, and it has developed a substantial research base for judging the effectiveness of its techniques (Kayale & Forness, 1999). Is special education working? The answer, unfortunately, is no - at least not at the level intended. However, it is not the individualized education program process that is at fault. The fault lies in the follow-through at a district level.

In identifying effective techniques, certain crucial and neglected components of the individualized education program surface. It is these components that will create IEPs that work for students. These components (in order of effectiveness) are parental, student, and teacher involvement in the individualized education program process.

These three components are typically the most time-consuming for the learning support coordinator to include in the IEP team meeting. Special education law mandates that school districts adequately incorporate these IEP components, yet school districts, particularly learning support coordinators, persist in their insolence. We will now look at each of these components and the outcomes they produce for student and family.

If anything can be said for making an IEP work for child and family, it is that the involvement of parents create working IEPs. Fish (2006) found that students who are more successful as a result of the individualized education program process are children whose IEP meetings consisted of positive and equal interactions between educators and parents. In as early as 1998, Pruitt et al. contended that parents should possess equitable roles during IEP meetings. Pruitt et al. (1998) had determined that parents possess essential insight concerning their children and that this insight facilitates the success of the IEP.

## Running Head: IEPS THAT REALLY WORK FOR STUDENTS

Parental participation is not a suggestion; the learning support coordinator must make every effort to include the parents in the IEP process. Parental participation in the individualized education program process is mandated by law. However, despite legislation, parents still do not participate (Deslandes, Royer, Potvin, & Leclerc, 1999; Valle & Aponte, 2002).

While research has demonstrated that the parent is the most effective member of the IEP team, it also demonstrated that for years parents have felt undervalued. Goldstein (1993) and Kroth & Edge (1997) found that many parents feel guilty, intimidated, disenfranchised, and alienated towards educational systems in general, and that attending an IEP meeting was no exception to these feelings. Teachers devaluing parent input at IEP team meetings has resulted in parents keeping quiet, or not attending at all. Fish (2006) found that parents believed that their children's teachers did not value them as equals, nor did they value their input as being as important as their own.

Rock (2002) found that decreased parental feedback and participation in IEP meetings was generating legally inappropriate and educationally unsound educational programs for students receiving special education services. In 1996, Simpson found that parental roles were not increasing in IEP team meetings and positive relationships between parents and educators were not being formed. This was occurring despite laws that regulated the parental involvement under P.L. 94-142 (Simpson, 1996). To increase the effectiveness of the IEP process, parents must feel they are a valued member of the IEP team. According to research they are the most valuable and effective member of the IEP team. In 2001, Polloway, Bursuck and Epstein found schools can effectively facilitate communication between parents and teachers through the employment of non-threatening and positive communication strategies. The learning support

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

coordinator must realize the importance of parental participation and be sure to make every effort to facilitate the parent's participation.

Werts, Mamlin, & Pogoloff (2002) concluded that passive participation among parents in the IEP process is likely to hinder productive planning of a student's education. To arrive at this conclusion, Werts, Mamlin, & Pogoloff (2002) found that parents often view the IEP meeting as an opportunity for educators to brief them on their failures in raising their children; as a result parents were embarrassed to attend the meetings. When they did attend, parents provided little input due to their intimidation.

Fish (2006) conducted a case study interviewing parents of students in individualized education programs. Parents expressed the following concerns:

- Parents thought the IEP process was being abused or neglected.
- Parents indicated that teachers did not update IEP goals.
- Parents believed that teachers did not update goals in order to decrease paperwork.
- Parents thought teachers did not want to make lesson plan adjustments.
- Parents believed that classroom teachers documented sufficient student progress toward IEP goals in order to adhere to IEP documentation procedures despite objectives not having been fully mastered by the child.
- Parents believed that there was a stack of papers already completed and that they only attended the meetings to sign off on paperwork they had nothing to do with creating.

Fish (2006) quoted parents as saying:

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

- “It (referring to implementing an IEP document) is in the paperwork and on the recording. It is written in the minutes, but it’s just never done. It is a meeting they have to have, but really a lot of it is never really carried through.”
- “You come up with these good ideas, but then if the teacher doesn’t do them, then that is very frustrating.”
- “Note that these teachers hardly ever read the IEP’s. Most of those teachers get folders and they never even open them up.”
- “They have it all figured out before you get there.”
- “Half of those boxes are already checked and filled out. It’s all just cut and paste.”
- “We read it, and we are asked to sign it. So, all of the decisions have been made without parental input.”
- “They hand you your booklet, or procedural safeguards, and so forth, but I think it can be difficult to understand. You’re just overwhelmed with the information that they give you and no one explains it to you.”

When Fish (2006) asked parents what they thought school districts could do to improve IEP meetings, parents provided the following feedback: IEP meetings could be improved by making these conferences more of a democratic process where parents felt they were equal contributors. Make special education law easier to understand. Make the IEP process easier to understand.

In addition to parent involvement, student involvement creates IEPs that work for students. Research results from the past two decades suggest that youth who are involved in their IEP development are more likely to (a) achieve their goals (e.g., Kennedy & Haring, 1993; Perlmutter & Monty, 1977; Powers et al., 2001; Realon, Favell, & Lowerre, 1990, Van Ruesen,

## Running Head: IEPs THAT REALLY WORK FOR STUDENTS

Deshler, & Schumaker, 1989, (b) improve their academic skills (Schunk, 1985), (c) develop important self-advocacy and communication skills (Mason, McGahee-Kovac, Johnson, & Stillerman, 2002, (d) graduate from high school (Benz, Lindstrom & Yovanoff, 2000), and gain better employment and quality of life as adults (Furney & Salembier, 2000; Halpern, Yovanoff, Doren, & Benz, 1995; Wehmeyer, Agran, & Hughes, 2000).

In terms of creating IEPs that work for students, the involvement the student has in their own IEP's development is second only to parental involvement. Student involvement is also mandated by law. Yet, only 48% to 64% of adolescents studied attended their IEP meetings (deFur, Getzel, & Kregal, 1994; Grigal Test, Beattie & Wood, 1997; Trach & Shelden, 2000). These results are consistent with a study by Williams and O'Leary (2000), who found that approximately one-third of U.S. states were not in compliance. In these states, students were not invited to their IEP meetings, even when transition issues, such as career placement, were to be discussed. In some instances, students were being placed before their IEP goals were written. (Dragow, et al., 2001).

If a student is not afforded participation, the school district can be held liable. IDEA makes it clear that children and youth with disabilities ages 14 to 16 are to be invited to participate in their IEP meetings. IDEA goes even further to mandate IEP team decisions be based on the students' interests and preferences (34 C.F.R. 300.344 (b) and 300.29).

Not allowing students to participate in their own IEP meetings is a practice that has been occurring for years. Aside from the learning support coordinator saving time and paperwork, in 1998, Wehmeyer & Schwartz pointed to another possible reason for this negligence. They demonstrated this to be an issue developing out of a lack of teacher preparation. Wehmeyer & Schwartz stated: 31% of teachers surveyed reported that they wrote no self-determination goals,

Running Head: IEPs THAT REALLY WORK FOR STUDENTS

and 41% indicated they did not have sufficient training or information on self-determination.

Wehmeyer & Schwartz demonstrated that despite IDEA requirements, research results, teacher perceptions, and strong encouragement from disabilities rights advocates, many youth had been left out of the IEP's self-determination activities.

General education involvement in the IEP team process has consistently shown itself to be a lacking component of the IEP process. In the '80s and '90s general education teachers rarely attended IEP meetings nor participated in the IEP development process (Ammer, 1982; Pugach, 1982, Smith, 1990). When general education teachers did attend IEP meetings, they failed to interact with special educators (Ysseldyke, Algozzine, & Allen, 1982). This has created a myriad of problems that compromise an effective individualized education program.

In 2001, Menlove identified a number of these problems noting that: Regular education teachers report that they do not know how to prepare for IEP team meetings, and feel they are trying to catch-up with the special education teacher. These teachers feel they do not have enough time to complete what they are expected to bring to the meeting, and feel disorganized. Regular education teachers express a need to understand the value of the IEP document, and many times report not being invited to the IEP meeting. When invited to the IEP team meeting, many regular education teachers report that they view the meetings as gripe sessions where people attack students. Regular education teachers are not sure if they are at the meeting for input or just for signatures on forms, and feel IEP development is not always collaborative or their input valued. These teachers feel they are ignored at, and prior to, the IEP meeting.

In 2001 Menlove's research warned us that: Regular education teachers think there is too much focus on paperwork and that the paperwork is more important than the student. Regular education teachers don't relate the IEP to what students are learning, and think the IEP goals are

## Running Head: IEPS THAT REALLY WORK FOR STUDENTS

unrealistic and vague, do not believe student progress is addressed, forget the IEP goals altogether, do not know how to implement the IEP goals, and do not know who is responsible for assessing the IEP goals. Regular education teachers felt as though the IEP process didn't address problems in general education, so they did not perceive that it would benefit students in their classrooms. Regular education teachers think that IEPs do not focus on what the student can do and only focus on what they cannot do. Will (1986) noted this finding as well, yet another consequence of the way we think and go about educating students with learning problems is that special programs frequently address failure rather than prevention. Menlove (2001) also noted that a related frustration regular education teachers expressed was a disconnect between goals, objectives, and services developed in the IEP meeting to what happens instructionally in the classroom.

One final consideration, the time it takes to develop an individualized education program has been demonstrated to have an adverse effect. Only 20% of the special education teacher's class time was spent on teaching (Vannest, Hagan-Burke, Parker, & Soares, 2011). Adding the responsibilities of developing an IEP to the learning support teacher's day results in inadequate instruction time.

### **Conclusions**

Learning support costs are measured only once every decade, and, to date, no one has figured out an adequate way to measure the effectiveness of the IEP process. Over the past 10 years, the number of U.S. students enrolled in special education programs has risen 30%, and three out of every four of these students now spend part or all of their school day in the general education curriculum. As a result, nearly every general education classroom across the country includes students with disabilities. Each school and district is required to determine the best way

Running Head: IEPS THAT REALLY WORK FOR STUDENTS

to conduct these programs and judge the most efficient way to pay for them (National Education Association, 2012).

If the past is an indication of the future, special education costs will continue to rise. We can relatively safely predict that Congress will increase federal funds for special education. However, those funds will not adequately cover special education's rising costs.

For decades, the individualized education program process has revealed itself to be ineffective. It has long since reflected a flawed vision of education (Will, 1986). To date, fulfillment of the individualize education program process eludes us. At best we are met with mixed results. In 1990, Smith had already found that there was overwhelming evidence that IEPs failed to accomplish their mission, and that little was being done to rectify the situation. By 1999, there had not been a single study yielding conclusive results for IEP effectiveness (Kayale & Forness 1999), and by 2013, the U.S. Department of Education is yet to have any data that can be used to answer questions about costs, expenditures, or fiscal planning for the individualized education program process. Nor can they offer any information pertaining to the provision of special education services.

The research done for this article has determined that, to date, not one study has been able to identify a pool of findings to support IEP effectiveness. Support for the IEP process is becoming increasingly necessary to justify spending as education researchers, along with school district officials, continue making claims that special education students are draining resources away from regular education students (Winters & Greene, 2007).

As this article indicates, three of the most productive elements of the IEP process are routinely disregarded to save time and paperwork. These elements are parent involvement, student involvement, and regular education teacher involvement. This negligence results in an

Running Head: IEPS THAT REALLY WORK FOR STUDENTS

ineffective process. Despite legal mandates, parents are habitually left out of the IEP process and not valued as equals (Fish, 2006, Deslandes, Royer, Potvin, & Leclerc, 1999; Valle & Aponte, 2002). IDEA mandated student participation is regularly neglected (IDEA, 34 C.F.R. 300.344 (b) and 300.29). General education teachers continue to be left out of the IEP process (Ammer, 1982; Pugach, 1982, Smith, 1990). All this occurs as the most recent estimate of \$77.3 billion is annually spent to meet the needs of the IEP process (Center for Special Education Finance, 2004). The individualized education program process has become a system of misappropriated school funds and professional time. However, this issue can be clarified and settled by adhering to the legal mandates of adequate parent, student, and teacher involvement. The IEP process can then result in IEPs that really work for students.

Title: Feminist EFL teachers' teaching beliefs and practices in Japanese universities

Name: Reiko Yoshihara

Affiliation: Associate Professor, Nihon University

Address: 5-2-1 Kinuta, Setagaya-ku, Tokyo, Japan, 157-8570

E-mail address: [yoshihara.reiko@nihon-u.ac.jp](mailto:yoshihara.reiko@nihon-u.ac.jp)

## ABSTRACT

The purpose of this study is to explore feminist EFL teachers' teaching beliefs and practices. The exploration includes determinations of how they develop their feminist teaching beliefs and how their feminist teaching beliefs are reflected in their teaching practices.

Nine Japan-based feminist EFL college teachers participated in this study. I employed a qualitative narrative study approach by triangulating multiple methods such as open-ended questionnaires, interviews, classroom observations, teacher journals, and e-mail communications. Data was collected from March 2011 through August 2013. The teachers' narratives were analyzed within the framework of feminist theories and pedagogies. The results of interviews with the nine Japan-based feminist EFL teachers revealed that they had similar but slightly different feminist teaching beliefs. They developed their feminist teaching beliefs through their feminist identities, personal learning and teaching experiences, interactions with other feminist teachers. Results suggested that while six participants of them reflected their feminist teaching beliefs to their teaching practices, three participants did not. Six participants taught about gender issues and incorporated gender issues into the lesson. Even though other three participants did not teach about gender-related topics in their classrooms, they were concerned with critical thinking, empowerment, and care. I found that nine participants were concerned about not only what they taught teaching but also how they taught. I also found that institutional constraints such as unified curricular and assigned textbooks prevented them from teaching about gender-related topics in their EFL classrooms.

The study is intended to help understand what teaching beliefs

feminist EFL teachers hold and how they reflected their teaching beliefs in their teaching practices – including curriculum and materials design, classroom management, and innovation related to other aspects of teaching about gender issues.

6. Abstract

A large number of English language learners (ELLs) in secondary school are long-term ELLs who have attended public schools in the United States for seven years or more without reaching a fluent level in English (Capps, Fix, Murray, Ost, Passel, & Herwanto, 2005; Olsen, 2010). In spite of the growing presence of long-term ELLs in secondary schools, little research has been conducted on this population. In particular, the field needs research that investigates long-term ELLs' educational needs from the students' perspectives on their learning experience, which can be a fundamental source to understanding the underachievement of this population.

This qualitative study explored the reality of long-term ELLs' academic struggles through their schooling history, and perceptions of their learning experience. Thirteen long-term ELLs, ages ranging from 15 to 19, at a high school located in central Texas participated in this study. Data were generated from in-depth interviews and various documents, including students' cumulative folders, language proficiency assessment records, and state assessment data. The constant comparative method of the grounded theory approach was used as the primary approach for data analysis.

The findings revealed that long-term ELLs in this study did not sufficiently acquire academic language skills throughout their schooling, resulting in their limited access to the full rigor of the curriculum and further falling behind in learning. In addition, more than half of the participants were either referred to special education or retained during elementary years in the hope of improving their academic skills. However, the participants experienced on-going failures throughout school. Without strong language and adequate academic services for this population, simple retention or placement in special education does not effectively serve these learners.

Despite their academic underachievement, participants in this study did not perceive themselves as struggling students but as active learners. They viewed their progress in learning as a considerable accomplishment and believed it would lead to college and career readiness. This finding has significant implications for understanding the nature of struggling long-term English language learners' academic challenges and developing adequate instructional systems to address these gaps in learning.

## **Submission to the Hawaii International Conference on Education**

### **Engaging with the Future in Teacher Education**

Sandy Schuck and Peter Aubusson

Centre for Research in Learning and Change

University of Technology, Sydney

P.O. Box 222

Lindfield 2070 NSW

Australia

Emails: [Sandy.schuck@uts.edu.au](mailto:Sandy.schuck@uts.edu.au) and [Peter.aubusson@uts.edu.au](mailto:Peter.aubusson@uts.edu.au)

Teacher Education is undergoing change in conception, location and purpose in many countries. To cater for the future, the key question arises as to what Teacher Education will or should look like in ten years' time. What trends will be influential in determining its structure? How best can teacher educators prepare their students for schools of the future, and for a rapidly changing world?

To develop an agenda for future research in Teacher Education, the above questions must be considered. Added to these, are other important questions. What is the role of technological development? How may such development affect schools, teachers and students? How will it influence the way we organize education in the future? How do we prepare our students for the unexpected? Similar questions to these have formed the theme of conferences on Teacher Education (ATEE, 2013), symposia (Burden et al., 2012) and a special issue on Teacher Education (Schuck & Aubusson, 2013) and are becoming increasingly relevant to teacher educators.

Given these important and pressing questions regarding Teacher Education futures, the authors suggest that an agenda for future research in the area is essential. Such research should consider what questions need to be investigated to inform the future of Teacher Education. It should also consider what tools are helpful in this investigation. The authors suggest that the use of scenarios in Teacher Education is a helpful way of conceptualising the impact of different issues and trends on Teacher Education. Scenarios provide a means of reflecting on, and imagining different futures for Teacher Education (Snoek, 2003).

The aim of this session is to present recent research that used scenario thinking to explore teacher education futures and to engage in discussion with other teacher educators to articulate the most pressing questions that need to be addressed in research on Teacher Education futures. Finally we

intend to use the session to investigate the feasibility of an international research collaboration in the area of Teacher Education futures.

## PRESENTATION OUTLINE

### WHAT ARE OUR CHALLENGES AS EDUCATORS IN A CONTEMPORARY LEARNING SETTING FOR THE ASD ADOLESCENT?

**Co-Presenters: Val Hardie & Liz Alserda**

**Padua College,  
Mornington, Victoria, Australia**

[vhardie@padua.catholic.edu.au](mailto:vhardie@padua.catholic.edu.au)  
[ealserda@padua.catholic.edu.au](mailto:ealserda@padua.catholic.edu.au)

“The way I see it, a huge mistake many teachers and parents make is to try to make people

“The way I see it, a huge mistake many teachers and parents make is to try to make people with autism or Asperger’s into something they are not.” **Temple Grandin** [*“The Way I See It”*]

*Autism is not a disability; it is a difference*

Adolescents on the autism spectrum have unique challenges that are often hard for their parents, teachers, and peers to understand. While adolescence is a difficult time for most people, it is especially tough for teens who struggle to understand ever-changing social expectations. We all remember the stress of our secondary school years. Our bodies were changing, our friends were changing, and all of the rules around us were changing. Since people on the autism spectrum rely on consistency and predictable social environments, they enter this phase of life at an extreme disadvantage. Supporting them during adolescence requires an understanding of the syndrome and knowledge about strategies that will give them the skills they will need to thrive and reach their potential. In simplest form, Theory of Mind is the skill to perceive an event or situation from another person’s viewpoint. It encompasses all social thinking skills that usually develop without specific instruction from an early age, and it is wrongly assumed, including by teachers, that all people possess these skills at varying degrees; this is not true within autism.

Without the right support, adolescents on the autism spectrum retreat into themselves during this period. They express extreme loneliness and confusion, and are at risk for acting out behaviourally. There is an increased risk of depression and suicide during these years as well. As unpredictable as their social world is during adolescence, their response to this stress can be equally unpredictable.

This poses a major concern for parents and educators. Autism is estimated to be about one in every 110 births. Therefore, more students with autism enter primary and secondary school every year and their struggles are noticeable.

As our education systems have improved dramatically over the last 20 years, education for students with special needs, both developmental and behavioural, has become more inclusive. Mainstream education teachers are better trained, and supports for students with special needs are much more understood and available. However, students with autism present a different set of challenges than students with other developmental disorders. While most children with special needs are very social and readily express their needs and wants, students on the autism spectrum struggle with communication and social understanding. Their behaviour can appear unpredictable to an untrained professional. As they enter adolescence, the volume gets turned up on every aspect of this syndrome. While educators are struggling to find a way to better serve these students, more parents are struggling to cope with their child’s adolescence as well. This goes well beyond the typical acting out or sullen behaviour many teens express. They are not retreating from parent control and wanting more time with friends; they often have no friends. As lonely as they may report they are, they desperately seem to want to be left alone.

Their school experience is more threatening than ever before. They may not feel safe, and may come home with heightened sensitivity, anger, and sadness. Teens with autism have difficulty expressing how alone and frightened they feel. Many regress into the interests they had when they were younger, or spend their time in repetitive

activities, attempting to control their world in the simplest of ways. They are more easily angered, which is common with any form of depression.

### **In brief:**

ASD Core features:

- Communication
- Social Skills
  
- Social interaction
- Social Behaviour
- Strategies

Individuals with autism have very different characteristics. It is not an easy question to answer how to help such a diverse group of teens. They range from being nonverbal to very expressive. Some struggle with the simplest of social interactions, while others interact readily but inappropriately. Behavioural challenges can range from refusing to make eye contact to physical aggression. Compulsive behaviour can be as simple as wanting their desk arranged the same way each day or as complex as body rocking or repeating the same sentence over and over. There is no single answer, but multiple approaches to consider.

-  **Maintain Perspective**
-  **Make It Visual**
-  **Foster Independence**
-  **Promote Quality of Life**

It is very hard to build an educational program that needs to succeed on so many levels to build independence and ensure optimal quality of life. Without a shared vision and a well-thought out plan, one that includes as many people as possible, it becomes confusing and difficult to stay on task. Specifically, educational settings for adolescents need to address the following:

- Proactive programs: Teach teens various self-management strategies that result in social successes. These strategies work to reduce social anxiety, prompt appropriate social skills, and identify and organise social opportunities. For example, an individual's self-management program may involve learning to avoid specific social situations that result in negative outcomes, and identifying social opportunities to practice new skills with success. It may also include specific behavioural strategies to reduce anxiety, and self-reward successes. If there are social behaviours that have proven to be stigmatizing with peers, the program would also support replacing those behaviours with a more appropriate behaviour that serves the same social function.
- Assess all behavioural challenges and find meaningful replacement behaviours. By adolescence, an individual has developed many ways of coping with social confusion and stress. There may be behaviours that are getting them into trouble, or that are getting them teased, or that are isolating and resulting in few opportunities to practice social skills. Assess the function of each behaviour and work with the individual [and their peers] to develop and practise better options. The result is a new set of social skills that are developed strategically to pinpoint existing needs. Apart from basic skills necessary for social success, these strategic skills serve to remove barriers and set the stage for developing broader social skills. For example, if the student raises his voice to an alarming level whenever a conversation becomes difficult, that behaviour needs to be replaced with a more appropriate conversation skill that serves the same function, reduces anxiety, and changes the social exchange. There are limitless ways to avoid difficult topics or social situations (e.g., presenting a new topic, providing a compliment to redirect the conversation, asking a question, excusing oneself appropriately). Options need to be identified and practised to best fit the person and the social context.
- Create social opportunities in which a teen can experience success and have a better chance of developing age-appropriate friendships. Developing and nurturing a friendship takes ongoing assessment, creativity, and planning. As individuals learn skills to better understand the perspective of their peers and how to engage them more affectively, they need opportunities to practice and be appropriately challenged as well. This process can be the most difficult. It involves working closely with the family and anyone in the family's network who can be involved, as well as school personnel, and community opportunities. Each child's social supports represent a new puzzle to solve. Adolescents with ASD who are doing well [good academic abilities] can be overlooked in the school system as not needing the support given to others; this is a fallacy.

**The pervasive nature of social skills impairments should always be taken into account by educators.**

1. Be realistic
2. Focus on talents not deficiencies
3. Set life skills – setting a table, eating at a table, cleaning, handling money
4. Teach flexible thinking
5. Provide and accept diversity of subject matter, levels of ability and variety of evaluation tools
6. Practise skills of group dynamics
7. Model consideration and acting socially
8. Expect good grooming; however, it may take time for the sensory-challenged student to find products that are not causes of discomfort
9. Multi-tasking is not a reasonable expectation by teachers of ASD students
10. Allow some 'downtime'
11. Avoid installing fluorescent lights; at worst, limit the lighting, or provide a specific area lamp for the ASD student.
12. Set expectations: for example –
  - a. Limit allowed questions to 2 per period
  - b. Remind ASD students not to make noise or talk to themselves in exams
  - c. Monitor interruptions and challenges to what other students may be offering orally in class discussions.

Self-esteem can be built in small steps through real achievements. The literal mind of the ASD student requires tangible, meaningful accomplishments recognised with praise.

We must teach with a sense of humour and always with compassion and consideration. We are mixed ability schools and our education system therefore addresses not only mixed ability but emphasises focus on the individual; accommodating differences, therefore, is an expectation, not a hope.

**Preparing your ASD student for employment**

1. Organise work experience prior
2. Provide specific explanations of the expectations of the employer whilst on work experience
3. Provide specific explanations for presentation of any employee:
  - a. Be well-groomed
  - b. Sell your skills.
  - c. Dependability.
  - d. Visual Difficulties at work
  - e. Daily tasks
  - f. Sound Sensitivity
  - g. Diplomacy
  - h. Be nice and have good manners.
  - i. Workplace politics

**IN ANY EDUCATIONAL PLACEMENT AND FOR ANY STUDENT, the following apply. In inclusive education, the qualities for success for students are:**

- Sense of self-confidence
- Being engaged
- Sense of belonging

**KEY PHRASES:**

- ❖ **Focus – Building a community into the program** – making relationships within a cohort and with staff means
- ❖ **Individual/student-centred**

**Further:**

- **Considerations in the classroom for students undertaking an altered Curriculum**
- **WorkPlace Preparation**

## **SUCCESS IN ALGEBRA BEGINS WITH TEACHER TRAINING**

Imagine a classroom of students who are actively engaged in algebraic thought. The teacher has confidence in their own algebraic abilities and an understanding of the importance of algebra for students at all levels. While the lessons focus on unraveling a given pattern, students are encouraged to describe the pattern in their own words, and the conversation turns to descriptions of how the pattern is “increasing by 2” or how each new element is “two more than the previous one.” Whether one imagines a first grade classroom or a ninth grade classroom, establishing the type of algebraic environment as described by the NCTM Standards should be a goal for all mathematics educators.

Too often, teachers make comments such as, “I only want to teach kindergarten, so why do I have to know all of this math, especially algebra?” The response to this comment seems obvious. “Would you only want to read at a kindergarten level if you were teaching kindergarten? Then why would you only want to be able to work math problems at a kindergarten level?” Others might comment, “I teach high school, so why should my students need manipulative ‘toys’?” A response to this type of comment might focus on learning to walk before one learns to run. Unfortunately, many preservice and existing teachers are “. . . not comfortable with their own memories of algebra, much less with teaching it to their young students” (Burns, 2002). This lack of confidence teachers have can be explained by their failure to develop a firm foundation of algebra. They have “. . . only a shallow understanding of the concepts behind the rules and procedures, leaving them ill-prepared to promote algebraic reasoning in the early grades” (Stump, Bishop, and Britton, 2003).

The study of algebra is one of the major focuses in the mathematics preparation courses for future K-8 teachers and one of the requirements of current teachers as defined by the NCTM Standards. “By viewing algebra as a strand in the curriculum from pre-kindergarten, teachers can help students build a solid foundation of understanding and experience as a preparation for more-sophisticated work in algebra in the middle grades and high school” (2000). The successful training of mathematics teachers at all levels must focus on developing a more conceptual understanding of algebra through improved teaching strategies, the use of concrete models, and the incorporation of technology.

What exactly is algebraic thinking? Several definitions exist that provide various views about the topic. A combination of multiple views of algebraic thought states that “. . . algebraic thinking includes the ability to analyze and recognize patterns, to represent the quantitative relationships between the patterns, and to generalize these quantitative relationships” (Steele, 2005). Algebraic thinking requires students to be able to work at some of the higher levels of Bloom’s Taxonomy. A student must be able to analyze a given pattern to gain understanding, synthesize the information of the problem to make accurate predictions, and evaluate the pattern for adequate conclusions.

### **Research Focusing on the Teaching and Learning of Algebraic Thought**

Just as “. . . each child learns at his or her own developmental pace, progressing sequentially from the concrete operational level to the abstract level” (Thompson, 1988), prospective and practicing teachers must experience the growth across levels in order to mentally mature their algebraic thoughts. Teachers’ beliefs, knowledge, and confidence greatly affect their ability to guide and support students’ learning. If teachers do not

believe that the development of algebraic thought is important, then their students will not experience the chance to develop this important tool. Also, if teachers lack adequate knowledge and confidence for teaching algebraic thought, they may barely scratch the surface of this topic while creating a weak basis for their students' future experiences to grow. Janet Sharp writes that "Flexibility requires teachers know the mathematics so they can concentrate on figuring out exactly what a student knows or doesn't know. Otherwise, teachers with limited mathematics knowledge have to spend their mental energy trying to remember the mathematics . . . rather than thinking about assessing the student's understanding and framing the next question" (2004). Thus, the maturation of teachers' algebraic thoughts serves a vital role in the success of students in their classrooms.

Teachers need to begin the process of learning algebraic thought at the concrete operational level. Only after a firm foundation has been established at this level, can a teacher progress to the more abstract level of algebraic thought. The best means of gauging a teacher's knowledge of algebra for teaching is through written responses. By having the teachers carefully explain their thought processes in words, university faculty members can assess the level of understanding of algebraic thought of each teacher. Diana Steele writes about a study that uses ". . . writing to access students' schemata knowledge for algebraic thinking." In this study, eight seventh graders participated in a pre-algebra course where the process of solving a problem was stressed. Students were asked to examine problems independently and to write down their reasoning. Students then met in groups to discuss the problems together. Just as "the use of writing and the use of algebraic problems related in mathematical structure . . . help students develop

tools they need to think algebraically,” writing about algebraic problems can also help develop the knowledge base of a teacher. Steele explains that this writing experience allows students to learn how to “. . . communicate their schemata knowledge by explaining and justifying their solutions.” This opportunity develops conceptual knowledge “. . . which cannot be generated by procedures by rote” (2005).

### **Exploring Ideas for Teaching Algebra**

A K-8 teacher must completely understand the mathematical content, as well as, the students who will be taught. “Effective mathematics teaching requires an intimate knowledge of both mathematics and how people learn mathematics” (Sharp and Ohana, 2004). In order to assess the students’ prior knowledge of algebra and understand the thought processes students use in algebra, a teacher must create opportunities for students to verbalize their thoughts as they actively solve algebraic problems. This process also helps a teacher to understand how students learn algebra. “Teachers must focus on student thinking in order to develop their ‘algebra eyes and ears’” (Blanton and Kaput, 2003). These ‘algebra eyes and ears’ lead to additional effective instructional strategies for the teacher who becomes more successful at understanding both the mathematics and the student learning.

After completely understanding the knowledge base of the students, a teacher must create a positive learning environment in the classroom. “When young children are placed in a failure-free, fear-free environment, they enjoy the puzzlelike nature of algebraic problems. Their enthusiasm serves to transform mathematics from a passive to an active subject, thereby increasing student participation” (Femiano, 2003).

Many ideas about the teaching of algebraic thinking exist. One article suggests that “. . . much early work with algebraic reasoning centers around patterns. Children identify and extend patterns, describe patterns in everyday language, and gradually learn to generalize the relationships among elements of patterns in symbolic form” (Stump, Bishop, and Britton, 2003). Success with these patterns produces a firm foundation for students to further develop their algebraic thoughts. Sharp and Ohana comment that “The primary teachers’ eyes lit up when they comprehended the fact that they taught kindergarteners about foundations of algebraic thinking. Although the patterns might look simple on the surface, teachers could recall children describing the patterns in sophisticated ways” (2004). Another teaching experiment, using schema theory and writing in the instruction, “. . . supports both the use of writing and the use of structurally related concrete algebraic problems, especially problems that encourage the use of diagrams to help students develop the tools they need to think algebraically” (Steele, 2005). Marilyn Burns suggests the importance of students being able to organize their own work in mathematics. “When children have to take responsibility for representing their work, they focus on making sense of the problem, not merely on filling in the answers” (2002). In order to develop a teacher’s ability to use these teaching methods effectively, preservice and inservice instructors must model the instructional methods actually used in the K-8 classroom. Repeated modeling of effective teaching methods gives a teacher confidence in teaching and allows a teacher to gain experiences in observing ways to direct student learning in algebraic thinking.

Once a teacher completely understands the knowledge base of the students and has created a positive learning environment where effective teaching strategies are used,

the teacher must be able to assess this new algebraic knowledge. In order to assess the knowledge effectively, a teacher must integrate many opportunities for the students to write about their thought processes in solving an algebraic problem. “Children’s papers are extremely useful for assessing their progress” (Burns, 2002).

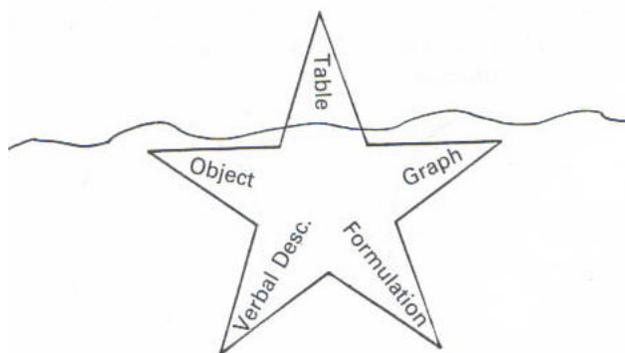

### **Exploring Algebra Using Concrete Manipulatives**

In the past, the mathematics courses for K-8 teachers have taught algebraic concepts using concrete manipulatives, such as rainbow centimeter cubes, to explore various patterns. A modeling approach has a strong influence on students’ algebra learning. Students who learn to accurately model various problems create a tool bag of skills which may be applied to future, related problems. “While the focus for younger students is to represent patterns concretely with various materials, numerically on T-charts, and verbally, older students can also describe the pattern of growth using algebraic symbols” (Burns, 2002). Additionally, students can transfer the information from the given pattern to a graph. Sharp and Ohana comment that “. . . students who explore algebraic ideas in multiple ways, including a variety of concrete representations, as well as, in contextual situations during their elementary learning years, are more able to make connections to symbolic representations in the algebra course” (2004).

“Elementary teachers need their own experiences with a richer and more connected algebra and an understanding of how to build these opportunities for their students” (Blanton and Kaput, 2003). The modeling of mathematics instruction for future teachers can equip these teachers with an effective instructional technique that they will hopefully use in their future classrooms. Typically, the study of algebra in one particular

mathematics course for teachers begins with a lesson that focuses on an investigation of algebraic patterns using five steps. These steps center on the ideas of Janvier's floating star-shaped iceberg (see **fig. 1**), which represents the learning of mathematics and the translations between different modes of representation (1987). The intent of the image is to stress the fact that multiple representations in mathematics exist and often only one representation may seem visible in a given problem. However, if the learner has a strong understanding of all the types of representations, the learner can switch to a different form when needed. In teaching preservice teachers, different representations of the same problem must be stressed. Future teachers need to be fluent in multiple ways to solve problems, so that they may use these varied approaches in their future classrooms.

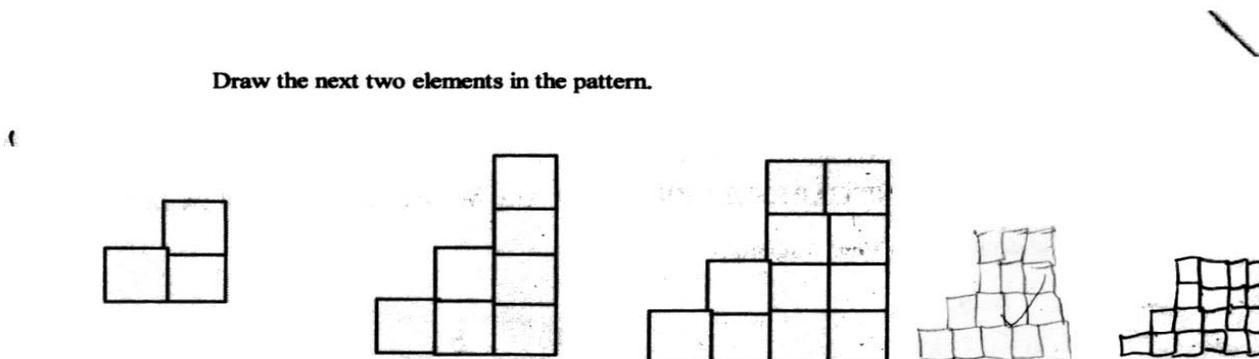

**Figure 1:** Janvier (1987) presents a floating star-shaped iceberg.

One way this objective has been accomplished focuses on a five-step problem centered on a linear relationship. The first step begins with the concrete step. Teachers are presented with a pattern and asked to continue building the pattern with concrete manipulatives. Teachers are also asked to transfer their pattern onto paper. **Figure 2** shows a sample pattern with one student's continuation of the pattern. The second step

follows with a verbal representation of the pattern. Teachers are asked to describe the pattern in detail and then write a word problem that fits the pattern. This step builds mathematical vocabulary, as well as, enhances critical thinking and reading skills. Stump, Bishop, and Britton focus on “Building a vision of algebra for preservice teachers.” In their article, they support this writing task by stating that they “. . . ask preservice teachers to translate these notions into teaching practices by writing questions which are related to the changes occurring with various quantities in their activities” (2003). **Figure 3** provides an example of a verbal description given by a teacher.

**Figure 2:** A student’s drawing of the next two elements in the pattern.

**Figure 3:** A student’s word problem.

**Write a word problem, which fits the pattern.**

I work at Wal-Mart & I'm supposed to stack cans of green beans on the shelf. My first group of green beans consists of 2 cans on the bottom level & one can that sits on top of the can on the right. In my next group of green beans I stack the same display again, except this time I add another column to the right which is a stack of four cans of green beans sitting directly on top of each other, so that this group has a total of 7 cans. I make a third group of green beans next in which I add another column of 4 green beans stacked on top of each other on the right side to make a total of 11 cans. If I continue this process down the aisle, how many green beans will be in the 10<sup>th</sup> group of cans?

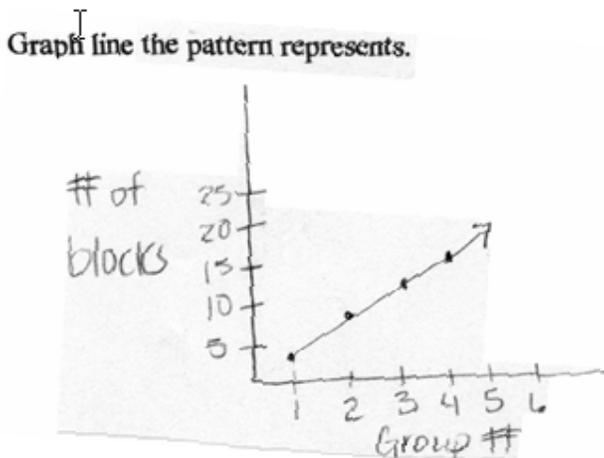

Next, teachers put the data into a T-chart. The independent variable is the pattern number and the dependant variable is the number of cubes in each element (see **fig. 4**). Then, teachers are asked to graph the data from the chart (see **fig. 5**). Finally, teachers are asked to find the linear equation that represents the pattern. Teachers investigate the slope on the graph in the form of rise / run and find the slope in the table in the form of the change from one pattern to the next. For instance, in the table (see **fig. 4** again), teachers note that the change from group 1 to group 2 is four blocks. The change from group 2 to group 3 is four blocks. They quickly note that the change is constant and this change equals the slope. The y-intercept can be seen from the graph. The y-intercept can also be found in the concrete stage in the following manner. Teachers notice how many cubes are being added from one pattern element to the next. Then, going to the first element and taking away the same number of cubes leaves them with the y-intercept. The algebraic equation for this specific example is  $y = 4x - 1$ . Students are often surprised to learn that one problem can be examined in so many different forms.

**Figure 4:** A student's numerical chart and prediction.

**Create a numerical chart showing the pattern and predict the 12<sup>th</sup> element.**

Group #		# of blocks
0		-1
1	+	4
2	+	7
3	+	11
4	+	15
5	+	19
12		47

**Figure 5:** A student's graph.

The study of algebraic thinking continues with a lesson to focus on systems of equations using problems such as a “pig-and-chicken” problem. A sample problem might have stated:

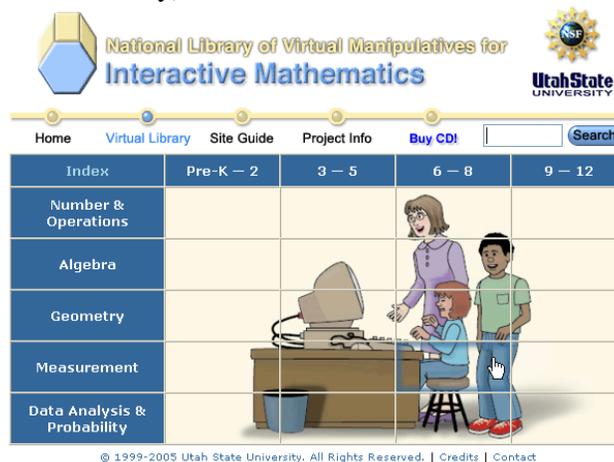

*A farmer owns only two types of animals. They are pigs and chickens. One day, he looks out in his field and counts 10 total animals and 26 total legs. How many of each animal does he have?*

To analyze this problem, students are given spaghetti and rainbow centimeter cubes. Some of them quickly utilize the manipulatives and start to create models of pigs and chickens, using broken spaghetti pieces for the legs. Other students begin a trial and error process on paper as they make guesses to see what the totals might be. Still others begin creating a table of values in search of a pattern. All of these approaches focus on algebraic thinking and allow the students the freedom to lead their own train of thought as they investigate a process for solving the problem. This activity for future teachers models an effective way to allow their future students to develop algebraic thinking for themselves. The activity then extends to include other systems of equations that can be solved using similar techniques.

## Exploring Algebra and Developing Algebraic Thinking Using Technology

Technology plays a vital role in a students' learning of algebraic topics. The use of technology takes away the amount of time that might be spent on developing concepts by allowing multiple problems to be worked in a shorter amount of time. The National Library of Virtual Manipulatives (NLVM) for Interactive Mathematics located at <http://nlvm.usu.edu/en/nav/vlibrary.html> provides an extensive resource of over 75 virtual manipulatives, which were developed at Utah State University through funding from the National Science Foundation. Some teachers may not have adequate supplies of concrete manipulatives available, so this website provides a free alternative when computers with access to the Internet are available (Hodge 2003). The website contains an index of various activities from each of the five content standards as outlined by the National Council of Teachers of Mathematics (NCTM). The virtual manipulatives are broken down into groups by grade level which include PreK-2, 3-5, 6-8 and 9-12. **Figure 6** shows the entry page to the NLVM.

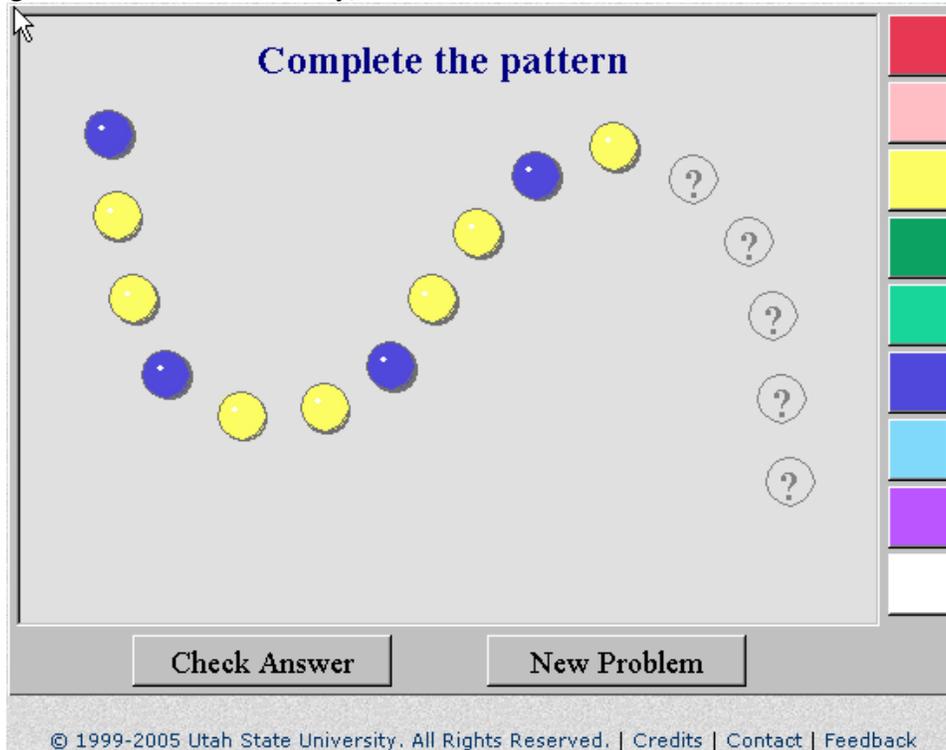

**Figure 6:** The National Library of Virtual Manipulatives at <http://nlvm.usu.edu> (Copyright: Utah State University)

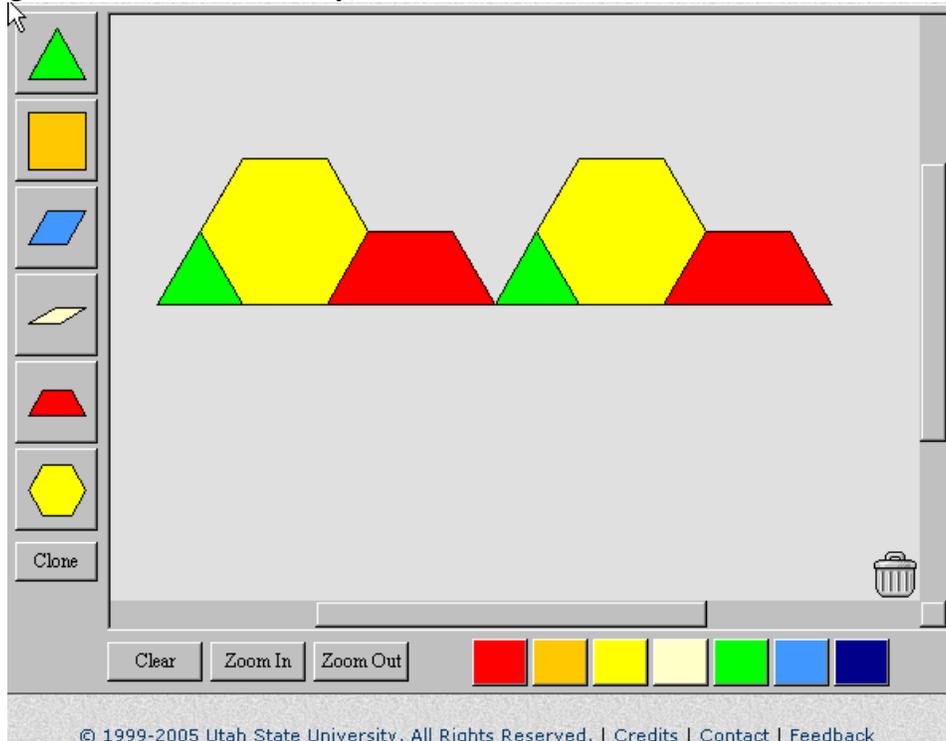

With the continued emphasis on the integration of technology in the classroom, virtual manipulatives can be used to develop and explore algebra. Sharp and Ohana emphasize that “. . . algebraic thinking grows from an understanding of numbers, which includes number sense . . .” (2004).

The NLVM offers many more opportunities which utilize technology to affect and promote a student’s learning and understanding of algebraic topics. At the Pre K-2nd grade level, students can strengthen their understanding of algebraic thinking by exploring color patterns (see **fig. 10**) and by using pattern blocks to build patterns (see **fig. 11**). These same manipulatives can be used at the 3rd-5th grade level in addition to space blocks which can be used to explore surface areas (see **fig. 12**). At the 6th-8th grade level, students can strengthen their ability to shift from the concrete to the abstract by manipulating virtual algebra tiles to multiply polynomials (See **fig. 13**), by using an algebra balance to solve basic linear equations (see **fig. 14**), and by observing the output of a function machine as values are being input (see **fig. 15**). At the 9th-12th grade level, students can strengthen their ability to fully understand algebraic symbols by using the manipulatives mentioned for middle school, as well as, a grapher to explore functions (see **fig. 16**). Thus, the NLVM provide ways for technology to greatly enhance the teaching of algebra.

The successful training of K-8 mathematics teachers must focus on developing a more conceptual understanding of algebra through improved teaching strategies, the use of concrete models, and the incorporation of technology. The teaching of algebra is important at all grade levels, and an established need for improved teacher training exists. Several suggestions for improving the confidence and knowledge of teachers have been given. The use of concrete models and the incorporation of technology, especially the NLVM, have proven to be successful methods for teaching preservice teachers. These methods can also be incorporated into successful professional development opportunities for current teachers. Thus, success in algebra at all levels begins with teacher training.

**ABSTRACT**

**Health Education**

**Objectives :** (1) To enforce the role of Pre-Elderly Integrated Service Post (Posyandu Pra-Lansia) as the way to solve experienced symptoms because of negative attitude toward menopause in Girirejo Village, Magelang District, Indonesia, (2) To increase of women knowledge about attitude toward menopause and experienced symptoms.

**Methods :** We will enforce POSYANDU PRA-LANSIA with Forum Group Discussion (FGD). Women aged 45-60 will become members in POSYANDU PRA-LANSIA. Many programs will be held to solve about their feeling in menopause symptoms. Sharing and social activity will be main program in POSYANDU PRA-LANSIA. Increasing of self-confident and good body image become the important thing to change negative attitude.

**Discussion :**

Several studies about the health of menopausal women showed that well-being during the climacteric is highly related to a positive attitude towards aging and menopause. Women who had regarded themselves as very attractive and who were satisfied with their physical appearance had the fewest menopausal symptoms. On the other hand, women who didn't regard themselves as attractive and were dissatisfied with their own body showed the largest number menopausal symptoms. Indonesia is developing country with women aged 44-45 who get menopause is 22%, and 45% among women aged 48-49. Many health programs hold in Indonesia. Therefore, programs in well-being during climacteric is uncovered. POSYANDU PRA-LANSIA can solve in climacteric symptoms among women 45-60. We know that Girirejo Village of Magelang District is one of agricultural areas in Indonesia. By enforcing POSYANDU PRA-LANSIA in Girirejo is expected can solve climacteric symptoms. Many activities can be done in POSYANDU PRA-LANSIA for solving climacteric symptoms. We know that negative attitude can affect in symptoms severity. Forum Group Discussion (FGD) which is regularly held in POSYANDU PRA-LANSIA can understand about attitude

toward menopause. Sharing and social activity are the effective ways to enhance self-confident among women toward menopause. Sharing about their feeling during climacteric period can be used to share with similar person who have similar feeling. So that, both of sharing and social activity can enhance their self-confident to face their climacteric problems. Self-assurance, self confident, and good body image contribute with womens's well-being and probably could be considered as protective factors during menopause. Positive attitude is protective factor for reducing symptoms experienced. So, with activities in POSYANDU PRA-LANSIA can affect attitude among women toward menopause and finally can reduce the symptoms severity in climacteric period. Quality of life among women toward menopause can increase with this program.

**A. Title of Submission**

Facilitating perspective-taking in writing through case studies and virtual world role-play

**B. Topic Area of Submission**

Curriculum, Research and Development

**C. Presentation Format**

Paper Session

**D. Description**

This paper is based on an exploratory study involving a multifaceted curricular intervention to help enhance high school students' capacity for perspective-taking in their written assignments on disability issues. The curricular intervention encompassing case studies and virtual world role-play is described. The paper presents an analytical example from a collective case study examining emergent patterns of perspective-taking in student participants' written work. Findings will be used to develop an analytical framework on perspective-taking to inform curriculum design. (77 words)

## **Abstract**

This paper is based on an exploratory study involving a multifaceted curricular intervention to help enhance high school students' capacity for perspective-taking in their written assignments on disability issues. Drawing on findings from experimental studies examining variables correlated with participants taking on the perspectives of out-groups, this study extended these findings by examining the factors affecting the mechanisms of perspective-taking in a dynamic classroom setting. The research involved a curricular intervention encompassing (i) direct instruction on critical literacy to facilitate analysis of differing representations of the people with disabilities in the media, (ii) individual student case study analysis of a written text or a video on a specific type of disability produced by a person with that disability, and (iii) three iterations of role-playing by student groups in a three-dimensional virtual world in which one member took on an avatar with a disability and had to decide how to respond to the prejudiced treatment or moral support of the able-bodied avatars. This paper describes the curricular intervention and presents one analytical example from a collective case study illustrating the mechanisms of perspective-taking enacted in student participants' written work. It represents the first step towards developing an analytical framework on perspective-taking to inform future curricular interventions aiming to initiate a shift in the perspective taken by students.

## **Stop the Bleeding: Rebuilding Master Level Enrollments**

Susan R. Cramer, PhD  
Dean of Graduate Studies  
University of Wisconsin Oshkosh  
800 Algoma Blvd.  
Oshkosh WI 54901  
[cramer@uwosh.edu](mailto:cramer@uwosh.edu)

Graduate education at many public comprehensive universities face enrollment challenges. Some external forces such as the global economic crisis and shrinking support for public education are beyond one's control. Other factors such as support by your university's upper administration can help mitigate plummeting enrollment numbers. While recovery has not been immediate, the tide is beginning to turn. Actions taken include development and implementation of a strategic plan, hiring of a Graduate Dean while maintaining the Director of Graduate Studies position, development and implementation of a marketing plan, redesigning and optimizing websites, engaging in data digging, and more. Hear one university's story and share your experiences. Today in higher education everyone must be a marketer.

6. When used to their fullest, rubrics serve as both the teaching tool and the assessment tool. By presenting the task and criteria at the start, students are introduced to backwards planning: identifying the desired end results, the form of evidence that will be examined, and key components/rules of the evidence. By benchmarking descriptors for levels of performance, teachers and students can use the rubric to chart growth over time. Participants will receive compelling justification for the use of rubrics in their instruction, the steps to follow in designing a “balanced” rubric, and examples of rubrics used in narrative and expository writing. The rubric format is easily adapted to science, math, and social studies projects. Designing a weighted rubric is an effective way to use existing materials and resources to meet the Common Core Standards.

## *Abstract*

*Multi-touch devices are becoming popular technology tools for use in mathematics education. Researchers have identified affordances of virtual manipulatives and have created cognitive design principles for mathematics apps. Emerging studies report some empirical evidence of connections between specific mathematics apps and student performance in mathematics. However, there are gaps in the current research, including a lack of in-depth analyses of children’s interactions and strategies related to specific mathematics apps. Thus, the authors recommend a detailed examination of the nexus of mathematics, strategy, and technology in children’s interactions with a virtual manipulative app for the iPad.*

Schools are increasingly using Apple iPads and other multi-touch devices to facilitate mathematics instruction. Despite the widespread adoption, there is scant published research regarding sound mathematics app design principles or connections between student performance in mathematics and interactions with specific iPad apps. Little current literature provides in-depth analyses of children’s interactions and strategies related to specific iPad apps. The purpose

of this paper is to lay the foundations for an examination of the nexus of mathematics, strategy, and technology in children's interactions with a virtual manipulative app for the iPad. In the following sections, we examine literature that has implications for mathematics app design and literature that reports empirical results connecting specific mathematics apps and student performance in mathematics before making recommendations for future research.

### **Implications for App Design**

#### **Studies Focusing on Virtual Manipulatives and Apps**

An increasing number of publications have implications for the design of virtual manipulatives mathematics apps for the iPad. Mathematics apps are often collections of related virtual manipulatives (see also Moyer-Packenham et al., 2014) which are “an interactive... visual representation of a dynamic object that presents opportunities for constructing mathematical knowledge” (Moyer, Bolyard, & Spikell, 2002, p. 373). In a recent meta-analysis, Moyer-Packenham and Westenskow (2012, 2013) concluded that virtual manipulatives (VM) have five affordances that promote student learning:

*focused constraint* (i.e., VMs focus and constrain student attention on mathematical objects and processes), *creative variation* (i.e., VMs encourage creativity and increase the variety of students' solutions), *simultaneous linking* (i.e., VMs simultaneously link representations with each other and with students' actions), *efficient precision* (i.e., VMs contain precise representations allowing accurate and efficient use), and *motivation* (i.e., VMs motivate students to persist at mathematical tasks). (2012, p. 2)

These interrelated affordances produced positive moderate effects (0.35) when virtual manipulatives were compared to other instructional factors.

Other studies emphasize the importance of feedback in computer- and iPad-based virtual manipulatives. For example, Paek and colleagues (Paek, Hoffman, & Black, 2013; Paek, Hoffman, Saravanos, Kim, & Black, 2012; Paek, Hoffman, Saravanos, Black, & Kinzer, 2011; Paek, 2012) noted that the combination of visual and auditory feedback when using a virtual manipulative helped improve students' performance on multiplication tasks, whether the virtual manipulatives are based on iPads or computers. Bartoschek, Schwering, Li, & Munzer (2013) piloted an iPad app designed to improve spatial awareness, concluding that young students approved of audio feedback but desired more specific responses to their mistakes. Blair (2013) categorized feedback types found in iPad mathematics apps as Answer Until Correct, Corrective Feedback, and Implication Feedback, which she planned to examine in a study comparing how preschool students respond to these feedback types. These studies link affordances and feedback in virtual manipulatives and iPad mathematics apps with student performance and preferences.

### **Studies Focusing on Design and Evaluation of Mathematics Technology**

Other authors have noted design and evaluation principles or features of mathematics technology. Ginsburg, Jamalain, and Creighan (2013) created a list of six cognitive design principles to take advantage of technology affordances. They recommend that designers should

- a) engage children in cognitively and mathematically appropriate activities, b) develop effective models for representing abstract ideas, c) encourage accurate and efficient strategies, d) identify and eliminate bugs and other misconceptions, e) design appropriate physical interactions, and f) integrate narratives and stories with mathematical concepts.

(p. 85)

Encompassing parts of both VM affordances (Moyer-Packenham & Westenskow, 2012, 2013) and cognitive design principles (Ginsburg et al., 2013), Sedig and Liang (2006) offered a

framework for evaluating interactivity factors affecting learning and cognitive processes of those using mathematics technology. The twelve factors were affordances, cognitive offloading, constraints, distance, epistemic appropriateness, feedback, flexibility, flow, focus, involvement, scaffolding, and transition. Sedig and Sumner (2006) refined the human-technology interactions into three basic interactions and twelve task-based interactions. Adesina, Stone, Batmaz, and Jones (2013) also noted that apps have the potential to track students' solution strategies and interactions, allowing for a deeper analysis of their thinking. Combined with affordances of virtual manipulatives, these complementary frameworks not only inform app design and evaluation, but may also influence interpretation of children's interactions with virtual manipulative apps.

### **iPad Apps and Mathematics Achievement**

Few studies report empirical connections between specific iPad apps and mathematics achievement.

#### **Single Studies of Specific Apps**

Two notable studies reported promising empirical results. Barendregt, Lindstrom, Rietz-Leppänen, Holgersson, and Otteson (2012) reported data from an investigation including 11 5- and 6-year old children playing Fingu, an iPad app focusing on finger gnosis and subitizing skills. Their preliminary results suggested that students gained precision with practice and developed different strategies as they played. The authors designed Fingu to provide back-end data, including finger placement and time-to-completion data to supplement the performance data. Their full study will include achievement and affective measurements examined through performance data and video coding. The combination of comprehensive data collection and analysis might lead to results with implications for future studies' content and design.

Riconscente's (2012) white paper reported results of a study involving 122 fifth grade students' interactions with a fraction-focused iPad app called Motion Math. The author concluded that students made statistically significant growth in achievement on fractions on number lines tasks. Riconscente also found that the positive affect extended beyond the iPad itself. Students in her study overwhelmingly gave high ratings to a game-based fraction app and showed increases in self-efficacy and liking of fractions after playing. These results indicate that iPad apps have the potential to positively affect students' achievement and attitudes.

### **Multiple Studies of a Specific App**

In a series of related studies, Paek and colleagues (Paek et al., 2013, 2012, 2011; Paek, 2012) examined how combinations of feedback and input modalities while using virtual manipulatives affected students' performance on multiplication tasks. Students used a researcher-designed app on the iPad (touch interaction) or computer (mouse interaction) and received audio and/or visual feedback. In the most comprehensive of the studies (Paek, 2012), statistically significant differences for far-transfer tests included those in the Audio + Visual feedback group outperforming the Visual-only group and Touch interaction groups outperforming Mouse interaction groups. Statistically significant differences for near-transfer tests included Touch interaction groups outperforming the Mouse interaction groups. The author concluded that audio information had more of a short-term impact while the degree of embodiment was a greater factor in the long-term results. Research suggests that specific mathematics apps may improve students' mathematics achievement, but little current research detailed fine-grained analyses of students' interactions with specific mathematics apps.

### **Recommendations for Research**

As research on students' interactions with tablets expands, researchers should acknowledge that mathematics iPad apps are often collections of virtual manipulatives. Although studies are beginning to provide data linking students' use of specific iPad apps and their achievement in mathematics, there was less evidence of fine-grained analyses of students' interactions with specific mathematics apps on iPads. Such research could consider the prior frameworks and affordances while exploring what the interactions reveal about students' mathematical understanding and sense-making strategies. Current research by the Virtual Manipulatives Research Group at Utah State University aims to address these and other gaps in our understanding of children's mathematics learning and interactions with iPad apps.

### **Summary**

This paper examined literature with important implications for mathematics app design and literature that reported empirical results connecting specific mathematics apps with students' mathematics performance. Additionally, we made recommendations for research, including the connection of iPad apps with virtual manipulatives. We hope this paper provides a spur for research, including explorations of the nexus of mathematics, strategy, and technology in children's interactions with virtual manipulative apps on the iPad.

Abstract (Work in Progress):

Black Hills State University, like so many other institutions, has struggled with the problem of students failing Basic Algebra and Intermediate Algebra. Many of these students subsequently failed to graduate. To address this issue, the mathematics department transformed the way these courses were offered. In this presentation, we will give a brief historical overview of this transformation, its impact on student success, and how it led to receiving a National Science Foundation TUES (Transforming Undergraduate Education in Science) grant. The focus of the grant is to study the predictability of student attributes and instructional variables on student success in remedial math courses and their subsequent pathway to graduation. The transformation of these courses involved both structural and instructional changes. The structural changes included allowing students to repeat one of the three units of content and still finish by the end of the semester. The instructional changes included focusing on student learning, student engagement, the use of explicit instruction, and evidence based procedures. The initial results from these changes have motivated us to develop a multi-tiered system of support to identify and assist at-risk students. This presentation will conclude with discussion on how these students performed in their subsequent college level classes.

Supported by NSF Grant #1141334: The Predictability of Student Attributes and Instructional Milieu on Success in Developmental Math Courses, College Algebra, the CAAP exam, and Matriculation to Degree

## HICE Proceedings Submission

1. **Title of the Submission:** Common Core – Uncommon School: Teaching and Learning in the Walton Rural Life Charter School in Walton, Kansas (Population 235)
2. **Name of the Author:** Dr. John R. Morton
3. **Affiliation of the Author:** Associate Professor, School Leadership/Middle and Secondary Teacher Education, Emporia State University, Emporia, Kansas
4. **Address of the Author:** 304 Lakewood Drive, North Newton, Kansas, USA 67117
5. **E-mail address of the Author:** [jmorton@emporia.edu](mailto:jmorton@emporia.edu) or [jmorton304@gmail.com](mailto:jmorton304@gmail.com)
6. **Abstract:** In 2007, Walton Elementary was the smallest school in the Newton Public Schools, Unified School District 373, Newton, Kansas. Concerns arose regarding whether it was even feasible for the school to remain open. Around this same time, charter grant money was made available through the Kansas State Department of Education. With the unanimous approval of the board, then Superintendent Dr. John Morton led an effort to submit a charter application converting Walton to the Walton 21<sup>st</sup> Century Rural Life Center. The charter was approved, and the rest is history! Walton has succeeded beyond even the most optimistic vision of most of those involved with the project. Dr. Morton, now an Associate Professor in the School Leadership/MSTE Department at Emporia State University located in Emporia, Kansas, will discuss Walton’s success as a project based learning charter elementary school, complete with its own teaching barn, greenhouse and wind turbine! This school could be a model for every struggling rural community, not only in Kansas, but throughout the world!
7. **Full Paper: Common Core – Uncommon School: Teaching and Learning in the Walton Rural Life Charter School in Walton, KS**

By  
Dr. John R. Morton, Associate Professor  
Emporia State University  
Emporia, Kansas

“Give the pupils something to do, not something to learn; and the doing is of such a nature as to demand thinking; learning naturally results.”

— [John Dewey](#)

John Dewey’s quintessential quote perhaps sets the stage for the premise of this paper better than any other source. His “learn by doing” approach to education has been in and out of vogue since

the 1930s. Yet now, with the advent of a more common sense, common core standards approach to teaching and learning, the pendulum may be swinging back, as evidenced by what has occurred since a small, rural, low-enrollment elementary school in Kansas shifted both its philosophy and focus as part of its move to a nationally recognized charter school.

Walton's roots can be traced by to its origin as a K-12 rural school which began its work in 1934 and served as a hub of activity for the small, rural Kansas town of the same name. Over time, the town became smaller, the school struggled to retain enrollment, and it eventually became part of the Newton Unified School District 373 as an elementary school. However, enrollment issues persisted, leading to increasing concerns regarding its future. Ironically, during this same time, school districts were being urged to write for charter school funding to promote innovative and out-of-the-box schools throughout the state.

As a superintendent, the prospect of transforming Walton into a charter school, with dollars available to support change, was an appealing one to me. As I considered various themes for the school, an obvious one came to mind; Walton was in the middle of a rural, predominantly agricultural area of Harvey County, Kansas. It seemed logical to create a "rural life center" around that theme. So, in 2007, with the assistance of the district's very capable grant writer at the time, Barbara Burns, and with the unanimous approval of the USD 373 Board of Education, a charter application was submitted to the Kansas State Department of Education. The application also had the unqualified support of the school's principal, Natise Vogt, and all of the staff working in the school.

We had begun to plan anticipating a three year implementation timeline. Imagine our surprise when, because of changes in the charter implementation policies at the federal and state levels, we had to telescope the first two years into one, combining staff training with implementation and building an addition to the school at the same time. It was, needless to say, a whirlwind of activity! And, yet, it was an energizing adventure for all of us in the school district.

Walton not only survived the accelerated timetable, it began to thrive. Teachers focused on the agricultural theme, and instituted project-based learning as a primary method of teaching and learning in the building. We were able to utilize the newly constructed greenhouse, powered by a wind turbine secured by a grant, as a teaching and learning laboratory. I will never forget visiting a classroom in the building where students and teachers had just discovered aphids in the greenhouse. The teachers, Kathy Murphy and Derrick Richling, used a document camera to show the insects to the students, they researched methods of dealing with them by utilizing the Internet, and formulated a plan to save the plants in the greenhouse. If anything epitomized "learning by doing," this example certainly did.

In addition, farm families adopted each classroom, allowing students to follow the agricultural cycle through visits to individual farms throughout the year. They began to produce items that could be sold via a local farmers' market. They made their own salsa. They attended agriculture camp in the summer to extend their learning. And, more importantly, we saw gains in learning from students that were unprecedented, especially from students with special learning needs.

With additional funding, we were able to construct a teaching barn so that farm animals could both be housed on site and brought in for student learning activities. An informal school mascot, Petey, the goat, led the students and staff in their daily walking activity around the school property.

Chickens, and the eggs they produced, were also added to the overall learning environment. An initial experience with chickens also afforded students and staff an additional learning opportunity. Once the coop was built and the fencing was put in place, the chickens were installed in their new home prior to the weekend. When the students returned to school on Monday, not a chicken was to be found. Enterprising foxes had dug under the fencing and had decimated the flock. Not to be deterred, teachers, staff and parents used the event as a teaching moment to stress the need for a barrier to be constructed beneath the fence which would keep animals from availing themselves of the opportunity to select chickens for their next meal. Teachers now use the eggs collected by students as part of a science learning activity and the sale of eggs as an exercise in math application while also serving as a mini-fund raiser for the school.

As with any school, Walton remains a work in progress. The principal, through the school's charter status, has allowed her very creative teachers to exercise creativity and flexibility in their approach to teaching and learning, still keeping the end in mind – the standards students are expected to master at each grade level. Kansas State Department of Education data for the 2011-2012 school year provides the following statistics for the school: 92.6% of the students perform at or above the standard in reading; 100% of the students perform at or above the standard in science, and 100% of the students perform at or above the standard in mathematics. (KSDE Online Report Card at [www.ksde.org](http://www.ksde.org)) In addition, the school has received multiple recognitions for both its overall program and academic achievement, including receiving the Governor's Award and being named a finalist in the Intel Corporation Schools of Distinction in 2011. (Intel)

All of these successes have been occurring at Walton over the past five years first in the context of a national effort orchestrated by the federal government through No Child Left Behind and now in the transitioning to the common core standards initiative which has been adopted by the majority of the states, including Kansas. Walton, however, has been ahead of the curve as usual. The school could serve as a prime example of what the common core is working to instill in all schools in the country.

“The Common Core State Standards focus on core conceptual understandings and procedures starting in the early grades, thus enabling teachers to take the time needed to teach core concepts and procedures well – and to give students the opportunity to master them.” (Common Core Standards Initiative) The expectation is that the Common Core will provide a “real-world approach to learning and teaching.” (Core Standards State of Washington) Such an approach focuses on application of knowledge, consistent learning expectations, clear standards focused on understanding and critical thinking and a more meaningful assessment process (CCSS State of Washington). And, as John Young states in his commentary regarding the standards in The Denver Post, “Education isn't just about plugging individuals into the workforce. It's about exciting them about the possibilities of the mind.”

I would contend that Walton teachers and their students not only extend the “possibilities of the mind,” but could serve as a demonstration school for successful implementation of the common core standards. With the school’s focus on problem solving and critical thinking through a project based infrastructure, Walton students are among some of the best prepared students in the district to succeed in mastering the common core standards which will prepare them for continued success in “college, work and life.” (CCSS State of Washington) For example, the second graders have their chicken project. In English/Language Arts (ELA), they are to read three stories and compare/contrast. They use stories about chickens (ex- “The Little Red Hen”). They can compare and contrast with those stories. They sell the eggs and use math money skills in making change and counting their money.

For students to be successful as they confront the challenges of the 21 century, a different skill set will be needed, which is why I am at least cautiously optimistic that the common core standards initiative may at least put us on the right track. As it stands now, it would appear that the students at the WRLC (Walton Rural Life Center) may well have a leg up when it comes to acquiring the right skills, utilizing the agriculture themed approach to learning that has allowed them to become critical thinkers and problem solvers. For example, Walton fourth grade students were given the problem of watering the school’s garden. They worked in groups to design a watering system. They had to measure for PVC pipe, estimate lengths, prices and then construct the irrigation system. They also worked on area and circumference.

Originally, one of the goals of the charter school movement was to create innovative schools whose efforts could be replicated across the country. While the Walton program might not succeed as well in Washington, D. C. or in Los Angeles, it might well be a model for a multitude of small, rural schools in rural communities throughout the country, preparing students to compete in a global economy with skills that can transfer to innumerable situations. And, the project based problem solving approach to teaching and learning has universal implications.

The individual teachers look at the common core standards and match classroom projects to the standards. Then when students have an interest in individual projects, the teachers can find ways to match the projects with the standards. To quote Walton Rural Life Center Principal, Natise Vogt, “Project Based Learning is fun and engaging for students. Students learn better when they are engaged. The real-life examples throughout the article demonstrate why and how they learn the common core by constantly applying the standards to actual situations.”

It has been one of the highlights of my professional career in education to watch the transformation that has occurred at the Walton Rural Life Center, knowing that the risks we took in submitting the initial application have paid off in outstanding, relevant learning opportunities for ALL students, allowing Walton to remain a viable institution of twenty-first century learning instead of becoming another shuttered building.

**TITLE****Middle School Teachers' Perception on Instructional Adaptation and Cooperative Teaching for Inclusive Education**

Topic Areas: Special education

Presentation Format: Poster session

**ABSTRACT**

The purpose of this study is to investigate how the instructional adaptation and cooperative teaching with special education teachers for their students with disabilities in the inclusive settings. For this study, the survey was developed and distributed 55 general middle schools, total of 440 middle school teachers. To analyze the collected questionnaires, Kruskal-wallis one way ANOVA by rank based and Kai square ( $\chi^2$ ) were used. In this study result and implication were discussed.

Keywords: Special education, Inclusive education, Instructional adaptation, Cooperative teaching

## **The development of Early Childhood Teacher Resilience Scale**

This study aims at developing a rating scale assessing resilience in early childhood teachers who are working with 3 to 5 year-old children. Resilience in early childhood teachers means the ability to dedicate themselves to their professional work as teachers despite of personal and environmental difficulties and adversities. To develop an instrument which takes into account various factors of resilience in early childhood teachers is essential to provide effective and customized support for teachers and their education, because resilience in early childhood teachers should be recognized as the one distinct from resilience in adults in general or in other professions, when considering unique situational, organizational, and professional features of their work.

As initial steps, 76 items were developed through extensive literature review, four focus group interviews (consisting of early childhood teachers with various educational levels and teaching experiences), and three specialist conferences (consisting of professors, researchers, and grammarian). Then, through a pilot study and data collection of over 500 early childhood teachers, the final items for assessing resilience in early childhood teachers were settled based on the item analysis results (Andrich's Rating Scale Model and infit-outfit MNSQ) and the empirical verification of validity (content, criterion-related, and construct) and reliability (test-retest and Cronbach alpha). Through these processes, the Early Childhood Teacher Resilience Scale (ECTRS) is proved to be a valid and reliable measure to assess the resilience in early childhood teachers who are working with young children.

### **Abstract**

Article acquaints kindergarten teachers and primary school teachers about ideas of daily contemporary music lessons in the classroom. Contemporary music ideas are extremely varied from culture to culture. But all music has the same roots deep in human's basic daily activities. We know different methods and theories of teaching contemporary music, e.g. Edgar Willems and NAFME. Teacher's task is to be aware that he has THE power to choose the most effective teaching method for her students.

### **Keywords**

Teacher, student, contemporary music education, Edgar Willems, NAFME, primary school music education around the World.

What does contemporary mean? The dictionary of Slovenian language defines it as something that relates to the present or to the most recent norms. The meaning of contemporaneity in music differs a lot. For Slovenian primary school education, contemporaneity means to use mathematical elements during the music lessons, in the United States it means to have air-conditioned classrooms, in Africa this term means that music lessons are taught in their mother tongue and in Lebanon contemporaneity would be, if music lessons were introduced to schools at all.

I have started inside of my and your body and asked myself, what music does inside of us. I took a walk to the nearby primary school and observed what pupils do during their music lesson. I started to wonder who should teach music lessons in the first cycle of primary education – the homeroom teacher or a music pedagogue. As you know, the first often says he/she enjoys teaching all subjects but not music. Music is not her line. I rose above Slovenia and took a look at the structure of the Slovenian curriculum of music education. With one foot

I already stood in Belgium, where Edgar Willems's method comes from, which is used in some Slovenian schools instead of the national curriculum. Afterwards I flew over to the United States, where The National Association for Music Education (**NAfME**), one of the most advanced music education associations, is stationed. How about Africa, are they allowed to be contemporary? And the Arab world? How about China, Hong Kong, Taiwan? What does contemporaneity mean to them?

### **Music for children**

All kinds of music have deep roots in everyday activities of human life (Blacking 1976). Music has creative and spiritual dimensions, which are sometimes expressive; they are created by pupils' playing and sometimes they become visible at dancing. Therefore it is expected that music represents an aesthetic value of children, like their work of arts. When pupils are involved into music activities in the classroom, it is expected that the music will sound like "their" music – it is similar to children's art.

The nature of music education is the active way of learning, also with reference to the teaching of music theory. For a deep music experience we should make a move into our body and soul, into creativity. An example of learning language: the most effective way of learning a foreign language is to visit the foreign country for a longer period of time. A similar principle applies to the music theory. The passive learning style – sitting and talking – is not enough. Researches have shown that the active learning approach can help to preserve up to 80 % of the new learning material. The effectiveness of active learning is confirmed by a music teacher in a kindergarten, who often teaches children in the presence of their parents. The parents who sat in the background of the classroom were amazed at how their children were able to remember more than they could. They were explained that their children were actively included into an in-depth activity, whereas they passively sat and listened (Glover 2004). "Passivity in making music excludes emotional and mental collaboration."

7<sup>th</sup> August 2013).

### **Who is more effective at teaching music in the first cycle of primary education – a homeroom teacher or a music pedagogue?**

The Slovenian curriculum for the first cycle of primary education prescribes that a homeroom teacher teaches all subjects. That assures a holistic view on the pupils' development. In the past, there were some theories about early music education – it was described to be

“different” and that it cannot be taught the same way as the other subjects and therefore it should be taken over by the music pedagogues.

Music education needs to be assured to an individual. This means:

- Each pupil develops skills, understands and is able to use music independently.
- Music lessons need to meet the capabilities and needs of each pupil.
- The teacher controls the personal development of each pupil in the field of music.

Only the homeroom teacher is in position to organize time, space and the necessary instruments that are close enough to the knowledge of pupils. The outcome is teaching with maximum effect.

The question of who should teach music provides different answers. If pupils are given lessons only by a music pedagogue, there are numerous disadvantages.

Below are described two important arguments regarding taking responsibility for music education in favour of a homeroom teacher:

- The effectiveness of music education often depends on the way in which it is organized. If all the school teachers are taking part in musical activities and if they teach music as well as all other subjects, they bear a message that music is accessible to all and a value for everyone. Where teaching music is limited to one music pedagogue for all pupils in school, or even worse, when the music education is provided by an outside school teacher, there is no wonder that pupils start to think that only certain people can make music or that music education needs to be provided by someone special. This assumption is transferred from childhood to adulthood and is still present in many primary school teachers who have a lack of confidence about their own abilities to teach music. They are still marked by the teaching model of their youth.
- The second argument bases on the music concept, which requires interdisciplinary integration. Music is in many ways a wonderful complement to the various views of human experience. This can be observed on a personal level, since music combines intellectual, physical, emotional and social dimensions of an energetic and historical significance, such as the extensive fields of understanding and action. Within the school organization, music education has an almost unique position regarding the integration of various fields, since it is in its nature to have common characteristics with other fields. The music teachers, who wish to fully explore and use this, have to manage the whole curriculum. The discussion of music topics alone is not enough. It

is much more effective if the music education includes other elements of the curriculum, such as mathematics, science, social studies, language, sports, etc.

In a recent musical debate, the participants were discussing about who should provide music education: a “specialist – music pedagogue” or a “homeroom teacher”. The idea of dividing teachers into specialists and non-specialists (homeroom teachers) raises negative perceptions and can lead to the misunderstanding of the role of a homeroom teacher. Indeed many homeroom teachers have different musical skills, such as instrumental, vocal, dance, composing music or art knowledge and technical skills. School can make them available, if the teacher is willing to teach and share his knowledge.

The question, whether all homeroom teachers have skills to teach music, sometimes raises in teachers themselves, who feel inadequately educated both, in the field of music and didactics. The question frequently bothers teachers who have a past experience about the importance of having a music specialization, which cannot be reached by everyone. However, the extensive researches on teachers, teaching all subjects, and music pedagogues, teaching only music in primary school, show that great music skills are not essential for the proper realization of the curriculum (Glover 2004).

The thesis, who should teach music, is additionally supported: there are alternatives leading to the same goal. The school teacher expertise may be applied in various ways. The findings of the English music inspection OFSTED show: “There is no evidence of common links between a “specialist’s knowledge” and the quality of music education, taught in the elementary school. Some specialists teach very effectively, others do not” (Mills 2009).

We have to be aware of the fact that having a teacher with special skills can in the worst case lead to the teaching based too much on the teacher's, rather than the pupils’ musical abilities. This can sometimes have a negative effect on the pupils’ development. Each pupil has some musical skills, which he brings to the music lessons. Everyone is somewhere in the music map (Woodward 1986). Nevertheless, it is important to ask the homeroom teacher, where he feels a lack of skills to ensure a rich and stimulating music education.

Below are given some general concise music skills and the duties of an average teacher, who professionally executes the curriculum in the first cycle of primary school:

- To be clearly attentive listener, sensitive to sound and its quality.
- To use musical language and vocabulary confidently in accordance with the pupils’ level.
- To provide thoughtful proposals, enthusiasm and wide range of ideas, including pupils’ ideas.

- To explore with a wide range of skills.
- To plan and provide the learning process of each pupil to achieve at least the minimum standards of the curriculum.
- To assess pupils' progress.

The tendency of defining musicality lies in specific teaching skills of solo singing, playing instruments or reading music literature. Of course, these capabilities are teachers' advantages; however, the success of a teacher is defined by a wide range of skills, including those that are not directly linked to music. An important aspect of teaching musicality in the classroom is teacher's susceptibility to music as a listener. A pupil should be able to experience the teacher's spontaneous response to music, the emotional effect of the arts and to see that music is accessible to everyone. Music is experienced in various individual ways. When listening to music, feelings sometimes inflame our hearts. For some pupils it may be difficult to listen to music without dancing along, jumping, swinging in its rhythm or do some physical activities. Music helps some pupils to calm down and concentrate. The understanding of music depends on our mood, taste of music, company, etc. Music "hits" our feelings in different ways.

Many adults define themselves as unmusical. A partial reason may be their sharp criterion, which includes the technical ability to play instruments, such as playing the piano. Some of them have negative experience from their early school years, if they were rejected by the school choir. It is important that the teacher does not make a negative music impression on children. What is more, the teacher should provide an atmosphere of understanding music elements and effective learning of music basics (Glover 2004).

### **The Slovenian curriculum for music education**

Music is an art that combines numerous concepts and techniques and uses them for evoking inspiration, imagination, invention and the expression of feelings. These are the features of performing, listening and creating music, included in the Slovenian curriculum ([http://www.curriculumonline.ie/en/Primary\\_School\\_Curriculum/Arts\\_Education/Music/Music\\_Teacher\\_Guidelines/](http://www.curriculumonline.ie/en/Primary_School_Curriculum/Arts_Education/Music/Music_Teacher_Guidelines/), 8<sup>th</sup> August 2013).

The current Slovenian curriculum for the nine-year primary school includes teaching goals, defined by activities. Despite the fact that some new contents have been added, this is an open curriculum that offers and provides the teachers a professional autonomy in selecting didactic ways and materials. The planning process provides activities on affective, cognitive, psychomotoric and social field of the child's personality. Affective processes stimulate activities in the cognitive and psychomotoric field of personality and this interactive relation

presents the basis of the pupils' musical development. The emphasis of teacher's work with pupils is on the educational process, not just on the results. Between the pedagogical goals of the curriculum and the pupils' interests, there is a gap that has to be filled. Therefore, the teachers' task is to apply new approaches, oriented towards pupils. The pupils will thus develop holistic thinking, the ability to cooperate with peers, creativity, autonomy and interest in learning (personal notes from the subject of Didactics of Music Education, academic year 2008/2009, and The Music Education Curriculum 2004).

### **Music education according to Edgar Willems**

One of the teaching methods that provide holistic learning is supported by the Edgar Willems Music Center. Edgar Willems is an international association that has existed since 1968. It was founded by Belgian teacher Edgar Willems, who worked mainly in Switzerland, France, South America, Spain and Portugal.

Willems's method emphasizes on the pupil's activity and creativity from the very beginning. Pupils have to test and physically hold all the musical instruments, try all sorts of movements, rhythms and voices. Therefore, it is important that the teacher enables them to experience all of this. Consecutively, pupils will link this experience to their mental aspect and will build knowledge from the unconscious to the conscious.

The school's fundamental activity is the execution of two educational programs:

- Musical introduction by Edgar Willems.
- Music education by Edgar Willems: compulsory subjects are music theory and solfeggio, playing an instrument is a choice. The education lasts six or eight years.

The main features of Willems approach

The teacher's responsibilities:

- Whether the pupils will establish a positive relation or interest towards music depends mainly on the teacher.
- The teacher has to teach with enthusiasm.
- The teacher has to teach in a way that makes the pupils think that he is experiencing the lesson for the first time as well.

- The teacher is a unique person for a pupil – or – a pupil imitates the teacher (psychological game). A pupil will imitate a teacher if he will have a great teaching role model.

The development of pupils is emphasized on: an active experience of musical involvement, the emotional perception of music, intellectual learning from previous experiences and their later conscious reliving.

Edgar Willems distinguishes between three main types of goals:

Music goals:

- To encourage love for music, firstly as a language, then as an art and science.
- To develop an ear for music and sense for rhythm, this presents a pre-stage and the preparation for the solfeggio, to play an instrument or to perform any other musical activity.
- To be open for musical language and musical art of different periods and cultures.

Human goals:

- To stimulate all activities: senso-motoric, emotional, mental and intuitive.
- To develop these activities, getting to know their coherence and accordance.

Social goals:

- To collaborate with everyone equally (children, adolescents and adults), irrespective of their initial knowledge, talent, age and origin.
- To make good use of small groups to improve the richness and complexity of each meeting by listening, expressing of each participant and by intensive communication.

Edgar Willems differs four teaching stages:

1<sup>st</sup> Stage: Musical introduction (3–4 years of age):

The priority is given to oral and practical experience, discovering music phenomena, stimulating musical interest, active participation in activities and developing the taste for fine arts.

The general plan of music lesson implementation is based on four major parts. Each part should last a quarter of a lesson:

- Auditory and vocal development (in order to stir up an interest in the sounds).
- Rhythmic education (in order to stir up pupils' energy into auditory organ).
- Singing songs (life energy of rhythm, melodies, harmonic structures and texts).

- Body's natural movement.

*An example of auditory development is a game for keen ears. Its goal is to find differences in sounds of various rattles. The teacher provides six rattles – three pairs providing three different sounds. Pupils listen to each rattle carefully and match them according to the sound. When the rattles are matched correctly, pupils shake them again and guess what material is inside of them. This game develops the ability to detect different sounds. The rattles can be made of plastic cups, half-filled with e.g. flour, sugar, rice and beans.*

2<sup>nd</sup> Stage: Musical introduction (4–5 years of age):

This stage broadens the knowledge of the 1<sup>st</sup> stage.

3<sup>rd</sup> Stage: Musical introduction before solfeggio and instrument (6–7 years of age):

This is the period, in which the learned concepts are transformed from concrete to abstract thinking: different rules, body lateralization, the use of instruments, etc.

*An example of activity in this period is a game that trains rapid movement of fingers. The game prepares fingers for playing an instrument: the first step of the game is naming fingers, then each finger gets a number (the thumb is number 1, the forefinger is number 2, the middle finger is number 3, etc.). Afterwards the teacher carries out the exercise with fingers by typing on the grounding:*

- 1, 12, 123, 1234, 12345/5, 54, 543, 5432, 54321.
- 12-21, 123-321, etc., 54-45, 543-345, etc.
- 121, 12321, etc.

*When performing this exercise, rhythmic vitality is important: the sweep of hand, the flip with finger and the rebound of hand.*

4<sup>th</sup> Stage: Solfeggio and musical instruments: (after the age of 7):

- Beside solfeggio, one of the peaks of music education, rhythmic, melodic, harmonic reading and improvisation are also significant.
- The musical language continues to be seen as the sum of all musical styles and eras.
- This is the period, in which a pupil starts to play his own instrument.

- At this lesson, music is more important than the musical instrument and life is more important than formal perfection.

*An example of the 4<sup>th</sup> Stage exercise is a sensory exercise of panchromatic tones, for which a pull flute is needed.*

- *The teacher plays the pull flute by pushing the stick slowly in. Pupils imitate the flute sound by singing. They can also accompany the flute playing with hands, moving from the lower to the raised position.*
- *The teacher plays the flute by pulling the stick out and the pupils imitate it by singing.*
- *The teacher places the stick in a suitable position and plays a single tone without moving the stick. The pupils imitate the sound.*

*If no pull flute is available, the teacher can use loudspeakers or a keyboard (personal notes from the lessons about Edgar Willems – Pedagogic Studying Program, academic year 2008/2009).*

“All real music stems from the need to express oneself; it is created from inside and not from the exterior” (<http://www.willems.ch/en/edgard-willems.htm>, 12<sup>th</sup> October 2013).

### **National Association for Music Education – NAFME**

Among the world’s largest arts education organizations, NAFME is the only association that addresses all aspects of music education.

NAFME was founded in 1907 with 64 members, today’s membership has grown to more than 130,000 including active music teachers, university faculty and researchers, college students preparing to be teachers, high school honor society members and Music Friends.

NAFME advocates at the local, state, and national levels of the USA; provides resources for teachers, parents, and administrators; hosts professional development events; and offers a variety of opportunities for students and teachers. The Association orchestrates success for millions of students nationwide and has supported music educators at all teaching levels for more than a century.

Since 1907, NAFME has worked to ensure that every student has access to a well-balanced, comprehensive, and high-quality program of music instruction taught by qualified teachers. NAFME’s activities and resources have been largely responsible for the establishment of music education as a profession, for the promotion and guidance of music study as an integral

part of the school curriculum, and for the development of the National Standards for Arts Education.

NAfME were originally called Music Supervisors National Conference, then Music Educators National Conference (MENC), then MENC: The National Association for Music Education. On September 1, 2011, they became simply National Association for Music Education.

#### National Standards for Music Education

NAfME developed the National Standards for Music Education and administered the overall development of the National Standards for Arts Education (1994) under a grant from the U.S. Department of Education, the National Endowment for the Humanities, and the National Endowment for the Arts. The National Standards represent the first comprehensive set of educational standards for K–12 arts instruction. NAfME has since published more than 20 documents in instructional techniques for helping students accomplish the Standards, dealing with such issues as staffing, scheduling, equipment, technology, and assessment (<http://www.nafme.org/>, 12<sup>th</sup> September 2013).

#### Curriculum for primary school K–4

The Standards divide achievement in to four levels: Ages 2–4, Grades K–4, Grades 5–8 and grades 9–12. Performing, creating, and responding to music are the fundamental music processes in which humans engage. Students, particularly in grades K–4, learn by doing. Singing, playing instruments, moving to music, and creating music enable them to acquire musical skills and knowledge that can be developed in no other way. Learning to read and notate music gives them a skill with which to explore music independently and with others. Listening to, analysing, and evaluating music are important building blocks of musical learning. Further, to participate fully in a diverse, global society, students must understand their own historical and cultural heritage and those of others within their communities and beyond. Because music is a basic expression of human culture, every student should have access to a balanced, comprehensive, and sequential program of study in music.

The standards below in this section describe the cumulative skills and knowledge expected of all students upon exiting grade 4. Students in the earlier grades should engage in developmentally appropriate learning experiences designed to prepare them to achieve these standards at grade 4. Determining the curriculum and the specific instructional activities necessary to achieve the standards is the responsibility of states, local school districts, and individual teachers.

NAfME's standards are interdependent, meaning that the ability to meet one standard facilitates meeting another. For example, Standard 5 aids Standard 4; Standard 1 improves one's proficiency of Standard 2; Standard 6 helps Standard 4, etc. As with a spiral curriculum, the standards operate under the assumption that any topic can be taught in some intellectually honest way at any level of development. Each level builds upon the previous one's expectations (Feldman 2011).

Content standards and Achievement for Grades K–4 (below is listed only some of Achievement Standards):

*1. Content Standard: Singing, alone and with others, a varied repertoire of music.*

Achievement Standard: Students sing independently, on pitch and in rhythm, with appropriate timbre, diction, and posture, and maintain a steady tempo.

*2. Content Standard: Performing on instruments, alone and with others, a varied repertoire of music.*

Achievement Standard: Students perform on pitch, in rhythm, with appropriate dynamics and timbre, and maintain a steady tempo.

*3. Content Standard: Improvising melodies, variations, and accompaniments.*

Achievement Standard: Students improvise “answers” in the same style to given rhythmic and melodic phrases.

*4. Content Standard: Composing and arranging music within specified guidelines.*

Achievement Standard: Students create and arrange music to accompany readings or dramatizations

*5. Content Standard: Reading and notating music.*

Achievement Standard: Students read whole, half, dotted half, quarter, and eighth notes and rests in 24, 34, and 44 meter signatures.

*6. Content Standard: Listening to, analyzing, and describing music.*

Achievement Standard: Students identify simple music forms when presented aurally.

*7. Content Standard: Evaluating music and music performances.*

Achievement Standard: Students devise criteria for evaluating performances and compositions.

*8. Content Standard: Understanding relationships between music, the other arts, and disciplines outside the arts.*

Achievement Standard: Students identify similarities and differences in the meanings of common terms used in the various arts.

*9. Content Standard: Understanding music in relation to history and culture.*

Achievement Standard: Students identify by genre or style aural examples of music from various historical periods and cultures. (Campbell 2010).

National music standards are not the only set of standards available in US. Many states, including New York, California, Virginia and Texas, have their own content standards. Though not identical to NAFME's standards, they generally display a similar balance of declarative, procedural, and conceptual learning. For example, Virginia's standards cover four areas with increasingly advanced tasks for each standard as instrumental music students progress from beginner level (Grade 1–2 music), Intermediate level (Grade 2–4), Advanced level (Grade 4–5), and Artist level (Grade 5–6), (Feldman 2011).

**Decolonization of music curriculum in modern Africa**

In some parts of Africa, they are trying again to deepen the understanding of Africans tradition and its methods of development the knowledge of the local systems (Masoga 2005). There is no need to speak of the African colonial history to understand the pain some African intellectuals. At the Music Conference in Kenya in year 2003, the delegates deplored the general arrogant and domineering Western Music and Art Curriculum at all school levels, that was in use at many schools in Africa.

Learning to read and write Western-oriented music, and playing western instruments is still highly appreciated act for many of their students and parents. Longing to orientate yourself into another culture is not necessarily negative, but it becomes problematic when it became mocking over the native culture or underestimation of the home school system.

The current African music pedagogues perceive a strong desire to include in curriculum African and Western content at the same time which would base on oral and written African folklore. At the conference 2003, which brought together musicians from many African countries has been expressed that the Africans are aware of:

- Their socio-cultural heritage is at risk due to foreigners (the current or former owners of the colonies);
- One of their next steps is to make sure that African teachers will be properly educated in playing their authentic instruments.
- The mother tongue of a state should be the heart of the curriculum. This would create a globally positive image of each country.

These three points should be the main part of the future formation of the school curriculum, in order to return to the roots of their music (Herbst 2005).

### **The curriculum for music education in the Arab world**

The learning approaches of music education in the Arab world arise from the very foundations of informal music institutions, such as private conservatoires. Until recently, there has not been established any formal music education system. In the last decade, an increased interest has aroused in the development of music education and in the proper approaches of teaching music in the classroom. Many Arab countries have a formal music curriculum; however, it is a reproduction of the Western world curriculum with a lack of authenticity.

Lebanon is a cultural, geographical and economical part of the Arab world. The local education center for research and development reports that in 2005 there were only 513 music teachers in their public schools and they were not equably arranged across the country (the country's population is about 4 Million people). It is clear that the music lessons do not have much value for school administrators and get a very low priority. The Lebanon school ideology is highly traditional and there is no possible way that any significant changes will happen in the field of modernization of music education in the following years.

The report of those responsible for the music education in the Arab world shows that they are aware of the new musical innovations worldwide. However, the slow progression, the lack of resources and teachers' weak position make the development of Arabic art impossible. The analyses show that the Arab world is currently focused on the development and improvement of three areas:

- The development of curriculum and teaching methods.
- The education of teachers.
- The production of learning materials for pupils and teachers (Fakhouri 2002).

### **The current improvement of music curriculum in primary schools of China, Hong Kong and Taiwan**

At the turn of the twenty-first century, the school curriculums of China, Hong Kong and Taiwan have introduced some major changes, oriented towards the Western trends, but based on their local context. With this new content of music lessons, the need for a different education of teachers has increased.

The new curriculum standards in China (MCS) give pupils more motivation to learn and try to stimulate them for research and creativity. In addition, the holistic criteria for assessment have been introduced. The aim is to prevent too much emphasis on the content, to prevent taking textbooks' content for granted and the separation from the social context. The teacher is allowed to have autonomy in teaching. Popular songs are included in textbooks; however, their content mostly describes the love for the country. The teaching of Chinese music has been strongly stimulated. The teaching content of such vast country varies from one region to another; there is a major difference especially between urban and rural areas. Due to China's openness to Western ideology, an even greater influence of Western didactics is expected in the future development of China's music education.

In 1997, Hong Kong was returned under the authority of China. At that time, Hong Kong adopted new school legislation. The previous was founded on the Western curriculum, including also creativity and Chinese music. The new teaching approaches emphasize on creativity, Chinese music, popular music and music theory, which correspond to their folklore context. However, the world music is not a part of the curriculum as Hong Kong needs time to re-establish its own culture – Chinese.

Since 1987, Taiwan has followed a more liberally oriented music curriculum. At that time, they were already more open to cultural diversity. Their local arts and culture were included in the lessons and were thus available for development. The music textbooks contained many folk songs and compositions by local composers. In 2001, the very new curriculum was introduced, making learning folk songs an even more important part of the artistic and social sciences. The new curriculum abolished the objective development of nationalism, supported by education and music; however the passion for the support of ethnicity still prevails. The new curriculum provides instructions for teachers, but not in detail, and topics are suggested. The requirements and needs for a different teaching education for teachers occurred at the same time as changes in curriculum (Mills 2009).

## **Conclusion**

Each pupil should have an opportunity to learn music, since music helps people express their inner feelings and presents an important part of our culture. There is no one universal contemporary approach of learning and teaching music that could be used by all schools of

the world. One particular method may be contemporary for a certain culture, folklore, language or mentality, but when it is transferred to another environment, it may hinder the education process.

# Learning in Depth with Imaginative Education Secondary Social Studies

Presenter: Ms. Corine Carey  
Workshop Session

My session examines using Learning in Depth to teach Secondary Social Studies while encouraging imagination and engagement in your classroom. My focus will be on Social Studies 8-11 and look at how to get your students more engaged in their learning and education through imaginative teaching strategies, independent inquiry-based learning in depth topics, and excitement about history and social studies!

Presenter: Ms. Corine Carey \*  
Social Studies Department Head  
Burnaby North Secondary School  
Burnaby, British Columbia  
Canada  
[Corine.Carey@sd41.bc.ca](mailto:Corine.Carey@sd41.bc.ca)

\* Masters Student at Simon Fraser University in Burnaby, British Columbia in  
Imaginative Education

Abstract:

As the Social Studies Department Head of Burnaby North Secondary and as a Masters of Imaginative Education Student of Simon Fraser University, I have become energized about a new strategy to teach Secondary Social Studies. After 11 years of teaching full time in the classroom I felt I needed a challenge or shift in direction within my own teaching practice. I teach everything from Social Studies 8, AP Psychology 12 and AP World History and more. I enrolled in the Imaginative Education Masters program because I saw Dr. Kieran Egan's work as something I would be interested in.

Long story short, I was sold. For the past year I have been in classes and preparing to implement my own version of Learning in Depth with my Social Studies 8 classes. I have implemented the program this year and it has been a huge success so far. My students can go beyond the textbook and get excited about their topics from their own independent angles and perspectives. It is a program that enriches the prescribed learning outcomes and curriculum established by any Ministry of Education or Government.

My session would look at the history behind Learning in Depth and how I came to find it, how I implemented it with examples and suggestions for colleagues, specific strategies that I use to be imaginative in my lesson planning around all of my socials classes including Learning in Depth time and the regular curriculum, and look at assessment practices surrounding my Learning in Depth program and regular class lessons.

My plan is to have an interactive session (power-point presentation, activities and demonstrations, and a hands-on practical package of strategies) that encourages fellow peers to reflect upon their own teaching practices in Secondary Social Studies and learn a new way of exciting students about learning. I will present but also give a practical and hands-on package of ways to implement, create and plan, assess, and use Imaginative Education and LiD in a social studies or history classroom. I will have 6+ months of evidence from my own classroom and strongly believe that many educators are doing many of these things on their own but are not sure how to enhance what they are doing. My goal is to help them reach that next level that will energize them and in turn their students to become more engaged in their teaching and learning.

If you require more specific information, please email me at anytime. I look forward to your response and am very excited about your conference.

Sincerely,

**Corine Carey**

Burnaby North Secondary

**Abstract:** The flipped classroom model is an approach to maximizing classroom time by using technology to "flip" the traditional model of teaching. Content in the form of online lectures and presentations is offered outside of class, while hands-on activities and collaborative learning take place in the classroom. With innovative tools for producing online content and interactive lessons, instruction that used to occur in class is now accessed at home. Class becomes the place to work through problems, advance concepts and engage students with creative learning strategies. Most importantly, all aspects of instruction can be rethought to best maximize the scarcest resource of all, time. This model can be applied to both K-12 and higher education learning environments.

## Abstract :

This poster presents the results of an innovative project using dance activities to enhance vocabulary among four to six year old children from a socioeconomically disadvantaged neighborhood near Montreal, Canada. Previous studies have shown that children coming from low SES (socio economic status) families tend to have a weaker vocabulary than their peers from more privileged backgrounds. Since practices like reading aloud and explicit teaching of words have produced better results among children from average and privileged backgrounds, new ideas are needed about how to best foster vocabulary acquisition by disadvantaged children (Marulis et Neuman, 2010). The potential for dance activities to positively impact upon child development has been well documented (April, 2010). Our study sought to more specifically explore how directed dance activities based on kinesthetic and creative involvement with the four seasons might foster vocabulary acquisition on this theme.

Children were individually interviewed before the activity, right after it and three weeks after it in order to determine how their vocabulary related to the four seasons had been affected by the dance activities. During each interview, children were asked to describe what they know about the seasons through a general question (What do you know about the seasons?) as well as more specific questions (can you tell me what winter is? What do you do in winter?). Results show that semantic knowledge about the seasons evolved between the first and the last interview. More precisely, some children specified their vocabulary about the seasons while others reorganized their semantic knowledge. This study contributes to a better understanding of multidisciplinary interventions and innovative pathways to foster vocabulary acquisition among children from low SES.

TITLE: Using the flipped classroom to teach flower/foilage production, plant growth/development, and crop modeling courses

TOPIC AREA: Higher Education

PRESENTATION FORMAT: Poster Session

DESCRIPTION OF PRESENTATION:

The flipped classroom teaching technique was used in several undergraduate and graduate horticulture courses. Lecture materials were assigned for outside of class, and class time was devoted to active learning in-class activities.

AUTHORS:

Kent D. Kobayashi, Tropical Plant & Soil Sciences Department, University of Hawaii at Manoa, e-mail: [kentko@hawaii.edu](mailto:kentko@hawaii.edu)

Teresita D. Amore, Tropical Plant & Soil Sciences Department, University of Hawaii at Manoa, e-mail: [amore@hawaii.edu](mailto:amore@hawaii.edu)

## ABSTRACT:

In a typical classroom setting, the instructor lectures and students do homework activities outside of class. The flipped classroom technique was used in several horticulture courses in which lecture material was assigned for homework, and students did active learning activities in the classroom. The objective of this presentation is to discuss how the flipped classroom approach was used in Tropical Plant & Soil Sciences (TPSS) courses—TPSS 402 Flower and Foliage Production, TPSS 601 Crop Modeling, and TPSS 674 Plant Growth and Development.

TPSS 402 is an upper level undergraduate level course offered every other fall term. Lecture topics focused on factors affecting plant growth, namely, light, temperature, plant nutrition, plant growth regulation, pest and disease control, and postharvest handling. Later in the semester, production requirements of commercially important flower and foliage crops grown in Hawaii were discussed. Online information sources such as YouTube videos, e-Gro University modules, and online articles in Greenhouse Grower and Greenhouse Product News, were provided as assigned readings to students. Virtual field tours of production sites were experienced on UBloom.com.

In TPSS 601 and 674, various lectures were replaced by YouTube videos, websites, and HortTalks presentations which students viewed outside of class. They reviewed the Virtual Plants online crop simulation, Flower Power wheat flowering model, Prune Chilling Prediction Model, chilling accumulation models, and a growing degree-days phenology model. Students were encouraged to bring their laptops, tablets, and smartphones to class to do Internet searches for relevant information for class discussions, small group discussions, and hands-on activities. In class, students ran online computer simulations. For homework, students searched for online crop models and brought their URLs to class to share with other students. Using the flipped classroom approach helped reduce lecture preparation time and create an active learning environment in the classroom.

6. ***Abstract:***

As a methodology based on interviews and observations, this aims to give intuitive, but carefully developed and documented larger and deeper impressions of the form and shape which particular characteristics take in the life of an individual participant. At the same time, what the researcher sees and brings out in the portrait reflects and crucially depends on their own inspiration. This is the study of nontraditional teachers who went into teaching after another career.

**TITLE:** Job Satisfaction Level of Female Teachers in Turkey

**Paper author(s):**

E-mail: nelcan@uemail.iu.edu

### **Abstract**

In this study, the researchers explore the factors affecting the satisfaction of female teachers in their workplace in Turkey. For this purpose, the researchers address the following research questions: 1) what is the job satisfaction level of female teachers in schools? 2) what factors affect their job satisfaction? To this extent, the researchers employed a qualitative research methodology interviewing 12 female teachers (three purposefully selected female teachers from four different elementary schools) and performing document analysis to gather in-depth information.

Based on the collected data the researchers found that many participants (10 out of 12) have job dissatisfaction because of the following reasons: 1) inadequate administrative support, 2) lack of inclusion in the decision making processes in school, 3) low salary, 4) student discipline problems, 5) lack of student motivation, 6) unsafe environment, 7) poor opportunity for professional advancement, 8) lack of community support, 9) lack of professional competence of colleagues, and 10) intrusions on teaching time. The researchers also found that “the less experienced teachers”, less than 10 years of experience, are more likely seek different jobs or career opportunities, or to pursue graduate level training compared with the experienced teachers, more than 10 years of experience. In addition, most female teachers (9 out of 12) believe, because of their gender, male teachers, school administrators, and the regional director ignores them and their desire for success.

**Keywords:** satisfaction, female teachers, workplace, Turkey

6. ***Abstract:***

Teacher preparation in American is based on a triadic model related to knowledge, skills, and dispositions. Often the subjective aspect of teacher dispositions takes a “back-seat” to the more easily assessable, quantitative nature of knowledge and skills. This workshop presentation will provide an opportunity for attendees to discuss the non-cognitive skills and dispositions/character as related to effective teaching. The agenda for this workshop presentation will allow an opportunity for attendees to converse about the non-cognitive skills (i.e. “soft skills”) and dispositions/character as related to effective teaching.

Anticipated discussion points will include the following:

- Defining teacher dispositions, as found in the literature as well as the impact of cultural influences on dispositions/character
- The implications for the variety of definitions of dispositions on teacher education
- Ethical issues surrounding dispositions
- Discussion surrounding the importance of “non-cognitive” aspects of teachers and the hierarchical aspects of dispositions
- How to effectively assess teacher dispositions, both within teacher education programs and with practicing teachers (current and future practices)

**6. Abstract**

The agenda for this workshop will include current definitions, research, statistics, and symptoms of burnout and why the recognition of burnout is important for educators and those in the helping professions. In addition, current definitions and research related to resilience for educators and helping professions is essential for well-being as well as those who are being taught and assisted. The primary focus of the workshop will also include activities in which participants will be able to practice and apply some of (but not limited to) the following techniques to help when troubled times arise through experiences of helping others:

- Creation of a humor file
- Creation of a “to keep” file
- Vision boarding (reflection on lives and careers)
- Stress management and relaxation techniques
- Guidelines for building quality, supportive relationships
- List of additional resources related to resilience

Title of the Submission: Practices of Data-Driven School Development

Topic Area of the Submission: Educational Administration

Presentation Format: Paper Session

Description of Presentation: This presentation explores a significant topic in the school field. The study not only expands the academic inquiry of data use, but also provides a detailed sketch of school practices.

# **Practices of Data-Driven School Development**

## **Abstract**

Propelled by the international comparison of student achievement in the 21st century, student learning once again caught the world's attention and became a significant issue in the agenda of education reform. Data-driven decision making thus reenergizes its power in this accountability context, playing an important role to assist school improvement and to enhance student achievement.

In order to investigate how schools use data to ground their improvement efforts, a qualitative case study was conducted. It explored how a high school in Taiwan used data to drive change through its collaboration with a university. Considering preexisting beliefs influence how school members enact new intervention, sensemaking theory was employed to examine teachers' conceptions of data use in the case school. Besides, the process of using data to formulate school improvement plan and the conditions affecting how the school participants' using data were also researched.

In the study, observation, interview and document analysis were used to collect data. The findings indicated that the case school learned to integrate different data to diagnose its weaknesses and problems through the facilitation of the university. Grounded on the data, improvement action plan was developed. It was also observed that school faculty with suspicious attitude in the initial stage, and then gradually changed their mentality, conceptualizing that data might be a legitimate basis for policy decisions in the sense-making process. In addition, principal leadership, school member's time, capacity and willingness were critical conditions for successful use of data in the school.

## Promise Neighborhood Evaluation

Texas Tech University (TTU) received a Promise Neighborhood grant from the U.S. Department of Education on behalf of a significantly underserved, impoverished community in Lubbock, Texas. Consequences of past de jure discrimination and subsequent poor school performance, low employment and substandard health services plague the neighborhood, leaving most residents with a sense of hopelessness and frustration. Promise Neighborhood grants are designated for the purpose of revitalizing a community, utilizing the school district and supporting agencies as catalysts. Programs are proposed to engage residents, support students from cradle-to-college and career preparedness, and rejuvenate community involvement. Multivariate analyses focusing on longitudinal analysis of individual and group interventions will be conducted to evaluate impact on key outcome measures, common to all Promise Neighborhoods.

### **Statement of Need**

While many community agencies, including social service and health agencies had been providing services, their efforts remained isolated – uncoordinated with the residents and schools – and their effectiveness had not been adequately measured. Census and health data indicated that families' basic needs were not being met, and problems such as food insecurity, medical facility access, and physical safety were common among residents. Students were not receiving adequate nutrition, exercise and access to health care. Comprehensive, coordinated services are being implemented, leveraging the neighborhood schools as a means of revitalizing the neighborhood as well as reforming school curriculum.

## Promise Neighborhood Evaluation

A Promise Neighborhood is both a place and a strategy. It is a defined community, established by geographical boundaries, with quantified resource needs. It is also a strategy, that brings together resources from within the community as well as from other sources in order to facilitate the active participation of residents in identifying and addressing challenges, thus contributing to capacity building and coordinated services. The strategy is to engage community members and students in the decision-making process, building upon their strengths, which in turn would be the means for identifying and coordinating services and relieving neighborhood distress. In the process residents would become active contributors in addressing challenges and embarking on solutions.

The design of the project required an approach to program evaluation that simultaneously considered improvements in service delivery and the effectiveness of individual programs. The variety of services and complexity of the program design necessitated both a longitudinal and case management approach to data collection and ultimately the use of sophisticated multivariate modeling (Structural Equation Modeling, SEM), to capture the relationship among services, individual differences, and interventions over time. Ultimately, the authors will measure the impact of associated variables on key performance indicators, closely examining the contribution of individual variables on the variance in outcome measures.

### **Methods**

The national Promise Neighborhood program focuses on fourteen Government Performance and Results Act (GPRA) performance objectives. Table 1 lists the required objectives. (Insert table 1 here.) For each objective, the present authors developed a detailed protocol which included:

## Promise Neighborhood Evaluation

- Specific Performance Measure for that objective
- Data Source, e.g., survey instrument, medical record, school record, attendance at events, pre- and post-questionnaire for interventions such as a parenting class, etc.
- Original source of Questions to be Asked, e.g. validated instrument vs. faculty-developed instrument
- Categorization as Aggregate or Individual Level of Data Collection
- Categorization as Identifiable or Non-Identifiable Data (establishment of procedures for Informed Consent and maintaining confidentiality)
- Categorization as Longitudinal or Case-Management Level Data
- Determination of Other Variables to which Specific Data Would be Combined in the Analyses
- Comprehensive Analyzes.

Interventions include expansion of neighborhood health clinic hours to evenings and weekends; development of parenting classes for new and expectant parents; expansion of early learning opportunities; parent/toddler “Read Aloud” sessions at libraries and churches throughout the community; project-based learning revisions to the school curriculum; intensive academic intervention for students at risk; coordination of social and school services for students and families; mental health services for students and families; cooking and nutrition classes for students and families; after-school enrichment; high school dual enrollment college courses; and informational programs for students and their parents on college admissions requirements and financial aid.

## Promise Neighborhood Evaluation

- Anonymous Neighborhood Survey
- Anonymous School Survey
- Health Clinic Data on Use Rates and Child Health Variables
- Community Partner service data (Salvation Army, City of Lubbock, Red Cross, United Way, etc.)

### **Data Sources**

- Individual and group data are collected in a common data platform; with the following sources for de-identified group data:

- Anonymous Neighborhood Survey
- Anonymous School Survey
- Health Clinic Data on Use Rates and Child Health Variables
- Community Partner Service Data (Salvation Army, City of Lubbock, Red Cross, United Way, etc.)

- Individual “case” data is collected using two methodologies: master data agreements with partners; and program-specific instruments and measures. We have negotiated elaborated master data agreements, allowing our data system to integrate with the data systems of key strategic partners, obviating the need to collect profile data from participants during service deliver. Examples of data collected from master data agreements include:

- Nutritional Screenings
- Head Start Screenings on Multiple Domains of Age-Appropriate Functioning

## Promise Neighborhood Evaluation

- Early Childhood Enrollment Data
- School Performance Data
- School Attendance Data
- Student Mobility Data
- School Disciplinary Referral Data
- School Graduation Data

- Examples of data collected at our service delivery points include:

- Pre and Post- Measures for Specific Interventions
- Follow-up Data on Graduates via Databases and Surveys
- After-School Participation Data.

A concentrated review of existing literature and research led us to the development of specific predictive and causal models to test over time, as we ultimately attempt to make and measure tangible progress and improvement in the Promise Neighborhood.

### **Support for Approach**

The Modeling Approach measures the impact of individual program participation and performance on the targeted outcome variables, accounting for various individual difference predictors. By making use of the Structural Equation Modeling (SEM) statistical approach, it is possible to determine the relative strength of variables in predicting outcome variables. SEM is a statistical techniques that “is ideally suited to address theoretically motivated quasi-experimental research questions (Little, 2013, p. 13). It makes fewer assumptions than multiple regression or analysis of variance, an important consideration when conducting analyses or data that may not

## Promise Neighborhood Evaluation

be normally distributed. In addition, the method allows for the association among all variables (exogenous, endogenous), the presence of unaccounted for variance (and its effects on the model), and the importance of mathematical directionality in terms of causality. Driven by a robust theoretical underpinning, structural modeling offers sophisticated means for examining variables in such a diverse and intricate project and for collection of services over time.

### **Significance**

The present study goes beyond the identification of student needs and the study of effectiveness of individual interventions or combinations of interventions. It demonstrates the usefulness of the powerful SEM methodology in identifying appropriate constellations of services for students and families.

## ABSTRACT

The terms hybrid, blended, flipped, and inverted are inconsistently defined in the literature creating a barrier to efficient research on and implementations of these types of classes. This paper examines existing definitions of these new types of courses and uses those definitions to identify two dimensions critical to differentiating types of courses: how instruction is delivered to students and what type of instruction students receive. The paper then addresses how these dimensions were used to create a taxonomy that defines hybrid, blended, flipped, and inverted classrooms. The taxonomy focuses on learning experiences in which students receive instructional guidance either directly from an instructor or indirectly from an instructional designer (e.g., through educational software); therefore, some elements of courses, such as unmonitored problem solving, are not specified.

## INTRODUCTION

Educators have been adapting their courses by using computing technology to promote student engagement (e.g., by using online simulations), make course content more accessible (e.g., by using video conferencing), and much more. The increasing use of technology impacts students' learning experiences, especially how students receive instruction and what type of instruction they receive. In some cases, the experience of learners had changed so drastically that it became necessary to create a new name to describe the course (i.e., hybrid, blended, flipped, and inverted). Much research has been conducted in the past few years to assess the effectiveness of these new types of courses. In this literature, researchers inconsistently use these terms to describe the type of course that they are evaluating, causing ideas and discussion in the literature to be unclear.

Many researchers use the terms hybrid and blended interchangeably. In three of the first five articles found in a search for "blended" (using the ERIC database on 13 September 2013), the terms blended and hybrid are represented as the same concept (Calderon, Ginsberg, & Ciabocchi, 2012; Dikmenli & Unaldi, 2013; Gecer & Dag, 2012; Owston, York, & Murtha, 2013; Pregot, 2013). This result suggests that some researchers use blended and

hybrid to represent the same concept while some do not (or perhaps are not aware of the term hybrid). Additionally, the term flipped is indistinguishable from the term inverted in the literature, but some researchers use flipped and some use inverted (e.g., Bishop & Verleger, 2013; Morin, Kecskemeti, Harper, & Clingan, 2013; Strayer, 2012).

Inconsistent definitions of hybrid, blended, flipped, and inverted classrooms cause these terms to be confused and wastes the time of researchers and practitioners interested in studying and implementing these types of courses. The inconsistencies make comparing results, replicating experiments, and finding and deeply understanding information from the research difficult. For example, imagine the theoretical and pragmatic repercussions if the terms *secondary* and *higher* education were used interchangeably. To address this issue, we propose a taxonomy that considers critical dimensions of courses and consistently defines these terms by these dimensions.

## Identifying Dimensions from Existing Definitions

To identify the relevant dimensions for defining these courses, we qualitatively analyzed a sample of previous definitions of hybrid, blended, flipped, and inverted classrooms (see Table 1) using techniques described in Taylor-Powell and Renner (2003) to find the emergent dimensions. We identified four primary dimensions:

1. *Instructional location* describes whether the learner receives instruction in a classroom or in a non-traditional setting (e.g., home, library, coffee shop),
2. *Delivery medium* describes whether a person or technology delivers instruction to the learner,
3. *Instruction type* describes whether the learner is receiving content (e.g., lecture) or applying content to learning activities (e.g., practice problems), and
4. *Synchronicity* describes whether learners are following a group pace or individual pace.

Then each definition in the sample was scored by two raters on whether it included information about the dimensions. The initial interrater agreement was 92%. Then, raters discussed disagreements until they reached full agreement. The dimensions of the definitions are represented in Table 2.

Article	Term	Definition
Sands, 2002	Hybrid	"...hybrid course, seat time is reduced and some of the course activities—information transfer, exchange of ideas, testing, essay-writing, etc.—are distributed throughout the semester, with students accessing course materials and performing other tasks online."
Johnson, 2012, pp. 94	Hybrid	"Hybrid classes have required amounts of physical attendance, but some of that attendance requirement is replaced by online work."
Arispe & Blake, 2012, pp. 450	Hybrid	"We will use the <i>hybrid</i> to refer to courses that regularly combine scheduled classroom sessions with online meetings."
Allen & Seaman, 2010, pp. 5	Hybrid and Blended	"Course that blends online and face-to-face delivery. Substantial proportion [30-79%] of the content is delivered online...and typically has a reduced number of face-to-face meetings."
Singh & Reed, 2001, pp. 2	Blended	"Blended learning focuses on optimizing achievement of learning objective by applying the "right" learning technologies to match the "right" personal learning style to transfer the "right" skills to the "right" person at the "right" time."
Garrison & Vaughn, 2008, pp. 5	Blended	"The basic principle is that face-to-face oral communication and online written communication are optimally integrated..."
Johnson, 2012, pp. 94	Blended	"Blended classes meet face-to-face full time like regular classes but are augmented by formal, extensive online resources."
Johnson, 2012, pp. 94	Flipped	"One model of a blended classroom is the flipped classroom, in which students access the curricular content outside of class and then use class time to discuss, apply, and clarify the content."
Carpenter & Pease, 2012, pp. 37	Flipped	"Flipping describes a model [in which] ... At home, students watch online lectures, while class time is spent on...processing activities. The teacher, freed from front-of-class lecturing, works more intensively with individuals and groups of students."
Morin, Kecskemeti, Harper, & Clingan, 2013	Flipped and Inverted	"The inverted classroom "flips" the in-class and out-of-class activities, often by moving the lecture content before class and working on homework and hands-on activities during class time."
Bishop & Verleger, 2013	Flipped and Inverted	"the flipped classroom...employs asynchronous video lectures and practice problems as homework, and active, group-based problem solving activities in the classroom."
Strayer, 2012	Inverted	"[Inverted classrooms] rely on technology to introduce students to course content outside of class so that students can engage that content at a deeper level inside the classroom."
Lage, Platt, & Treglia, 2000, pp. 32	Inverted	"Inverting the classroom means that events that have traditionally take place inside the classroom now take place outside the classroom and vice versa"

**Table 1. List of Previous Definitions of Hybrid, Blended, Flipped, and Inverted.** Sample definitions were selected from a range of publication dates (i.e., 2000-2013) and publication types (e.g., empirical articles, books, magazines). Definitions that are cited frequently, such as those by Lage et al. (2000) and Allen and Seaman (2010), were also included.

Table 2 illustrates the dimensions that are used to describe hybrid, blended, flipped, and inverted classrooms. Definitions of hybrid courses consistently describe instructional location; definitions of blended courses consistently describe delivery medium; definitions of flipped and inverted courses consistently describe instructional location and instruction type. These patterns suggest which dimensions are important to defining these terms.

Flipped/inverted courses are widely considered to be a type of blended learning (e.g., Johnson, 2012; Strayer, 2012); therefore, it seems contrary that flipped/inverted courses and blended courses are not defined by the same

dimensions. To explore this discrepancy, the instructional location and delivery medium dimensions were examined more closely. Because these two dimensions discuss the same type of learning experiences (e.g., face-to-face or online) from different perspectives, these dimensions seem to address the same issue: how learners receive instruction. To reduce redundancy, we propose that these two dimensions be represented by a single dimension.

We think that how instruction is delivered is more descriptive of learning experiences than the physical environment in which instruction is received. If instruction is delivered via an instructor, then it is implied that the learner and instructor are face-to-face. On the other hand,

Article	Term	Location of Instruction	Delivery of Instruction	Type of Instruction	Synchronicity of Instruction

**Table 2. List of Previous Definitions of Hybrid, Blended, Flipped, and Inverted Characterized by Their Underlying Dimensions.**

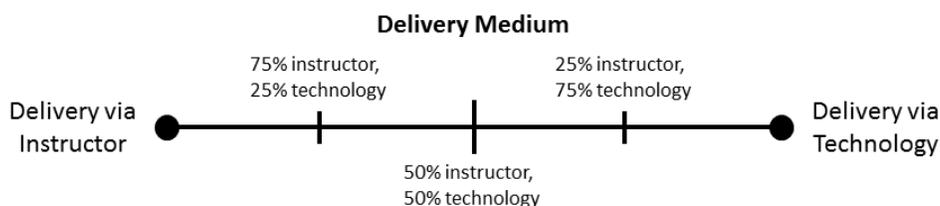

if instruction is delivered via technology, then the location of the student can be anywhere that has an internet connection, including a classroom. Delivering instruction via technology is beneficial because it affords flexibility in instruction on a variety of factors including location, pace, and style (Gedik, Kiraz, & Ozden, 2013; Singh & Reed, 2001). Given the mobility of modern technology, specifying how instruction is delivered to students rather than where instruction is delivered might be more a useful dimension for defining courses.

In the sample of definitions, describing the synchronicity of instruction was not common. Instruction can be synchronous or asynchronous regardless of whether it is delivered in class or online, via an instructor or technology, or for lecture or application activities. For this reason, synchronicity could be considered a product of the instructional method. For example, learners watch online video lectures individually, so instruction is asynchronous. For another example, learners watch a live lecture in class with an instructor, so instruction is synchronous. Though

synchronicity is an important factor in learning experiences, we propose that synchronicity is not a defining dimension of courses.

#### Dimensions Used in Taxonomy

Two dimensions were used for defining courses: delivery medium and instruction type. Delivery medium is defined as the medium through which instruction is delivered to the learner. The two main types of delivery media are via an instructor and via technology, so they will be the end points of this dimension (see Figure 1). Delivery via an instructor implies that the learner receives instruction in a face-to-face environment, whereas delivery via technology makes no assumptions about the physical environment of the student. Instead, technology-delivered instruction allows for flexibility in the learning experience. For example, the physical location of the learner is flexible in a class that meets synchronously via a video conference. For another example, the pace of the instruction is flexible when learners individually watch a video recorded by their instructor.

*Figure 1.* Delivery medium dimension of learning experiences ranging from 100% delivery via an instructor to 100% delivery via technology.

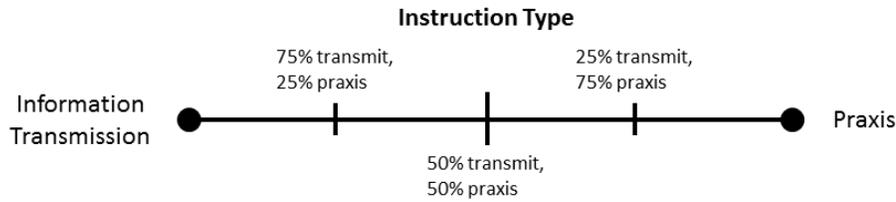

Figure 2. Instruction type dimension of learning experiences ranging from 100% information transmission to 100% praxis.

The dimension of instruction type is defined by the roles that the students and instructors take during instruction. The two main types of instruction are information transmission and praxis, so they will be the end points of this dimension (see Figure 2). Information transmission is defined as instructor-driven delivery of content to the learner (Gonzales, 2012). During information transmission, the instructor or instructional program dictates information while the student receives information. Examples of information transmission are lectures and educational videos. Praxis, on the other hand, is defined as student-driven learning through the application of knowledge (Singh, 2012). During praxis, the student applies knowledge while the instructor or program supports the student by providing guidance and feedback. Examples of praxis are experiential learning and discussions.

courses, such as hybrid and blended classrooms, and create consistent definitions for them. We use these dimensions to form the structural foundation of the Learning Experiences Taxonomy (see Figure 3). The taxonomy focuses on learning experiences in which instructors interactively guide students for the purpose of acquiring new knowledge. This guidance addresses, among other things, the credibility of content, how to organize knowledge, the progress of the student, strategies for problem solving. Therefore, the taxonomy does not specify learning activities that are entirely student-directed. For example, it does not include unmonitored peer discussion (i.e., face-to-face or online) or the unguided use of the Internet to look up additional information. It also does not include assignments on which students receive delayed feedback such as homework assignments that students complete independently.

The delivery medium and instruction type dimensions are independent and can be used to differentiate types of

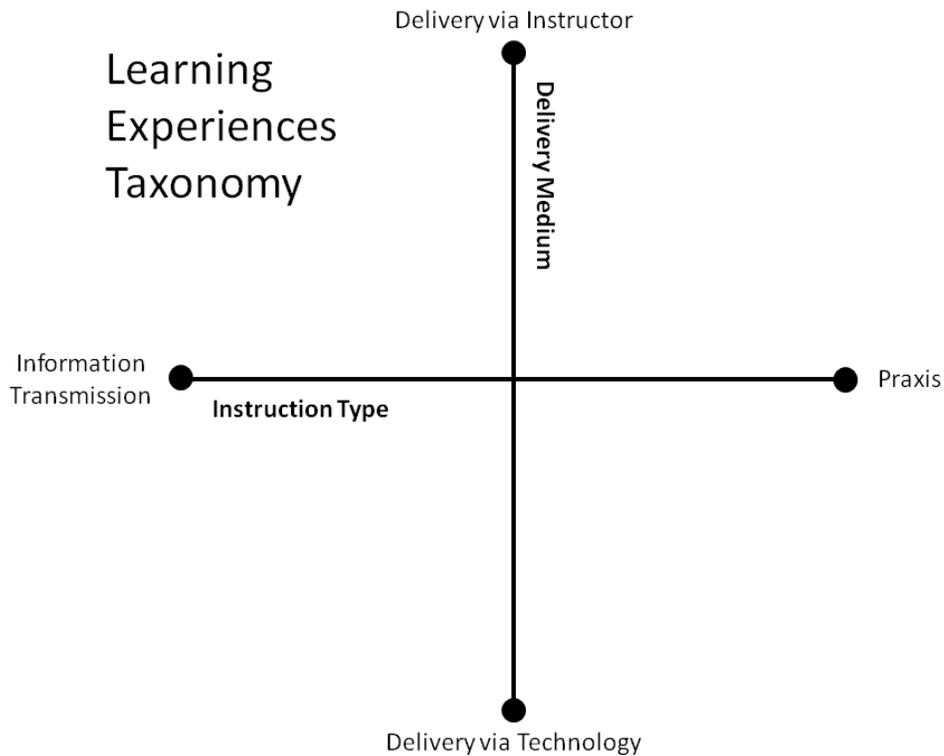

Figure 3. Delivery medium and instruction type dimensions orthogonally crossed to form the structural foundation for Learning Experiences Taxonomy.

### The Fundamental Learning Experiences

The dimensions form four quadrants, and these quadrants represent the four fundamental learning experiences in the taxonomy (see Figure 4). The following sections define each of the four quadrants and offer two examples of classes, one in the science domain (i.e., chemistry) and one in the humanities domain (i.e., history).

*Instructor-transmitted* describes the top, left quadrant in which courses are primarily delivered via instructor and information transmission. In the examples below, the only instructional guidance that students receive is through watching or listening to their instructor.

Example Chemistry Class	Example History Class
During class, students watch demonstrations of lab procedures performed by their instructor.	During class, students listen to the instructor lecture.

*Technology-transmitted* describes the bottom, left quadrant in which courses are primarily delivered via technology and information transmission. In the examples below, the only instructional guidance that students receive is through watching videos.

Example Chemistry Class	Example History Class
During class, students watch videos of demonstrations of lab procedures selected by the instructor.	There is no face-to-face class. Students individually listen to pre-recorded lectures by the instructor.

*Instructor-mediated* describes the top, right quadrant in which courses are primarily delivered via instructor and praxis (i.e., the student applies knowledge with an instructor who provides guidance and feedback). In the examples below, the students receive feedback on their progress from the instructor during class.

Example Chemistry Class	Example History Class
During class, students use lab equipment to complete assignments.	During class, students discuss readings and ideas.

*Technology-mediated* describes the bottom, right quadrant in which courses are primarily delivery via technology and praxis (i.e., the student applies knowledge using technology that provides guidance and feedback). In the examples below, the online program and video game are providing feedback to the students about how well they are applying knowledge.

Example Chemistry Class	Example History Class
Students work through lab assignments using an online lab simulator.	Students play through an educational video game by answering questions.

The examples given for these fundamental learning experiences use only one type of delivery and one type of instruction; therefore, they would all be located at the outer corners of the taxonomy. Many courses, however, use a combination of delivery media and instruction types

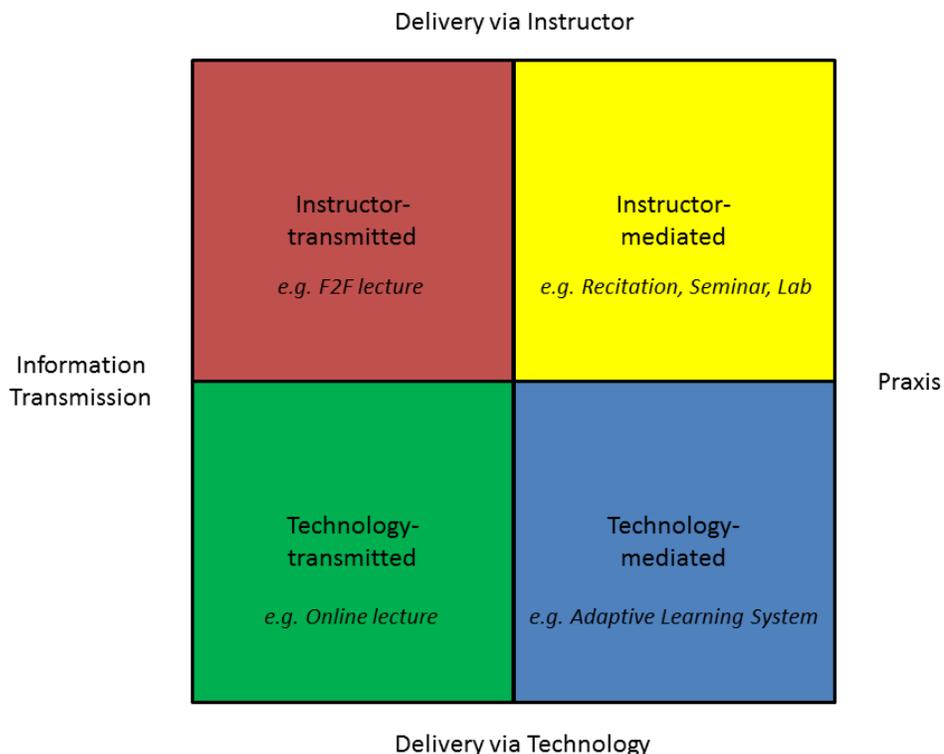

Figure 4. Fundamental learning experiences form the four quadrants of the taxonomy.

resulting in a course that would fall more towards the center of the taxonomy. For example, if a course was delivered via an instructor but half information transmission and half praxis, then, it would be in the middle of the top edge of the taxonomy. A course like this could not be accurately categorized by one of the four fundamental learning experiences. In the taxonomy, courses are only classified by the four fundamentals if they do not use a substantial portion (more than 25%) of the pedagogical elements from other quadrants. Courses that use a substantial portion of two fundamental learning experiences are called combined learning experiences.

### The Combined Learning Experiences

The taxonomy has four combined learning experiences: one for each combination of adjacent quadrants (see Figure 5). Though hybrid and blended are often confounded (e.g., Allen & Seaman, 2010), in discriminating definitions, hybrid is used to describe courses that are simply part face-to-face and part online (e.g., Arispe & Blake, 2012; Johnson, 2012; Sands, 2002). For this reason, the taxonomy uses hybrid to describe courses that combine delivery via an instructor and delivery via technology.

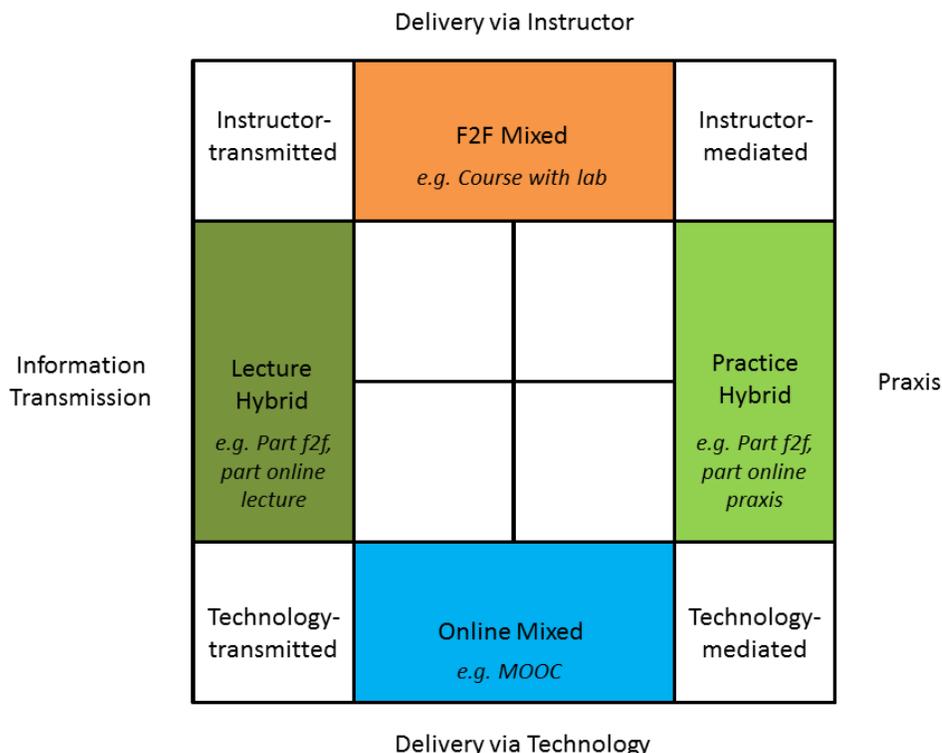

Figure 5. Combined learning experiences include a substantial portion (25% to 75%) of methods from two adjacent fundamental learning experiences.

*Lecture hybrid* describes the combination between instruction-transmitted and technology-transmitted experiences. In lecture hybrid courses, the student receives information partially via an instructor and partially via technology. In the examples below, information is being transmitted to the students via both delivery media. For the technology-delivered portion, sometimes students watch the delivery synchronously (i.e., live lecture), and sometimes they watch it asynchronously.

Example Chemistry Class	Example History Class
Students listen to live lectures sometimes face-to-face and sometimes online.	Students attend class once a week to listen to the instructor lecture, and the rest of the week, they watch videos.

*Practice hybrid* describes the combination between instructor- and technology-mediated experiences. In practice hybrid courses, the student applies knowledge with guidance and feedback partially via an instructor and partially via technology. In the examples below, students apply knowledge with feedback via both delivery media. For the technology-delivered portion, sometimes students receive feedback from a program, and sometimes they receive feedback from their instructor virtually.

Example Chemistry Class	Example History Class
Students attend lab once a week to conduct experiments. Then, they participate in discussions in online forums that the instructor moderates.	Students use an intelligent tutoring system to build problem solving skills. In class, students solve large problems as a group.

To the authors' knowledge, there is not a common term to describe courses that combine information transmission and praxis. In this taxonomy, the term mixed will be used to describe these experiences. *Face-to-face (F2F) mixed* describes the combination between instruction-transmitted and instructor-mediated learning experiences. In F2F mixed courses, the students receive information from and apply knowledge with guidance from an instructor. In the examples below, the students receive information from the instructor then apply their knowledge while the instructor is available to provide guidance and feedback.

Example Chemistry Class	Example History Class
For part of class time, students watch demos of procedure, and during the other time, they work on a lab assignment.	For part of class time, students listen to the instructor lecture, and during the other time, they discuss readings and ideas.

*Online mixed* describes the combination between technology-transmitted and technology-mediated learning experiences. In online mixed courses, the students receive information from and apply knowledge with guidance from technology. In the examples below, the students use technology to receive knowledge and receive feedback while applying their knowledge.

Example Chemistry Class	Example History Class
Students watch demos selected by the instructor, and they use an online lab simulation to work on lab assignments and get computer-generated feedback on their work.	Students watch videos selected by the instructor, and they participate in discussions in online forums monitored by the instructor.

### The Blended Learning Experiences

The middle of the taxonomy is called the blended learning experience, and it uses a substantial portion (between 25% and 75%) of delivery via an instructor, delivery via technology, information transmission, and praxis (see Figure 6). We chose blended to represent this area in the taxonomy because of how the term flipped is used in the literature. Flipped is indistinguishable from inverted in the literature, but this paper uses flipped because it is more common. A flipped classroom is generally considered to be a type of blended learning (e.g., Johnson, 2012), and central to its definition is how different types of instruction are delivered to students (see Table 2). Given flipped classes are a type of blended classroom, then other types of blended learning should also be defined by both how instruction is delivered and what type of instruction students receive.

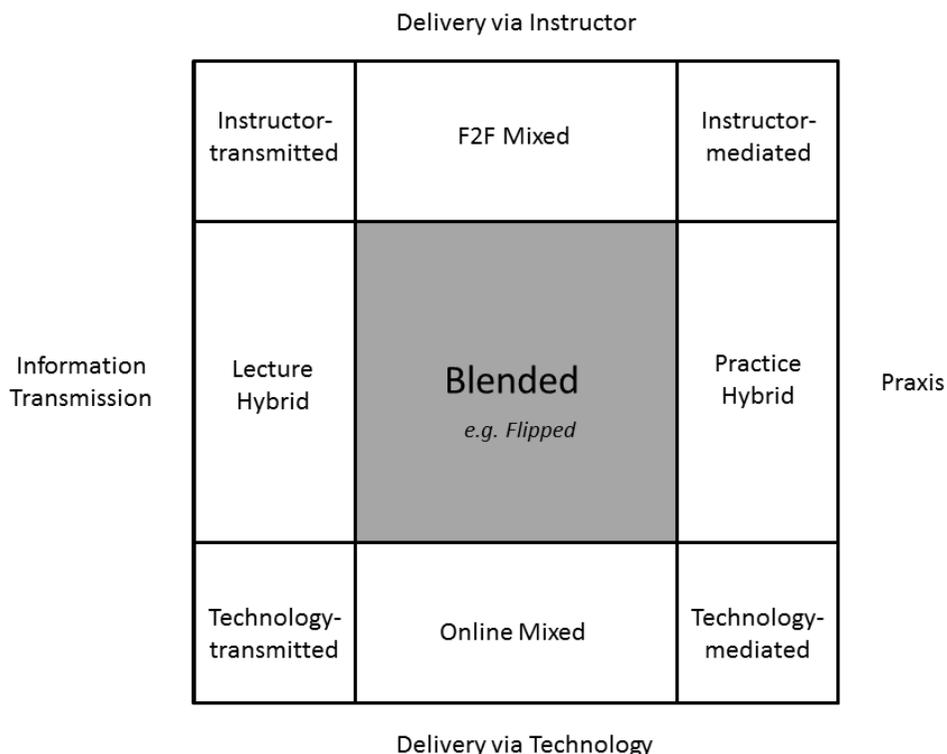

Figure 6. Blended learning experiences include a substantial portion (25% to 75%) of teaching methods from both delivery media (i.e., delivery via instructor and delivery via technology) and both instruction types (i.e., information transmission and praxis).

There are many possible types of blended courses that can be defined by the taxonomy by blending the fundamental technology (i.e., technology-transmitted) and apply knowledge with help from an instructor (i.e., instructor-mediated). For another example, a course would be considered blended if it were any combination of the combined learning environments. Types of blended learning are not included in the current nomenclature of the taxonomy, but they can be defined, like flipped has been, using terms from the taxonomy.

**Conclusion**

Given the number of papers evaluating hybrid, blended, flipped, and inverted classrooms (e.g., there were 10 papers on flipped/inverted classes at the American Society of Engineering Education conference in 2013 alone) and the inconsistent use of terms in the recent literature, a

and combination learning experiences. For example, flipped classes are those in which students receive content from taxonomy for courses is necessary. The proposed Learning Experiences Taxonomy (see Figure 7) aims to provide consistent terms for those discussing different types of courses. Although the impetus for the taxonomy was to differentiate hybrid, blended, flipped, and inverted classes, the scope of the taxonomy includes other types of courses. The definitions used in the taxonomy took into consideration previous definitions from the literature, so implementing these definitions should not cause undue confusion. Although detailed descriptions of a particular course in a study will always be necessary in the literature, classifying courses by the terms used in the taxonomy can help researchers and practitioners find information about specific types of courses.

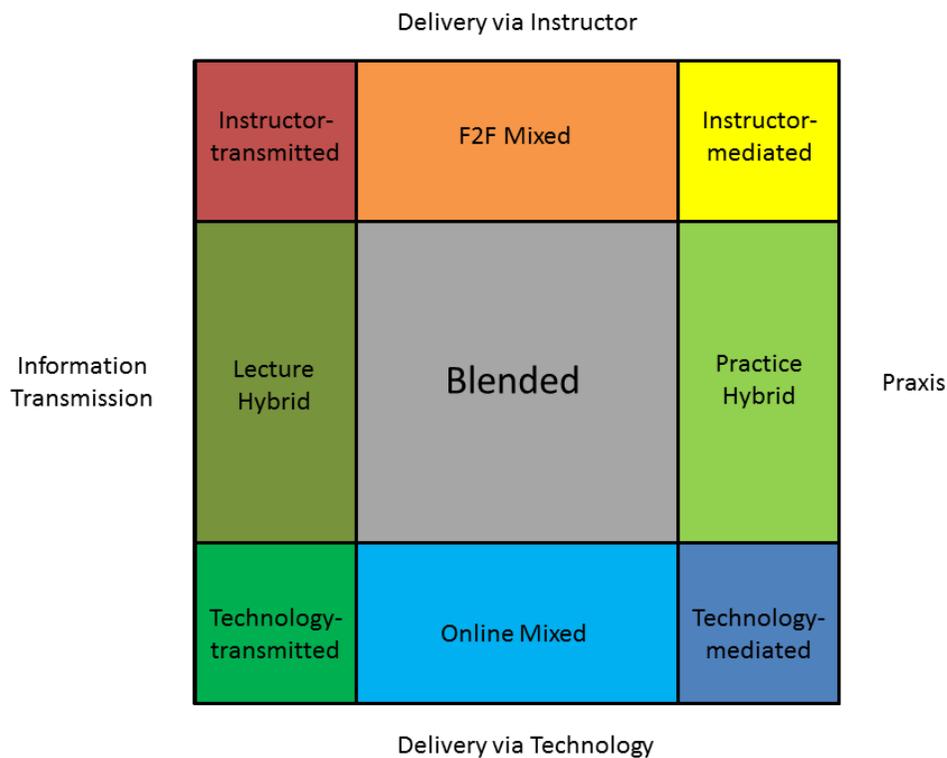

Figure 7. The Learning Experiences Taxonomy provides terminology to consistently categorize courses in which students have guidance via an instructor or technology.

**Abstract:** This research investigated adult learners' social presence in an online learning community using the group memory support system(GMSS), which can show the passes of learners' comments clearly and systematically. The purpose of this study was to find the aspects to promote online discussions for busy adult learners from the aspects of online social presence. This study found that providing opportunities to express their ideas freely was important.

## INTRODUCTION

Busy adult learners are often introduced an online learning environment because of its advantages that allow a flexible learning environment without limiting time and space. Specifically, effective online communication is a key for adult learners. An online learning environment should not only be

sharing simple information each other. Rather, high quality discussions should be designed and well implemented. Recently, the importance of higher order cognitive activities such as meta-cognition or social cognition are discussed as a framework for promoting learning transfer. Learning transfer is that one can apply what one learned to another situation or other context. If learners participate in quality discussions that affect one's higher order cognitive activities, learning transfer may occur. Quality discussions can be related to foster social presence.

Social presence supports the social cognition for understanding the others and society in social psychology and it is referred to as one of the factors which promote an interaction with the others. However, how to foster social presence has not been well investigated. In this research, the practice result of GMSS was analyzed from a viewpoint of support of social presence, and it aimed at clarifying a method to foster of social presence.

### Literature Review

The theory of social presence had its inception through the research of social psychologists Short, Williams, and Christie (1976), although other researchers would say that it could be traced back to Mehrabian's (1969) concept of immediacy (Rourke, Anderson, Garrison, & Archer, 2001). Mehrabian (1969) described immediacy as "communicative behaviors that enhance closeness to and nonverbal interaction with another". The concept of immediacy and social presence are closely related and are often used interchangeably in the literature (Thurlow, Lengel, & Tomic, 2004).

According to these authors, social presence refers to the "ability of the community of inquiry participants to project themselves socially and emotionally, in all aspects of their personality, through the communication media that they use" (Garrison, Anderson, Archer, 2000, p. 94). Garrison and Anderson (2003) link "social presence" to three main categories of collaborative interactions. Each of these refers to specific indicators. (Table 1)

Table 1. Categories of social presence and indicators (Garrison and Anderson, 2003, p. 51)

<i>Interaction Categories</i>	<i>Indicators</i>
Affective	Expression of emotions; sense of humour The telling of personal anecdotes
Open communication	Holding up the main thread of the communication; respect of others; explicit reference to messages from others; expressing agreement with other or the content of their messages

Cohesive	To address or refer to others by their first name; to address or refer to the group by using inclusive expressions, the writing of salutations
----------	--

Figure1. Visibility of argument by GMSS

## METHOD

### Research Question

The research question is what the important elements are to foster social presence for the learning transfer.

### Settings

Tokyo Institute of Technology Graduate School of Innovation Management has been offering Management of Technology Program for adult learners since 2009. This is a non-degree program that expects adult learners to recognize the importance of learning and continue learning as an autonomous learner think about their career. There are 12 courses offering for one year and 8 courses for 6 months.

Two of them are lecture format and 5 of them have online discussions after the lectures and other 5 courses provide simulation tasks. Five courses included face-to-face sessions two to four times. It was about 4 to 8 hours. Since most learners have a job in various fields, spending time together to do a group work project was not easy for busy adult learners in a classroom. Thus, this program provided an online discussion system such as Group Memory Support System(GMSS), which can show the path of learners` comments clearly and systematically. This system was developed to promote effective online discussions for adult learners (Higa & Yamazaki).

### GMSS System

GMSS is a unique system that shows the links among threads very clearly and systematically. The discussion points are easily recognized and relationships among the learners' ideas are clearly indicates (see,Figure1). Each thread indicates thread number, a label of message type, and author's subject. When a learner posts his idea, he needs to select a message type that is appropriate for the idea and/or whose opinions are related. There are two message categories such as opinion and comments. In the category of opinion, there are 7 types of labels, such as (1)suggestion for the discussion topic, (2)new idea, (3)related idea, (4)constructive idea, (5)blended idea, (6)selecting idea, and (7)decision. In the category of comment, there are four types of labels such as (1)agree, (2)disagree, (3)add, (4)question, and (5)reply.

Table 2. Types of Message in Opinion Category

Message type	Explanation
suggestion for the discussion	Suggest discussion topics to others to initiate a new discussion
new idea	Suggest a new opinion without referring to other opinions
related idea	State an opinion that related to other opinions
constructive idea	State a constructive opinion based on others
blended idea	State a blended idea that combined other ideas.
selecting idea	State an opinion that selecting one of te ideas.
decision.	State an opinion about decision

Table 3. Types of Message in Comment Category

Message type	Explanation
agree	State a comment to agree with others.
disagree	State a comment to disagree with others.
add	State an additional comment to other comments
question	State a comment to ask something to other comments
answer	State a comment to answer to a question

Figure1. Online forums in GMSS

### Data Collections & Analyses

The data were collected from the learners' threads online discussion forums that used GMSS in 5 courses in 2011 and through the questionnaire. There were 17 students participated in this program and 16 students answered the questionnaires.

The following observed variables were used for the learners' threads.

1. The number of discussion threads about an assignment.
2. The number of discussion threads for a free topic forum such as self-introduction etc.
3. The number of discussion threads for questions or comments that were posted more than twice for a topic.

If these observed variables are high, the social presence could be fostered. Thus, this research investigated what are the important element to foster social presence.

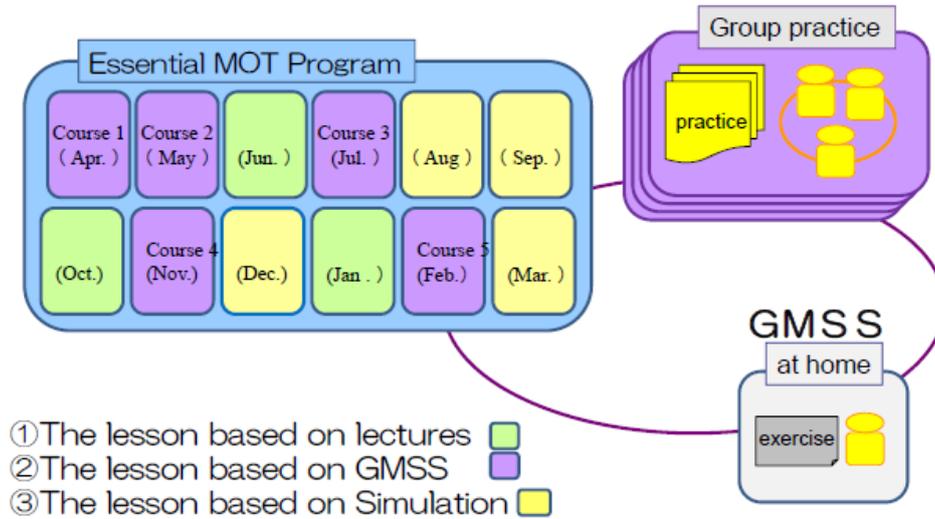

Figure2. 5 courses in 2011

In this program, the expected learning outcomes were whether or not adult learners were motivated to learn continuously as an autonomous learner to be able to enhance their career rather than passing a test or report. Thus, the questionnaires were used to collect the data after the course.

The questionnaires were developed based on the elements of ARCS model (Keller, 1987), because the elements of ARCS model are used to motivate learners and the goals of MOT programs are well matched. Each item was measured using a five-point likert scale.

Table 2. The questionnaire about learning transfer

A	Are you interested in the theme of the course?
R1	Do you continue to studying the theme of the course?
R2	Do you think that what you learned in this course could be helpful?
C	Did you gain confidence by learning this course?
S	Were you satisfied with the course?

## FINDINGS

### Results

The results of collected data through the questionnaire were shown in table 3. Learning experience

in MOT seems to help them to have an intention to continue learning.

Table 3. The result of a questionnaire about learning transfer

	A	R1	R2	C	S
Mean	3.63	4.17	4.11	3.98	4.10
Variance	0.08	0.12	0.14	0.11	0.08

The table 4 shows the number of threads of the observed variable 1 and 2, which are the number of threads about assignment and free topics.

Table 4. The number of messages for every subject

	observed variable1	observed variable2
Course1	404	13
Course2	92	49
Course 3	88	8
Course 4	67	4
Course 5	126	10

Table 5 shows the number of threads classified based on each hierarchical layer about an assignment.

Table 5. The number of threads classified based on each hierarchical layer about an assignment

	0	1	2	3	4	5	6 or more
Course 1	9	57	68	66	49	38	104
Course 2	6	25	6	2	2	2	0
Course 3	4	20	24	14	9	6	3
Couse 4	4	16	16	13	6	3	5
Course5	7	22	25	20	14	11	17

Table 6 shows the correlation coefficient of learning transfer and observed variables. Learning transfer and observed variable 2 (free topics) was 0.56. The observed variable 2 had high correlation with R1 (continuing study). Observed variable 1 (threads about an assignment) and Observed variable 3 (over twice for a topic) had a weak correlation.

Table 6. The correlation coefficient of learning transfer and observed variables

	A	R1	R2	C	S
--	---	----	----	---	---

observed variable1	-0.88	0.14	0.17	0.18	0.21
observed variable2	0.31	0.49	0.56	0.43	0.68
observed variable3	-0.61	0.20	0.22	0.25	0.11

### Discussion & Conclusions

This study investigated the adult learners' social presence in online discussion forums in the GMSS using three observable variables. The data showed that the values of the questionnaire about learning transfer moderately had correlation with the observed variable2. Although this study used three types of observed variables and analyses of discussion threads, free topic discussions had higher correlation rather than the threads about an assignment.

Thus, in order for adult learners to foster social presence using GMSS, providing the opportunities for learners to express their ideas or their interesting topics is the key element. In addition, stating related ideas, statement of disagree and questions to others are also important.

Although this research is very limited, one insight may be suggested for busy adult learners to participate in online discussions.

**Abstract:** This work-in progress research is to suggest using PISA-based assessment test for teachers' professional development in the Japanese middle school, who specifically teach Sogo course (Integrated Study Course). This presentation briefly includes background issues in the course and presents how the course was implemented in one middle school. Finally, the suggestions will be made how the results of the pilot study should be used for teachers' professional development.

## Introduction

This is a work-in-progress report of conducting assessment method of problem solving skills of the Japanese middle school students in order to use teachers' professional development. The report introduces the background issues of Japanese education, and efforts to improve the skills in middle school based on the policy enforced by the Ministry of Education, Culture, Sports, Science and Technology (MEXT). This paper suggests a plan to conduct assessment test for teachers to recognize students' abilities or skills in order to use the results for the course improvement.

It has often been pointed out that Japanese students tend to lack problem-solving skills and applied skills, because of the style of coursework in current Japanese education. Traditionally, in the Japanese education system, students memorize information to gain concrete knowledge rather than developing problem-solving skills by identifying problems and searching for solutions.

In response to this problem, in 1998, the Ministry of Education, Culture, Sports, Science and Technology (MEXT) of Japan implemented the Integrated Study Course little by little, which is now taught in elementary, middle, and high school. The goal of the course is to have students gain problem-solving skills and abilities. The course objectives are that students should develop problem-solving skills and abilities by finding a problem, learning, thinking, and judging the possible solutions by themselves across each subject course; gain the skills of how to learn and how to think; and think about real-life issues by engaging in problem-solving and investigational activities voluntarily, creatively, and collaboratively.

In fact, since 2000, the Organisation for Economic Co-operation and Development (OECD) has run the Program for International Student Assessment (PISA) every three years, for students aged 15. The evaluation assessed Japanese students' knowledge and skills at the international level, and the results indicated Japanese students lagged behind in literacy skills, such as retrieving information or comprehension skills. To address this problem, in 2005, MEXT provided guidelines and materials for teaching plans, with examples, aimed at improving students' literacy skills (MEXT, 2005).

## **Purpose of This Work-in Progress Report**

The purpose of this report is to discuss a possible way to assess students' abilities or skills in real life issues regularly and use the results for professional development showing the case of a particular middle school. This will allow the teachers to better implement the regular coursework and as well as the Period of Integrated Study Course which specifically work for the practical knowledge in real life based on the assessment results. Sharing work-in progress report could bring a chance to reconsider what could be the better way to complete the plan. Furthermore, the issues and evaluation methods described here can contribute toward a better course curriculum or improvement plans for other Japanese middle schools.

## **Efforts in the Period of Integrated Study Course in a Middle School**

At the middle school that introduced in this project, the Period of Integrated Study Course was held for a total of 50 hours in the seventh grade and 70 hours in the eighth and ninth grades, respectively, in an academic year. The Period of Integrated Study Course had been introduced slowly to the school since the new curriculum guidelines were issued in 1998. The current curriculum has been used since 2008.

A course supervisor developed all the curriculum and course materials for the three grades. The lesson topics are shown in Table 1. The topics included various fields so that students would gain practical skills for real life. The homeroom teachers such as taught the course based on the course plan, using the course materials developed by the course supervisor. Although each lesson dealt with different topics, students were provided worksheets that they worked on throughout the course. For example, the students selected their own research topic, thought about it or researched it, and wrote down ideas and solutions. Moreover, they presented their work at a school festival. Finally, the ninth grade students wrote a graduation research paper.

## **Assessment Tool**

Using PISA problems are suggesting that the students' problem solving skills in real life, The PISA problems included practical and realistic materials. Arimoto (2006) described the seven features of PISA problems as follows: (1) The problems are practical in real life, (2) Practical figures and maps account for 40%, (3) The topics range from science to social studies, (4) Free description types of questions account for 40%, (5) Expressing your opinions is required, (6) Evaluating the text and criticizing it are required, and (7) Stating your reasoning using the provided information is necessary. Because of these characteristics of PISA problems, the assessment points are very different from those used in Japanese education. The PISA test is designed to evaluate students' skills or abilities to solve problems in real life.

## **Pilot Case Study**

This is a first step to see if the results of selected PISA problems can be helpful for the data for teacher's reflection to improve course design. The data collected in this pilot study are very limited and may not be sufficient to reach a firm conclusion.

The participants were 252 middle school students in Tokyo. They all attended the same middle school. In September 2012, 59 seventh-grade students, 92 eight-grade students, and 101 ninth-grade students took the paper-based test.

The test consisted of items selected from the PISA 2000 and 2006 questions in the literacy category. The seventh grade students answered 16 questions from 4 topics. The eighth and ninth grades answered 14 questions from 4 topics. Three topics were the same for all students. The answer sheets were checked and graded by the researchers based on the evaluation manual (National Institute for Educational Policy Research, 2010). The test results of the three topics that all students answered were analyzed by grade level to identify the differences. The test results of the four topics taken by each grade level were also compared to identify any differences among the individual classes.

Table 1 *Lesson Topics in the Integrated Study Course*

	Seventh grade		Eighth grade		Ninth grade
1	Problem-solving study for field work	1	Problem-solving study	1	Problem-solving study
2	Problem-solving study	2	Media literacy	2	Media literacy
3	Media literacy	3	Volunteer experience	3	Volunteer experience
4	Volunteer experience	4	Volunteer education	4	Volunteer education
5	Volunteer education	5	Library and reading instruction	5	Library and reading instruction
6	Library and reading instruction	6	Human rights education	6	Cardiac resuscitation
7	Human rights education	7	Visiting workplace	7	Human rights education
8	Visiting workplace	8	Dietary education	8	Information literacy
9	Dietary education	9	Information literacy	9	Information moral
10	Information literacy	10	Information moral	10	Visiting higher education schools
11	Information moral	11	Outside teacher lecture	11	Research related to the school trip
12	Outside teacher lecture	12	Career education	12	Public service education
13	Career education	13	Environment education	13	Lecture by high school teacher
14	Environment education	14	Life education	14	Career education
15	Life education	15	Problem-solving study	15	Environment education
				16	Life education

## Results

The accuracy rate of each problem is shown by grade in Figure 1. Each grade had a similar accuracy rate on each problem. However, the accuracy rates of higher grades were mostly higher.

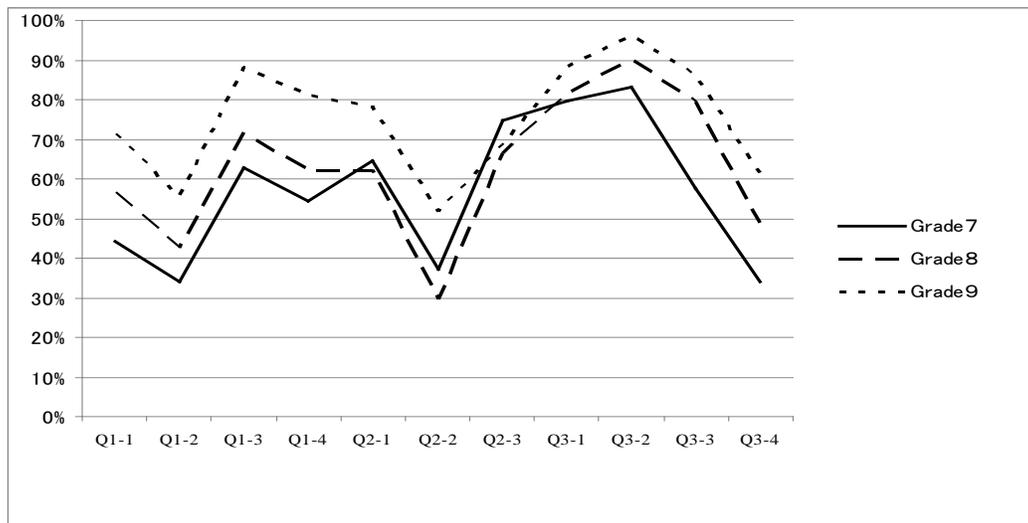

Figure 1. Accuracy rate of each grade by problem.

Next, Figure 2 shows the accuracy rates of the seventh grade students. The accuracy rates of Class 2 were higher than those of Class 1 for each problem. The average scores of Classes 1 and 2 were 5.5 and 10 respectively.

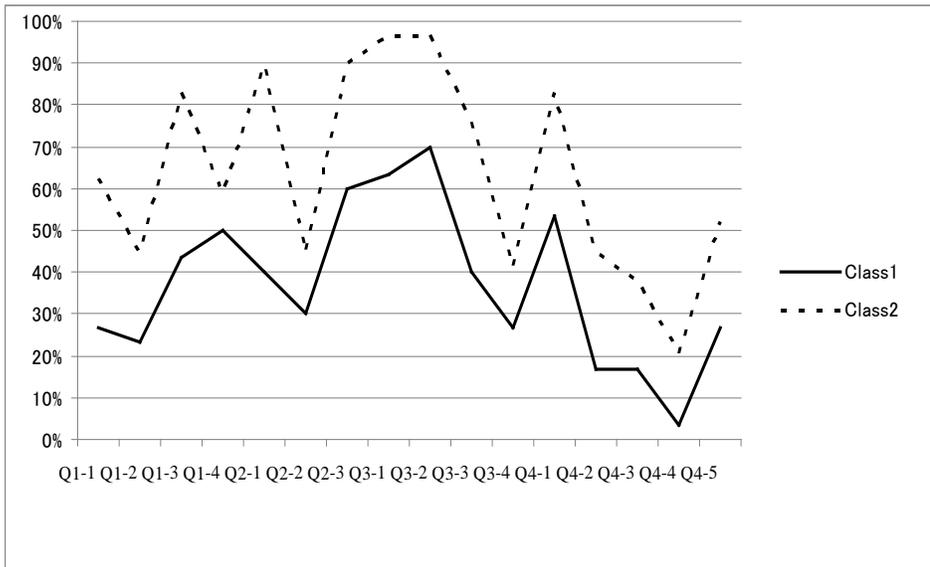

Figure 2. Accuracy rate of seventh grade students (classes 1 and 2) by problem.

Figure 3 shows the accuracy rates of the eighth grade students. The accuracy rates for the three classes were very similar. The average scores were 8.3, 8.1, and 7.9 for Classes 1 to 3, respectively.

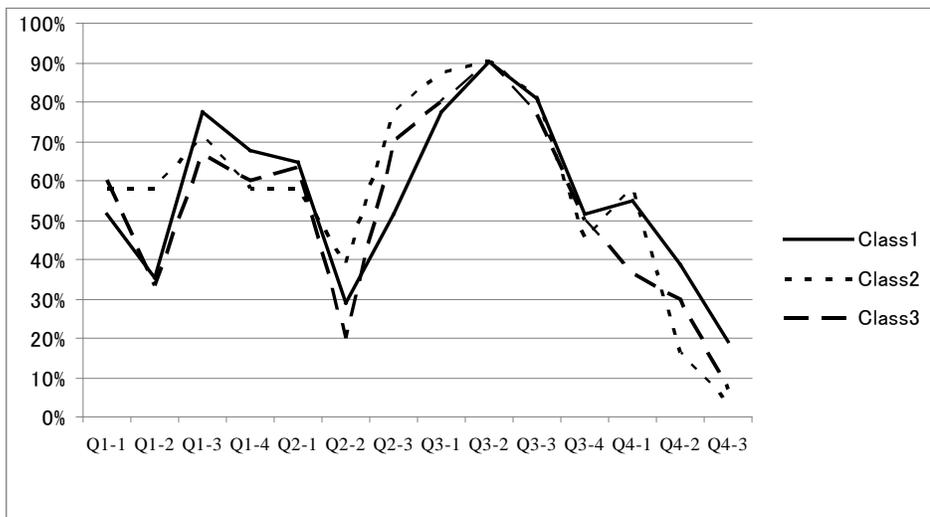

Figure 3. Accuracy rate of eighth grade students (classes 1, 2, and 3) by problem.

Figure 4 shows the accuracy rates of the ninth grade students. The accuracy rates were very similar among the three classes. The average scores were 9.4, 9.8, and 9.4 for Classes 1 to 3, respectively.

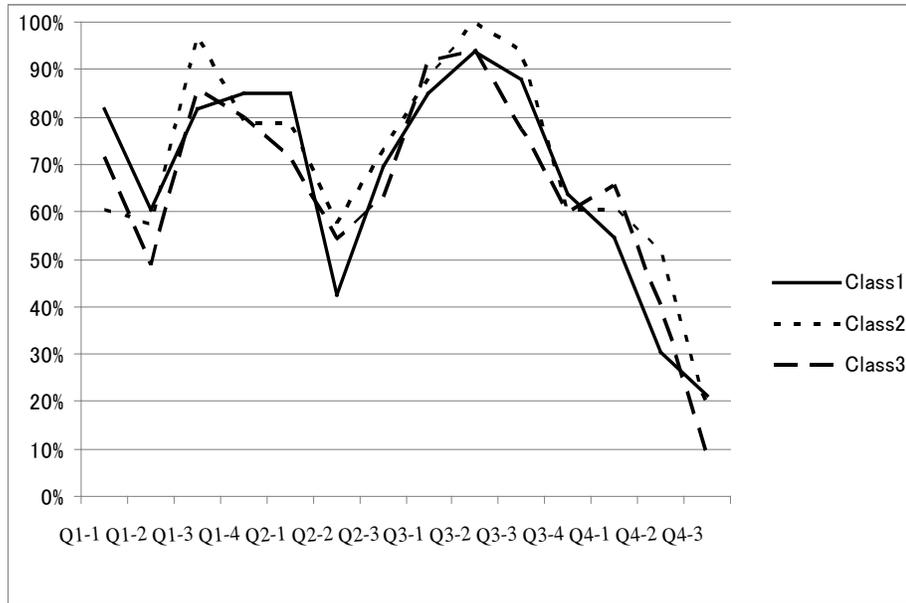

Figure 4. Accuracy rate of ninth grade students (classes 1, 2, and 3) by problem.

As described, the accuracy rates and average scores were better in the higher grades. Although the scores between classes were remarkably different for the seventh graders, the average scores of ninth graders were very close.

As the tentative results indicated, the higher grades had better test scores. By the time they took the test, the ninth grade students had spent about 150 hours in the Period of Study Course, while the seventh grade students had spent about 25 hours in it. The results suggested that the higher grades had higher abilities and skills.

## Discussion and Future Plan

The results of the seventh grade students suggested that differences may have existed in their skills in the beginning. Yet, their skills or knowledge improved by the ninth grade to some degree.

As the tentative results indicated, the score can be compared by grades or classes. Teachers are able to have an idea about their students' skills that should improve. Teachers or curriculum developer can be referred to the results to change their course or curriculum. However, the problems used in the test administered during the pilot study were very limited and may not have been sufficient for evaluating the students' true abilities and skills. Additionally, these types of skills or abilities may be related to their efforts in other courses or to human development. Furthermore, to examine the effectiveness of this course reliably, it is necessary to follow up on the students' skills and abilities. Yet, the results may be able to use teachers' professional developments

This report is the first step toward thinking about a better way to implement the course and evaluate students' skills to use teachers' professional developments. Next stage for this project is to establish teachers' reflection and examine how they think about the results and how they change the course.

## **Abstract**

Teaching and learning are mysterious. Education research has been criticized for being granular, anecdotal, lacking foundational theory, and applied to the wrong questions using the wrong methods. The advent of online teaching sparked a frantic blizzard of ideas, opinions and research to distill best practices not only online but in the classroom. The field of instructional systems design seeks to scientifically ground instruction to achieve predictable, measureable and consistent learning outcomes, primarily for corporate and military learners. This powerful mix of cultures, worldviews, and emerging technologies has distilled out admirable tools and techniques as well as assessment rubrics for distance learning courses. While there is no question that online courses and pedagogy have improved significantly in a relatively short time, the aim of a unifying, theoretical approach to online course design, delivery and evaluation is not always realized. This is the theme in the recent article, *The Buddha's Distance Learning Consult* (Hopper, 2012), which attempts to reveal the bedrock level silliness inherent in trying to match cookie cutter course templates to master teachers. This article proceeds from that point to offer a baker's dozen insights, admittedly anecdotal, based on a long career of teaching with and without technology.

## **Of Buddhas**

Master teachers, the true exemplars, often use(d) unconventional methods such as parables, koans, storytelling, dialogue and even various physical prompts and privations. Consider Jesus, Socrates, Plato, Anne Sullivan, Confucius, Aristotle and, of course, the Buddha. Which of these would successfully adapt their teaching style to the detailed online course design rubric of the contemporary online course? This is not to say that there is no value in employing specific tools, techniques and best practices for online courses in the general sense. But as the harried instructional designer in the Buddha article discovers, it may be he who has something to learn about teaching and trying to adapt a teacher of highest caliber to a learning management system may be a humbling exercise.

## **A Baker's Dozen**

As a professional instructional designer, I wish that I could recommend teaching strategies that worked for all learners, in all subjects, at all times. We achieve modest success for systematic training in the workplace but not in education. Contemplating the differences that would be found between sex education and sex training easily makes the distinction. But, perhaps thankfully, the mystery of teaching and learning has not been resolved in a universal way. Jonassen (2003) was right that there is no unified theory of the teaching and learning enigma. But this is the very thing that makes teaching worthy of a life's focus and work. Even

instructional design theorists of the highest order acknowledged that simply observing expert teachers reveals effective strategies, anecdotal or not. The following is this author's short list of best insights and strategies in exemplary teaching. I make no distinction between teaching with or without technology.

### 1. Teaching Doesn't Matter

Learning matters. Without learning there is no teaching. Your greatest, smoothest, most brilliant lecture or other instructional event is of no consequence in and of itself. Its worth is in learning outcomes. Great lectures are admirable and often inspirational, at least temporarily—like some sermons. But as Dewey (1933) explained long ago, a student who has truly learned can do something they were not previously able to do. That must be our measure.

A prime example of “the proof is in the doing” is the body of work by medical measurement leader Christine McGuire (2005, p. 73), who bluntly stated, “...if you want to know can someone do something, ask him (to do it).” McGuire boldly pointed out that assessing the readiness of a doctor to doctor by giving them a multiple-choice exam on biochemistry is silly.

### 2. Of Hamsters—Learning is Mysterious

Education is not a research-based practice for either teachers or administrators. Education research has earned a dismal reputation (Kaestle, 1993). Teaching may be most generously considered pre-science and most critically as pseudoscience (Reeves, 1995). Teachers base their methods on anecdotal “evidence” (such as this article), which is idiosyncratic and even political. Unlike the field and discipline of instructional design (Smith & Ragan, 2005), which earnestly seeks to link cognitive science and learning, the field of education does not.

The visual metaphor that comes to me as I peek into overfilled classrooms in my world, students in various caricature poses of dismay or boredom, is the bulging face of an overstuffed hamster. Teachers continue to shovel in content until the lecture period ends, often unaware (or unconcerned) that attention spans and short-term memories are exhausted.

### 3. Of Vulcans—Knowledge Transfer is a Myth

Transmitting information is not teaching. Absorbing information is not learning. The visual metaphor of *Star Trek's* First Officer Spock performing the Vulcan mind merge is powerful. But it does not ring true in authentic teaching and learning. The software analogy of installing computer software is false for human learning.

“Learning...is a process of meaning making, not of knowledge reception.”  
(Jonassen, 2002)

I consider Jonassen's quote to be among the most eloquent and incisive insights in the realm of education and training. A major factor in the parade of technology-mediated teaching failures seems to be a fundamental misapprehension of what knowledge is, and therefore, what learning is. Memorizing and regurgitating facts, which we tend to do a great deal of in our collective educational experiences, does not result in true knowledge because:

- It evaporates quickly
- It does not prepare the "learner" to DO anything

We know very well that passive absorption of "knowledge" simply does not work yet we continue focus our effort and investment in machinery to more efficiently distribute data. The proper use of most communications technologies is to serve as "cognitive tools" (Jonassen & Reeves, 1996) to help the learner solve the problem, not to deliver a canned solution to memorize and forget.

#### 4. Learning is (Still) Work

And the learner does it. We can watch. We can encourage. We can offer guidance. We can point to our own learning. But ultimately the onus is on the learner alone and our measure must be of a student's newly acquired ability to do something—preferably something useful. Teachers cannot do the work of learning for another human mind, nor can technology (see item 8 below). The Hopper theory of learning:

"Get them to roll up their sleeves and grapple with it."

#### 5. Good Teachers Clam Up

Appreciating that knowledge absorption and regurgitation is not learning, some teachers elect to make seemingly radical changes in teaching style.

"I've decided to stop talking and start teaching." Dr. Betty Oliver, Professor Emeritus, Southern Polytechnic State University

Soon after earning tenure, Dr. Oliver made this startling announcement in a matter of fact manner that conveyed a deal of thought behind her decision. Indeed it had. She filed away her lecture notes, PowerPoint files and canned classroom exercises. She started afresh, sometimes going to class with just a notecard of learning outcomes and ideas. She put the students to work. She literally adopted a "guide on the side" teaching philosophy and patiently waited out the inevitable student resistance and resentment. Until retirement she never changed back to a lecture style teaching approach. Her discipline is art and design and her expertise assured her that her decision had been the right one.

## 6. Courage!

A significant move away from the familiar “chalk and talk” teaching style is risky. Students tend to resist and object. Administrators may be lukewarm. Dr. Oliver waited this period out and in due course students were lining up and administrators were gushing over her results—some even signed up for her courses. She sums up her experience with the following quote from a course evaluation:

“This was the worst course ever. The instructor did not teach us at all, would not give us the answers, and left it all up to us. Even so, thanks to my own efforts, I learned more in this course than any course I ever took!”

This was precisely what Dr. Oliver wanted to hear. But teaching insight was only part of her recipe for success. The other primary ingredient was courage.

## 7. Good Teachers Share

We too often hear professional teachers begin a presentation or a meeting with the hackneyed phrase, “You know how teachers love to hear themselves talk!” It might be funnier were it not so.

In my own teaching career, a good bit of it in health professions, I observed teachers who seemed to leap between students and their insights. But consider your own time as a student—do you best recall the things you discovered or solved by yourself? The best teachers do not cheat students of the joy and pride of “figuring it out” for themselves. They are patient; sometimes almost brutally so. They hold back and give the student a time in the limelight.

Good teachers also share their own humanity, and that includes the reality that they do not have all the answers. But this can be a starting point for sharing the way the teacher has learned to go about creating meaning and accumulating knowledge. Giving a student something of a track record in resolving their own learning needs is a terrific gift.

## 8. Technology is a Liar

Thomas Reeves (1999) long ago described the “big technology lie” that technology will make learning fast, easy and fun. Yet we continue to seek this elusive magic, and vendors continue to use these very terms. Credible educational technology programs ceased media comparison studies fifteen years ago. Yet the field of education continues to conduct them and permit graduate students to continue this futile research direction. Three decades later, Clark’s (1983) admonition still rings true, “No credible evidence that any medium (or combination of media) increases learning that is not explained by other factors.”

## 9. Your Students are Good Typists!

Our students wander the hallways and enter the classrooms with mobile technology in hand. This leads us to believe that the present generation of students is good with technology. But as we noted elsewhere, “Social networking technologies are attractive to undergraduates for potent hormonal reasons that we cannot match with any sort of technology mediated instruction.” (Hopper & Hendricks, 2008, p. 15) They may be remarkably good typists but my contemporary experience on an engineering campus persuades me that current students are not competent in technology fundamentals such as word processors and spreadsheets, their own opinions notwithstanding (Hopper & Rainey, 2003).

Educational luminaries decree paradigm shifts in education at the foundational level. Dede (2007) waxes poetic in his introduction to the 2007 ECAR (Educause Center for Applied Research) study of undergraduate students and information technology (Salaway, Caruso, & Nelson, 2007), quoting Shakespeare to describe the beginnings of a “sea change” in technology applications related to teaching and learning. I simply cannot see a “sea change” evidenced in the ECAR study report or data, which indicates to me that undergraduate students have passionately embraced social networking Internet technologies, online entertainment video, and a blizzard of communications gadgets. But the data say little about actual instructional applications and shows a decided student preference for “moderate technology use” by skilled instructors in their college courses.

## 10. Good Teachers Are (a Lot) More Important Than Technology

“Any teacher who can be replaced by a computer should be.” Arthur C. Clarke, 1980

Technology has spread panic in administrators and faculty in wave-like fashion since introduction of the Apple IIe microcomputer (Hopper & Hendricks, 2008). All in all, the impact of technology in education over time has been gradual and slight (Cuban, 2003). While we ought to be “sniffing the wind” as flagship universities weigh in, there is no need for panic. Yet. The dismal record of course completion in the current MOOC mania proclaims the worth of good teachers, with or without technology. We are not close to a true adaptive teaching technology and the intuition, experience and savvy of expert teachers remains in short supply.

## 11. Good Teaching is Good Teaching

My own (dusty) doctoral research centered on finding and analyzing exemplary online courses at a time when online teaching was new and my blood boiled with the potential I perceived in teaching with technology. But I came full circle back to the planks of expert traditional classroom teaching, the very ones that the old masters have expounded for generations (Hopper & Harmon, 2000):

- Learning by doing
- Abundant, rapid feedback
- Judicious, conservative use of technologies

Chief among the prescriptions for effective teaching, online or not, would be the well known work of Chickering and Gamson (1987), that good practice in undergraduate education:

- encourages contact between students and faculty,
- develops reciprocity and cooperation among students,
- encourages active learning,
- gives prompt feedback,
- emphasizes time on task,
- communicates high expectations, and
- respects diverse talents and ways of learning.

These authors revisited the original set of seven principles, applied to technology, without major revision (Chickering & Ehrmann, 1996).

## 12. What You Do is Important

We cannot spare you. Your knowledge, skill, experience and dedication are not easily replaced. But you are human. You cannot give your learners what you do not have. Human brains need down time. Conferences in Hawaii are not luxuries—they are precious opportunities to refresh, recharge and get back to business.

## 13. You (Still) Deserve Respect

Persistent dotting attitudes of helicopter parents looking after their special snowflakes notwithstanding, you have a reasonable expectation to be treated with respect. You should insist. To do otherwise cheats yourself and cheats your learners of a role model of a serious professional who requires respect.

## Conclusion

If we had all the answers teaching wouldn't be fun and exciting anymore and we would not need conferences in Hawaii. Thankfully there is room for imagination, creativity and personality in professional teaching. My baker's dozen top teaching insights are not exhaustive and may overlap little with those of other teachers with greater skills. I encourage the reader to look around at the great teachers in your own world, at your own teaching wisdom, and compile a baker's dozen of your own. My guess is that it will be difficult to constrain your accumulated teaching wisdom to a list of thirteen.

Mail Call!: The “War Letters Project” in Action in the Classroom

Social Studies Education; Cross-Disciplinary Education

A Report on An Issue Related to Teaching

Leigh Ann Wilson, Ph.D.

Associate Professor, History

Brandman University, Riverside, CA

lawilson@brandman.edu

Description: This report describes a new vehicle in Social Studies and English Education, Andrew Carroll’s War Letters Project. His query to “Dear Abby” resulted in the public’s contribution of more than 90,000 letters exchanged between military personnel and their families during military conflicts ranging from the American Revolution until Iraq. This is a new approach for teachers to illustrate the emotions and thoughts of the lives of military personnel and their families.

Abstract:

Educators of History and Social Sciences are constantly seeking new ways to provide their students with different perspectives and a greater understanding of the events of the past. While certain events in United States History, such as the American Revolution, the Civil War, and World War II, are ubiquitous and timeless subjects, a new way of making the people whose lives were affected by these domestic and international conflicts has been unearthed.

In 1998, Andrew Carroll created the War Letters Project, in which he sought to create a repository of the letters exchanged between service members and their families during domestic and international conflicts. His query to “Dear Abby” resulted in the public’s contribution of more than 90,000 letters exchanged between military personnel and their families during conflicts ranging from the American Revolution until Iraq. This is a new approach for teachers to illustrate the emotions and thoughts of the lives of service members and their families.

Significant letters were authored by John Steinbeck, Ernie Pyle, General George A. Custer, General John “Black Jack” Pershing, Theodore Roosevelt, General George S. Patton, Douglas Fairbanks, Jr., George McGovern, General William Tecumseh Sherman, General William Westmoreland, General H. Norman Schwarzkopf, and General Colin Powell. Other contributions to the collection that focused on diplomatic, social, and political difficulties of the period were written by Julia Child, John F. Kennedy, Richard Nixon, Alger Hiss, and Whitaker Chambers. Aside from these notable authors, many insightful contributions to the collection are made by ordinary citizens who reflect on the themes of honor, integrity, love, honor, peace, and reconciliation.

These letters, which are now housed at Chapman University in Orange, CA, provide a rich collection of materials for researchers, educators, and the public at-large to learn more about

the everyday lives and concerns of the service members and families of those who served in armed conflicts on behalf of the United States. A live dramatic performance entitled, “If All the Sky Were Paper,” is now in development and scheduled to be performed on stages nationwide, giving this project multiple potential applications for educators.

**SUBMISSION ID NUMBER: 1576**  
**WORKSHOP PRESENTATION**

**1. Title of the submission:**

I Choose C: Learner-Centered Strategies to Promote Engagement in the University Classroom

**2. Name of the authors:**

- Dr. Victoria (Vicki) Childs (Assistant Professor) – Lead presenter
- Dr. Brian Kahn (Assistant Professor)
- Dr. Cynthia (Cindy) Wilson (Associate Professor/Department Chair)

**3. Affiliation of the authors:**

University of Illinois Springfield, Department of Teacher Education

**4. Address of the authors:**

University of Illinois at Springfield  
Department of Teacher Education  
College of Education and Human Services  
One University Plaza, MS BRK 330  
Springfield, IL 62703-5407  
United States of America

**5. E-mail addresses of the authors:**

- Dr. Victoria (Vicki) Childs – vchil2@uis.edu
- Dr. Brian Kahn – briankah@uis.edu
- Dr. Cynthia (Cindy) Wilson – cwils1@uis.edu

**6. Abstract**

As the Common Core standards are being implemented across the country, the hope is that future students entering higher education will bring with them improved critical thinking and analysis skills. In order to meet the needs of these learners, it will be essential that the traditional teacher-centered model of university classroom instruction become more student-centered, providing the learners themselves with opportunities to become more actively engaged in the learning process. Attendees will have the opportunity to experience a small group discussion concerning their own teaching practices and ways they can move toward a more engaged style of instruction. The primary focus of the workshop is to provide participants with the opportunity to "model" a number of these basic classroom instructional strategies, designed to provide the learner with a sense of greater ownership of the content knowledge. Strategies to be modeled include cooperative learning, think-pair-share, the jigsaw, concept sorts, and semantic features analysis.

# **Facilitating Learning Inside and Outside the Classroom with Mobile Technology, Open Educational Resources, and Class Specific Apps – A Preliminary Study**

Wendy Noffke, D.C. and Loren Davis, M.Ed.

Clover Park Technical College, Northwest Career and Technical High School

## **Abstract:**

### **Background:**

In this project, our goal was to devise a strategy that would increase accessibility of quality learning materials in a variety of formats without the expense of textbooks and the LMS (Learning Management System).

### **Methods:**

Our pilot classes explored the use of the Kindle Fire and Apple iPads for a college level biology course and history course presented to both college students and high school students. A combination of flipped learning and blended learning was used in the course presentation, along with face-to-face laboratory activities. Along with the mobile devices, Google blogs and websites were used to impart information and classroom activities. Assessment was made using student surveys before and after participation and instructor feedback.

### **Results:**

This approach proved to be very cost effective. Students were actively engaged both inside and outside the classroom with increased flexibility for doing their studies. The instructor reported more effective use of class time for labs and increased efficiency in managing the course, especially over multiple quarters. Feedback from the students was positive.

### **Discussion:**

Information gathered throughout these pilots has proved useful in implementing additional use of technology to enhance both face-to-face instruction and distance education. It has opened options of using additional modes of instruction to enhance accessibility, increase comprehension, and positive feedback from students on the learning experience. It also helped to clarify some challenges to the campus and infrastructure to incorporate the further use of technology on a widespread basis.

## **Introduction**

The digital age has brought about many changes in our daily lives, not the least of which is the access to free open source information. In addition, digital innovations permeate the lives of students like never before. It is not uncommon for students to carry a smartphone and/or a tablet to school and go home to multiple devices that can access the internet. Educational institutions are exploring innovative ways to integrate digital technologies into the classroom. (1) E-learning tools used in cooperation with the traditional classroom support various learning style and educational media. (2) Our goals

in establishing the pilot programs discussed in this paper were to wed these two phenomena by merging mobile technology with open educational resources (OER). Using a “flipped classroom” or “blended learning” model we attempted to enhance student learning while providing cost effective alternatives to educational practices that are currently in place. (3) We will discuss the pilot projects that we implemented at Clover Park Technical College and Northwest Career & Technical High School over the previous two years, share the data that was collected, and discuss the direction that we currently moving based on our findings.

Clover Park Technical College (CPTC) is located in Lakewood, Washington and is part of Washington State’s community and technical college system. CPTC serves Pierce County and the South Puget Sound region. Northwest Career & Technical High School (NWCTHS) is a high school located on the campus of CPTC. High school students who are the ages of 16-21 enroll in high school, obtain a high school diploma, and receive career training. Many high school students opt to take college classes that will later apply to their college degree.

### **Pilot Class Development**

Our initial pilot project focused on a cohort of pre-nursing students who were enrolled at NWCTHS. Each student in this cohort indicated that they intended to register for Biology 175 from the college because it was a prerequisite class for later entry into CPTC’s nursing program. It was decided to offer a Biology 175 for these high school pre-nursing students. From the early planning stages, we agreed to use open source materials and facilitate learning through multiple modes of presentation on digital tablet devices. OER's are beneficial to students when they are used to promote learning activities that are “real, rich and relevant”. (4) The use of open course materials would not only provide significant cost savings to NWCTHS, but if successful, would be integrated into the existing college courses offered to CPTC students saving them the expense of purchasing a high priced textbook. According to a survey “by the US Public Interest Research Group, a nonprofit consumer-advocacy organization, seven in 10 college students said they had not purchased a textbook at least once because they had found the price too high.” (5)

In addition to the use of open educational resources (OERs) and digital tablet devices, the course instructor created both written and multimedia presentations which enabled students access to course materials both on and off campus in a blended learning approach. The blended learning model allows instructors to create their own adaptations and plan learning activities to take place before, during, and after class. (6) Student engagement is an important component of student learning. There is also the added benefit of reduced paper use and early intervention for students struggling in a course. (7)

Several mobile devices were considered as options. The devices would be purchased by NWCTHS and checked out to students in place of a textbook. At the time, the most well known models were the Kindle Fire and Apple iPad. While evaluating those and a few other models, we decided we wanted our information to be available across multiple platforms and not exclusively to one type of device. Factors taken into consideration were portability, speed and functionality, and cost. Given the options available at the time in 2011, we selected the Kindle Fire for our pilot. At a cost of approximately \$200 per student, the Kindle Fire was near the price of the textbook alone.

We selected a small number of free apps that would be useful for the course and

ensured the Kindle Fires were functional for accessing course materials, namely the presentations and handouts. Course materials were also presented on a Google blog to allow access by more traditional computers and other platforms of tablets and smartphones. Prior to issuing devices to students, an open source textbook was loaded onto the Kindle Fires along with PDF files of class presentations and the lab manual.

A blended learning model was used in course presentation. (3) Videos of the lectures were available for students to view prior to coming to class on the blog. Face to face class time was used for discussion of the course materials, labs, and clarification of more challenging concepts. This allowed more time for active learning in the classroom rather than traditional passive techniques. Blended courses allow more time for problem based learning to actively engage the student in the learning process. (8)

### **Implementation and Survey Data**

Students were given an initial survey when they were issued the Kindle Fires at the start of the course. Feedback was assessed through an additional post-class survey at the end of the course. Initial surveys and post surveys were continued in each of the classes every quarter to monitor results.

The survey results are as follows:

#### Post Survey Results Fall 2012

*21 post-surveys submitted*

1. *Prior to this class how much experience did you have using e-books?*
  - a. *Ranked from 0 being none to 10 being very experienced*
  - b. *Average response 4.95*
  
2. *Would you be more likely to use e-book format if they were available in future classes than you were before this class?*
  - a. *Ranked from 0 being not likely to 10 being very likely*
  - b. *Average response 8.57*
  
3. *Did you purchase a hard copy of the book in addition to the free open source book available for this class?*
  - a. *YES 9 responses*
  - b. *NO 10 responses*
  - c. *Comment noted: "purchased prior to class – wish I'd known, I wouldn't have"*
  
4. *How helpful did you find the mobile device in assisting with your learning experience overall?*
  - a. *Ranked from 0 being not helpful at all to 10 being very helpful*
  - b. *Average response 8.33*
  
5. *How helpful did you find the mobile device in providing learning tools & explanations beyond traditional lecture only learning?*
  - a. *Ranked from 0 being not helpful to 10 being very helpful*

- b. Average response 8.19
6. How helpful did you find the mobile device in providing convenient to access your course & complete course assignments?
    - a. Ranked from 0 being not helpful to 10 being very helpful
    - b. Average response 8.40
  7. How comfortable are you using mobile technology?
    - a. Ranged from 0 being not helpful to 10 being very helpful
    - b. Average response 9.29
  8. How prepared do you feel you are to use mobile technology in the workplace?
    - a. Ranked from 0 being not at all prepared to 10 being very prepared
    - b. Average response 9.57
  9. How prepared do you feel you are to use computers and the internet in the workplace?
    - a. Ranked from 0 being not prepared to 10 being very prepared
    - b. Average response 9.35
  10. How many of the tools provided by the mobile device did you use?
 

a. All of them	1 response
b. 75-99%	10 responses
c. 50-74%	6 responses
d. 25-49%	2 responses
e. 1-24%	0 responses
f. none of them	2 responses
  11. Would you be willing to spend \$500-\$600 for a mobile device to use in class if it was required?
 

a. Yes, I am already planning on spending that much or more for a computer as a student	3 responses
b. I already own a mobile device to use as a student	4 responses
c. Yes, but only if it was required	4 responses
d. Yes, if it allows me to use e-books & reduce textbook costs	2 responses
e. No	8 responses

During this pilot course with high school students, we concluded that this delivery model worked well for the instructor and the students. The students appreciated the convenience of the device and the increased opportunity for interaction with the instructor. The added time to complete lab activities in the classroom was also a benefit for the students. Preloading the written materials onto the devices for the entire course prior to issuing them to students simplified updating the device and dispersing materials to students. This meant students would have access to course materials regardless of available internet connectivity and if weather conditions caused the campus to be closed. As expected, there were some challenges in using digital devices in the classroom; most

of them due to connectivity. An additional wireless access point was installed to provide the needed bandwidth.

Success with the initial pilot of Biology 175, using the blended learning model with high school students, prompted the college to approve another pilot of Biology 175 with college students, but this time iPads would be purchased and signed out to the students. During the first quarter of our pilot using iPads, we were able to compare grades with a section of the same course being taught utilizing more traditional teaching methods. The section with iPads was given specific instructions on using the iPad for the course. The second section had the option of using Kindle Fires we had available from a previous class without any instruction or guidance for use with the class.

#### Comparison of Test Results Fall 2012

<i>Test</i>	<i>Non-iPad group (average score)</i>	<i>iPad group (average score)</i>
1	60.39	61.55
2	53.55	68.55
3	56.67	63.33
4	70	60
5	70.36	67.71
6	76	79
7	42	72.63
8	55.77	55.6
9	59.09	59.23
10	63.64	65.4
<i>Average of all tests</i>	60.75	65.3

This data showed approximately a five percent improvement in overall scores in the class. This initial comparison had some challenges, which may have decreased the accuracy of the comparison. During this initial comparison we discovered the existing wifi setup did not provide adequate coverage to meet our needs, and this issues was not resolved until the term was partially completed. In addition, it would have been a better comparison to have a group that did not receive mobile devices at all as a comparison rather than a group with Kindle Fires to use without guidance. At the time we did opt to give students the choice for the Kindle Fires to maximize internet access to course materials for as many students as possible. Other groups studying these models have found similar results. Adam Pesky et al. conducted a study with pharmacy students using a flipped course model where students prepared prior to class with web-based materials. They demonstrated students could acquire content outside of class with no decrease in proficiency and allow time for more small group discussion and problem solving. (9) A similar study was conducted teaching bronchial hygiene therapy to physical therapy students comparing traditional instruction versus hybrid instruction combined with multimedia resources and found the group with the online hybrid instruction performed significantly better on the final test. (10)

#### **Challenges and Benefits**

In our pilot programs, we wanted to consider the challenges and benefits to the students, the instructors, and the overall institution. With each successive quarter,

adjustments were made to how the devices were implemented. In looking at feedback from the initial quarter, the main challenge presented to the students was becoming familiar with the equipment. This was easily overcome in subsequent quarters by conducting a brief introduction on how to use the device on the day the devices are distributed. We have also noted each quarter students are more and more familiar with these devices upon entering the class, and seem to need less demonstration. As digital technology becomes more affordable and easier to use, audio and video formats are becoming more common and familiar formats for distributing information. (11) Benefits to students included the convenience and access to course materials, the availability of multimedia resources, ability to use photographs and video in class, and experience using new technology. By having access to all of the materials to review at anytime, many accommodations we provide to those with learning disabilities are already available to all students in the class. This approach is helpful in protecting the student's privacy. A study by A. Russell Smith Jr. et al. on student and instructor attitudes towards instruction multimedia also noted positive feedback. Both the faculty and students reported greater opportunity to view course content and control the pace of learning. The instructors reported greater levels of cognitive interactions in the lab. (12)

During the initial quarter of the pilot, the main challenge to the instructor was the time required to collect the resources and selecting applications. A significant amount of time was required to prepare video materials in advance for a flipped style presentation during the initial quarter, but the time required for preparation in subsequent quarters was greatly reduced. Class preparation was more streamline and there was greater flexibility for use of class time. The use of the blended presentation and mobile device allowed a greater amount of time to be used for class discussions and interactive lab activities. The additional time and discussions provided more opportunity to look at the application of the course material and critical thinking activities. This type of course does require the faculty to have ample time to plan a develop a course specifically to engage online students. With careful design, learning outcomes, retention, and engagement can be equal or greater than in a traditional environment. (13)

There was some initial challenge in determining which platform device to use, but the biggest challenge to the institution is having adequate wireless infrastructure to support the additional use of wireless devices. The addition of mobile devices assigned specifically for use in class likely increased the usage, it is also very likely usage will increase as more students bring their own devices on campus. An additional wireless access point was needed for adequate coverage in the classroom, and was installed a couple weeks into the quarter. Our pilot did not distinguish the amount of wireless service used for devices in our pilot from that of the rest of the campus. Other challenges presented to the institution were device management software to track location and usage, deciding which programs to implement the technology in next, and training faculty to use the devices. At the time of writing this article, a basic training course was available to faculty at no charge on college LMS, Canvas. Additional training for using specific apps is in progress to be delivered through Canvas in the future.

## **Conclusion**

Use of the mobile devices in the classroom is a natural progression to prepare students for using technology in industry after their education. Many younger students

have grown up and never known a day without computers. Older students returning for retraining need the experience with technology to prepare for a new career.

The use of the internet and technology is increasing on the campus. More and more students and faculty come to campus with one or more internet capable devices and expect rapid internet connection. This means our current system must expand, and is currently the biggest challenge. We need to not only meet our current needs, but must anticipate the rapid growth and dependence on technology in our classrooms. As we find more efficient ways to use this in the classroom, we are providing training to faculty wishing to include mobile technologies in their classes. The mobile technology increases convenience, time management, and communication. This technology will soon be ubiquitous, and although there may be concerns of distraction, reliability of information, and privacy, it is important to assist students and faculty in integrating the technology in a responsible and professional manner. (14)

The easy use of the Google blog with open source materials led to an additional pilot for NWCTHS creating a US History Class that is managed with this format and a pilot with the Biology 175 course using iPads through CPTC. The use of these tools in the US History class alone saved \$15,000 in annual licenses for materials.

This pilot has expanded our awareness of opportunities to reach our students in new ways and increase accessibility. For classes not on the LMS Canvas, Google blogs and Google sites have provided a way for students to access multimedia presentations, videos, course documents, and collaborate on projects both in and out of the classroom. Google forms have provided a tool to assess students outside of the LMS. As we move into the future, this pilot has helped to expand choices available to students. In some classes we are able to offer students the choice of a paper textbook, an electronic textbook, or a collection of open source materials in multiple formats to allow them to choose which meets their preferred learning methods and budget. Students have more choices with when and how to access course materials. Recently, we have started exploring the use of apps created specifically for our classes using free resources. Overall, this is helping us to deliver a learning experience to students that not only gives them flexibility in modes of learning, but prepares them to use technology in the future.

An additional unexpected benefit in using mobile technologies in Biology 175 has arisen. Biology 175 is a prerequisite class for many of the college programs; Surgical Technologies is one of those programs. Students who take Biology 175 through this blended learning approach have learned how to use tablet technology in their education. When those students start their career training programs, the instructors do not have to teach them how to use the devices; it is already second nature for them.

### **Going Forward**

Clover Park Technical College now has a mobile initiative. The successful use of mobile technologies has prompted other college programs to follow suit. Mobile devices are not an integral part of the curriculum in: Culinary Arts, Cosmetology, Media design and Production, Nursing, and Surgical Technologies. The cosmetology program has found that it saves students hundreds of dollars in textbook cost by requiring the students to purchase iPads and making low cost e-books available to them. The students then have the iPads that can use in other class activities and in academic classes. According to Mara Hancock of University of California Berkeley, partnering with

commercial entities that support open source or community efforts will result in improved quality of material, less expense, and increased availability of knowledge for higher education and life long learning. (15)

CPTC is now exploring the use of MOOCs, creating class specific apps, and competency based instruction. NWCTHS will pilot a science class that is designed to be a MOOC run through an app. The purpose of this class is to provide students who have not yet passed the state End of Course Biology exam, curriculum to study to help achieve success. We are aligning the content to the Common Core Standards. We are exploring the idea of granting credit for the class if the student completes all class materials and passes the state test.

Digital devices are here to stay. With careful planning and support from the institution, educators can use the devices that students already possess along with blended learning approaches to enhance the educational experience. Students at the college level can see cost benefits if the instructors intentionally plan to use open resources and lower cost e-books.

Title: 1939 Comes Alive: Integrating Computer Gaming into the History Classroom

Topic: Social Sciences Education, Higher Education

Presentation Format: Paper Session

Description:

Engaging university freshmen is critical for student success and university retention efforts. At our university, first semester writing courses are theme-based and seek to both excite students as well as provide interdisciplinary links. In spring 2013 we decided to take this one step further and add a computer gaming component to a history course.

Abstract:

Have you ever wondered how the study of history could be transformed into a hands-on, active-learning activity? Engaging university freshmen is critical for student success and university retention efforts. At our math- and science- centric university, general education writing courses are theme-based seeking to excite students and provide disciplinary links while teaching critical thinking, reading, and writing skills. In a history themed course, it can be a challenge to create active learning assignments while maintaining the rigor of instruction. In our course studying the 1939 World's Fair, we were intrigued with the possibilities asking the students to research The Fair's designers, their plans, and their intentions. Then they took their research and applied it by recreating The Fair using Minecraft, a massively multiplayer sandbox video game. The result was that we learned that computer gaming could be integrated into a history course and could compliment more conventional assignments, such as research papers. Our paper will explain how to implement such assignments as well as the benefits and limits of such assignments.

**6. Abstract**

As the Common Core standards are being implemented across the country, the hope is that future students entering higher education will bring with them improved critical thinking and analysis skills. In order to meet the needs of these learners, it will be essential that the traditional teacher-centered model of university classroom instruction become more student-centered, providing the learners themselves with opportunities to become more actively engaged in the learning process. Attendees will be invited to reflect upon their own teaching practices and to consider some basic strategies that can help them move toward a more engaged style of instruction. The primary focus of this panel discussion is to provide participants with the opportunity to discuss and ask questions about a variety of classroom instructional strategies that are designed to provide the learner with a sense of greater ownership of the content knowledge. Strategies that will be highlighted in the panel discussion include cooperative learning, think-pair-share, the jigsaw, concept sorts, and semantic features analysis.

## **6. ABSTRACT**

A fairly regulated school system with certain support mechanisms for students and teachers, in combination with inter-culturally educated teaching staff, are key to the successful integration of immigrant students in the school. Research shows that Slovenian teachers' views are generally not in favour of intercultural pedagogy and that the relevant guidelines are even being rejected. Researchers in this field have pointed out that teachers who are in contact with immigrant children need specific knowledge and skills, and that they thus need to be educated. The thesis I am going to present has the following objectives: to analyse training programs for future teachers in Slovenia and compare them with some teacher education programs in selected countries (Sweden, Canada and Australia) with a longer tradition of (successfully) integrating immigrant students in schools, and to analyse the informal intercultural practices of Slovenian primary teachers and identify the necessary skills of teachers to work in a multicultural classroom. On the basis of a theoretical study and empirical research, a model for future teachers' (intercultural) education will be designed. The study will be descriptive and causal non-experimental. Data collection techniques will be both qualitative and quantitative. As instruments for data collection, semi-structured interviews with teachers and a questionnaire with both teachers and senior students of teacher education will be used. A model of intercultural teacher education will emerge based on theoretical guidelines and the empirical research, namely on the current state in the system and needs of the Slovenian teachers.

***Key words: immigrant students, teacher education, intercultural education***

## **ABSTRACT**

Researchers, using the NAEP database, initially investigated the aspect of curriculum narrowing in respect to student achievement in social studies. While investigating the data from NAEP, the researchers were struck by the lack of change in the achievement gap throughout the time frame of NCLB, an integral component of NCLB intent. Failure to close the achievement gap based on socioeconomics, disability, ESL/ELL status and ethnicity are discussed.

## **INTRODUCTION**

Since the inception of No Child Left Behind (NCLB), intense discussion has been raised regarding the negative impact on academic instruction associated with the tendency to devote additional instructional time to academic areas where testing has been mandated by legislation. Curriculum narrowing (Gunzenhauser, 2003) is the practice of focusing additional classroom instruction time in mathematics and reading by limiting instruction in other areas, specifically art, foreign language, music, physical education, science and social studies.

As suggested by Jerald (2006), reduction of instructional time in areas other than mathematics and literacy carries with it major costs for students, costs which “are unlikely to be recouped later in the educational pipeline.” Not a new phenomenon, curriculum narrowing has been reported as early as the 1980s (Stecher & Hamilton, 2002) and has grown to the point where 71 percent of elementary school districts report reducing instructional time for one or more subjects to make room for reading and/or mathematics (Tanner, 2008). Zellmer, Frontier & Pheifer (2006) indicate that 18 percent of comments by Wisconsin teachers, when asked about unintended negative consequences of NCLB, were related to curriculum narrowing. King & Zucker (2005) relate that a 2003 survey conducted by the National Board on Educational Testing

and Public Policy reports 79 percent of teachers in states with accountability testing limited instruction in non-tested areas. Packer (2007) cites studies by the Center on Education Policy in which “71% of the nation’s 15,000 school districts” have narrowed their curriculum to address testing needs in math and literacy. In addition to limiting instructional time in non-tested content areas, research conducted by Crocco & Costigan (2007) highlights reports from beginning teachers where they indicate that curriculum narrowing has had a negative effect on their perceptions about their opportunities for developing a satisfying teaching practice.

The culprit, however, may not just be the narrowing of the curriculum, but may also include a narrowed vision of educational priorities as well. Extensive research has been conducted regarding the impact of ethnicity, socioeconomics, English language learner status, and disability status (Orlich & Gifford, 2006; Abbot & Joireman, 2001; Howley & Bickel, 2000) on student achievement, and have documented extensive differences in achievement scores for student impacted by each of these factors. Results from the NAEP studies indicate alarming discrepancies between ethnic groups, conditions which were originally supposed to be addressed by a more alert educational system under NCLB. Interestingly enough, while scores for individual students did improve over time, the gap in student achievement remained essentially the same. Gap analyses indicated no statistically significant differences from year to year.

## **PROJECT OVERVIEW**

The purpose of the project was to determine whether or not curriculum narrowing places restrictions on student performance in social studies areas. Large-scale datasets are readily available from the U.S. Department of Education, and data were obtained from the 2010 Civics Study available online from the National Center for Educational Statistics’ (NCES) National Assessment of Educational Progress (NAEP) website. Data were analyzed using the NAEP Data

Explorer tool, also part of the NAEP website (<http://nces.ed.gov/nationsreportcard>). This data explorer tool enables researchers to select appropriate variables for analysis, as well as having options for determining statistical significance, and performing gap analysis on student achievement. Student scale scores for 4<sup>th</sup> graders in national public schools were utilized, with variables of interest including the amount of time teachers spent teaching civics in the classroom, ethnicity, ELL (English Language Learner), disability, and socioeconomic status (eligibility for free and reduced school lunch programs). In addition to evaluating changes in scale scores over time, researchers utilized the data explorer tool to assess the impact of civics instruction on the achievement gaps between various student groups.

## **FINDINGS AND DISCUSSION**

In conjunction with the Civics studies conducted in 1998, 2006, and 2010, researchers noted that data were collected relative to the amount of instructional time devoted to civics instruction in the classroom in 4<sup>th</sup> grade. Upon review of the data, statistical difference was noted during the 2006 study, but not in 1998 where the data collected was insufficient for statistical analysis, or for 2010. Table 1 provides a breakdown of average scale scores for 4<sup>th</sup> grade students in the NAEP Civics study. Student scale scores were based upon national public schools surveyed, and do not reflect private school scores. Scale score ranges for the 1998, 2006, and 2010 NAEP Civics Studies are 0 – 300.

Table 2 details student scale scores for 4<sup>th</sup> grade students by ethnicity, participating in the civics education study conducted by the NAEP. Jurisdiction for this data represents national public schools surveyed for each of the three (3) NAEP Civics studies.

Table 3 provides a breakdown of differences in student achievement based upon the amount of instructional time allocated for civics instruction. Note that the percentages indicated relate to the percentage of social studies instruction dedicated solely to civics instruction.

Results indicate that student scale scores generally improved based upon the amount of instructional time devoted to teaching civics to 4<sup>th</sup> graders. Focusing on 61-90% time category, however, data present a three (3) point decrease in student scale scores in 2010.

Delineating the data based upon restrictive factors previously discussed, (disability and ELL status) researchers noted that scales scores for students with disabilities and/or ELL status performed well below the averages for students without those performance inhibitors. Data for these students is provided in Table 4.

Evaluation of these scores is particularly disconcerting when consideration is made of the NAEP selection criteria for students with SD and ELL status. A student who was identified as LEP or ELL and who was a native speaker of a language other than English should be included in the NAEP assessment unless the student had received reading or mathematics instruction primarily in English for less than 3 school years including the current year, and the student could not demonstrate his or her knowledge of the subject in English even with an accommodation permitted by NAEP.

Table 5 provides data for students based upon socioeconomic status as determined by eligibility for free and reduced lunch programs.

Comparisons of average scale scores for 4<sup>th</sup> grade students reflected the following information:

- Average scale scores increased year by year from 148 to 156
- There was a significant difference in student scale scores based upon the amount of time teachers spent teaching civics to 4<sup>th</sup> grade students in 2006 and 2010
- White students scores were notably higher than other ethnic groups

- Scale scores for students with disabilities were 24 points lower than those without disabilities in 2006 and 25 points lower in 2010
- Scale scores for English Language Learners were 37 points lower than non-ELL students in 2006 and 37 points lower in 2010
- Scale scores for students with disabilities and ELL status were 55 points lower than students without disability or ELL status in 2006, and 62 points lower in 2010
- Student achievement gaps have not significantly changed, despite the changes that have occurred in student scales scores themselves

## **CONCLUSION**

The purpose of this study was to evaluate scale scores for students participating in the NAEP Civics Studies conducted in 1998, 2006, and 2010 with the intent of determining whether or not curriculum narrowing has an impact on student scores. Researchers looked at scores for 4<sup>th</sup> grade. Data were obtained from the National Center for Educational Statistics' website (<http://nces.ed.gov/nationsreportcard>) and analyzed using the NAEP Data Explorer tool.

Analyses of the data indicated significant increases in student scale scores, and student scale scores were noted to have increased in 2006 and 2010 for 4<sup>th</sup> grade students based upon the amount of civics instructional time students received. Evaluating scale scores overall for 2006 and 2010, it is noted that generally scale scores improved based upon an increase in the amount of instructional time devoted each week to civics and social studies instruction. Concerns have been noted regarding variations in student performance based upon restrictive factors, especially when considering that an integral aspect of NCLB has been the extent achievement gap based upon ethnicity, ELL, student disability, and socioeconomic status (Orlich & Gifford, 2006; Abbot & Joireman, 2001; Howley & Bickel, 2000). It was noted in this project that while scale scores increased for each of the ethnic groups, a definitive achievement gap still exists, and that while scale scores increased, the achievement gap has not significantly diminished.

Limitations to this study have been noted by the researchers. Specifically, while the same is nationally representative, the data for this study are limited to students enrolled in public

schools, and does not reflect the scores for private school enrollees. Secondly, the potential for study replication is limited by the potential researchers needing to know how to access the NAEP datasets and then utilization of the NAEP Data Tool. This can be readily addressed through use of the NAEP Data Tool training program available from the National Center for Educational Statistics or via the website at <http://www.ed.gov>. Additionally, the National Center for Educational Statistics conducts frequent training on usage of the NAEP datasets at national conferences such as the American Education Research Association (AERA) annual conference.

Implications for this research are far reaching. First of all, it is important to note that one of the primary concerns of NCLB legislation was to prepare all students for school, and to give each of them an equal opportunity to succeed in their academic endeavors. It is obvious that while scale scores did increase, the achievement gap has not been appropriately addressed, and therefore it has not been decreased. Nesbitt (Spring, 2011) indicates that much can be done to reduce various aspects of the achievement gap, however, reaching parity among different student groups probably will not be possible within the 2014 mandate of NCLB.

Future research concerning the narrowing of curriculum and its impact on student scores is scheduled in content areas other than civics. Recently released NAEP studies in the areas of U.S History and Geography for grades 4, 8 and 12 are currently underway with the intent of determining whether or not curriculum narrowing has had an impact on student performance in those areas. Researchers are also planning on broadening their inquiries into the other multi-year studies conducted by the NAEP such as mathematics, reading and science to assess whether or not instructional practices have impacted student scale scores and narrowed the gap in student achievement.

[Absatou.Edgar@umanitoba.ca](mailto:Absatou.Edgar@umanitoba.ca)

This presentation will highlight the efficacy of wholistic guiding principles utilized by the team of Personal and Academic Counsellors in the Access Programs. The Access Programs is a supportive program for students, the majority of which are Aboriginal, who are facing barriers in a post-secondary setting. The strengths and challenges students bring with them into the learning environment are discussed. The factors that affect and promote success are three main areas: systemic and structural, social and cultural, and personal. These factors are also viewed as external to the student or factors that are internal. The factors promoting wholistic success are relational that include engaging interactions in safe learning spaces.

### **Abstract**

The objective of this study is to examine factors that lead to a successful implementation of a new school model within an existing school, while maintaining cultural traditions that are considered hallmarks of the existing school. The methodology that will guide this research will take place through survey analysis from respondents in the state of Indiana. This study could help to guide school leaders through a seamless transition when implementing a new school model within an existing school as well as highlight options for creating and maintaining a desired school culture. It is expected that the research will show that regardless of the antecedent(s) that prompts the need for change that the way in which school leaders approach the implementation process will play a crucial role in how successful the new school model will become.

## Introduction

Change tends to make people uncomfortable yet educational mandates from state and local levels require that schools are in a constant flux of change. In terms of changing models, school leaders have the most crucial impact on how successful the implementation process can be. Determining factors for how successful a new school model will become depends upon how well the school leader prepares his or her stakeholders to embrace the cultural shift. Whether an evidence-based intervention will have a positive effect in your schools or classrooms may depend critically on your adhering closely to the details of its implementation (Policy, 2003).

There are schools and / or school districts that have become “Model Shoppers;” meaning that they have become willing to change from one model to another solely based on the funding that comes with the implementation of a new model. Often times the practice of model shopping gives little regard to the needs of its consumers; the students who are being served. The sole purpose of changing from one model to another should be because it offers a better benefit to the students being served. Student success must be the primary reason that drives change. Implementation drivers are methods to create and sustain effective education (Dean L. Fixsen, Karen A. Blase, 2009). This study will look at factors that should serve as tools to help school leaders to drive change within their buildings.

Any school model that would be offered as a choice for a school to choose from comes with proven research that would suggest that it can work if implemented properly. This suggests that the successfulness of the model rest with the implementers of the model. Proper implementation of a new model involves changing the behavior of teachers, staff, and students alike. It requires a systematic approach from the beginning stages and throughout the implementation process. This study is important because school leaders must operate as good stewards over the resources that have been left in their care while at the same time, ensuring academic success of the students they serve. This study examines the implementation process from the lens of preserving the positive attributes of the existing school cultural and examines ways in which to preserve that culture while changing school models.

## Research Questions

In order to examine attitudes and assumptions about the implementation process of new school models; district leaders, school principals, teachers, and community partners in the state of Indiana were asked the following questions in a survey:

## Changing School Models: Maintaining School Culture

1. What steps should be taken when implementing a school model?
2. What steps must be taken to facilitate a smooth transition from one model to another?
3. How should information about a new model be communicated with staff, parents, and community stakeholders?
4. What are things that school leaders can do to support their staff and students through the change process?
5. What school systems and partnerships must be in place, in order to transition from one model to another smoothly?
6. What are some cultural traditions specific to the school you are affiliated with that must be supported and maintained in the mist of the shift?
7. How is success defined in regards to transitioning from one school model to another?

## Methodology

Survey Research was the best method for this type of research because, “open-ended questions allow for a greater variety of responses from participants” (Jackson, 2009). This study includes survey questions that were sent out to district leaders, such as CEO’s or school superintendents; site leaders such as school principals or directors; classroom leaders, such as teachers and students; and community leaders, such as school partners or parents.

Although survey research can be limiting because it can only *describe* a set of observations or the data collected. It cannot draw conclusions from that data about which way the relationship goes — Does A cause B, or does B cause A? (Jackson, 2009), this study strives to understand each element of the implementation process and how best to support the cultural attributes that would potentially be disrupted in the shift.

### *Setting*

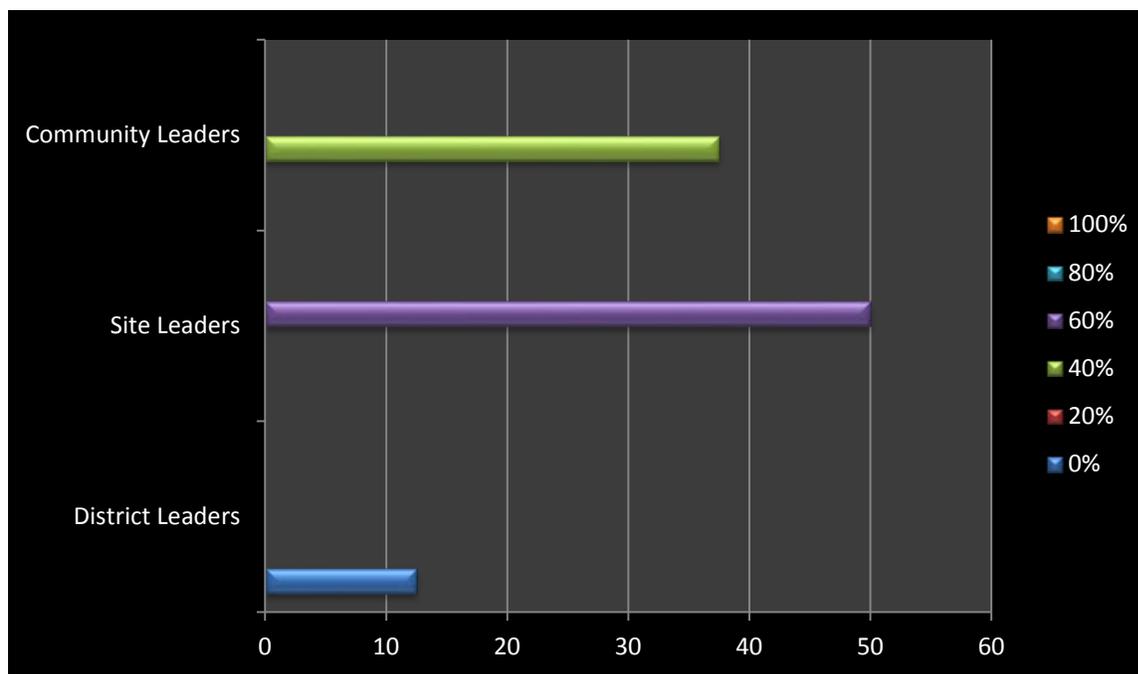

The study was conducted over a period of 6 months and involved 2 network meetings and 3 different site visits to secondary schools that were in the beginning, middle, or full implementation phases of changing school models. The network meetings highlighted a total of 6 different schools that presented their successes and pitfalls as they moved to full implementation of their chosen school model there were 119 individual participants that attended the network meetings. Fifteen people that represented district leaders, site leaders, classroom leaders, or community leaders were invited to participate in this study. They were all presented with the same set of questions and asked to respond based on their own unique situations within their individual schools or districts. Their perspectives will help this study look at implementation in a more diverse way.

Changing School Models: Maintaining School Culture

Participants

The participants are categorized in Table 1. Fifteen individuals were invited to complete the survey. Nine participants completed the survey. The results in Table 1 reflect the 9 survey respondents.

**TABLE 1**

Answer Choices –	Responses –
Superintendent / CEO of a school corporation	11.11%
School Leader / Director / Principal	44.44%
Community Partner	44.44%
Total Respondents: 9	

**Data Collection**

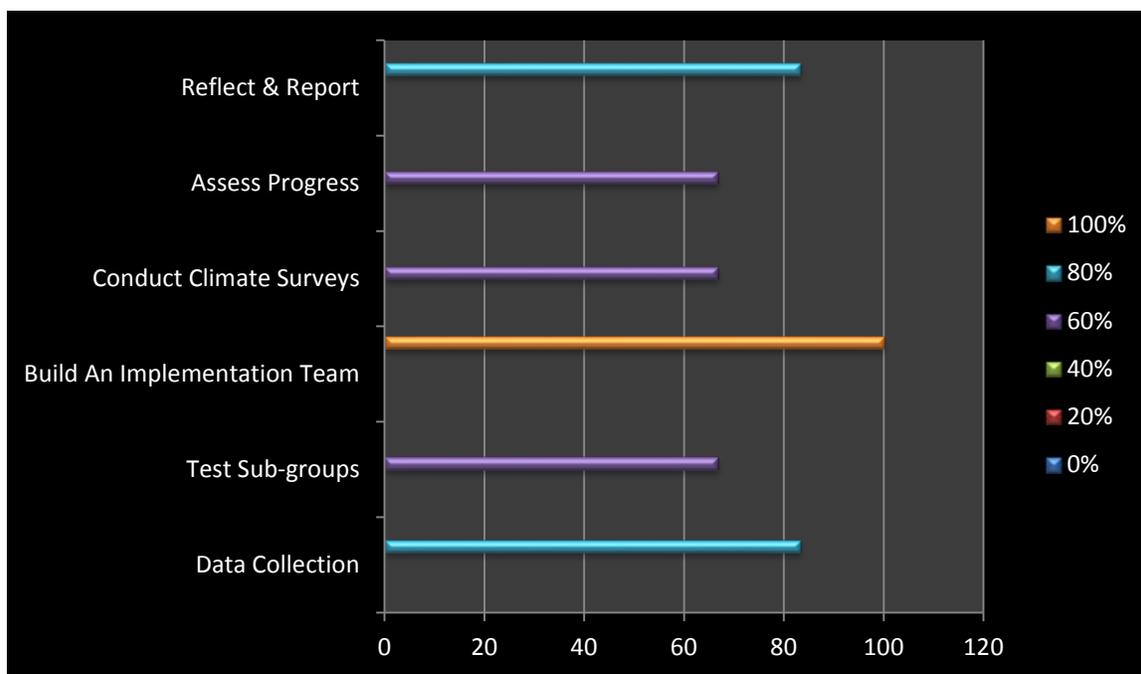

The survey was conducted through both on-line and face-to-face modalities. The research questions were primarily qualitative. The philosophy in using this approach was to allow respondents to expound on questions, which may have led to a more in-depth discovery. Initially (3) multiple choice questions were asked to collect data on the respondent’s role within the implementation process, identify what region they were responding from, and to gain an understanding of the respondent’s awareness of what steps should be taken within the implementation process. The steps that were presented to the participants represent an implementation model developed by the researcher and are displayed in Table 2 below.

### Changing School Models: Maintaining School Culture

Additionally, the respondents were provided space on their survey to give additional comments. One respondent included: “create buy-in with staff” on their survey to indicate a step that should be taken during the implementation process. A total of 6 participants responded to the question, while 2 participants left this question blank.

### Table 2

Which of the following steps should be taken when implementing a school model?

Answer Choices –	Responses –
Data Collection & Comparison	75%
Test Sub-groups	50%
Build an implementation team	100%
Conduct Climate Surveys	62.50%
Assess Progress	62.50%
Reflect and Report	75%
Total Respondents: 9	

## Results

Questions 1-3 were discussed the Data Collection section; therefore only the core questions that were designed to guide the research will be discussed in this section. The following insights were revealed through the on-line and face-to-face survey interviews:

1. *In your opinion, what steps MUST be taken to facilitate a smooth transition from one model to another?*

100% of the participants responded to this question and the following themes materialized in their responses: In order to facilitate a smooth transition from one model to another, informed and collaborative decision making that includes district leaders and school leaders is essential. Leaders then must ensure buy-in from all stake holders while being honest about why the change is needed. Leaders must then begin to build their team being careful to get the right people on the bus. This process involves sharing information across all levels, advertising and communicating the goals and objectives of the new model in as many ways as possible. For example, advertising on relevant websites. Collecting data that will help the team learn from the previous model as a means to support the pieces of desired culture that must stay in place. Other ideas included school leaders sponsoring activities that will rally the staff, students, parents, and community around the change. And lastly, Leaders must become transparent and honest about any barriers and short comings about the new model, while at the same time, presenting a plan of action that will address the barriers and short comings.

2. *How should information about a new model be communicated with staff, parents, and community stakeholders?*

100% of the participants responded to this question and the following themes materialized in their responses: Information about a new school model should be communicated with staff parents and community stakeholders face-to-face initially due to the imperative need to understand the affected population. It is critical that the initial communication should be conducted face-to-face. It was suggested, in the responses, that several opportunities for face-to-face meetings such as Parent Nights, Town Hall Meetings and the like be a vehicle for disseminating information about the transition. It was also noted that school leaders should

## Changing School Models: Maintaining School Culture

remain positive, but honest with their staff. Staff should be included in the implementation process by forming committees to achieve the goal and providing opportunities for leadership roles. The caution here is that school leaders should not make promises around future salaries and positions until he or she is ready to move forward. Once the initial message has been shared it then becomes imperative for the news to be shared consistently in the following forms please refer to Table 3:

**TABLE 3**

### Vehicles for Sharing Information

Staff	Parents & Students	Community
In Writing	In Writing	In Writing
Radio/Television ads	Radio/Television ads	Radio/Television ads
New letters /Website	New letters /Website	New letters /Website
Phone Calls	Phone Calls	Phone Calls
E-mail / Text/ Postal	E-mail / Text/ Postal	E-mail / Text/ Postal
Staff Meetings	Parent Meetings	Community / Board Meetings
One-on-one Meetings	One-on-one Meetings	One-on-one Meetings
Community Events	Community Events	Community Events

3. *What are things that school leaders can do to support their staff and students through the change process?*

One respondent skipped this question, while 8 offered a response. The following themes materialized in their responses: In order for School leaders to support their staff and students through the change process they must lead by example and clearly communicate regularly about where the team is in the process of transition and what areas need to be improved upon. The respondents felt it would be important to communicate what team is doing well. School leaders should bring to the team data that supports the goal and use this to spring board next steps. School leaders must support with fidelity that way implementation will take place, with fidelity. School leaders should continue to have open meetings and be open to suggestions. School leaders should be both willing and able to qualify the fears/angst of staff and students. School leaders should involve staff, students, parents, and community into the process. Allow the transition to be positive and fun. School leaders should bring in specialist to

## Changing School Models: Maintaining School Culture

conduct on-going professional development. Lastly, school leaders should listen, listen, and listen.

4. *What school systems and partnerships MUST be in place, in order to transition from one model to another smoothly?*

Seven respondents replied to this question while 2 skipped the question. The seven respondents felt that in order to transition from one model to another smoothly the school systems and partnerships that must be in place are outside organizations that will provide support for teachers and students, ideally free of charge, specifically mentoring and counseling services because academics must remain the focus in spite of any change process. While it is noted that education of scholars can't slip while the change takes place schools must also strive to produce holistic scholars therefore schools must have partnerships in place that include community based organizations, faith based organizations, and business organizations. There must be systems in place to track, monitor and assess student growth to ensure success. These partnerships should be well informed and amenable to the transition. School leaders must reach out to organizations and form partners that may have not been considered before so that the school is in the best position for success.

5. *What cultural traditions specific to the school you are affiliated with must be supported and maintained in the mist of the shift?*

Seven respondents replied to this question while 2 skipped the question. The seven respondents ascertained that the following cultural traditions must be created, in some cases, and maintained in others: A culture of respect and support for students, no matter what their background. The respondents felt that school leaders had to produce culturally competent staff as well. Examples of In-house programs that were mentioned are as follows:

- ◆ Academic programs such as Dual Enrollment
- ◆ Community building programs such as Grade level celebrations
- ◆ Programs of recognitions such as Student of the Month

6. *How is success defined in regards to transitioning from one school model to another?*

Seven respondents replied to this question while 2 skipped the question. The seven respondents noted that success, in terms of transitioning from one school model to another, is

## Changing School Models: Maintaining School Culture

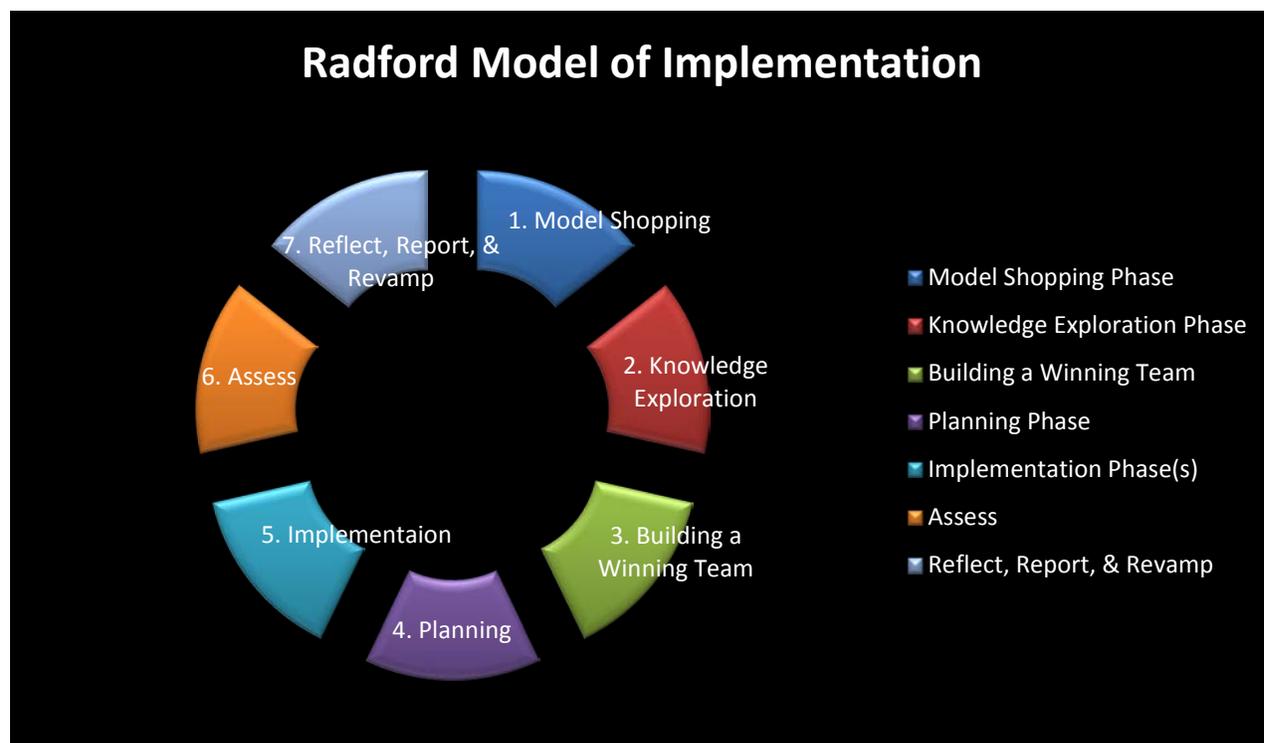

when there is full implementation of the new model and the data shows positive growth in tracked areas of student, staff, and leadership performances. It was also noted that student and staff attitudes are great indicators of success.

## Discussion

The findings of this study show that school leaders are not always aware of the steps that should be taken when implementing a new school model. Table 2 shows that, when asked about which steps should be taken to implement a school model, only 1 of the 6 answer choices were selected by 100% of the respondents yet all the answer choices are essential when implementing a new school model if success is to be found.

The National Registry of Evidence-based Programs and Practices (NREPP) states that successfully implementing a program that fits your organization's needs is a process... It is not enough to simply select a proven evidence-based program and assume success will automatically follow. Good implementation strategies are essential (The Five Stages of Implementation, 2012) While NREPP suggest that there are 5 stages to follow when implementing an evidence-based program, the researcher would suggest the following model of implementation:

**FIGURE 1**

### **1. Shopping**

The phase of shopping for a new school model involves more than simply looking for the model that offers the largest amount of funding. Typically this phase happens on the district level, but when carried out correctly it involves board members, district level staff, the school leader, and key department heads. Prior to shopping the team should make a shopping list of must have in a program and a list of desirables. This is a model that the team will potentially be married to for quite some time so it is worthy of careful consideration. The work involves meeting regularly to discuss progress and selection. The goal during this phase is not to select one model and run with it. Ideally, 3 models are selected to present to a larger community of decision makers. . A desired cultural hallmark to create or maintain in this phase would be good stewardship.

### **2. Knowledge Exploration**

Once the program shopping phase is completed a new team should be formed. The team should be comprised of board members, district staff, the school leader, teachers, and students. This team may find it beneficial to operate in sub-committees. The big goal is to learn about the 3 school models selected by dissecting it apart to weigh the pros and cons of each element of the program to determine its usefulness to the school being served. Some of the members may need to conduct site visits, while others operate as scientist and subjects. If it is a teaching model a small group of teachers and students should work together, perhaps over a summer program, to do small phases of implementation for the purpose of field testing. Once all the information has been gather, the findings should then be presented to the larger team and then turned over to the school principle and the district administrator for further consideration. The final decision should be a collaborative effort from the board members, the district level leader, and the school leader. It is important to be selective in the process being careful not to choose a model for the sake of choosing one or to save time. A desired cultural hallmark to create or maintain in this phase would be Academic Excellence.

### **3. Building a winning Team**

Building a winning team is perhaps the hardest, but most important step in this process. Once a decision has been made about the model that will be adopted the real work begins. A school leader must be aware of his or her team members. Knowing their strengths and challenges will be vital in the selection process. Too often leaders select the staff they enjoy working with, but those staff members are not always the best

candidates to move a model forward. If the goal truly is to build a winning team allowances have to be made for potential personality conflicts in order to meet the goal in mind. School leaders must be aware of the dream achievers as well as the dream killers on their staff because work has to be done with both groups. A School leader may find it helpful to introduce some team building activities into a staff meeting that highlights personality traits prior to building their team. Once the team is formed the school leader will need to keep flexibility in mind, knowing that team members may come and go. Building a winning team takes work and school leaders should be mindful of those that would join the team for hidden personal agendas to safeguard against such actions. The only focus should be student achievement and school-wide success. A desired cultural hallmark to create or maintain in this phase would be teamwork.

#### **4. Planning Stages**

If building a winning team is the hardest task for a school leader, then surely the planning stages of implementation must be the most frustrating. However it is work that is once again crucial. Planning the implementation of something new is challenging on all levels because people, by nature, are resistant to change. One of the hallmarks of the school culture must be that mistakes are only things to learn from. If the students and staff in the building can view mistakes as tools for learning then the challenge isn't so great. Every element and population of the building must be considered when a new model is being introduced. Time has to be allotted for mistakes and the correction of those mistakes. Meetings should be held regularly to check the process. One of the biggest pitfalls that school leaders run into when implementing a new model, is not having an effective checks and balance system. Every meeting should have an agenda, and there should be documentation of the responsibilities assigned in each meeting with deadlines attached to the assignments. This tool should not be used as a, "Gotcha!" but rather it should be used as a reminder and accountability tool. Leaders need to set deadlines but follow up with responsible parties so that everyone feels both responsible and supported. A desired cultural hallmark to create or maintain in this phase would be responsibility.

#### **5. Implementation of the model**

It's time to go live! The winning team has put their hands to the plow. They have put their all into bringing the new model into the school so the rest is a downhill battle

right? No, there is still much work to be done. Implementing the model so that students and staff don't fill the bumps and bruises of change is a craft. It's achievable, but it does take some skill. The number one rule is positive honesty. It is so important to remain both positive and honest in this phase. School leaders must remain calm in the face of what could seem like chaos. Teacher and students will take cues the leader. If the leader appears as if all is well, then the building will function as if all is well; the opposite is true as well. During this phase the school leader must be observant and be willing to listen and stay open to suggestions. Many of leader has fallen because they became inflexible and operated as if their way is the only right way, when in fact there are many way to a successful path, the difference is that they are different paths. A desired cultural hallmark to create or maintain in this phase would be honesty.

## **6. Assess**

Many leaders look at assessment as an ugly word, but assessment is really meant to be supportive. If you begin, as suggested, in phase 1, with your shopping list, then you have a clear picture of the things that the model was meant to achieve. Assessment should really begin in the beginning. Testing your old program to identify the things that were working and the things that need to be replaced give you a baseline for where the model should be taking you. Assessment should, at minimum, happen at the onset of a program, midway through, and again once full implementation has been achieved. Ideally, assessment is happening consistently and often. School leaders should consider bringing outside evaluators in to evaluate the process so that fidelity is protected. A desired cultural hallmark to create or maintain in this phase would be Integrity.

## **7. Reflect, Report, Revamp**

This stage involves not just looking back at the end of the day on your drive home to say, "That was really done well.," or, "I will change the way I do that next time." Reflection should also be a systematic process that involves the make up a team. It may feel to a school leader that he or she is putting his or her neck out for slaughter, but the next step is necessary if success is to be had. As stated before, every team has some dream makers and some dream killers. The reflection team should have both dream makers and dream killers on the team in a purposeful way. The goal is to gather honest information about what is working and what isn't working. Although it may be painful to listen to, the dream killers on your team are going to be all too helpful in providing

## Changing School Models: Maintaining School Culture

the information about what isn't working in the implementation process. School leaders may find it helpful to limit these meetings by having pre-set times.

The reflection meetings should be followed by school-wide staff meetings to celebrate the successes and report the challenges that lay ahead. In this reporting phase the school leader should be pro-active in informing the board members, his or her district level supervisors, as well as parents and community partners. It's important to keep everyone informed to both garner support and seek solutions.

Revamping is a cycle that should not end. Once the new school model has been implemented and people are comfortable with how to run it, the innovation or revamping will naturally kick in. However; school leaders need to be mindful to facilitate that process to make sure that some members of the team don't become individual shining stars, while others become comets and burn to a fizzle. The goal is to work as a team to produce the best scholars possible and individuals can't achieve that goal, only effective teams can. A desired cultural hallmark to create or maintain in this phase would be Family.

## Conclusion

In conclusion, the data presented in this study supports the claim that school leaders have the most crucial impact on how successful the implementation process can be. The study further confirms that implementation is an on-going process that requires a team effort. The research shows that Leaders must build a winning team that is inclusive of school staff, students, parents, community partners, and district level leaders if they are to facilitate successful implementation of a new school model. This study shows that there are clear steps that a school leader can't bypass in the implementation process if he or she is to avoid pitfalls in the process. The study moves on to offer information on ways information should be communicated concerning ushering in a new school model. Included in this study are steps that school leaders can take in order to support their staff and students through the change process. This study shows that school leaders capable of empowering their staff and students through the change process instead of mandating and dictating them through the process. This student considers the cultural digression that can be avoided when going through the implementation process by offering snapshots of partnerships and organizations that must be on board to support this change. School culture does not have to suffer as a result of a school changing its model. This study encourages school leaders follow an implementation model when implementing a new school initiative and further cautions leaders that skipping steps can lead to the demise of a successful plan.

**Description:**

This study investigated leadership strategies in relation to the implementation of an accountability initiative in a graduate program in higher education. Findings indicated that strategies identified as most salient within each of stage of implementation relate to establishing the purpose the initiative, to fostering faculty empowerment, to promoting positive capacity beliefs, and to promoting positive context beliefs. The identified leadership strategies have the potential to assist the institution's efforts to demonstrate institutional effectiveness. (\*abstract is on the next page)

## **ABSTRACT**

The purpose of this study was to determine what strategies appeared most salient in the implementation of a locally developed comprehensive exam in a graduate program in higher education. Specifically, the researcher aimed to situate an understanding of the role of leaders in the adoption and implementation of this accountability measure. Limited information in literature specific to the implementation phase of a capstone assessment in graduate programs within higher education frames the need for this study's findings.

This qualitative study examined implementers' experiences with the implementation processes of a locally developed comprehensive exam. Findings supported the study's argument that strategies identified as most salient within each of stage of implementation relate to establishing the purpose of the comprehensive exam, to fostering faculty empowerment, to promoting positive capacity beliefs, and to promoting positive context beliefs. Findings suggest that organizational leaders can foster conditions that promote optimal implementation of this accountability-related initiative by employing these strategies, which equips front line implementers to meet the challenges of change. These strategies ultimately have the potential to assist the institution's ability to effectively respond to accountability-related mandates, thereby assisting with efforts to demonstrate institutional effectiveness.

## **Abstract**

While questions exist about the effectiveness of online education, it is a growing part of the pantheon of educational choices available to students in America today. Though online education first gained popularity for advanced learners, increasingly at-risk populations are enrolling in online learning environments. Research in K-12 full-time, online learning environments is nearly non-existent. This study investigates student achievement in the full-time, online learning environment and the effect parents have on student success. Themes from semi-structured interviews found parents of current or former students in a full-time, online school perceive multiple facets of student success in the online environment. The school can provide support to families by communicating, being transparent with tools, and individualizing instruction. Students must be self-motivated, engaged and participating, and accountable for their own learning. Parents should be available to monitor, mentor, and motivate students.

Keywords: Online education, high school, parental involvement

## **Parental Involvement and Student Success in High School Online Education**

Technology has a tremendous impact on many facets of 21<sup>st</sup> Century life. Technology affects how we communicate, do business, make friends, retrieve and disseminate information, and maintain relationships. Education is not exempt from adapting to changing technology. Education has long been augmented by the daily use of SMART boards™, projectors, personal computers, and the internet. With the rapid growth of internet-based courses and online schools, technology is also impacting how instructors teach, and students learn.

Online K-12 education is one of the fastest growing educational reforms in American education today (Watson, Murin, Vashaw, Gemin, & Rapp, 2011). Online learning is often difficult to define as it is not a one-size-fits-all model. One of the difficulties facing researchers and policy makers is in defining online learning environments to be able to compare like programs. There are multiple variations in program and delivery, ranging from full-time schools where students earn a diploma, to statewide programs providing single-course enrollments, to a student in a rural area taking an advanced course not offered in his district, and more (Cavanaugh, Barbour, & Clark, 2009; Clark, 2001; Rice, 2009; Watson et al., 2011).

In the 2011 version of the annual report, *Keeping Pace with K-12 Online Learning*, Watson et al. (2011) state that full-time enrollment, in schools where students do their coursework completely in an online environment, continues to grow. Enrollment has increased by approximately 50,000 students nationwide just between 2009 and 2011 (Watson et al., 2011). Additionally, between 2010 and 2011, three more states opened full-time, virtual schools bringing the total number of U.S. states with this educational choice to 30 (Watson et al., 2011).

While the volume of research in the online school population is increasing, not all research is comparable as not all online programs have the same scope (Barbour, 2009; Clark,

2001; Cavanaugh et al., 2009; Watson et al., 2011). An often-cited study conducted by Clark (2001) defines early online educational programs. A virtual school is defined as, “an educational organization that offers K-12 courses taught through Internet- or Web-based methods” (Clark, 2001, p. 1). Barbour (2009) further defines the differences between virtual schools and what he terms cyber schools. Virtual schools can be state-wide, multiple school district, or province consortia, and provide courses to students on an individual basis, whereas cyber schools are full-time programs in which students participate for their entire school experience (Barbour 2009). Clark (2001) termed the course providers or consortia Virtual Charter Schools while the full-time schools he termed Local Education Agency-Based Schools. Between the years 2004-2007, cyber school enrollments tripled, but they still account for a small percentage of the overall population of students taking classes in an online environment (Tucker, 2007). While it is a small part of the overall population, during the years 2009-2011, 50,000 additional students enrolled in a full-time, online educational option (Watson et al., 2011).

Much of the research conducted in the online learning environment has been completed in large, state-sponsored virtual course providers, such as Florida Virtual School which does not provide full-time, comprehensive school programs for students (Black, 2009; Feng & Cavanaugh, 2011; Hawkins, Barbour, & Graham, 2011; Lemley, Sudweeks, Howell, Laws, & Sawyer, 2007; Liu, Black, Algina, Cavanaugh, & Dawson, 2010; Liu & Cavanaugh, 2011; Lowes, 2005; Wallace, 2009). In addition, more research has been conducted with older participants from post-secondary institutions and is sometimes used by policy makers and/or educators to make generalizations regarding K-12 education (DeTure, 2004; Dixson, 2010; Hung & Zhang, 2008). Neither of those segments of the population learning in online environments encompasses the group of learners who attend school in full-time, K-12 online environments.

Most of the current research surrounding those attending full-time, online schools is limited (Barbour & Reeves, 2009; Cavanaugh et al., 2009). Research reporting sometimes consists of personal experiences of practitioners in the field. For example, Greenway and Vanourek (2006) provide some history of full-time, online environments and then give examples of different types of programs, including a description of the typical day for a virtual school student. Revenaugh (2005-2006) shares her experiences as an administrator in an online school in Arizona, illustrating how online learning functions in a fully-virtual environment with stories of unique student situations. While engaging and informative, questions remain in the minds of policy makers regarding the effectiveness of a fully online education for students in grades K-12. In an article based on their research, Picciano, Seaman, and Allen (2010) state that without more public policy and study, fully-online programs are never going to be as widely accepted as blended programs. Black (2009) affirms that virtual schools should be leading the research in online learning. There remains a need for more systematic, organized research using full-time, online learning environments.

Research demonstrates that most students require a caring community to be successful in online learning environments (Archambault et al., 2010; Dzakiria, 2008; Kerr, 2009; Repetto, Cavanaugh, Wayer, & Feng, 2010; Ronsisvalle & Watkins, 2005). Online education is not fully asynchronous any longer as stakeholder interaction becomes more mainstream through blended learning and synchronous opportunities for students. Teachers find opportunities for students to participate with each other in the online environment using a variety of strategies including micro blogs such as Twitter™, blogs, peer feedback, and student mentors (Cavanaugh et al., 2009; Dixon, 2010; Nykvist, 2012, Zhao, Yan, Lai, & Tan, 2009).

Though policy makers and those responsible for school budgets may want to believe this is not the case, students who attend online schools still need teachers (Dawley, Rice, & Hinck, 2010; Zhao et al., 2009). In a survey of 220 school superintendents, assistant superintendents, and curriculum coordinators commissioned by K12, Inc., America's largest provider of curriculum and online education programs, 88% responded that it was extremely important to have teachers available to help students with individual needs when taking online courses (K12, Inc., 2012). In that same survey, 97% of respondents indicated that if students were engaged in full-time, online schooling, teachers were extremely important (K12, Inc., 2012). Teachers are reaching out to students in new ways using project-based learning and technology to decrease the distance between teacher and student with YouTube™, flipping the classroom, text messaging, and virtual role playing (Boling & Beatty, 2010; Fralinger & Owens, 2009; Herring, 2004; Rosa & Lerman, 2011).

Parents are one group of stakeholders virtually absent from literature related to K-12 online learning environments. Full-time, online schools often partner with parents to oversee and support students who are completing their education in an online environment. Though parents play a significant role in educating students who school online, the research is nearly silent on their roles. For the purposes of this research, the larger issue of parental involvement, and how it relates to the online environment, was explored.

### **Research Questions and Purpose**

The goal of every educator is to find solutions to help students be more successful. With that end in mind, this study focuses on two primary questions:

1. What factors affect student achievement in a K-12 online school?

2. What are the perceptions of parents concerning their role in the student achievement of their children while they were enrolled in a full-time, K-12 online school?

This study provides a glimpse into perceptions of parents whose children attended or are currently enrolled in a full-time, online school, and may better generalize to that growing school population. Policy makers are looking to technology to help solve the problem of teacher shortages or budget shortfalls. If online education is to be used for this purpose, it needs to be effective and systematic so students may find success. To that end, practitioners in the field must find methods to reach all of the students who walk through the door.

With a few notable exceptions, research pertaining to parental involvement in K-12 online schools of any configuration is nearly absent from the discussion (Black, 2009; Liu et al., 2010; Rice, 2009). Most American parents send their children to the local brick and mortar school to be mentored by a teacher at least 180 days each year. Even in the best blended or synchronous online environments, teachers are not in front of students daily in the same way they are in a brick and mortar school. Black (2009) maintains that parents who have students in an online school environment have a strong influence on the achievement of their students, but encourages further study using qualitative methods to determine perceptions and the roles of parents of students in virtual schools.

## **Methods**

### **Setting**

Online High School (OHS) is a full-time, virtual school in the Western United States. Ninety-five percent of the students at Online High School are full-time students, with the other 5% attending OHS part time and also taking classes at a brick and mortar high school part time. OHS is a public charter high school and demographically similar to the brick and mortar high

schools in the state where it exists. Special populations include students with special needs (>10% of the overall population), free and reduced lunch (>60%), a growing number of homeless students (<1%) and at-risk or emancipated youth (>20%). Populations that are not attracted to OHS are students who are Limited English Proficient (LEP) or students who are interested in activities that a virtual school has a difficult time providing, such as team sports or musical performance groups. OHS is a large virtual school with students in every county of the state where it is chartered.

OHS' instructional model is ideal for a study that could be generalized to the larger full-time, online school population for several reasons. OHS has large enrollments and, as it has been enrolling students for over 10 years, there is a significant population from which to draw. OHS also has some challenges, as many online learning environments do, including high student attrition. Seeking solutions to increase student achievement and parental engagement will aid OHS and other online schools by helping students increase the frequency and level of academic success.

### **Data Collection**

The most effective way to determine the perceptions of parents of full-time, online school students is through the use of a series of semi-structured, one-on-one interviews. Semi-structured interviews allow the researcher to collect data efficiently and give participants a chance to voice their opinions (Creswell, 2008; Marshall & Rossman, 2011). An electronic notice was sent to current and former parents of OHS students from the public directory information provided by OHS. This notice explained the research project and solicited volunteers for a follow-up phone call. Using the results from the electronic notice, all parent volunteers were contacted to determine which parents were suitable candidates for participation in this study. There were two

established criteria for parent participants in this study: 1) parents had a student enrolled at OHS for at least one semester between 2010 and 2012, and 2) students had either been successful at OHS or had not found success in the online environment.

After participants were recruited, a schedule was established for the first of two semi-structured interviews conducted, either face-to-face or electronically, using Blackboard Collaborate™ or Audacity™. The first interviews lasted 70-105 minutes each. All participants consented to a follow-up interview which lasted 35-55 minutes.

## **Results**

Using a group of eight volunteer participants, 16 semi-structured interviews were conducted, transcribed, and coded for themes to determine the perceptions of parents concerning their roles in the achievement of their child. These participants were a varied group with diverse journeys to having their children participate in online education. It is difficult to determine the perceptions of parents concerning their involvement in their students' education without spending some time describing the personal experiences that brought these families to online education. A greater understanding of the participants allows the reader to establish a paradigm for the parents' roles and the success factors of their students. Pseudonyms were provided to increase anonymity of all participants and their children as suggested by Creswell (2008) and Marshall and Rossman (2011). The table below describes the demographics of the parent participants in the order they were interviewed.

*Participant Synopsis*

*N=8*

<b><i>Pseudonym</i></b>	<b><i>Family Status</i></b>	<b><i>Education</i></b>	<b><i>Free and Reduced Lunch</i></b>
Hillary	<i>Same-sex relationship 2 children 1 learned online (F)</i>	Graduate school	Yes
Michael	<i>Married 4 children 1 learned online (M)</i>	College	Not sure
Melody	<i>Single parent 4 children 1 learned online (M)</i>	Graduate school	Yes
Maria	<i>Married 4 children 2 learned online (M/F)</i>	College	Yes
Cari	<i>Married 3 children 1 learned online (M)</i>	College	No
Nathaniel	<i>Married 4 children 1 learned online (M)</i>	Graduate school	Yes
Elizabeth	<i>Married 2 children 2 learned online (M/F)</i>	College	No
Shelli	<i>Married 2 children 2 learned online (M)</i>	Some college	No

All of the parent participants attended college at some point in their educational journey.

The mean online learning experience of the students in this group of families was 2.13 years.

Half of the families qualified for an internet subsidy while their children were enrolled at OHS, which is indicative of having a lower socioeconomic status or qualifying for free or reduced lunch. Within these eight families, 11 students were represented, with varying degrees of success in the online environment. Diversity in experience was evident within some families, as one student was often more successful or participated more fully than a sibling. Of the 11 students, six had negative experiences and the remaining five succeeded as online learners. Two of the students dropped out of OHS as their last school, passed the GED test, and are currently employed. Two left OHS to attend other online schools and three are attending other brick and mortar high schools. Three students remain at OHS, and are on track to graduate with their cohort.

The setting, structure or culture of the prior school attended by the children influenced many of the parent participants to select OHS for their children. Three participants removed their children from brick and mortar schools, enrolling them in OHS to help their children deal with social pressures.

Phoebe came to online learning in middle school and stayed through her first two years of high school. She was driven, very focused on her studies, and hoped that she would find a culture in an online school conducive to excellence. Her mother shared that the middle school she had attended was a negative environment for Phoebe, and Phoebe “hoped that everybody would be there [OHS] because they were really super focused on academics and wanting to work hard and learn a lot.” She found a wide variety of students in the online school. She successfully attended online schools for four years and will graduate this year with honors from her brick and mortar high school.

Michael's son, Gabe, came to OHS to flee from social pressures that caused him to try to take his own life more than once. Originally, Michael's wife responded to my electronic notice. When the phone call was made to ask if Michael's wife would participate in a longer interview, she responded that it was too painful a time for her to discuss. Later, Michael responded to the email request volunteering to participate. Remembering those high school years when Gabe was suffering he recalls:

"I guess he felt like he was picked on at times, and sometimes bullied, although he's a big kid. He's probably six-two or six-three, 230 pounds...He's a pretty sensitive kid, and he's really nice. He's just really a gentle giant type of thing, so I think he did feel intimidated by some of the kids at school."

Aside from bullying, other students came to OHS because they had debilitating social anxiety. Shelli's son, Porter resisted going to school for years. After a successful year in kindergarten, Shelli and her husband noticed that Porter was struggling socially in first grade. Their older son, Preston, would wave to his parents, jump out of the car and go on the playground, but Porter would refuse to get out of the car or go into the school building. Shelli noted during one of the interviews:

"...we literally had to drag him into school every day. After years of going through this with him, I mean, this went on through fifth grade, and after fighting him every day, every step of the way and him, you know, he would pretend that he was sick, and we didn't know if he was sick. I mean, this went on like I said, through fifth grade...It was just an emotional drain on us."

Porter and his family sought and found some relief with the online educational setting.

Multiple participants noted their students lacked motivation. While there was some communication between school and home in the brick and mortar school, by the time the parents were made aware that students were falling behind, it was too late for them to catch up. Maria shared that both of her students would come home telling her they had no homework and because she could not see exactly what they were doing in class all the time, she did not realize that they were struggling. “They always came home and said they never had homework, and then I would find out midterm that they were failing and they haven’t been doing their homework.”

Other participants sought the flexibility of the online setting. Three of the participants had sons with disabilities. Cari’s son, Christian, and Elizabeth’s son, Skylar, have Attention Deficit Hyperactivity Disorder (ADHD). Skylar also was diagnosed with Oppositional Defiant Disorder (ODD) shortly after starting at OHS. Shelli’s son, Porter takes medicine for his social anxiety that flips his day. He sometimes slept late into the afternoon, and virtual school gave him the opportunity to do his schoolwork in the evenings or late into the night. Elizabeth’s daughter, Lori was able to take on the responsibility of raising a guide dog due to her flexible schedule at OHS.

Physical illness drove Nathaniel to choose an online school for his son Brian. During the first semester of Brian’s sophomore year in high school, he contracted Swine Flu and was never able to go back to a traditional high school. He attempted to go back several times. During the interview, the family noted:

“He had a fever most days. He had several strep infections; I think he had six of them in a matter of two months. He had two years where he was feeling really sick, too sick to do anything on a daily basis. In fact he still feels some of the effects from it today.”

### Top 10 Frequent Codes from Interviews

<b>Successful Students</b>	<b>Number of Responses</b>	<b>Unsuccessful students</b>	<b>Number of Responses</b>
Parent Monitoring	37	Students need to be self-motivated	41
Students need to be self motivated	35	Parent available to support, encourage, coach	41
Time with student (positive)	29	Education cannot be one size fits all	36
Immediate Feedback for students	29	Students see relevance of education	35
Parent available to support, encourage, coach	29	Daily Schedule/lack of schedule	33
Being there makes a difference	28	Parent question and monitor	31
Flexible = preferred activity	25	Student needs increased accountability	29
Students see relevance of education	22	Student lack of participation	28
Student responsibility/accountability	21	Parent time requirement	28
Communication with school	18	Communication with school	27

Often, the participants had conflicting thoughts whether they had identified their student as successful or not successful. For example, the parents of successful students described students making their own schedules, setting a daily plan, and doing much of the work independently.

Hillary shared:

“One of the things that made me think from the beginning that an online school would work for [Phoebe] is that she is a person who can really just get up in the morning and get to work, doesn’t need to have much direction, is able to stay focused and

accomplish a lot. So very much a self-starter and somebody who is intrinsically motivated rather than extrinsically motivated.”

Parents of students who were unsuccessful online learners often responded that students could be more successful if they kept to a schedule or a daily plan and were self-motivated. For example, Michael shared that Gabe was capable of high level work “...if you can get him to do the work and apply himself. And that’s the real challenge with Gabe is the motivation and discipline to keep at it.” Both Hillary and Michael were sharing the same attribute of self-motivation, but sharing from different paradigms.

While interviewing the participants in this study, three main stakeholders emerged as present: parents, school, and students. Though the focus of this study was primarily on parental guidance and student success in the online environment, the full-time, virtual school also plays a role in facilitating parent and student success.

### **Communication: A two-way street**

Educational research in both brick and mortar and online settings indicates the importance of communication between school and home (Archambault et al., 2010; Black, 2009; Diaz & Entonado, 2009; Hawkins et al., 2011; Mandernach, 2009; Thomson, 2010a). Participants report communication with the school affects success in an online school (n=45). Parents also discuss the effect not communicating with the school had on the achievement of their children. When asked specifically about the frequency of communication with instructors or administrators, answers from the eight participants varied. Two participants communicated with staff as needed, three indicated communication occurred about once a week, one indicated they communicated with staff up to three times each week, and the last two indicated the frequency of communication was once per month. Electronic communication was more frequent, ranging

from daily (n=2) to once or twice per week (n=4) to every time email was received (n=1). One participant was unsure about the number or frequency of email communication with the school.

Communication with families at various points on the educational spectrum is highlighted in the literature. Thomson (2010a) notes academically gifted students learning online benefit from frequent and prompt communication from instructors, whether it is directed at the entire class or individual students. Additionally, at-risk students can benefit from positive relationships with caring adults, including school personnel (Archambault et al., 2010; Cavanaugh, Repetto, Wayer, & Spitler, 2013). All students can benefit from increased association with caring adults.

The most successful students in the current study were those who had parents who communicated with the school regularly. Many parents reported checking electronic mail daily and calling teachers or school personnel regularly. Parents also spoke about communication coming from the school as positive, especially as they realized that student-teacher ratios at OHS are high, and teacher time is valuable.

Just like in brick and mortar schools, relationships with school personnel are important in online schools. While parents had mainly positive experiences with teachers at OHS, all of them indicated the students would have connected with teachers more deeply had they been face to face. One parent relayed a very negative experience with a teacher that he felt was part of the reason his student dropped out of school. Another participant admitted that when her children were enrolled in a full-time, online school, she did not reach out to the teachers for help or resources, and her children are behind in credits as a result.

Regarding communication, participants also suggested the school communicate more fully about the resources provided to parents with the goal to help students be more successful.

Multiple participants recommended in the first stages of learning online that the school provide connections and resources to parents, including partnering them with veteran, successful parents, to utilize for assistance. Experiences with training were varied as Michael, Maria, and Melody all indicate training information from the school was sufficient. Cari advocates on-demand parent training to increase knowledge of how to operate the learning management system (LMS). She mentioned by the time the first days of school arrived she needed to fully understand how to navigate the LMS in order to help her son be more successful, and on-demand parent training could have improved that experience. Researchers suggest if time spent on the LMS is the most statistically significant variable to student success, then the LMS needs to be effectively organized for students (Liu & Cavanaugh, 2011, Roblyer et al., 2008). Participants in this study would add that parents need to understand how to use the LMS so they can assist their children, and indicate the necessity of the school communicating LMS training for families. Elizabeth cautions online schools that too much parent information can be overwhelming, and to provide it in usable chunks.

### **Transparency: Coming up vs. catching up**

Whether parents were relating past school experiences, speaking about current practice, or advocating for an increase, transparency in online education was indicated as an important way for schools to help students be more successful when learning online. Parents often spoke of the transparency the school provided in terms of electronic tools making it possible for them to help students be more successful. The experience Michael shared about his son, Gabe is illustrative of multiple participants in this study. He notes:

“In a traditional school, we were kind of behind the curve of knowing what was done and what wasn’t done. Because he would tell us everything was fine, paint a pretty

rosy picture until we found out that wasn't the case, and it was too late. It was a little different with the online school because we were closer to the real time of when he wasn't getting his work done.”

Multiple parents shared similar experiences regarding students who were academically successful in the online environment and those who were not. Both Maria, Elizabeth, and Cari selected to send their students to OHS hoping increased transparency would allow them to help their students be more successful.

A recommendation by Black (2009) is that online schools create systems for giving consistent and regular feedback to parents. This is an example of one of the problems with generalizing research conducted at online course providers to what happens in full-time, online schools. OHS has an extensive set of tools available for student and parent purview inside the Learning Management System (LMS). Students and parents have continuous access to student grades, time spent in each unit or lesson within a class, and on demand recordings of live class sessions. Maria shares that having this transparency is the best part about having her students in an online school. Maria notes:

“Knowing what your kids are doing and knowing their grades and how they're doing in school and seeing, you know, that's the best part. Knowing exactly what they're doing and being able to see their grades and their schoolwork, and they can't just say, 'Oh yeah, I did it' when they didn't. I like that part.”

While there is no peer-reviewed research about transparency in the online environment beyond the recommendation made above by Black (2009), participants in this study consistently pointed to the transparency of the virtual school technology system as a contributing factor in parents' ability to help students be successful. The experiences of the participants indicate that technology

is a barrier for students who are unsuccessful in the online environment. For parents who identified children as being less successful learning online, 22 instances during the interviews technology challenges were listed as a barrier to learning. Parents reported that when students could not log in to school, it was a readily available excuse to stop participating, and parents needed technology to work so that students would persist. In only two instances did parents of more successful students cite technology as a concern for their children. Technology should be transparent rather than a barrier to students while learning online (Kerr, 2009; Rice, 2009).

Transparency in technological systems can help students understand expectations for course assignments and increases feedback to parents (Black, 2009; Duncan & Barnett, 2009). Parents of online learners add to the literature when they advocate for full transparency in systems so they can monitor the progress of students. Participants with experience having students in both traditional and online school settings point to the tools available in the fully online setting, such as OHS provides, being superior and more transparent than experienced in the brick and mortar school.

### **Individualization: Learning is not one-size-fits-all**

For the participants in this study, individualized instruction proved far more important to parents who identified their students as being less successful than those whose students had been successful in the online environment. Thirty-six times in the five interviews conducted with parents of less successful students, participants mentioned the need for individualized instruction for students versus being cited five times in the other three interviews.

Online learning provided the freedom to minimize distractions or amend schedules to individualize instruction for students with unique needs. Archambault et al. (2010) support the participants in this study by noting at-risk students who are enrolling in online schools could be

better supported in learning by utilizing small group or individualized instruction, mastery learning or ABC not yet type programs. All of these options give students more freedom and flexibility in learning. Mastery based learning alone may not be sufficient to meet the diverse needs of students at-risk of failing.

Multiple participants in this study expressed the need to increase awareness of student strengths and weaknesses, designing an educational experience that suits individualized learning. Hilary, a university administrator, noted the difficulty of providing individualized education for students. Hilary noted:

“It’s one of the challenges of public school administration, of any kind, you know, whether it’s online or bricks and mortar, that you’re trying to meet the needs of so many different kinds of students with a fairly limited set of resources.”

Hilary reveals the reality that lack of resources is a barrier to individualized instruction in all educational settings. Black (2009) and Moore (1993) both identify additional obstacles when speaking about the high student-teacher ratios in online schools, and the considerable distance separating student and teacher. The administration and faculty at OHS struggle to meet these challenges daily, and parents recognize those challenges, but are still looking for solutions for their own children.

Parents enrolling students in an online school were hoping technology could fill this need to individualize instruction for students. For some, online learning and the transparency a virtual school provided did make a difference, and allowed them to tailor education to their students. For others, the current online education system was not individual enough. Michael gave some suggestions for future course designers. He notes:

“Nothing is impossible. In fact with technology, I suspect you could probably do it [tailor curriculum to each student]....How would you determine which one works for that person? So if you have a curriculum that was divided into different styles of teaching, and then even within that you’re going to have students that want to move really fast, students who grasp it really quickly, students who move a lot slower, students who like interactive things, other students just say ‘let me read it,’ and other students will want to have a lecture or video, they’re better at video than they are at audio. I don’t know but I think you’d have to have a variation of that entire [curriculum] put together, and then the students can maybe pick what helps them best out of that.”

Though he may not have known it, Michael was describing intelligent adaptive learning. This emerging technology may make completely differentiated instruction a possibility for students (Dreambox Learning, 2012). Because this technology is just entering the discussion, there are no peer reviewed studies to determine effectiveness or impact on student achievement. Responses from participants in this study indicate a desire for individualized technology to improve education for their particular students.

Whether it is in the allocation of resources, teaching to student strengths, mastery learning, or interactive technology, parents are looking for education to cease being one-size-fits-all, and to be individually tailored to meet the needs of their students.

Parents in this study express that students must be self-motivated, fully participatory, and accountable in order to increase achievement in the online learning environment.

### **Self-Motivation**

The themes of self-motivation, self-efficacy, or self-direction are consistent themes found in research regarding successful students in online school environments (Artino, 2008; Rice, 2006; Roblyer & Marshall, 2002; Ronsisvalle & Watkins, 2005). Participants in this study indicate parental involvement encourages students to increase self-motivation or self-reliance. The necessity of students being self-motivated to achieve success in the online school was the top concern for parents of non-successful students (n=41). Self-motivation was in the top two responses for parents of successful students, being mentioned 35 times during the interviews. 100% the students who were identified as successful going to school online were also identified by parents as being self-motivated or self-directed. Additionally, all parents who identified their children as being unsuccessful indicated that self-motivation would have increased success for their own children.

Evidence shows when learners have some control over their learning environment, they are more successful (Cavanaugh et al., 2013; Kerr, 2009; Rosa & Lerman, 2011; Thomson, 2010a; US Department of Education, 2009). Parents of children who are showing academic success and exhibit self-motivation indicate they are able to allow students to set their own schedules (n=11) and have choice in preferred activities (n=25). They also suggest students who are self-motivated do not need as much monitoring as others (n=13). One parent said once her child demonstrated she was going to be successful learning online, she just had to add water and watch her grow.

Not all of the participants in this study would agree with the idea that increased freedom equates to increased success. Online learning is full of freedom and independence, yet over half of the participants in this study had students who failed. Most parents indicated too much freedom is detrimental to student success. One parent pointed to flexibility and freedom in

learning as the reason her children are currently lacking the credits to graduate with their cohort group. Many students thrive with the freedom to make decisions about their own education as is noted in the literature, but the question remains does the choice and/or control create success, or are successful, self-motivated students inherently ready for freedom and control? It is not clear from the literature which is the case. Parents of students in this study would indicate additional choice or freedom without consistent involvement by parents could result in increased failure rather than increased success.

Participants also encouraged other parents considering enrollment in an online learning environment to examine the level of self-motivation or self-direction exhibited by the student to determine if online learning would be the best placement. Michael clearly stated that if the student is “unsure about what you want to do, or you’re hesitant or don’t really care for school, I think online school is a disaster.” Nathaniel echoed the thought that students must be motivated to go to school online. He noted:

“Ask them [other parents] if their child is highly motivated. If they are, I would say by all means, online school is a very good option. And if they were struggling to pay attention or to do their work in a brick-and-mortar school, I’d tell them to be very wary of it.”

One finding from this study was the most important characteristic of a successful online learner is belief in the learner’s ability or self-efficacy. Participants in this study echo the finding that self-motivation or self-efficacy does affect student achievement. Parents report that parental roles and level of involvement change with the level of self-motivation for the student.

Participants also advocate assessing the level of self-direction of the student prior to enrolling in an online school.

## **Student participation and accountability**

Research in online education supports the need for students to be motivated to participate and complete courses (Archambault et al., 2010; Artino, 2008; Picciano & Seaman, 2010; Roblyer & Marshall, 2002). In a full-time, virtual school, when school and family are so interrelated, it is important not to forget that participating students are vital to the equation. Participants in this study indicated students must be full participants in their education in order for online learning to be successful (n=49).

Parents of students at OHS corroborated Artino's (2008) finding that online learning does not work effectively if students are not involved or engaged. Nathaniel and Cari shared they had to sit with their children to get any participation from them. Cari related her experience with Christian going to OHS as a "full-time job"; if he was in class or working on an assignment, so was she. Christian would not participate and was not successful, even with that level of parent support.

Michael mentions if students are not independent or accountable, the online school is not going to "light a fire under them." Maria found just the opposite to be true for her children. Both Brock and Aria had attended regular public and brick and mortar charter schools prior to enrolling at OHS. In Maria's opinion, they were academically unsuccessful in their former schools, but this changed, especially for Aria, upon enrolling at OHS.

College students with prior online school experience during high school, who had successfully completed some of their education through an online program, were more likely to attend brick and mortar colleges and universities rather than trade schools or community colleges (Kirby, Sharpe, Bourgeois, & Greene, 2010). Nearly all students interviewed credited experiences learning online as preparing them to be more independent, responsible and self-

disciplined in their postsecondary studies. They found students indicate their experiences attending school online helped them develop independence and self-discipline needed to excel.

Experiences relayed by participants such as shared by Maria above, indicate the findings in Kirby et al. (2010) are accurate for some students. Other experiences related by parents of less successful children denote when students are not accountable or participatory in their own education, the benefits of increased self-motivation or the hope for added independence go unrealized. Multiple parents, who had difficulty eliciting participation from their children, thought it might be easier to do the work for their children than to fight them to participate; however, all noted even that would not have been effective. According to the parents in this study, no amount of parental involvement will be able to overcome an unwilling student.

### **Parents--Monitor, Mentor, and Motivate**

Multiple studies addressing student success in the online environment list parental involvement or adult mentoring as an important factor of that success (Archambault et al., 2010; Black, 2009; Cavanaugh et al., 2013; Feng & Cavanaugh, 2011; Liu et al., 2010; Liu & Cavanaugh, 2011; Repetto et al., 2010; Roblyer & Marshall, 2002). While studies identify the importance of having a caring adult or mentor to guide students while they are in the online environment, none discuss the perceptions or roles of parents in an online school. Research question two endeavored to uncover the perceptions of parents concerning their role in the achievement of their children while enrolled in a full-time, online school. In all cases, parents reported their roles to be that of monitoring, mentoring, and motivating.

Individuals who participated in this study were all actively engaged in the education of their children. All indicated they communicated with teachers multiple times each month, checked their students Learning Management Systems (LMS) several times each week, asked

their children about their school work every day, and helped with assignments many times each week. Those who indicated their students were not successful in an online school as evidenced by failing courses, dropping out, or being credit deficient, reported they were diligent in their roles, but were unable to get their students to participate.

When asked about time commitments of parents with students at an online school, parents reported they spent much more time engaged in learning with their students while they were in an online school than they spent when students were enrolled in a traditional school. If a student was spending 30 hours per week engaged in school activities, parents reported a mean of 13.8 hours spent engaged in learning with the students. The range was from two hours through 29 hours for the parent for every 30 hours the student spent. Parents of successful students reported spending less time with their students once routines were established. In sixteen instances, it was noted students who were more successful did not need as much monitoring as other students.

Beyond the time commitment, parent participants noted they felt that monitoring children included questioning about assignments, monitoring assignment completion (n=68), setting a schedule for/with the student (n=44), and advanced preparation of student materials (n=22).

Several studies have found negative correlations between parental involvement and student achievement at brick and mortar schools. Chen and Gregory (2009) and Fan and Williams (2010) both indicate parent communication with the school has a negative relationship according to student perceptions. Both authors postulate a reason for this negative relationship may be that by the time parents communicate with the school, students are in trouble due to a lag in academic performance or because of disciplinary issues. Only parents of less successful students related perceptions indicating monitoring causes conflict (n=12). Nathaniel remembers

many nights, after working all day, coming home to sit with Brian to ensure he was completing some work. He shared about half of the time, this level of monitoring caused discord, and Brian's work would remain unfinished.

Much of the research related to parental involvement is conducted in elementary settings and parental involvement abates as students get older (Catsambis, 2001; Chen & Gregory, 2009; Epstein, 2001). High school parental involvement research often centers on the relationship between parental aspirations and future success, or relationships between parents attending school activities and student success (Catsambis, 2001; Chen & Gregory, 2009; Fan & Williams, 2010; Mo & Singh, 2008). The type of daily monitoring required for parents of children in a full-time, online school is more like the teacher in the classroom. Participants in this study noted their roles being like a teacher many times (n=18) as well as providing advanced preparation of materials and/or schedules for students (n=55). Current research studies do not include effectiveness of this level of involvement and monitoring for parents. Chen and Gregory(2009) found high school students would prefer their parents to support them from afar. Researchers make the assertion teenagers would like their parents to be involved by expectation rather than by monitoring their homework or serving with the parent teacher association. The authors further explain this may be related to students asserting their autonomy in this stage of their lives.

Even with conflict or the possibility of negative relationships between parental involvement and student perceptions, the participants were clear that in the online learning environment monitoring was important to student success, and lack of parental involvement could result in failure. Shelli shares that both of her students are behind their graduation cohorts because of lack of monitoring in the later years that the boys attended online school. In the early years, when the boys were in elementary and middle school, Shelli's husband was able to be

home with them during the day to monitor their education, but a job change meant that both boys were home alone. Shelli shared:

“This last couple of years, the boys were kind of a little more on their own. So that’s kind of where we started to flounder, is because we weren’t here to...what do you call it? Keep an eye on them. And so basically, the older they got, the more we trusted them that they did their work, and they were doing what they were supposed to be doing, and they were doing the work while we were gone at work...I hate to admit, because they’ve got the whole house to themselves and they’ve got, you know, access to TV’s and video games and computers, and you know, so it was easy for them to want to slack off because they had nobody at home to monitor them.”

Along with monitoring progress at school, parents interviewed for this study indicated student mentoring was important when going to school online. Students are seeking connections and mentoring (Catsambis, 2001; Chen & Gregory, 2009). One way parents mentor students is by being available for them for immediate feedback. Thirty-eight times this theme of immediate feedback was discussed by participants. Parents encouraged students to reach out to teachers but knew that being available to help students when needed or requested made a difference in achievement for students. While there is a gap in the professional literature regarding parents providing immediate feedback to students, one study did indicate that students in a distance education program who got electronic feedback from teachers (more immediate) versus feedback by mail (less immediate) had greater academic achievement on the final exam in the course (Lemley et al., 2007). Being careful not to over generalize, parents of both successful and unsuccessful students discuss part of their roles when students are in a full-time, online school is

that of teacher (n=13). If parents are taking the teacher role, then more immediate feedback received from present parents could increase achievement.

Coupled with being available to answer questions or increase student understanding, parents report that a very positive element of their role included spending time with students and engaging in learning with their children. Mo and Singh (2008) found a relationship between positive parent/child interactions and increased student engagement in a traditional school setting. All of the parents in this study were engaged in the home environment with their students. They all report positive relationships with students, and point to experiences in the online learning environment as enhancing parent/child relationships. Because all learning happens in the home setting, often with parents present, all parents reported enjoying learning about student academic strengths and weaknesses (n=26). A benefit of children attending school in a full-time, online school is parents can try to motivate their students as they have an intimate knowledge of children and their needs. Many parents point to motivating students as important to their success. Cari talked about her increased understanding of her son, Christian and his ADHD. She shared:

“I learned a lot about Christian. About how he thinks and how he learns. I actually recognized more of the struggle he has to put thoughts together with the ADHD. I mean, that challenge, [I] understand a little bit more about how that makes things harder for him to put things together. Not that it’s impossible, but I can see the hurdles that he has to go through to do that. I did think it was a positive thing to get to know him better and do spend that time with him.”

Where some of the parents would question the finding above in Mo and Singh (2008) is in the claim of increased student engagement. Parents who could not engage students in high school

curriculum by sitting with them, attending class, or encouraging, would not say improved parent-child relationships amplified student engagement in school.

A unique aspect of full-time, online schools in this regard is parents can, and often do, attend class with their children. Multiple parents noted working through assignments and projects with students regularly. On occasion, a second time through the course for the parent helped their own attitude toward a difficult subject. Parents indicated 44 times during the interviews that time with their student, whether it was struggling through a proof in geometry or just being able to eat lunch together, was a positive outcome of being part of a full-time, online school. Parents of students interviewed for this study suggested an important parental role in an online school is motivating their children to strive to attain a better future. Research conducted in brick and mortar settings suggests parental aspirations for children are related to future student success (Catsambis, 2001; Chen & Gregory, 2009; Fan & Williams, 2010; Mo & Singh, 2008). Researchers suggest parents who discuss with their children their future expectations positively affected the academic success or failure of those students. Fan and Williams (2010) also found a strong correlation for parental aspirations. They suggest high school students who knew their parents were engaged in their education exhibited increased confidence in their own abilities and were more interested in school. All of the parents in this study shared specific hopes and dreams for their children, taking opportunities to impart those expectations and dreams to children directly through conversations and by example. When a student struggles to succeed in school, parents sometimes have to re-evaluate their aspirations for that particular student. Nathaniel discusses this experience when his son, Brian dropped out of school and took the GED test rather than earning a high school diploma. He shared:

“When your child is born, you have certain expectations and hopes. And as they get older, you discover that they have a mind of their own and interests of their own. And as a parent, you try and adjust your dreams and aspirations and try to help them succeed. I guess that’s how we’ve dealt with it. It’s been a very painful process though.”

Parents continue to share aspirations with their students through school and beyond, hoping to affect the future for their students.

Aspirations research is effective for students who are successful in school, and researchers show that it makes a difference in academic achievement (Catsambis, 2001; Chen & Gregory, 2009). The participants in this study all explicitly shared their hopes, expectations and dreams with their students, yet, over half of them failed. They were involved in student activities from booting up the computer through checking grades on the assignments, yet sometimes they could not rouse students from their beds. Parental involvement and parental aspirations did not improve student achievement for the two students who dropped out of OHS and never finished a high school diploma. In this way, the shared experience of parents does not match some of the current literature regarding parental aspirations affecting student achievement.

In fifty-seven instances during the 16 interviews, parents determined helping students discover the relevance or importance in their own education as a factor to increase success. In this study, parents repeatedly related their experiences with children acknowledging the importance of education as a factor in their success. Maria’s experience with Aria illustrated student awareness of the relevance of an education in their lives can make a difference in performance. She stated:

“I think she [Aria] has finally learned the importance of school and an education.

I don’t think she cared before. It was all about boys and socialization. And she’s come to

realize that school is important; it's something you need. You need an education to go on.

And I don't have to make her, and I used to nag her all the time.”

Michael, whose son Gabe struggled to find relevance in school, encouraged parents to be supportive of students and to guide them toward an understanding the importance of planning for the future. Michael stated:

“Every child is different and so you just have to find what their skills are and try to build upon those skills and try to keep them vested in their future, recognizing the fact that I think the hardest thing with teenagers is to get them out of the here and now. That they will actually have a future and they should probably do something now to prepare for that.”

Students like Gabe and Aria have different educational experiences and outcomes, but their parents have the same desire for them. Parents recognize education is the key to a better future and a more productive life for their children. Even if children do not understand educational relevance currently, parents hope they will someday grasp those ideals to create a better future. It was because of this hope that parents made the sacrifice of time and energy to monitor, mentor, and motivate children while they were enrolled at OHS. The experiences of parents in an online school indicate that in a full-time, online school, the primary roles of the parent are to monitor, mentor, and motivate.

## **Conclusions**

No single factor affects student achievement in a full-time, online high school. The shared perceptions of participants demonstrated achievement for students is affected by the performance of school, students, and parents. Scholars and parents agreed that the online school must communicate effectively in multiple ways with both parents and students (Archambault et

al., 2010; Black, 2009; Diaz & Entonado, 2009; Hawkins et al., 2011; Mandernach, 2009; Thomson, 2010a). Parents agreed full communication about resources would encourage families to engage in school more effectively. The experiences of parents add to the literature when they advocate for parent training on demand and partnerships with veteran parents during school start-up. Parents also illuminated the fact that when parents do not utilize the resources provided by the school or communicate with school personnel, students fail.

Participants in this study overwhelmingly appreciated the transparency provided for them in the LMS. Parents had full and continuous access to student grades, progress, time spent on lessons and units, and on-demand recordings of live class sessions. Parents indicate that knowledge of student progress gave them the tools they needed to assist their children. Scholars do indicate that time on the LMS is a significant variable related to increased academic achievement (Liu & Cavanaugh, 2011; Roblyer et al., 2008). The school must provide transparency to families through tools in the Learning Management System and information about student growth to parents. Parents of students who were not as successful were grateful for the tools provided by OHS, but transparency alone did not motivate or inspire increased success when learning online.

Finally, schools must also seek to individualize the student learning experience. Parents of students who were already struggling in school sought out a different experience for their children at a full-time, online school (Morabito, 2011). In some instances, the flexibility and control students had online was helpful and motivated students to be more successful as the literature indicated (Cavanaugh et al., 2013; Kerr, 2009; Rosa & Lerman, 2011; Thomson, 2010a; US Department of Education, 2009). In other cases, that freedom increased failure. Emerging technology utilizing adaptive computer testing to fully individualize the student

educational experience (Dreambox Learning, 2012) is promising, but too new to be vetted by research. Parents of children who were unsuccessful in the online learning environment admitted their children have been unsuccessful in multiple school settings, but indicate again they are looking for education to adapt to fit the particular needs of their student. It is in this way that they believe their children will experience success.

Students must be self-motivated, engaged in curriculum as a full participant in their own education, and held accountable. Research in online education supports the need for students to be motivated to participate and complete courses (Archambault et al., 2010; Artino, 2008; Picciano & Seaman, 2010; Roblyer & Marshall, 2002). Parents of children who were self-motivated, fully participating, and accountable found the transition to a full-time, online school to be pleasant and rewarding. They not only watched their children achieving and thriving in the online environment, but also could participate in learning themselves. Parents who identified students as not being successful were very involved, sometimes sitting with students for every lesson. Yet, they struggled to get students out of bed some days, and half of the children failed. Their experiences validate the research that students who are unwilling participants will not be successful learning online. While there is limited literature regarding the consequences of not being motivated to participate, the experiences of parents adds to the body of knowledge noting when students are not accountable or participatory in their own education, any benefit of increased independence or self-motivation provided by going to school online are unrealized. Parents are critical to the success of their children by being available to monitor, mentor, and motivate on a daily basis. Parents perceive their role as vital to children being successful. The parental roles vary based on the motivation level of the child, with self-motivated students needing reduced involvement from parents than less motivated students. Unfortunately, there are

occasions when parents are unable to inspire their children to be active participants in their own education. In those instances, students are unsuccessful and often fail. If students are unwilling to be involved in their own education, and parents are unable to motivate them, it is rare that an outside force, such as the school, would be able to either.

The question regarding the factors affecting student achievement in an online school is as complex as the students who enroll. Students are not widgets, and cannot be expected or predicted to always act a certain way. That is what makes education of all types so complicated. Students are influenced by continuous involvement by their parents when they are going to a full-time, online school. As was evidenced by the experiences of the parents in this study, all of those variables influence success or failure of students, but unfortunately, not one is the solution for all students.

**THE EFFECT OF PARENTAL STRUCTURES ON HOMESCHOOL  
ACADEMIC ACHIEVEMENTS**

Title: The Effect of Parental Structures on Homeschool Academic Achievements

Author: Nalungo Nsombi Harkness Ed.D.

Homeschooling Parent

Address: 408 Keswick Ave, Davenport, Florida 33897

## **ABSTRACT**

The rebirth of homeschool is expanding the format of education. As parents consider alternative options of education, the need for in depth knowledge is pertinent. The objective of this study was to determine the relationship between specific variables of homeschool parental structures, culture, age, and gender against eleventh grade homeschool academic achievements. This study examined the parental structures impact on the eleventh grade homeschooled student's academic achievements. To accomplish this study, six research questions guided the investigation into homeschool parent(s) demographics to determine if a relationship existed between the parental structures and the academic achievements of the eleventh grade homeschooled students. The study utilized a quantitative research methodology that employed a demographic questionnaire and archived data as the data collection method. The demographic questionnaire evaluated the parents (a) gender, (b) culture, (c) sexual orientation, (d) age, and (e) relationship status. The results of this study implied that the majority of parents who homeschool students in the eleventh grade are married females of white decent between the ages of 30 to 50 years old. It was also determined from this study that a positive relationship exists between married couples and academic success of eleventh grade homeschooled student. This study affords knowledge to parents on how parental structures impact the academic success of homeschooled students.

# **Improving the Design Framework of Problem-based Instruction in Mathematics Based on the Student Model**

Graduate School of Decision Science and Technology,  
Tokyo Institute of Technology,

2-12-1-W9-22, O-okayama, Meguro-ku, Tokyo, 152-8552, Japan  
yurie@et.hum.titech.ac.jp and matsuda@et4te.org

## **ABSTRACT**

We proposed an online design framework for problem-based learning in mathematics and developed e-learning materials in HICE 2013. In the present paper, we revise the design framework based on results of trial lessons and improved the e-learning materials. Secondly, we employed it to conduct new trial lessons, and assess the effects of this revision. Thirdly, we discuss a student model that outlines the required elements for students to perform mathematical problem solving in their daily lives. We conclude by revising our framework and e-learning materials based on the results of the new trial lessons, and the student model.

## **INTRODUCTION**

### ***The issue of “problem-based learning” in high school mathematics in Japan***

According to the PISA 2009 survey (OECD, 2009), Japanese 15-year-old students achieved the highest scores on the mathematical portion of test. However, a National Institute of Educational Policy Research [NIEPR] (2007) survey revealed that 17-year-old students could not reach a satisfactory score level on the Mathematics-I test, which consists of problems that students should be able to solve at 15. The survey also asked students' attitudes toward mathematics; results showed that the percentages of students who replied, “mathematics lessons are enjoyable,” “mathematics is useful in daily life,” and “I

tried to use mathematics in daily life” were very low.

In order to improve this situation, the National Course of Studies (NCoS) was revised in 2009. The revisions introduced problem-based learning into the compulsory subject “Mathematics I” and one of the optional subject “Mathematics A”. The introduction of problem-based learning was intended to raise students’ interest and motivation, cultivate their use of mathematical views and ways of thinking, and prompt them to study mathematics independently by making time for performing authentic learning activities (Ministry of Education, Culture, Sports, Science and Technology [MEXT], 2009). In addition, problem-based learning was expected to prompt students to employ information and communication technology (ICT) in a positive manner in order to use mathematics in daily life.

However, it is doubtful that problem-based learning will play this role in the new curriculum—no MEXT-authorized textbooks provide appropriate problems, and few textbooks provide appropriate instructions for problem-solving strategies. This situation is unlikely to change, with Matsuda and Masuda (2011) noting that student teachers could not make appropriate lesson plans for problem-based learning. Although teachers could explain the necessary features of problem-based learning oriented lessons, the problems chosen for lesson plans were not concerned with daily life and each had a single correct answer. Teachers were, therefore, forced to explain the problem solving method of each problem for learners to reach the correct answer. Moreover, teachers did not change problems which selected for lesson plans and did not use ICT in the lesson plans, even though they were pointed out issues in their lesson plans with performing microteaching.

### ***Development of e-learning material for problem-based learning in mathematics***

In order to improve the present teaching situation, Ito and Matsuda (2013) developed a lesson plan and e-learning materials appropriate to use in problem-based learning.

- 1) We saw the objective of problem-based learning as cultivating the ability and positive attitude towards solving problems faced in daily living using a mathematical approach.
- 2) We believed that, rather than scientific problems, technological or social-scientific problems should form the core topics of problem-based learning lessons; such problems are suited to being approached from both a practical and a statistical standpoint.
- 3) We posited that it was necessary to emphasize the plurality of available answers, which are dependent both on the different formulations of a problem and the different data used for analysis. To do so, we provided a problem in the form of an ambiguous expression. We also decided to provide two or more data items, or not to show all of the data at the outset, providing it to students progressively. In order to do this, we made a learning process cycle following the four sub-processes defined by revising Hirabayashi and Matsuda (2011)’s framework: problem understanding, generation and assessment of alternatives, decision making, and reflection. Furthermore, we constructed a lesson plan by repeating the cycles with changing situations, and

a range of factors, both simple and complex.

- 4) We supposed that each e-learning item should be completed within 50 minutes. Therefore, we suppose that each cycle should be designed to be as short as possible so that all students can finish the minimum number of required cycles during the lesson.
- 5) When we guided students towards a problem-solving method, we prompt them make an appropriate decision given a particular set of choices without spending too much time on calculations, diagrams, etc. On the other hand, when we prompted students to practice the use of the method, we asked them to generate various alternatives and make decisions about choosing mathematical ways of thinking, methods to employ them (including methods of calculation and diagram drawing), and ways of interpreting the results.

The topic for this lesson is “Which choice leads to more profit: employment immediately following secondary school or after graduating university?” This problem has no specific answer, and there are many approaches to solving it.

In the first cycle, we explained the basic process: evaluated profit according financial value, showed the annual income data of workers from 24 to 40 years old, and then prompted students to compare the sum total (lifelong wages). In the second cycle, students were prompted to consider the income earned by workers aged 18–24 years old, in order to examine high school graduates and tuition for obtaining a Master’s degree at a university. Because the data we showed in the first cycle did not include the incomes of workers aged 18–24 years, we guided students toward a method of estimating them by applying a function to the data. We provided a linear function, a quadratic function, an irrational function, a logarithmic function, and an exponential function, which may be chosen in Microsoft Excel. In the third cycle, we prompted students to estimate the income of workers over 40 years of age in a similar way. In the fourth cycle, we prompted students to consider expenditures other than tuition. In the fifth cycle, we prompted them to consider different views of profit.

To aid students in understanding the problem, we presented them with different alternatives for problem solving. To help choose between alternatives, we prompted students to consider which functions were suitable for extrapolating and interpolating. Then, we showed students the function chart and asked them to choose the most appropriate equation. Following this, we asked them to read numeric values of  $f(X)$  corresponding to a given  $X$ , for all functions. During the decision-making process, students chose the best approximate function. After reflecting, they concluded which scenario yielded more profit by assessing the predicted results. Following this, we suggested that it may be important to consider other factors. In the process of evaluating and reflecting, we prompted students to consider whether the specific conclusion we reached was adequate, and showed the implications of choosing other factors

After such a lesson, students appreciated the usefulness of functions, and began to feel that mathematics was practical in daily life. Moreover, in line with problem-based learning, many students were able to apply the method that they learned to the material, discover their own dilemmas in daily life,

build hypotheses in their own ways, and collect information and solve the problems. Nevertheless, several issues emerged.

- a) Because we let all students experience the same activities, the lesson could not fit the individual differences between students.
- b) Because of time restrictions, we omitted the Rational Judgment process contained in Hirabayashi and Matsuda's framework. Therefore, the student might have come under the impression that any function may be applied instinctively, without evaluating the validity of the choice.
- c) Some students did not understand the appropriate manner of problem solving using a mathematical outlook, and submitted reports did not achieve the goals of problem-based learning.
- d) In the Review process, emphasized letting students recognize that it is not easy to judge "Which choice leads to more profit?" rather than letting them review adequacy of their problem-solving activity. However, since one of the learning objectives was to improve students' performance on problem-solving activities, it was necessary to let them review their activities.

In addition, we needed to discuss the guidelines of the e-learning materials in greater detail in order to develop the materials for various problems.

## **PURPOSE**

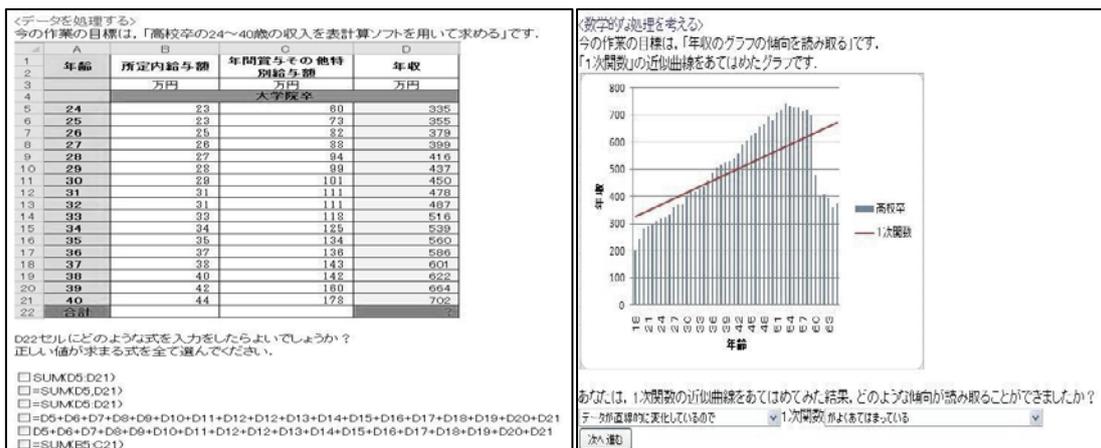

In the present paper, we improve our e-learning material and our design framework. In addition, after conducting new trial lessons for formative evaluation using the revised material, we discuss a student model for improving and refining our framework with reference to the obtained results.

## **REVISION OF THE MATERIAL AND THE DESIGN FRAMEWORK**

The following revisions pertain to issues discussed in a) – d) in the previous section. Improvements are listed with corresponding capital letters.

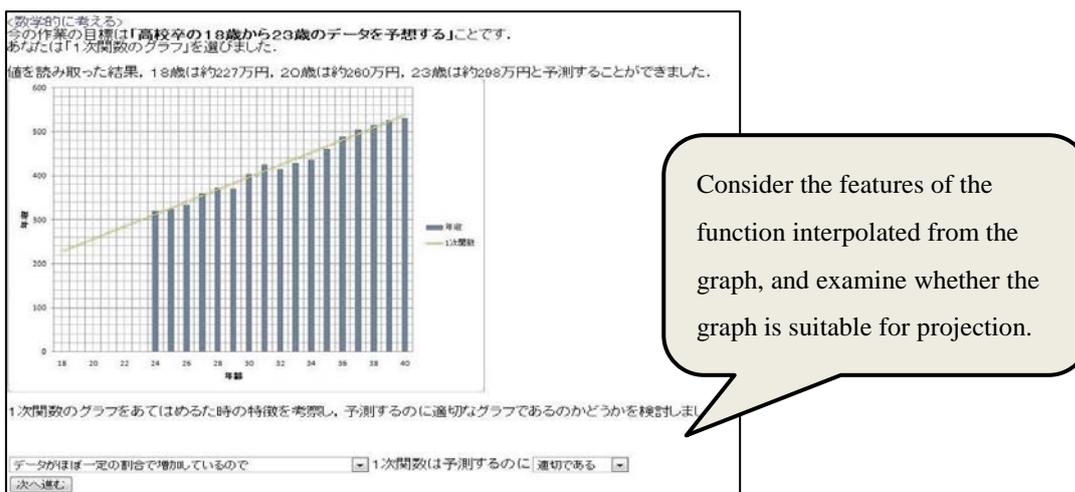

- A) As MEXT (2009) mentioned, in order to solve daily problems through mathematics, ICT use is helpful but not required. Therefore, we added a choice to the mathematical understanding aspect of the process to provide students with the skills to use Microsoft Excel (Figure 1 - left). In this task, students were asked to consider a formula to be entered into a cell, learned how to make a graph, and approximate functions. This task can be added to various e-learning materials for

problem-based learning. Moreover, in order to cultivate the ability to examine and express phenomena mathematically, we asked students to consider the kinds of features that a function must have according to a particular graph. For example, in this case, it is desirable to apply a linear function from 18 years to 55 years and a quadratic function whose inclination is negative after 55 years, but it depends on students which function is applied. In addition, students were prompted to examine whether an error between the values derived from the function and the data was sufficiently small (Figure 1 - right).

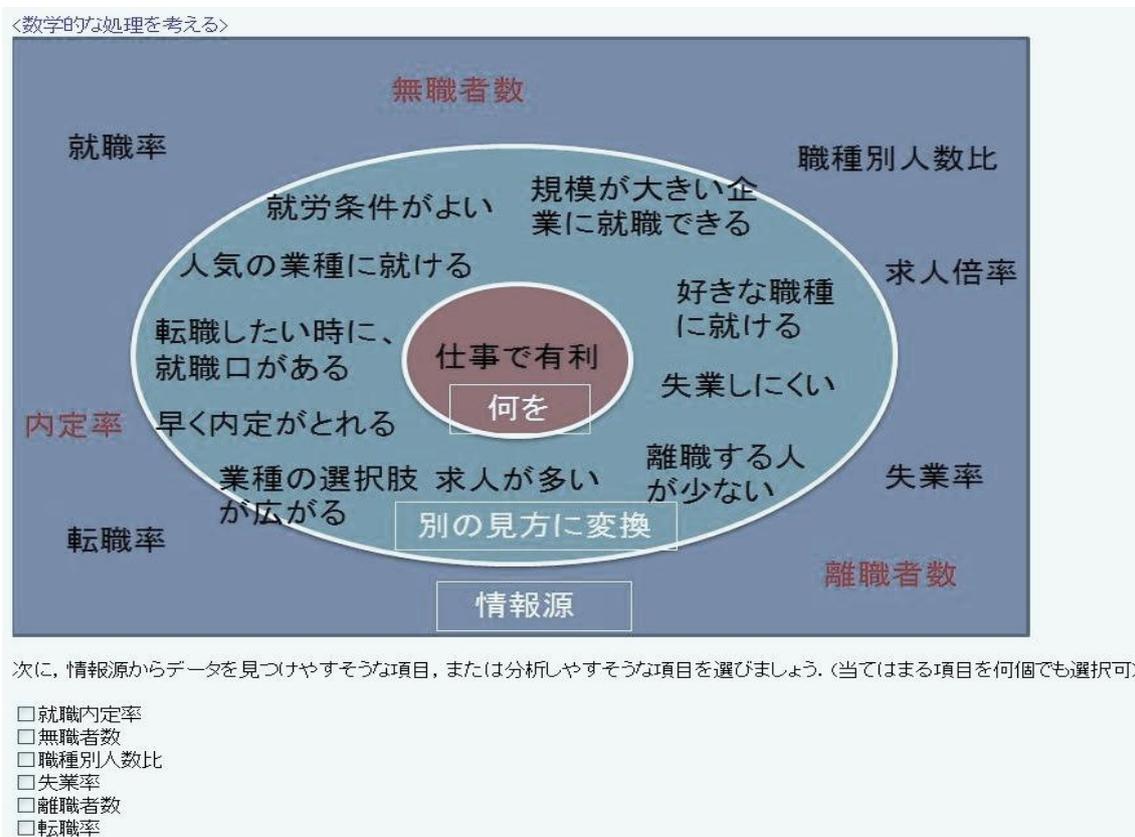

**Figure 1**  
Activities using Microsoft Excel in cycle 1.

B) We added the rational judgment process in order to examine the validity of each available alternative. In order to employ practical ways of thinking, we asked students to examine aspects such as the validity of the range of values stemming from a particular function (see Figure 2).

**Figure 2**  
Examining the validity of selected function in the rational judgment component.

C) Before solving the problem, we explicitly showed the rubric discussed in D) as an advanced system of organization (Ausubel 1963) that outlines the flow of problem solving, and guides the use of mathematical approaches. In addition, although we let students consider benefits other than money in cycle 5 of previous material's iteration, we did not explicitly guide them to treat it mathematically. We simply offered that they use the method to generate ideas, as shown in Figure 3; let students express "profit" in another word, such as "better to choose jobs," → explain their initially derived profit concretely, such as "possible to choose a job that has better conditions," "more choices of jobs are available" → to have statistical data to quantitatively compare with a different definition of profit.

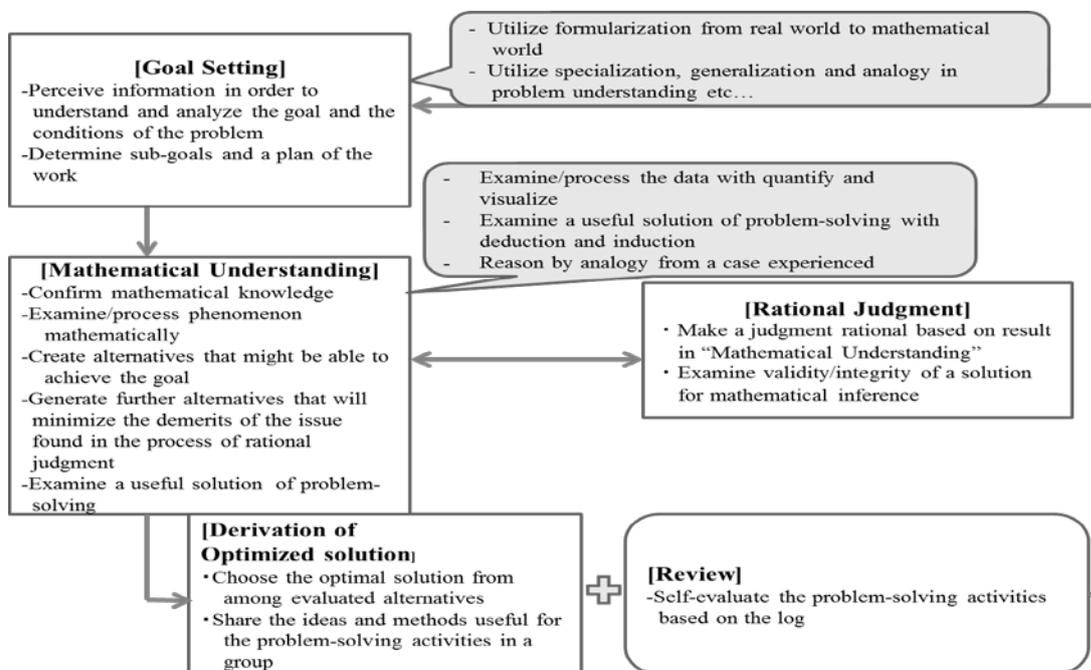

**Figure 3**

*An example to use the method to generate ideas presented to students.*

D) After learning how to engage in problem-based learning using this material, each student derived a problem of his or her own and solved it. In order to help students improve their problem-solving skills, we offered a rubric to self-evaluate their problem-solving approach (see Table 1). We set rubric levels based on how students performed the task which should be performed in each process appropriately.

	Level1	Level2	Level3
<b>Understanding problem</b>	In each process of such as “building up a hypothesis →setting sub-goal,” students could not understand a problem with utilizing views and ways of thinking abstraction and specialization and so on.	Students could understand a procedure of problem-solving activity , however, they could not understand how views and ways of thinking should be utilized.	Students could understand a procedure of problem-solving activity in “Understanding problem” and could solve a problem with views and ways of thinking such as abstraction and specialization in the process.
<b>Thinking mathematically</b>	Students could not utilize domain-specific knowledge and process mathematically with views and ways of thinking such as quantify, visualize and functional views and ways of thinking.	Students could utilize domain-specific knowledge, however, they could not process mathematically with views and ways of thinking such as quantify, visualize and functional views and ways of thinking.	Students could understand a procedure of problem-solving activity in “Thinking mathematically” and could solve a problem with domain-specific knowledge and views and ways of thinking such as quantify, visualize and functional views and ways of thinking.
<b>Thinking reasonably</b>	Students could not consider trade-off relationship about each alternative solution.	Students could understand trade-off relationship about alternative solution, however, they could not utilize various views and ways of thinking.	Students could understand trade-off relationship about alternative solution with various views and ways of thinking and store domain-specific knowledge correctly and could apply it.
<b>Thinking result</b>	Students could choose the optimal solution from among evaluated alternatives, however, they could not examine solution based on problem-solving activity so far.	Students could choose the optimal solution from among evaluated alternatives based on problem-solving activity so far in each process, however, its contents is not logical.	Students could choose the optimal solution from among evaluated alternatives based on problem-solving activity so far in each process, and its contents is not logical.
<b>Review</b>	Students review problem-solving activities based on the log, however, self-evaluation in each process is not consistency of real activity result. In short, they could not acquire meta-cognition knowledge.	Students review problem-solving activities based on the log, and self-evaluation in each process is consistency of real activity result. In short, they could not acquire meta-cognition knowledge.	Students review problem-solving activities based on the log, and self-evaluation in each process is consistency of real activity result. In short, they could not acquire meta-cognition knowledge. Moreover, they could perform mutual assessment as comparing with others evaluation.

**Table 1**  
A rubric for teacher evaluation and students' self-evaluation

**Figure 4**  
Design framework of e-learning materials for problem-based learning in mathematics.

## **FORMATIVE EVALUATION**

In July 2013, we performed practice lessons using the developed e-learning material for 196 tenth-grade students (ages 15–16) who comprised five classes at the Tokyo Tech High School of Science and Technology. The lessons lasted 50 minutes and consisted of the following steps: (1) The teacher explained the purpose of the lesson, (2) the students learned through e-learning material, and (3) the teacher explained their summer vacation homework. Therefore, we needed to design our e-learning material to finish by the third cycle—that is, within 30 minutes—for all students.

We asked the students to complete a pre- and post-questionnaires that consisted of the following items rated on a 5-point Likert scale:

Pre-1) I think that it is difficult to solve this problem mathematically.

Pre-2) I will think that mathematics is useful in daily life if this problem can be solved mathematically.

Post -1) I understand that mathematical functions are useful in explaining familiar phenomena.

Post-2) I think that mathematics is useful and helpful in my actual life.

Post-3) I would like to consider a familiar problem using mathematics by myself.

Post-4) I could understand how to perform problem-based learning over summer vacation.

We also referred to a log of the students' activity in the material, and a tentative report on problem-based learning submitted during their summer vacation.

We analyzed the data and assessed the effects of the new material by comparing it with the data from the previous year. To ascertain whether students' problem-solving improved, we examined the log and the report on problem-based learning. Based on our assessment, we understood the students' thinking and reconsidered our student model and design principle.

In the improved material, we considered that students performed with paying attention to the necessary tasks and utilization of mathematical views and ways of thinking in each process since we show them explicitly according to the analysis of their self-evaluation and comments.

## **DISCUSSING A STUDENT MODEL AND REVISIONS TO OUR FRAMEWORK**

We have developed the material for problem solving by converting the design framework developed by Hirabayashi and Matsuda (2011) into mathematical education. However, the current rubric is insufficient to examine the effects of the material, evaluate the validity of the design principle, and give appropriate feedback to a student. It is, therefore, necessary to establish a structure that can evaluate a student's acquisition of problem-solving skills. To do so, we considered that a student model is necessary

as in a design of intelligent CAI (Computer Assisted Instruction). Matsuda (2013), for example, has been developing a model for virtual mathematical lessons/games, which was also based on principles derived by Hirabayashi and Matsuda (2011). Unlike the present research, however, it focused on assessing necessary knowledge; our study, meanwhile, assessed the design of instruction materials.

### ***A Matsuda-based model for students***

Bruer (1993) claimed that domain-specific knowledge, metacognitive skills, and general strategies are all elements of human intelligence and expert performance. On the other hand, Matsuda's (2013) student model for mathematics education consists of domain-specific knowledge, mathematical views and ways of thinking (instead of metacognitive skills), and knowledge of problem-solving scripts (instead of general strategies).

Bruer (1993) illustrated a variety of different general strategies ranging from study skills to means-end analyses. He noted, however, that they are not easily transferrable without informed instruction. On the other hand, scripts are sets of procedural knowledge that represent appropriate behaviors for situations or places (e.g., restaurants). This type of knowledge is learned experientially, and depends upon specific situations. Matsuda believed that Hirabayashi and Matsuda's problem-solving framework should be taught as the ideal problem-solving script. Nevertheless, Matsuda also noted that no problem-solving scripts are explicitly presented to students as part of mathematics education, leading students to experientially learn their own scripts (e.g., trial-and-error problem solving).

Although the names of the five processes are slightly different between our framework and Matsuda's, the processes' purposes correspond to one other (see Figure 4). Matsuda's model, however, assumes that students learn their own problem-solving scripts empirically, and purpose of his model is to simulate different reactions of students according to appropriate/inappropriate instructions. On the other hand, our framework examined the ideal problem-solving scripts that should be used alongside e-learning materials. Therefore, the tasks, views, and ways of thinking required for each process should be reconsidered. It becomes necessary, in turn, to link information technology education with mathematics education. Hirabayashi and Matsuda's framework closely corresponds to the design process that International Technology Education Association [ITEA] (2007) suggested for technology education, and it is understood as a general method of problem solving. Conversely, it is assumed that the mathematical solution is necessary in a series of problem-solving process. Therefore, the flow of mathematical problem-solving would be to explicitly set the goal of quantitative thought in the goal setting process, to think and process mathematically in the mathematical understanding component, to examine the validity of the approach and its resultant solution closely in the rational judgment component, and to judge which solution should be chosen in a real context.

According to Sannomiya (1996), meta-cognition consists of meta-cognitive knowledge and activities, with the latter consisting of monitoring and control. We consider that monitoring corresponds

to assumptions about thinking, and control corresponds to a manner of thinking. Unlike meta-cognition, mathematical views and approaches are the aim of mathematics education according to Japanese teaching guideline. However, in our research, we changed the information technology approach present in Hirabayashi and Matsuda's framework to a mathematical approach. Nevertheless, students should be required to collect data and consider whether they use ICT or not, in order to apply functional problem solving approaches. This means that they would be required to use informatic and systematic views and ways of thinking, as well as mathematical ones, in problem-based learning. Therefore, we need to add mathematical approaches to each of the processes present in Hirabayashi & Matsuda's problem-solving script. In addition, Matsuda (2013) notes that mathematical views and ways of thinking are related to the ability of independently learn domain-specific knowledge, and the ability to discover one's own errors. Therefore, in the mathematical understanding and rational judgment processes, it is necessary to place that utilization of mathematical views and ways of thinking related with acquiring mathematical knowledge and inducing and examining a solution.

Domain-specific knowledge is modeled on the semantic network (Collins & Quillian, 1969). Since long-term memory is not lost but temporarily unavailable, Matsuda's model focused on explaining how knowledge may be activated and utilized. Therefore, his model emphasized chunking of knowledge, like the frames (Barr & Feigenbaum, 1981) used in artificial intelligence. Our framework needs to instruct students and evaluate whether they can learn new information through chunking, as well as whether they can acquire necessary knowledge by themselves using a particular approach. In addition, we considered that the direction and the strength of connections among different knowledge types, and between knowledge and a particular situation, is important in explaining differential ability to remember problem-solving information. Our framework also needs to contain processes to evaluate and instruct with a focus on the direction and strength of connections between various aspects of knowledge because they are concerned with knowledge activation mechanism (Matsuda 2013).

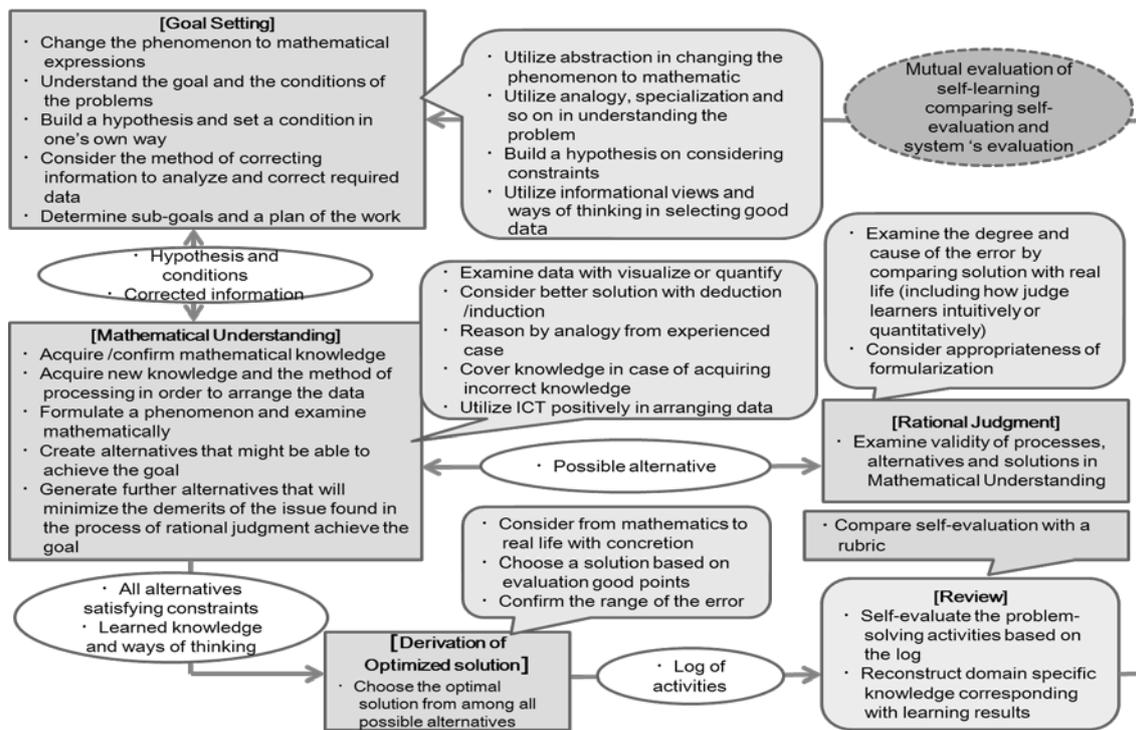

### ***Tasks, procedures, and use of views and ways of thinking in each process***

Based on the student model, we revised the framework, as shown in Figure 4. In this revision, we demonstrate how mathematical views and ways of thinking need to be employed in each process. We also revised the task pertaining to each process.

In the Goal Setting process, students must engage in analogical thinking by recalling past solved problems; not by focusing on superficial similarities, such as topics, but structural similarities, such as limiting conditions, goals, and methods of problem solving using mathematical approaches. We therefore included the exercises in the understanding of limiting conditions, building an individually suitable hypothesis and specializing to postulate conditions. In addition, when correcting data, students must incorporate information technology approaches such as thinking of further useful information and examining the use of ICT to correct and process it.

In the Mathematical Understanding process, students must formulate the problem mathematically through functional and series approaches, quantifying and visualizing. If students hold incorrect domain-specific knowledge, it is necessary to acquire correct knowledge. In the Rational Judgment process, students conceive of various alternative solutions and examine more appropriate options, while considering validity of alternative solutions. Additionally, examining error size is important to this latter component.

In the Derivation of an Optimized Solution process, students select a solution that appears to be the best out of all available choices, while considering constraints. The Review process is the process of self-evaluating students' problem-solving capacities based on the log of the problem-solving process so far. After completing several cycles, students compare past the results of self-evaluations and the results of the systemic evaluation, deriving a general evaluation from the two. These connections between tasks in the processes and the methods of instructions should be considered in devising the framework.

**Figure 5**

*Revised design framework of e-learning materials for problem-based learning in mathematics.*

## FUTURE PERSPECTIVES

We must review the student model and the design of the e-learning material for reference of student'

various reactions. In addition, it is necessary to plan generalization of a valuation basis made and that students can utilize a valuation basis in the activity of problem-solving with “problem-based learning” and mathematical views and ways of thinking. Taking this into account, we propose to generalize of a lesson plan, a design principle of the class and a valuation basis.

## ACKNOWLEDGEMENTS

I would like to thank teachers of mathematics in Tokyo Tech High School of Science and Technology, who advised about a lesson. This research was supported by JSPS KAKENHI Grant Numbers 23501137.

Multiple Levels of Assistance: Supporting Teachers in Training Who Work with Pupils with Mild to Moderate Disabilities (MMD), Moderate Severe Disabilities (MSD), and Early Childhood Special Education

Poster Presentation

Topic Area – Special Education

Abstract: The presenters will share successful strategies to support teachers in special education settings who are concurrently earning the required credential. This State University alternative certification (Intern) program has prepared hundreds of teachers in the area of special education over the past several years with excellent completion and retention rates. The critical program factors contributing to multiple levels of support will be delineated. Also shared with some research, which describes the specific support activities that candidates ranked as most valuable to their success.

## Abstract

This workshop focuses on the educational psychology of the first-year students required to take developmental writing courses as part of their provisional admission to a 4-year university. Offering a critical analysis of Lorenz's (1965) imprinting theory as it relates to early learning habits, we intend to demonstrate that cognitive neuroplasticity can redirect the earlier messages that students receive about their academic abilities. Explicit instruction and discussion of eight habits of mind as identified in the *Framework for Success in Post Secondary Writing* (2011) engages students in the practice of learning in a university environment. However, these habits of mind are neither prioritized by curricular standards, nor measured by standardized assessment. Specifically, we focus on Costa and Kallick's *Habits of Mind* (2000) in conjunction with Freires' (1985) concepts of *the critical act of study* and the *problem-posing model of education*, to support students in their performance under challenging conditions that demand "strategic reasoning, insightfulness, perseverance, creativity, and craftsmanship" (Costa and Kallick, 2000, p.1). Research demonstrates that these habits must be identified, and changed or created by learners in order to encourage development of skills needed for academic persistence at the university level.

## **Workshop Description**

In this workshop, attendees will be invited to dialogue about integrating the habits of mind into their current classroom pedagogy. Attendees are invited to consider and challenge beliefs about intellectual imprinting in order to re-imagine pedagogical constructs that encourage teaching and learning and promote equity in the classroom. Workshop facilitators encourage a critical dialogue about intersections of cross-disciplinary reading, writing, and oral communication and invite supportive teaching and learning strategies and contributions.

# AN ANALYSIS OF PRESCHOOL PROGRAMS OF SELECTED PUBLIC SCHOOLS IN TARLAC CITY, PHILIPPINES

Joanne Marie Igoy- Escalona

Tarlac State University, College of Education

**Abstract.** This study analyzed the preschool programs of selected public schools in Tarlac City along curriculum content, activities and assessment of child progress; teachers' educational qualifications, teaching strategies, relationship with children, parents and community; physical environment which includes classrooms, playground, equipment and facilities; health services; and leadership and management. The study also compared the preschool programs against the DepEd and NAEYC Preschool Program Standards. Findings revealed that the preschool programs follow the Kindergarten Education General Curriculum (KEGC) whose aim is to develop the different domains of the pupils. The curriculum follows the Developmentally Appropriate Practice and the different activities are play based. The preschool teachers have taken the required 12 units in Early Childhood/Preschool Education and have attended seminars and trainings in Early Childhood. The Preschool classrooms have not met the standard size of rooms and lacked Learning Centers and a playground for preschool pupils. In the Health component, the preschool programs promote pupils' health, proper nutrition and cleanliness though the health records lack information about immunizations, past illnesses etc. and persons to contact in case of emergency. The School Administrators are qualified and show personal commitment in their work. The ten preschool programs were also compared with the preschool program standards of the DepEd and NAEYC. Results showed that the ten preschool programs met DepEd and NAEYC's program standards for Curriculum, Teachers, Physical Environment, Health and Leadership and Management except for some benchmark statements that were not met.

**Keywords:** preschool programs, public elementary schools, DepEd and NAEYC preschool program standards

## I. INTRODUCTION

"As the twig is bent, so grows the tree" is an old Chinese saying which applies to all children and their early childhood experiences.

An abundance of literature and studies points to the fact that the early childhood years are indeed very important years. Cognizant of the vital role that the early childhood years play in the life and future of an individual, a call for the offering of the best early childhood learning experiences was made.

In the Philippines, the establishment of preschool programs both in private and public schools throughout the country was a response to the call of providing the best learning experiences to the Filipino children especially during their early years. The rationale behind their establishment includes: (1) to support the development of children in their early years; (2) to increase the intellectual and language competence of children so they can express themselves; and (3) to act as socializing agents which prepares children when they enter Grade 1, the elementary school (Enclosure No. 1, DECS Order No. 107, s. 1989). These vital reasons were established, to bridge between the child's life at home and in a larger community.

On January 20, 2012, Republic Act No. 10157 otherwise known as the Kindergarten Education Act was signed into law by President Benigno Aquino III. This Act institutionalizes the Kindergarten Education into the Basic Education System. Kindergarten education becomes mandatory and compulsory before entrance to Grade 1. In the Kindergarten Education Act, the kindergarten education program will be comprised of one year of preschool education for children aged five and above. The program will focus on the thematic and integrative curriculum to ensure the development of functional skills among children to prepare them for Grade 1.

In the city of Tarlac, Preschool Programs have been operational for the past ten years or more. At present, there are 155 organized preschool programs.

The researcher deemed it imperative therefore, to conduct an investigation and analysis of the preschool programs of selected public schools in Tarlac City. This study looked into how these preschool programs are implemented in terms of the essential components of Early Childhood Education. Likewise, benchmarking with Preschool Program Standards provided by the DepEd and the National Association for the Education of Young Children (NAEYC) was made to assess the present stature of the preschool programs.

The researcher believed that an analysis of the preschool programs of selected public schools in Tarlac City may help policy makers, administrators, principals, preschool teachers and parents discover the strengths and weaknesses of the said programs. Measures to address the weaknesses and

inadequacies that will further improve the preschool programs in public schools are recommended. In so doing, high quality preschool programs will be attained.

## II. STATEMENT OF THE PROBLEM

This study was conducted to analyze the preschool programs of selected public schools in Tarlac City. It aims to answer the following questions.

1. How are the following components of the preschool programs of selected public schools in Tarlac City implemented?
  - 1.1. Curriculum
    - 1.1.1. Content
    - 1.1.2. Activities
    - 1.1.3. Assessment of child progress
  - 1.2. Teachers
    - 1.2.1. Educational qualifications
    - 1.2.2. Teaching strategies
    - 1.2.3. Relationship with children, parents, and community
  - 1.3. Physical environment
    - 1.3.1. Classrooms
    - 1.3.2. Playground
    - 1.3.3. Equipment
    - 1.3.4. Facilities
  - 1.4. Health
  - 1.5. Leadership and management
2. How are the components of the preschool programs described when compared against benchmarks for DepEd and NAEYC Preschool Program Standards?
3. What are the implications of the findings to preschool education?

## III. METHODOLOGY

This study is a combination of qualitative and quantitative research. It focuses on the analysis of preschool programs of selected public schools in Tarlac City. In the qualitative aspect, this study looked into how these preschool programs are implemented in terms of the essential components by obtaining information, insights and opinions of the subjects namely: the preschool coordinator, school principals, preschool teachers and parents through focused interviews. Ocular visits of sites as well as analysis of records, lesson plans, assessment tools, work texts, memoranda, reports, etc. were also made. In the quantitative aspect of this study, the data obtained were tabulated according to frequency and percentage.

The status of the preschool programs of these selected public schools in Tarlac City was also assessed. The components of the preschool programs were benchmarked against the DepEd and the NAEYC preschool program standards.

The subjects of this study comprised three (3) groups, namely: the administrators, the preschool teachers, and the parents. All of the subjects came from the ten (10) selected public schools with preschool programs in Tarlac City. The first group of subjects was composed of ten (10) school principals of the selected public schools with preschools

programs. The second group of subjects was the preschool teachers. The group includes thirty three (33) preschool teachers from the ten (10) public schools with preschool programs. Fifteen (15) of these teachers are permanent while eighteen (18) are volunteer teachers. The third group of subjects was made up of forty (40) parents of the preschool pupils.

The five (5) types of instruments that were used for gathering pertinent data were: (1) interview schedule for principals and preschool teachers; (2) interview schedule for the Tarlac City Schools Division Preschool Coordinator; (3) interview schedule for parents, (4) questionnaire for preschool teachers; and (5) physical environment checklist.

In order to achieve the goals of this research the following actions were undertaken.

Letters addressed to the Tarlac City Schools Division Superintendent, to the Preschool Coordinator, to the school principals, and to the preschool teachers of selected public schools with preschool programs were prepared. After permission had been obtained, the researcher administered the questionnaires to the preschool teachers.

To gather pertinent information interviews were also conducted with the respondents of the study.

Also, an ocular inspection of the preschool programs' physical environment was made to look into the status of the preschool classrooms.

An analysis of school records like teachers' lesson plans, assessment tools like teacher made tests, and health records was also done.

Likewise, documents such as DepEd memorandums, orders, letters, announcements, minutes of meetings, progress reports, as well as archival records which include service records, performance ratings of the principals and preschool teachers, organizational charts, and other relevant papers were also examined. Data triangulation was achieved in this study.

Answers to the closed questions found in the Questionnaire for Teachers were tabulated into frequency and percentage.

The yes or no responses in the Physical Environment Checklist were also tabulated into frequency and percentage.

## IV. FINDINGS

### 1. Implementation of the Preschool Programs

#### 1.1. Curriculum

The preschool programs of the ten public schools in Tarlac City are guided by a philosophy, goals and objectives. The preschool curriculum aims to develop the different competencies of the preschool pupils.

The preschool programs of the ten public schools included in the study use the Kindergarten Education General Curriculum (KEGC). This is based on the Kindergarten Curriculum Framework that draws from the principles and goals of the K to 12 Philippine Basic Education Curriculum Framework which is also aligned with the National Early Learning Framework (NELF). The Kindergarten Education General Curriculum (KEGC) follows the principle of the Developmentally Appropriate Practice (DAP), one that is age appropriate, individually

appropriate and socio-culturally appropriate. It considers the developmental benchmarks of Filipino five year olds. The KEGC develops the six developmental domains of the preschool pupils- Physical Health, Socio-Emotional, Character and Values, Cognitive/Intellectual, Language and Creative/Aesthetic. Different play-based activities are used to develop the six domains. The “Blocks of Time” prescribed in the kindergarten curriculum ( Meeting Time 1; Work Period 1; Meeting Time 2; Supervised Recess; Story; Work Period 2; Indoor/Outdoor Activity and Meeting Time 3) is followed by the thirty three preschool teachers. A consistent daily schedule is followed by the thirty three preschool teachers in the teaching of concepts and skills in the five learning areas namely: Math, Language, Science, Physical Education, Health, Music and Arts and Values Education. Curricular themes are used for integrating the five learning areas to develop the six domains. The Readiness Skills Workbook is used by the thirty three preschool teachers. The mother tongue of the preschool pupils, on the other hand, is used as the medium of instruction in the ten public preschool programs.

In developing the pupils’ gross motor skills, activities such as playing, dancing or performing rhythmic activities, walking, running and exercising were used by the thirty three (33) preschool teachers. In developing the pupils’ fine motor skills, activities such as: writing, drawing, folding, tracing / copying letters; coloring and printing one’s name were used.

For the development of the pupils’ personal skills, activities such as singing, reciting poems on how to keep oneself clean; identifying things that one uses to keep himself groomed; demonstrating the proper way of brushing the teeth; teaching right table manners, following simple directions in putting on one’s clothes and tying one’s shoes were employed in all the preschool programs in this study. For the development of the pupils’ social skills, activities such as playing with toys; listening to stories on how to relate with others; assigning simple responsibilities to pupils; role playing to teach pupils in taking turns; story telling on the importance of following rules and participating during class discussions were also used.

For the development of the affective aspects of the preschool pupils, activities such as recognizing different types of facial expressions through games; showing different types of facial expressions/ emotions through action songs; showing concern for others through group play and telling something about themselves and their families were used. The activities for the inculcation of values to the preschool pupils used by all preschool teachers are: saying simple prayers before and after classes; story telling about God; answering the teacher and others politely; distinguishing right from wrong in a short story; following rules and regulations; role playing using courteous expressions; singing children’s songs about nature; reciting poems about love for the country and giving lectures on the importance of rules.

To develop the communication skills in English of the preschool pupils activities such as recognizing/ pronouncing vowel and consonant sounds; producing blended (short and

long) vowel and consonant sounds; and reading simple words with cue patterns and words that rhyme were used. The activities employed to develop the communication skills in Filipino of the preschool pupils were: pagkilala ng iba’t – ibang uri ng tunog / ugong at kung ano ang pinanggagalingan nito; pakilala ng tunog ng bawat titik; pagkilala/ pagbasa nang wasto sa tunog ng bawa’t titik ng alpabeto; at pagbasa ng mga huling pantig at mga salitang binubuo ng mga kambal katinig.

The activities used to develop the numeracy skills of the preschool pupils were: identifying and labeling objects according to color, shape, size, length, etc.; counting numbers; comparing numbers; doing addition and subtraction; recognizing fractions; telling time and days of the week; and counting money.

For the development of sensory – perceptual skills the following activities were employed by twenty one or 100% of preschool teachers: identifying the different parts of the body; distinguishing living from non-living things; describing the different types of food and manipulating matter to see what happens.

Assessment of child progress is an integral part of the curriculum of the ten public preschool programs included in the study, thus it is conducted three times, during the months of July, October and March. The Early Childhood Development (ECD) Checklist guides the thirty three preschool teachers in assessing their pupils’ progress in the different domains. The School Readiness Assessment (SReA), a tool to determine the level of progress of preschool pupils across developmental domains that are critical in tackling Grade 1 learning competencies are given at the end of the school year. Results of the ECD Checklist are shown to the parents.

## **1.2. Teachers**

Only one (1) among the thirty three preschool teachers included in the study is a graduate of Bachelor of Science in Preschool Education. In order to align themselves in the field of early childhood education, twenty six (26) preschool teachers are currently enrolled in a Master’s degree program major in Preschool Education. Eighteen (18) preschool teachers have passed the Licensure Examination for Teachers (LET), four of which are eligible by virtue of the Magna Carta for Teachers. Out of the eighteen, fifteen of the teachers are permanent.

Regarding preschool teaching experiences, four (4) teachers have been teaching preschool for more than ten years; seven (7) have 7-8 years of preschool teaching experience; ten (10) have 5-6 years; five (5) have 3-4 years; three (3) have 1-2 years and four (4) preschool teachers who have been with the program for only a few months.

With regard to seminars and trainings on preschool education, all preschool teachers have attended seminars/ trainings conducted by the Division Preschool Coordinator on Preschool Education. They enumerated past seminars which they have attended and these include the following: National Training of PTCS, LGUS, and Preschool Teachers on the Methodologies in Teaching Preschool; the Division Summer Training in ECE and School Readiness Assessment; Seminar-workshop in Training Beginning

Readers, "Teaching Beginning Reading Through Sound" and the Division Training of Preschool Teachers and many more.

All the thirty three preschool teachers employed varied teaching strategies such as playing; role playing; demonstrating / teaching; story telling; identifying/recognizing (different facial expressions); asking questions; reading; giving lectures; recognizing and pronouncing sounds; describing; noting details; comparing and differentiating objects; doing simple addition and subtraction; telling time and counting money.

No report of cases or complaints has been filed against any preschool teacher for harming her pupils – physically, emotionally and mentally.

The parents through the Parents – Teachers Community Association (PTCA) extend help to the preschool teachers by paying the basic utilities (electricity and water), repair and improvement of classrooms, construction of facilities like toilets and wash basins as well as in the purchase of equipment and other instructional materials. However, a relationship or partnership between the thirty three preschool teachers and the community has not been established.

### **1.3. Physical Environment**

The sizes of the preschool classrooms in the ten public preschool programs are 35 square meters, 40 square meters, 45 and 48 square meters respectively. All preschool classrooms have no learning or activity centers due to the small sizes of the classrooms. The preschool classrooms are properly ventilated and adequately lighted; attractive, safe, clean, orderly, have sufficient and appropriate tables and chairs. The main reason for the inadequacy in the conditions of the preschool classrooms is due to the lack of funds.

There is a dearth of instructional materials in all the preschool classrooms. Age-appropriate and varied instructional materials are lacking or of insufficient quantity due to the lack of funds. Regarding instructional equipment these are also present such as TV sets, radio cassettes, karaokes, and DVD/VCD players however all the preschool classrooms do not have musical instruments.

With regard to facilities, all preschool classrooms have no lockers for the personal belongings of pupils; some have storage cabinets (open shelves) for the teaching aids, materials and other reference books, all have blackboards but only some have display boards.

Regarding health facilities, majority of the preschool classrooms have provided toilets for their pupils. However, the toilet bowls are not the flush types and only some have wash basins which are not appropriate to the height of the pupils. Moreover, all ten public preschool programs do not have a playground for the use of preschool pupils.

### **1.4. Health**

Different health services are provided for preschool pupils in all the ten public preschool programs. All ten public preschool programs have school clinics but there are no resident nurses or physicians to manage the clinics. Only 4 preschool programs out of the ten have first aid kits. Only

two preschool teachers from two preschool programs have undergone first aid training. Furthermore, no drinking fountains are found in the ten public preschools.

### **1.5. Leadership and Management**

The preschool coordinator and ten school principals are Education graduates and have a doctoral or master's degree in Education. They obtained a very satisfactory performance rating in the management and supervision of their school including the preschool program.

All the school principals

## **2. Compliance of the Preschool Programs to the DepEd and NAEYC Preschool Standards**

In *Table 1*, all the benchmark statements for the DepEd preschool program standards for curriculum and all the benchmark statements for the NAEYC preschool program standards for curriculum content were met by the ten public preschool programs included in this study.

*Table 2* shows that eight out of eleven benchmark statements for the DepEd preschool program standards and NAEYC preschool program standards for teachers were met by the 33 preschool teachers while three benchmark statements were not met. Those that were not met are: teachers possess education degrees with specialization in preschool/early childhood education; teachers develop partnerships and professional relationships with agencies, consultants and organizations in the community to meet the needs of children; teachers communicate with other agencies and programs to achieve mutually desired outcomes for children.

In *Table 3*, it is shown that eight out of fourteen benchmark statements for the DepEd and NAEYC standards for physical environment were met by the 33 preschool classrooms. The benchmark statements that were not met pertain to the ideal size of the classrooms; the availability of individual storage and space for each child's belongings; having equipment, materials and furnishings that are accessible for children with disabilities; the presence of learning centers/areas inside the classrooms; the availability of a playground which has a minimum size of 360 square meters or a nearby park/open space to replace the playground if this is not available, the presence of apparatus such as jungle gym, slides, balance beams, etc. in the playground and the security and safety of the playground.

In *Table 4*, it is shown that two out of six benchmark statements for the DepEd and NAEYC preschool program standards for health were met by the ten preschool programs included in this study. The statements that were not met pertain to the health records containing the information about the child's health including immunization, the health records containing emergency information of each child; the programs' implementing a written agreement with a health consultant, and the programs having at least one teacher/staff who has first aid training.

In *Table 5*, it is presented that three out of four benchmark statements for the DepEd and NAEYC preschool program standards for leadership and management were met

by the preschool coordinator and school principals. The benchmark that they were not able to meet states that administrators/principals should have at least 12 units of preschool education course.

## V. CONCLUSIONS AND IMPLICATIONS

The results of the study revealed that the preschool programs in Tarlac City have complied with some of the standards prescribed by the DepED and NAEYC. This means that slowly, public schools are trying to provide the education services that pupils need to cope with elementary education once they complete their preschool. However, there were aspects in the standards which the schools failed to comply with which includes pertinent factors in developing excellent pupils such as teacher qualification to teach in preschool and ideal classroom sizes and facilities which would facilitate learning. Most teachers do not possess preschool education and classroom sizes did not meet standard specifications. In addition, the size of the classrooms were small, there was no playground, there were no individual storage/space for the children's belongings and equipment; facilities and furnishings for children with disabilities were not available.

Failure to address these inadequacies will most likely hinder full development of the pupils in public preschools in Tarlac City. Gapuz (2010) characterized a good preschool program. She said that preschools must be in a clean and secure location. This is non-negotiable for preschools. There must be complete and safe facilities. There are basic facilities children need round the clock and facilities that are required to keep the school child-friendly and hazard-free. Further, a preschool must have a toilet room, a sanitary area for eating, a separate area for trash, a clinic or medicine cabinet, a no-slip flooring and cabinets for toys and other materials. Furniture and any equipment must have no sharp edges. Electric outlets must have covers and anything else that pose harm to kids should be kept out of their reach and eyesight.

### THE IMPACT OF THE FINDINGS ON CHILDREN

#### *Curriculum*

On January 20, 2012, the Philippine President signed into law, Republic Act No. 10157, an Act Institutionalizing the Kindergarten Education into the Basic Education System. This Act makes Kindergarten compulsory and mandatory and an integral part of the basic education system of the country.

Corollary to this is the implementation of various reforms and programs for Filipino Preschool pupils. One of these is the use of the Kindergarten Education General Curriculum (KEGC), which is based on the Kindergarten Curriculum Framework. The Kindergarten Framework follows the Developmentally Appropriate Practice, one that is age-appropriate, individually appropriate and socio-culturally appropriate. The Kindergarten Framework also considers the developmental benchmarks of Filipino five year-old children, recommends the use of strategies that address needs and interests of the learners and uses the

mother tongue as medium of instruction. The KEGC aims to develop the six developmental domains of preschool pupils- their physical health; socio-emotional; character and values; cognitive / intellectual; language ; and aesthetic/creative. Different play based activities are also used to develop the six domains. Curricular themes for integrating the five learning areas to develop the six domains to develop the preschooler holistically and functionally is also used.

An enhanced kindergarten curriculum such as the KEGC would surely be beneficial to the young Filipino learners . The teachers will be guided in planning their daily lessons and activities, employing varied teaching strategies that are interesting and enjoyable for the children. The fact that the curriculum aims to develop the pupils holistically in the six domains means that the kindergarten program wants to produce well rounded individuals who are emergent literates and ready for formal school.

The Mother Tongue Based - Multilingual Education (MTB-MLE) method was also adopted pursuant to R. A. 10157. The mother tongue of the learners is used as medium of instruction for teaching and learning in the kindergarten level in all public schools throughout the country. The use of Filipino and English which are the learners' second language become obstacles of learning if the children are unfamiliar with either of the two languages. Pupils cannot learn concepts in English if they are still in the process of language acquisition. On the other hand, the use of the mother tongue as a language of instruction in the early years of schooling will facilitate the pupils' learning of all subjects. It will be beneficial to the young learners who are still beginning to learn the concepts. This is in consonance with what Cooper (2006) said that children become readers of English when they are already familiar with the vocabulary and concepts in their primary language.

Assessment is also an integral part of the KEGC. Information on pupils' learning and progress in the different domains is very important. It is also essential to the curriculum because sound decisions about teaching and learning are made when the young learners' strengths, progress and needs are determined.

#### *Teachers*

Majority of the teachers in the kindergarten level do not possess the necessary qualifications such as having a specialization in Preschool/Early Childhood Education. However, there are efforts on their part to align themselves in the field, by enrolling in the Master's degree program major in Preschool /Early Childhood Education and by attending seminars and trainings in Early Childhood Education. Researches have shown that the quality of young children's experiences in ECE depends so much on the educational qualifications of those who teach and care for them. NAEYC (2001) pointed out that children benefit most when teachers have high levels of formal education and specialized early childhood professional preparation. The presence of warm and positive environment for children results from teachers having specific preparation, knowledge

and skills in child development and early childhood education.

Varied teaching strategies were used by the preschool teachers. Playing games and role playing were the strategies they frequently use. The various kinds of play are effective vehicles for learning. According to De Vries et al. (2000), the spontaneous play of children provides opportunities for exploration, experimentation and manipulation that are essential for the construction of knowledge. At play children learn to draw feelings, interact with other children, resolve conflicts and gain a sense of competence. Role playing, on the other hand, develops representational thought.

A positive relationship exists between the preschool teachers and their pupils. The preschool teachers do not employ physical, psychological and emotional punishment as well as discrimination on their preschool pupils because of their knowledge and awareness of the Code of Ethics for Early Childhood Education. Beihler and Snowman (2004) said that the quality of children's relationships with their preschool teachers predicts how well they will adapt and learn. A positive and warm relationship developed between the teachers and their pupils will help the latter become secure and stable individuals with positive sense of selves.

No relationship/ linkages has been established between the preschool teachers and the community resulting to the lack or absence of invaluable support which these stakeholders can give to the preschool pupils and to the preschool program as a whole.

### ***Physical Environment***

Findings of the study showed that classrooms did not meet the standard size prescribed by the Department of Education in the Philippines. The preschool classrooms were not spacious enough to allow movement of young pupils. According to Beaty (2004), physical environment including classroom size is of great importance in the learning process of young children. With a spacious learning environment, pupils are provided with a high- activity, low stress environment where they can learn happily together.

Findings from the study also showed that there is a scarcity of instructional equipment in the preschool classrooms. The reason for this is due to the lack of funds. Instructional equipment supplements the curriculum. They can be used to support learning across domains. Dodge (2004) pointed out that the effective use of instructional equipment can maximize the learning of pupils. It is commonly accepted that preschoolers are active learners. Therefore, the scarcity of materials will affect their ability to explore, manipulate and become involved in the teaching-learning process.

Learning Centers or Areas such as communication skills center, sensory-perceptual and numeracy skills center, creative and development center are not found in the preschool classrooms. According to the preschool teachers, there are no learning centers in their classrooms because the sizes of the rooms are small. Research studies show that learning centers/areas do a lot of good to the pupils. They bring about good results in the different areas of

development of pupils. Learning centers encourage active learning by children. The learning centers allow preschoolers to make choices, encourage hands-on experiences and provide for individual learning styles.

Playground and the necessary apparatus / equipment was not also found in all preschool programs. According to the school officials, the reason for the absence of a developed playground for preschool pupils is because of the lack of funds for the project. Developing a playground complete with apparatus/equipment requires a huge amount of money.

### ***Health***

The preschool programs promote the pupils' good health, proper nutrition and cleanliness, availability of individual health records of children and the keeping of results of physical and dental examinations reflected in the health records. Health and education go hand in hand. Children who are healthy, stimulated, well nurtured during early years tend to do better in school and have better chance of developing the skills required to contribute to their total development.

### ***Leadership and Management***

One aspect which is vital to supervision and management of a preschool program is the educational qualifications of its administrators/ principals. Findings show that all the administrators are educationally qualified, they have at least two years of very satisfactory experience in managing, directing, supervising and monitoring their respective schools including the preschool program. Leadership and management is an important component of the preschool program. The quality of a preschool program depends on how it is supervised and managed.

## **VI. RECOMMENDATIONS**

1. A follow up study should be conducted to find out the effectiveness of the implementation of the Mother Tongue Based Multilingual Education (MTB-MLE) method.
2. Preschool Teachers should continuously upgrade themselves by attending seminars, workshops and trainings specially in the field of Early Childhood Education.
3. Preschool teachers should establish relationship/ partnership with the community such professional, civic and religious organizations and local government officials who could provide the necessary support and assistance for the improvement of the preschool program.
4. Preschool Programs should follow the standard classroom size for preschool rooms.
5. Storage cabinets/ lockers where preschool pupils could keep their personal belongings should be provided.
6. Facilities and furnishings for disabled preschool children should also be provided in preschool classrooms.
7. Learning/Activity Centers should be put up inside preschool classrooms.

8. The preschool programs should have a playground for the exclusive use of the preschool pupils.
9. The individual health records of the preschool pupils should include information about the children's immunization, health history and persons to contact in cases of emergency.
10. Preschool teachers should be required to undergo first-aid trainings.
11. School principals should comply with the DepEd requirement that they should have at least twelve units of preschool education.

# ‘Emirati Student’s Motivations for Entering a Teacher Training Institute and their Plans to Teach’

Melissa McMinn

Lecturer, Emirates College for Advanced Education

## ABSTRACT

Current education reform in Abu Dhabi, UAE, and the Abu Dhabi Vision 2030 which seeks to place more Emiratis in key sectors such as education, has driven a need for Emiratis to be trained as teachers. This paper presents the findings of a study into the motivations of Emiratis to enrol in teacher education and their intentions to teach after graduation. Over 200 students across the four-year degree programme at Abu Dhabi Teachers’ College (pseudonym) were surveyed to ascertain their original motivation for enrolment and their plans upon graduation, with a random selection of volunteers interviewed further in a mixed-methods approach. These interviews yielded interesting insight into the paths the subjects had travelled to get to teacher education and their future prospects, including their perspectives on themselves, the teaching profession and their families’ future plans for them.

Similar to research worldwide, the highest rated motivators for entering a teaching training programme had an intrinsic and altruistic attitude. However, extrinsic and pragmatic reasons were also rated highly indicating that Emirati students are multi-motivated. These ratings did not differ significantly for males and females, although a much greater percentage of males reported a lack of commitment to teaching upon graduation. An increase in teaching salaries may entice more Emiratis to the teaching profession; however a significant change in the perception of teaching and a transparent promotions path is likely to be needed to encourage male Emiratis to consider teaching.

## 1. INTRODUCTION

## 1.1 BACKGROUND

In Abu Dhabi, a teachers' college was established in 2007 in answer to significant educational reforms in the Emirate's public school system. It is the only local college offering a Bachelor of Education (B.Ed.) programme that prepares future teachers to teach integrated English, Mathematics and Science through the medium of English for cycle one schools (grades 1-5). Despite large-scale marketing in the past, particularly to school leavers, the College currently has only 242 students enrolled in the B.Ed. programme. Abu Dhabi needs approximately 5000 teachers for its public schools<sup>1</sup>. Last year, ADTC graduated its first cohort of teachers. Of the 147 graduates, only 50% accepted teaching positions in Abu Dhabi's public schools. For a dedicated teaching college expected to play a major part in the Abu Dhabi education reform, this is a mere drop in the bucket.

## 1.2 CONTEXT

This research took place within the B.Ed. programme at Abu Dhabi Teachers' College, ADTC (pseudonym). The College is the only dedicated teacher training college in Abu Dhabi and students must be Emirati to be eligible to enrol.

Through informal discussions with students, the author discovered that there are a wide variety of reasons for enrolment at ADTC, several of which indicate little or no commitment to the teaching profession. With Abu Dhabi requiring so many teachers for its cycle one public schools and with the Abu Dhabi 2030 Vision aiming to have Emiratis in key sectors, including education, it is imperative for the ADTC to produce high quality, dedicated teaching professionals. Therefore, it is important to understand what motivates an Emirati student to undertake a teaching degree. This information could not only inform recruitment and retention at the College, but also potentially inform policy-makers at an emirate or federal level.

---

<sup>1</sup> Education graduates of the Higher College of Technology and Zayed University were also employed in public schools for the first time this school year (2012-2013).

The purpose of this research is to better understand Emirati students' motivations for enrolling in a teacher training programme and what their intentions are upon graduation. For those who do not want to teach, or who are yet undecided, what moved them to enrol in the four year degree programme? Although student numbers are important to the continued existence of the college, are we wasting resources training students for a career they will not pursue?

### 1.3 RESEARCH OBJECTIVES

1. To investigate the reasons why Emirati students choose teacher education as a field of study.
2. To consider changes to recruitment policies and procedures and changes to programmes at the college to attract and retain committed teaching professionals.
3. To give a voice to Emirati student teachers as to what discourages them from teaching and ascertain their own solutions for overcoming these discouragements.
4. To identify implications and potentially inform policy makers at the Abu Dhabi Education Council (ADEC) about recruiting and retaining Emirati teachers.

### 1.4 FOCUS QUESTIONS

My research aims to find out what initially motivated the current Emirati students to enrol at ADTC and what percentage of them plan to teach upon completion of their Bachelor of Education.

Therefore, my research questions are:

- What were the motivating factors behind an Abu Dhabi teachers' college's students enrolling in the B.Ed. programme?
- How many students intend on entering the teaching profession upon graduation, and if not, why not?

- Do the answers to the previous questions differ for males and females?

## 2. LITERATURE REVIEW

### 2.1 ALTRUISTIC, INTRINSIC AND EXTRINSIC MOTIVATIONS

The preliminary review of literature indicates that intrinsic, altruistic and extrinsic motivations are key terms in understanding what motivates individuals to pursue teacher education and are therefore outlined here.

Motivation is what moves us to do something. “[M]otivation involves energy and drive to learn, work effectively and achieve potential” (Sinclair, 2008, p. 80).

Oxford Dictionary (2003) defines altruism as a regard for others as a principle of action and idealism as the practice of forming or following after ideals, especially when they are unrealistic. Intrinsic is defined by the same source as a motivation that is inherent, essential; one that belongs naturally; and extrinsic as motivation that is not inherent or intrinsic but extraneous or outwardly.

For the purpose of this study, altruistic, idealistic, intrinsic and extrinsic motivations will be defined in the following ways: altruism is concerned with opportunities to make a positive impact in the lives of young people, and/or for the development of Abu Dhabi as a whole suggesting a mindset of ‘what can I do for the world?’. Idealistic motivations is concerned with improvement of the education system to a perfect model, or ‘I want to make a positive difference’. Intrinsic motivation occurs when student teachers believe they will get personal enjoyment and satisfaction from teaching and from being in a school environment - ‘what makes me feel good’. Extrinsic motivation encourages student teachers to like teaching due to the remuneration and benefits of the profession, or ‘what will I get from teaching’.

### 2.2 TEACHING COMMITMENT

Teaching commitment is defined as a student teacher's degree of psychological attachment to the teaching profession (Rots, Aelterman, Devos and Vlerick, 2010). "Teaching commitment is considered to be a cognitive and emotional reaction to student teachers' learning experiences in teacher education and the resulting (self-perceived) values, competencies, and accomplishments as a teacher" (p. 1622). This implies that the experiences that a student teacher has during his or her time at a teachers' college can positively or negatively impact on the likelihood a student will teach upon graduation. Obviously, this has serious implications for teaching college curriculum designers.

### 2.3 MOTIVATION TO ENTER TEACHER TRAINING

Jarvis and Woodrow (2005) state that making a decision about one's future profession is a complex process influenced by varying motivations. Al-Yaseen (2011) highlights the tough decision high school graduates have to make when deciding on a future career: "Choosing to become a teacher is a courageous decision, as teaching is described as a stressful and demanding profession, and requires responsibility, commitment, and accountability" (2011, pg 667). She acknowledges that teaching is not for everyone.

Research (eg: Dowson and McInerney, 2003; McInerney, Maehr & Dowson, 2004) suggests that key motivations determine attraction to engage in certain activities, retention in those activities and the concentration applied to those activities. In terms of teaching, motivations may determine what attracts a person to teaching, how long they are willing to spend on teacher education and in the teaching profession and the depth to which they engage with their course work and subsequent teaching career.

Much has been written about altruistic and intrinsic motivations as major reasons why students choose to enter teacher training (Ejeh, 2005; Hao & Guzman, 2007; Al-Yaseen, 2011; Weaver-Hightower, 2011; Dickson & Le Roux, 2012, for example). In fact, a review of such research up to the early 1990s suggested that "altruistic, service-oriented and other intrinsic motivation are the source of the primary reasons entering teacher candidates report

for why they chose teaching as a career” (Brookhart & Freeman, 1992, p. 46). Many studies since then have continued to find this true. For example, Krecic and Gmek (2007) who report the main motives of future pedagogy workers are altruistic, including the pursuit of happiness and a wish to work with children, and Williams and Forgasz (2009), whose findings revealed motivations were largely intrinsic. This differs from the author’s experience as a faculty member in a teaching college. Informal conversations with students identified several motivations for enrolling and few of them seemed to have the desire to teach as the basis. These reasons range from ‘I thought this would be an easier course than the engineering one I also was accepted for’ to ‘I need a degree to go further in my current career’.

A study in Turkey found students choose teaching for four reasons; the desire to teach, the interest in the subject they would like to teach, better job opportunities and the perception that their personal characteristics match with the ones teachers are expected to have (Ok & Onkol, 2007) implying intrinsic and extrinsic factors as the main impetus. Morales (2007) found in Florida, USA, that “...the fulfillment of a need for service and the need for power to influence others were the major reasons for the respondents to have made teaching their career choice” (p. 342-343). A study in Slovenija found that self-realization and altruistic reasons ranked highest for elementary teacher trainees (Krecic & Grmek, 2007). Similarly, the top reason Filipino preservice teachers were found to pursue teacher education was for idealistic reasons that generally speak of teaching in its very nature (Hao & de Guzman, 2007).

Kyriacou and Coulthard (2000) found that career-change teacher trainees chose teaching because they believed the factors they required from a career could be met by the profession, most importantly having responsibility and making a contribution to society, indicating both intrinsic and altruistic motivations. Williams and Forgasz (2009) also studied career-changers and found that while intrinsic and altruistic reasons for entering teaching were prominent, there were also extrinsic motivations such as holidays. Jarvis and Woodrow (2005) also surveyed Post Graduate Certificate in Education (PGCE) trainees in Manchester about their reasons for choosing teacher training. 93% of the answers given

were able to be categorised as vocational commitment or career-related reasons. Interestingly, this research found that only 38% of all participants chose reasons that were categorised by the researchers as vocational, which had an altruistic and intrinsic slant. The results also showed that more than three times as many females than males replied that they had always wanted to teach. A reason Jarvis and Woodrow offer for this is that it is more likely that women would pursue a career that would fit in with family life. I would predict that this would also be a contributing factor for our family-focussed students, both female and male.

Closer to home, Al-Yaseen (2011) studied the factors influencing students to enrol at the College of Education in Kuwait and concluded that altruistic and intrinsic factors were the main influencers. However, interestingly, only 55% of the students in the Kuwaiti study claimed that the teaching profession was their first choice (Al-Yaseen, 2011).

Recent research in Abu Dhabi into the reasons behind male Emiratis choosing teacher training has uncovered that most male student teachers are there purely due to availability on the course (Dickson & Le Roux, 2012). Clearly, this indicates neither intrinsic nor altruistic motivations and does not signify any obligation to the teaching profession. In fact, half of the male students surveyed expressed that they were not committed to teaching upon graduation. This coincides with the author's experience at the teachers college.

## 2.4 MOTIVATION TO TEACH UPON GRADUATION

Ejeh's (2005) research into Nigerian students' motivations for entering teachers' college<sup>2</sup> found that that almost 80% of respondents cited opportunities to continue their education at university as the main motivational factor (2005). This indicates that a significant percentage of students are simply using teachers' college as a way into a university degree programme and have no intention of entering the teaching profession, which is cause for concern. This also corresponds with my experience, with students (males, in particular) requiring any degree to progress further in a current career or to start at a higher rank in a

---

<sup>2</sup> In Nigeria, a graduate from teachers' college is awarded a Certificate in Education, not a degree.

new career, for example, in the police department. Jarvis and Woodrow (2005) also found that a small minority in the PGCE programme did not intend to teach at all and were merely using the course as a stepping stone to another career. In a 2007 study on Filipino student teachers, Hao and Guzman found that the top motivator was idealistic, such as contributing to the development of knowledge, but were disturbed by the students' desire to work abroad and go to other countries which came in as a close runner-up, indicating that Filipino students' attribute a teaching qualification with the chance to "explore the globe for greener pastures" (p. 125).

Although not the case for the Emirati male students or the Kuwaiti trainee teachers, Rots, et al (2010), assume that most student teachers start their training with the motivation to become teachers, but then experience a reality shock about the complexity of a classroom. For some, this is enough to end their teaching aspirations.

Also disturbing was that approximately 23.5% of the participants in Williams and Forgasz's (2009) study, who had returned to higher education specifically to gain a teaching qualification, claimed that they were keeping their work options open.

Students in both Dickson and Le Roux's (2012) Abu Dhabi study and Ejie's (2005) Nigerian study claimed that the perceived low status of teachers was a major disincentive to enter the teaching profession, while Kyriacou and Coulthard (2000) cited 'dealing with disruptive pupils', 'the amount of bureaucratic tasks to perform' and 'undergoing inspections' as major deterrents to teaching.

Both Dickson and Le Roux's (2012) and Weaver-Hightower's (2011) studies, that focussed on male student teachers, found that students were subjected to much discouragement from teaching from friends, families and outside parties. The participants in Weaver-Hightower's study cited 'education is a feminine career' as one of the things repeatedly heard by the male students. In Dickson and Le Roux's study, the males did not mention this explicitly, but did allude to the pressures felt by Emirati males to provide for their families, a pressure not felt by Emirati females, and that they were often reminded they could get easier jobs

that paid more. Male students at ADTC have also alluded to teaching as not being seen as an important or respected job.

In contrast, Sinclair (2008) found the two-thirds of the student teachers surveyed at the beginning and end of their first year in teacher education reported a positive change in their commitment to teaching. They claimed to be “more committed, more focussed, and working harder” (p. 91). These students had completed their first practicum and commonly had a greater awareness of the job of being a teacher. They reported that the increased commitment was due to the experience of working with and having influence over children in real schools, the working conditions they experienced, through self-evaluation of their suitability as teacher and from feeling like they were making a difference in the world, thus indicating that intrinsic, extrinsic and altruistic motivations all have a part to play.

Sinclair (2008) reported that student teachers have multiple motivations rather than a single motivation to teach. These motivations are centred on an individual’s future students, capabilities, likes and dislikes and how their future work and working conditions fit with their personal lives. This means research may not be able to narrow down a group’s or even an individual’s main motivation to teach, but it may help determine whether there is a bias towards one or the other.

Based on the above definitions, it appears that altruism is the noblest of the motivations to teach. However, interestingly, Miech & Elder (1996) found that altruistically motivated teachers were more likely to leave the profession due to frustration from a lack of guidance on goals, means and evaluation of their work. In an earlier study, Martinez-Pons (1990) found that intrinsically motivated teachers were slightly more committed to teaching than extrinsically motivated teachers.

Not all teacher trainee graduates enter the teaching profession upon graduation, either because they never had the intention to or their plan changed over the course of the programme. It is, therefore, imperative to know what initially motivates students to enrol in an education degree and what their goals are after graduation. It is also important to ascertain what factors may encourage and/or maintain a motivation to teach and what are

the dissuasions to teaching, perceived or real. This study will compare the motivations of Abu Dhabi's student teachers with the relevant literature.

## 2.5 THEORETICAL FRAMEWORK

Research studies (eg, Jarvis & Woodrow, 2005; Sinclair, 2008; Watt & Richardson, 2008; Chong & Low, 2009; Richardson & Watt, 2010, among others) suggested making a decision about one's future profession as a complex process due to influences by various motivations. The review of literature indicates that intrinsic, altruistic and extrinsic motivations are key terms in understanding what motivates individuals to pursue teacher education. This study has, therefore, attended to what motivates Emiratis to enter teacher education and the teaching profession. These motivations have been uncovered by asking students to rate their reasons for enrolling in a teacher training programme. The given reasons had either an intrinsic, extrinsic or altruistic perspective. In light of the prior observations of the author on ADTC students and UAE culture, some prominent pragmatic reasons were taken into consideration (Figure 1) for empirical study.

Figure 1: List of motivations under study: Scales & items

Scale	Items	Item No. on questionnaire
<i>Altruistic</i>	I enjoy working with children	1
	I want to be a part of the educational reform in Abu Dhabi	6
<i>Intrinsic</i>	I want to share my knowledge with my students	7
	I have always wanted to be a teacher	13
	Teaching fits in with family life/being a parent	14
<i>Extrinsic</i>	The salary for teachers is high/attractive	4
	I want to enjoy 3 months of holiday each year	5
	Teaching is likely to assure me a job after graduation	10
	The teacher has a high status in society	11
<i>Pragmatic</i>	My family chose the college for me	2
	I want to obtain a university degree only	3
	The possibility of working close to my home	8
	I want to work in a segregated workplace	9
	ADTC is an easy college to get into/study at	12

The questionnaire will also reveal the intentions of the participants after graduation and subsequent interviews will reveal more about the reasons students might not want to teach after graduation.

### 3. RESEARCH DESIGN AND METHOD

#### 3.1 METHODOLOGY

Using an explanatory sequential mixed method design, the research was conducted in two phases; quantitative research (questionnaire) followed by qualitative (interview).

A questionnaire, consisting of a 5-point scale to indicate the importance of a supplied reason for enrolling in the college, space to write reasons other than those supplied if desired and a three point scale to indicate intentions upon graduation (I will definitely teach, I will definitely not teach, I am not sure yet). Participants who responded that they will definitely not teach or are still undecided had space to write an explanation as to why that is. The questionnaire was anonymous. However, students were given the option of recording their student ID number if they agreed to being contacted subsequently for an interview concerning their post-graduation intentions. Interview candidates who claimed they will definitely not teach after graduation or are unsure, were divided into male and females and four of each were chosen at random. Interviews were open-ended and questions emerged from the interviewees' responses.

#### 3.2 DATA SOURCE

A non-probability method was employed here. Each B.Ed. 1-4 section at ADTC was visited and students had class time to complete the questionnaire. Classes were visited only once, so responses from absent students were not collected. Responses to the questionnaire were collated and analysed. The participants were those available and willing to be studied, thereby making them a convenience sample. Interview participants also opted to be

interviewed. The number of students that responded they were definitely not going to teach or yet undecided who consented to be interviewed was 34%.

### 3.3 DATA ANALYSIS METHOD

The numerical data (5-point scale) for each supplied reason was tallied. Many of the supplied reasons for enrolment have an underlying intrinsic, altruistic or extrinsic motivation, and this was examined. Male and female responses were also compared to identify commonalities and differences.

Narrative questionnaire and interview responses were analysed for trends. Some common themes emerged that will help identify the main reasons why students are not choosing to enter the teaching profession.

### 3.4 ETHICAL CONSIDERATIONS

Approval for this research has been awarded by the research committee and the Academic Dean of ADTC. All respondents are over the age of 18. Respondents were given the option to decline to respond.

### 3.5 LIMITATIONS

This study did not include students who were not present on the day the survey was conducted. The absent students make up 12% out of a possible pool of 242 students enrolled in the Bachelor of Education programme at ADTC.

The questionnaire used did not ask students who are planning to teach, whether they are planning to teach in Abu Dhabi's cycle one (elementary) public schools (which is the purpose of the college).

Only two reasons indicating an altruistic motivation were included in the questionnaire. Another altruistic reason was eliminated for being too similar. A replacement for it was overlooked in the short timeframe.

B.Ed. 3 and 4 students were not included in the interview portion of this study as they were out of the college on practical assignments during the time the interviews were conducted.

## 4. RESULTS AND DISCUSSION

### 4.1 QUESTIONNAIRE

A total of 210 surveys were distributed and completed: a response rate of 100%.

7% of participants were male and 93% were female, 32% of students were in the first year of the degree course, 23% in the second year, 20% in the third year and 25% in Year 4.

Table 1. Students' ratings of motivations: Summary statistics

Item numbers (from box 1)	Scale	1	2	3	4	5	Mean	SD	Rank
I want to share my knowledge with my students	I	121	57	23	1	7	1.64	0.94	1
I enjoy working with children	A	107	70	21	3	6	1.70	0.92	2
I want to be a part of the educational reform in Abu Dhabi	A	96	69	30	2	11	1.86	1.05	3
I want to enjoy 3 months of holiday each year	E	100	38	37	15	17	2.09	1.3	4
Teaching is likely to assure me a job after graduation	E	59	84	51	11	3	2.11	0.93	5
Teaching fits in with family life/being a parent	I	62	71	42	9	14	2.20	1.14	6
The teacher has a high status in society	E	64	61	52	20	12	2.31	1.17	7
The possibility of working close to my home	P	72	46	51	13	24	2.37	1.33	8
I want to work in a segregated workplace	P	66	39	60	12	25	2.46	1.33	9
I have always wanted to be a teacher	I	59	61	48	20	22	2.45	1.28	10
ADTC is an easy college to get into/study at	P	43	55	69	23	19	2.62	1.19	11
My family chose the college for me	P	40	43	33	34	56	3.11	1.50	12
I want to obtain a university degree only	P	23	26	52	55	49	3.40	1.29	13
The salary for teachers is high/attractive	E	6	27	61	40	75	3.72	1.16	14
<p>Key:            1 = strongly agree; 2 = agree; 3 = neither agree nor disagree; 4 = disagree; 5 = strongly disagree. A = Altruistic; I = Intrinsic; E = Extrinsic; P = Pragmatic. SD= Standard Deviation.            Source: Questionnaire survey.</p>									

The students' ratings of the motivations behind entering a teacher education programme are shown in Table 1. It can be seen that 'I want to share my knowledge with my students' (intrinsic) and 'I enjoy working with children' (altruistic) were the top reasons overall (85% and 84% strongly agree or agree, respectively) for enrolling at ADTC. This result remained the same when separating the data into male and female participant.

'The salary is high/attractive' was the least chosen reason (36% strongly disagree) for enrolling at ADTC, indicating that for the majority of the students salary was not a motivator.

Overall, 57% of respondents agreed or strongly agreed that they had always desired to be a teacher (see Table 1). Interestingly more males than females claimed they had always wanted to be a teacher and yet more males than females were undecided about pursuing a career in teaching (see Table 3). One third of the students are currently married and as family holds great importance to Emiratis, it is not surprising that a significant percentage (64%) agreed or strongly agreed that a motivation for entering teacher education was that teaching fits in with family life.

Table 2. Motivating factors and gender

Scale	Item Numbers in Questionnaire	Male (n = 17)		Female (n = 193)	
		Mean	SD	Mean	SD
Altruistic	1,6	1.67	0.69	1.79	1.01
Intrinsic	7, 13 & 14	1.96	0.99	2.11	1.19
Extrinsic	4, 5, 10 & 11	2.22	1.16	2.59	1.34
Pragmatic	2, 3, 8, 9 & 12	2.73	1.27	2.80	1.39
Note: p-value in the parenthesis.					
Source: Authors' own work.					

Three months holiday per year was a motivator for 66% of the students, and 59% responded positively to the high status of teachers as a motivation. 68% of participants agreed or strongly agreed that an assured job was a motivator, however it could be asserted

that job opportunities is the aim of most individual's undertaking higher education, so this high number is to be expected. Only 16% of participants claimed that an attractive salary was a motivator.

Pleasingly, 46% of the total students strongly agreed to wanting to be part of the educational reform currently taking place in Abu Dhabi, and another 33% agreed. This indicates a strong desire by the Emirati students to become involved in developing the emirate of Abu Dhabi. This also reflects a strong altruistic motivation among our students. However, this desire to be a part of the educational reform does not specify that this would be fulfilled through teaching. As, Dickson and Le Roux (2012) found, the male Emirati students they interviewed were interested in quick promotion into positions of responsibility, such as vice-principal and principal.

Smaller percentages were reported overall for the pragmatic motivations for choosing to enrol in teacher education. This indicates that, while these reasons may be taken into consideration by some students, they were not the impetus for enrolment. However, half of the students agreed or strongly agreed that the possibility of working close to home was a motivator, just over half of the females indicated that a segregated workplace was a factor and 59% of males stated that the college being easy to get into was a strong motivator (see interview section below).

Contrary to earlier indications, only 11% of the total students strongly agreed that they had enrolled to obtain a university degree only.

Of the 210 respondents, 136 (or 65%) indicated that they would definitely teach upon graduation – a surprisingly positive result (see Table 3). However, this means that 73 (one non-response), or just over one third of students surveyed, are not committed to teaching. Encouragingly, only 3 students responded that they would definitely not teach, while the other 70 remain undecided at this time. The 73 students not committed to teaching were made up of 63 females (33% of the total female participants) and 10 males (59% of the total male participants).

Table 5: Student teachers' intentions to teach upon graduation.

	Females %	Males %
I will definitely teach	67	41
I'm not sure yet	31	59
I will definitely not teach	2	0

*\*One female student did not respond to this question*

A greater proportion of B.Ed. 1 students claimed to definitely want to teach than did the other students. One explanation for this could be that the current first years have not yet been out on practicum into schools and experienced teaching first hand. B.Ed. students in the second to fourth years, who have completed a practicum course each year of their studies, may have been discouraged by the realities of teaching. Due to the major reform, the nature of teaching has changed in cycle one public schools since the B.Ed. 1 students were in those schools themselves as students. However, this would be in contrast to Sinclair (2008) who found that students' commitment to teaching increased after completing their first practicum.

Interestingly, one male student who responded that he would definitely teach upon graduation has left the college since the survey was conducted, due to being accepted to a police training course. His reasons for this change of heart was that he had decided he "didn't want to study", and because he would receive a salary upon starting police training.

It is encouraging, nonetheless, to find that more students are enrolling with (at least) the initial motivation to enter to the teaching profession. However, the significant number of undecided students is cause for concern.

## 4.2 INTERVIEWS

Of the 30 uncommitted B.Ed, 1 and 2 students, 13 were willing to be interview (43%), and of this smaller group, 4 males and 4 females were chosen randomly for further interview. All 8 students agreed to be interviewed, however one female student, Assila (pseudonym),

left the college before the interview could be conducted. She withdrew from the programme due to being pregnant and breaking her leg. Assila had indicated on the questionnaire that she was not sure yet if she would teach. However, in the space to explain further, she wrote 'I have kids and I want to relax', indicating that she did not want to work at all, and didn't have an aversion to teaching specifically.

From the interviews it was revealed that four of the seven interviewees had enrolled at ADTC with the intention to teach, two females and two males. Two interviewees had enrolled despite having no intention of ever teaching, both male, and the final (female) interviewee was undecided upon enrolling. Pseudonyms will be used throughout this section.

For the two male students who had no intention of teaching, the motivation behind enrolling at ADTC was simply to earn a degree. Amer's ambition since he was a child has been to join the police force. According to him, policemen earn a higher salary (than teachers), are well respected (unlike teachers) and even feared. A degree - any degree - qualifies Amer for a one-star ranking upon joining; "Without a star, it is like the army - anyone can boss you around. With a star, you can be the boss!" His reasons for enrolling at ADTC, specifically, were the free tuition and his ability to meet the entry criteria, which in his words was lowered to entice him to join due to low male numbers at the college. A stipend was also offered.

Salim also had no intention to teach, but is undecided about what to do after graduation. One option he is considering is becoming a translator. He enrolled at ADTC because the programme will help him to improve his English and a Bachelor of Education is a 'good qualification'. He also aims to undertake a Masters degree and therefore needs 'any degree' in order to be eligible. He also spoke of the low status of teachers. "In UAE, locals being teachers are like a joke. It is a horrible job and not well respected. You work so hard for little money when you can get a high paying job for easier work."

The interviews with Amer and Salim imply that there is unlikely to be a simple way to attract Emirati males into the profession. Changing the perception of teachers to one that

would be appealing is likely to take time. However the questionnaire responses revealed that about two-thirds of the students overall agreed or strongly agreed that a motivator for them enrolling was the teacher's held a held status in society. It could be concluded that the perceptions of the status of teachers held by males and females differ significantly and the participants of this survey are predominantly female.

The four students who claimed, through the interviews, that they did enrol with intentions to teach upon graduation, had varying reasons for responded that they were not sure yet about teaching upon graduation on the questionnaire.

Zain implied an intrinsic desire to become a teacher, and enjoys teaching younger siblings at home, but is uncertain about securing a teaching position. His concern stems from the fact that his (late) father was Omani and he worries he is not 'Emirati enough' to be employed in Abu Dhabi's public schools. Also concerning him is the requirement to obtain a 6.5 IELTS rating.

Alia also maintains her motivation to teach upon graduation, but is not convinced she will complete her teacher training at ADTC. Alia's initial purpose for wanting to become a teacher stems largely from her having had 'bad' teachers at school and her belief that she can 'do it better', indicating an altruistic drive. She claims the current salary for Emirati teachers is not a reason for or against being a teacher in her opinion. Alia joined ADTC because it is a small college and is teaching specific. However since starting she has found the college administration to be 'disorganised' and 'overly conservative'. Alia is hoping to continue her teacher education outside the UAE.

Similarly, Obaid is interested in teaching, but has also had issues with college management. He feels he was promised a lot upon enrolment and feels these promises have not been kept. Obaid associates the college administration with the Abu Dhabi Education Council who would be his employer if he pursued a teaching career in Abu Dhabi's public schools and therefore is now unsure of this path. Like Alia, he is not influenced either way by the starting salary for teachers; he is more concerned with having a strong and supportive management. Without this, he feels that promotion opportunities will be fewer, indicating a

similar viewpoint to the Emirati males interviewed by Dickson and Le Roux (2102). He does, however, mention that he can earn the same, if not more, money in different jobs.

Mouza started ADTC with an intention to teach that was based on information she had been given by outside parties that the salary for teachers was high, clearly indicating an extrinsic motivation. She claims that since starting the programme, she has learned from graduated students that the salary is much less than she expected and this has changed her decision to be a teacher. She was also not impressed to find out teachers sometimes have to provide cover for absent teachers, that they have administration and other work to do after the students leave, and that teachers are expected to be in the school even when they have a free lesson. She is also affronted by the IELTS requirement. This suggests that Mouza had little idea about the nature of teaching before enrolling. She claims she can earn almost 150% of a teaching salary working in an office. Mouza did concede that she may consider teaching for one or two years just for experience and her own self-esteem.

A salary increase for teachers might encourage Mouza back to the profession. The issues for Alia and Obaid, while more complex, are college-based rather than system-wide issues and therefore potentially easier to rectify, and it is these intrinsically and altruistically motivated students who should be supported on their journey to become educators.

Conversely, Ibtisam, enrolled at ADTC as her first two study choices were either not available in the UAE or discouraged by her father. It was her father who suggested teaching as a career as he had noticed that Ibtisam loved children and was already teaching her younger brothers and sisters at home. "I knew how to deliver the information and create games to teach them." Her father also pointed out that as a teacher she would be helping a new generation of Emiratis and would be contributing to the development of the country, which struck a chord for her. However, she claims the final decision to enrol at ADTC was her own and it was a younger relative calling her 'beautiful teacher' that tipped the scale. Ibtisam was still unsure that she would pursue a teaching career at the time of enrolment but since starting the programme is now convinced that this is the right profession for her.

## 5. CONCLUSION

This study suggests that while enrolling in a teacher education programme does not purport an intention to teach in all students, the majority of Emirati student teachers at ADTC are seeking a teaching career.

Significant percentages of the student body responded that they agreed or strongly agreed that their reasons for entering the teacher education programme at ADTC were 'I enjoy working with children' (84%), 'I want to share my knowledge with my students' (85%) and 'I want to be a part of the educational reform in Abu Dhabi' (79%), indicating strong intrinsic and altruistic motivations. Interestingly only 16% of participants responded positively that a high salary was a reason for enrolment. The other extrinsic motivators were rated highly, supporting Sinclair's (2008) conclusion that student teachers have multiple motivations to teach. Pragmatic motivations also had an impact, particularly working in a segregated workplace for females and the college being easy to get into for the coveted male students. This study also found that experiences during teacher training can have an impact upon the likelihood that students will teach after graduation, both positively and negatively. The ratings of motivations did not differ significantly between male and female students.

An increase in teaching salaries may entice more Emiratis to the teacher profession, however a significant change in the perception of teaching and a transparent promotions path is likely to be needed to encourage male Emiratis to consider teaching.

Of course a claim to definitely be pursuing a teaching career on a questionnaire does not actually mean that this will happen in all cases in reality. Further research could look into the intentions of the same cohort to teach as they get closer to graduation and a follow up survey conducted after graduation. It would also be interesting to conduct the same research on subsequent cohorts, as future students will become more and more impacted by

the education reform underway on public schools – will this attract more students to education?

<input type="checkbox"/>	I'm not sure yet (see over page)				
<input type="checkbox"/>	I will definitely not teach (see over page)				

If you are not sure if you will teach, what are your reasons?

Please put your ID number if you are willing to be interviewed. \_\_\_\_\_

If you will definitely **not** teach, what are your reasons?

Please put your ID number if you are willing to be interviewed. \_\_\_\_\_

**THE EFFECTS OF SOCIAL INTEGRATION  
ON MINORITY STUDENT RETENTION  
AT A PREDOMINANTLY  
WHITE INSTITUTION**

Author: C. Nichole Thompson Ed.D.

Auburn University Montgomery

## **ABSTRACT**

Higher education leaders are not only charged with providing environments conducive to learning, but optimally the environment should aid in the retention and ultimately the graduation of all students. Thus, the retention conversation is broad and encompasses a wide spectrum of research. More specifically, the research identifies academic and social integration as two primary variables required to aid in successful matriculation. This body of research narrowed the retention probe by examining how social perceptions and social integration impact retention among African American and Latino students attending a Predominantly White Institution (PWI). To fulfill the purpose of this study, 50 self-identified, African American and Latino students were administered the Institutional Integration Scale developed by Pascarella and Terenzini (1980). The instrument is a 34 item Likert scale, which examined levels of integration based on five components (a) Peer-Group Interactions, (b) Interactions with Faculty, (c) Faculty Concern for Student Development and Teaching, (d) Academic and Intellectual Development, and (e) Institutional and Goal Commitment. Frequency distributions were used to categorize data and calculate the mean, median and mode for each question. The data revealed there was statistically no relationship between campus connectedness and retention. The results implied that participants at the PWI had developed positive levels of integration socially and academically. Lower composite scores for the sub-scale, Faculty Concern for Student development, suggested that students were unsure as to the faculty's level of concern for minority students. Current minority student graduation rates

imply that a serious discussion of the factors impacting retention must be progressive and ongoing. Theoretical approaches on retention propose that students must obtain academic and social integration for persistence to occur (Tinto, 1993). This research provides implications for practice and recommendations to address social integration and the impact of untraditional faculty interactions.

Louisiana Safe and Supportive Schools Initiative: A Four-Year Comparison of School Climate  
Measures in Diverse School Districts

Educational Measurement and Evaluation

Workshop

The Louisiana Safe and Supportive School Initiative (LSSSI) is a four-year project by the Louisiana State Department of Education and eight diverse districts around the state. Now in the fourth year of implementation, LSSSI evaluates a school's climate using research-based interventions and data analysis. District personnel from Caddo Parish and LSUS will share their successful strategies regarding prevention, as well as results of data from participating districts.

## Louisiana Safe and Supportive Schools Initiative: A Four-Year Comparison of School Climate Measures in Diverse School Districts

According to the Centers for Disease Control and Prevention (2013), approximately 20% of American children may have a mental disorder. As a part of a state-wide effort to reduce substance abuse, victimization, and drop-out rates, a four-year prevention project was initiated in 2010. The Louisiana Safe and Supportive Schools Initiative (LSSSI) district liaisons and coaches evaluate a school's climate based on four measures: 1) support and engagement (40%); 2) violence, victimization, and substance abuse (40%); 3) attendance rates (10%), and dropout rates (10%). Eight school districts were selected to participate: Caddo, East Baton Rouge, Lafayette, Lafourche, Jefferson, Plaquemines, Tangipahoa, and Terrebonne. Now beginning the fourth year of implementation, Caddo Parish School District and Louisiana State University in Shreveport personnel will share their successful implementation programs and strategies regarding prevention and how they merged those initiatives with existing mandates for better use of personnel and resources. Using a national climate survey, discipline data, and dropout rates, Caddo Parish personnel have seen a reduction in violence, victimization, substance abuse, and dropout rates, as well as statistically significant increases in attendance rates, support, and school engagement. In addition, specific district and statewide strategies, as well as results for the first 3 years of this on-going project, will be shared.

Exploring the Blend of Traditional and Contemporary Active Learning Strategies for Undergraduate Students

This presentation will describe our experience exploring and reflecting on innovative teaching strategies in nursing education.

As student populations and their expectations of the learning environment become increasingly diverse, maintaining their engagement during a four hour class and meeting different learning styles has become increasingly challenging.

In the 3rd year of our undergraduate nursing course, classroom learning is offered intensively for one week and then one day each week for five weeks, and focuses on a variety of topics. A brief power-point lecture is presented to highlight key-points from the

pre-class readings. To enhance engagement, and to promote higher forms of thinking, class or small group discussion, video clips, and creative activities are also implemented. We have implemented “Think Tanks” as one example of an innovative strategy. Through pre-readings and online modules, students prepare for each class. During class time, they meet in small working groups to discuss their prep work, and relevant topics guided by the professor. Small group discussion is connected to the overall class content and may take the form of questions, case studies or relevant events in health care. In turn, the students are invited to summarize their discussions and make recommendations. Their own creative and innovative approaches to sharing their work is also encouraged. During this presentation we will share examples of how we have operationalized small group discussion into these forms of engagement.

**Emotional/behavioral difficulties is negatively associated with academic  
performance in special education immigrant youth**

Cécile Rousseau, MD, Sally Mustafa, PhD, Caroline Beauregard

Division of Social and Transcultural Psychiatry, McGill University

[cecile.rousseau@mcgill.ca](mailto:cecile.rousseau@mcgill.ca)

[sallyssmustafa@gmail.com](mailto:sallyssmustafa@gmail.com)

[carolinebeauregard@yahoo.ca](mailto:carolinebeauregard@yahoo.ca)

**Objective:**

The literature emphasizes the role of school environment and peer relationships in supporting the mental health and academic achievement of immigrant youth. The aim of this work is to study the association between emotional difficulties and academic performance and their correlates in first and second generation immigrants assigned to a special class.

**Method:**

Participants were 464 high school students enrolled in special classes assigned for students with learning and/or behavioral problems. Emotional and behavioral symptoms and associated impairment were measured by the youth and their teachers with the Strengths and Difficulties Questionnaire (SDQ). Relationship with peers was measured using the Adolescent Friendship Inventory (AFI). Classroom environment was assessed by the What is Happening in this Class (WIHIC)? Questionnaire. Mathematics and French grades were also recorded.

**Results:**

Our students had an approximate mean age of 14 years, were largely second (46.6%) or first (42.7%) generation immigrants. Almost all (92.5%) of these youth reported being cared for by their mother, evaluated their family economic status to be comfortable (81.5%) and lived in households with an average of five members.

Demographically, self SDQ total score decreased with age ( $p = .028$ ) and increased with witnessing violence or persecution in the country of origin ( $p = .050$ ) or a lower socioeconomic status ( $p = .007$ ). Teacher SDQ total score was significantly lower for girls than for boys ( $p = .009$ ).

As expected, emotional and behavioral symptoms and school performance were significantly associated. Both self and teacher reported total symptoms were significantly negatively correlated to French (self:  $p = .015$ , teacher:  $p = .001$ ) and mathematics (self:  $p = .006$ , teacher:  $p = .002$ ) grades.

The presence of the mother ( $p = .029$ ) and relationships with peers ( $p < .001$ ) were significant protective factors. The classroom environment was negatively correlated with symptoms and impairment and positively with grades (WIHIC with self SDQ total score ( $p = .033$ ), teacher SDQ ( $p = .004$ ), French ( $p = .002$ ) and Mathematics ( $p = .028$ ) grades).

Linear regression analysis showed that having a mother caregiver and positive relationship with peers significantly contribute to self-reported SDQ total symptoms ( $P < .001$ ) while age was inversely associated with teacher SDQ total symptoms score ( $P = .001$ ).

### **Conclusions:**

The findings emphasize the need to adopt an eco-systemic model to understand the relations between emotional and behavioral symptoms and academic performance in immigrant youth identified as having difficulties by the school. The salience of peer relationships and classroom environment suggest that schools need to promote positive school based relationship to improve these youth mental health.

## **Teacher Self-Efficacy Findings from the Teacher-to-Teacher (T2T) Professional Development Model in Elementary Science**

jan.ray@hawaii.edu

### **Abstract**

The Frameworks for Success in Science Math/Science Partnership (MSP) Title IIB project was designed to increase teacher content knowledge and pedagogical skills in elementary science education using a Teacher-to-Teacher (T2T) professional development (PD) model. Participants in this study included elementary school teachers from three of the seven schools that fed into Hilo High School on Hawaii Island. Both qualitative and quantitative findings from the first cohort of participants in the MSP T2T PD project suggested significant changes in teacher self-efficacy related to science attitudes, behaviors, skills and perceptions of supporting professional learning communities (PLCs).

### **Introduction**

Conderman and Sheldon Woods (2008) suggested that although science plays a central role in our world today, science instruction seems to be minimized, particularly at the elementary grade levels. To cultivate higher-order thinking, as well as meet the changing demands of society, the quality and quantity of science teaching and learning must be increased in the elementary classroom. According to Abell and Lee (2008), the most effective professional development in science has: (a) relevant and applicable content directly connected to the classroom, (b) teachers learning in a way similar to the way their students will learn, (c) collaborative teacher relationships, and (d) sustained opportunities to collaborate and reflect over time (p.62).

Researchers have investigated the construct of efficacy (Bandura, 1977, 2006a; Riggs & Enochs, 1990; Ramey-Gassert, Shroyer & Staver, 1996; Tschannen-Moran, Hoy & Hoy, 1998).

Professional and conceptual development in teachers has also been explored (Gordon, 1990; Sheerer, 1997; Skaalvik & Skaalvik, 2007). Supporting science content knowledge development, and effective science teaching, is imperative for elementary school teachers.

### **Purpose of Study**

The purpose of this study was to examine the changes in self-efficacy elementary teachers experienced as they participated in in the Frameworks for Success in Science Math/Science Partnership Title IIB Teacher-to-Teacher Professional Development (MSP T2T PD) project. Specifically, this study focused on the identification and description of the changes in teachers' attitudes, behaviors and skills related to science instruction at the elementary level.

### **Research Question**

One research question was posed for this study. How does a teacher's sense of self-efficacy (attitude) towards teaching elementary science change over a sustained period of professional development?

## **Methodology**

### **Research Design**

This mixed-methods study used two research designs. The quantitative portion of the study used a one-group, post-test design with teacher participants. The qualitative portion of the study used a semi-structured interview protocol with a sub-sample of teacher participants.

### **Subjects**

Eighteen teachers from three different elementary schools, who formed the first cohort of participants in the MSP T2T PD project, were the subjects of this study. Sixteen of the teachers were female, and two of the teachers were male. All teachers were fully certified to teach at the elementary level. Eleven teachers held bachelor's degrees, and 7 teachers held master's degrees. Teachers ranged from 6 to 27 years of teaching experience, with an average of 13.4 years.

### **Instrumentation and Administration**

Research data was gathered in two ways for this study—first, through the Teacher Retrospective Self-Efficacy Questionnaire and, second, through participant interviews. Both instruments were administered to teacher at the conclusion of their second year of participation in the MSP T2T PD program.

**Teacher Retrospective Self-Efficacy Questionnaire (TRSEQ).** The TRSEQ was developed through analyzing and adapting components of several existing surveys (Bleicher, R.E., 2004; Koehler, J.R., 2006; Tschannen-Moran, Woolfolk Hoy & Hoy, 1998; Woolfolk Hoy, 2000). Internal consistency reliability was addressed by the fact that all survey items represented only one construct—self-efficacy. Cronbach's alpha was used to calculate the reliability for the TRSEQ pre and post questions within the survey. Findings yielded a pre score of 0.921 and a post score of 0.951, indicating very high instrument reliability. Two measures of validity were established—content validity and construct validity. TRSEQ items were adapted from already established surveys of teacher self-efficacy. The content was further adapted to reflect the behaviors and skills of elementary science teachers. Construct validity was addressed by including items that specifically described the behaviors and skills of self-efficacy in science

teaching. The TRSEQ was administered to teachers during the summer after their second year of participation in the MPS T2T PD program.

**Participant Interviews.** A Semi-Structured Interview Protocol (SSIP) was developed that addressed three broad categories—(a) efficacy and attitude towards teaching science, (b) the skills and behaviors needed to plan and teach science lessons, and (c) feelings about professional learning communities (PLCs). The interviews took 25-30 minutes to complete. Each interview was conducted in person. Interviews were audiotaped and transcribed for analysis. Threats to both descriptive and interpretive validity were addressed. Respondents were each given a copy of the transcript to check for accuracy, and an external auditor verified the transcripts with the audiotapes.

## Data Analysis

**Retrospective Self-Efficacy Questionnaire Pre/Post Data Analysis.** Since the sample size for Cohort I ( $n=18$ ) was smaller than the recommended size for parametric tests, a Wilcoxon signed-ranks test was first conducted on the total pre and post scores for the Teacher Retrospective Self-Efficacy Questionnaire. (See Table 1 below.)

**Table 1**  
**Wilcoxon Signed-Ranks Pre/Post Teacher Retrospective Self-Efficacy Questionnaire**

	RpostTotal - RpreTotal
Z	-3.726 <sup>a</sup>
Asymp. Sig. (2-tailed)	.000

Table 1 reveals a statistically significant increase in the total scores on the Teacher Retrospective Self-Efficacy Questionnaire following the MSP T2T PD experience,  $z=3.726$   $p < .001$ , with a medium effect size ( $r=.621$ ). The median score increased from the pre-survey scores based on experience prior to the MSP professional development ( $Mdn=23$ ) to the post score based on their perceptions after completing two years of T2T professional development ( $Mdn=39.5$ ).

In order to confirm the non-parametric results, a more robust paired samples  $t$  test was conducted with the totals for the pre and post responses ( $M_{pre}=25.22$ ,  $SD=6.5$ ,  $M_{post}=40.4$ ,  $SD=4.97$ ). (See Table 2 below.) There was a significant increase in the total scores for the Teacher Retrospective Self-Efficacy Questionnaire pre score ( $M=25.2$ ,  $SD=6.5$ ) and post score ( $M=40.4$ ,  $SD=4.9$ ) conditions  $t=10.6$ ,  $p<.01$ .

**Table 2**  
**Paired Samples  $t$  Test – Pre/Post Teacher Retrospective Self-Efficacy Questionnaire**

	Mean	Std. Deviation	Std. Error	Paired Differences		$t$	$df$	Sig. (2-tailed)
				95% Confidence Interval of the Difference				
				Lower	Upper			
RpostTotal - RpreTotal	15.222	6.093	1.436	12.192	18.252	10.600	17	.000

**Participant Interviews.** Three broad categories of questions were explored through the participant interviews. They were: (a) efficacy and attitude towards teaching science, (b) the skills and behaviors needed to plan and teach science lessons, and (c) feelings about professional learning communities (PLCs). Five of the 18 teachers were interviewed. The five teachers were purposely selected from different grade levels (grades K-6), with at least one teacher selected from each of the three participating schools. Further, in order to assure a diverse representation of teachers, ethnicities and years of experience were also considered.

**Analyzing Transcripts and Unitizing.** All interview audiotapes were transcribed to electronic documents. Then the Coding Scheme for Interviews of Teachers was developed in order to analyze the interviews.

Through content analysis of the interview transcripts, categories emerged. They included discussion related to:

1. educational background,
2. prior science experiences,
3. current science experiences,
4. feelings about current science lessons,
5. feelings about the grade-level PLC,
6. lesson prep skills,
7. lesson “habits of mind,”
8. science lesson examples,
9. changes to lesson examples,
10. success of lessons,
11. PLC configuration, and
12. feelings about peers.

Each category was determined to be complete when both “internal homogeneity and external heterogeneity” criteria were met (Patton, 2002, p. 465).

After reviewing and placing categories within quadrants, the process of saliency analysis (Buetow, 2010) was completed. As can be seen in Table 3: Saliency Analysis of Teacher Interviews below, the categories were placed into one of four quadrants: (1) highly important and recurrent, (2) highly important but not recurrent, (3) not highly important but recurrent, and (4) neither highly important nor recurrent.

**Table 3**  
**Saliency Analysis of Teacher Interviews**

<p><b>Quadrant 1</b> <u>Highly Important and Recurrent</u></p> <ul style="list-style-type: none"> <li>• Sciences Experiences</li> <li>• PLC Support</li> <li>• Time to Prepare/Understand Lessons</li> <li>• Student Engagement</li> </ul>	<p><b>Quadrant 2</b> <u>Highly Important But Not Recurrent</u></p> <ul style="list-style-type: none"> <li>• Professional Growth</li> <li>• Teacher Learning the Science First</li> <li>• Teachers Teaching Teachers</li> <li>• Older Teachers Learning New Tricks</li> </ul>
<p><b>Quadrant 3</b></p>	<p><b>Quadrant 4</b></p>

Not Highly Important But Recurrent	Neither Highly Important Nor Recurrent
<ul style="list-style-type: none"> <li>• Organization (binders, material prep)</li> <li>• Collaboration/Sharing</li> <li>• Revisions/Extension of Lessons</li> <li>• Cooperative Learning</li> <li>• Hands-on</li> <li>• Differentiation</li> <li>• Integration</li> <li>• Science Tools/Materials Used</li> </ul>	<ul style="list-style-type: none"> <li>• Educational Background</li> <li>• Use of SMART Boards</li> </ul>

Once the saliency analysis using quadrants was completed, major themes were identified. The Quadrant 1: Highly Important and Recurrent themes that emerged included: (1) impact of science experiences, (2) impact of grade-level PLCs, (3) time, and (4) student engagement. It became apparent that much of what was placed in Quadrant 2 could also be categorized within the themes developed above, except (5) professional growth, which became the fifth major theme. Each of the items in quadrant three supported the four major themes described above and thus did not provide any additional themes.

### Limitations

There were three limitations identified for this research study. First, there were a small number of participants (18) who participated in this study. Consequently, generalizability of the data to larger populations would be limited. Second, participating teachers were self-selected for the project and, therefore, self-selected for this research study as well. Finally, this research was not a randomized controlled trial study because the T2T model is still under development, and the resources were not available for testing effectiveness via a larger experimental study.

## Findings

### Findings for the Teacher Retrospective Self-Efficacy Questionnaire

The Teacher Retrospective Self-Efficacy Questionnaire was used to determine how the teachers perceived their changes in self-efficacy over the first two years of the MSP T2T PD project. According to the data, there were statistically significant positive changes from the pre to the post total score on the survey. The pre ( $M=2.5$ ) indicated the average answer choice of “Very Little” to “Some” for the teacher’s perceived sense of efficacy prior to participating in the MSP grant. The post ( $M=40.4$ ) total score indicated an average response of “Quite a Bit” for the survey, with two of the 18 teachers selecting “A Great Deal” as their primary response. The data from the parametric and non-parametric tests suggest that teachers reported they were feeling more confident and doing more science in their classrooms after participating in the project over the past two years.

### Findings for the Participant Interviews

The differences between how teachers felt before and after participating in the MSP T2T PD project were shared during the interviews. The word “confident” appeared multiple times in all five interviews, as did positive descriptors like “supported,” “successful,” “accomplished,”

“significant” and “reflective.” The teachers also emphasized that they enjoyed the sharing that occurred in their regular PLC meetings, as well as the support they received. Overall, the interview themes suggested that the teachers believed the MSP T2T PD model used in their grade-level PLCs allowed for substantial professional growth in science teaching and learning.

Prior to the project, three of the five teachers stated that they did not have positive science experiences. One teacher shared, “So one of my [prior experiences] was taking a science class. It was astronomy. It was Astronomy 101. It was at the University of Hawaii at Manoa, and it was just one of my harder classes in my whole educational career. Just taking the class and understanding the concepts and just struggling with that kind of class . . . .”

A second teacher shared that she did not have positive experiences in science. She stated that one of her classes at the University of Hawaii at Hilo “did not prepare” her to teach in her own classroom. “I never had very good experiences in science. [They] were not positive. They were negative.” In addition, her experiences were mostly paper/pencil and “very boring”—as both as a student and as a teacher with her first students.

The third teacher stated that she “wasn’t that into science” because her experiences were “. . . at times intimidating. Some of the astronomy was just overwhelming. The chemistry I took as a summer course, and that was intense.” However, this teacher did end by saying that her experiences “overall [were] positive” due to having several classes with hands-on experiences to augment the textbook.

In contrast to the past, current science experiences were more positive in tone. Two of the teachers stated that they “learned a lot” over the last two years in the MSP T2T PD project. One teacher shared, “. . . over [the] years with MSP, I feel really comfortable. I feel prepared. I know I have more knowledge now, and when I do science with the kids, they’re more excited because I know how to better teach science.”

Additionally, teachers shared that they became more organized, excited, and comfortable with the science content and pedagogy that they developed and implemented. One teacher commented, “I’ve learned a lot, and I’ve also gotten really organized with science. I feel like Ms. Frizzle with lots of growth [when] doing hands-on science experiences. I’ve really had a lot of growth because there’re a lot of things I wouldn’t have done if I didn’t participate, mainly a lot of hands-on, I guess, because, like I said, in college they taught [using] pencil/paper.”

The word “confident” appeared repeatedly throughout two of the five teachers’ interviews. As one teacher explained, “I think for me, my teaching of science changed. Within myself, I feel more comfortable, more knowledgeable and more confident in the science curriculum. And when a teacher feels more comfortable and more knowledgeable, students will have an easier time understanding what you’re trying to teach them.”

When questioned about how she feels about science after participating in the T2T PD project, one teacher stated that she is better at teaching science. Prior to the project, she did “activities and fun” but didn’t really teach science. Now, she feels that she is able to meet the kids where they are and take them to the next level by setting the stage and facilitating their science learning. Two key words described her current feelings towards science—accomplished and significant. She also stated, “I really get [into] science now that I’ve been participating in the grant. I can kinda build on what they know and I just . . . [meet] the kids where they’re at and [take] them to the next level.”

Throughout the interviews, it was evident that science teacher self-efficacy improved through teacher participation in the MSP T2T PD project.

## Conclusions

The findings indicated that teachers felt supported by MSP T2T PD model in both physical and social ways. All of their responses aligned with what Bolman and Deal (2008) address as the structural frame—the one that looks at the “social architecture of work” (p. 106).

This study reinforced the idea that teachers grow and develop over time. The prior literature only described, in a limited ways, what efficacy looks like at one moment in time (Bandura, 1977, 2006a; Riggs & Enochs, 1990; Ramey-Gassert, Shroyer & Staver, 1996; Tschannen-Moran, Hoy & Hoy, 1998). When teachers are supported by the MSP T2T PD model over a two- or three-year period, they do learn more than basic science content because they begin to internalize and implement science experiences for their students that are deeper and more engaging than those simple activities they did in the past (if they even taught science). In addition, as they continue to learn and become more confident, they also recognize what they have not quite understood and they move towards trying to improve in those areas; they now know what they don't know, so they can learn more about it, which in turn will support their identification and addressing of misconceptions in their student's learning. Finally, as the teachers move towards a higher sense of efficacy, their feelings towards learning challenging material or experiments changes to a “can do” attitude, and they take on the challenge of learning and teaching new skills.

Finally, the ability to take this professional development model and use it to help teachers with the Common Core Standards needs to be explored. There needs to be a way to support teachers and schools through the MSP T2T PD model to continually improve teaching and learning.

**Title:**

Teacher Self-Efficacy Findings from the Teacher-to-Teacher (T2T) Professional Development Model in Elementary Science

**Topic Area:**

Science Education

**Presentation Format:**

Paper Session

**Description of Presentation:**

The Frameworks for Success in Science Math/Science Partnership (MSP) Title IIB project was designed to increase teacher content knowledge and pedagogical skills in elementary science education using a Teacher-to-Teacher (T2T) professional development (PD) model. Participants included elementary school teachers from the three schools that fed into Hilo Intermediate and Hilo High School on Hawaii Island. Both qualitative and quantitative findings from the first cohort of participants in the MSP T2T PD project suggested significant changes in teacher science self-efficacy related to attitudes, behaviors, and skills.

6. Abstract :

### **An Analysis of Kindergarten Activities on Social Studies**

This study aims at exploring the general trends of kindergarten activities on social studies presented in daily educational plans written by kindergarten teachers in Korea. In particular, the proportion of social studies activities, the contents and themes of social studies that embedded in the activities, the expressed types of the activities, and the age-related differences are being examined. For this purpose, 9 kindergarten teachers (3 teachers per each age level of young children: 3, 4, 5) provided their daily educational plans for a year. Data analysis is being conducted based on the classification criteria proposed by Song (2010),

NCSS (2010), Seefeldt, Castle, and Falconer (2009), and Lee, Yoo, and Lee (2005). The findings of this study will be presented and discussed in terms of the implications for early childhood practice and teacher education.

### **Abstract**

Northern Arizona University has received international recognition for its significant effort to embed global learning outcomes into the higher education environment through its Global Learning Initiative (GLI). GLI at NAU is embodied by the provision of multiple, intentional, substantive learning experiences to infuse global perspectives throughout the academic disciplines. Departments were invited to participate in conversations and collaborations that would ultimately result in the adoption by the university of three global themes: global engagement, environmental sustainability and diversity. As global education was being investigated and implemented by departments across the university, faculty members of the NAU Yuma Branch Campus Education Department considered how best to develop and incorporate GL outcomes to benefit pre-service teachers; outcomes that would be both meaningful and aligned to the teaching and learning standards for which they would soon be responsible. Our connection to global competencies lay in the pedagogies of teaching and learning that foster critical thinking, problem finding, framing, and solving, and creative thinking; and that support authentic, student-led investigations. When two first year teachers implemented the service-learning curriculum they had constructed in an NAU education methods course, they were able to observe and document those global learning competencies under construction in their second grade classroom. In addition, they found that by facilitating the inquiry-based project, their young students grew as decision-makers who were more comfortable with complex challenges, more confident in themselves and more excited to come to school! Inquiry-based learning experiences spark the curiosity that drives meaning-making through analysis, synthesis, and evaluation at all grade levels, and even more importantly, makes possible those moments of challenge and discovery that combine to not only to develop global competencies, but to inspire life-long learning.

## **Teaching Critical-Thinking: The Promise of Integrated Case Analysis**

### **Abstract**

This paper advances critical-thinking teaching practice through a 3-course module at the front end of an MBA program which incrementally builds students' critical thinking abilities. It describes an integrated case analysis approach that builds on Bloom's Taxonomy and Klebba and Hamilton's Structured Case Analysis approach that diminishes typical challenges to teaching critical thinking.

### **Introduction**

Despite broad longstanding consensus around the need for Business educators to develop students' critical thinking skills, schools still appear to be struggling with how to do so. The case has been made that university graduates simply do not possess the critical thinking skills desired by employers (Braun, 2004; Smith, 2003), that they over-rely on formulaic models with a

consequent inability to deeply examine them (Martin, 2010; Nentl & Zietlow, 2008), that efforts in business schools to teach critical thinking have been “wanting in depth and substance” (Smith, 2003). This gap in Business-school education has been linked to challenges in integrating critical thinking into curricula due to a lack of training for faculty, a lack of information about critical thinking, preconceptions about the subject, and a lack of time available to teach it (Snyder & Snyder, 2008). A further challenge emerges from the fact that critical thinking is simply a very hard thing to do (Gelder, 2005). According to Gelder, its reliance on both lower and higher-level cognitive capacities makes learning critical thinking as difficult as learning a second language and thus “is more of a lifelong journey than something picked up in a two-week module.” (Gelder, 2005)

### **Critical Thinking and Its Instruction in Business Schools**

The variety of definitions and conceptualizations of critical thinking in the literature demonstrates a wide range of understanding. Indeed, at the broadest level, critical thinking has been understood from two primary perspectives. One view, most notably put forward by Brookfield, frames critical thinking within the context of critiquing society (Brookfield, 1987). The other, which is the approach we have taken, views critical thinking in the context of strong analysis/argumentation. Definitions in this latter perspective range on a continuum from simple to complex. An example of a simpler description sees critical thinking as “reasonably reflective thinking that is focused on deciding what to believe or do” (Ennis, 1991). The more complex end of the continuum describes critical thinking as:

The intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated by,

observation, experience, reflection, reasoning, or communication, as a guide to belief and action. In its exemplary form, it is based on universal intellectual values that transcend subject matter divisions: clarity, accuracy, precision, consistency, relevance, sound evidence, good reasons, depth, breadth, and fairness. (Foundation for Critical Thinking, 2013)

Huitt finds a mid-point on the continuum by defining critical thinking as “the disciplined mental activity of evaluating arguments or propositions and making judgments that can guide the development of beliefs and taking action" (Huitt, 1998).

Regardless of the specific definition, a common approach to understanding critical thinking in the context of business education is framed around six core critical thinking skills: interpretation, analysis, inference, evaluation, explanation, self-regulation. (Facione, 1998) In one form or another, elements of these six skills appear in the majority of conceptualizations of critical thinking. Common also to most conceptualizations is the notion that critical thinking is about the use of cognitive skills directed towards a desirable outcome. As such it is purposeful, reasoned, and goal-directed (Halpern, 1999).

For the purposes of this article, and for our approach to developing critical thinking skills in the MBA program, we believe that critical thinking is the ability to construct cogent, coherent, and concise arguments in support of a specific course of action. Doing so requires the application of subject-specific theories, concepts or frameworks towards the explication of personal and/or organizational issues, and the synthesis of complex and often interrelated information. In essence it means being able to articulate logically (although not necessarily in this order) what should happen, why it should happen and ultimately how it should happen.

## **The Role of the Case Study**

The case study method, a pedagogical approach that asks students to navigate, make decisions, and support their perspectives about personal and/or organizational challenges based on real-world situations, often has been regarded as a tool for developing critical thinking and analytical skills (Brooke, 2006; Jerrard, 2005; Kreber, 2001; Kunselman & Johnson, 2004; Popil, 2011; Tomey, 2003). Brooke contrasts the “banking method of education” where students “spit back the facts to the instructor as provided” and where “there is no critical thinking involved” to the case method where “students and the professor engage in a Socratic dialogue which fosters critical thinking skills” (Brooke, 2006, p. 142). Kreber argues that “the case study approach to post-secondary teaching would be particularly effective in fostering students’ growth in critical thinking and self-direction as case studies have the potential to create genuine experiential learning experiences for students” (2001, p. 226). These sentiments are echoed by educators in a multitude of disciplines. For example, according to one Professor of Science Education, “If reading, arguing, and challenging are hallmarks of critical thinking, then case studies are the poster children for the process. [Cases] grapple with the essence of critical thinking—asking for evidence—developing a habit of mind that should permeate everyday life” (Herreid, 1994).

### **Best Practices in Critical Thinking Instruction**

Just as there are a range of conceptualizations of critical thinking, so too are there a range of perspectives about how to actually teach critical thinking. That said, a review of the literature suggests that four pedagogical approaches can be identified as best practices.

- 1. Explicit instruction around what thinking critically means and how students can recognize when they are doing it.** There appears broad consensus that “critical thinking

skills and abilities are unlikely to develop in the absence of explicit instruction” (Lai, 2011). Critical thinking is a complex topic with its own theories, along with its own cognitive and attitudinal dimensions, and students must know **how** to think critically and then must be inclined to do so (Smith, 2003). The implication for instructors is that they must not only clearly define thinking goals for students but also help them develop an awareness of their own thinking, or metacognition: “[Metacognition] is considered an important component of higher-order thinking skills because the student not only recognises the practice of critical thinking skills but also is able to focus on, develop, and control their use” (Joanne M Klebba & Janet G Hamilton, 2007).

- 2. Embedded instruction, which promotes the use of critical thinking concepts in discipline-focused classes.** While students require explicit instruction in critical thinking, it is not sufficient (Lazzara et al., 2009). According to Lai, “There appear to be both general and domain-specific aspects of critical thinking, which suggests that instruction should represent a fusion of preparation in general critical thinking principles, as well as practice in applying critical thinking skills within the context of specific domains” (Lai, 2011) and “Transfer of critical thinking skills to new contexts is unlikely to occur unless students are specifically taught to transfer by sensitizing them to deep problem structures and are given adequate opportunities to rehearse critical thinking skills in a variety of domains.” (Lai, 2011)
- 3. The use of active and experiential learning.** To increase critical thinking abilities, instructors must move beyond demanding “standard responses to questions focused on mere knowledge and comprehension” and “regurgitating a step based definition of a framework” (French & Tracey, 2008) and move toward presenting students with

opportunities to actively use new knowledge by applying it. The goal here is to build students' abstract thinking skills, so that they can apply principles learned in one context to another. According to Smith, experiential knowledge is “the essential raw material for effective thinking [and] abstraction is the indispensable means for putting the knowledge to work. Because no two experiences are ever the same, one must be able to conceive experienced phenomena in more fundamental and abstract terms, so past experiences of an appropriate kind are recalled when needed.” (Smith, 2003).

**4. The scaffolding of instruction, so that students can gradually build skills and abilities.**

Instructors must be strategic in determining the amount and type of guidance that will most benefit students at each stage of the learning process. Instructors should provide sufficient support and instruction to enable students to incrementally develop abilities and should gradually withdraw support, so that students become independent thinkers, as student abilities develop (Althausen & Darnall, 2001; Bensley, 2010; Joanne M Klebba & Janet G Hamilton, 2007). According to Bensley (2010, p?):

Scaffolding involves providing product guidelines, rules, and other frameworks to support the process of thinking....Modeling, scaffolding, and guided practice are especially useful in helping students first acquire CT skills. After sufficient practice, however, instructors should fade these and have students do more challenging assignments without these supports to promote transfer.

For the most part, the case method of instruction promotes the latter three principles of critical thinking instruction, but not the first. The case method excels at embedding critical thinking training throughout the curriculum, ensuring that students are practicing and improving their analytical skills, while they learn key theories and information in the various business disciplines like HR, OB, Accounting, and Marketing. Also the case method provides a rigorous and well-developed approach for fostering active learning. Moreover, a degree of scaffolding can be built into case-method pedagogy. For example, Erskine (Erskine, Leenders, & Mauffette-Leenders, 1998) advise that, in selecting cases, faculty should refer to the “case difficulty cube,” which can be used to assess cases according to how long they are, how complex they are, and the degree of definition around the decision that needs to be made.

That said, it has been pointed out that faculty generally lack the training to properly teach critical thinking, as a subject area, and that even with the appropriate training, they lack the time to include explicit instruction in the curriculum (Snyder & Snyder, 2008). This latter point about the conflict between time spent on course content vs. time spent on critical thinking is a very pragmatic one for teachers; put simply, there is an assertion that focusing on critical thinking takes away from time on course content (McEwen, 1994).

In short, although most Business schools and faculty are committed to critical thinking skills and many use the case method to develop them, case pedagogy, in itself, does not fully address what students need to develop as critical thinkers. But by drawing and building on two foundational frameworks, Bloom’s Taxonomy of Educational Objectives and Structured Case Analysis, both outlined below, this paper’s authors were able to design a 3-course module at the front end of an MBA curriculum that better satisfies all the best practices principles of critical thinking instruction identified above.

## Relevant Frameworks

### Bloom's Taxonomy

*Bloom's Taxonomy of Educational Objectives* (Bloom, Engelhart, Furst, Hill, & Krathwohl, 1956) was originally published in 1956 as an effort to clarify and organize educational goals. The taxonomy classifies cognitive skills into 6 categories, *Knowledge, Comprehension, Application, Analysis, Synthesis, Evaluation*, which are sequenced from most simple to most complex and from most concrete to most abstract. The taxonomy assumes that each stage builds on and includes that which comes before, which is to say, for example, that in order *apply* a concept, one must first possess *knowledge* and *comprehension* of it.

Bloom's taxonomy was originally designed to facilitate assessment, with the goal of enabling educators to exchange tests between institutions. However, in the time since its inception, it has been widely adopted as a tool for curriculum design. It appears to be particularly helpful in the development of critical thinking skills, because it addresses a fundamental challenge, mentioned above, that is faced by many faculty members, who are trained in their discipline and not explicitly in critical thinking. The advantage of Bloom's taxonomy is that it makes the steps towards better thinking explicit, providing the instructor both with a map of how to get where they want to go, and the language to articulate these steps to students.

Numerous management educators from a wide range of disciplines, including Organizational Behavior, Entrepreneurship, Marketing, and Business Policy, have recognized the value of Bloom's taxonomy to guide course/class design (Athanassiou, N., Jeanne, M. M., Harvey, C., 2003; Betts, 2008; Cannon & Feinstein, 2005; Forbes & Clabaugh, 1995; Lang & Dittrich, 1982; Leach, 2007). Noting students' inability to solve unstructured problems, Lang and Dittrich (1982) employed it in the design and

teaching of a capstone Business Policy class. Both Cannon & Feinsten (2005) and Leach (2007), in the context of, respectively, employing service learning and teaching entrepreneurship, have employed the taxonomy to guide in bridging the knowing-doing gap, so that those they teach can move from being students able to understand and apply concepts in the orderly environment of the classroom to being managers or entrepreneurs with increased capability in using these concepts in facing chaotic real-world challenges. Braun has demonstrated that the levels of learning, as defined by Bloom's taxonomy can be directly mapped onto the steps of problem solving that students are expected to undergo in completing a case analysis. For example, in tackling a case study, a student must first fulfill the lowest level of cognitive expectation according to Bloom, the acquisition of *Knowledge*, through "reading the case study" to "understand the problem situation" (Braun, 2004). The student must then achieve *Comprehension* through "identifying business concepts embedded/illustrated in the case," followed by achieving *Application* through "comprehending the effects of the business concepts within the case" (Braun, 2004, p. 233).

In all of the above examples, Bloom's taxonomy was perceived as instrumental in designing classes which helped students move from fulfilling less realistic and more structured tasks to navigating more realistic tasks of the type that move more closely to emulating what they will encounter as working professionals.

### **Structured Case Analysis**

Perhaps most relevant to our own work, both as authors of this paper and instructors of our respective MBA classes, is Klebba and Hamilton's, where it is pointed out that although case analysis holds the potential to offer students deep learning in critical thinking, "a process to systemically further this result in case courses has not emerged" (Joanne M Klebba & Janet G Hamilton, 2007). Their solution is a "structured case analysis" (SCA) approach, which in using

Bloom's taxonomy, "integrates a multilevel incremental learning process into case analysis" (Joanne M Klebba & Janet G Hamilton, 2007). In practical terms, the SCA approach advocates simultaneously building both students' content knowledge and critical thinking skills in an incremental manner by having them participate in a series of increasingly less structured exercises, as they gradually acquire the skills to tackle a structured and then an unstructured case analysis.

Klebba and Hamilton propose that instructional activities exist on a hierarchy from less to more realistic: lectures, followed by problem exercises, laboratory exercises, simulation exercises, structured cases, unstructured cases, live business projects. As activities ascend in the level of realism they presumably ascend Bloom's hierarchy. For example, completing case exercises, in which an instructor asks pointed questions of limited scope, requires less complex thinking skills than does completing an overall case study, whereby students must analyze complex situations and make recommendations. Real life, or in the case of MBAs, operating in the real world as a working manager requires the most complex thinking skills of all. The case study approach lies somewhere in the middle of the realism scale. In designing a class using the SCA approach, faculty strategically sequence instructional activities so they move from less to more realistic.

In the remainder of this paper we build on Klebba and Hamilton's work, by introducing an alternative version of the SCA approach. As outlined in the following section, our approach contains some notable differences, which we hope will contribute to the robustness of this pedagogical innovation:

1. Rather than addressing a critical thinking and a disciplinary curriculum in the context of a single course, as Klebba and Hamilton do within the context of a Marketing class, we integrate three courses: One which explicitly addresses critical thinking and argumentation, one in Organizational Behaviour, and one in Leadership.
2. Our students are working professionals, who are an average age of 40 with a minimum of three years of managerial experience. Our classes therefore build towards a great degree of realism and complexity. By their end, students are expected to apply course concepts to a personal, real-world situation.

### **Case Study: An MBA Curriculum to Foster Critical Thinking**

#### **Context**

The MBA program in which our module is situated caters to mid-career students working in managerial positions. The program is delivered using a blended format: Students attend two three-week residencies, one at the beginning and one at the end of the 18-month program, and complete all other coursework via distance learning. It is a cohort- and team-based program. Students move through the program as a cohort and all classes require teamwork. The program is based on eight learning outcomes, of which Critical Thinking is one.

In 2012, a new course, Crafting and Communicating Effective Arguments (CCEA), was introduced to the beginning of the MBA to assist students in transitioning into the academic world. This course filled a gap in the curriculum, since as explained above, students require explicit instruction in critical thinking in order to master it, but previous to the introduction of CCEA it was not provided. The course was developed through consulting with faculty who teach at various points in the MBA program, to identify where students struggled and how this new course could best enable their success. Once the class's high-level goals were established, the

course designer worked closely with faculty responsible for courses taught concurrently with CCEA: Foundations of Strategic Leadership (FSL) and Managing Organizations through People (UOTP). The overarching objective of this consultation was to ensure that critical thinking, communication, and argumentation skills taught in CCEA directly supported their content. CCEA thus serves as an integrator, drawing on and using material from both FSL and UOTP. These courses were chosen to integrate with CCEA for three reasons (1) They are the first courses in the program and thus are offered at a point in time when students most need critical thinking development; (2) Students seem to particularly struggle to exhibit rigorous critical thinking when dealing with courses that deal with people issues and require them to use non-quantitative information to formulate their arguments; and (3) These courses are offered in an abridged time frame (5 weeks), thus requiring their instructors to address a lot of content in a short time, leaving little time left over for explicit instruction in critical thinking.

The three courses all take place in the first eight weeks of the MBA. As illustrated in Figure 1, all employ a combination of online and face-to-face learning. CCEA begins in an online pre-residency period and continues on campus. FSL and UOTP begin when the students arrive on campus and conclude in a post-residency on-line period.

Online Pre-Residency			Face-to-Face Residency			Online Post-Residency		
Week 1	Week 2	Week 3	Week 4	Week 5	Week 6	Week 7	Week 8	Week 9
Crafting and Communicating Effective Arguments (CCEA)								
			Understanding Organizations Through People (UOTP)					
			Foundations of Strategic Leadership (FSL)					

Figure 1 – Sequence of Classes

***A Curriculum Designed to Incrementally Develop Critical Thinking Capacity***

FSL and UOTP both aim not simply to transmit to students content knowledge about Leadership or Organizational Behavior, but rather to help them grow as professionals by providing conceptual knowledge and tools that will enable them to change how they decide, act, manage, and lead in their roles as managers. For this reason, both classes culminate with a final paper which asks students to apply class concepts to their professional practice. From the perspective of Bloom’s taxonomy, the complexity of these final assignments can be explained as follows:

1. When students are asked to use their own professional experience as a case, they must create a coherent narrative from the messiness of life. In so doing, they must select an appropriate experience or topic to focus on, sift through multiple potential ways to frame and narrate it, and select salient details (without getting lost in detail), so that the instructor can understand the aspect of their professional experience they are addressing.

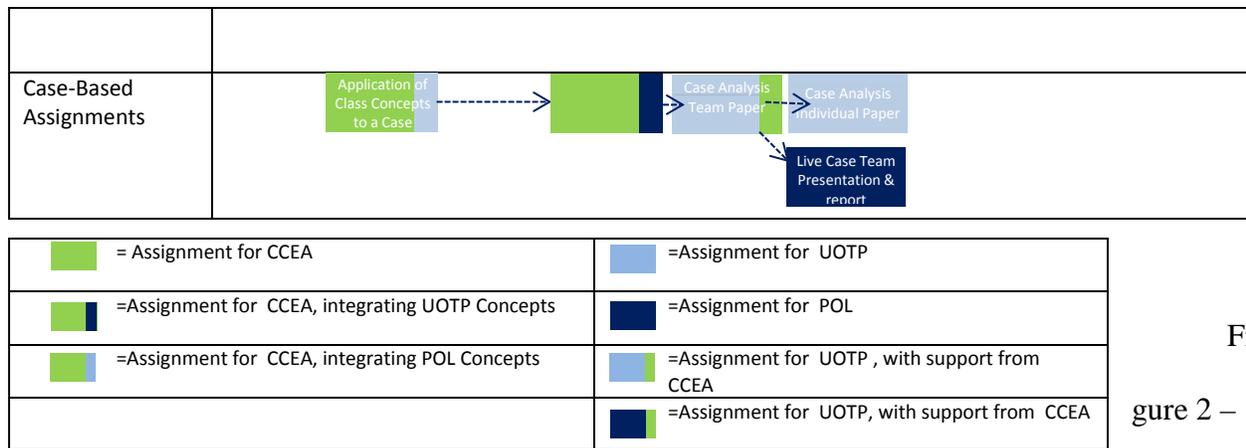

In other words, advanced *Synthesis* skills, defined as the ability to “build a structure or pattern from diverse elements” (Clark, 2010), are required.

2. Students are not directed to a predetermined class concepts or theories, but rather must decide independently which, out of all that have been covered throughout the course, are most relevant to the professional situation they have chosen.

Here, *Evaluation*, defined as “making judgments about the value of ideas or materials” (Clark, 2010) is needed.

To help students get to this point, CCEA, FSL and UOTP work together to incrementally build cognitive capacity, through scaffolding. Specifically, students begin their MBA with explicit instruction in critical thinking, including modules and readings on the principles of strong critical thinking, inductive and deductive argument, and critical reading. Students progress through their first weeks concurrently building capacity in (1) using their own life experience as fodder for analysis, which as explained above requires a complex act of synthesis and (2) honing their analytical, synthesis, and evaluation skills, using case analysis as the training ground. As illustrated in Figure 2 and explained in more detail in Appendix A, students begin by completing fairly straightforward tasks upfront. For example, a second-week assignment in CCEA asks students to use UOTP class theory to answer focused and directive questions about a case study, with an example of such a question being, “Referring to the Rokeach Value Survey, identify three values held by the case protagonist and provide evidence from the case for how you know this to be true.” Only two weeks later, after receiving feedback in this assignment, do students begin completing more comprehensive case analyses in CCEA, in which they receive less instructor direction.

Integration of Classes

Figure 2 –

Figure 2 illustrates the degree of integration between the classes. As indicated, students’ first MBA assignments are for CCEA, where critical thinking concepts are specifically assessed and commented on. However, although there is a critical thinking focus to these first assignments, the material on which they draw comes from FSL and UOTP class content. For example, in Week 2, students complete a critical thinking focused assignment in CCEA by drawing on UOTP readings. The final assignment for CCEA is due in Week 4. CCEA’s focus then shifts into an explicit support role. For example, in CCEA students bring to class a draft of an upcoming UOTP assignment and complete a guided self-review to ensure they have adhered to principles of critical thinking. Students receive similar developmental support in approaching their final assignment for FSL. In short, CCEA explicitly scaffolds critical thinking instruction, gradually withdrawing support as students build capacity. Appendix A provides more detail about the nature of the various assignments involved in the module.

**Analysis and Discussion Observations and Future Directions**

While it is still too early to draw definitive conclusions, critical thinking capacity of MBA students appears to have improved since the introduction of CCEA, as evidenced by the perception of FSL and UOTP faculty. According to a UOTP faculty member, when compared to past years, students received higher grades particularly in their first two assignments, and demonstrated increased ability in using theoretical frameworks for the sake of analysis, supporting their views with sufficient relevant evidence, and writing coherently. In short, students demonstrated an increased ability to think critically, as defined by the authors at the start of this article as “the ability to construct cogent, coherent, and concise arguments in support of a specific course of action,” “applying subject-specific theories, concepts or frameworks towards the explication of personal and/or organizational issues,” “synthesizing complex and often interrelated information, “ and “articulating what should happen, why it should happen and ultimately how it should happen.”

That said, this apparent success cannot be viewed as unqualified. Clearly, the improvements noted in critical thinking are based on the observations and subjective assessment of instructors in the program. As such, the results are more indications of promise about teaching critical thinking rather than definitive results about the efficacy of the approach. Also, While assignments submitted by students while on campus seemed to notably improve, there appeared little change from past years in the final assignments, submitted at the end of the Week 8, once students had returned home and were working online. We speculate that this speaks to the degree of difficulty in thinking critically and the degree of focus required to do so well. When students were writing their first assignments while on campus, they were removed from professional and familial responsibilities and could focus entirely on their schoolwork. Once back at home and

work, schoolwork became one of multiple competing responsibilities. Indeed, the two weeks back at home and work after a three-week absence would likely be particularly busy.

~~Also~~Additionally, improvements to students' thinking might not be wholly attributable to the addition of CCEA, but rather to a broader domino effect catalyzed by its introduction.

Designing CCEA required many conversations between this paper's co-authors and led to minor changes in the other courses to better scaffold critical thinking. For example, in past years, the first case analysis assignment for UOTP simply asked students to conduct an analysis and come to a recommendation. Since the introduction of CCEA, the assignment instructions have been made more focused and directive, pointing students to which framework they should use to conduct their analysis. Another example of how the act of designing the integrated module led to stronger critical thinking instruction lies in the fact that, because of our collaboration, we were able to more precisely articulate to students the differing critical thinking expectations in FSL and UOTP, with the former focusing more on synthesis and the latter more on analysis.

Finally, it should be noted that successfully designing and teaching an integrated critical thinking curriculum of this type requires a very high degree of collegiality and extensive time dedicated to collaboration. The introduction of CCEA occurred after many years of discussion and collaborative work between the three faculty members and of prototyping different approaches. We entered into the integrated design process with a strong understanding of each other as teachers and a high degree of trust.

In conclusion, definitive results on the three-course module's impact on critical thinking remain inconclusive, and present an opportunity for further research. A more rigorous research design based on multi-year data, with a variety of instructors and testable hypotheses will enrich

understanding and practice about developing critical thinking abilities in MBA students. That said, the authors' experience suggest that adding explicit instruction on critical thinking to the front-end of an MBA program improves students' ability to demonstrate strong critical thinking in assignments, as does the use of cases, scaffolding, and integration across courses to create an integrated curriculum, with a high degree of faculty collaboration. It also suggests that using Bloom's Taxonomy and Klebba and Hamilton's Structured Case Analysis approach as foundational frameworks for an integrated curriculum appears to offer a promising direction.

### Appendix A. Progression of Assignments, with Assignment Details

	Course	Assignment	Brief Description	Associated Class Activities	Stage of Cognitive Development	How Builds on Previous Assignment
Experience-Based Assignments	BUSA 502	You as a Team Member	Learners craft an argument indicating why they will be good team members	Readings and lectures to foster knowledge and comprehension of principles of argumentation	Application	N/A
	BUSA 508	Leadership Vision	Students draw on class readings to articulate a leadership vision	Class discussion and readings	Analysis	Students must choose from a range of articles to articulate a personal vision. They do not need to recommend action at this point.
	BUSA 514	Learning Implementati	Students review what they have learned during	All activities during the course with strong	Evaluation	Students must choose from a wider range of

		on Plan	the course, select and describe three (one identified for them) most relevant topics to their work lives, and articulate a plan for transferring their learning to the work place	reliance on personal reflections written at the end of each class in the course. These reflection periods are built into the class design.		concepts and articles (all concepts presented in class) and apply to real world experience
	BUSA 508	Leadership Portfolio	Students draw on class readings to identify action steps to achieving their leadership vision.	All activities during the course.		
Case-Based Assignments	BUSA502	Application of Course Concepts to a Case	Students apply concepts from BUSA514 to a case study, by answering focused and directive questions, for example, "Referring to the Rokeach Value Survey, identify three values held by the case protagonist and provide evidence for how you know this to be true"	Readings and lectures on active reading and on the application of theoretical concepts to a case	Application	N/A
	BUSA502	Case analysis and recommendation: Team Paper	Using the same case as was used in the previous assignment, students use an article from BUSA508 to conduct an analysis and come to recommendations. Instructions are still fairly directive, but less so than in the previous assignment.	Teams present their analysis and recommendation before writing the team paper. All teams receive on-the-spot feedback on their critical thinking from the instructor after presenting. By the end of the class, students often are able to provide feedback to each other that is on par with that provided by the instructor, thus assimilating the principles of good critical thinking.	Synthesis (with emphasis on analysis)	Students use the same case as analyzed in the previous assignment but now:  -Apply different theory, thus demonstrating how using a different conceptual lens will impact analysis. -Make recommendations
	BUSA 514	Case Analysis	Explain an ethical problem and suggest an action – students are required to use a specified analytical framework and respond to two specific questions	Readings and class discussion to clarify content	Synthesis (with emphasis on application)	Students use a specific framework to analyze a case and make recommendations

	BUSA 514	Case Analysis	Explain an organizational problem and suggest an action – students are directed to rely on two specific course content areas in responding to two questions that are more vague than their previous assignment	Readings and class discussion to clarify content Classroom case activity to illustrate key argumentation requirements	Synthesis (with emphasis on analysis)	Students analyze a case and make recommendations, but are not pointed to which specific class concepts to utilize
	BUSA 508	Live Case Team Presentation and Report	Students use class concepts to analyze a “live case,” presented by an organizational leader, to whom they make recommendations	Class discussion and readings.	Synthesis	Students must make sense of the situation presented by a live case host in order to conduct analysis and come to recommendations.

Title: The Alternative Learning Center: A Social/Emotional Approach to Academic Excellence Without Sacrificing Rigor

Paper Authors: Barry Tyler and Barbara Perez

Affiliation: Oceanside Unified School District

Address: Alternative Learning Center  
Ocean Shores High  
3131 Oceanside Blvd.  
Oceanside, CA 92056

Email: [barry.tyler@oside.us](mailto:barry.tyler@oside.us)  
[barbara.perez@oside.us](mailto:barbara.perez@oside.us)

## **Alternative Learning Center Abstract Oceanside Unified School District Fall, 2013**

**History:** In the spring of 2012, Barry Tyler and Barbara Perez attended a conference for continuation students. During one of the sessions, an educator from Riverside County, California presented a program they implemented to service students who would have normally been expelled from the district within the district. This session sparked a series of conversations regarding current practice in the Oceanside Unified School District. The reality at the time was that students who were recommended for expulsion were sent outside the district to a local court school to receive their educational services. This practice had negative implications on several levels; expelled students often failed to fulfill their conditions to return (anger management, gang diversion, community service, etc.). In addition, because expelled students were not enrolled in the Oceanside Unified School District, the district did not monitor their progress toward meeting those requirements. Lastly, the financial implications of having expelled students serviced outside the district were substantial. During the 2010–2011 school year, the district expelled 71 students from the district at a loss in ADA of \$185,000.00. For 2011–2012, there were 48 expelled students with losses totaling \$125,000.00. After some initial investigation, data collection and collaborative conversation, the motto of what would become the Alternative Learning Center was born: *Serving Our Students First*.

Once the initial concept was put into place, the possibilities for serving students in a non-traditional setting became endless. What about students with social phobia or anxiety who were traditionally assigned to home hospital or non-public school? What about students who simply didn't attend school at all? What about students who present a safety concern? What about students who aren't at risk at all, but who simply want to study utilizing an online format? As we started talking about the possibilities, it became clear that we wanted to create an alternative for these students that simply did not exist within the district. Though the district had implemented an independent study program on the comprehensive high school campuses, the concept of the Alternative Learning Center was to go beyond attending to the individual student's academic needs; by adopting a holistic approach, the ALC attends to the social/emotional needs of the students and their families by incorporating both individual and group counseling via community agencies and therapists. Quite simply put, this is not just another online learning program. The Alternative Learning Center takes a social/emotional approach to academic excellence without sacrificing rigor.

In the fall of 2012, Barry Tyler and Barbara Perez proposed an online/independent study pilot program designed to meet the needs of 21<sup>st</sup> Century Learners from a variety of backgrounds and circumstances to the Oceanside Unified School District. The Alternative Learning Center was embraced by the Oceanside Unified School District's Superintendent and Board of Trustees and opened on January 28<sup>th</sup>, 2013 with two instructional afternoon blocks, two teachers, two students and one administrator. During the semester, the program grew to include nearly 50 students who earned more than 500 credits and logged more than 2000 attendance hours – a significant statistic given the fact that most of these students were not earning credits or attending school during the previous semester.

The abstract below details the initial proposal which was submitted to the Oceanside Unified School District's Superintendent, Cabinet and Board of Trustees.

**Background:** Many school districts offer different variations of alternative learning centers in an effort to meet the diverse needs of 21<sup>st</sup> Century Learners. Today's learners often require alternatives to the traditional school setting; these variations include multiple learning modalities and schedules as well as independent, online and accelerated learning opportunities. In addition, there is a significant need to serve at-risk students who are often not successful in the traditional educational setting. These students are susceptible to being suspended or expelled; in addition, they often struggle with attendance and/or social/emotional issues. Economic concerns, scheduling conflicts, transportation difficulties and childcare needs are among the daunting issues that interfere with students participating in a traditional school system and schedule. Left unaddressed, these students become part of our at-risk population and increase the district's dropout rate. Families rely on district support to ensure their children's success. In addition to providing an alternative educational setting, the Alternative Learning Center seeks to provide families with community agency support as well as family outreach and education opportunities. How much better for our district to offer these comprehensive services in the Alternative Learning Center?

The creation of an Alternative Learning Center would specifically address these needs allowing students to be served within the district rather than looking to outside districts, charter schools, private schools and online programs for alternative learning experiences that better meet their individual needs.

#### **Alternative Learning Center Format:**

Located on the Ocean Shores (Continuation) Campus during the initial pilot phase, the Alternative Learning Center includes a computer lab and adjoining classroom. Designed to operate between the hours of 1:00 p.m. and 5:00 p.m., the Center provides an opportunity for students to create an individual schedule which best fits their needs. They are able to complete high school graduation requirements and receive a diploma from their home schools using an online independent study format.

#### **Students Who Will Benefit from Attending the Alternative Learning Center:**

**Home Hospital** – Many of our current home hospital students could successfully access the Alternative Learning Center for their educational needs. In the current system, each student is assigned one hour per day, five days a week. With the Alternative Learning Center model, one home hospital teacher will service multiple home hospital students using the small group, individualized instructional model, at a substantial savings to the district. By providing a "home base" for the home hospital teachers at the Alternative Learning Center, they will have a centralized location to meet with parents and students instead of at the students' houses, a library or community center. Moreover, home hospital teachers will have immediate access to the student information system, AERIES, in order to review demographic data, transcripts, grades, test scores and interventions. In addition, being housed at the Alternative Learning Center also gives students access to district curriculum programs such as Read 180 and Mind Institute. With these resources, the home hospital teacher is better able to create an individualized academic plan for each student which significantly increases their ability to continue to earn credits toward graduation while they are unable to participate in the traditional program.

**Special Education Students** – Many special education students experience circumstances that make it difficult to function on a comprehensive high school campus (anxiety, social phobia, etc.). Presently, students who need an alternative experience are referred to day treatment (in the most extreme cases), home hospital or non public school. Often, what these students need is an alternative to the traditional schedule and could be successful in the Alternative Learning Center with appropriate support.

**SARB** – Students who are placed on a SARB contract regarding inconsistent or non-existent attendance could access the Alternative Learning Center as an intervention or alternative to the traditional school setting and schedule. Students in this situation have already demonstrated that they are unwilling or unable to attend a regular schedule for a variety of reasons. By attending the Alternative Learning Center, the student can continue to progress toward completing their graduation requirements by adhering to an individualized schedule that addresses the hardships or obstacles that have negatively impacted their daily attendance.

**Administrative Transfers** – Several factors have the potential to necessitate an administrative transfer. In these cases, the Principal may consider moving the student to the Alternative Learning Center as a means of preserving the campus culture and maintaining a safe school environment.

**Students at Risk of Being Expelled** – Students who have reached 10 days of suspension and have not responded to traditional progressive discipline procedures or interventions would be eligible to attend the Alternative Learning Center. At the recommendation of the administrators throughout the district, the Alternative Learning Center would represent an additional intervention with the intent of changing the behavior that led to multiple suspension days.

**Expelled Students** – In an effort to decrease the number of expulsions per school year and to maintain and manage students who have been expelled, students who are granted a suspended enforcement of an expulsion would be eligible to attend the Alternative Learning Center. This would be decided on a case by case basis as determined by district administrators who would then submit a list of eligible names to the Board.

In addition, one of the challenging issues for expelled students is meeting the conditions listed in their Rehabilitation Plan which is necessary for their return to the district. These often include drug and alcohol counseling, anger management, decision making and community service. In partnership with Interfaith, AWARE and other community outreach programs available to OUSD, suspended enforcement of expulsion students could receive these services at no additional cost to the district. By implementing the ALC, OUSD assists students in meeting the rehabilitation conditions outlined in their expulsion order.

**On-line Learners** – In an effort to support the 21<sup>st</sup> Century Learner, the creation of a virtual school gives students an opportunity to access the curriculum in a rigorous and relevant learning environment while supporting the digital native in college and career readiness. Access is available 24 hours a day, 7 days a week and utilizes the same course outlines as students in the traditional setting. Courses are taught by credentialed teachers and are A-G and NCAA compliant. On-line learning allows flexibility as well as acceleration opportunities for students.

## **Benefits of Piloting the Alternative Learning Center**

- Small group individualized instruction
- Social interaction
- Alternative to NPS for special education students needing 45 day placement
- Centralized location with access to student information system (AERIES)
- Recover lost ADA
- Maintain positive campus culture; increase campus safety
- Facilitating and managing intervention/rehabilitation plan
- Connecting students and families with community resources
- Alternative to traditional intervention
- Serving students who desire acceleration
- Access to 21<sup>st</sup> Century Learning
- Flexible scheduling for students with careers/special interests
- A-G and NCAA compliant
- No initial start up costs to the district; cost neutral program
- Streamline individual learning experiences to support diverse educational needs
- Increase graduation rate; decrease dropout rate
- Serving the needs of our students within the district
- ALC is OUSD's commitment to meet the needs of the 21<sup>st</sup> Century Learner
- Providing resources, training and parenting courses for families of students being educated in an alternative setting

## **Summary:**

OUSD has a unique opportunity to streamline individual learning experiences for students by creating an Alternative Learning Center to support their diverse educational needs. In developing and implementing this program, we are able to provide additional options for individual students. Creating and facilitating these services minimizes students' and parents' desire to leave the district.

One year ago, our district was faced with a charter application from a group of parents who did not think that our district provided the programs or learning experiences they wanted for their children. Though the effort was not successful, our Superintendent talked to his Leadership Team about his commitment to hear what the community wanted and to create programs to fulfill those requests. The Alternative Learning Center is a prime example of the Oceanside Unified School District's commitment to recognize, address and support the educational shift necessary to create rigorous and relevant learning opportunities which meet the needs of the 21<sup>st</sup> Century Learner as they become college and career ready.

For the 2012- 2013 school year, Ms. Perez and Mr. Tyler propose implementing and piloting the Alternative Learning Center starting second semester. During this pilot phase, the focus will be on servicing a cohort of students including home hospital, special education and those with behavior and attendance concerns. Our goal will be to evaluate practices and procedures for managing the ALC, identify best instructional practices, and establish community agency relationships. Additionally, we will be researching the viability of piloting an on-line/virtual school in a summer school session to lay the foundation for a future on-line/virtual school.

### **Status Report as of Fall 2013:**

This fall, the ALC has expanded to include blocks throughout the instructional day. Staffing includes: three teachers, two aides, and one administrator. Currently, there are 50 students enrolled, with additional students being added almost daily since the district's six week grading period ended.

As of fall, 2013, during the first 6 weeks of school, we had 40 students enrolled who have earned 180 credits and logged over 1600 attendance hours in the program. Additionally, we have augmented the social/emotional component of the program; Palomar Family Counseling (a local agency) has started both individual and group sessions. Group sessions include: social skills, anger management, decision making, substance abuse and gang awareness. Additionally, students and families are being referred to outside agencies for individual and family sessions based on discovery conversations from the on-campus meetings.

### **Conclusion:**

The Alternative Learning Center has been developed with the understanding that not all students can be successful in a traditional school setting. To address this need, districts, charter schools and independent companies have tried to implement online and virtual programs. The Alternative Learning Center is not just another online learning/independent study program. The Alternative Learning Center takes a social/emotional approach to ensuring academic excellence – without sacrificing rigor.

## TODAY'S TRIVIUM, TAKE ONE: ZERO-G

From the weighty comfort of my theater seat I recently experienced the euphoria- and fear-inducing weightlessness of Alfonso Cuarón's film *Gravity*. I also recognized this as a kairotic moment in my life as an English/language arts teacher, a moment in which to address the drifting issue of grammar instruction as I see it from the secondary language arts classroom. Immersed as I have been in a current-traditional world where I have always believed that grammar instruction has kept me and my students anchored, I was finally free, in that theater, to imagine life in "Zero-G," a world without grammar instruction to weigh it down.

Like gravity, grammar has always been a comforting constant for me. I have long understood its systems and variables. But for a generation or more of American young people, the experience of "Zero-G" is actually the status quo. Within today's enlightened educational state, explain researchers, grammar should be gone. A parade of analyses and meta-analyses by Harris (1962), Braddock (1963), Elley (1976), Hillocks (1984), and Hartwell (1985), have only served to reinforce the insufficiency of instruction for the control group: grammar, as it has often been taught in the classroom, has done no good. In fact, say Harris and Braddock, it has actually been "harmful."

For decades, researchers have been fanning these "winds of change," as Maxine Hairston famously called them, seeking a new direction for writing instruction. In their eyes, secondary writing textbooks must focus on student-centered, process-based instruction and must abandon the useless and time-consuming practices of grammar drilling and sentence diagramming. Furthermore, influential (and agenda-setting) NCTE publications come close to disregarding grammar instruction altogether. Researcher Martha Kolln notes a SLATE Starter Sheet designed by grammar guru Constance Weaver to disseminate the NCTE's official position on grammar (National). The prominent quote affixed to the top is from George Hillocks's "definitive" research and declares that the "teaching of school grammar has little or no effect on students." According to composition scholar James D. Williams, the teaching of grammar

throughout history has been an abject failure. He writes that “[d]espite all the concern and attention devoted to it, grammar has not had any positive effect on writing performance” (314). One would anticipate, then, that a shift away from traditional grammar instruction would have a markedly positive effect on student writing performance, but on September 26, 2013, the College Board, one US gatekeeper tasked with anticipating and assessing levels of college success, announced that Houston--as well as the rest of the country--may have a problem: only 43 percent of SAT takers in the class of 2013 graduated from high school academically prepared for the rigors of college-level course work” (“Stagnant”), and their performance on the writing portion was the worst of the test’s three components. Theorists will likely be quick to complain that secondary teachers simply aren’t following the research and are still teaching traditional grammar. Yet recent studies indicate that this really isn’t the case.

#### A RATIONALE FOR A SECOND LOOK

According to Hudson and Walmsley (2005) and Kolln and Hancock (2005), students in English-speaking countries have long lived in a “Zero-G” world. The pair of historical analyses by these authors describes the shift away from explicit grammar instruction in Great Britain and the United States. Yet while the British pair Hudson and Walmsley report trends of grammar revival, Kolln and Hancock are still awaiting similar changes in the US.

According to the most recent meta-analysis that builds on Hillocks’s previous work, Graham and Perin (2007) give practitioners little reason to change their drifting ways. The portrait that emerges is one of failed grammar instruction and stranded students. Yet Graham and Perin make an interesting disclaimer. They write that “[f]indings regarding grammar instruction must be interpreted cautiously, because the grammar treatment was the control condition for all but one of the obtained effect sizes” (462). In other words, for most historical studies of grammar-teaching effectiveness, grammar was the status quo in the particular classrooms under close study, but today we live and learn in a different world. Grammar historians declare to us that an entire generation has been grammar free. Hudson and

Walmsley pass on findings from 1998 that “younger teachers had generally not been taught grammar explicitly as part of their own education” and Kolln and Hancock explain that many teachers in both countries would be “happy to go on record as knowing nothing whatsoever about the grammar of their native language” (21).

Today, grammar is rarely taught systematically. This makes recent studies within Graham and Perin’s scholarship stand out, since the tables are now turned. In other words, the experimental variables (teaching grammar only in context or using only process-based writing) have today become the control treatments. Grammar minimalism within process writing is firmly entrenched within almost every writing classroom in the United States (Lacina and Block 12). This makes recent statistics regarding student progress as writers all the more alarming, since a process approach was supposed to address these problems. In England, similar trends have sparked a revived government mandate for grammar instruction, and the momentum for change in the United States is building as well.

#### DEFYING GRAVITY

From these developments, it is clear that the gravity of grammar is pulling whether we believe it is or not. Unfortunately, for students in secondary education, the effect is dizzying. Official mouthpieces, including teachers and school systems, condemn grammar instruction even as communities demand it. Even classroom textbooks, composed to create company profits, seem to offer grammar as a valid subject for consideration, but in the hands of inexperienced teachers this mixed message will usually produce negative results.

It is true that many textbooks continue to present grammar as a natural feature within the classroom. Over the past two decades, grammar instruction has even been integrated within literature texts, pulling examples from the context of literary models. Unfortunately, this does not mean that teachers have been equipped to use those examples or that teachers themselves have positive attitudes about grammar learning to pass on to their students. In fact, teachers have been able to cast off the teaching of grammar entirely if state standards haven’t specified

it. Essentially, secondary schools have long been speaking out of both sides of their curricula, and theorists haven't been all that helpful as referees, either. Some seem almost ready to blame teachers for beating the dead horse by teaching grammar with discredited methods. It is teachers, then, who must change or be changed. Yet this position betrays two false assumptions.

First, it is not true that, just because grammar-teaching materials can be found in textbooks, the teacher is actually using them. I would venture to guess that most teachers are actually happy to ignore those prompts and feel justified in doing so. Second, teachers have no reason to know any better. Theorists, within their sphere of influence at the university level, have failed to communicate to state legislators and secondary teachers the relationships between rhetoric and composition in general, and among language, logic, and learning in particular. Even though theorists themselves acknowledge the importance of grammar as a topic (always paying homage to Chomsky), they have failed to pass on the weight of this discussion to teachers and their students.

#### THE GRAVITY OF GRAMMAR: WHY IT MATTERS

The silence of mission control at this critical time has been deafening. It is time for theorists, researchers, legislators, administrators, and teachers to stand together, ready to cultivate with students an understanding that grammar learning has practical uses that reach beyond conventional wisdom of "error correction" and "writing improvement." Hudson and Walmsley itemize the following specific benefits. Grammar learning, they say, expands grammatical competence by introducing young students to patterns that do not appear naturally in the discourse of children; establishes a shared metalanguage for talking about language; supports the learning of other, non-native languages; develops critical thinking skills; develops investigative skills; fosters an appreciation of students' own minds; and helps students develop strategies to critically respond to the ways language is used.

#### THE LANGUAGE OF GRAMMAR: A COMMON CORE

Perhaps most compelling is the identification by Hudson and Walmsley of grammar as “metalanguage.” It is a system--albeit a coded system--by which teachers are able to support writers. With the relatively recent adoption of specific state standards, and now through the Common Core State Standards Initiative, the terms of engagement have been codified, for better or for worse. According to new Common Core standards, students in forty-six states are going to learn grammar again. Unfortunately, many teachers will be playing catch up as they struggle to re-learn terms that have fallen out of our national conversation.

Yet a set of standards alone will never be enough for students to experience the gravity of grammar in a healthy, affirming way. An understanding of language will not be communicated through the Common Core’s list of language targets alone: teachers must be carefully trained so that the debris of past disasters does not come crashing down upon them and their students. Already the backlash against the Common Core is beginning, and I am reminded of a certain orbiting field of debris that will most likely always be lingering as Americans bristle at any suggestion of a pedagogical yoke imposed by those who are far removed from the classroom. The question, then, is how we can best assist students as the country re-enters the study of grammar, a harrowing process not far removed from the odyssey of *Gravity’s* Dr. Ryan Stone, especially considering the chasm between public perceptions of grammar and the desire of theorists to help students move beyond rote learning and error correction.

#### TOWARD A SUCCESSFUL RE-ENTRY

Re-entry is a fiery circumstance, especially as state and national politics begin to heat up. In the midst of the defunding and backtracking of school systems balking at wide-scale reform, students are left in the care of individual teachers who have the power of affect. Yet these teachers, too, are embroiled in a fiery descent of their own--and by descent, I am not suggesting that the teaching of grammar is backsliding. Care must be taken by all involved at mission control to ensure a smooth transition from a Zero G environment to one in which

grammar is vibrantly and enthusiastically studied as a part of metalinguistic discourse and the scientific method. To accomplish this, several features must obtain.

First, universities must improve teacher training regarding the study of language. Of course, this goes against the current grain by which teacher credentialing must be a streamlined business that quickly connects teachers with the classrooms that need them so desperately. A compromise would be to provide mandatory support for teachers who are not fluent in grammatical principles and teaching methods. Second, those teachers who have been trained in traditional grammar must be redirected toward research-based pedagogies. Teachers must be trained to help students focus on patterns and functions within a larger context instead of referring students to arbitrary “rules.” This does not mean that grammatical patterns are never drilled. Sufficient practice will always be a key to the internalization and naturalization of grammatical concepts.

Finally, administrators and textbook publishers must begin to turn their full attention toward research-based strategies that work. In other words, they must put their money where the research is and teach sentence combining, which “involves teaching students to construct more complex and sophisticated sentences through exercises in which two or more basic sentences are combined into a single sentence” (Graham and Perin 462). Of the grammar-teaching strategies noted by Graham and Perin, sentence combining wins the day as having had “a moderate impact on the quality of students’ writing” (462)--and yet, few texts have dedicated portions to sentence combining practice, probably because of the devaluation of any form of grammar teaching over the past three decades. It is absolutely time for textbook companies--led by the “Big Three” of Houghton-Mifflin Harcourt, McGraw-Hill, and Pearson--to focus squarely on this type of proven pedagogy.

In twenty-first century writing textbooks, sentence combining has been almost absent, except in William Strong’s Glencoe *Writer’s Choice* series (1996), now virtually out of print. Interestingly enough, both Strong, a sentence combining guru, and student- and process-

centered scholar James Kinneavy collaborated on texts that had a sizable traditional grammar portion (Beason 274). Was this merely a marriage of corporate convenience, or can research-based theories of composition and renewed pushes for grammar instruction learn to co-exist and complement one another?

#### CHANGES IN TEXTBOOK TRAJECTORY: COMING IN TOO HOT?

Textbook developers must go farther than merely providing exercises and helpful tips. They must decide it is valuable to foster the intellectual tools of the trivium--grammar, logic, and rhetoric--in teachers and students instead of leaving them for scholars to sort out. This means that school districts and states must demand a different kind of textbook.

It is true that textbooks *are* changing, but it seems that demand for texts with student appeal and technological innovations is driving the market. Contrary to conventional wisdom, teachers and students do not necessarily need a profusion of graphics and images when we are trying to get at the heart of language. In addition, secondary teachers rarely use a separate writing text. Instead, they often rely on a combined literature/composition text. One necessary development may be the reduction of literature selections in common anthologies combined with increased emphasis on the foundations in rhetoric, logic, and grammar. Textbook companies have made strides in recent years. Houghton-Mifflin Harcourt has begun to use a rhetorically-minded 6+1 Trait model for composition. McGraw-Hill (Glencoe) has created a *Writer's Workspace* that gives students command of the writing process online, while Pearson has launched their *Writing Coach Online* toward similar ends.

Still, technology should be a tool, not a rabbit trail down a dazzling yet distracting rabbit hole. One can only imagine what LA school teachers were forced to do after reclaiming district-issued iPads once they discovered students had learned to crack their security.

Even better than new bells and whistles, school districts have begun to launch textbook-independent programs so that teachers will learn systems that can be applied flexibly across the curriculum (Davis). The potential for curricular development is unlimited, and it has the Big

Three scrambling to keep up. The multi-modal Shurley Method is one such research-driven pedagogy that Graham and Perin mention as a means for helping students re-enter the elementary and secondary grammar classroom (472). Already there are independent publishers who are responding innovatively to the prospects of the Common Core's impact, such as the *Grammar Gallery*, a web-based grammar program light-years beyond the dusty grammar tomes of ages past.

At heart, sound pedagogical principles and clear communication of concepts both to teachers and to students should determine the resources we use in our schools, and it is the heart for bridging these kinds of gaps that teachers most need if they want to help students re-enter the High-G world through a sometimes hostile and confusing academic atmosphere.

Saudi Arabia

## **Abstract**

The purpose of this study was to evaluate the effectiveness of using streaming the web 2,0 to improve, maintain, and generalize Improving some of Reading skills of ten students (12-15 years old) diagnosed with intellectual disabilities. A pre-experimental design was used to evaluate the effectiveness of a web 2,0 multimedia program. Instruction consisted of supported viewing and imitation of Reading skills videos available online, with students searching for a video of the desired skill, viewing it, and then imitating the video's sequence of steps to complete the task. Results were assessed by means of a questionnaire administered to each participant's primary caregivers, and indicated that the structured use of the websites was effective in improving Reading skills. Implications and suggestions for future research are also discussed.

**Key words: Reading skills, intellectual disabilities, websites, web2,0.**

## Utilizing peer instruction to teach educational integrity: Student learning outcomes

The objective of the current research was to examine the instructional effectiveness of a peer instruction intervention in an attempt to develop an economical and effective institutional method of promoting educational integrity. In this study, residence dons provided a brief presentation on educational integrity to residence students. The study utilized a pre-test post-test design to assess the impact of the instructional intervention. The pre-test survey inquired about students' demographic information and their perceived knowledge and confidence of four distinct components of educational integrity: definition of educational integrity, detection of misconduct, consequences of misconduct and the importance of educational integrity. The pre-test survey also inquired about students' personal importance of academic integrity. The post-test survey assessed the impact of the peer instruction on students' perceptions of their knowledge, confidence and personal importance of academic integrity. In addition, in the post-test survey, students rated the quality of the PowerPoint presentation (informative, clear, helpful, etc.) as well as its impact on helping them make safer choices in the future. The results revealed that students perceived having made gains in knowledge and confidence in all four topics of educational integrity covered in the presentation. On average, students also reported that participating in the presentation increased their personal importance of academic integrity. Additionally, a linear regression revealed that four variables significantly predicted students' perceptions of the effectiveness of the educational integrity presentation. These variables include 1) students' personal importance of educational integrity measured at post-test, 2) students' confidence about educational integrity measured at post-test, 3) the presentation was informative, and 4) the presentation helped students to make safer choices in the future.

An Experimental Study on the Semantic Correlation Effects Between  
Words and Illustrations in Elementary Chinese Textbooks

**Abstract:** The current study examined the semantic correlation effects (SCE) between words and illustrations in elementary Chinese textbooks. SCE refers to the degree of consistency between two semantic variables. The study hypothesized SCE between words and illustrations affected students' understanding of text content and enhance learning efficiency. 142 students from third and fifth grades in an elementary school in China participated in this study. Results affirmed the hypothesis. Stronger SCE correlated with higher level of reading comprehension and vice versa. These illustrations, therefore, were shown to play an important role in promoting understanding of knowledge in elementary grades.

## **Abstract**

This study examines the academic, administrative, and social issues relating to the creation of a center for positive behavior support (PBS) in People's Republic of China. It identifies the major mental health problems among primary and secondary school students and how PBS can be an effective strategy in tackling many of these problems. It provides a detailed description of the theoretical foundation and practical application of PBS. It anticipates the administrative challenges at multiple institutional and governmental levels and offers a number of recommendations on how PBS can be implemented in a socially acceptable way. The paper also states credentials of the key participating personnel and institutions. Results of the study will effect the founding a PBS center with potential to affect many lives in China.

**Abstract.** The Web based distance education can be analyzed by using UML diagrams. UML diagrams can describe the Web teaching content and the Web teaching delivery. Describing the online teaching process using UML modeling can also help finding relationships between the teaching material and its delivery method.

**Keywords:** UML, Distance Learning, Web Based Learning, Teaching Foreign Languages.

## 1 Introduction

There is a significant evolution of distance education as reflected in the literature [7, 10, 12]. All of the distance education types include physical separation of an instructor and students [7]. That characteristic determines the distance education basic advantages and challenges. Among advantages the most often mentioned are [11] (a) institutions can offer courses with very low enrollment (b) classes can be offered in institutions with no qualified instructors available on campus (c) more graphical method of delivery can be used. The challenges are related to (a) limited social and academic relations between students from remote sites and the instructor, (b) harder to enforce central role of the instructor, and (c) heavy dependence on equipment i.e. computer or ITV and their problems [14].

The distance education and especially Web based teaching can be enhanced by using semantic models [1, 5, 6]. For example, UML state diagrams can be used to describe the delivery components and the delivery process. Describing the online teaching process using UML modeling can help finding relationships between the teaching material and its delivery method. In this paper we describe experiments leading to improvement of online courses for teaching foreign languages.

## **2 Types of Distance Education**

The Distance education can be classified using different criteria. The main classification criterion is the type of communication between an instructor and a student, and between students themselves [7]. Generally the communication can be two-way or one-way. The types of available two-way communication used in the distance education are divided into two groups: asynchronous and synchronous. Asynchronous two-way communication is a mode of delivery where participants access course materials and communicate with instructor on their own schedule. Instructor and students are not required to be together at the same time. One of the historically first asynchronous two-way communications between an instructor and a student was a regular mail correspondence. That type of communication provided the slowest feedback and therefore was very similar to self-education. With the development of new communication technologies such as Computer networking, and course management systems e.g. Blackboard [9], the feedback was significantly improved.

Synchronous (real-time) two-way communication is a mode of delivery where all participants are "present" at the same time. Typical synchronous two-way communication categories are video conferencing and Web conferencing. Video conferencing became the foundation of ITV distance education and Web conferencing became the foundation for synchronous Web based (online) distance education.

One-way communication takes place when the content is delivered via radio or television. This type of distance learning is referred to as Broadcasting or Tele-courses. The special type of one-way communication is computer based when the content is stored typically on CD-ROM or DVD and delivered by a computer. The student interacts with a computer instead of instructor. The computer, however, executes the program prepared previously by an instructor.

The distance education can employ several categories of communication for the same course. Then it is generally referred as hybrid distance education. The most widely implemented hybrid distance education is hybrid online instruction where the integration of live, in-group instruction with asynchronous online instruction takes place.

## **3 Diagrams and Types of Distance Education**

The Unified Modeling Language (UML) is used typically for visualizing, specifying, constructing, and documenting the artifacts of software-intensive systems [1, 5]. Generally, we can use the UML to capture classifications that constitute the basic knowledge about a variety of subjects. For that reason, UML models can be very important for the educational process, since they can provide systematic description of educational materials and their delivery [8, 15, 16, 17, 18, 19]. These diagrams will reflect classifications based on a subclass hierarchy, an aggregation hierarchy, named association relationships, or any combination of these. Such classifications can be used to develop a deeper understanding of the subject area for instructors. In addition, other UML models can describe the learning process itself, which should allow

instructors to prepare better presentations about the subject, including Web presentations.

The UML modeling is object oriented, meaning that whatever system is being modeled, its components become abstract objects that can have some properties (also called attributes) and functions (also referred to as responsibilities). A class is a collection of these abstract objects with the same attributes and functions.

Class diagrams contain classes and relationships between them. Classes are graphically represented as boxes. Lines or arrows are then drawn between classes to describe their relationships, the most common of which are aggregation, generalization, and named association. The aggregation relationship corresponds to a link between classes that can be described by natural language phrases such as: consists of, has part, and is part of. For example the phrase “Material segment consists of rules, templates and examples” contains aggregation relationship and is graphically represented in Fig. 1a.

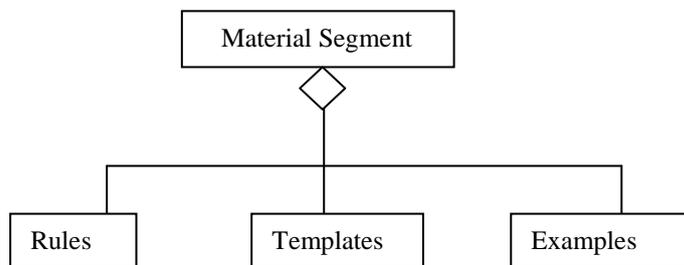

Fig.1a. An example of an aggregation relationship

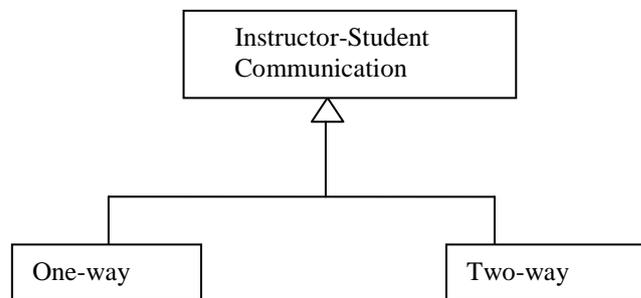

Figure 1b. An example of a subclass relationship for Instructor-Student Communication

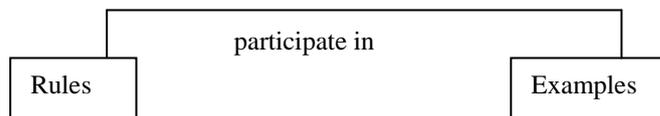

Figure 1c. An example of a named association relationship

The subclass relationship corresponds to a link between classes that can be described by natural language phrases such as: has subtype, has category, and is a. For example “Instructor-Student communication has two categories one-way and two-way communication” contains the subclass relationship and is graphically represented in Fig. 1b. The named association corresponds to a link between classes that can be described by other natural language phrases such as: buy, owns, etc. For example the phrase “Rules participate in examples” contains the named association and is graphically represented as a line with the label as shown in Fig.1c. These different relationships use different graphical symbols as shown in Fig. 1.

We can expand modeling different types of communication used in distance education as shown Fig. 2. It is a graphical representation of discussion carried out in Section 2.

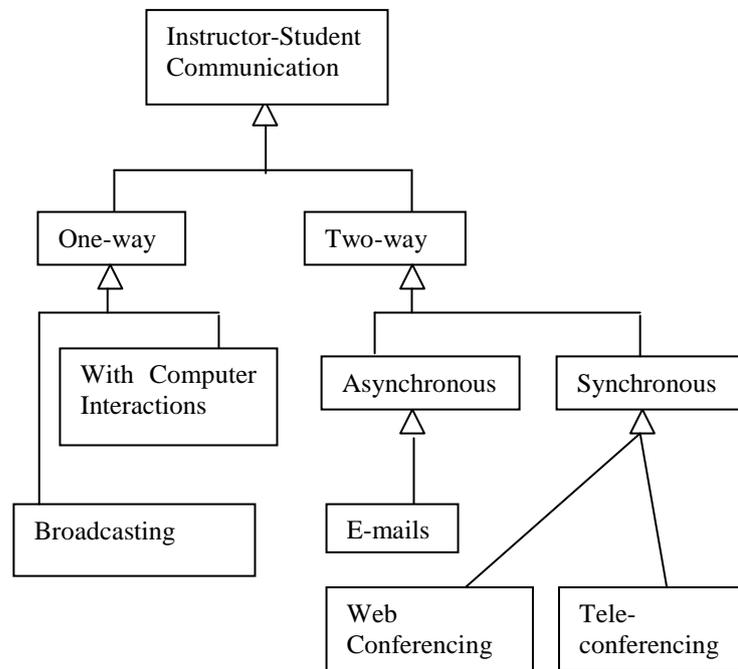

Fig. 2. Classification of Instructor-Student Communication in Distance Learning.

Based on types of communication we can define various types of distance learning including hybrid distance education. Hybrid distance education can be based on integration different types of communication including traditional education with direct contact between an instructor and a student. Typically it refers to a combination of traditional and asynchronous online education but in general can be based on different combinations.

## 4 UML models for distance education of foreign languages

The distance education program has its special importance for smaller rural universities. For example, there is a need to implement distance education at Edinboro University of Pennsylvania and its sister institutions. The foreign languages instruction at Edinboro University includes Spanish and Russian. There are enough students of Spanish language to offer of various courses in a traditional classroom. However, in the case of Russian population of students very small and course offering is limited. Distance education is a useful medium for delivering of instruction to students at different sites [20, 21, 22, 23, 24]

The distance education requires very careful preparation of educational materials and their method of delivery. There are many methods of teaching foreign languages and they can be classified in a variety of ways [2, 3, 13]. For our work the most useful is a classification based on the role of the grammar [4]. Some methods emphasize the importance of understanding grammar, e.g. the Grammar Translation Method [4]. Other methods, e.g. the Series Method, teach students without translation and conceptually without grammatical rules and explanations. Similarly, the Direct Method stresses oral interaction and no translation. Other classifications based on a role of reading skill development, memorization, physical activity and discovery are beyond the scope of this work.

In order to model the teaching process an additional modeling tool is required i.e. a UML state diagram. A state diagram has a collection of states that correspond to the phases of the modeled process. This type of diagram is often helpful when there are explicit or implicit references to states in the subject area, like steps or phases in a technological process.

Materials used for teaching foreign languages, such as the teaching of declinations, can be divided into material segments. Each segment consists of rules, templates and examples. Frequently there are two types of rules: declination tables (referred to simply as "declinations") and usage rules (referred to simply as "usage").

Rules, templates and examples are interrelated. This means that some examples correspond to some template and to some rules. Declinations and usage are also interrelated. This means that some declination forms correspond to some usage forms. Each material segment is related with background material segments. Each background material segment is structured the same way.

There are also usage rules such as:

- The third person forms of polite address take the third person of the verb.
- PAN and PANI may be used either with the first or last name. The use with the first name is considered polite, while the use with the last name connotes formality.

In addition to the rules, examples can be used:

- CZY PAN ROZUMIE TO? (Do you (sir) understand that?)

Based on examples, templates can be developed:

- CZY \_\_\_\_ROZUMIE TO?

Rules, templates and examples are interrelated. This means that some examples correspond to some template and to some rules. Declinations and usage are also

interrelated. This means that some declination forms correspond to some usage forms. Each material segment is related with background material segments. Each background material segment is structured the same way. The UML model for material segments in teaching declinations in foreign languages is shown in Figure 3. For readability purposes, the relationships between rules, templates and examples in a material segment with the rules, templates and examples in a background material segment are omitted. They are symbolically represented by the relationship, *requires*, shown between a material segment and a background material segment.

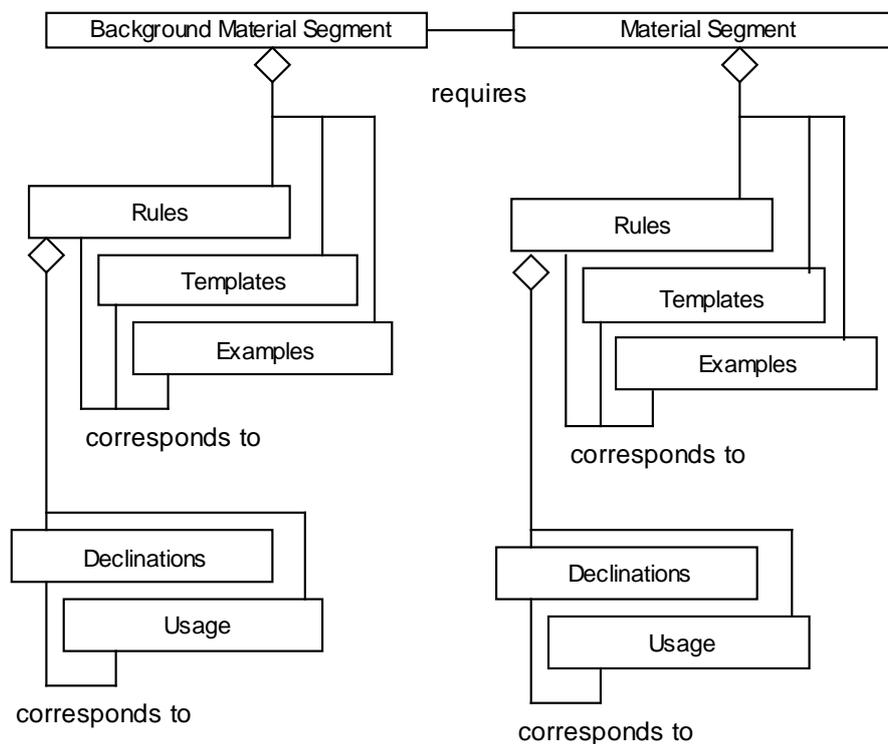

Figure 3. UML Model for Material Segments in Teaching Declinations in Foreign Languages

## 5. Modeling of online teaching methods

The teaching process requires a modeling tool based on state diagram. A state diagram has a collection of states that correspond to the phases of the modeled process. This type of diagram is often helpful when there are explicit or implicit references to states in the subject area, like steps or phases in a technological process.

We will concentrate on teaching methods based on traversing between different abstraction levels and according to scheme, "Practice-Theory-Practice." In teaching

declinations in foreign languages, we identify three levels associated primarily with using examples, templates and rules.

### 5.1. Template-based Teaching of the Concept of "Polite Address" in Polish

There are many methods used to teach foreign language, such as Polish. Let us first consider the method of teaching based on templates. In this method of teaching, in the first phase, we operate on the level of examples. This means examples are presented to students, e.g. E1 and E2.

E1: CZY PAN JEST TUTAJ? (Are you here, sir?)  
E2: CZY ON JEST TUTAJ? (Is he here?)

In the second phase, an explicit or implicit template T1 is constructed based on these examples:

T1: CZY \_\_\_\_\_ JEST TUTAJ?

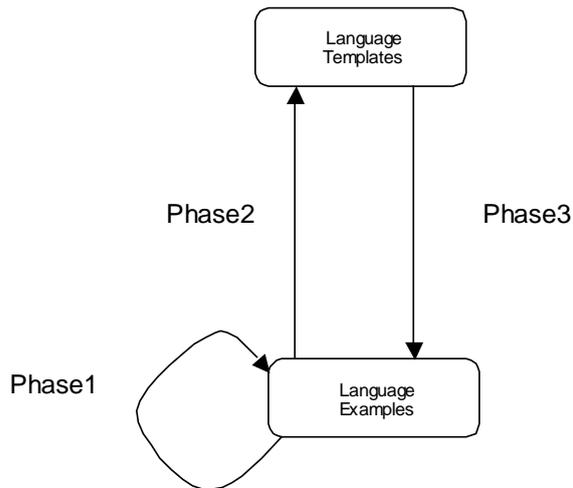

Figure 4. UML Model for Template-based Teaching of Declinations in Foreign Languages

In the third phase the template T1 is filled with appropriate entries so that the examples are constructed, e.g. E3:

E3: CZY PANI JEST TUTAJ? (Are you here, ma'am?).

This method of teaching is referred to as "template-based-teaching" and is represented by the UML state diagram shown in Figure 4.

## 5.2. Rule-based Teaching of the Concept of "Polite Address" in Polish

Now let us consider the method of teaching based on rules. In this method of teaching, in the first phase, we operate on the level of examples that are presented to students, e.g. E4.

E4: WIDZE TUTAJ PANA . (I see you here, sir?)

In the second phase, an explicit template T2 is constructed based on these examples:

T2: WIDZE TUTAJ \_\_\_\_\_.

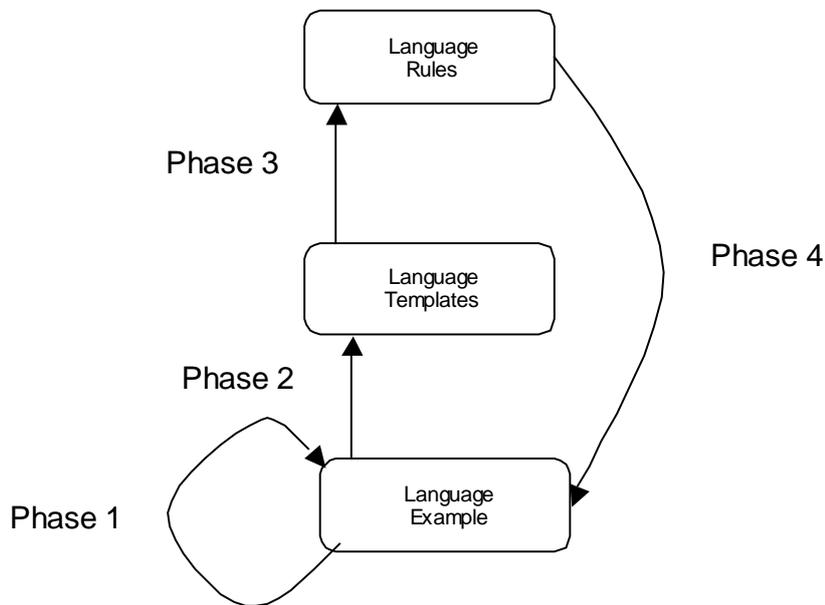

Figure 5. UML Model for Simple Rule-based Teaching Declinations in Foreign Languages

In the third phase, all relationships between the template T2 and rules and usage need to be determined by the instructor. In this case, it can be determined that the Accusative form is required in the declination rules. This also means that we now move to the level of rules. In the fourth phase, we fill-in the template with appropriate entry from the declination table as shown in E5:

E5: WIDZE TUTAJ PANIA . (I see you here, ma'am?)

This method of teaching is referred to as "simple rule-based-teaching" and is represented by the UML state diagram shown in Figure 5.

### 5.3. Advanced Rule-based Teaching of the Concept of "Polite Address" in Polish

Now let us now consider the advanced method of teaching based on rules. In this method of teaching, in the first phase, we also operate on the level of examples. It means examples are presented to students, e.g. E6.

E6: KUPILEM PANU ZEGAREK . (I bought you a watch, sir?)

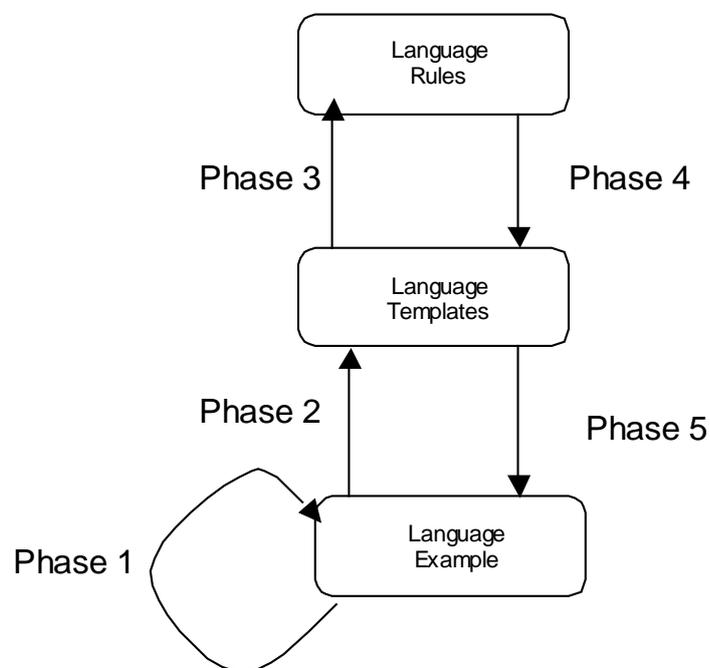

Figure 6. UML Model for Advanced Rule-based Teaching Declinations in Foreign Languages

In the second phase, an explicit template T3 is constructed based on these examples:

T3: KUPILEM \_\_\_\_ ZEGAREK.

In the third phase, all relationships between the template T3 and rules and usage are determined. In this case, it is determined that the Dative form is required and no usage rules are involved. It means that we now operate on the level of rules.

In the fourth phase, we generate different templates with the same entry from the declination table as shown in T4

T4: DALEM \_\_\_\_\_ PREZENT.

In the last phase, we fill-in the template with appropriate entry from the declination table as shown in E7

E7: DALEM PANI PREZENT . (I gave you present, ma'am.)

This method of teaching, referred to as "advanced rule based-teaching," can be represented by UML state diagram shown in Figure 6.

## 6. Experiments

The discussion of this paper was supported by practical implementation of distance education at education at Edinboro University of Pennsylvania and its sister institutions organized into Western Pennsylvania Consortium for the Advancement of Language and Culture Studies.

The preparation was based on the assumption that the material segments were designed as delivery independent i.e. that can be used for both traditional and online teaching.

The results can be described as follows:

1. The learning curve seems to be an important factor for deciding the delivery method. More specifically the Student mistakes are important factor for selecting the delivery method but the algorithm is not completely clear. The case studies have shown that for the high mistake level it is crucial to differentiate between students who were making mistakes and those who were just guessing the answers. The students who were making mistakes benefitted from synchronous method of communication. The students who were guessing the results were better off with the asynchronous mode.
2. Generally, the synchronous mode is required for verbal aspect of teaching. However, we can use the asynchronous mode for teaching the grammar. Our experiments of using template and rules methods have shown that student-student feedback can be useful in teaching foreign languages. More specifically, the template method requires a complex template selection to allow a "natural" flow of exchange of student-to-student messages. The rule method is more theoretical and rules can be discussed on the individual basis.

## 7. Summary

In this paper we showed how to analyze distance teaching of foreign languages with assistance Unified Modeling Language (UML). It was shown that the UML can help to classify material segments and their method of improved delivery. The factors for deciding the delivery method were analyzed and described.

**Title:** Adoption of Technology in Hawaii Schools: *Social and Educational impact of education technology on cultural relevance in K-12 on O'ahu.*

**Topic Area of Submission:** Education Technology

**Presentation Format:** Paper Session

**Description:** This paper presentation explores the impact of educational technology in K-12 schools in Hawaii and attempts to examine the implications on cultural values and relevance for students and educators. Education technology plays an important role in course content delivery, classroom experience, and assessment of student performance. However, this study attempts to understand the juxtaposition of technology and cultural importance for the Hawaiian educational system. Resources, tools, and techniques for implementation will be presented and shared in this presentation.

**Abstract:** A fast paced technology driven world surrounds today's K-12 students and balancing this paradigm with the cultural traditions of Hawaii has been increasingly difficult. The use of technology in education is a continually growing topic in educational leadership, administration, teaching, and instructional design. The effects of technological integration on the cultural values for students and educators needs to be considered in order for a stable system of educational leadership to assist in maintaining a solid connection to the past while preparing for a hi-tech future. The bridge between these seemingly opposing worlds lies in leadership that allows for increasing cultural relevance by incorporating traditional norms through new media systems in the educational experience, while highlighting the positive effects of cultural values applied to new technologies in building a more well-rounded and prepared student.

## **Author Bios:**

### **Helene S.M. Honda MSCP, EdD Candidate at Argosy University-Honolulu, HI**

Helene S.M. Honda, MSCP is a candidate in EdD Organization Leadership at Argosy University in Honolulu Hawaii. Ms. Honda has a Master's Degree in Counseling Psychology. Ms. Honda has extensive instructional experience in educational settings, including facilitating career classes for adults diagnosed with psychological conditions as well as employees of organizations. A frequent speaker in college, high school, and elementary school classrooms, Ms. Honda developed, implemented, and instructed programs and classes on topics including those directed by my current part-time employer, the Native Hawaiian Roll Commission. Ms. Honda is skilled at developing curricula that is understandable for students based on their learning abilities.

### **Dr. James J. Jaurez, National University, San Diego, CA**

James J. Jaurez, PhD is an Assistant Professor with National University's School of Engineering, Technology, and Media. Dr. Jaurez teaches courses in Computer Science, Educational and Instructional Technology, and Digital Media Design programs, which has lead him to pioneer a fusion of the education and computing technology disciplines. As lead researcher and co-PI on Hewlett Packard Technology for Teaching – Higher Education – Leadership Grant 2008 and Catalyst Grant 2010, Dr Jaurez has worked extensively in Game Design Methodology as a novel teaching framework for STEM+ courses. A PhD from Nova Southeastern University, his dissertation work is in Research and Development in the discipline of Computing Technology in Education. As board member for an organization called Learning for Life, Dr. Jaurez also uses video game technology to inspire juvenile court system kids in the area of science, technology, engineering and mathematics (STEM). His aim is to encourage academic and professional career paths in gaming, and inspire "at risk" youth to enroll in college. Dr. Jaurez also sits on the board of his local church and assists with outreach programs and ministries.

## **Introduction**

In the K-12 environment on Oahu, Hawaii, as well as across the United States, there is a prevalent drive to utilize technology in order to better facilitate educational processes, as well as engage and motivate teachers and learners (Bunag, 2012; Mireles, 2012). Technology in the classroom is defined as computer based, networked, and digital media that facilitates advanced learning environments (Horton, 2011). Education technology and cultural identity often find themselves at odds or in competition for relevance in student's personal and academic life on Oahu.

Much of the traditional Hawaiian "way" relies on externalized activities, where people or surroundings provide context and positioning for perspective and behavior. For some Hawaiian students, qualities of cultural identity may include an appreciation for thoughtful or extended processes of communication and productivity, which can appear slower or less engaged from an outside perspective (Affonso et al., 2010; Kana'iaupuni, 2004). Additionally, the Hawaiian culture embraces implicit non-verbal modes for information transfer and collective interpersonal and environmental interactions (Au & Blake, 2003; Correa, 2013).

Information technology can indeed bolster the pervasiveness and understanding of Hawaiian culture (Iding & Skouge, 2005; Warschauer, 2000). However the mechanical nature of technology can be significantly different than the established elements of Hawaiian thoughts and behaviors, both in modes of interaction and ways of processing information. Educational innovations through technology often promote explicit communication, using detailed and often vast amounts of data, the student learns in an internalized manner that promotes individual accomplishment (Horton, 2011; Warschauer, 2000).

The questions become, does the non-verbal expression and relationship to surroundings associated with the Hawaiian perspective find itself contentiously positioned against the inherently individualistic and discrete communication of modern technology? Or do the unique qualities shared by Hawaiian students actually lend themselves to greater adoption and embrace of new technologies? This preliminary review of literature explores the possible factors, individuals, and environments to discover the major and minor discourses on the connection between Native Hawaiian identity and education technology.

## **Background**

Bunag (2012), shows that Hawaii schools, and especially Hawaiian-focused charter schools, face major issues financing education costs and upgrading technological infrastructure. Boulay (2008), demonstrates that the US DOE invests over \$400 million dollars across over 400 different programs in pre-service training for education technology to effectively enhance student learning. According to Acopan-Tuasivi (2012), the United States in the last three decades is spending over twice as much money on education, without demonstrating significant improvement in academic performance. According to Ng (2012) there may not be a direct correlation to professional development and completion rates for Native Hawaiians.

Ng (2010), stated that as of 2005 Native Hawaiians were the least likely minority to graduate from high school on Hawaii. According to Singh (2011), No Child Left Behind (NCLB) is designed to benefit and bolster achievement for a number of marginalized groups, including minorities, socioeconomic class, special education (SPED), and Limited English Proficiency (LEP) individuals. Bunag (2012), points out the No Child Left Behind (NCLB),

using Adequate Yearly Progress (AYP), goals provides and standard and mandate for 100% proficiency in schools by 2014.

According to Leslein-Yoshihiro (2008), the role of administration in support of education technology and the surrounding training on its implementation in the classroom was critical to the success of adoption across multiple Hawaiian K-12 schools. According to Bunag (2012), the use of Evidence-Based Model (EBM) and Odden's Ten Strategies for Doubling Student Performance are effective means for managing and bolstering the efficiency of resource allocation in Hawaii schools. According to Ng (2011) educational leadership, beyond instruction, plays a significant role in the completion rates of Native Hawaiians.

Guided by the Hawaii Department of Education (HDOE), the general learner outcomes (GLOs) for public K-12 students include self-directed learner, community contributor, complex thinker, quality producer, effective communicator, and effective user of technology (HDOE, 2013). The HDOE lists the primary public schools for its education technologies resources in their Strategic Plan, Race to the Top initiative, and the Strive HI system as Waianae, Nanakuli, Waialua, Leilehua, Mililani, Kapolei, Waipahu, Campbell, Pearl City, Aiea, Radford, Moanalua, Farrington, McKinley, Roosevelt, Kaimuki, Kalani, Kaiser, Kailua, Kalaheo, Castle, and Kahuku High Schools, with additions of intermediate and elementary school education technology. In additions there are many private and charter schools servicing Hawaiian students with the use of education technology throughout Oahu, which are funded by private and corporate grants, government and educational grants, and in conjunction with the various university systems.

## **Native Hawaiian Culture, Identity, and Learning Style**

The stress on social connectedness transcends the adoption of technology through the history of the Hawaii archipelago. According to Kana'iaupuni (2004), the strength of Hawaii innovation or scientific perspective embraces self-efficacy, positive coping, practical knowledge, and persistence as represented in the ancestral journey. According to Au and Blake (2003), the definition of Hawaiian identity includes social class, ethnicity, and primary language. Kaimipono Kaiwi and Kahumoku III (2006), points out that Kanaka Moali (Native Hawaiians) view teaching and learning through makawalu, or “having eight eyes” or native perspective, which is a holistic amalgam of language, epistemology, and text.

Kana'iaupuni and Malone (2006), discusses the modern transformation of Hawaii into a metropolitan society, and its impact to diminish the meaning of “place” or home to the native Hawaiian people. Hall (2005) describes the commodification of Hawaii themes and cultural elements, giving a false sense of the native lifestyle. Hawaiians contribute much of their genealogical identity to the natural surroundings of nature, including from the mountain to the sea and everything in between. Kana'iaupuni and Malone (2006), indicate the significance of these natural surroundings on impacting the Native Hawaiians throughout their mind, body, heritage, and collective philosophical understanding. The mythologies of the birthing of the Hawaiian Islands, created by the gods outlined the ecological apologue of po (darkness, obscurity). The Islands were created from a birthing of papahanaumoku or the earth mother and the sky father of Wakea. Wakea is also known for birthing the kalo, or the taro plant, the staple crop for the native Hawaiians as both a source of sustenance and metaphorical symbol of life. The people are intimately intertwined to their land through their identity, history, culture, and very way of living.

According to Pukui, Haertig, and Lee (2001), before religion transformed the islands, feasting was the main celebration for religious occasions and human milestones. Due to the limited resource of living on a desolate island, food was very precious making these events treasurable. It is said that filling a man's opu (belly) boosted the relationship and connection with other man. The ancestors connected these feast to old Hawaii, and every meal as communing with god.

Meyer (1998), states that logical context is related to the Hawaiian culture, in that activities and behaviors are deeply related to natural environment and the ancestral line of family. Generationally, understanding and perspective are viewed as a continuum from elders living and deceased through storytelling and cultural tradition. Spirituality and practical life are intertwined through the basic needs of community and family utilizing traditional tools. A significant component of being Hawaiian is the "unspoken" or inherent understanding of relationship between greater ways of life, expressed inner being, and the practicalities of life (Meyer, 1998).

According to Handler and Linnekin (1984) tradition cannot be defined solely through description, ancestry, or persona, rather tradition can be described in terms of consistencies and non-consistencies. According to Linnekin (1983) each generation develops and enhances their sense of tradition based from ancestral influences or consistencies. Part of the modern Hawaiian traditions is to incorporate the imported cultures that are now part of the Hawaiian Islands. This incorporation of multicultural perspectives is always infused with Hawaiian substance, thereby making it their own. For example, food has been a significant influence, malasadas, taken from the Portuguese, sweet and sour from the Chinese, Kim Chee from the Koreans, sashimi from the

Japanese and pasteles from the Puerto Rican's are just some of the contributions from these migrant countries that Hawaiians have embraced.

Beginning with the definition of "local" Hawaiian, from a linguistic perspective, the term is derived from the immigration of the plantation workers and their families (Warschauer, 2000). These workers traveled primarily from Korea, China, Japan, Portugal and the Philippines. This melting pot of diverse languages and gestures created the local Hawaiian "pidgin" language (Warschauer, 2000). This concept of "local" Hawaiian extends beyond Native Hawaiian and includes many non-Native Hawaiians through the vocabulary, cadence, and intonation, "pidgin" allows an acceptance within the communities on the islands.

Wilson and Kamanā (2006), state that advantages for Hawaiian-medium education over English-medium includes cultural connectedness, consistent identity, support for academics, English as a second language, and additional language study. According to Cabalo (2011), classroom focus and student involvement can be classified into two categories, culturally conforming with the attention on the collective, and the culturally confronting where students are engaged with an individualistic approach. Additionally, biological technologies provide a layer of connection to surroundings and interpersonal interaction through the physical mechanics of the individual.

Warschauer (2000), describes that identity is defined through language. Language plays an important role for transferring and expressing information on complex levels. Identity creates the similar beliefs diversified through the dynamic multitudes of expression of positive and or negative reactions. Verbal communication through language has transformed the concept for individuals to create a collective environment based from similar thoughts, beliefs and manifestations. Based on Warschauer (2000) public schools and universities in Hawaii indicate

the learning technique commonly used for Hawaiians in the classrooms focus on the interaction and form of storytelling or informal and encouraging approach for exchanging information. Research revealed Hawaiians work best for community merit versus individual gains; these students were motivated to strive towards excellence knowing the rest of the group would benefit.

The connection to social relations and the extension to biological interactions may create a number of unique educational opportunities for Hawaiian students. Boulay (2008), stated that providing technology mentors in Hawaii schools has been shown to bolster adoption of technology in the classroom for educators and students. Kaomea (2005), states that there is increased interest in having indigenous culture incorporated into curricula and the difficulty for non-indigenous educators to represent and model the indigenous perspective. According to Freitas, Wright, Balutski, and Wu (2013) describe student development in terms of persistence, attrition, and matriculation. Hishinuma et al. (2000), states that ethnicity in terms of cultural norms, values, attitude towards minority status, and ancestry. Each of the research studies focus on varying aspects of creating environment and interactions specific to the Hawaiian perspective.

### **Mapping Native Hawaiian Learning to Education Technology**

According to Dator, Yeh, and Park (2013) technology can be defined as being physical, social, and biological. The physical elements, or in modern terms virtual elements, of technology allow the practical application of tools to multiply the attributes or talents of the user. Bunag (2012), established that the early Hawaiian education system, before the Missionary movement of the 1800s, focused on practical technologies that assisted the people in daily life on the Hawaiian archipelago. In a modern environment, according to Correa (2013), technology

can provide the tools for problem solving for real world Hawaiian cultural situations through immersive environments and computer mediate curricula. Social technologies provide means for communications between humans and approach ways of collecting and process information about the individuals' environment.

Technology implementation in education in and of itself does not guarantee improvements in achievement for Hawaiian students, but that the catered or carefully designed use of technologies can have a significant effect on performance (Leslein-Yoshihiro, 2008). The fact the education technology can be molded or shaped to include or exclude modalities or digital interaction affords this teaching medium a high level of customization. According to Miller (2002), the role of the teacher in Hawaii is becoming that of learning producer, or the individual who creates opportunities and environment by which learning and teaching can occur. The efforts to create digital learning environments often involves teams of professionals to develop including, resource and project managers, subject matter experts, instructional designers, technology specialists (web designers/developers), and teachers.

According to Mireles (2012), learning networks and development team facilitate the adoption and implementation of technology in the classroom. The timing of technology can also play a role in effectiveness as Singh (2011), stated that early childhood development in academics can significantly increase later academic achievement in Native Hawaiians. By creating custom learning experience with appropriate technology the educator has the potential to meet these unique needs for Hawaiian students.

Through the use of in class education technology like Smart boards (interactive white boards), networked computer based classrooms, electronic polling devices, mobile devices,

classroom management software and online resources, many Hawaiian K-12 classrooms are being transformed into mixed modality environments of traditional and digital learning, while some classrooms are even being facilitated primarily online (Leslein-Yoshihiro, 2008). Smart board technology allows the teacher to share presentation using a projected image, while providing the additional benefit of interaction with interface with special markers that can sense the teachers touch of the board and interact like a computer mouse (Horton, 2011). This interaction with digital whiteboards can promote tactile learning and provides a sense of physical immersion by allowing the user to approach and touch the large projection screen. Classroom activities that involve Smart boards tend to provoke a constructionist interaction or the “act of physically doing”, where students build on the teachers or other students initial work while being called to interact on the device (Leslein-Yoshihiro, 2008). This type of activity can closely resemble the more physical qualities of everyday life in the native Hawaiian tradition, because it provides direct manipulation of the environment, even though parts of the environment are digital. For example, Native Hawaiians practice working in the lo’i (taro patch, irrigated terrace) where they demonstrate the physical act of farming the land as a collective to sustain the community, and the computer based Smart board can simulate similar experience and promote community in the classroom.

Electronic polling devices and mobile technologies are quickly expanding prevalence in the onsite classroom in Hawaii K-12 education (Mireles, 2012). Through the use of less expensive handheld polling systems that incorporate a simplified user interface for eliciting student input and rapid response in data collection and analysis, these systems increase real time aspect of teaching and learning to facilitate the assessment and diagnostics for student performance (Horton, 2011). Teachers will pose questions to the class and student respond by

clicking a button on the hand held device, so a quick analysis can be performed and a collective understanding of topics can be accessed (Horton, 2011). These polling devices can be useful in connecting with the inherently social constructivist interpersonal components of the Hawaiian culture, in that they allow an expedited means for collecting the share knowledge of the group. This shared knowledge perspective can then be bolstered and the Native Hawaiian students can experience the community inclusiveness that aligns with traditional and cultural ways (Wilson & Kamanā, 2006).

This idea of mobile devices extends beyond the simple polling device to the far more technologically advanced smart phone, tablet, or laptop device. Initiatives like one-to-one computer access and BYOD (Bring Your Own Device) are providing many Hawaiian youth with access to computing and network technologies that previously were unavailable (Iding & Skouge, 2005). Mobile devices provide individual and networked learning opportunities through internet access and downloadable education applications (Horton, 2011). Although, normally associated with the individual interaction between device or software and the user, most applications increasingly provide social network integration and information exchange which assists in the constructivist elements of teaching and learning. The lack of applications or software designed specifically for Native Hawaiian in terms of leveraging particular elements of their learning styles may seemingly hinder their educational usefulness, however these programs often exhibit universal tools and interfaces for many modes of communication and can therefore be customized or designed to fit the needs of the targeted learner.

Networked internet enabled computers and devices allows for immense amounts of information and communication to be assembled and delivered to the classroom and individual students at a sometimes overwhelming rate and persistency. Learning Management Systems

(LMS) like Moodle and Edmodo (used by STEM Hawaii for teacher support), with 29 million users across the US, contains social media tools and mobile applications for accessibility (HDOE, 2013). Although the benefits of internet networked devices have been well researched and established, the inherent nature of too much information and cognitive load becomes a concern for teachers and students alike, especially in the case of Native Hawaiians who tend to experience information through implicit non-verbal and environmental sources. The explicit, direct, and individualist modality of internet browsing and application interaction does afford the opportunity for acclimation or learning of the systems, but doing so may adversely interfere or replace an established learning style, moving from Native Hawaiian style to a western perspective. Conversely, the connected devices do promote collective intelligence, social networked environments, and rapid communication with other people, which align directly with elements of the native Hawaiian style.

### **Discussion and Further Research**

Hawaii, like most states in the US, views technology in education as a powerful tool for increasing achievement and engaging students at the K-12 level and beyond. Unique to Hawaii, are its very own Native Hawaiian students and peoples, which possess a distinct perspective towards the educational environment as well as the world around them. This distinction, as island peoples, affords the individual student and community of Native Hawaiians an often admired sense of exceptionality and especially rich cultural ancestry that values family, community, art, intuition, and spirituality that is recognized throughout the world.

Traits associated with the Native Hawaiian identity often form around the emphasis within the culture on family and community that drive the individual to appreciate and associate

the betterment of others with personal achievement and reward. For education technology in the classroom setting, internet devices and social networks can help foster these social constructiveness environments and could bridge the challenges of isolationism and alienation sometimes felt by the Native Hawaiian students. Art, intuition, and spirituality can too find themselves bolstered or enhanced by education technology through graphic applications, simulations of environments, and connections to advanced digital media with stories and narratives familiar to the Native Hawaiian Culture.

As a preliminary examination of literature for the Native Hawaiian identity and the effects of educational technology with Native Hawaiian students, further research will include extended literature review, Hawaii's adoption of education technology, and reaction of Native Hawaiian students to education technology, and changes to cultural that may be caused by use of technology in K-12 on Oahu. Extensive literature review for understanding the details of culture and identity on student learning style will help shed light on the relationship between culture and education. An in-depth study of the education technology employed at specific school servicing the Native Hawaiian community can help quantify the touch points for education technology and the effectiveness of current technology on Native Hawaiian students. Last, the exploration of the effects of technology on the cultural-placidity (changing of traditional and modern culture) for K-12 students on Oahu may yield interesting results and will be examined in future research.

**Title:** Adoption of Technology in Hawaii Schools: *Social and Educational impact of education technology on cultural relevance in K-12 on O'ahu.*

**Topic Area of Submission:** Education Technology

**Presentation Format:** Paper Session

**Description:** This paper presentation explores the impact of educational technology in K-12 schools in Hawaii and attempts to examine the implications on cultural values and relevance for students and educators. Education technology plays an important role in course content delivery, classroom experience, and assessment of student performance. However, this study attempts to understand the juxtaposition of technology and cultural importance for the Hawaiian educational system. Resources, tools, and techniques for implementation will be presented and shared in this presentation.

**Authors:**

**Abstract:** A fast paced technology driven world surrounds today's K-12 students and balancing this paradigm with the cultural traditions of Hawaii has been increasingly difficult. The use of technology in education is a continually growing topic in educational leadership, administration, teaching, and instructional design. The effects of technological integration on the cultural values for students and educators needs to be considered in order for a stable system of educational leadership to assist in maintaining a solid connection to the past while preparing for a hi-tech future. The bridge between these seemingly opposing worlds lies in leadership that allows for increasing cultural relevance by incorporating traditional norms through new media systems in the educational experience, while highlighting the positive effects of cultural values applied to new technologies in building a more well-rounded and prepared student.

## **Author Bios:**

### **Helene S.M. Honda MSCP, EdD Candidate at Argosy University-Honolulu, HI**

Helene S.M. Honda, MSCP is a candidate in EdD Organization Leadership at Argosy University in Honolulu Hawaii. Ms. Honda has a Master's Degree in Counseling Psychology. Ms. Honda has extensive instructional experience in educational settings, including facilitating career classes for adults diagnosed with psychological conditions as well as employees of organizations. A frequent speaker in college, high school, and elementary school classrooms, Ms. Honda developed, implemented, and instructed programs and classes on topics including those directed by my current part-time employer, the Native Hawaiian Roll Commission. Ms. Honda is skilled at developing curricula that is understandable for students based on their learning abilities.

### **Dr. James J. Jaurez, National University, San Diego, CA**

James J. Jaurez, PhD is an Assistant Professor with National University's School of Engineering, Technology, and Media. Dr. Jaurez teaches courses in Computer Science, Educational and Instructional Technology, and Digital Media Design programs, which has lead him to pioneer a fusion of the education and computing technology disciplines. As lead researcher and co-PI on Hewlett Packard Technology for Teaching – Higher Education – Leadership Grant 2008 and Catalyst Grant 2010, Dr Jaurez has worked extensively in Game Design Methodology as a novel teaching framework for STEM+ courses. A PhD from Nova Southeastern University, his dissertation work is in Research and Development in the discipline of Computing Technology in Education. As board member for an organization called Learning for Life, Dr. Jaurez also uses video game technology to inspire juvenile court system kids in the area of science, technology, engineering and mathematics (STEM). His aim is to encourage academic and professional career paths in gaming, and inspire "at risk" youth to enroll in college. Dr. Jaurez also sits on the board of his local church and assists with outreach programs and ministries.

## **Introduction**

In the K-12 environment on Oahu, Hawaii, as well as across the United States, there is a prevalent drive to utilize technology in order to better facilitate educational processes, as well as engage and motivate teachers and learners (Bunag, 2012; Mireles, 2012). Technology in the classroom is defined as computer based, networked, and digital media that facilitates advanced learning environments (Horton, 2011). Education technology and cultural identity often find themselves at odds or in competition for relevance in student's personal and academic life on Oahu.

Much of the traditional Hawaiian "way" relies on externalized activities, where people or surroundings provide context and positioning for perspective and behavior. For some Hawaiian students, qualities of cultural identity may include an appreciation for thoughtful or extended processes of communication and productivity, which can appear slower or less engaged from an outside perspective (Affonso et al., 2010; Kana'iaupuni, 2004). Additionally, the Hawaiian culture embraces implicit non-verbal modes for information transfer and collective interpersonal and environmental interactions (Au & Blake, 2003; Correa, 2013).

Information technology can indeed bolster the pervasiveness and understanding of Hawaiian culture (Iding & Skouge, 2005; Warschauer, 2000). However the mechanical nature of technology can be significantly different than the established elements of Hawaiian thoughts and behaviors, both in modes of interaction and ways of processing information. Educational innovations through technology often promote explicit communication, using detailed and often vast amounts of data, the student learns in an internalized manner that promotes individual accomplishment (Horton, 2011; Warschauer, 2000).

The questions become, does the non-verbal expression and relationship to surroundings associated with the Hawaiian perspective find itself contentiously positioned against the inherently individualistic and discrete communication of modern technology? Or do the unique qualities shared by Hawaiian students actually lend themselves to greater adoption and embrace of new technologies? This preliminary review of literature explores the possible factors, individuals, and environments to discover the major and minor discourses on the connection between Native Hawaiian identity and education technology.

## **Background**

Bunag (2012), shows that Hawaii schools, and especially Hawaiian-focused charter schools, face major issues financing education costs and upgrading technological infrastructure. Boulay (2008), demonstrates that the US DOE invests over \$400 million dollars across over 400 different programs in pre-service training for education technology to effectively enhance student learning. According to Acopan-Tuasivi (2012), the United States in the last three decades is spending over twice as much money on education, without demonstrating significant improvement in academic performance. According to Ng (2012) there may not be a direct correlation to professional development and completion rates for Native Hawaiians.

Ng (2010), stated that as of 2005 Native Hawaiians were the least likely minority to graduate from high school on Hawaii. According to Singh (2011), No Child Left Behind (NCLB) is designed to benefit and bolster achievement for a number of marginalized groups, including minorities, socioeconomic class, special education (SPED), and Limited English Proficiency (LEP) individuals. Bunag (2012), points out the No Child Left Behind (NCLB),

using Adequate Yearly Progress (AYP), goals provides and standard and mandate for 100% proficiency in schools by 2014.

According to Leslein-Yoshihiro (2008), the role of administration in support of education technology and the surrounding training on its implementation in the classroom was critical to the success of adoption across multiple Hawaiian K-12 schools. According to Bunag (2012), the use of Evidence-Based Model (EBM) and Odden's Ten Strategies for Doubling Student Performance are effective means for managing and bolstering the efficiency of resource allocation in Hawaii schools. According to Ng (2011) educational leadership, beyond instruction, plays a significant role in the completion rates of Native Hawaiians.

Guided by the Hawaii Department of Education (HDOE), the general learner outcomes (GLOs) for public K-12 students include self-directed learner, community contributor, complex thinker, quality producer, effective communicator, and effective user of technology (HDOE, 2013). The HDOE lists the primary public schools for its education technologies resources in their Strategic Plan, Race to the Top initiative, and the Strive HI system as Waianae, Nanakuli, Waialua, Leilehua, Mililani, Kapolei, Waipahu, Campbell, Pearl City, Aiea, Radford, Moanalua, Farrington, McKinley, Roosevelt, Kaimuki, Kalani, Kaiser, Kailua, Kalaheo, Castle, and Kahuku High Schools, with additions of intermediate and elementary school education technology. In additions there are many private and charter schools servicing Hawaiian students with the use of education technology throughout Oahu, which are funded by private and corporate grants, government and educational grants, and in conjunction with the various university systems.

## **Native Hawaiian Culture, Identity, and Learning Style**

The stress on social connectedness transcends the adoption of technology through the history of the Hawaii archipelago. According to Kana'iaupuni (2004), the strength of Hawaii innovation or scientific perspective embraces self-efficacy, positive coping, practical knowledge, and persistence as represented in the ancestral journey. According to Au and Blake (2003), the definition of Hawaiian identity includes social class, ethnicity, and primary language. Kaimipono Kaiwi and Kahumoku III (2006), points out that Kanaka Moali (Native Hawaiians) view teaching and learning through makawalu, or “having eight eyes” or native perspective, which is a holistic amalgam of language, epistemology, and text.

Kana'iaupuni and Malone (2006), discusses the modern transformation of Hawaii into a metropolitan society, and its impact to diminish the meaning of “place” or home to the native Hawaiian people. Hall (2005) describes the commodification of Hawaii themes and cultural elements, giving a false sense of the native lifestyle. Hawaiians contribute much of their genealogical identity to the natural surroundings of nature, including from the mountain to the sea and everything in between. Kana'iaupuni and Malone (2006), indicate the significance of these natural surroundings on impacting the Native Hawaiians throughout their mind, body, heritage, and collective philosophical understanding. The mythologies of the birthing of the Hawaiian Islands, created by the gods outlined the ecological apologue of po (darkness, obscurity). The Islands were created from a birthing of papahanaumoku or the earth mother and the sky father of Wakea. Wakea is also known for birthing the kalo, or the taro plant, the staple crop for the native Hawaiians as both a source of sustenance and metaphorical symbol of life. The people are intimately intertwined to their land through their identity, history, culture, and very way of living.

According to Pukui, Haertig, and Lee (2001), before religion transformed the islands, feasting was the main celebration for religious occasions and human milestones. Due to the limited resource of living on a desolate island, food was very precious making these events treasurable. It is said that filling a man's opu (belly) boosted the relationship and connection with other man. The ancestors connected these feast to old Hawaii, and every meal as communing with god.

Meyer (1998), states that logical context is related to the Hawaiian culture, in that activities and behaviors are deeply related to natural environment and the ancestral line of family. Generationally, understanding and perspective are viewed as a continuum from elders living and deceased through storytelling and cultural tradition. Spirituality and practical life are intertwined through the basic needs of community and family utilizing traditional tools. A significant component of being Hawaiian is the "unspoken" or inherent understanding of relationship between greater ways of life, expressed inner being, and the practicalities of life (Meyer, 1998).

According to Handler and Linnekin (1984) tradition cannot be defined solely through description, ancestry, or persona, rather tradition can be described in terms of consistencies and non-consistencies. According to Linnekin (1983) each generation develops and enhances their sense of tradition based from ancestral influences or consistencies. Part of the modern Hawaiian traditions is to incorporate the imported cultures that are now part of the Hawaiian Islands. This incorporation of multicultural perspectives is always infused with Hawaiian substance, thereby making it their own. For example, food has been a significant influence, malasadas, taken from the Portuguese, sweet and sour from the Chinese, Kim Chee from the Koreans, sashimi from the

Japanese and pasteles from the Puerto Rican's are just some of the contributions from these migrant countries that Hawaiians have embraced.

Beginning with the definition of "local" Hawaiian, from a linguistic perspective, the term is derived from the immigration of the plantation workers and their families (Warschauer, 2000). These workers traveled primarily from Korea, China, Japan, Portugal and the Philippines. This melting pot of diverse languages and gestures created the local Hawaiian "pidgin" language (Warschauer, 2000). This concept of "local" Hawaiian extends beyond Native Hawaiian and includes many non-Native Hawaiians through the vocabulary, cadence, and intonation, "pidgin" allows an acceptance within the communities on the islands.

Wilson and Kamanā (2006), state that advantages for Hawaiian-medium education over English-medium includes cultural connectedness, consistent identity, support for academics, English as a second language, and additional language study. According to Cabalo (2011), classroom focus and student involvement can be classified into two categories, culturally conforming with the attention on the collective, and the culturally confronting where students are engaged with an individualistic approach. Additionally, biological technologies provide a layer of connection to surroundings and interpersonal interaction through the physical mechanics of the individual.

Warschauer (2000), describes that identity is defined through language. Language plays an important role for transferring and expressing information on complex levels. Identity creates the similar beliefs diversified through the dynamic multitudes of expression of positive and or negative reactions. Verbal communication through language has transformed the concept for individuals to create a collective environment based from similar thoughts, beliefs and manifestations. Based on Warschauer (2000) public schools and universities in Hawaii indicate

the learning technique commonly used for Hawaiians in the classrooms focus on the interaction and form of storytelling or informal and encouraging approach for exchanging information. Research revealed Hawaiians work best for community merit versus individual gains; these students were motivated to strive towards excellence knowing the rest of the group would benefit.

The connection to social relations and the extension to biological interactions may create a number of unique educational opportunities for Hawaiian students. Boulay (2008), stated that providing technology mentors in Hawaii schools has been shown to bolster adoption of technology in the classroom for educators and students. Kaomea (2005), states that there is increased interest in having indigenous culture incorporated into curricula and the difficulty for non-indigenous educators to represent and model the indigenous perspective. According to Freitas, Wright, Balutski, and Wu (2013) describe student development in terms of persistence, attrition, and matriculation. Hishinuma et al. (2000), states that ethnicity in terms of cultural norms, values, attitude towards minority status, and ancestry. Each of the research studies focus on varying aspects of creating environment and interactions specific to the Hawaiian perspective.

### **Mapping Native Hawaiian Learning to Education Technology**

According to Dator, Yeh, and Park (2013) technology can be defined as being physical, social, and biological. The physical elements, or in modern terms virtual elements, of technology allow the practical application of tools to multiply the attributes or talents of the user. Bunag (2012), established that the early Hawaiian education system, before the Missionary movement of the 1800s, focused on practical technologies that assisted the people in daily life on the Hawaiian archipelago. In a modern environment, according to Correa (2013), technology

can provide the tools for problem solving for real world Hawaiian cultural situations through immersive environments and computer mediate curricula. Social technologies provide means for communications between humans and approach ways of collecting and process information about the individuals' environment.

Technology implementation in education in and of itself does not guarantee improvements in achievement for Hawaiian students, but that the catered or carefully designed use of technologies can have a significant effect on performance (Leslein-Yoshihiro, 2008). The fact the education technology can be molded or shaped to include or exclude modalities or digital interaction affords this teaching medium a high level of customization. According to Miller (2002), the role of the teacher in Hawaii is becoming that of learning producer, or the individual who creates opportunities and environment by which learning and teaching can occur. The efforts to create digital learning environments often involves teams of professionals to develop including, resource and project managers, subject matter experts, instructional designers, technology specialists (web designers/developers), and teachers.

According to Mireles (2012), learning networks and development team facilitate the adoption and implementation of technology in the classroom. The timing of technology can also play a role in effectiveness as Singh (2011), stated that early childhood development in academics can significantly increase later academic achievement in Native Hawaiians. By creating custom learning experience with appropriate technology the educator has the potential to meet these unique needs for Hawaiian students.

Through the use of in class education technology like Smart boards (interactive white boards), networked computer based classrooms, electronic polling devices, mobile devices,

classroom management software and online resources, many Hawaiian K-12 classrooms are being transformed into mixed modality environments of traditional and digital learning, while some classrooms are even being facilitated primarily online (Leslein-Yoshihiro, 2008). Smart board technology allows the teacher to share presentation using a projected image, while providing the additional benefit of interaction with interface with special markers that can sense the teachers touch of the board and interact like a computer mouse (Horton, 2011). This interaction with digital whiteboards can promote tactile learning and provides a sense of physical immersion by allowing the user to approach and touch the large projection screen. Classroom activities that involve Smart boards tend to provoke a constructionist interaction or the “act of physically doing”, where students build on the teachers or other students initial work while being called to interact on the device (Leslein-Yoshihiro, 2008). This type of activity can closely resemble the more physical qualities of everyday life in the native Hawaiian tradition, because it provides direct manipulation of the environment, even though parts of the environment are digital. For example, Native Hawaiians practice working in the lo’i (taro patch, irrigated terrace) where they demonstrate the physical act of farming the land as a collective to sustain the community, and the computer based Smart board can simulate similar experience and promote community in the classroom.

Electronic polling devices and mobile technologies are quickly expanding prevalence in the onsite classroom in Hawaii K-12 education (Mireles, 2012). Through the use of less expensive handheld polling systems that incorporate a simplified user interface for eliciting student input and rapid response in data collection and analysis, these systems increase real time aspect of teaching and learning to facilitate the assessment and diagnostics for student performance (Horton, 2011). Teachers will pose questions to the class and student respond by

clicking a button on the hand held device, so a quick analysis can be performed and a collective understanding of topics can be accessed (Horton, 2011). These polling devices can be useful in connecting with the inherently social constructivist interpersonal components of the Hawaiian culture, in that they allow an expedited means for collecting the share knowledge of the group. This shared knowledge perspective can then be bolstered and the Native Hawaiian students can experience the community inclusiveness that aligns with traditional and cultural ways (Wilson & Kamanā, 2006).

This idea of mobile devices extends beyond the simple polling device to the far more technologically advanced smart phone, tablet, or laptop device. Initiatives like one-to-one computer access and BYOD (Bring Your Own Device) are providing many Hawaiian youth with access to computing and network technologies that previously were unavailable (Iding & Skouge, 2005). Mobile devices provide individual and networked learning opportunities through internet access and downloadable education applications (Horton, 2011). Although, normally associated with the individual interaction between device or software and the user, most applications increasingly provide social network integration and information exchange which assists in the constructivist elements of teaching and learning. The lack of applications or software designed specifically for Native Hawaiian in terms of leveraging particular elements of their learning styles may seemingly hinder their educational usefulness, however these programs often exhibit universal tools and interfaces for many modes of communication and can therefore be customized or designed to fit the needs of the targeted learner.

Networked internet enabled computers and devices allows for immense amounts of information and communication to be assembled and delivered to the classroom and individual students at a sometimes overwhelming rate and persistency. Learning Management Systems

(LMS) like Moodle and Edmodo (used by STEM Hawaii for teacher support), with 29 million users across the US, contains social media tools and mobile applications for accessibility (HDOE, 2013). Although the benefits of internet networked devices have been well researched and established, the inherent nature of too much information and cognitive load becomes a concern for teachers and students alike, especially in the case of Native Hawaiians who tend to experience information through implicit non-verbal and environmental sources. The explicit, direct, and individualist modality of internet browsing and application interaction does afford the opportunity for acclimation or learning of the systems, but doing so may adversely interfere or replace an established learning style, moving from Native Hawaiian style to a western perspective. Conversely, the connected devices do promote collective intelligence, social networked environments, and rapid communication with other people, which align directly with elements of the native Hawaiian style.

### **Discussion and Further Research**

Hawaii, like most states in the US, views technology in education as a powerful tool for increasing achievement and engaging students at the K-12 level and beyond. Unique to Hawaii, are its very own Native Hawaiian students and peoples, which possess a distinct perspective towards the educational environment as well as the world around them. This distinction, as island peoples, affords the individual student and community of Native Hawaiians an often admired sense of exceptionality and especially rich cultural ancestry that values family, community, art, intuition, and spirituality that is recognized throughout the world.

Traits associated with the Native Hawaiian identity often form around the emphasis within the culture on family and community that drive the individual to appreciate and associate

the betterment of others with personal achievement and reward. For education technology in the classroom setting, internet devices and social networks can help foster these social constructiveness environments and could bridge the challenges of isolationism and alienation sometimes felt by the Native Hawaiian students. Art, intuition, and spirituality can too find themselves bolstered or enhanced by education technology through graphic applications, simulations of environments, and connections to advanced digital media with stories and narratives familiar to the Native Hawaiian Culture.

As a preliminary examination of literature for the Native Hawaiian identity and the effects of educational technology with Native Hawaiian students, further research will include extended literature review, Hawaii's adoption of education technology, and reaction of Native Hawaiian students to education technology, and changes to cultural that may be caused by use of technology in K-12 on Oahu. Extensive literature review for understanding the details of culture and identity on student learning style will help shed light on the relationship between culture and education. An in-depth study of the education technology employed at specific school servicing the Native Hawaiian community can help quantify the touch points for education technology and the effectiveness of current technology on Native Hawaiian students. Last, the exploration of the effects of technology on the cultural-placidity (changing of traditional and modern culture) for K-12 students on Oahu may yield interesting results and will be examined in future research.

## **Creating a Learning Community Where Black Men Excel Academically**

Duane O. Reid Jr.

Baltimore City Community College, Academic Acceleration for African American Males (4A)

Baltimore City Community College (BCCC) is implementing a student success model entitled Academic Acceleration for African American males (4A) program. The presentation will highlight the national, regional, and BCCC data trends regarding Black Male retention and completion rates. A discussion on the source of funding for this program and the main components of the model will show the direct impact on the men and the subsequent impact on the campus and surrounding community. The moderators will provide tangible information pertaining to the main events and programs and lead a discussion on how elements of the 4A program can enrich similar programs as well as be informed by comparable efforts.

### **Biographical Sketch:**

Duane O. Reid Jr. is currently the Project Director of The Academic Acceleration for African American Males (4A) Program at Baltimore City Community College. He received his BA degree in History Pre- Law from Columbia Union College in 2001 and his MBA degree from Columbia Union College in 2009. He went on to receive his M.A. in Public Administration in May 2011 from Washington Adventist University. Mr. Reid has been working in Higher Education since 2006. Prior to accepting his current post at BCCC in 2012 he served in various positions including; Associate dean of Men, Associate Director of Admissions, and Director of Admissions and Recruitment.

## **Abstract**

**Title: Are you prepared to use a variety of computer technology tools to improve your ELL students' learning outcomes?**

By Mautumua Porotesano and Kim Weolsoon Rupnow

### **Abstract:**

The growing number of English Language Learners (ELL) in schools in the U.S. has motivated teachers to expand beyond linear, text-based learning and explore innovative strategies to meet the needs of their students. With modern technologies on the rise, staying abreast of the latest trends in this digital information age not only has potential to engage students who learn best in other ways but can also better equip students with skills that are beneficial for life beyond school. The purpose of this presentation is to showcase a variety of computer-related strategies for improving literacy skills that were shared through an online Professional Development (PD) course offered to teachers with the Hawaii Department of Education. The two presenters from the University of Hawaii Center on Disability Studies, course instructor and project director, will present some of the online technology tools available for K-12 teachers to supplement their classroom lessons and improve ELLs' writing skills. They will also share a selection of PD trainees' learning portfolios and writing samples of their ELL students' pre- and post-technology work. In conclusion, the presenters will attempt to answer the following questions: Is technology more engaging, thus showing potential for improving the ELL case students' writing skills? What kind of online computer technology tools are available, and how have they been used to engage students' learning?

**THE ROLE OF FOLK MUSIC IN TRADITIONAL AFRICAN  
SOCIETY: THE IGBO EXPERIENCE**

**BEING A PAPER PRESENTED AT THE HAWAII INTERNATIONAL  
CONFERENCE ON EDUCATION AT HONOLULU, HAWAII**

**FROM JANUARY 5-8, 2014**

**SUBMISSION ID: 1731**

**TOPIC AREA: MUSIC EDUCATION**

## **ABSTRACT**

Folk music is spontaneously composed music of a race, tribe, group etc of a humble nature, orally transmitted from generation to generation with an unknown composer. The traditional Igbo society was not a literate one. We had our culture, traditions and music before the coming of the early missionaries. In the olden days, Igbo people did not derive entertainment from books rather they developed and derived joy from imaginations through oral narratives including traditional (folk) music and dance. According to Emenyonu (1978), Igbo oral tradition or folklore (oral performance) is the foundation of the traditional Igbo music and they include folksongs, folktales, proverbs, prayers including incantations, histories, legends, myths, drama, oratory and festivals. In Africa generally, music plays an important part in the lives of the people and one of the major characteristics of African music is that it has function. The various stages of the life-cycle of an individual and the life-cycles of the society are all marked with music.

**Definition:**

Folk music is the term used to designate the traditional music of a people in contrast to the so called popular music and the serious music of concert halls and opera houses. The best approach to defining folk music may be to identify some of the characteristics none of which by themselves are the exclusive property of folk songs but all of which taken together serve to distinguish it.

**Origin:**

Folk music originated in the 19th century as a term for musical folklore. It has been defined in several ways; as music transmitted by word of mouth, music of the lower classes, music with no known composer been contrasted with commercial and classical styles. Since the middle of the 20th century the term has also been used to describe a kind of popular music that is based on traditional music. Its genres are a fusion of folk rock, electric folk, folk metal and progressive folk music. There are extensions of the term folklore which was coined in 1846 by the English antiquarian William Thomas used to describe “the traditions, customs and superstitions of the uncultured classes”

**Characteristics:**

Folk music normally exists in oral tradition being taught and learned by word of mouth without the use of written music. Occasionally the written or printed tradition influences folk music as when art songs or popular songs are

taken up by genuine folksingers. It is the music of the rural groups, of rural origin used by recent migrations to the city. Folk songs are associated with activities such as work, games, dances, wars or religious ceremonies. There are still others which are purely for entertainment, enjoyment by the performer or listener. It is usually the music of the relatively uneducated and unsophisticated strata of the society normally produced and disseminated by formal institutions such as schools or churches.

Finally it is usually a relatively simple music when compared with concerts because it is intended to be sung by many perhaps even most ordinary individuals in a community. However, it is important to note that folk music although earlier on distinguished by its sound from the popular and concert music, always bears a close relationship historically and stylistically to the other kinds of music in the same culture.

According to Scholes (1977) in [http://en.wikipedia.org\(2010\);](http://en.wikipedia.org(2010);)

Folk music may tend to have certain characteristics but it cannot clearly be differentiated in purely musical terms. One meaning often given is that of “old songs, with no known composers”, another is that of music that has been submitted to an evolutionary.

He went further to explain that such depends upon the cultural processes rather than abstract musical types upon continuity and oral transmission. Correlating the above, Charles Seeger (1980) was quoted as having said that,

Folk music is associated with a lower class in societies which are culturally and socially stratified that is which have developed an elite, and possibly also a popular musical culture. In these terms folk music may be seen as part of a “schema comprising four musical types”, ‘primitive’ or ‘tribal’; ‘elite’ or ‘art’; ‘folk’; and ‘popular’.

### **Nature of African Music:**

Africa, home to 350 million people belonging to some 3,000 tribes and speaking some 800-1000 distinct languages is one of the most musically diversified regions of the world. The geographical variety of the continent from the mountains and the vast desert of the north to the central rain forests and the fertile southern coast are reflected in a multiplicity of musical styles.

In spite of this diversity, unifying features may be identified. African music is primarily percussive with drums, rattles, bells and gongs dominating. The important melodic instruments include Xylophones and plucked strings which are played with percussive techniques. African melodies are based on short units, on which performers improvise. Though the melodies are often simple, the rhythms

are complex by European standards with much syncopations hemiola and polyrhythm. An unusual aspect of African rhythm is what has been called the 'metronome sense' which is the ability of many musicians to perform for long periods without deviating from the exact tempo. Group performances are most typical and the 'call – and – response style with a solo leader and responsorial group used throughout the continent. In Africa, participation in music is spontaneous and voluntary. It is also an obligation imposed by one's membership of a social group or a responsibility attached to one's situation in a society. Too many however it is an economic activity and a necessity because it fetches money and the most common basis of musical organization in Africa is age and sex. There is equally a general music for everybody the aged, male and female.

For women, for instance, there are recreational music involving – grinding, pounding, cooking, sweeping, marriage rites, post natal ceremonies and other domestic duties. In some parts of West Africa for example, there is music for healing the sick, for correcting disorders, for encouragement and for endurance for women in some specified occasions.

Another important feature of African music is the existence of a wide diversity of singing and dancing styles which seem to create difficulties of understanding and appreciation by those who are not accustomed to the tradition. This diversity is partly due to linguistic factors, for many African music reflect

speech mannerisms of the various language groups including common features of speech such as rhythm and intonation. Africans depend on music as a means of communication within and outside the community. The fact is that the traditional African sees a link in time past, time present and in the future. This link is however symbolized by the sound of music.

Music is culture and with it one can give meaning to other cultural milieu within the society such objects include man, myths, spirits, animals, plants and the elements of living and non-living things plus the various forces are brought to the same level of action and interaction through the performance of folk music.

Music is not just ordinary in the African society but it is believed that all good music has a mystical connotation. The composer/performer had been taught and probably inspired by the supernatural beings either from the evil forests or the waters – Egwu m si na mmiri (my music came from the waters).

African traditional music is also the music of the farmer, the fisherman and the hunter, craft man, trader and the palm wine tapper. He composes, sings and dances and also transmits it from one generation to another through an elaborate process of specialization.

Explaining this further, Ekwonwa (2009) said;

This is also true of Yoruba music or any other group in Africa. African music maker does not describe a mood to his listeners, rather he creates (unlike the western music maker ) and puts his audience on that frame of mind. Think of late Celestine Ukwu's music display in "Onwu eme anyi, Onwu amaghi onye ukwu" (Death has no friend; death does not know a rich man)

On hearing this music alone, the mood had been created. African music can easily be altered by the use of different pitches for a particular word. Thus, it is a recognized theory in African music that the nature of inflections of speech is the ultimate origin of the concept of melody.

### **The Igbo Cultural Community**

Igbo society constitutes what linguists call a speech community. All Igbo dialects derive from one proto-Igbo language and share common grammatical, lexical and phonological characteristic. Egbule (2006) observes that: "Igbo customs are basically similar sometimes with local variations. The kolanut custom, music art, dance and literature ethics, philosophy, ritual avoidance and taboo are basically patterned to reflect an identical conception of Igbo social and ritual systems". The Igbo cultural area is delimit able by an imaginary line running outside the settlements of Agbor, Kwale, Obiaruku, Ebu (West Niger Igbo area),

Ahoada, Diobu, Umuagbanyi (Port-Harcourt area), Arochukwu, Afikpo, Ndimioafo, Isiogo (Abakaliki area) and Enugu Ezike (Nsukka area) and Nzam. This imaginary line encloses an area in which the people speak both the various dialects of the Igbo language and also share typical and significant common culture traits and pattern up to or above 50 percent. Presently the Igbo states of Nigeria include Enugu, Anambra, Imo, Abia and Ebonyi states.

### **Igbo Folk Music:**

The Igbo folk music is media through which idioms and proverbs are learnt. They are channels through which noble ideas and vices are acknowledged or condemned, encouraged or discouraged. Our folklores often times warn, praise or entertain. For instance the tortoise in the tales is reflected as a trickster and at the end is jeopardized by its activities. The ability to listen through the tales teaches children to develop attention and listening skills, perseverance, endurance etc. Folktales stresses the importance of not breaking the social norms or been a deviant. If broken, the culprit is ostracized until he restores the broken order.

Folksong is a means of social control among the citizens and a way of stamping out communal vices. In some Igbo communities masquerades are used for the administration of justice in public functions. These masquerades are ritual masks which sing, look ugly, fearful, and full of charms and are unconcerned with the entertainment of their spectators. Nevertheless, Onyeke (2009) opined that;

There are masquerades that are merely concerned with entertainment of their spectators. They are noted for chasing young boys and girls around, singing and dancing. Some are known for their ability for disclosing all evils perpetrated in the village and the perpetrators. Sometimes they mention names of those involved and the very actions performed and the day it took place.

The poetic justice found in folksongs serves the purpose to reform and instruct the society. Music arouses feelings and the intellect in Igbo culture. Some folktales are structured in a way that they are chanted with imagery having messages emerging only with deeper reflection. Quoting Bascom (1965) he said; “they play very vital roles in the education of young ones in the transmission of cultural values, customs and moral codes, social and religious institutions.

The issue of hard work among the youths is not overlooked in the communal folksongs and tales. It emphasizes self-dependence and not been lazy. Traditional Igbo folksongs are adopted even today as a way of expressing opinions on important contemporary issues.

### **Types of Traditional Igbo Music:**

These are music that goes with folktales. Examples are folktales, funeral music, entertainment and praise songs, marriage music, music for manual labour,

communicative and announcement songs. Others include songs for Truck pushing and block moulding sarcastic music, religious music, Birth song, ceremonial songs, games and puberty songs.

### **Igbo Song**

Udara m too, nda

Too, too, too, nda

Nwunye nna muo nda

Zuta udara n'ahia nda

Racha, racha, racha nda

### **English Translation**

My father's wife nda

My apple tree grow, nda

Grow, grow, grow, nda

Bought apple from the market,

Ate, ate, ate, ate nda

### **Entertainment:**

Among the Igbos, entertainment music and praise songs are quite popular. They are used to give accolade to the brave – the great warriors, hunters, chiefs, wrestlers and great achievers. In modern times however, these songs have been used to extol politicians in times of political campaigns.

### **Funeral Music:**

Burial songs for special rites are accorded old people in the traditional Igbo Community. Examples include “Ukom” and “Esse” funeral rites of Ngwa and Mbaise people of Abia and Imo states respectively. They express their status, societal bonds and their arts. “Ukom” is for the funeral honour and worthwhile “Esse” is for the funeral rites of a worthy man through and through.

The Ahiajoku Lecture Colloquium (1991) typified the importance of funeral song in Igbo society. It is laden with meaning rites due to the dead and as the expression of social values. The music and drama interplay is usually an outpouring of grief, pain, the ugly and the beautiful.

Ugo bere n’oji efeliele	Eagle perch on the Iroko don’t rise
O dikwa onye iwe ji?	Is anyone annoyed?
Ugo bere n’oji efeliele o	Eagle perch on the Iroko don’t rise
O dikwa onye iwe ji e?	Is anyone annoyed?
Dede lawa o.	Elder brother go
O dikwa onye iwe ji?	Is anyone annoyed?

### **Music for Manual Labour:**

It is believed that music which is rendered during manual labour tend to energize the labourers to perform effectively.

Onye gbuwe achara onye gbuwe,	Let each one cut his grass,
Onye akpala ibe ya	No one should call
Onye ikoni...	His fellow a prisoner

### **Sarcastic Music:**

In Igbo traditional society, sarcastic songs are usually employed to ward-off deceivers who want to cause trouble among brothers. Such scornful language is not accepted in our community.

Onye agbugba laba o,	Deceiver go
Mu na nwanne m ekpeziela	I have reconciled with my brother
Agbugba laba o	Deceiver please go
Asi m gi laba o	I say go
Mu na nwanne m ekpeziela	I have reconciled with my brother

**Religious Music:**

Among the Igbos, this is occasional music and there is a strong belief that songs are used in achieving power control, for supplications and for spiritual upliftment. Others are used for invocations, magic and for healing purposes. Religious music in Igbo is, sacred and is regarded as having extraordinary power. According to Nzewi (1989) worship finds its most respectful and satisfying mode of address in music. Also Agu (1990) observes that;

The high priest and the diviners known for their usual practice of communicating with the deities through songs which are intermittently accompanied with rhythm instruments as they invoke or consult with the deities. Most of these songs are praise songs designed to glorify or praise the deities and consequently prepare grounds for easy communication with and favourable replies from them.

**Birth Song:**

The announcement of the birth of a child is sometimes encoded in the number of long hoots or calls made by the paternal grandmother. The sex of the

baby is often not announced directly but is encoded in reference to tools or trade depending on the prevailing occupation in the locality. For example, the palm – wine tapper’s climbing – rope (agbu –nkwu) would refer to a male child while broom (aziza) or trading basket would refer to a female child. In the example below from Imezi – Owa, Ezeagu Local Government Area of Enugu State the first two lines, after koko koyi, would be chanted to announce the birth of a male child while the last two would refer to a female child.

<b>Call</b>	<b>Response</b>	<b>Call</b>	<b>Response</b>
Koko koyi!	Koko koyi;	Koko koyi	Koko koyi
Chilu agbu-nwku	Koko koyi;	Take up the palm-wine Tappers climbing rope	Koko koyi
Welu mma olu,	Koko koyi	Take up the machete,	Koko koyi
Welu azuza ezu,	Koko koyi;	Take up the broom,	Koko koyi
Vulu alia ashua,	Koko koyi	Carry the trading-basket	Koko koyi

(Okafor, R. C. 2005:50)

### **Instruments of Traditional Music:**

In Igbo culture, certain musical (local) instruments are used to transmit messages of various degrees. Such include the giant slit wooden drum (Ikoro, uhie/Ekwe), flute (Oja) and metal gong (Ogene) ngelenge (Xylophone) etc. The sound of Ikoro for example travels very fast, conveying messages for a distance of 10 kilometers or more especially at night. The Igbo prefer sending their messages

at night with these instruments because they presume that everyone had returned home.

Songs accompanied with these instruments are used to disseminate information about the outbreak of diseases and to create awareness regarding Cholera, Malaria, Measles, and HIV/AIDS etc.

### **Conclusion:**

As a result of the enormous potentials of Igbo folksongs in this work, it should be seen as a means and path of re-orientating and rebranding our people to going back to our culture through the learning of our language. This is the basic foundation for the retention of our culture.

### **Recommendations:**

The author recommends as follows: That parents should be the first music teacher of their children at home. Let us go back to our roots.

Scholarships should be awarded to students who study music to encourage them.

Parents should buy Igbo novels which are rich in Igbo folksongs. Such books include Emenajo's *Omaalinze*, Ogbalu's *Mbediogu*, Odunke's *Ojaadili* etc. These are the way forward in the retention of Igbo culture and tradition.

### **Is College a Worthwhile Investment?**

Helen O. Au, Ph.D., Assistant Director of the Curriculum Research & Development Group (CRDG) in the College of Education at the University of Hawai'i at Mānoa

#### **Abstract**

The purpose of this research study was to examine the inner voice behind the students' and college graduates' perceptions on their investments in higher education. Case studies were used to answer the two research questions: 1) How do educational attainment and wages affect students' personal and professional satisfaction? 2) Do students perceive education as a worthwhile investment for life? How so and in what way? This study provided college students and graduates with a voice to describe their educational investment returns in terms of personal and professional satisfaction.

A review of the literature for this study examines past research on investment in education. The human capital theory suggests that education or training raises the productivity of workers by imparting useful knowledge and skills, hence, raising workers' future income by increasing their lifetime earnings (Becker, 1994). It postulates that expenditure on training and education is costly and should be considered an investment since it is undertaken largely to increase personal incomes. The human capital approach is often used to explain occupational wage differentials. Human capital can be viewed in general terms, such as the ability to read and write, or in specific terms, such as the acquisition of a particular skill with a limited industrial application. Becker's view emphasizes that human capital is similar to physical means of production, e.g., factories and machines: one can invest in human capital (via education, training, medical treatment) and one's output depends partly on the rate of return on the human capital one owns. Thus, human capital is a means of production, into which additional investment yields additional output. This theory is useful to study students' perceptions of their investment in college and their outputs during and after college. Output translates to earning, general advancement, and personal satisfaction in life.

Purposeful and snowball sampling were employed in this study. To execute case studies, interviews were conducted with nine participants on a one-on-one basis. The participants are all students and graduates from the University of Hawai'i System. Four of them enrolled in two-year community colleges and five of them enrolled in university undergraduate and graduate programs. The participants' real life stories were developed into categories, themes, and deep and rich descriptive dialogs for within-case analysis and the cross-case analysis, and ultimately they were used to answer the research questions.

The findings of this study revealed that students believed that higher education does provide higher personal satisfaction in terms of gaining valuable skills and knowledge, but does not necessarily provide professional satisfaction. Professional satisfaction represents both earning potential and their current wages and salary. Participants in this study shared that educational attainment does not guarantee higher earning because of differences in their program of study and other uncontrollable variables such as the economy. Nevertheless, they do perceive education as a worthwhile investment for life. The nine

participants unanimously believed that college made them feel more confident, better prepared them for life, taught them how to be better thinkers and how to approach and solve problems, helped them to gain technical knowledge and skills, enhanced their critical thinking, analytical, and social skills, and taught them more about themselves and their priorities in life. In general, the participants believed that all these skill sets that they earned in college were a worthwhile investment for life, as long as educational attainment and wages were not tied together. The participants simply felt uneasy about their current earnings and the loans that they had to take out to finance college.

## **ABSTRACT**

The Japanese Course of Studies requires engineers' ethics education in technical high schools (Ministry of Education, Culture, Sports, Science and Technology 2012). Therefore, we advocated engineers' moral education in reference to Murai's (1988) framework for moral education, a method based on the three types of knowledge that emphasizes knowledge of situations given that ethical code and rational judgment knowledge is taught in moral education in primary and lower secondary schools. We also developed and examined lessons and e-learning materials for conducting this program at our school. In addition, because students do not have work experience in companies, they do not understand the professional situation of engineers. However, in situational knowledge, a strong emphasis was given to making students understand the reasons for leaning toward certain corporate decisions. Even so, decision making from the perspective of consumers was necessary, and thus we taught judgment practices. However, a significant number of students were inclined toward corporate decisions out of self-protection when they understood the circumstances. In this regard, as a second type of situational knowledge, this research presents an understanding whereby the true purpose of an engineer is to take precautions against incidents and accidents through learning technical knowledge and initiating technological and systematic thinking and attitudes, which the profession calls for.

## **KEYWORDS**

Moral Education in Engineering, High School Education, Instructional Games, Gaming Simulation

## **INTRODUCTION**

The Tohoku earthquake and tsunami caused great damage to an extensive area of Japan, especially the serious incident of the tsunami striking the Fukushima Daiichi nuclear power plant. Although the tsunami was a

natural disaster, it provoked many questions related with the role of engineers: “Did they pay sufficient attention to safety measures?”; “Were their assumptions about incidents too lenient?”; “Did they try to conceal the situation?”

At the higher education level, ethics education for engineers is already conducted. However, in most cases, students acquire only knowledge about such incidents through case studies by tracing the decisions made in each case and their results. On the other hand, practices of case-method teaching, in which students study the framework and sequence of consideration and learn deduction methods, have also been advancing. For example, Harris et al. (1998) and Fudano (2004) were proponents of this method. However, they did not advocate special features for the ethics education of engineers with the exception of cases and methods presented in relation to engineers’ judgments.

In Japan, morality classes are conducted in primary and lower secondary schools once a week, while the upper secondary school curriculum does not regularly include these classes, because the objectives of moral education are assumed to have been achieved. However, the social needs for engineering ethics education in upper secondary schools have increased following several incidents caused by engineers. Accordingly, we developed a small course on moral education for engineers along with e-learning materials. Our approach emphasized the connection with the moral education in lower secondary schools and focused on helping students without prior work experience to understand why these problems occurred in companies (Endo & Matsuda 2008, 2009). According to our experience, the upper secondary school students tended to consider that they would never conceal improper activities because they were unable to understand an engineer’s situation in a company, which may lead to inappropriate decision making.

There are two theoretical backgrounds to our approach. The first is Kohlberg’s (1971) theory on the developmental stages of moral judgment. This theory hypothesizes the following six stages: 1) obedience and punishment orientation; 2) self-interest orientation; 3) interpersonal accord and conformity; 4) authority and social-order maintaining orientation; 5) social contract orientation; 6) universal ethical principles. Our target students were ninth graders (aged 15–16 years) who were considered to be at the fourth stage regarding general moral judgment problems. However, learning outcomes are situation-dependent and not easy to transfer to an inexperienced area, as mentioned above regarding an engineer’s moral judgment.

For this reason, the second theoretical basis referred to Murai’s (1987) method of moral education based on the three types of knowledge: ethical code knowledge, knowledge of situations, and knowledge of rational judgment. We assumed that our students had a sufficient knowledge of ethical codes and rational judgment. In addition, they had a sufficient knowledge of situations to infer the type of results brought about by decisions in their daily lives. However, when judging an engineer’s moral problems, students did not feel a moral dilemma because they did not have a sufficient knowledge of situations. Therefore, our previous studies (Endo & Matsuda 2008, 2009) focused on providing students with knowledge of situations, such as the knowledge of human relationships within a company, the pressure from superiors, and the social and financial obligations within a company. We thus considered the main aspect in moral education for engineers to be developing an understanding of the reasons behind incorrect decisions and helping them overcome these barriers. We found this approach to be adequate because the number of factors that can be considered corresponds to Kohlberg’s developmental stages.

In our previous approach, we asked students to choose between siding with the company or consumer when an incident arose. However, it is not adequate for engineers to consider the relationship between consumers and companies to be opposing, but rather they should understand it as coexisting and mutually beneficial as consumers receive the fair benefits of the technological innovation brought by companies. To this end, engineering acts will occur before any major accident. Students need to understand that engineers should make all possible efforts to prevent dilemmas by using technological and systematic thinking as well as domain

specific knowledge to foresee and evade problems, scientifically analyze the possibility of issues arising, and lead the situation to an appropriate and logical conclusion. In addition, engineers need to cultivate an attitude of self-questioning and find the optimal solution by studying new technology on their own account. This is the second knowledge of situations that we incorporated anew into this study. If students deem that an appropriate judgment is possible by using this knowledge, their self-efficacy may increase, thus heightening their motivation to start technological education.

On the other hand, teaching the additional knowledge of situations increases the number of lesson hours; our own course is restricted to four 50-minute lessons, and we assume similar limitations to be in place in most other schools. Therefore, it is necessary to review the current curriculum and improve the efficiency of lessons, including the development and revision of e-learning materials.

## **PURPOSE**

This research aimed to improve our moral education course for engineers. It emphasized the importance of understanding the judgment framework to avoid incidents and accidents in advance along with the need to use technology knowledge appropriately. To add new teaching content, some of the redundant material included in the current curriculum should be condensed or removed to guarantee the available teaching time. To this end, we revised or developed e-learning materials for every lesson.

## **REVISION OF THE LESSON PLAN**

The first lesson in our previous course was introductory. At first, a teacher presented the “Heinz dilemma” as a familiar topic. Thereafter, a case study of deception and concealment known as “Meat Hope Corporation’s Mislabeling Scam of Meat Case” was presented in order to determine the moral development stage of each student. The second and third lessons aimed to teach the knowledge of situations for engineers in a company. In the second lesson, the information and computer technology (ICT) “Company Manager” game (Endo & Matsuda 2009) was used to teach about the roles of a company manager, and in the third lesson, students enacted several roles in a computer assembling company, such as engineer, sales staff, and complaints officer, using the ICT “Engineer in a Company” game (Endo & Matsuda 2010) to teach how people influence each other. In the fourth and final lesson, another ICT game based on the Ford Pinto case was used to train students’ comprehensive judgment skills. After these lessons, each student was asked to choose a topic and report their opinions to the following questions as homework: 1) the incident; 2) the strengths and weaknesses of whistleblowing; 3) decision-making processes of a company engineer; 4) decision-making processes of a company manager.

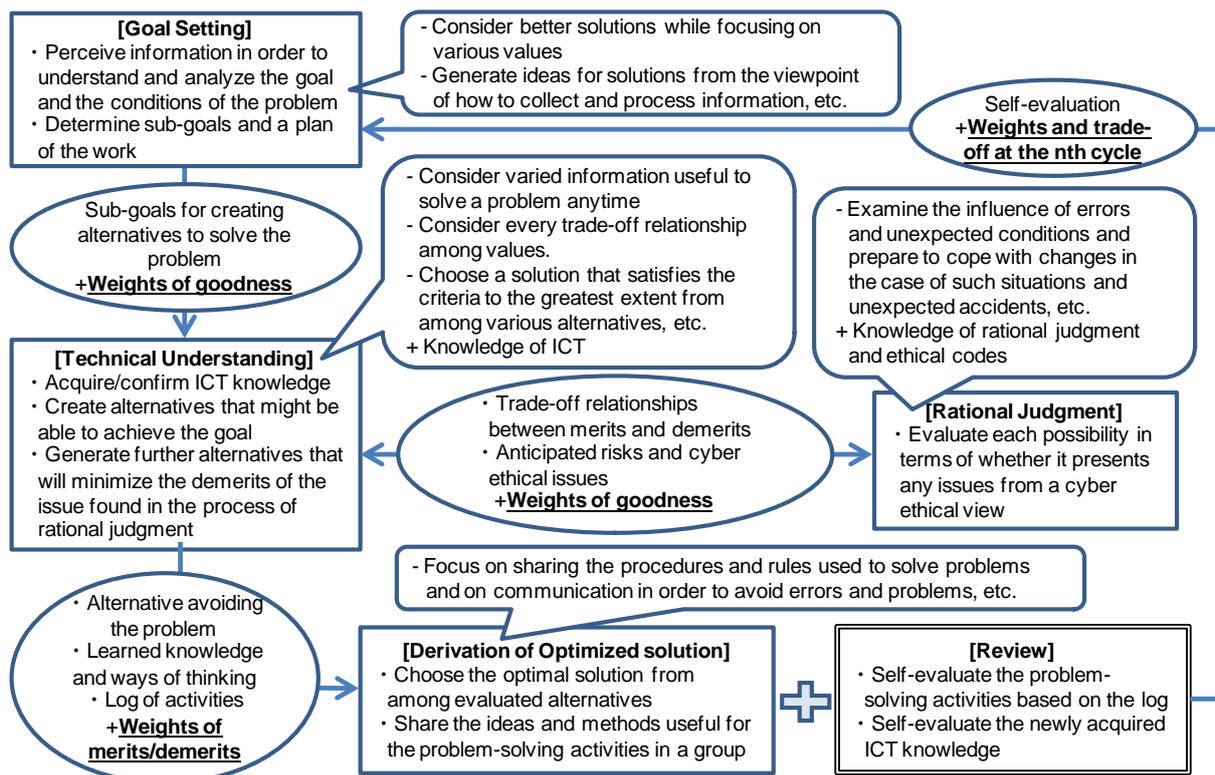

As the course emphasized teaching the first knowledge of situations, it needed to be improved by decreasing the overlapping and unnecessary contents. Firstly, as students are supposed to reach the fourth stage of general moral judgment, they do not need an introduction to the “Heinz dilemma.” In addition, we removed the “Mislabeling of Meat Scam Case” because it involved a concealment case in business ethics. Secondly, we merged the “Company Manager” and “Engineer in a Company” games, specifically by adding the role of company manager to the latter game. As a result, two hours of teaching time could be devoted to new material.

In the new curriculum, we used the first and second lessons to teach the knowledge of situations and the third and the fourth lessons to conduct judgment practices using the newly developed e-learning materials for every lesson. In the first lesson, the “Engineer in a Company” game was used to deepen students’ knowledge about companies. In the second lesson, the “Acquisition of Technology Literacy” game allowed students to recognize the importance of technological and systematic thinking as well as technological knowledge. In the

third lesson, a judgment practice game in the Science and Technology Communication field was used to ask students about the decisions of an engineer in a company after they gained an understanding of the first knowledge of situations discussed above. In the fourth lesson, the “Dilemma Block” game was the final exercise, especially aimed at practicing the avoidance of risks based on the second knowledge of situations. Afterwards, students submitted a worksheet as homework, as in the previous course, and confirmed the effects of curriculum improvement.

## COMMON DESIGN FRAMEWORK OF E-LEARNING MATERIALS

Hirabayashi and Matsuda (2011) proposed Figure 1 as a framework for developing game materials to cultivate problem-solving abilities in an Information Studies subject in upper secondary schools. This framework integrated Tamada and Matsuda’s (2004) method of cyber ethics education based on three types of knowledge, with Matsuda’s (2003) method emphasizing the usage of informatics and systematic ways of thinking. Moreover, this framework is similar to the design process of the International Technology Education Association (2007). Therefore, we expected to convert most parts of the framework into teaching materials developed for this study.

**Figure 1**

*Hirabayashi and Matsuda’s (2011) design framework of the e-learning game materials for Information Studies*

In the goal-setting process of Figure 1, students apply “informatics and systematic views and ways of thinking” to analyze and understand the goal and conditions of the presented problem. As the purpose of this process is to understand the problem by collecting information, we did not think it necessary to introduce “technological and systematic views and ways of thinking” instead of “informatics and systematic views and ways of thinking.” In the technical understanding process, students generated various alternatives to solve

problems using domain-specific knowledge. In this study, domain-specific knowledge corresponded to technological knowledge. However, students needed to choose the optimal technology while taking into account company pressures: new technology with a high risk but high return, or stable technology. To improve the trade-off relationship between risks and benefits, they had to consider how to prevent incidents. If problems were anticipated, they examined the technical understanding process and improved the alternatives. Subsequently, they chose an optimal solution by deriving the optimized solution process. After a series of activities, we let students review, self-evaluate, and provide feedback on the evaluation of the system. We decided to revise this framework while adapting the details to the contents peculiar to engineering ethics education.

### DESIGN OF THE TEACHING MATERIALS

#### “Engineer in a Company” Game

The “Engineer in a Company” game was developed to provide students with the first knowledge of situations. Previously, the story within the game only progressed chronologically from design and sales to the outbreak of incidents. The game was developed based on the design illustrated in Figure 2. In this game, each student played four representative roles in a company to experience each applicable dilemma: company manager, engineer, sales staff, and complaints officer. The game featured not only the pressures of human relations, but also the desire for success and promotion in each role. Moreover, in the technical understanding process, we presented a cost-benefit analysis to persuade the company manager and members.

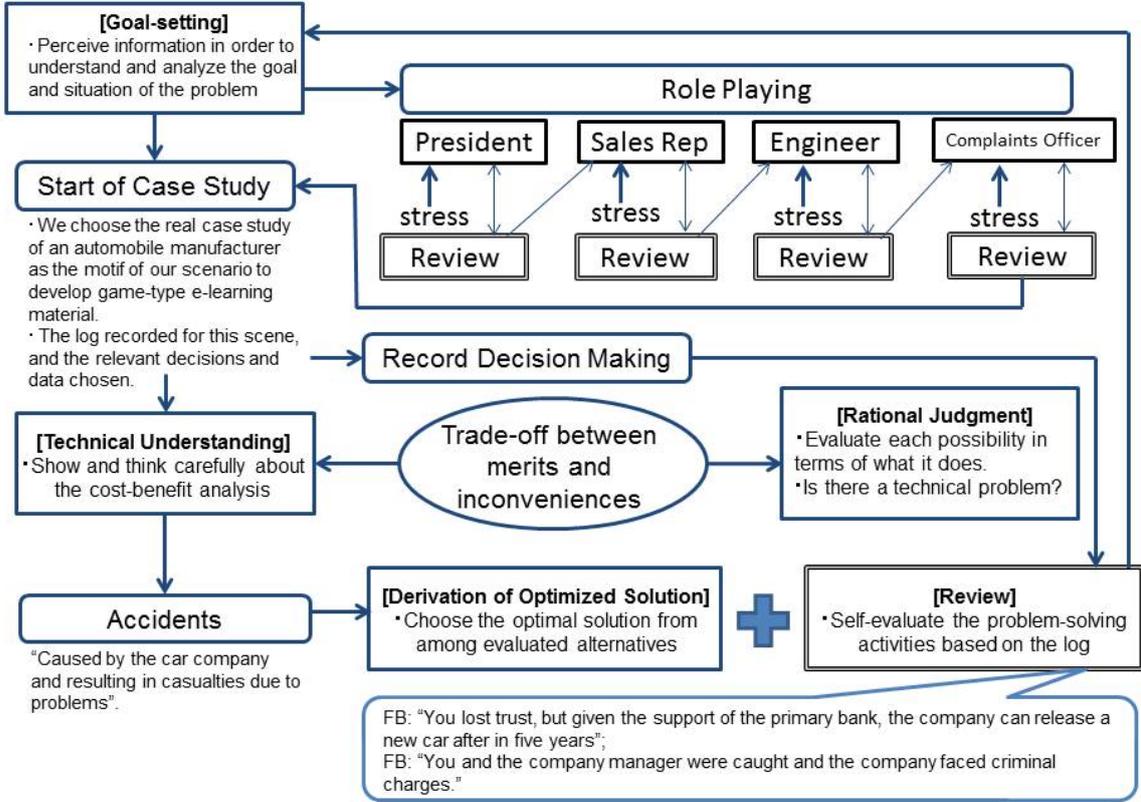

Figure 2  
“Engineer in a Company” game

The case used in this game is based on the fictional 1960s Ford Pinto case. The game begins with an explanation of the company's deteriorating situation due to the pressure exerted by the small car industry in Japan. At this point, students examine how engineers are perceived in society, which expects much of them and places a huge responsibility on them. During the goal-setting process, students experience four different roles in a company. As mentioned above, they take on the different roles by rotation and review their experiences of being a company manager, sales representative, engineer, and complaints officer. They were asked to make their own decision regarding the automobile sales, while considering how consumers would judge their decisions. Afterward, it became clear that a defect was found in the car under current development. Each student was thus required to make a decision as an engineer as to how to treat the defect, with the decision being recorded. In the next scene, an incident occurs. However, the identified defect does not manifest unless the car is hit from behind. In the technical understanding process, the game presents the result of cost-benefit analysis and prompts students scrutinize the trade-off between profit and safety. Through discussions in the rational judgment process, with questions such as "Does any technical issue exist?", students had to derive the optimized solution. They then decided whether to continue with the sale of the car despite the defect or to repair it at their own cost. After arriving at the optimum solution, the story unfolds with many incidents taking place whereby cars burst into flames followed by related lawsuits. Subsequently, the students undertook a simulation exercise to discover what happened to the company. At this point, the outcome differs based on the previous decisions made and recorded. In the reflection process, regardless of the pressure in the company, the right decisions need to be taken from a technical perspective, or otherwise, consumers turn their backs on the company.

### ***"Acquisition of Technology Literacy" Game***

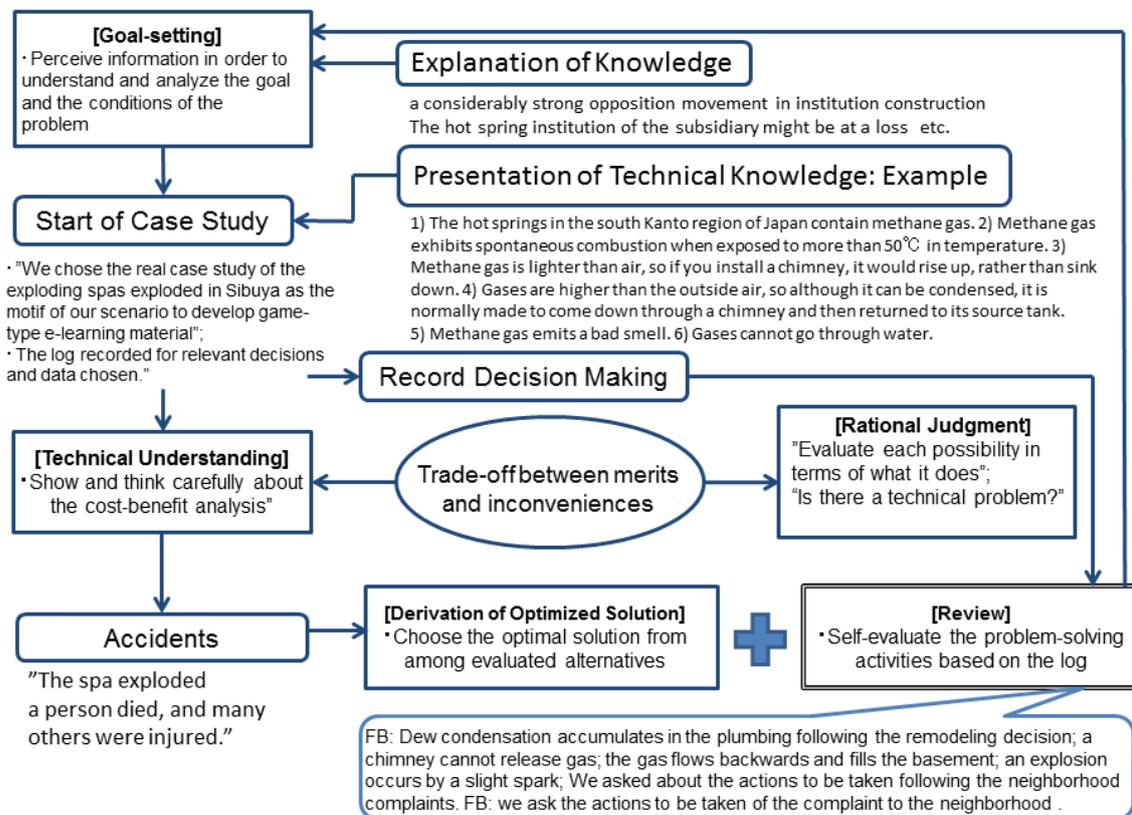

This game was newly developed for the second knowledge of situations. Technological and systematic views and ways of thinking, such as "generating ideas to foresee by a problem," "collecting information to avoid a problem," and "scientifically analyzing information and logically inducing a conclusion," are necessary attributes of engineers. In this game, we attempted to show the second knowledge of situations in the technical understanding process, and therefore, we adopted Figure 3 as the design framework following Figure 1.

The game scenario was a fictitious case study, modified from the "Exploding Spa Case in Sibuya." In the goal-setting process, the game begins with the following explanations: "There was a considerably strong opposition movement in the spa construction industry"; "Since the subsidiary of the spa company has a deficit, it wants to reduce costs as much as possible"; "The management of hot spring pumping is outsourced." In the technical understanding process, the game presents the following technical knowledge:

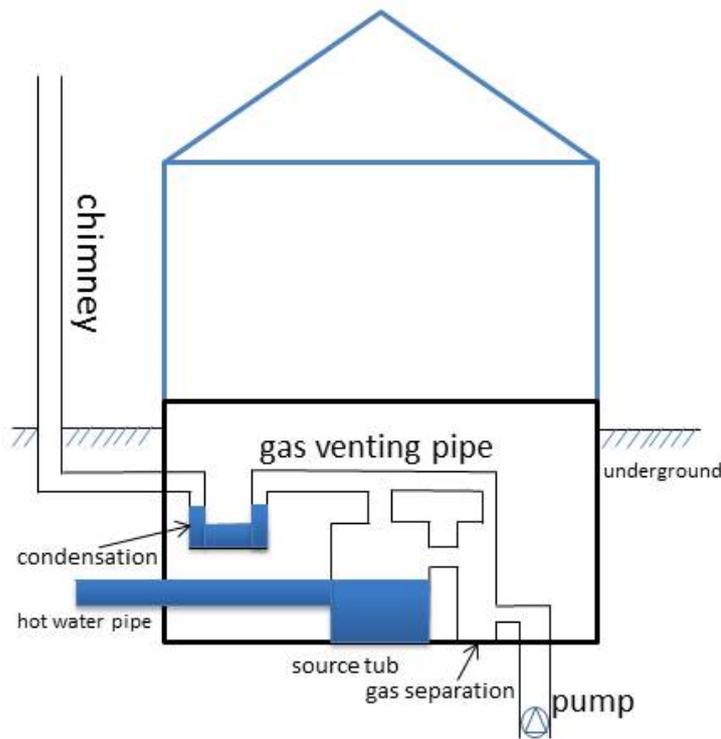

- 1) The hot springs in the South Kanto region of Japan contain methane gas.
- 2) Methane gas exhibits spontaneous combustion when exposed to temperatures exceeding 50°C.
- 3) Methane gas is lighter than air, so if a chimney were installed, the gas would rise up rather than sink down.
- 4) Although methane gas may be condensed because it is warmer than the outside air, it is normally made to descend a chimney and then return to its source tank.
- 5) Methane gas emits a bad smell.
- 6) Gases cannot pass through water.

In the next scene, a complaint was received about smells from the neighborhood, and the company decided to change the position of a chimney, moving it from the proximity of the neighboring houses to a higher position. To do this, the manager proposed to undertake the construction work not with the original design company, but with a cheaper repair company to redesign the chimney as in Figure 4. Here, the game presents cost-benefit analysis and prompts students to examine it closely while considering profit and safety trade-off. After considering a rational judgment process, students were asked to determine whether to conduct the

reconstruction according to the optimized solution process, while referring to their discussion in the rational judgment process. If they agreed to the reconstruction, dew condensation would accumulate in the plumbing, the chimney would not free the gas, the gas would flow backwards and fill the basement, and an explosion could accidentally occur with a slight spark. As the result, they simulated what would happen to the company. On the other hand, if students did not opt for the reconstruction, they were asked what actions should be taken in response to the neighborhood complaints. If this game were designed without an engineer underestimating the risk, the accident could be prevented. The students could switch to the correct piping without any cost if the engineers had the technical knowledge. With these teaching materials, students gained a second knowledge of the situations and understood their importance.

**Figure 3**  
 Flow of "Acquisition of Technology Literacy" game

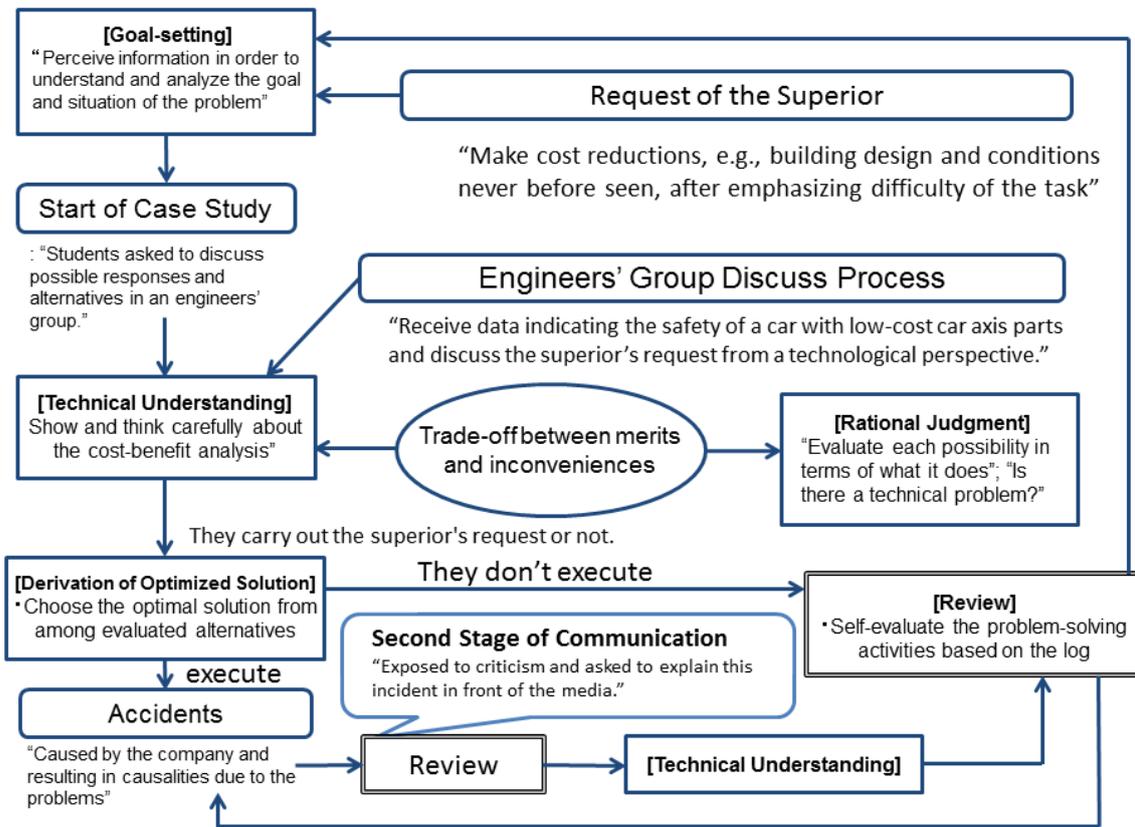

**Figure 4**  
*Accident: Spa explosion in Sibuya*

***Judgment practice in Science and Technology Communication***

Both of the judgment practice games were developed, leading to the constitution of Figure 5 based on the framework of Figure 1. This game was based on a fictional case using the motif of the “Mitsubishi Motors’ 2002 Recall Case” to create new judgment practice materials with Endo and Matsuda’s (2012) contents. Instead of explaining the story in chronological order, the game prompted students to perform problem solving according to the framework illustrated in Figure 1.

In the goal-setting process, a student as an engineer of company “M” was asked to decide whether to accept the request of a superior to make cost reductions. In addition, the recall would lose consumer’s trust in the company and be an immeasurable loss. This related to a recall cover-up. Thereafter, students were asked to discuss the possible responses and alternatives in an engineers’ group. In the technical understanding process, they received data indicating the safety of a car with low-cost car axis parts and discussed the superior’s request from a technological perspective.

Through the discussion in the rational judgment process, they were asked to determine whether to carry out the superior’s request or not. If they did so, people would be injured or die in accidents caused by the car’s axis or wheels falling off. They would be exposed to criticism and asked to explain this incident in front of the media. This was the second stage of communication. In the reflection process, they reviewed the situation and held another technical discussion on whether this result was predictable at the first discussion. If they could predict the problem, the game moved to the results section, but if they could not, they would go to the problem outbreak scenario. In this game, the students realized the attributes necessary in the situation, the knowledge required in advance, and the necessity of communication knowledge. We guided students to the conclusion with the two knowledge situations without covering anything up, and through technical knowledge and its practical uses, students were able to avoid the problem before it occurred. In short, this game uses a real case’s motif and judges whether students can make the correct decision based on the three types of knowledge.

**Figure 5**  
*Constitution of judgment practice*

### ***Dilemma Check Game***

The game scenario was a fictitious case based on the 1977 “Crisis of Citicorp Tower.” The contents of the game were based on the dilemma check game by Katto et al. (2012). The purpose was to prompt students to consider what is necessary to avoid a dilemma situation.

In the goal-setting process, the construction manager asks the company manager for the design and conditions of a building that no designer has ever seen. After emphasizing the difficulty of the task, the system asks the student whether to undertake the design as an engineer. As this game emphasizes the importance of learning “technological abilities,” in the case of choosing not to undertake the work, the system provided the following feedback: “because another engineer constructed the building, you have lost trust.” Moreover, we supposed the case in which students undertook work. They confirmed the laws established in the country where they were to undertake the work and then continued to the next scene.

In the technical understanding process, students considered what they needed to do to design the building, while meeting the constraints to avoid part of a church. In this scene, we emphasized that many alternatives were inapplicable and thus narrowed the solution down to the real case. In addition, we let students confirm that the design met the safety level of the country. With this in mind, they receive the advice from a senior engineer that “new risks would be introduced when using a new technology.” In the next scene of a meeting in the company, the system asked students to make a decision as to whether to begin construction after confirming that their designs met the safety standards of the country.

In the rational judgment process, students inquired into whether there is any technical problem or not more

closely.. Moreover, in the derivation of the optimized solution process, the optimum solution was derived. The building was built, but during the construction process, a problem arose. The game transited from the risk-prediction scene if students chose to stop the construction. Because they did not consider the diagonal wind affecting the building in the problem occurrence scene, they understood that there was the risk that the building would collapse in the event of a hurricane occurring once every 30 years. The engineer would lose his fame if the problem were announced, and at the same time, compensation for possible damages would have to be paid; therefore, students had to choose whether to conceal the problem or make a decision. The expansion of the story finishes here and transits from the scene warning about such a dilemma. Students reexamined the risk of the building as the technical understanding process. The game then transits from the result if they notice that it is dangerous “to consider only vertical wind,” but they return to the problem occurrence scene if they do not notice it, and the building is built. In the resulting scene, the game praises the student who did not cause a dilemma, with the game then finishing. In other words, in this game, we assessed whether right judgment is possible using three types of knowledge in a situation based on a real case study.

## **SUMMARY AND FUTURE PERSPECTIVES**

This research presented an understanding that the true purpose of an engineer is to take precautions against incidents and accidents through learning technological knowledge, technological views and ways of thinking, and the attitudes necessary in the profession.

In addition, traditionally, we used to cover cases and incidents that had occurred in real life. However, this can also cause inconsistencies with what is learned in order to gain knowledge of situations. Therefore, we designed fictional incidents to be used during teaching. The reason for this is that general incidents are just examples of failure. An experience on learning the actions to be taken and failed in is not necessary. An experience that does not fail is necessary. In addition, the game that we developed in this study was not yet in practice. We would very much like to consider putting this game into practice in the future.

Title: A Model For Developing Interculturally Aware Teachers

Name: Dr. Jodi Katsafanas

Affiliation: Slippery Rock University, Pennsylvania  
I am an Assistant Professor of Special Education

My Address: Jodi Katsafanas, 4307 Glades Drive Allison Park PA 15101

Email: [jodi.katsafanas@sruc.edu](mailto:jodi.katsafanas@sruc.edu) or [jodikatsafanas@aol.com](mailto:jodikatsafanas@aol.com)

**ABSTRACT:**

The need to graduate well-prepared teachers to staff our culturally diverse and globally connected classrooms is of significant concern to all US teacher education programs. A model is presented in this poster for supporting intercultural field experiences that includes modeling culturally responsive teaching in the college classroom, introducing skills to learn about one's own cultural identity and that of others, and leading reflective classroom discussions. These activities, coupled with intercultural field experiences whether internationally or in US cultural minority communities can dissolve pre-service teachers' misconceptions and stereotypes and develop increased intercultural awareness by enhancing students' knowledge, skills and dispositions about cultural diversity. These activities assist in the development of interculturally aware teachers who will be effective teachers for global learners in global classrooms.

ABSTRACT:

Where does ‘our healing’ come from? The voice of the mainstream speaks on ‘best practices’ though it’s actual content is based on ‘non-traditional’ ‘non-indigenous’ ways of being applied to Alaskan Native peoples. How do we respond to our greatest need? That is our healing!

The National Resource Center for American Indian, Alaskan Native, and Native Hawaiian Elders in their paper ‘Establishing Best Practices for Elders’ (Segal, Smith, Easley, Kanaqlak, 2004) suggests “undertaking the physical, socio-cultural and economic factors involved in the life of Alaskan Native Elders. This means creating approaches that are meaningful and acceptable to the population served. Key components mentioned are the involvement of Native staff, ceremony, traditional arts and crafts, individual and group counseling (tundra walks), enhancement of self esteem and involvement of elders to name but a few.

We know that bringing together Youth and Elders serves a greater purpose; conferences such as this and forums such as the Alaskan federation of Natives who addressed the issues below in dialogue form can begin our journey to healing:

“Warriors for a New Era: Challenging Alaska Native Youth to Repower Their World,” is a series of five interactive community forums. During each forum Alaska Native youth are given a chance to voice their opinions and seek the advice of elders and Native youth leaders.

The first forum, held Oct. 19, was called “Ancient Wisdom for Modern Times: Kickin’ it With the Elders.”

(The Northern Light, 2009)

The Alaskan Native Heritage Center Offers a High School Program that provides our at-risk youth (who have had significant trauma experiences and those at –risk of school suspension/expulsion) the opportunities to be steeped in traditional and character building experiences which have been shown to affect not only the acquisition of traditional skills but the growth, development and character of the youth that attend. Programs such as these are undeniably critical to the need we have to provide the ‘best’ for our communities.

How the two aspects mentioned above intersect is what this presentation seeks to respond to. Can the experiences of bringing youth and elders together in such a structured, positive and meaningful way serve as a conduit to ‘healing’ on both sides? Experience and evidence tells us this is indeed not only feasible but occurs within programs such as these through the interaction of teaching and learning; listening and sharing as well as hearing and feeling.

*“When I teach the youth, I am not just sewing and beading; I hear kids talk. They are tired of the drinking; the lack of role models; and they share their stories. Their voice can make us ashamed and can heal us”* (Elder, 2011)

Simultaneously the Cook Inlet Tribal Council (CITC) in addition provide a setting where new educational skills and access to technology through gaming experience provides a context for students to know about who they are.

Schoolyard is a new afterschool educational program for Alaska Native and American Indian youth ages 12–19 that infuses video game design and development into its curriculum to engage students in STEM-related learning.

The goal is to increase middle school engagement, and high school graduation and GED attainment rates, while teaching entrepreneurial employment skills through gaming exploration and development. Connecting students with their culture and heritage is also an important focus of the program.

“Our team is very excited about the opportunity this program will offer our Alaska Native youth, and the positive impact it will have on their lives; Not only are we providing students with the skills and support to keep them engaged with school and get them back on track, we are already seeing an interest in higher education,” (said CITC Youth Opportunities Program Coordinator)

Using the online gaming tool Gamestar Mechanic, students spent Spring Break this year learning to design and create their own video game as they developed skills like critical and systems thinking, creative problem solving, and writing and storytelling—all in a collaborative learning environment.

Schoolyard also teaches students how to use Global Positioning Systems (GPS), and provides field trips in the community, like the Anchorage Museum; the Alaska Native Science and Engineering Program (ANSEP); the University of Alaska Anchorage (UAA); and the Alaska Native Heritage Center.

Specific objectives of this presentation are to hear the *authentic voice* of youth, their counterpart Elders and Master teachers in regards to how the reciprocity of ‘healing’ through the process of learning traditional arts has manifested. Paying close attention to the children’s experience and listening to their needs can be a conduit for change within our community. Our children watch us and learn from us. Their anger; their hurt is ours and can lead us toward healing through the exchange of our uniqueness and the undeniable desire to make differences and strengthen our identity.

Participant outcomes include (I) Learn the perspectives of youth that have participated in the High School Program and their counterpart Elders (II) Hear how ‘reciprocal healing’ has resulted from Youth and Elder interaction (III) Discuss the ‘need’ for increased provision for programs that bring Youth & Elders together for ‘healing’

This session discusses themes revealed from interview and observational data of adolescent’s students within the High School program and the Elders/Master teachers they work with. The themes reveal the capacity for such programs to address what we call ‘reciprocal healing’. Reflections of possible next steps to increase as well as facilitate this, limitations, and future research will be shared.

ACCEPTED ABSTRACT WITH SUBMISSION ID NUMBER 182

**Title of the paper: Nigerian pre-service Science Teachers' Self-perceptions of acquired pedagogical knowledge and skills after teaching practice exposure**

**Topic Area: Science Education**

**Presentation format: Paper Session**

**ABSTRACT**

*The purposes of this study were to investigate the teaching competencies acquired and those not acquired by science teachers-in-training after exposure to teaching practice. The investigator used a fifty-six item questionnaire, labeled as Perception of the Acquired Pedagogical Knowledge and Skills Scale (PAPS), to elicit information from two hundred and ten pre-service science teachers in south-west geo-political zone of Nigeria. A panel of (5) science educators determined the content validity of the questionnaire. The sample of science education undergraduates were drawn from three (3) randomly selected universities using stratified random sampling technique. The pre-service teachers were required to rate their performance level on each teaching competence on a five-point Likert scale ranging from "high performance level" to "no performance level" with "average performance level" as the pivotal point of the scale. Following that, the mean of each competence item were computed. Any competence statement that had a mean rating of less than 3.00 was considered to be of low performance cadre, since the mean value of the scale was 3.00. The findings of the study indicate that most of the teaching competencies that teachers-in-training have not acquired fall under theme 1 (planning instruction), theme 2 (implementing instruction), theme 3 (evaluating instruction), and theme 7 (integrating technology and media in the classroom). The study also revealed that pre-service science teachers demonstrated proficiency in reinforcing learning, managing classroom, building professional links with colleagues and understanding learners' development. Based on the findings of this study, it was recommended that the principle of collaborative approaches for teacher learning should be incorporated into the teacher training program and that regular follow-up workshops aiming at developing Pedagogical Content Knowledge (PCK) of pre-service science teachers should be scheduled as needs arise.*

# **Creating English Comfort Zone for LEP Students**

## Abstract

Extracurricular activities can contribute to help LEP (Limited English Proficiency) students to improve English. Teachers need to create English comfort zone so that students can have more confidence to speak English. The researcher encouraged students to have more chances to meet native speakers and participated in the extracurricular activities. The result of the study showed students became more confident to express themselves in English.

Key words: LEP (Limited English Proficiency), extracurricular activities, English comfort zone, affective filter

## I. Introduction

How can English teachers create comfort zone for LEP (Limited English Proficiency) students? Most LEP students are nervous when they have to communicate in English. It is important for LEP students to break their mental block which hinders communicating in English. It is teachers' job to provide more comfortable environment so that LEP students can express themselves without any burden or mental block.

According to Johnson (2003), in communicative language teaching, language is not merely a set of forms. Language should be used to convey information. Some Korean students have difficulty to communicate in English with native speakers. They have memorized certain forms but they are not good at applying these forms in real communication. English is more than short communication in fragmented patterns. Using fragmented and unnatural recorded conversation, students cannot carry quality communication. In the current society, students should be able to express their thoughts and expressions in English. They need to learn natural communication strategies which can be used in the English speaking countries. To

accomplish these goals, the authentic materials dealing with real life situation can be used to help students. When students are exposed to the authentic and natural environment, their affective filter will be lowered. In this paper, the researcher is going to share how to create English comfort zone for LEP students.

## II. Creating English Comfort Zone

LEP students are supposed to learn better when they are exposed to the English comfort zone. Extracurricular activities using mentoring program, mass media and mobile phones can be used to motivate LEP students. Interdependence hypothesis supports that when students have enough background knowledge through reading books in their mother tongue, they are willing to express their opinion in English. The result of this study will show that students have more positive attitude in learning English when authentic materials are used in and outside the classroom. When English is used as an instrument to share their own culture and their perspective about the world, students can create meaningful small talk and carry successful communication in the real life situation.

Teachers need to encourage students and give positive feedback to the students. Applying Pygmalion effect shows that when the teachers expect positive results from the students, they turn out good result. It is important to have dynamics between teacher and students' power relationship in the classroom. Education means positive change or transformation. Positive comment or feedback by the teacher can influence the students. Since the researcher is teaching lower level of students in academics, the positive relationship with the students plays an important role in the classroom. The role of the teacher is crucial for the LEP students. LEP students lack confidence about themselves. Auerbach (1992) suggests that teachers should facilitate students to discover of their own answers. Thompson (2013) mentions that the teachers should be guide, coach and learning partner.

In 2010, Howon University made one comfortable lounge for students to help their English. In this English comfort zone, students were encouraged to use English only. English comfort zone is a place where students can communicate with native speakers. Various extracurricular activities are conducted in the English café. LEP students also go to the English cafe to practice English. Coffee or other beverages are sold with reasonable price. Students can enjoy coffee talk with native speakers. Students are supposed to send the instructor their photos with a native speaker to prove that they have been to the English café to practice English. There are children's story books, game boards, karaoke machine, and TV in the English café. The following extracurricular activities are held in the English cafe during the spring and fall semesters.

- a) English pop song contest
- b) English essay contest
- c) Debating in English
- d) Basic English class
- e) Story telling contest

It is crucial to provide an environment for students to use English. English Pop Song contest is an effective way to encourage students. When students sing songs in English, they can learn the useful expressions naturally. At the English cafe, native English faculty members take turns to help students every day. Sometimes, students play games with native speakers or get some help from the native English faculty members. By doing these extracurricular activities, students can lower the barrier and learn how to communicate in English. One student who has limited English proficiency said that he was able to use his body language. He was pleased when he was successful to communicate with native speakers. That is the way this student fulfill his goal. When students get across the meaning to the native speaker, they can feel fulfillment. One to one conference with professor helps students to gain confidence.

English speech contest was little bit challenging for LEP students since students felt difficult to write their own stories in English. It was beyond their ability to write something in English. Instead of speech contest, English story telling contest was conducted. Some easy children's stories were provided. It was easier for LEP students because they could practice telling stories in English.

### III. Meaningful Communicative Activities

The following authentic materials can be used to motivate LEP students. Through title of the songs, students can learn useful expressions. Students can have long term memory since the song titles are memorable. When the titles show the meaningful situation, students tend to remember longer and they can use titles of the songs in oral communication and written communication. Even one sentence of the lyrics can be meaningful to the students. The example of the title of songs and movies are as follows:

“I am a woman in love.”

"Friday I am in love."

“I was born to love you.”

“You raise me up.”

“I have a dream.”

“Man of Steel”

“The Dark Knight Rises”

“Iron Man”

“It is complicated”

It will take time to memorize all the lyrics of the song. However, students can learn some lines from the lyrics or libretto of the musicals such as “Miss Saigon” or “The Phantom of the Opera”. When teachers use films or songs in creative ways in the classroom, students can learn English effectively.

The examples of meaningful communicative activities are as follows:

- a. Students can make a movie about school life with a group of four. Group work creates more positive outcome. When students use English as an instrument to communicate, they can expect more meaningful learning. At the end of the semester, students' produced movie can be shared in the classroom. Each group will present their movie about 3-5 minutes. By watching other classmates' work, they can get positive insight and reflect themselves.
- b. Showing inspirational video from YouTube is one of the effective ways to inspire students. There are several inspirational videos available in YouTube. Students can be inspired by the video of Lena Maria who became worldwide singer even though she was a physically challenged person. They can learn valuable lessons about how to overcome obstacles in life.
- c. Sharing Korean culture and Korean wave can be used since students can use their background knowledge about their own culture. Students will have lots of things to share about Korean wave. Since they know about Korean wave well, students feel comfortable to talk about Korean wave in English.
- d. Sharing ethnic food recipe can be used. Cooking is one of the wonderful ways to talk about their own country. Kimchi making can be useful activity. Students can talk about recipe in English. Teachers need to provide some guidelines so that students can keep in the track. As a follow-up activity, ask students to write down the recipe of their favorite food.
- e. Kakao is an application which we can use in the Smartphone. Smartphone can be an excellent tool to study English. There are several useful programs which can be downloaded freely. Students can take advantage of using these applications to improve their English. It is strongly encouraged to use digital gadgets for their development. Smartphone changed the communication style in the 21 century. Students use more phone rather than computer because of the

accessibility. By creating group chat in Smartphone, professors can have direct communication with students. Teachers can use Kakao smart ways to help students.

#### IV. Conclusion and Implication

English comfort zone makes LEP students more comfortable in using English. In this paper, the researchers suggested to create English comfort zone for LEP students. Using extracurricular activities, students will have more chances to use English without any mental block. When LEP students have lower affective filter, they can have more productive outcome. The researcher shared various effective ways to help students. These methods can be modified and used in the classroom. In the further research, it is recommended to provide more specific lesson plans to help students better.

**Title:** Higher Education Policy in Brazil: Recent Developments

**Topic area:** Higher Education

**Presentation format:** Paper Session

**Description of presentation:** The paper describes the state of higher education in Brazil and discusses its future perspectives and the factors that may limit its ability to improve the quality of higher education. Among the limiting factors, most concerning is the decreasing performance indices of secondary public school students.

## Higher Education Policy in Brazil: Recent Developments

### Abstract

In recent decades, Brazilian education has grown at a very brisk rate, but many fear that the larger availability of higher (tertiary) education has come at the cost of quality to a large segment of its population. The government has made a serious effort to increase access to education at all levels and has set up a pervasive evaluation system to monitor school performance. This study, therefore, examined factors that affect access to quality education in Brazil. Methodologically, the study looked at data available from government and international sources along with other qualitative data about educational policy. The results showed that 86.7% of pre-tertiary students were going to free public schools, where performance levels have been declining, while 13.3% were going to private schools where performance levels have increased significantly over the years. At the tertiary level the proportions were exactly the opposite: 75% were enrolled in private educational institutions and 25% in public ones. At this level the public tertiary institutions are better than the private. The educational policy is thus still failing to provide quality education to the larger and poorer segments of Brazilian society.

Keywords: Higher Education, Brazil, Quality of Secondary Education, International Comparisons

### Introduction

Brazilian education, particularly in the last decade and a half, has grown at a very brisk rate. The significant increase in the higher education system has provided opportunities for a larger share of the population to enjoy university education. Many, however, point out that the full potential from growth has not been achieved because the larger availability of higher education came at the cost of quality, and many newer colleges are feared to be substandard. This in itself is an important problem; but it is also feared that such substandard schools have a common variable. They tend to be schools where the poorer students are enrolled.

This study, therefore, attempts to answer the question of whether Brazil has been able to provide quality education to all its citizens seeking higher education. Methodologically, the study looks at data available from government and international sources as well as other qualitative data and tries to see whether there is evidence of inequality in higher education. The study is exploratory and as such looks at facts from different perspectives and provides preliminary interpretations.

#### *Basic structure of Brazilian higher education*

For the purpose of this study, the higher education institutions are referred to as Tertiary Educational Institutions (TEIs). With regard to legal status, TEIs can be classified either as public or private. Public TEIs are created and supported by public funds. They exist at the federal, state and municipal levels. Private TEIs are created and funded by private organizations, and can be further divided into for profit and non-profit organizations. The private non-profit TEIs are generally created and

supported by religious and philanthropic organizations. In terms of relative size, the public TEIs are generally larger, followed by the private non-profit institutions, and finally by the smaller private for profit TEIs. The average number of students for each type is shown in Table 1 below. Although small on average, the private for profit TEIs have the largest proportion of enrolled students. By 2008, the for-profit TEIs had roughly half of all students, with the other half equally divided between public and private non-profit TEIs.

Table 1. Distribution of tertiary educational institutions (TEIs) and students by legal status, 2008.

Legal status of TEIs	TEIs		Students		Average # of students
	#	%	#	%	
Public	236	11%	1,273,965	25%	5,398
Private for-profit	1,579	70%	2,448,801	48%	1,551
Private non-profit	437	19%	1,357,290	27%	3,106
Total	2,252	100%	5,080,056	100%	2,256

Note: Data from the Instituto Nacional de Estudos e Pesquisas Educacionais (INEP) 2009, Tables 1.1 & 5.1.

From the perspective of the academic activities carried out in the TEIs, they can be classified into three categories: colleges, university centers, and universities. Colleges are institutions that need to submit a request to the Ministry of Education every time they want to create a new program or expand its capacity. University centers have the autonomy to create new programs or to expand their capacity but do not need to carry out research activities. Universities have full autonomy to create new programs, new campi, expand capacity, but are required to carry out research and extension activities, and to have at least two doctoral programs and four masters programs (Ministério da Educação of Brazil 2010, Art. 3). Universities are the largest among them with an average size of 14.7 thousand students. University centers have an average size of 5.8 thousand students, and colleges have about 850 students on average (See Table 2).

Table 2. Distribution of TEIs and students by category, 2008.

Category of TEIs	Share of total # of TEIs	Share of total # of students	Average # of students
University	8.1%	52.9%	14,676
University centers	5.5%	14.2%	5,811
Colleges	84.9%	32.1%	854
Others	1.5%	0.8%	1,204

Note: Data from INEP 2009, Tables 1.1 & 5.1.

## Significant Growth of Higher Education

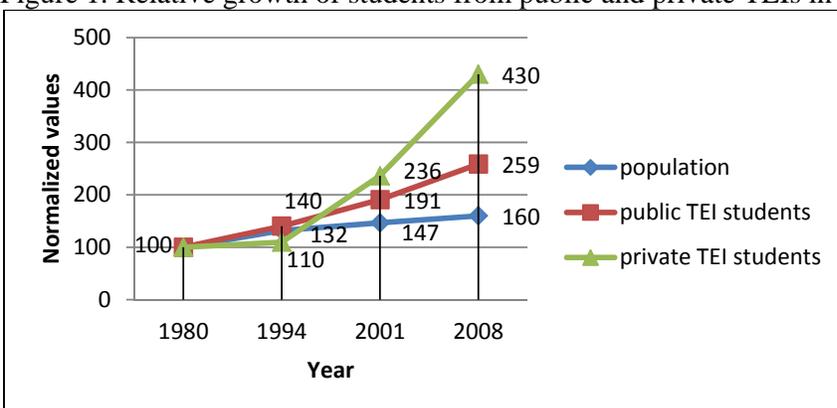

### *Growth of Student Enrollment*

In the late 1980s, changes implemented by the new Brazilian Federal Constitution of 1988 demanded that government spending on education should represent at least 18% of the annual budget of the Federal Government and at least 25% of the State and Municipal Governments (Presidência da República 1988, Art. 212).

In the public higher education sector these Constitutional changes showed positive impacts, ensuring the expansion of enrollment opportunities in public colleges. Figure 1 below shows a 40% increase in enrollment at public TEIs from 1980 to 1994, slightly above the 32% population growth.

The overall student enrollment, however, rose by only 21% due to a very small increase of 10% of private TEIs over the period. Actually, the number of TEIs had declined by 4%, from the normalized value of 100 to 96.

Figure 1. Relative growth of students from public and private TEIs in Brazil – 1980-2008

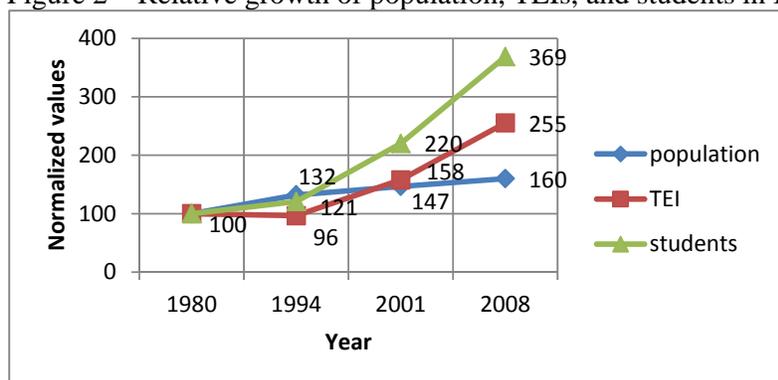

Notes: 1. Values normalized to 100 in 1980.

2. Data from the Instituto Brasileiro de Geografia e Estatística of Brazil (IBGE) 2008; INEP 2000 & INEP 1995-2009.

Only after 1994, with the end of hyper-inflation, initiatives for education finally started bearing some fruit. Since then, student enrollment more than tripled, and the number of TEIs more than doubled (See Figure 2).

Figure 2 – Relative growth of population, TEIs, and students in Brazil.

Notes: 1. Values normalized to 100 in 1980.

2. Data from the Instituto Brasileiro de Geografia e Estatística of Brazil (IBGE) 2008; INEP 2000 & INEP 1995-2009.

### *Public vs. Private TEIs*

Table 3 below shows that, while the share of public TEIs and their students grew from 1980 to 1994, it decreased sharply after that. From 1994 to 2008, the public TEIs fell from a quarter to one tenth of the total TEIs, and the number of students diminished from almost half to a quarter of the total number of students. On the other hand, the economic changes brought by the 1994 Plano Real -- which ended more than a decade of extremely high inflation -- set a new period of enormous expansion of the private TEIs. In 2008, they comprised 90% of TEIs, and had 75% of the students in higher education.

Table 3. Share of public and private TEIs and their students - 1980-2008

Year	Shares in # of TEIs		Share in # of students	
	Public	Private	Public	Private
1980	23%	77%	36%	64%
1994	26%	74%	42%	58%
2001	13%	87%	31%	69%
2008	10%	90%	25%	75%

Notes: TEI and student data from INEP 2000 & INEP 1995-2009.

## **Factors Affecting Quality of Higher Education**

### *Government Expenditures on Education*

Table 4 below shows that Brazilian educational expenditures rose significantly from 2000 to 2006, increasing its participation in the GDP by about 50% (from 2.6% in 2000 to 3.8% in 2006). However, Brazil still had one of the smallest shares (4.9%) compared to OECD countries in 2006.

Another notable aspect in Table 4 is that most of this growth came from pre-tertiary education, showing some evidence that the Fourteenth Amendment to the Constitution (Presidência da República of Brazil 1996, Art. 5), passed by Congress in 1996 and requiring that at least 60% of government spending on education be directed to basic education, was showing an impact on increased access to education.

According to the OECD data for 2004, the share of total educational expenditures held by tertiary education was 17.2% for Brazil, smaller than 29 out of 30 OECD countries (OECD 2007, Table B1.2.). In contrast, Brazil spent 73.7% of its resources on primary and secondary education, a share that is smaller than only 2 of 26 OECD countries. These numbers show a clear effort to improve conditions for pre-tertiary levels of education, but if the efforts are going in the right direction why is it that Brazil is still lagging in the Programme for International Student Assessment (PISA) tests? In PISA 2006, Brazil scored around the bottom of the list of 57 participating countries, ranking fourth from last in Math (OECD 2007a, p. 53).

Table 4. Expenditures on educational institutions as share of GDP.

Country	2006			2000			1995		
	Pre-tertiary education (%)	Tertiary education (%)	Total (%)	Pre-tertiary education (%)	Tertiary education (%)	Total (%)	Pre-tertiary education (%)	Tertiary education (%)	Total (%)
Brazil <sup>2</sup>	3.8	0.8	4.9	2.6	0.7	3.7	2.6	0.7	3.7
Japan	2.8	1.5	5.0	3.0	1.4	5.0	3.1	1.3	5.0
Korea	4.3	2.5	7.3	3.6	2.3	6.4			
Mexico	3.8	1.1	5.7	3.5	1.0	5.0	3.7	1.0	5.1
Portugal	3.6	1.4	5.6	3.9	1.0	5.4	3.6	0.9	5.0
United States	4.0	2.9	7.4	3.9	2.7	7.0	3.8	2.3	6.6
OECD mean for 24 countries	3.6	1.4	5.5	3.5	1.3	5.2	3.7	1.3	5.4

Notes: 1. Data from Organization for Economic Cooperation and Development (OECD) 2009, Table B2.1.

2. Data for Brazil is only for public expenditures.

One explanation is that, compared to OECD countries, Brazil has a very small fraction of its students in the tertiary educational institutions (TEIs) and a relatively large proportion in pre-tertiary education. In 2004, only 2.6% of all Brazilian students were in TEIs. These proportions for the OECD countries ranged from 7.5% for Mexico to 28.8% for Greece (OECD 2007, Table B1.2.). As a result, tertiary education in Brazil (represented in these statistics only by public TEIs) actually received a disproportionately larger amount of resources per student than pre-tertiary education. For instance, on a per student basis, Brazil spent US\$ 8,903 per student in tertiary education, while

spending only US\$1,033 per student in secondary education, and US\$1,159 per student in primary education. When compared to the OECD countries, only Turkey (US\$1,120) spent less than Brazil in primary education. In secondary education, even Turkey (US\$1,808) with the lowest per student expenditure among OECD countries spent almost twice as much as Brazil. In the tertiary education (excluding R&D activities), Brazil spent US\$8,903, a per-student amount that is only smaller than six OECD countries (OECD 2007, Table B1.1a.).

Therefore, when expenditures per student are considered, the situation of Brazilian public pre-tertiary education is found to be wanting, while public tertiary education is striving and receiving resources at a level competitive with the highest investing OECD countries. This may help explain why it has lagged so seriously in PISA tests, while performing well in scientific production. According to data collected from Thomson Reuters by the Ministry of Science and Technology of Brazil, Brazilian world share of articles indexed by Thomson doubled from 1.35% in 2000 to 2.63% in 2008 (Ministério da Ciência e Tecnologia of Brazil (MCT) 2009, Table 5.5.).

#### *Improvements in the Evaluation System*

During the early 1990s, public TEIs were a source of concern, because there was a perception of lack of accountability in their use of resources. First of all, they were structured in such a way that they did not need to respond to any external public scrutiny. For instance, in an interview to *Revista Estudos Avançados* in 1992, Roberto Lobo, then the Rector of São Paulo University, mentioned that the collective body comprised of the professors in a department had complete power to run the department any way they wanted. As a result, departments were too often run in the interest of the professors and not of the students or the society at large (Lobo 1992).

Another example of self-serving behavior was described by Rondon when the State of São Paulo decided to grant autonomy to the state public universities by the 1989 amendment to the State Constitution. Nine years later, in 1998, at the State University of Campinas, the most notable result of giving autonomy was the drastic change in the ratio of wage payments to total expenses which grew from 64.4% in 1989 to 91.8% (Rondon 2002, p. 119).

Responding to such concerns, Congress enacted the law instituting the National Exam for Undergraduate Programs (ENC) in 1995. The ENC was a mandatory national test for all college students graduating in a specific year. The average of the student grades would represent the grade of the particular Program, which after sorted in decreasing order, would “neatly” rank all institutions from A to E, according to the following distribution: A (top 12%), B (next 18%), C(next 40%), D(next 18%), and E (bottom 12%).

The ENC shook up the Brazilian universities and their students. For various reasons, there was significant and lasting resistance to the exam. Even in 2001, five years after it was started, there was much discussion about boycotting the exam (FolhaOnline 2001). A study by the Instituto Nacional

de Estudos e Pesquisas Educacionais (INEP), analyzing data from 1997 to 2004 (which was the last year ENC was administered), concluded that the rate of absence was small, ranging from 5.4% to 9.2% during the period. According to these authors such small numbers suggested that, in spite of much hype in the media, there was no evidence of boycott in the exams (Leitão et al. 2010).

The boycotting, whether large scale or not, was only one of the problems. Some institutions began to act strategically, offering prizes to those who had gotten the best grades or giving tuition discounts (FolhaOnline 2001a). Private universities continued to argue that solely evaluating institutions on the basis of student scoring ability on a standardized test could not measure the “value added,” i.e., the learning being provided by the institution that took in a relatively weak student.

In 2004, a new system with a broader and more diverse vision of evaluation was set up. The National System for the Evaluation of Higher Education (SINAES) was established on April 14, 2004 (PRB 2004), and evaluated institutions from several perspectives as indicated in Table 5 below. Each of these dimensions received a score, which would lead to a final institutional score known as IGC and classified TEIs in 5 groups ranging from 5 (excellent) to 1 (poor).

Table 5. Criteria for evaluating tertiary educational institutions (TEI)

Criterion	Weight
Mission and the Institutional Development Plan (PDI) <sup>1</sup>	5
Description of main internal norms and actions to improve teaching, research, and extension activities	35
Social responsibility by improving access to the poor and disadvantaged, enhancing protection of the natural environment, stimulating the preservation of culture and encouraging the arts	5
Communication with society	5
Policy on career path for faculty and non-faculty positions	20
Governance, particularly with regards to independence of the institution from the owners and representativeness of collective bodies for decision making, such as faculties in academic departments	5
Physical infrastructure for teaching and research, libraries, and communications and information infrastructure	10
Planning, implementation of self-evaluation processes and utilization of the results.	5
Student services	5
Financial sustainability, particularly regarding its ability to continue providing educational services.	5

<sup>1</sup> The Institutional Development Plan is a document describing the mission, the strategy, the organizational structure, the pedagogical approach, the action plan, the profile of professors, the infrastructure, and any relevant aspect that shows a sound plan for financial sustainability of the institution. It should be updated frequently and should cover a period of five years.

Note: Summarized and adapted from INEP (2010).

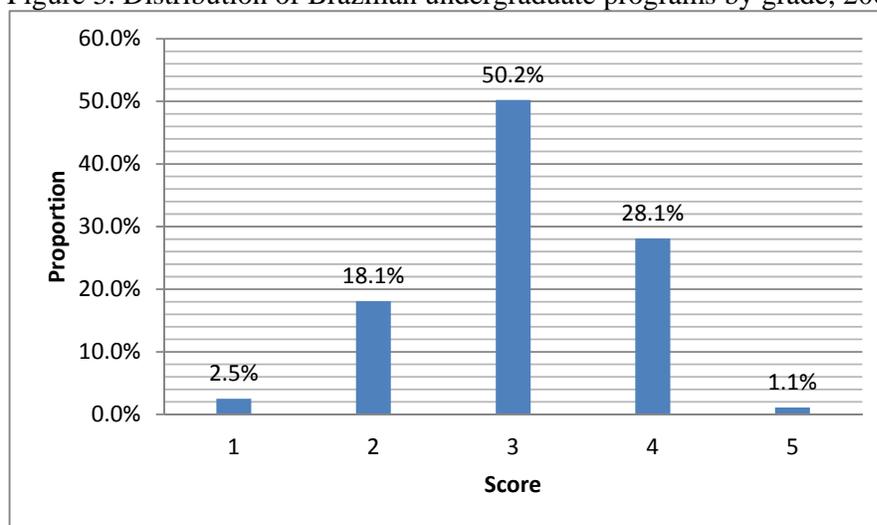

The SINAES also evaluates individual undergraduate programs (referred to as Courses in Brazil). Each program is evaluated by an index called Preliminary Course Grade (CPC) comprised by the weighted combination of eight indicators measured from three sources: i) the faculty registry at the Ministry of Education; ii) the student opinion survey; and iii) the student grades in the National Student Performance Exam (ENADE). The eight indicators and their respective weights are shown in Table 6. Results from the evaluation carried out in 2008 are presented in Figure 3.

Table 6. Indicators used to calculate the preliminary course grade and their respective weights.

Source	Indicator	Weight
Faculty registry at Ministry of Education	Percentage of PhD degree holders	20%
	Percentage of Masters or higher degree holders	5%
	Percentage of full-time faculty	5%
Student Opinion Survey	Physical infrastructure	5%
	Structure and content of syllabi	5%
Student grades in the National Student Performance Exam (ENADE)	By seniors	15%
	By freshmen	15%
	Difference between Expected and Observed Performance	30%
Total		100%

Note: Adapted from INEP (2009).

Figure 3. Distribution of Brazilian undergraduate programs by grade, 2008

Note: Data from INEP (2009, p. 11).

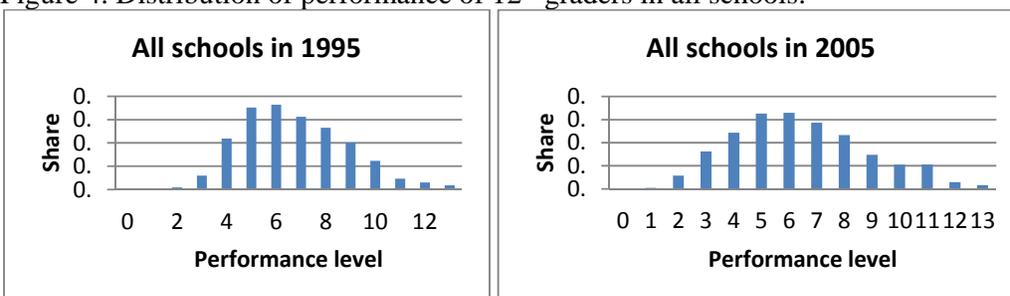

### *The Quality of Students Entering Tertiary Education*

In addition to reasonable amounts of government financial resources for higher education, a key input to a productive educational system is the students themselves.

Aware of this simple and fundamental principle, the Ministry of Education started in 1990 a voluntary evaluation system for all pre-tertiary students in the country under a program called SAEB, a type of National System for the Evaluation of Pre-Tertiary Education. The main tool is a biennial standardized test covering Portuguese language and Mathematics. The test is offered to students studying in grades 5, 9, and 12. (INEP 2007).

SAEB results are classified into 14 performance levels (0-13). Figure 4 shows the distribution of grades throughout the 14 performance levels for all schools in 1995 and 2005. There are some differences between the two distributions, for example, the 2005 distribution is flatter, and its bars representing performance levels 2, 3, and 10, are slightly taller. In order to make comparisons easier, exam results from 1995 to 2005 were transformed into a single index by calculating the weighted average for each year, with the weights being the fraction of students at each level (See Figures 5 to 7).

Figure 4. Distribution of performance of 12<sup>th</sup> graders in all schools.

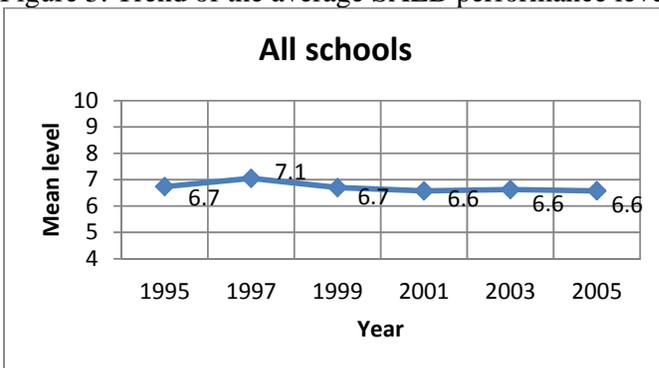

Note: Data from INEP (2011).

The indexes show that average performance in all schools increased significantly in 1997, but then decreased back to 6.7 and remained constant at 6.6. This decrease followed by stability at such a low level is not a desirable result for the Brazilian education system. One would normally expect that, as time passes, the average performance level to go up.

An even greater concern, however, is the steady fall of the performance level in public schools as featured in Figure 6.

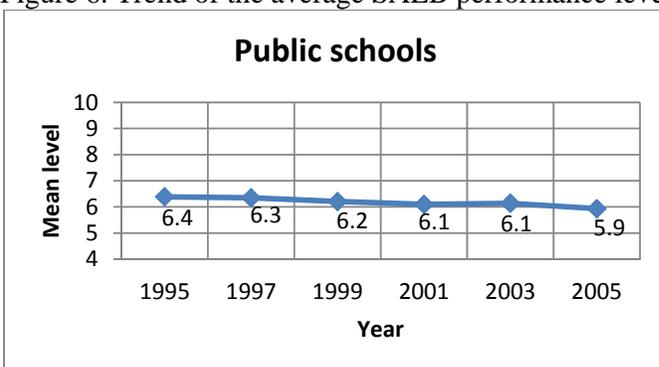

Finally, and one could say “as expected,” private schools have recorded an outstanding degree of improvement starting from an average index of 7.8 in 1995 and posting an impressive 10.4 in 2005 (See Figure 7).

Figure 5. Trend of the average SAEB performance level in all schools.

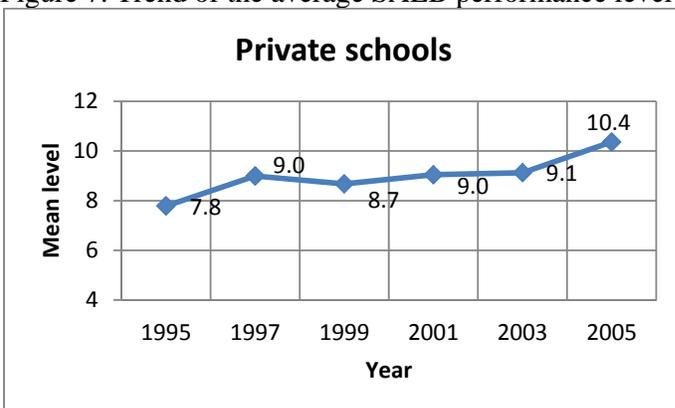

Note: Data from INEP (2011).

Figure 6. Trend of the average SAEB performance levels in public schools.

Note: Data from INEP (2011).

Figure 7. Trend of the average SAEB performance level in private schools

Note: Data from INEP (2011)

Table 7. Number of pre-tertiary students and shares of public and private institutions

Year	Number of students			Share (%)	
	Total	Public	Private	Public	Private
1994	43792803	37447623	6345180	85.5%	14.5%
2001	55950424	48963054	6987370	87.5%	12.5%
2008	53232868	46131825	7101043	86.7%	13.3%

Notes: Data from INEP (1991-2009).

When this evidence is linked to the relatively small per-capita public expenditures on pre-tertiary education, as discussed earlier, it appears that the educational policy is seriously failing to provide quality education to the larger and poorer segments of Brazilian society.

Table 7 sheds more light on the issue. Table 7 shows that only a small fraction (13.3%) of Brazilian pre-tertiary students are studying in private schools, and Figure 7 shows that these private school students are recording an impressive growth in their performance level over the past four exams (Figure 7).

Private high schools are expensive in Brazil, with tuition rates ranging from US\$9,000 to US\$18,000 a year, far more expensive than the tuition of most private colleges and universities. The larger fraction of pre-tertiary students (86.7%) goes to free public schools. In contrast, the larger fraction of tertiary students (75%) goes to private colleges and universities. There, fierce competition in the last 10 years has brought prices down. In the field of social sciences, tuitions start from US\$2,000 a year, and only courses requiring expensive facilities and labs such as Medical Schools, would charge tuitions as high as US\$22,000 a year. The lower prices have been achieved by improved efficiency by large educational business groups that have standardized facilities, content, produced their own text books, and streamlined teaching procedures. The cost efficiency strategy has shown to be very successful and many business saw TEIs as good investment opportunities, rather than as institutions chartered to play an important social role. In mid 2007, the Grupo Anhanguera, with 53 thousand students, successfully raised US\$273 million<sup>2</sup> in their Initial Public Offering (IPO) at the São Paulo Stock Exchange (Almeida 2008; Yokoi 2007). By the end of 2007, three other large TEIs, Kroton (195 thousand students), Estácio de Sá (185 thousand students), and SEB (69 thousand students in 2010), had together raised an additional US\$464 million (Instituto Metodista de Ensino Superior 2008; Jornal Brasil Online 2010).

Ironically, the smaller but better prepared proportion of students (25%) can receive the best tertiary education at the federal and state financed universities, which are funded at the level of the best

<sup>2</sup> R\$512 million in local currency at the rate of 0.5341US\$/R\$ on July 14, 2007 using ten-year currency converter from Bank of Canada (<http://www.bankofcanada.ca/en/rates/exchform.html>) on July 23, 2010.

OECD countries, and are completely free of charge for the students. The latest results available from the Ministry of Education ranking all 180 universities in the country show that all the top ten universities are public. Among the top 50, 45 are public and only 5 are private. Although the distribution of public and private universities is fairly balanced, with 92 public and 88 private, the ranking shows that the public free of charge institutions are the best ones in the country. With such great conditions at public TEIs, there can be little doubt that the best students will always choose the better public universities.

In a sense, this apparently odd configuration is actually very logical. Students coming from a free public pre-tertiary educational system, which have lower performance levels, will not be able to join the very selective and competitive public colleges. As a result, they will have to go into the private college system, which due to cost competition has become financially more accessible, but tends to have less qualified professors, standardized content, and limited infrastructure. The outcome is logical but the result is socially undesirable.

### **Partial Conclusions**

In the last two decades, the government has made significant efforts to improve the educational system. On the one hand, it is undeniable that there was a huge increase in enrollment in TEIs, meaning that a larger proportion of society obtained access to higher education. It is also true that the government has implemented better evaluation systems at all levels of education, which has forced educational institutions to make efforts to improve the quality of teachers and the infrastructure in general. The evaluation system, however, has not solved the problem of unequal outcomes that seem to be produced by a flaw, embedded in the system, which is the enormous privilege given to public TEIs that are fully funded by public resources and can thus provide better infrastructure and better professors for free. The result is an educational sector dominated by a large for profit segment providing standardized educational content, and a small publicly funded high quality research intensive segment. It is hoped that this exploratory discussion on the current situation of the Brazilian educational sector can stimulate further studies looking at the causes of the unfair structure favoring wealthier segments of the population.

# ***Beginning Teachers Initiative***

*Rocky View Schools 2012-2013*

**Heather Fansher, PhD**

**Asst. Principal: Springbank High School**

**Facilitator: Beginning Teachers' Initiative**

## Abstract

This action research paper will outline the development, implementation and evaluation of the Beginning Teachers Initiative in Rocky View Schools in Alberta, Canada. This program has evolved over the last three years into a powerful professional learning opportunity for beginning and pre-service teachers. The program aims to build the bridge between university experiences and the practical day-to-day application of teaching and learning theory. Supporting beginning teachers is imperative as schools and classrooms transform into 21<sup>st</sup> century learning environments. This program allows for tangible and timely support not only at a school level but also at a district level. This paper also looks at how the development of social networks and professional capital in new teachers can lead to powerful learning outcomes not only for the teachers themselves but also for the students they teach.

## Introduction

Whenever you ask an educator about the level of support they received in their first few years of teaching, many say that there was little to none. Often, teachers in their formative years were left alone to struggle with the complexities of the classroom. As educators, we intuitively know that without a collaborative and supportive network, beginning teachers are often overwhelmed and frustrated. As Bower (2012) suggests, “Teachers eat their young”. (Bower, *Teachers eat their young*, <http://www.joebower.org/2012/05/teachers-eat-their-young.html>, May 8, 2012) We tend to give the beginning teachers a challenging timetable, challenging students, and make them ‘sink or swim’ with little to no support. Bower comments, “A teacher who is responsible for more than 100 students in a day isn’t really teaching anymore – they’re doing crowd control” (Bower, *Teachers eat their young*, <http://www.joebower.org/2012/05/teachers-eat-their-young.html>, May 8, 2012) These beginning teachers often lose their initial love for teaching and for children. As a result of this neglect, between one third and one half of the teachers, who begin teaching, leave the profession within five years. Granted, there ~~potentially~~ could be other factors that influence the decision to leave like higher paying opportunities elsewhere but how many potentially good teachers are leaving because they were simply left to struggle on their own?

Intuitively, as educators, we know there is a problem in continuing with this lack of support for beginning teachers. As Hargreaves and Fullan (2012) suggest, “Teaching is at a crossroads: a crossroads at the top of the world. Never before have teachers, teaching, and the future of teaching had such elevated importance. There is widespread agreement now that of all the factors that affect children’s learning and achievement, the most important is the teacher – not standards, assessments, resources, or even the school’s leadership, but the quality of the teacher.” (Hargreaves and Fullan, 2012, *Professional Capital: Transforming Teaching in Every School*, Teachers College, Columbia University, p. xii) It only stands to reason then, that the support we give to teachers will transform student learning: the stronger the teacher, the stronger student learning.

Rocky View Schools (RVS) has been a leader in supporting teachers’ and administrators’ professional learning. In 2010, Springbank Community High School set about supporting the beginning teachers within the school with direct mentoring from various staff members including teachers and administration. As a result of this effort the Beginning Teachers Initiative was founded in 2011, where school-based mentoring and division-wide coaching was centralized into one Community of Practice. This Community of Practice was created informally initially to provide a space where beginning teachers could collaborate and commiserate in an evaluation-free environment. Guided by a veteran teacher, the beginning teachers began to make sense of their classroom experience and offer greater learning opportunities for their students. A [Beginning Teachers](#) website was created as a one-stop-shop for a variety of resources allowing the beginning teachers a quick reference guide to many of the ideas that are discussed in their schools and classrooms. As well, through the course of the year, this group quickly bonded into a tight knit cohort and have been providing support to each other through their second year.

In 2012-2013, the program developed further. Beyond the regular three Community of Practice days set by the school jurisdiction, we expanded the program to seven sessions in total. This allowed the beginning teachers to meet on a more regular basis, typically once a month following the school calendar. Not only is the initiative structured to provide beginning teachers with the foundational knowledge of teaching in the 21<sup>st</sup> century and Rocky View Schools but we also had two dedicated teacher coaches,

one with an elementary focus and one with a middle/high school focus. These coaches met the teachers at their schools and in their classrooms on an on-going basis. These coaches were not in an evaluative role. They provided support and coaching to the new teachers in their classrooms.

The goal of the Beginning Teachers Initiative research is to provide tangible support to the new teachers in Rocky View Schools. The objective is to measure whether supporting new teachers, through learning and coaching, can create the conditions where the beginning teacher feels supported, where the retention rate of beginning teachers is high, and where beginning teachers create positive learning environments. One thing is for certain; happy teachers make happy students and with that comes greater student learning. Ultimately as educators, this is our goal.

## **1. Research Questions**

- What is the best practice in supporting beginning teachers?
- How will we know if the Beginning Teachers Initiative has added value to the teacher, student, and Rocky View Schools?

## **2. Beginning Teachers Initiative Program and Process**

Seven collaborative sessions were planned for the 2012-2013 school year. RVS supported the beginning teachers by providing substitute teachers for the sessions outside the regular Community of Practice professional learning days. Figure 1 outlines the agenda for this Community of Practice.

<b>Date/Time</b>	<b>Location</b>	<b>Agenda Items</b>
Friday Sept. 14: 9:00-2:00	Springbank Community High School (Learning Commons)	<b>Orientation:</b> - Introduction to Beginning Teachers website (www.beginningteachers.net), twitter #rvsnewteacher, RVS blog, discussion board, Remind 101 - Professional Code of Conduct - RVS Learning Model <b>Speakers:</b> Human Resources (Pat), Learning (Manny), 21 <sup>st</sup> Century in RVS (Dave), Literacy Coach (Melanie)
Fri. Oct. 5: 8:30-2:00	Springbank Community High School (Rm 312)	<b>Marzano's Protocol</b> <b>Planning:</b> UbD <b>Action Research:</b> teacher as researcher
Mon. Nov. 12: 4:30-7:00	Springbank Community High School (Rm 312)	<b>Learning Support</b> (Greg/Rob) <b>Social/Emotional Support</b> (Chris P.)
Mon. Dec. 3: 8:30-3:30	Springbank Community High School (Rm 312)	<b>UbD planning</b> <b>Finding Evidence</b>
Thurs. Mar. 14: 1:00-4:00	Rocky View Education Centre (Airdire)	<b>Inquiry</b> (Barry/Josh)
Mon Apr. 8: 8:30-3:30	Springbank Community High School (Rm 312)	<b>Emotional Intelligence/ Personality Dimensions</b> (Tracy) <b>Administration</b> (Leslie)
Thurs. May 16: 4:30-7:00	Rocky View Education Centre (Airdrie)	<b>Diversity</b> (Theresa Cardinal) <b>Celebrating Success</b> <b>Final Reflections</b>

Figure 1: Agenda for Beginning Teachers' Initiative 2012-2013

Through each of these sessions, we aimed to build the capacity of these beginning teachers. All of the fears and anxieties of organizing, managing, designing, implementing and evaluating their respective teaching programs, we talked about together. We collaborated, worked through problems, gave each other the support needed. Each session added to the learning of the previous and in turn, added to the teaching and learning in their various classrooms. The Beginning Teachers' Initiative was carefully designed so each piece built on the last and was timely in the cycle of a school year.

### 3. Background Information

As we begin to develop schools with a 21<sup>st</sup> century focus on collaboration, one of the important areas is networking. With new teachers to a school division or beginning teachers, many lack the social network that supports their professional growth. In many

cases, this lack of support creates tension and isolation. Teaching (and learning for that matter) is collaborative in nature and without these social ties, can be an overwhelming task. In part, this can be linked to social network theory and the development of human and social capital. Essentially, a beginning teacher will have strong social ties to some colleagues and weaker social ties to others.

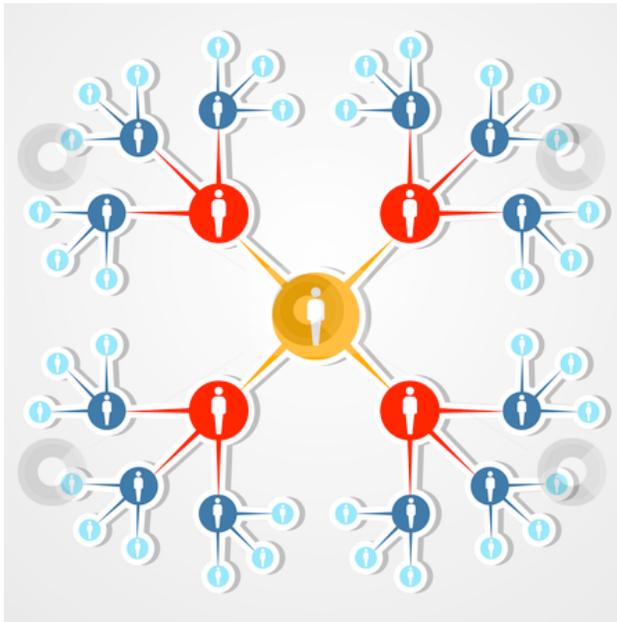

Figure 2: Picture retrieved July 13, 2013 from <http://cutcaster.com/photo/801073107-Social-web-network-marketing-diagram/>

If we look at Figure 2, we can see the power of social networks in teaching and learning. In the centre, lies the student. Student learning indeed, must be the centre of all that we do in education. Circling the student is the beginning teachers. Each serves to support student learning. But the key to this idea is that not only each beginning teacher is also supported by each other, but also mentors, coaches, peers and administrators. If we can create a strong network or web of support, where all work together collaboratively increased student learning will be achieved.

In another way, Figure 2 could be viewed with the beginning teacher at the centre of the network. The close ties are with other beginning teachers, and colleagues. The next layer would consist of other teachers in departments or grade level teams and the third layer consisting of mentors, coaches and/or other educational professionals like administrators or learning specialists at a divisional level. Whichever way you look at the

interactive and supportive web, each teacher or student is supported in their learning at a variety of levels and through a variety of means.

This also can be linked to the development of what Hargreaves and Fullan (2012) suggest is professional capital. The investment in developing and supporting teachers will reap the benefit of increased student learning and greater capacity among all teachers. This is not isolated however to just between teachers or between teachers and students. “If we need much more social capital within our schools – colleague to colleague, peer to peer – we need this just as much across and between our schools. Professional capital as human capital plus social capital is therefore a personal thing, a within-school thing, and a whole system thing.” (Hargreaves and Fullan, 2012, p. 5)

It is vital for new and beginning teachers to start strong. They therefore then must be provided the opportunity to create these strong and weak social ties early in their first year. By creating a formal supportive network in a school and school division, these ties are more easily produced.

Beginning teachers come to the profession from a variety of backgrounds and experiences with their own schooling. Some have entered teaching with an idyllic view of classroom practice. They may have been inspired by a teacher in their own childhood, a Hollywood movie, or simply because they feel they can make a difference. However, when they face the reality of their own classroom with their own students, they can become quickly overwhelmed. In *Workplaces That Support High-Performing Teaching and Learning: Insights from Generation Y Teachers*, the authors suggest there are five facets to a high-performing workplace. They include: Frequent feedback on effectiveness, high quality evaluation, effective instruction technology, differentiated support, and collaborative and shared practice. (Coggshall, J.G., et al, April 2011, *Workplaces That Support High-Performing Teaching and Learning: Insights from Generation Y Teachers: A Report from the American Federation of Teachers and American Institutes for Research*, p. 3) By creating a learning space where beginning teachers can come together to collaborate and share their practice is vital to building their teaching capacity. They note, “...[this is] the most powerful thing that policymakers and others can do is to support teachers’ ability to be effective with their students.” (Coggshall et al, 2009, p.19 as cited in Coggshall, J.G., et.al, April 2011, *Workplaces That Support High-Performing*

*Teaching and Learning: Insights from Generation Y Teachers: A Report from the American Federation of Teachers and American Institutes for Research*, p. 7) If we can create, as school leaders, the conditions for beginning teachers to feel supported in their own professional learning and practice, student learning will benefit, as will the profession itself.

#### **4. Data Collection and Analysis**

Through the year, data was collected using a variety of methodologies. The quantitative data was gathered through attendance at the various sessions, the number of visits to the Beginning Teachers Initiative website, and retention levels through the Rocky View Schools Human Resources department. Also qualitative data was collected regularly through participants' reflections on each of the seven sessions and a final reflection for the 2012-2013 school year.

Attendance at each of the sessions was good. For each of the Community of Practice days, attendance was 100%. For those days outside the formal professional learning days, attendance was lower yet still acceptable at between 70 and 100%. This was designed as a voluntary program as there are variances in readiness levels for beginning teachers. Some of the beginning teachers stayed within their school community for their professional learning while others chose to become part of this cohort. In the 2010-2011 school year, we had four participants all in their first year of teaching. In the 2011-2012 school year, we had twelve participants, again all in their first year. By the 2012-2013 school year, we had twenty participants, some in their first year and some that continued with the program into their second year of teaching. We also provided support for pre-service teachers while they were completing their practicum within the school division.

Rocky View Schools is one of the fastest growing school divisions in the province of Alberta and as such, the growth of the number of participants in the program can be attributed to Divisional growth but also to the success and support achieved from this program. We are expecting in the 2013-2014 school year that the participant level will double again.

The [Beginning Teachers website](#) offered the participants a quick reference guide for much of the latest research and promising practices. The website was developed in 2011-2012 using as its base and with permission from Robert Marzano (2007), *The Art and Science of Teaching*. From there, the website has developed into an interactive tool where beginning teachers can connect and discuss relevant issues. It has also been the storage house for the agenda and reflections of each session. The website is maintained regularly. From the data gathered, there has been at least one visitor to the website on a daily basis, and on many days we are getting 30 to 50 “hits”.

The Human Resources department for Rocky View Schools collects data for the acquisition and retention of new and beginning teachers. In 2010-2011, all of the four participants retained their positions with the school division and continue to teach for the school division. In the 2011-2012 school year, all twelve participants also retained their teaching positions. In 2012-2013, of the twenty beginning teachers participating in the Beginning Teachers Initiative, all but one retained a teaching position. One teacher resigned her position by the middle of the year.

The qualitative data reflects the success of the program and the individual and collective learning of the group. Each session provided the participants an opportunity to reflect on their own learning and how that could be transferred into their own practice. As well, a final reflection provided data that spoke to a variety of questions. Each question reflected the desired outcomes of the program itself. It gave the beginning teachers an opportunity to reflect on their own learning and the journey through the first few years of their teaching career. Each of the questions is discussed below along with the reflections from the beginning teachers themselves.

*1. Describe one accomplishment you are proud of and why?*

Since the first few years of teaching are daunting at best, learning curriculum, program design, evaluation tools, and classroom organization and management, the initial question served as a place for these beginning teachers to reflect on what had really gone right in their first experiences as a teacher. They are insightful in their reflections and

overwhelmingly keyed in on the importance of the relationships they built with their students and their colleagues.

I am proud of the relationships that I developed with my students, and how I was able to use this to connect with them with their learning as well. I have one student in my classroom especially that was a challenge to 'get through to'. He went from not even talking to me or coming into the classroom to playing games, talking and participating in the class. (First year teacher)

I am proud of the deep relationships I have been able to build with my students. It is my hope that when students come into my class that they know that they have at least one person who cares and has their best interest in mind. I have a particular grade nine student who has a "spare" during my grade nine English class and he comes just to hang out. Although you may think he is coming simply to hang out with his friends, which he might, I know that he is having severe problems at home and if he feels comfortable and safe "hanging out" in my class, I feel like I am doing a good thing." (Second year teacher)

After my first year as a substitute participating in the Beginning Teacher Community of Practice I witnessed my peers fears and anxiety facing their first year of teaching. I sat back and nervously waited for my opportunity to have my own class, slightly apprehensive of what I was getting into and worried that my "dream job" may not be what I had expected. Now that I am a year into my own classroom and have experienced some of those same fears and anxieties, I am most proud of the positive outlook and attitude I have been able to maintain. I am still in love with my profession and am grateful for every day I am able to walk into my class of 24 willing and eager faces and explore our learning and their interests together. I think I have accomplished a great feat in the education profession of continuing to be a lifelong learner and not be discouraged by all of the responsibilities it entails." (Second year teacher)

"I am most proud of my work on using inquiry in my classes this year. I was able to participate in developing two inquiry projects through the division. I am proud of the outcome of these projects as I believe they have had, and will have, a great impact on student learning as they require many 21st century learning skills. While working through the process, I feel I have developed professionally and now use inquiry on a more daily basis with my students and not just in a project based setting. I believe I was also able to develop new and stronger working relationships with my colleagues through these projects." (First year teacher)

II. *How have you used Understanding by Design in planning and designing learning experiences for your students?*

One of our focuses for instructional design in Rockyview Schools is using the *Understanding by Design* model. (Wiggins and McTighe, 2005). As a cohort, we were able to help these beginning teachers understand this model and to help them use it in their own practice. Because our beginning teachers come to us from a variety of teacher education programs, we cannot as a school division, be assured that all have the required background and theory we wish to promote. What the Beginning Teachers' Initiative has done is created a common understanding, knowledge, and language of 21<sup>st</sup> century learning and teaching for all teachers in our school division.

I used Understanding by Design in all my planning, but especially in unit planning. It is helpful to have an idea of what you want the end outcome in knowledge or understanding for students to be. Planning the learning experiences needed to reach that point becomes much easier and really focuses what is happening in the classroom. (First year teacher)

Luckily in the first year of this CofP we had the opportunity to play with the UbD concept and collaborate and design lessons with it. I found that using the UbD concept broke down the curriculum into manageable bits and made my planning more thorough and specific. This year I used it in a couple math units (multiplication, geometry and fractions), all of my science units and a few language arts units (poetry and a novel study). An end project and goal was established and then from there I worked backwards [sic] to plan the mini lessons that would give them the skills to accomplish the end goal. Looking back those are the units my students enjoyed the most and obtained the most from. (Second year teacher)

I have used Understanding by Design to develop inquiry and project based learning activities for my students in all core curricular units. The Understanding by Design framework helps me to develop deeper essential questions that focus and guide critical thinking within my classroom. The Understanding by Design framework helps me ensure I provide multiple ways of representing, engaging, and presenting knowledge to meet the diverse learners in my class. (First year teacher)

Understanding by Design has helped me develop unique learning opportunities for my students that are centered and driven by essential questions. By ensuring

my students have opportunities to learn in flexible learning environments, with different opportunities, my students have had the ability to engage in projects that allow for student choice and a broad range of direction. (Second year teacher)

*III. How have you used Universal Learning Environments in planning and designing learning experiences for your students?*

Another area of focus for teacher development and professional learning through Rocky View Schools is the idea of Universal Learning Environments. Here all students receive the individualized and personal support from their teacher. Again, the Beginning Teachers' Initiative created a space for learning and collaboration to take place. We explored such questions such as: How do we support all learners in a classroom? How can we individualize a program for each student making sure that all learning outcomes are met? Again, the responses from the participants were insightful. Some talked about the ability of on-line technologies to assist in this differentiation and others talked about differentiation in assignments and assessments.

By having an online presence for all of my classes, my students have the flexibility to access my classroom at anytime and any where. This learning environment, which is supplemented in accordance to my daily classroom interaction, provides students with access to multiple learning avenues so that they have different options when students are acquiring information. I have also created discussion boards that allow students to make meaning of the issue questions they are examining--this is a great place for students to engage in discussion, ask questions, and have a voice. My online presence has also served as a great place for my students to showcase their learning when they are at the "transfer" stage. (Second year teacher)

I have a wide variety of students ranging in levels and abilities. I will often plan a lesson, using various methods to present the material. The students then have various methods to demonstrate their learning. If a student suggests a wild project idea, I will often say yes because I know they are enthusiastic about it and will often be more motivated in accomplishing the task. (Second year teacher)

By providing a variety of ways that they learn, practice and show their growth I have tried to provide a learning environment that meets all the students needs. Incorporating music into math, drama into LA, and providing opportunities for students to learn outside are all things I have tried to do. Presenting information

with audio, visuals, movement, music and words I try to get all the students engaged and understanding. While assessing I try to keep in mind that students need to show their learning in a form that they are comfortable with, and have the best chance of being successful in. (Second year teacher)

Universal Learning Environments are essential to student engagement of learning. Providing multiple ways for students to interact with material and have material accessible to all learners is critical. One form of this was to use a graphic novel in my grade 7 Language Arts class. The students of a variety of reading levels and abilities including ELLs [English Language Learners] were able to interact with the content. The critical challenges surrounding the content were then tailored to their individual learning needs or literacy goals. ULE's are a constant focus in my instructional design in order to target all the learners in my classroom and so that they may be successful with content, meeting learning outcomes and to have a sense of accomplishment in their experiences at school. (Second year teacher)

*IV. How have you used Balanced Assessment in planning and designing learning experiences for your students?*

Another area of focus for Rocky View Schools is the idea of balanced assessment. As a teacher, it is important to use both summative and formative assessment along with metacognition to increase student learning. Again, as a cohort, the beginning teachers clarified their understanding of balanced assessment and what that actually means in their classroom and teaching practice.

I have used formative assessments constantly to check in with students to where we were at. These exit cards, quick checks etc. informed my planning and how I delivered/changed my teaching. Constant communication with the students enabled them to know what they had to do to succeed, and their parents were there to support them in this. Summative assessments showed me how the learners understood the material after I had taught and they had practiced/interacted with it. This will help me in years to come! (First year teacher)

Through the development of daily activities and projects, one of my main focuses is to ensure that students have multiple opportunities to practice the essential skills needed in Social Studies. As one example, it is common practice for my students to engage in discussion boards where they are asked to reflect on the essential questions in class, while defending and establishing a position on a topic that has multiple perspectives associated with it. When designing projects, my

department has implemented a "chunking process" which includes student critiques and feedback (allowing for formative assessment) while integrating a skill associated with each element of the project. By looking at the "big picture" in planning it has allowed me to focus on essential questions and ensure that students are inquiring into these questions both through formative and summative assessment; at the same time they are continuously practicing the skills they need to be critical thinkers, analytical writers and 21st century learners. When it gets to the point of a summative assessment, my students have practiced in risk free environments along the way, which allows for greater student success." (Second year teacher)

Balanced Assessment has been incorporated into my planning and designing for students by multiple methods. I have utilized literacy assessments to find target areas of growth for my students. Once learning the target areas I was able to design my instruction around the needs of my learners in the lessons and activities for them. Further, ongoing assessment with one on one conferencing, small group conferencing allows for check points and check ins with students to tailor instruction based on assessing how they are managing the material and their level of engagement. From these conferences I am able to provide instruction in areas where students are missing key concepts or struggling with information or strategies through mini lessons or targeted instruction. Utilizing student self evaluations assist with my designing as well to tailor to their needs, positive experiences and areas of interest. (First year teacher)

As noted, many of their responses are quite insightful and complex. They demonstrate their understanding of some of the most complicated aspects of teaching practice. However, they not only understand but also can put these ideas into effective and strong teaching practice as evidenced by their descriptions.

*V. How have you used feedback in planning and designing learning experiences for your students?*

Another area we are trying to develop in our teachers in Rocky View Schools is the notion of feedback, particularly feedback for students both informally and formally. This question allowed the beginning teachers to reflect on their practice regarding their use of feedback in the classroom. However, most interpreted the question through the lens of increasing the effectiveness of individual lessons, assignments, or projects.

After trying a new, engaging lesson, I always ask my students for direct feedback on what went well and how they would improve upon it. The students are usually very candid and honest. I use this information to tweak my lessons going forward. (Second year teacher)

I have used Google forms as a formative self-assessment tool to measure student engagement. I have also used flex time in the classroom as an opportunity to touch base with students about general classroom feedback as well as the skill they are currently working on. (Second year teacher)

Feedback is important to assist students in guiding them to achieving the purpose of the learning goal. Feedback assists me in providing the appropriate instruction for their learning needs. (First year teacher)

I use Google Drive to provide continuous feedback to my students on the projects and assignments they are working. My students and I set goals for learning to help them improve. The feedback guides my students' goal setting and together we set a plan of how to achieve their goal. (First year teacher)

*VI. How have you used Inquiry in planning and designing learning experiences for your students?*

Last, one of the additional foci for Rocky View Schools is to build in the Inquiry model into teacher practice and instructional design. The Inquiry model, along with *Understanding by Design*, works simultaneously to create an engaging learning environment. These beginning teachers understand the power of inquiry as they plan and design their classes.

I often give students a question on the board that they must solve by planning and carrying out their own experiment. ie. In Chemistry 20 - How much Co<sub>2</sub> is in a package of poprocks? (Third year teacher)

I have involved inquiry to try and engage the students, get them asking questions and thinking critically, and create a project that not only carries into other subjects but into their real lives. Through this process students have been able to create projects/plays/songs/displays that they connect with and show their learning in a meaningful way. (First year teacher)

Inquiry planning in all of my social studies classes is centered around essential questions. These questions are posted clearly in my classroom and clearly incorporated into daily lessons as well as project design. (First year teacher)

Inquiry is an area that is ongoing for myself in terms of how to support students with being successful. I have attempted very broad open inquiry projects learning quickly the scaffolding and supports that are needed to assist students in their strategies for working towards the goals and essential questions. Inquiry is an area that I provide opportunities within projects or material allowing for guided inquiry to be a foundation for my instructional practice. For example, some of my grade 7 students have created murals to represent Confederation in Canada. A student was able to take it from the perspective of Indigenous people and create a mural based on that lens. Allowing for students to have a voice in their learning is essential to their engagement and success. (First year teacher)

*VII. Were the speakers helpful in providing timely information and suggestions for your practice?*

The next few questions asked offered insight into the Beginning Teachers' Initiative. Tapping into the resources both human and knowledge that work for Rocky View Schools added an additional element to the professional learning of the beginning teachers. The speakers were experts in their own fields and provided the beginning teachers with support and advice. They came to understand that they were supported by a much larger network than just their colleagues and administrators in their respective schools but also by experts in a wider divisional setting.

The speakers provided information that was relevant and practical to my instruction and pedagogy. Guest Speakers focused on topics such as Diversity, Emotional Intelligence and Inquiry to name a few. These speakers expertise in their field was exceptional to have shared with us. To have access to so many experts within a small span of time facilitated excellent opportunities for trying new things and to reflect on pedagogical practices. (First year teacher)

I enjoyed every speaker that came in to speak and found them all to be relevant and applicable to my work. I do feel that the inquiry speakers could have occurred earlier on so as to inspire work in the early stages of development. I enjoyed having multiple points of view displayed and provided an avenue for professional development that otherwise would have been hard to find in the first couple of years of teaching. (Second year teacher)

I found the speakers helpful in providing information and suggestions for my practice, sometimes answering question I didn't even know I had! (First year teacher)

Definitely! I felt it was very valuable to get this information from professionals at Rocky View who are experts, was very helpful in learning about the direction of RVS and what I should be striving for. (First year teacher)

*VIII. What were two or three valuable experiences this year regarding your own professional learning?*

Professional learning takes many forms. Sometimes it is a conversation with colleagues, sometimes through a cohort model and sometimes through collaborative settings designed specifically to maximize professional learning. Building professional networks like the beginning teachers provides career-long support. Sometimes though, particularly beginning teachers have either so many questions or simply do not even know what questions to start asking. The beginning teachers' own professional learning journey should be designed individually, by them and for them.

Having a mentor to come in and observe/teach/provide support was invaluable for me [or] the time we were provided with to brainstorm and find connections with other curriculums helped generate ideas. (First year teacher)

To have access to the experts led to essential questions of my own growth and practice. Reflecting on action research and balanced assessment I utilized specialists at my school board to work with me in the classroom and with my instructional design. Collaborating with colleagues in my C of P provided me the courage and inspiration to collaborate with others in my school, and school board. These opportunities to share knowledge and practice strengthened my confidence in the classroom as a new teacher and allowed me to take risks such as the Daily 5 in a middle school classroom. (First year teacher)

I found the time to plan collaboratively with the support of the learning coaches during our discussion of UbD to be very helpful. It was nice to work through the process with other teachers and have your questions answered right away if needed. I also enjoyed the discussion of Emotional Intelligence, as I have never heard about student differences presented in that way. It was wonderful to go back to my class the next day and have somewhat of a greater understanding of how I could support those students. (First year teacher)

*IX. Was the access to direct coaching/mentoring helpful to you? If so, how? If not, why not?*

As the Beginning Teachers' Initiative evolved, Rocky View Schools provided direct coaching to the beginning teachers. These two coaches along with the facilitator, all experienced educators, offered direct support. The learning coaches would travel to the various schools to observe, discuss, plan and support the beginning teachers. They would help the beginning teachers make sense of what was going on in their classrooms. This formal support was in addition to the support available at each respective school through grade level or department teams and administration.

Yes, it was great to have experienced teachers on hand to help with my Action Research project, making UBD unit plans, and thinking about inquiry projects. (First year teacher)

Yes. It was nice to know I had a place and person to ask questions to, and that I would get help relevant to RVS and my grade level. (First year teacher)

I did utilize the coaching through email. They provided timely and relevant advice and resources. (First year teacher)

I thoroughly enjoyed the access to a coach this year. I was given resources, guidance and most importantly time from someone who I didn't feel guilty taking it from! Teachers within the school are realistically too busy to mentor beginning teachers so to have someone with ample experience at many levels who are transitioning from the teaching profession was extremely valuable. (Second year teacher)

The important piece to take out of this is that the beginning teachers' chose who to access and what level of support they wanted. Their professional learning became their own, making connections and judgments as they saw fit. This gave them the autonomy they needed and the safety net to explore.

X. *In your opinion, what was the most valuable part of the Beginning Teachers' Community of Practice?*

As an over-arching question, the value of the Beginning Teachers' Initiative in the beginning teachers' practice resulted in enthusiastic support for the program. They commented on the professional and social network created and the relationships they forged with not only each other but with their coaches and facilitators as well. They commented that their feelings of isolation were diminished and that they knew they had support if they needed it.

Meeting new teachers across the board and learning about things they do in their classrooms, regardless of the age group they teach. (Third year teacher)

Getting connected with my mentor/coach and being able to connect and share with other first year teachers who were going through the same things as I was! (First year teacher)

The most valuable part of the Community of Practice was having a support system comprised not only of the veteran teachers running the CofP but more importantly my peers; teachers just like me. It was great to have people to talk to, to vent to, and to share experiences with. It was great to realize I am not alone, and that the experiences I am having are happening to others as well. (Second year teacher)

Creating relationships with colleagues around the division and also having a time and place to discuss some of the experiences we were all having. Knowing there is a support system out there helps because when you are in a workplace surrounded by teachers who have been in the career a few more years than you, it definitely makes for different experiences. Having a place where we were all just "starting out" provides an alternative perspective. (Second year teacher)

XI. *Would you be willing to participate in the Beginning Teachers' CofP next year?  
Would you recommend that Beginning Teachers participate in the future?*

Overwhelmingly, the support for this Beginning Teachers' Initiative by the participants is strong. It was designed as a two year process so as teachers move into their third year of teaching, they can expand their own professional learning networks and move on to learning about their own passions in teaching and learning. Having the

program consist of first and second year teachers adds a dimension of experience to the conversations. Including pre-service teachers also allows for additional depth to the professional learning. Those in their first and second years offer insight into their experiences for those coming up the ranks. The support is reciprocal and generative.

Absolutely I would be willing to participate in the C of P next year. I would absolutely recommend the C of P to new teachers in the future. This experience has given me knowledge of my school board and the specialists that exist. As a new teacher to the province and a beginning teacher the C of P gave me the bridge between University and beginning my profession. Further, it provided me a great structure to continue my continued life long learning. The C of P was facilitated in a way that gave a model for how a C of P should be experienced and organized for when I am able to lead my own. (First year teacher)

I am greatly appreciative of the experience I had with the Community of Practice. While I feel that I am ready to explore other community of practice opportunities I would love to continue with coaching for one more year as a sort of transition piece to the program. I think it could look at expanding my professional portfolio and be exposed to a greater network of opportunities that would be available as I move from being a 'beginning teacher' to a 'developing professional'. I would HIGHLY recommend every beginning teacher be a part of this community. You could not ask for more willing leaders to guide you through the beginning stages of your career and an avenue such as this to break down the process and keep you grounded. It is with a heavy heart that I move on from this C of P but I firmly believe it has strengthened my foundation in this wonderful yet complex profession. (Second year teacher)

This was a great experience! I was pleasantly surprised with the amount of support I received in my first year of teaching - and it was influenced much by this C of P! (First year teacher)

I just want to thank Rocky View for this opportunity as well as Dr. Fansher. I moved here from another province and speaking to my colleagues back home, they see the value of this community of practice. The opportunity and support this has provided me in my first two years of teaching has allowed me to transition into my teaching career with the mentorship I needed. As well, the coaches offered some insight into the program as did school and district administrators. This data was collected in verbal conversations but each person was enthusiastic about the success of the program and the level of support each new teacher received. The success of the program rests on the success of the beginning teachers and the students in their classrooms. (Second year teacher)

Thank you! Thank you for the inspiration, engagement, time and encouragement that you have all given us. Thank you! (First year teacher)

## **5. Recommendations for Further Action**

As we move into the next phase of the Beginning Teachers' Initiative, changes will occur to strengthen and broaden the scope of the program. We asked the beginning teachers a question in their final reflection giving us some direction in the path to follow. Their comments suggest a greater awareness of this opportunity must be presented to all beginning teachers in Rocky View Schools. Hence, what we must do is advertise with not only the beginning teachers but also to schools' administration to promote the program. Also, we should consider having a dedicated mentor in each school, specifically not in an administrative role where these teachers could ask the seemingly innocuous questions.

*What could we do to ensure that Beginning Teachers in Rocky View receive the support they need?*

Make it known to all the beginning teachers that the coaching/mentoring and C of P is available. If I would not have been involved with the school I was at I don't think I would have been able to benefit from this amazing opportunity Rocky View provides. An email from the mentor, or a quick visit even would be beneficial in my opinion.

I think there should be someone on staff at every school that is responsible for "orienting" new teachers. Although I naturally made connections with teachers, there were still questions that I had that I was slightly anxious asking. Just having a "go-to" person would be nice.

Continue to ask what teachers need and allow them to have a voice. Provide opportunities for collaboration and time to do so.

It would be great to have new teachers paired up with a mentor. The mentor wouldn't need to be at the same school but within the board. A person that new teacher could ask those silly questions to but also to provide guidance. As new teachers are adjusting to new schools and have not developed professional relationships yet the beginning part of transition to the school is the most crucial. Further to ensure that the C of P for new teachers is provided and upon hiring it is

advised/recommended to join this C of P. Administration should also provide access to the information that the C of P exists.

I highly recommend continuing to have the coaching element. My first year with the C of P largely focused on theory, understanding and application. As I moved into my second year with the C of P I feel that the coaching provided another viewpoint and a refreshing approach to the C of P. This is an aspect that should not be lost and continue to be offered to teachers in this C of P as they transition from being a beginning teacher.

I think just providing information to first year teachers about the resources available through the division for support, including the learning specialists, would be a huge help. Perhaps holding an information session for those that are not part of the C of P would be helpful.

Make sure new teachers are aware of all the resources that are available. There is a lot of technology use in the class, but sometimes it is hard to know what we have at our disposal at RVS.

The Initiative has grown in numbers and as such, the Beginning Teachers' Initiative has split into two distinct parts for the coming 2013-2014 school year. The four Community of Practice days, lead by two veteran teachers and administrators, will continue focusing on the goals of bridging the beginning teachers experience from university to daily practice. The second part, *Vistas*, will offer the beginning teachers mentoring and coaching from a divisional level through the Organizational Learning department, along with introducing them to the resources available. In this way, we hope to continue the success of previous years, yet offer even greater support to our growing cohort of beginning teachers.

Where this will evolve, no one can know for sure. Beyond continuing the practice that has already been established, there are still groups of teachers who would benefit from this type of wrap-around service. Potentially, experienced teachers within Rocky View Schools may find this program beneficial to their teaching practice. Administrators may want to recommend this program to some who are struggling. Also, those experienced teachers who are new to Rocky View Schools may be included in this program. It lays the foundation for what is important in the school division and creates a culture of what it means to teach within Rocky View Schools. Additionally, one group we need to be aware of is the pre-service teachers. Each year, teachers invite pre-service

teachers in to their classrooms to do their practice teaching. These pre-service teachers could potentially be the new employees for the school division and would therefore already be aware of the culture and expectations of Rocky View Schools.

Building the bridge between theory and practice is important as we support and encourage new and beginning teachers. Making sense of what is going on in their own classrooms and working collaboratively only strengthens a new teacher's practice. If we can ensure that their foundation is strong, we can strengthen the profession, the division and most importantly, student learning.

## **Using the Flipped Classroom to Teach Flower/Foliage Production, Plant Growth/Development, and Crop Modeling Courses**

Kent D. Kobayashi  
Tropical Plant & Soil Sciences Department  
University of Hawaii at Manoa  
E-mail: [kentko@hawaii.edu](mailto:kentko@hawaii.edu)

Teresita D. Amore  
Tropical Plant & Soil Sciences Department  
University of Hawaii at Manoa  
E-mail: [amore@hawaii.edu](mailto:amore@hawaii.edu)

### **Abstract**

In a typical classroom setting, the instructor lectures, and students do homework activities outside of class. The flipped classroom technique was used in several horticulture courses in which lecture material was assigned for homework, and students did active learning activities in the classroom. The objective of this paper is to discuss how the flipped classroom approach was used in Tropical Plant & Soil Sciences (TPSS) courses—TPSS 402 Flower and Foliage Production, TPSS 601 Crop Modeling, and TPSS 674 Plant Growth and Development.

TPSS 402 is an upper level undergraduate level course offered every other fall term. Lecture topics focused on factors affecting plant growth, namely, light, temperature, plant nutrition, plant growth regulation, pest and disease control, and postharvest handling. Later in the semester, production requirements of commercially important flower and foliage crops grown in Hawaii were discussed. Online information sources such as YouTube videos, e-Gro University modules, and online articles in Greenhouse Grower and Greenhouse Product News, were provided as assigned readings to students. Virtual field tours of production sites were experienced on UBloom.com.

In TPSS 601 and 674, various lectures were replaced by YouTube videos, websites, and HortTalks presentations which students viewed outside of class. They reviewed the Virtual Plants online crop simulation, Flower Power wheat flowering model, Prune Chilling Prediction Model, chilling accumulation models, and a growing degree-days phenology model. Students were encouraged to bring their laptops, tablets, and smartphones to class to do Internet searches for relevant information for class discussions, small group discussions, and hands-on activities. In class, students ran online computer simulations. For homework, students searched for online crop models and brought their URLs to class to share with other students. Using the flipped classroom approach helped reduce lecture preparation time and create an active learning environment in the classroom.

## **Introduction**

The typical university classroom setting has students in class to hear a lecture from the instructor, take notes, and then work on homework, projects, and other activities outside of class (Talbert, 2012). However, the lecture format may not always be the best practice for student learning. The flipped classroom approach replaces the lecture format with the in-class exploring of concepts and discussion of materials from outside of class. Students learn and review information outside of class and come to class prepared to discuss concepts and participate in active learning activities (Kharbach, M. 2012; Young, 2011). Studies have shown that the flipped classroom approach can improve student learning, for example, improving exam scores in introductory biology classes (Moravac et al., 2010). The objective of this paper is to discuss how the flipped classroom approach was used in Tropical Plant & Soil Sciences (TPSS) courses—TPSS 402 Flower and Foliage Production, TPSS 674 Plant Growth and Development, and TPSS 601 Crop Modeling.

## **TPSS 402 Flower/Foliage Production**

Teresita Amore

TPSS 402 is an upper level undergraduate course offered every other fall term. The course covers the biology and production of cut flowers, flowering potted plants, foliage plants under field and protected cultivation in Hawai'i and globally (<http://www.catalog.hawaii.edu/courses/departments/tpss.htm>). Learning modules focused on factors influencing plant growth such as light, temperature, plant nutrition, plant growth regulation, pest and disease control, and postharvest handling, to provide the scientific basis of plant production.

In addition to the required textbook, online information sources such as e-GRO University modules, YouTube videos, FloriCAST videos and online articles in Greenhouse Grower and Greenhouse Product News, were assigned to students to supplement the lectures. The website e-gro.org (<http://e-gro.org/>) is home to Electronic Grower Resource Online (e-GRO) and provides a comprehensive, up-to-date online floriculture reference. e-GRO provides a link to e-GRO University, a free online introductory greenhouse production course, produced by six university faculty across the United States, and covers a diverse set of topics on the greenhouse management, plant growth management, nutrient management and pest and disease management. FloriCAST is a series of podcasts/educational videos hosted by Greenhouse Grower (<http://www.greenhousegrower.com/video/>) in conjunction with Cornell University, North Carolina State University, Kansas State University and the University of New Hampshire. The videos ranging from 5-10 minutes provide basic and in-depth information on general production, disease control, insect control, nutrition, and plant growth regulators.

Utilizing e-Gro University or FloriCast is akin to inviting guest lecturers to share their expertise in specific topics or modules, or having the students go on a study abroad or

exchange program. The presenters are faculty members in other universities, and are familiar names in trade publications. A disadvantage is the lack of interpersonal exchange wherein students can ask questions of the guest lecturers.

To illustrate the application of the flipped classroom in TPSS 402, an instructional module on light and temperature as factors affecting plant growth was developed with a lecture and laboratory exercise. The lecture was presented by a faculty member with considerable background in utilizing different instruments to monitor light and temperature in the growing environment. To prepare for the lecture, a list of readings from the e-Gro University topics was provided by the guest lecturer (Figure 1), and emailed to the students prior to lecture. During the lecture, the importance of timing of crops to meet specific market needs, identification of environmental factors influencing the timing of crop, and the need to measure the environmental factors using simple to operate and portable instruments, were stressed to the students by the guest lecturer. Students then used different instruments to measure light intensity and temperature in the greenhouse in the laboratory period following the lecture. Students then collate their information and prepare laboratory reports which include data on shade levels in the greenhouse, air, leaf and potting medium temperatures under different shade levels, and differences in air, leaf and medium temperatures after overhead irrigation.

**Figure 1.** Example of online resources sent to students prior to the lecture.

Production requirements of commercially important flower and foliage crops grown in Hawaii and elsewhere are discussed in the latter part of the semester. Where production sites are within driving distance from the university campus, field trips are scheduled to observe nursery production practices. However, some of the important floriculture or foliage crops are produced on a neighboring island, or out-of state. Virtual tours via YouTube videos or California Grown Experience on UBloom videos are assigned to expose students to production practices in a real world setting, as opposed to reading or seeing pictures in a textbook or publication. For instance, students can visit flower

production facilities in California such as the Ocean Breeze International cut chrysanthemum farm (Figure 2), Westerlay Orchids (Figure 3), or the Resendiz Brothers protea production farm (Figure 4).

The advantages of online videos are 1) no cost compared to instructional DVDs; 2) students can go on virtual tours of production areas, that would have been otherwise costlier to visit; 3) students are able to view videos online on their own without signing out for single copy DVDs. A disadvantage of virtual tours is the absence of person-to-person interaction. Students are unable to ask questions of the owner of the facility.

The flipped approach for TPSS 402 enriches the traditional approach of lecture/laboratory teaching method. Online resources broaden the students' learning by listening to guest lecturers and virtually visiting production areas.

### **TPSS 674 Plant Growth and Development and TPSS 601 Crop Modeling** Kent Kobayashi

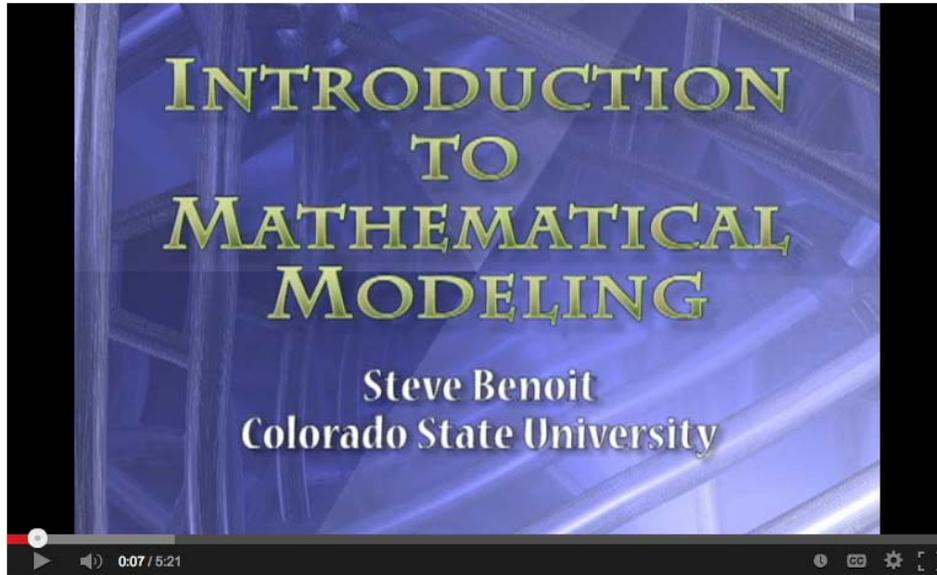

*Philosophy.* I have used the lecture format in my courses, but prefer not to use this technique extensively. When I was a new faculty in 1982-83, I used the lecture format almost exclusive to teach TPSS 601 ( <http://manoa.hawaii.edu/ctahr/tpss/current-students/course?id=601> ). Over the years, I have learned other teaching techniques and have reduced the amount of lecturing that I do in my courses. I now use the flipped classroom approach to help make my courses more interactive and hands-on.

Another reason for using the flipped classroom approach is to reduce my teaching preparation time. When I was hired, I was responsible for developing and teaching only

one course, TPSS 601. Now, I teach three courses a year—TPSS 601 or TPSS 674 Plant Growth and Development (team taught, <http://manoa.hawaii.edu/ctahr/tpss/current-students/course?id=674>) on an alternate year basis, TPSS 654 Communications in the Sciences (<http://manoa.hawaii.edu/ctahr/tpss/current-students/course?id=654>), and TPSS 300 Tropical Production Systems (<http://manoa.hawaii.edu/ctahr/tpss/current-students/course?id=300>). This may not seem like a lot of teaching, but I am a Researcher (> 0.5 FTE) with some Extension FTE and Teaching FTE also. I am evaluated primarily on my research and thus would like to reduce the amount of time used to prepare lectures. The flipped classroom approach has helped me do this.

*Approach.* I first heard and learned about the flipped classroom approach in a workshop by the University of Hawaii at Manoa Center for Teaching Excellence (<http://www.cte.hawaii.edu>). Subsequently, my goal has been to continue to learn about and incorporate some of the aspects of the flipped classroom approach into my courses.

*Procedure.* In TPSS 601 and 674, various lectures were replaced by YouTube videos (Figure 5), websites, and HortTalks presentations ([http://ashs.org/index.php?option=com\\_content&view=category&id=44&Itemid=146](http://ashs.org/index.php?option=com_content&view=category&id=44&Itemid=146)) which students viewed outside of class. HortTalks are conference presentations from American Society for Horticultural Science conferences, which include oral sessions, workshops, colloquia, and symposia talks. The students read about and ran the Virtual Plants online crop simulation (Figure 6), Flower Power wheat flowering model (Figure 7), Prune Chilling Prediction Model (Figure 8), chilling accumulation models, and a growing degree-days phenology model (Figure 9).

### Introduction to Modeling Lesson

**Figure 5.** YouTube video "Introduction to Mathematical Modeling" by Steve Benoit, Colorado State University. The topics covered include mathematics and the scientific method, statistical models, modeling and prediction, computers and mathematical modeling, and mathematical modeling activity. < <http://www.youtube.com/watch?v=GnlGmLNn5o> >.

## Virtual Cotton Comparison

More class time in my courses was spent on interactive, collaborative learning activities including small group discussions (Hughes, 2012), class discussions, in-class activities, and oral presentations (Pappas, 2013). Students were encouraged to bring their laptops, tablets, and smartphones to class to do Internet searches for relevant information for class discussions, small group discussions, and hands-on activities. In class, students ran online computer simulations, showed them to other students, and discussed them. For homework, students searched for online crop models and brought their URLs to class to share with other students.

*Discussion.* The use of YouTube videos, websites, and online computer models and simulations helped reduce the time I spent developing lectures on some specific topics (Kordyban and Kinash, 2013). I did notice that it required more commitment and work up front to search and evaluate videos and websites to be sure they were appropriate for the students and provided information that would have been covered by my lectures (Houston & Lin, 2012). Videos needed to be brief, 3 to 5 minutes long, to maintain

student interest (Pappas, 2013). Thus, I did not select 30-minute or hour-long videos. Ten to 15 minutes was the upper limit.

I needed to be careful to not depend on the flipped classroom approach so much as to forget about the important of lecturing. Some topics just lend themselves to lectures and explanations by the instructor. I also had to be aware of not using the same flipped classroom techniques over and over to avoid students getting tired of it. I still continued to use in-class assignments, small group activities, and class discussions that were not always related to the materials that the students had read or viewed outside of class. The students were also given homework assignments to do outside of class.

Students were not assessed to the effectiveness of the flipped classroom approach, for example, using a pre-test and post-test or using the flipped classroom approach one semester and not using it in another semester for comparison. I did have a means of providing accountability of students to view lecture materials outside of class and then come prepared to discuss the course materials in class. I did not consider the idea that video and multimedia materials may not be accessible by students who did not have access to computers or mobile devices or students with disabilities (Young 2011).

I agree with Young (2011) that flipped classroom changes do not have to be huge to yield significant results. Using the flipped classroom approach helped reduce lecture preparation time and create an active learning environment in the classroom. The modifications to these courses helped the students with critical thinking, teamwork, and recognition of the potential significance of the flipped classroom approach.

## **Conclusions**

The flipped approach for TPSS 402 enriches the traditional approach of lecture/laboratory teaching method. Online resources broaden the students' learning by listening to guest lecturers and virtually visiting production areas. Using the flipped classroom approach helped reduce lecture preparation time and create an active learning environment in the classroom. The modifications to these courses helped the students with critical thinking, teamwork, and recognition of the potential significance of the flipped classroom approach.

## **Abstract**

*This study examines the changes in teachers' technological pedagogical content knowledge (TPACK) and attitudes toward mathematics teaching of grade eighth teachers after completing a one-year collaborative inquiry program. Theoretical frames, strategies and training content of the project are described. The results indicate that the integration of technology such as geometric software and grade eight mathematics online resources, mathematics content and pedagogical strategies is an effective way to help teachers' professional development. Wikis are good tools to help teachers' learning and share resources, but teachers need more training to use two-way interaction websites. Collaboration between peer teachers, schools and education institutes, researchers and practical teachers can improve teachers' professional knowledge.*

**Keywords:** teachers' professional development, collaboration, use of technology

## **Introduction**

Highly qualified teachers enhance student achievement in mathematics. Subject teachers require not only a deep understanding of subject matter but also the methods to deliver subject matter knowledge to students. With the research in the recent decades, mathematics educational scholars have found weaknesses in mathematics teachers in North America (Ma, 1999). International studies such as TIMSS also showed that Canadian students did not performed well enough comparing to their counterparts of East Asia (Millis, et al., 2012). The results reflected the deficiencies of mathematics teachers' knowledge in mathematics and pedagogical content knowledge. As a result, mathematics teachers need to upgrade their subject matter knowledge and pedagogy. Moreover, with the development new technology such as geometric and algebraic

software and two ways websites that allow interaction between web users, teachers' pedagogical methods should be upgraded to help them represent content knowledge. They also need to know the methods for their communication so that they can learn from others and communicate with students, parents and colleagues.

How to help mathematics teachers to increase their knowledge about mathematics content and pedagogical skills is an important issue in teachers' professional development. The collaborative teacher inquiry project described in this paper develops a new model to integrate technology, mathematics content, and pedagogical knowledge to enhance and encourage professional development with teachers. This study examines the effectiveness of how grade eight teachers improve their professional knowledge.

### **Theoretical Framework**

When mathematics researchers have found elementary mathematics teachers' deficiencies in mathematics knowledge and pedagogical content knowledge (Ball, 1990; Ma, 1999), educational institutions have been worked on upgrading teachers' knowledge for teaching. Many states in US adopted standards for inservice teachers' professional development in order to help students increase their achievement in mathematics (Wei, et. al., 2009). Some researchers pointed out that preservice mathematics teachers are mis-educated in teacher preparation programs (Wu, 2011) and preservice teachers' training is insufficient (Shuman, 1999). The knowledge provided to preservice teachers is not matched with the need of practical classroom teaching (Wu, 2011).

In recent decades, educational researchers tried to find effective ways to improve teachers' professional knowledge (Desimone, 2009). Educational "field has acknowledged a need for more empirically valid methods of studying professional development" (p. 181). Scholars did emphasize job-embedded and collaborative professional learning (Wei, et al. 2009). Hence, creating a professional learning community is important to help teachers' formal and informal professional development. Here, the formal refers to learning opportunities by educational institutions, workshops and conferences while informal refers to learning from non-organized activities such as sharing ideas with colleagues (Wei, et al. 2009).

In addition, with the development of technology, mathematics computer software and Internet websites which include mathematics teaching resources, and as tools of communication and collaboration have appeared for years, mathematics teachers need to master these technologies to facilitate their teaching and professional development. Many governments or educational organizations such as Singapore (Hew, 2006) and the NCTM (NCTM Position Statement, 2011) encourage teachers integrating technology into classroom teaching. Hence, the

development of computer information communication technology (ICT) provides a chance to improve teachers' professional knowledge. It provides an informal and integral tool for teaching and learning (Solomon & Schrum, 2007). Technology should be integrated into the work of teachers through:

the incorporation of *technology resources* and *technology-based practices* into the daily routines, work, and management of schools. *Technology resources* are computers and specialized software, network-based communication systems, and other equipment and infrastructure. *Practices* include collaborative work and communication, Internet-based research, remote access to instrumentation, network-based transmission and retrieval of data, and other methods. (Technology in Schools Taskforce, 2002, p. 75)

Collective collaboration is effective way to improve teachers' professional knowledge (Geret, et. al, 2001; Wei, et al, 2009). In the collaboration, each participant should take some responsibility of collective cognition. The participants bring some contribution for group success (Scardamalia, 2002). Teachers will bring their expertise in mathematics teaching and learning, so that they can share their ideas by assembling in an educational institute or virtual websites. Situated approach to teachers' creating learning environment and learning is a new way of teaching (Putnam & Borko, 2000).

Teachers' programs in various subjects should focus on "a core set of features of effective professional development and a core conceptual framework" (Desimone, 2009, p. 181). Research has been showed that teachers' professional development focuses on specific mathematics content on teaching and learning is much better than general training (Cohen & Hill, 1998; Kennedy, 1998).

Mathematics teachers' core features and conceptual framework in grade 8 mathematics should concentrate on practical teaching and learning. McDougall (2004) designed ten dimensions to develop teachers' professional knowledge and to develop an understanding of what might be improved in their teaching practice. The ten dimensions can be further illustrated through a 20-item survey on teachers' attitude and beliefs on teaching practice (McDougall, 2004). The ten dimensions are: (1) program scope and planning, (2) meeting individual needs, (3) learning environment, (4) student tasks, (5) constructing knowledge, (6) communicating with parents, (7) manipulatives and technology, (8) students' mathematical communication, (9) assessment, and (10) teacher's attitude towards and comfort with mathematics. This teachers' inquiry project set this ten dimensions as a guide to carry on the training, investigation, interview and surveys. Some focuses dimensions selected by schools will be relied on their needs.

### **Design of the project**

This one-year involved grade eight mathematics teachers from an urban school district in Ontario. Because Ontario elementary school teachers work all day in classrooms and they teach multi-courses in one semester, the program combined face to face workshops with on-line sources, teaching materials and forums. Part of content of the workshops encouraged participants to engage in formal and informal professional learning.

The workshops were conducted four times over a seven-month period. Before each workshop, the project designers and researchers investigated what teachers needed for their work, and then the workshop addressed these issues. The Ten Dimensions of Mathematics Education conceptual framework (McDougall, 2004) was used for the identification of areas of improvement. Principals and teachers participating in the project determined their goals at the beginning the project. According to the school's and teachers' situation, they selected a couple of dimensions (out of Ten Dimensions) for development in the first year program. The schools identified five dimensions amongst them: student tasks, constructing knowledge, manipulative and technology, assessment, and teacher comfort and attitude towards mathematics.

We provided many resources for teachers about practical teaching, technology-supported-pedagogical skills, and assessment skills. We also provided an environment for teachers to work collaboratively, and encouraged teachers to be collectively responsible for their own professional development. The teachers used a wiki (<http://grade8project.wikispaces.com/>), managed by the project team, to provide a platform for researchers and participants to share ideas and resources.

## **Method**

Quantitative and qualitative data were collected to examine the effects of the project. The research questions are: how teachers' improve their pedagogical knowledge?, what they view of use of technology?, and what we should provide in future programs?. The participants were 31 eighth grade mathematics teachers and 8 principals from eight different schools in a large urban school district in Ontario.

Data collection was by interviews and a 20-item Likert scale instrument (Appendix A). The surveys were administered at the beginning and the end the project. 29 and 24 teachers answered 20-item surveys at the beginning and the end respectively, while 18 teachers completed both surveys. The interviews gathered information related to professional development, teacher's background, teaching resource requirements, teaching supports, their attitudes and goals, their understanding of the curriculum, and their pedagogical content knowledge. At end of the project, researchers conducted a survey that collected participants' view and comments about the project, and suggestions for their professional development.

The mixed quantitative and qualitative research methods are employed to analyze the data. Paired T-test is used to compare the mean differences and changes of teachers' attitudes and pedagogical knowledge. Qualitative analysis will confirm these changes by analyzing interview data and the final survey. Advanced Excel, SPSS and Nvivo 10 were used to data coding and analysis.

## **Results**

The quantitative and qualitative results are described below. The quantitative results focus on comparison means and focus on the effect of teachers' professional development in mathematics attitudes and teaching strategies, use of technology in computer geometric software and wikis.

### **Quantitative:**

Quantitative results showed that teachers' attitudes and their mathematics teaching methods changed over the one year project. The paired T-test results indicate those teachers' attitudes and mathematics teaching methods of items 8, 9 and 16 were significantly changed in 95 percent confidence interval, and items 2, 10 and 12 are significantly changed in 90 percent confidence interval (Appendix B). Due to the intervention workshops, interactive website and school visits, teachers used more real life problems that are of interest to them (item 2). They integrated a variety of assessment strategies into most math activities and tasks (item 8). They communicated more with parents about students' achievement and about the mathematics program (item 9), they encouraged students to use manipulative to communicate their mathematics ideas (item 10), and they believed that create rubrics is more worthwhile and communicated with colleagues (item 12). They also change their view of that students should master basic operations before they tackle complex problems. Our data analysis also shows that items 1, 11, 13, 18, 19 20 had a moderate improvement, and the other items did not change very much.

At the end of the year, the teachers were asked to complete a survey.. When asked questions about the use of wikis, most teachers said that they did not often use it. They encountered some challenges or difficulties in using an interactive website. When teachers answered the question "how often do you visit and use wikispaces.com?", two people answered once a week, two answered sometimes, one person wrote "pretty often", eight people wrote "occasionally, rarely, never, not often enough, only once so far, once a month", and one teacher wrote "once a unit plan". The other teachers did not answer this question. 19 out of 24 teachers answered question: What other online mathematics materials do you use? They listed various

websites and online materials. This means that the grade eight teachers are able to use one-way websites to retrieval information.

When teachers answered the question about what they need for the future workshop, 71 percent of them said they needed upgrading on the use of a wiki and other online resources, 57 percent said they needed upgrading technology in mathematics classes, and 61 percent said they needed knowledge about how to assess students' learning.

### **Qualitative:**

Teachers indicated that they had improved their mathematics teaching due to the collaborative inquiry project. "It has allowed for more ideas/differentiation to come into the classroom ... my practice has been changed. It is easier to integrate, use a variety of resources, my kids (students) are happier, and energy is up" (T1, survey, May 16). "I have learned a lot about what I need to do (best practice) to get back to a successful math program for my students".

Teachers hold positive attitude for connecting with the same colleagues. One teacher wrote "Great way to connect with other colleagues from other schools. I especially enjoyed chatting and sharing with grade 9 teachers in the school our students more to"; while another teacher wrote "Collaboration has improved our overall student success and their perception of math success".

Teachers enjoyed this kind of workshops because they can access more resources. A teacher wrote in the final survey: "my practice has been changed. It is easier to integrate, to use a variety of recourses. My kids are happier and energy is up". School teachers in this urban school were very adoptive at technology. In this school professional learning community, teachers have opportunities to learn technology with others and share methods to use it. Some of them set blogs to communicate with students, parents and colleagues (Feb. 13, 2013, interview).

Some teachers encounter difficulties to use technology, but they try to use geometric software and visit websites to get teaching resources for teaching. However, they are not used to using two-way interactive websites such as wikis. Some teachers began to use blogs to communicate with students and parents, but most of the teachers use emails to communication. Many teachers in the survey suggested learning more technology in the further project. When we search the wiki website, none of the teachers took part in forum discussion of how to teach mathematics content in different strands.

## **Discussion and Implication**

The quantitative and qualitative results confirmed the emphases of the teachers' inquiry project. The five out of ten dimensions (McDougall, 2004): student tasks, constructing

knowledge, manipulative and technology, assessment, and teacher comfort and attitude towards mathematics; have been improved after the one year project. Although we have not observed students' performance of these participants, their feedback showed us the teachers felt that their comfort and attitude towards mathematics began to change. Teachers and principals expressed their appreciation to the content and style of training. The mathematics content addressed in the project was grade 8 curricula and connections with grade 7 and 9. Consequently, teachers understand mathematics knowledge in their teaching areas in breadth and depth. It helps teachers address students' needs of mathematics learning more flexible.

The upgrading technology helps teachers' instructional practice as well as communication. The use of computer software in teaching can help students' visualization and spatial development, and effectively use of Internet information can help teachers' collecting teaching materials and sharing ideas of teaching. Therefore, technology not only facilitates teachers' teaching and learning in formal and informal ways. The results of this project show us the advantage of use of technology, and also show us some teachers' struggle in use of technology. It reminds us when we upgrade teachers' subject matter knowledge, technology also one of the important content should be addressed.

Teachers' collaboration between educational institutions, peer teachers and schools, and educational researchers are important for their professional development and practical work. In this project, educational researchers knew what teachers may encounter in their teaching and learning and their investigation focused on the issues. This kind of content arrangement and program design are more closed to teachers' practical work. Teachers shared ideas during the workshop day and online sharing teaching materials reduced teachers' feeling of isolation. Peer teachers' ideas and experience provide positive impact on teachers' attitude towards mathematics teaching and learning.

In conclusion, the results provide evidence that professional development programs for elementary school mathematics teachers should contain workshops that include mathematics content that is appropriate for the teachers. The model of integrating technology, mathematics content, and pedagogical knowledge is an effective and efficient way of teacher professional development. The training that combines face to face and wiki interactive websites provides and creates opportunities for the same grade teachers' communication, sharing their ideas and resources. Use of wikis is a good way for sharing ideas and teaching resources. However, inservice teachers are not used to two-way interactive websites to communicate with peers. At present, most of them use one-way static websites and retrieve teaching materials. The results also showed that teachers' collaboration helps them improve their pedagogical content knowledge.

At present, in the Ontario province educational context, teachers have to find teaching resources in their limited time outside classrooms daily. The integration of technology and appropriate content training may be the best way to improve teachers' professional knowledge. However, teachers should upgrade their technology knowledge of use social media websites so that they can communicate on-line.

This study provides a useful model to improve inservice mathematics teachers' professional programs. It also indicates teachers' training should focus on their practical teaching, which is the most effective way to professional development. Hence, preservice teachers' programs may focus on teachers' practical work. The results also provide researchers and policymakers to consider how to upgrading teachers' technology.

## Appendix A

### Attitudes and Practices to Teaching Math Survey (McDougall, 2004, pp. 87-88)

Circle the extent to which you agree with each statement, according to the A to F scale below.

Then, use the charts at the top of the next page to complete the Score column for each statement.

**A** Strongly Disagree      **B** Disagree      **C** Mildly Disagree  
**D** Mildly Agree      **E** Agree      **F** Strongly Agree

1. I like to assign math problems that can be solved in different ways.
2. I regularly have all my students work through real-life math problems that are of interest to them.
3. When students solve the same problem using different strategies, I have them share their solutions with their peers.
4. I often integrate multiple strands of mathematics within a single unit.
5. I often learn from my students during math because they come up with ingenious ways of solving problems that I have never thought of.
6. It's often not very productive for students to work together during math.
7. Every student should feel that mathematics is something he or she can do.
8. I plan for and integrate a variety of assessment strategies into most math activities and tasks.
9. I try to communicate with my students' parents about student achievement on a regular basis as well as about the math program.
10. I encourage students to use manipulatives to communicate their mathematical ideas to me and to other students.
11. When students are working on problems, I put more emphasis on getting the correct answer rather than on the process followed.
12. Creating rubrics is a worthwhile exercise, particularly when I work with my colleagues.
13. It is just as important for students to learn probability as it is to learn multiplication.
14. I don't necessarily answer students' math questions, but rather ask good questions to get them thinking and let them puzzle things out for themselves.
15. I don't assign many open-ended tasks or explorations because I feel unprepared for unpredictable results and new concepts that might arise.
16. I like my students to master basic operations before they tackle complex problems.
17. I teach students how to communicate their math ideas.
18. Using technology distracts students from learning basic skills.
19. When communicating with parents and students about student performance, I tend to focus on student weaknesses instead of strengths.
20. I often remind my students that a lot of math is not fun or interesting but it's important to learn it anyway.

Title of Submission            One Song, a World of Education

Topic Area                    Teacher education

Presentation format        Paper (would like a 30 minute slot minimum but would prefer 40 minutes if this can be achieved without hindering anyone else's presentation)

#### Description

This presentation illustrates how one song opened doors to a world of real education more than years of formal secondary and post-secondary schooling. The presentation also demonstrates how this effective pedagogy enlivens and awakens the curiosity to learn, leading to a more rewarding learning experience. This is something that most schools still struggle with.

#### Author details;

Jin Thindal  
Faculty of Education  
Simon Fraser University  
Email: [tta12@sfu.ca](mailto:tta12@sfu.ca)

#### Abstract

The use of popular music and song as an effective pedagogical tool has largely been ignored by most teachers, education policy makers and education administrators. The fact that most young people would rather listen to their music than their teacher also goes largely unnoticed in schools. Could it be that 'lyrics and music provide students with access to deep emotional content' (Kelly, 2012) or that sound actually 'penetrates us' and engages us on a 'bodily level' (Bresler, 2005) yet most educators fail to see this connection to learning. This study demonstrates how engaging with just one song opened doors to a world of education that was not available in the traditional classroom settings.

Parallels are drawn with John Holt's examples from a One Room School for 'real' education and the author uses own personal experience (Van Manen, 1990) to show how one song can be incredibly effective as a teaching and learning tool. Phenomenological human science provided an account of how listening to and engaging with one particular popular song from 1984 developed an insatiable appetite for learning and how that study continues and ventures into areas not previously envisioned.

The study also aims to show how educators can use this pedagogy of song in many learning approaches such as Transformative learning, Life Long Learning, Case Study, Blended Learning.

# **A Report on Learning about Learning Together**

## **Synergy to Begin the Process**

For an idea to crystallize, there has to be an expressed need and committed people to see it through. Following the writing, publication and distribution of [A Value Added Decision](#), a little book on the power of learning walks, participating principals and the author continued to maintain a virtual relationship using Skype as the vehicle for frequent coaching conversations. These conversations, however, were just between two people. There was a need to expand the dialogue so Maria Guilott in Louisiana, USA and Leslie Collings in Calgary, Canada decided to create a venue for principals to chat. After much preparation and deliberation, on April 17, 2012, **Principal by Design Leadership Center** was born. With the advent of free distance communication through tools such as Skype, coaching over thousands of miles is no longer a dream. In fact, the reality is that distance communication is free on the Internet. To be able to include many speakers at once that could speak and see each other simultaneously on real time, the group used Google Hangout as the medium of communication. The tool lends itself to screen share and document share, both desirable options. The time difference for participants in the Americas was not more than 3 hours, thus making the communication possible during the school day. Participating schools were Springbank High School in Canada (three administrators), Chestermere High School in Canada (one administrator), George McDougall High School in Canada (one administrator), Northeast Middle School, USA (one administrator), Maria Guilott, consultant and retired educator, USA, Hixson Middle School, USA (one administrator) Escuela Internacional Sampedrana

in Honduras (2 administrators), and Santiago College in Chile (2 administrators). Attendance to monthly meetings of the Principal by Design Center was completely voluntary for this first group of fellows. Nevertheless, regardless of the time of the year, attendance remained at 85% for each session. Even during the month of December the group insisted on meeting despite a very full local agenda.

### **Process Followed**

Kim Brandon, principal at Northeast had participated in the writing of A Value Added Decision. She recruited a fellow principal. Leslie Collings recruited fellow administrators in Canada and Maria Guilott reached out to contacts to get participants in Honduras and Chile. Google Hangout limits participation to 10 computers so that made the limit of the number of fellows an easy one. Sponsoring this effort was Dr. Grant Wiggins, author of Schooling by Design, who also participated in the first conversation and recognized the need for principals to share concerns and work through problems together.

The idea to generate meaningful conversations up and down the Americas took the form of monthly hour-long meetings with a formal agenda driven by a burning question. To chronicle the work in the monthly conversations, Leslie Collings created a website using weebly as the tool. The link to the website is <http://principalbydesign.weebly.com/>, however, it is password protected. The website quickly became the repository of ideas, videos, shared possibilities, and links to other virtual tools. For example, one of those virtual tools each week became a newspaper published by Leslie Collings entitled Principal by Design using Paper.li as the software. All participants were privy to the weekly newspaper. Additionally, using Twitter as a social media to broadcast articles, videos, blogs, etc., there is a hastag: *#princonv* that captures the work for the group. In other words, the group has taken full advantage of the myriad of technology tools available to connect to the world, to expand their repertoire, to seek to understand, and to broaden their horizons.

## **Testimony from the Principal Center Fellows**

After one year of involvement in this virtual connection, principal participants have this to say.

### **Principal A**

The Virtual Principals' Center keeps me connected to other educators who are wrestling with similar issues. This year, for example, we have covered topics that have ranged from one-to-one computing, personalized learning, Learning Walks, dealing with challenging parents, communicating effectively with our stakeholders, and responding to difficult discipline situations—with students as well as staff.

Although I am in a large district that provides development to its administrators, the development is on a more “global” level and often misses the specific needs that I have. What we have been able to do through our Virtual Principals' Center is identify a focus for each of our meetings that is based on something one (or more) of us is dealing with at the time. If there isn't anything pressing, we have been challenged to think about something new (e.g., personalized learning).

### **Principal B**

Involvement in our virtual principal's centre has given me the opportunity to field questions to colleagues who are in the "trenches". I can bounce situations, ideas, etc. off a group of like-minded peers in a trusting way guided by an extremely knowledgeable facilitator. Sharing of ideas from all over the world puts the realm of education at our fingertips. When we ponder ideas, questions, and situations together and can speak about it, the synergy created is amazing. As I have said before, even when we are at our busiest, we NEED to meet with the group because of the positive energy I feel as a result of my involvement.

### **Principal C**

This experience is difficult to explain. We were a group of principals with the objective of being part of a learning community where common experiences will be shared and supported, but what we learned was not identifiable to be put in a

specific category or competence. It was an informal, organized, learning experience. As I participated, I was able to adjust my thinking and practice in dealing with school issues. Learning from others is a way to mature and move yourself from a place of comfort to a place where you are not an expert any more. I've learned that it's fine; it is not a sign of a weakness but a sign of growing.

Vygotsky suggested that knowledge is constructed in the midst of our interactions with others. In my interaction with other principals I've been able to acknowledge how similar our schools are and how our common school issues are impacted by culture, society and its values. I've been able to recognize similar struggles and how they've turned into victories or are on their way to make positive changes in my community. This is certainly encouraging for me in a new principal position. It reminds me of my responsibility and commitment to focus my efforts on student learning, their social and emotional well being, and creating a proactive community of teaching and learning.

#### Principal D

Being invited to join the virtual principal's group this year has been both an honor and an eye opener. Just knowing that there are other administrators from across the globe that struggle and question the various aspects of their role brings a sense of camaraderie. We are not alone. Reflection continues to be a huge component of each day – and listening to the reflections and the questions that arise from others reminds me that it's really okay not to know everything (thank goodness). It's okay to hang out in a state of '*uncomfortableness*' and oftentimes it is from this vantage point that learning occurs. Hearing their stories and sharing in their trials, tribulations, and successes makes me feel like I belong to something larger than the space I occupy.

#### Principal E

I have very much enjoyed the virtual principal's centre this year. These conversations influenced me in a couple of ways. We often talk about the importance of the social context in making decisions about our schools. We were able to talk about those contexts and the unique nature of each of the schools. What

one administrator was able to do in one school would not necessarily work in others. The group gave us a forum in which we could talk about those issues, get others' feedback, and essentially think through a variety of scenarios. It was the voices of many that strengthened the arguments and eventually the decisions. Although we found our differences particularly in social context, what really struck me was the commonality of our experiences. No matter where the person lived, the same underlying values resonated throughout. The educational leaders in this group focused on what was best for their students. There was a thread that held us together in being passionate and purposeful about what it is that we do. This gave me a much more global view not only on schools but also on those who choose to work in them.

### **The Use of Collegial Learning Walks**

A common yield from the yearlong experience was the use of collegial learning walks in three of the schools, Springbank Community High School, Chestemere High School, and Northeast Middle School. Actual participation in collegial learning walks was a school decision, one that participating teachers lauded in a virtual meeting on April 17, 2013 captured on video for the purpose of chronicling the event.

The actual process shared with the principals was the subject of collegial work for three years. Maria Guilott co-authored a book, "A Value Added Decision," that incorporates the work of two of the principals in the study, Leslie Collings and Kim Brandon. Initially, both were reluctant to consider the idea because they already "knew" how this by-product of management by walking around "worked." Both resisted considering that the process had value. However, they both finally agreed to try it out. Once they did, they embraced it wholeheartedly and have promoted the process within their buildings and in the case of Leslie Collings within her jurisdiction. The process has grown in appeal through repeated use and application.

## Collegial Learning Walks as a learning process

The process is designed to examine and analyze learning in the moment as it happens with students. As a professional development strategy, Collegial Learning Walks are designed for teachers in all disciplines and grade levels who teach students from all socio-economic and ability groups. By looking at learning first, we can begin to see together, as we mediate each other's thinking, which strategies are truly engaging students in their work, what makes the work we design engaging to students, and how the work is making it possible for students to transfer what they learn to a new and different context.

What it is	What it is not
<ul style="list-style-type: none"> <li>• It is a process designed to look for what's next in our learning about learning.</li> <li>• It is a collaborative, generative professional development process designed to support everyone's thinking about instructional practice.</li> <li>• It is designed to raise questions and promote self-reflection.</li> <li>• It is a process that will eventually promote a way of being in an instructional community, of sharing, of coaching, of examining practice with no particular agenda in mind other than improved learning.</li> </ul>	<ul style="list-style-type: none"> <li>• It is not a process designed to find what is wrong.</li> <li>• There are no presuppositions that anyone is broken or defective in their practice.</li> <li>• It is not putting anyone on notice of improvement.</li> <li>• It is not designed for the implementation of any particular improvement strategy.</li> <li>• It is not designed to put anyone's practice under scrutiny, critique, or improvement.</li> <li>• It is not a static group or network.</li> <li>• It is not designed to have a focus on a common "problem or practice."</li> </ul>

### Absolutes in a collegial learning walk:

1. With teacher permission, a group of 3 to 5 members walks in the classroom avoiding time when the teacher is in direct instruction. The short classroom visit is designed so that the participants on the walk can ask students specific questions getting at what the student is learning, how he will know when he has learned it, and what he will do with what he has learned.

2. Everyone talks to different students.
3. No one writes anything down.
4. Immediately following the 5-6 minute classroom visit, the group debriefs the experience adhering to a strict protocol.
5. No judgment enters the picture
6. The experience is designed to cause reflection in the 3-5 participants about their own teaching experience and grow the group's knowledge about learning.

### **What's the immediate and long-term payoff for learning walks?**

The power of the process resides in the mediated conversation that immediately follows the 5-6 minute classroom visit.

Teachers from Canada and the United States met electronically in a focus group setting using Google Hangout as the vehicle to discuss their experience with collegial learning walks. The meeting was taped and results of the session were captured to reflect the following observations.

### **Teacher responses to the process**

#### **What's next for me?**

Teachers noted that they wanted to encourage their peers to participate in the process and were now more open to welcoming their peers into their classrooms.

#### **Kick it up a notch**

Teachers pointed out that after participating in the Collegial Learning Walks, they had become accustomed to reflecting and always asking themselves how they could have "kicked it up a notch?" They found the process to be a powerful collaborative tool.

### **Cross-curricular opportunities**

Teachers observed that by participating in the walks and visiting cross-curricular classrooms, their practice did not stagnate and become stale. There was something to be learned from other disciplines.

### **Level of professionalism**

Participants feel that the Collegial Learning Walks bring a level of professionalism that you do not see otherwise.

### **Never Evaluative**

One teacher was adamant that the fact that Collegial Learning Walks were non-evaluative made them powerful because he was able to be relaxed without the fear of judgment when his peers walked in his classroom.

### **Rules of Engagement**

A teacher emphasized how critical it was to show constant fidelity to the rules of engagement. He felt everyone needs to know what the rules are and how to adhere to them.

**From "Drive by" to Learning walk**, an open and honest conversation among peers about learning

Finally, the group distinguished the clear difference between Collegial Learning Walks and the standard walk through or "drive by" as teachers refer to them. They felt without equivocation that the discussion immediately following the learning walks is what made the difference and the moment of learning about learning for everyone, from everyone in the group.

### **Practicing principals echo the teachers and add the following:**

1. The Learning Walks Process is a powerful professional tool. I have been lucky enough to participate in a variety of capacities now and have done so since we began implementing the Learning Walks at SCHS. For the teacher, the feedback provides excellent data to continue to improve your teaching practice. As an administrator it has been an excellent professional learning tool. The more I am exposed to others' classrooms, the more I can reflect on and change my own practice. It also gives me a framework in which I can engage students and teachers in the teaching and learning in the school. The more you can engage teachers in the process, the better the instructional design of the entire school will be.
2. Learning walks have become a platform for fantastic discussions and an opportunity to really think about best practice and what that looks like. It encourages an open-door environment where students and teachers become familiar with a constant movement in and out of the classroom. Students are provided an opportunity to share their understanding and to become active participants in dialogue with other adult people in the school. This increases their sense of belonging and leadership. Students feel heard.  
Not only are learning walks involving students in an authentic interaction, but they also provide a strong opportunity for professional learning on the part of the teachers and administrators engaged in the walk. By seeing and listening to what is happening in other classrooms, teachers begin to see beyond their own experience – another lens is created. This leads to reflection and questioning of practice, thus an environment of constant improvement becomes the norm. Sometimes 'we don't know what we don't know' and learning walks allow us to discover and therefore take action. Learning walks are all about building collegiality, building trust, and opening our doors to the possibilities of 'what's next?'

The 'what's next' at Springbank High is that our entire division has discovered the inherent value of learning walks and beginning in the fall, all schools in Rocky View School District have been invited to learn about and begin this practice in their own schools. Teachers of Springbank High will take a leadership role in this initiative.

3. Learning walks have opened up an entirely different way for staff to open their doors, share best practices, converse about education, reflect upon their own practice and for staff to join together with colleagues for a very positive experience in their own building. The payoff is that staff becomes more reflective of their own practice and concerned about the impact of their teaching on our kids. An added benefit is that students get to "sell" what they are doing to other teachers - our kids were excited to talk about what they were doing in class and it became a very positive experience for the students as well. They also got to share with professionals in the building that they may never have otherwise and the positive ownership they took was incredible.

The added bonus of Learning Walks is that everyone in the building can be involved and the time period for a walk is relatively short compared to other professional learning. Again, the benefit is that, for some teachers, it is life changing - they actually get to see education through our students' eyes. The experience is really quite amazing!

4. One thing that makes the Learning Walk so different from the typical "walk-through" is the way in which all involved in the Learning Walk are constantly learning. Even though there is a facilitator for the Learning Walk teams, these facilitators are not "experts." Their role is to keep the debriefing focused on the reflective questions and to maintain the learning experience as opposed to an evaluative process

Something else that makes the Learning Walk so different is the focus on the student and his/her engagement to the task rather than to the teacher (e.g., Eyes on the players—NOT the coach!).

We “bother” with Learning Walks because they challenge us to get out of our comfort zone—our own classrooms—and experience learning through our students’ eyes. The payoff is the increased level of collaboration. Teachers want to learn more from their peers as a result of observing students engaged in learning experiences in their peers’ classrooms. The payoff should also result in higher levels of engagement for all students and more meaningful learning experiences that—ultimately—should result in high achievement for all our learners!

### **Lesson Learned**

1. Although there was initial concern that virtual conversations with strange people would inhibit open and honest dialogue, apprehensions were ill conceived. The first session was a get to know you session that was a little stiff. One way used to break the ice was asking each participant to share a quote that resonated with each person and why that was so. By having tools and documents immediately at everyone’s disposal through the Weebly, everyone realized that this was their moment to share and learn.
2. Being a part of this group of principals is a privilege that comes with commitment on the part of each participant, a commitment to be present and come out from behind the desk to have real conversations. After the first meeting, each subsequent meeting was preceded by an email reminder that included the main topic or question for discussion to give participants an opportunity to think ahead. Ultimately, the group became comfortable with each other and was able to discuss burning issues each person had at his/her school.
3. Based on the group’s needs, members, including the facilitator, are able to offer resources, on-line professional development and deliver it

- virtually using Skype or Google Hangout.
4. It is important to note that participants need to be invited to participate and asked to commit their time to the monthly conversations. Since no one needs to travel to go anywhere, the group can simply meet from individual offices and dedicate the time to the conversations.

In conclusion, the entire virtual principal center experience has enriched the professional toolkit for all participants. Plans are to expand and continue the process next school year.

# Silent Custodians

A comparative study of public statues in the United States and Australia which reflect on relationships between Indigenous and Colonizing Peoples.

Dr Greg Blyton

Wollotuka Institute University of  
Newcastle Australia

# Pubic Statues

- Statues are found throughout the world commemorating the achievements, legacies and events of a human past.
- In this paper the nature of public statues portraying Indigenous Peoples in the United States and Australia will be explored as a tool of education.

# Colebrook Reconciliation Park

- Colebrook is located near Port Augusta in South Australia and was site to an Aboriginal mission.
- During a period from 1900 to 1970 it has been estimated that at least 50, 000 Aboriginal children were removed from their natural parents under various government legislations.
- These Children became known as the Stolen Generation.

- Some statues portray the injustices of past relations. To remember the Aboriginal children of the Stolen Generation, the 'Fountain of Tears' and the 'Grieving Mother' statues, sculpted by Silvio Apponi, have been created.

- **A concrete statue honours a blind Native American woman named Amanda who was removed from her farm on the headwaters of the Coos River, and marched north to Yachats.**

- A 3m high memorial consisting of a granite pedestal, with four panels of bas reliefs on each side and a bronze bust of Maitland Brown perched right on top.

- The panels in question depict Police Inspector J.K. Panter, Police Constable W.H. Goldwyer and James R. Harding who were killed allegedly killed by Aboriginal People in 1894).

- One panel shows a group of Aborigines being lead in single file with shackles around their necks

- In 1990 someone got themselves a chisel and chinked off Brown's head as a protest against the glorification of a man who had a reputation for mistreating Aborigines. A replacement bust was put in place until the head was secretly returned in 1993.

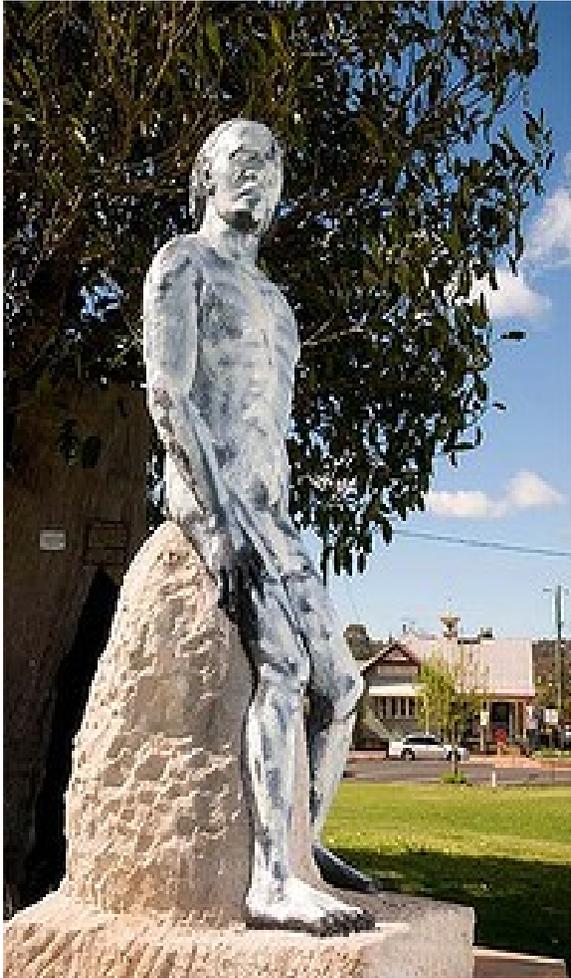

An Aboriginal statue in the centre of Albany's main street has been vandalised by being painted white.

The statue is of Aboriginal man, Mokare, who is celebrated as a peace maker between Indigenous and European people during the settlement of Albany in the 1800s.

- Opposite shows a cleaner repairing statue vandalised with white paint.

- Three teenagers have been charged over the desecration of a statue of a local aboriginal identity at Crows Nest in Queensland's Darling Downs.
- Police say the trio spray painted the statue white, broke a street light, started a fire in the middle of a road and broke into several vehicles.
- The two metre-high statue is of the town's namesake Jimmy Crow, a local Aboriginal legend who helped early white settlers and drovers travelling through the area.

- This sculpture by Craig Dan Goseyun, titled "Follows the Mountain," was spattered with paintballs recently. The vandalism on the Indian head was reported Tuesday morning. It is located in a roundabout on Richards Avenue near Santa Fe Community College and the Santa Maria de la Paz Catholic Community

- I'm glad they caught the knuckleheads responsible for knocking over the Big Indian statue on the New York State Thruway near the Cattaraugus Reservation. Six punks from Clarence High School were arrested for the crime today. These kids are so dumb, they probably didn't even realize how offensive this thoughtless act of vandalism was. I'd feel the same way if it were a statue of Martin Luther King or an Irish statue in South Buffalo.

- A sculptured statue of John Eyre and his Aboriginal guide Wylie – in recognition of their magnificent work in travelling across what is now known as the Nullarbor Plain nearly 200 years ago!

- Sacagewea, a Shoshone woman has become an important part of the Lewis and Clark legend in the American public imagination. The National American Woman Suffrage Association during the early 20<sup>th</sup> century adopted her as a symbol of women's worth and independence, erecting several statues and plaques in her memory, and doing much to spread the story of her accomplishments

- **Sotheby's withdraws sculptures of Woureddy & Truganini busts following protests from Aboriginal people claiming they depict a demeaning image of Aboriginal peoples.**

- The Rosenthal AP photo. (Photograph of Flag Raising on Iwo Jima, 02/23/1945 (NWDNS-80-G-413988; ARC Identifier: 520748); General Photographic File of the Department of Navy, 1943 - 1958; General Records of the Department of the Navy, 1804 - 1958; Record Group 80; National Archives.)

- “But the cigar-store Indian was everywhere similar, of no tribe and no place, wearing splendid jewelery, tunic, feathers, sometimes fringed leggings, the Noble Savage of early-19th-century romantic imagining -- and an object lesson in the relationship between popular art and stereotype.” (Phyllis Rose: 2014)

- King Kamehameha was out the front of this thrifty store until an Hawaiiin person complained to the owner that it was demeaning. The owner thought about it and sold the statue and since that time his business has prospered.

# BEYOND TOURIST CAMERAS

- It can be seen that statues have an important place in learning about past and present relations between Indigenous and non Indigenous peoples. Comparative studies of commemorative public statue figures depicting Indigenous history are useful visual tools for education in looking at past relationships between Indigenous and Colonial populations in countries such as Australia and the United States. Statues hold a key to the past as timeless symbols which transcend into the living world. Vandalism marred by racially derogative graffiti reflects an underbelly in contemporary society. On a positive note statues erected of Indigenous/Colonial contact endeavour to acknowledge and teach.

# The Use of Indigenous Sculptures in Education

- A variety of themes can be taught through the use of Indigenous sculptured works to illustrate both past and present events and issues.
- Statues have an ongoing value as symbols of the past which impart useful information about the relationships between Indigenous and Colonizing Peoples.
- The public statues in both the United States and Australia of about the relationship between Indigenous and Colonizing Peoples reflect distinct similarities.
